⚠ HIGH ALERT

abacavir (Rx)

(ah-bak′ah-veer)

Ziagen

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

Do not confuse:
abacavir/amprenavir

ACTION: Inhibitory action against HIV-1; inhibits replication of the virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES: In combination with other antiretroviral agents for HIV-1 infection
Unlabeled uses: HIV prophylaxis following occupational exposure

CONTRAINDICATIONS

Black Box Warning: Hypersensitivity, moderate/severe hepatic disease, lactic acidosis

Precautions: Pregnancy, breastfeeding, children <3 mo, granulocyte count <1000/mm^3 or HB <9.5 g/dL, severe renal disease, impaired hepatic function, HLA B5701+ (Black, White, Asian patients), abrupt discontinuation; Guillain-Barré syndrome, immune reconstitution syndrome, MI, obesity, polymyositis

DOSAGE AND ROUTES

- **Adult and adolescent ≥16 yr: PO** 300 mg bid or 600 mg/day with other antiretrovirals
- **Adolescent <16 yr and child ≥3 mo: PO** (oral solution) 8 mg/kg bid or 16 mg/kg daily, max 300 mg bid with other antiretrovirals; tablets 14-19 kg 150 mg bid or 300 mg daily; 20-24 kg 150 mg AM and 300 mg PM or 450 mg daily; ≥25 kg 300 mg bid or 600 mg daily

Hepatic dose

- **Adult: PO** (Child-Pugh A [5-6 points]) (oral solution) 200 mg bid; moderate to severe hepatic disease, do not use

HIV prophylaxis (unlabeled)

- **Adult: PO** 600 mg daily as an alternative

Available forms: Tablets 300 mg; oral solution 20 mg/mL

Administer:

- Give in combination with other antiretrovirals
- May give without regard to food q12hr around the clock
- Reduce dose in hepatic disease, use oral sol
- Storage at room temperature; protect from light; oral solution stored at room temperature; do not freeze

SIDE EFFECTS

CNS: *Fever, headache, malaise, insomnia, lethargy*
GI: *Nausea, vomiting, diarrhea, anorexia,* increase AST/ALT, hepatotoxicity, hepatomegaly with steatosis
INTEG: *Rash,* urticaria, hypersensitivity reactions
META: Lactic acidosis
OTHER: Fatal hypersensitivity reactions, MI, fat redistribution, immune reconstitution

PHARMACOKINETICS

Rapid/extensive absorption, distributed to extravascular space, then erythrocytes; 50% protein binding; extensively metabolized to inactive metabolites by the liver; half-life 1½ hr; excreted in urine, feces (unchanged); onset, peak, 1-1.5 hr, duration unknown

INTERACTIONS

- Do not coadminister with abacavir-containing products, ribavirin, interferon
- **Increase:** possible lactic acidosis—ribavirin

Increase: abacavir levels—alcohol
Decrease: levels of methadone, may require higher dose of methadone
Drug/Lab Test
Increase: serum glucose, triglycerides, ALT, AST, amylase, CK

NURSING CONSIDERATIONS

Assess:

- Symptoms of HIV and possible infections; increased temperature baseline and throughout treatment

Black Box Warning: Lactic acidosis (elevated lactate levels, increased LFTs), severe hepatomegaly with steatosis, discontinue and do not restart; may have enlarged liver, elevated AST, ALT, lactate levels; women and the obese may be at greater risk; monitor serum lactate levels, LFTs, palpate liver for enlargement

Black Box Warning: Fatal hypersensitivity reactions: fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted; those with HLA-B5701 are at great risk for hypersensitivity; obtain testing for HLA-B 5701 prior to starting treatment, register at the Abacavir Hypersensitivity Registry (800-270-0425)

- Renal studies: BUN; serum uric acid; CCr prior to, during therapy; these may be elevated

Black Box Warning: Hepatotoxicity: monitor hepatic studies prior to and monthly during therapy: bilirubin, AST, ALT, amylase, alkaline phosphatase, creatine phosphokinase, creatinine

- **Blood counts:** monitor viral load and CD4 counts during treatment; watch for decreasing granulocytes, HB; if low, therapy may have to be discontinued and restarted after recovery; blood transfusions may be required; perform hepatitis B virus (HBr) screening to confirm correct treatment
- **Resistance:** do not use triple antiretrovirals (abacavir, lamivudine, tenofovir) in treatment-naive persons
- **Immune reconstitution syndrome:** may occur anytime during treatment and is a response to CMV, *Mycobacterium avium* infection
- **Fat redistribution:** may occur anytime during treatment; buffalo hump, breast growth, moon face, facial wasting, trunk obesity

Evaluate:

- Therapeutic response: increased CD4 count, decreased viral load, decreased disease progression

Teach patient/family:

- That product is not a cure but will control symptoms; that patient is still infective, may pass HIV virus on to others, not to have sexual contact without condom, needles should not be shared, blood from infected individual should not come in contact with another's mucous membranes
- To carry emergency ID with condition, products taken; not to take other products that contain abacavir
- That body fat redistribution may occur; not to share product
- **Hypersensitivity:** to notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur; stop product and to notify prescriber immediately if skin rash, fever, cough, shortness of breath, GI symptoms occur; to advise all health care providers that allergic reaction has occurred with abacavir
- That follow-up visits must be continued because serious toxicity may occur; blood counts must be done
- To review and discuss points outlined on Medication Guide and Warning Card
- That other products may be necessary to prevent other infections and that drug is taken with other antiretrovirals
- Not to drink alcohol while taking this product
- To use exactly as prescribed, not to stop product or change dose, not to use with other products unless approved by prescriber
- **Pregnancy/breastfeeding:** to consider the use of contraception during treatment; identify if pregnancy is planned or suspected; use only if benefits outweigh risk; pregnant patients should enroll in Antiretroviral Pregnancy Registry at 800-258-4263; avoid breastfeeding

abaloparatide (Rx)

(a-bal-oh-PAR-a-tide)

Tymlos

Func. class.: Parathyroid hormone analog and modifier

ACTION: A synthetic peptide analog of a parathyroid hormone–related protein, which acts as an agonist at the PTH receptors

USES: For the treatment of postmenopausal women with osteoporosis at high risk for fracture

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Breastfeeding, children, pregnancy, radiation, hypercalcemia, hypercalciuria, hyperuricemia, hyperparathyroidism, renal disease, orthostatic hypotension

Black Box Warning: Osteogenic sarcoma, new primary malignancy

DOSAGE AND ROUTES

Postmenopausal women with osteoporosis at high risk for fracture

- **Adult postmenopausal female: SUBCUT** 80 mcg daily

Available forms: Solution for injection 80 mcg/dose

Administer:

SUBCUT route

- Visually inspect for particulate matter and discoloration prior to use
- Do not use IV/IM
- Needles are not included with the pen; a separate prescription for needles is needed. Use 8-mm, 31-gauge Clickfine needles such as ReliOn, Smart Sense, or TopCare brands
- Prime prior to first use to remove air bubbles
- Do not inject into areas where skin is tender, bruised, red, scaly, or hard. Avoid areas with scars or stretch marks
- Rotate site daily and give at the same time
- The first several doses should be given with the patient lying down in case of orthostatic hypotension
- **Storage:** Prior to first use, store pen in refrigerator (do not freeze). After first use, store for up to 30 days at room temperature (68°F-77°F or 20°C-25°C); do not freeze or expose to heat. Keep cap on when not in use. Do not store with a needle attached. Use pen only for 30 days. Dispose of properly

SIDE EFFECTS

CNS: Dizziness

META: Hypercalcemia, hyperuricemia

INTEG: Injection site reactions

CV: Orthostatic hypotension

PHARMACOKINETICS

Protein binding approximately 70%; half-life 0.7 hr

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:

- **Osteoporosis:** prior to and during treatment
- **Blood studies:** serum calcium, uric acid baseline and periodically
- **Urolithiasis:** product may increase the risk of urolithiasis in those with recent or current urolithiasis

Black Box Warning: Osteosarcoma: increased risk; use product for <2 yr

- **Pregnancy/breastfeeding:** not indicated for women of reproductive potential

Evaluate:

- Therapeutic response: increased bone mineral density

Teach patient/family:

- Not to try to inject until patient or caregiver receives training
- To receive the first several injections near a place to sit or lie down, until the effect of the injection is known; blood pressure may drop

• To inject 1 time each day into lower stomach area (abdomen) just under the skin (SUBCUT); to avoid giving the injection within the 2-inch area around the navel; to rotate injection sites daily
• That periodic lab tests will be done
• To take at same time each day; that if the dose is forgotten or cannot be taken at the usual time, to take drug as soon as remembered on that day
• Not to share pen or pen needles with others even if the needle has been changed
• **Urolithiasis:** to report painful urination

abametapir (Rx)

(a′ba-met′a-pir)

Xeglyze

Func. class.: Pediculicide

Chem. class.: Metalloproteinase inhibitor

ACTION:

Inhibits metalloproteinases that are critical to egg development and survival of lice

USES:

Head lice

CONTRAINDICATIONS

Hypersensitivity

Precautions: Risk of neonatal benzyl alcohol toxicity, accidental ingestion

DOSAGE AND ROUTES

• **Adult/child ≥6 mo: Topical** apply to whole scalp and hair using up to the whole bottle

Available forms: Lotion 0.74%

Administer:

Topical

• For topical use only
• Shake well before using, apply to dry hair to cover whole area to be treated, including hair and scalp
• Massage into the scalp and hair, leave on for 10 min, then rinse with warm water
• For single use only, discard unused portion
• Do not flush unused portion down sink or toilet
• Wash hands after use
• Store at room temperature

SIDE EFFECTS

GI: Vomiting

EENT: Eye irritation, burning

INTEG: Dermatitis, rash, head/scalp pruritus, hair color change

PHARMACOKINETICS:

Onset rapid, peak 34-92 min, duration unknown, half-life 12 hr

INTERACTIONS:

Increase: CYP1A2/CYP2B6/CYP3A4 substrates: avoid use 2 wk before application

NURSING CONSIDERATIONS

Assess:

• **Infestation:** Assess head, hair for lice, nits before and after treatment; identify source of infection: school, family
• **Pregnancy/breastfeeding:** Use only if needed, no studies in pregnancy or lactation

Evaluate:

• **Therapeutic response:** Absence of nits, brownish trails on scalp

Teach patient/family:

• To wash all inhabitants' clothing, brushes, bedding; that preventive treatment may be required of all persons living in same house, using lotion to decrease spread of infection
• Do not ingest
• Keep out of reach of children
• Use on children under the direct supervision of an adult, risk of benzyl alcohol toxicity
• Avoid contact with eyes
• Wash hands after application
• Shampoo hair any time after the treatment
• Use only once, do not reapply
• Discard unused portion, do not flush contents down sink/toilet

abatacept (Rx)

(ab-a-ta′sept)

Orencia, Orencia ClickJet

Func. class.: Antirheumatic agent (disease modifying)

Chem. class.: Immunomodulator

Do not confuse:
Orencia/Oracea

ACTION: A selective costimulation modulator; inhibits T lymphocytes, inhibits production of tumor necrosis factor (TNF-α), interferon-γ, interleukin-2, which are involved in immune and inflammatory reactions

USES: Polyarticular juvenile rheumatoid arthritis; moderate to severe rheumatoid arthritis; acute, chronic rheumatoid arthritis that has not responded to other disease-modifying agents; may use in combination with DMARDs; do not use with TNF antagonists (adalimumab, etanercept, infliximab), anakinra

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, children, geriatric patients, recurrent infections, COPD, TB, viral hepatitis, immunosuppression, neoplastic disease, respiratory infection

DOSAGE AND ROUTES

Rheumatoid arthritis/psoriatic arthritis

- **Adult: SUBCUT** 125 mg within 1 day after single IV loading dose, then 125 mg weekly; weekly SUBCUT dose may be initiated without an IV loading dose for those unable to receive an infusion
- **Adult >100 kg (220 lb): IV INFUSION** 1 g over 30 min, give at 2, 4 wk after first infusion, then q4wk
- **Adult 60-100 kg (132-220 lb): IV INFUSION** 750 mg over 30 min, give at 2, 4 wk after first infusion, then q4wk
- **Adult <60 kg (132 lb): IV INFUSION** 500 mg over 30 min, give at 2, 4 wk after first infusion, then q4wk

Juvenile rheumatoid arthritis (JRA)/juvenile idiopathic arthritis (JIA)

- **Adolescent and child ≥6 yr and >100 kg: IV INFUSION** 1 g given over 30 min q2wk × 3 doses, then 1 g given over 30 min q4wk starting at wk 8
- **Adolescent and child ≥6 yr and 75-100 kg: IV INFUSION** 750 mg over 30 min q2wk × 2 doses, then 750 mg given over 30 min q4wk starting at wk 8
- **Adolescent and child ≥6 yr and <75 kg: IV INFUSION** 10 mg/kg given over 30 min q2wk × 3 doses, then 10 mg/kg q4wk starting at wk 8

Moderate/severe polyarticular juvenile idiopathic arthritis as monotherapy with or without methotrexate

- **Child/adolescent ≥2 yr and ≥50 kg: SUBCUT** 125 mg q1wk
- **Child/adolescent ≥2 yr and 25-50 kg: SUBCUT** 87.5 mg q1wk
- **Child/adolescent ≥2 yr and 10-25 kg: SUBCUT** 50 mg q1wk

Available forms: Lyophilized powder, single-use vials 250 mg; sol for SUBCUT injection 125 mg/mL
Administer:

- Storage in refrigerator; do not use expired vials, protect from light, do not freeze

Intermittent IV INFUSION route

- **To reconstitute,** use 10 mL sterile water for injection; insert syringe needle into vial and direct stream of sterile water for injection on the wall of vial; rotate vial until mixed; vent with needle (25 mg/mL); **further dilute** in 100 mL NS from a 100-mL infusion bag/bottle; withdraw the needed volume (2 vials remove 20 mL, 3 vials remove 30 mL, 4 vials remove 40 mL); slowly add the reconstituted solution from each vial into the infusion bag/bottle using the same disposable syringe supplied; mix gently; discard unused portions of vials; do not use if particulate is present or discolored; **give** over 30 min; use non–protein-binding filter (0.2-1.2 microns); protect from light
- Do not admix with other solutions or medications

SUBCUT route

- Use prefilled syringe for SUBCUT only (do not use for IV); allow to warm to room temperature (30-60 min); inject into fronts of thighs, outer area of upper arm, or abdomen except for 2-inch area

around the navel; do not inject into tender, bruised area
• Rotate injection sites
• Use ClickJet for SUBCUT only; let warm for 30 min after removal from refrigerator, do not use if damaged or past expiration date

SIDE EFFECTS

CNS: Headache, asthenia, dizziness
CV: *Hypo/hypertension*
GI: Abdominal pain, dyspepsia, nausea, diarrhea, diverticulitis
GU: UTI, pyelonephritis
MS: Back pain
INTEG: Rash, *injection site reaction,* flushing, urticaria, pruritus
RESP: *Pharyngitis, cough, URI,* non-URI, *rhinitis,* wheezing
SYST: Anaphylaxis, malignancies, serious infections, antibody development

PHARMACOKINETICS

Half-life IV 13 days, SUBCUT 14.3 days, steady state 60 days; clearance increases with increased body weight

INTERACTIONS

• Do not give concurrently with live virus vaccines; immunizations should be brought up to date prior to treatment
• Do not use with TNF antagonists: adalimumab, etanercept, inFLIXimab; anakinra; infection may occur
• Avoid use with corticosteroids, immunosuppressives, atropine, scopolamine, halothane, nitrous oxide

NURSING CONSIDERATIONS

Assess:
• **RA:** pain, stiffness, ROM, swelling of joints during treatment baseline and periodically
• **HBV reactivation:** Screen patient at risk prior to starting treatment
• **TB:** for latent/active TB, viral hepatitis prior to beginning treatment
• For injection site pain, swelling
• Patient's overall health at each visit; product should not be given with active infections; parenteral product contains maltose, glucose monitoring must be done with glucose-specific testing
• **Infection:** sinusitis, UTI, influenza, bronchitis; serious infections have occurred; notify prescriber, therapy may need to be changed
• **Pregnancy/breastfeeding:** assess whether pregnancy is planned or suspected; if pregnant, register by calling 877-311-8972; use only if benefits outweigh fetal risk; do not breastfeed

Evaluate:
• Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:
• That product must be continued for prescribed time to be effective, not to use with alcohol
• To use caution when driving; dizziness may occur
• Not to have live virus vaccinations while taking this product or use alcohol, TNF antagonists, other immunosuppressants; bring vaccinations up to date prior to use of this product
• About patient information included in packaging, including "do not shake"
• How to inject and rotate injection sites
• To immediately report signs of infection: temperature, flu like symptoms, urinary burning/stinging, sinusitis
• To avoid those with known infections
• That product contains maltrose and may lead to elevated glucose levels in some glucose testing methods
• To inform all prescribers that this product is being used

abemaciclib (Rx)

(uh-beh′-muh-sy′-klib)
Verzenio
Func. class.: Antineoplastic
Chem. class.: Kinase inhibitors

ACTION: It is an inhibitor of the cyclin-dependent kinases 4 and 6, a protein kinase inhibitor

USES: For the treatment of HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression

following endocrine therapy and prior chemotherapy, as monotherapy, or in combination with fulvestrant

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Breastfeeding, contraception requirements, hepatic disease, hepatotoxicity, infertility, neutropenia, pregnancy, pregnancy testing, reproductive risk, thromboembolic disease

DOSAGE AND ROUTES

HR-positive, HER2-negative advanced or metastatic breast cancer disease progression following endocrine therapy and prior chemotherapy, as monotherapy

• **Adult: PO** 200 mg bid until disease progression or unacceptable toxicity

HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression following endocrine therapy, in combination with fulvestrant

• **Adult: PO** 150 mg bid with fulvestrant (500 mg **IM** as two 250-mg [5 mL] injections, 1 injection in each buttock, on days 1, 15, 29, and monthly thereafter) until disease progression or unacceptable toxicity. Pre- and perimenopausal women should also be treated with a gonadotropin-releasing hormone agonist

Therapeutic drug monitoring: dosage adjustments for treatment-related toxicities

Interrupt therapy per specific instructions. Restart as appropriate at the following reduced doses:

• **Starting dose:** Monotherapy, 200 mg bid; combination with fulvestrant, 150 mg bid

• **First occurrence:** Monotherapy, 150 mg bid; combination with fulvestrant, 100 mg bid

• **Second occurrence:** Monotherapy, 100 mg bid; combination with fulvestrant, 50 mg bid

• **Third occurrence:** Monotherapy, 50 mg bid; combination with fulvestrant, not applicable

Diarrhea

• **Grade 1:** Begin antidiarrheals, increase oral fluid intake. No change needed

• **Grade 2, first occurrence:** Begin antidiarrheals, increase oral fluid intake. If diarrhea does not resolve to grade ≤1 within 24 hr, hold until resolution. No change needed unless grade 2 diarrhea persists; upon resolution to grade ≤1, resume at next lower dose level

• **Grade 2, recurrent despite maximal supportive measures:** Begin antidiarrheals, increase oral fluid intake. When diarrhea resolves to grade ≤1, resume at next lower dose level

• **Grade 3 or 4, or requires hospitalization:** Begin antidiarrheals, increase oral fluid intake. When diarrhea resolves to grade ≤1, resume at next lower dose level

Hepatic dose

• **Adult: PO**

Child-Pugh A or B: no change; **Child-Pugh C:** reduce dosing to once per day; **grade 1 (AST/ALT 1.1-3× the upper limit of normal [ULN]), without an increase in total bilirubin above 2× ULN:** no change; **grade 2, first occurrence (AST/ALT 3.1-5× ULN), without an increase in total bilirubin above 2× ULN:** no change; if grade 2 persists, hold; after resolution to baseline or grade 1, resume at the next lower dose level; **grade 2, recurrent (AST/ALT 3.1-5× ULN), without an increase in total bilirubin above 2× ULN:** hold; after resolution to baseline or grade 1, resume at the next lower dose level; **grade 2 or 3 (AST/ALT 3.1-20× ULN) with total bilirubin greater than 2× ULN, in the absence of cholestasis:** discontinue; **grade 4 (AST/ALT >20× ULN):** discontinue

Available forms

Tablets 50, 100, 150, 200 mg

Administer

• With food at the same time every day

• Swallow tablets whole; do not chew, crush, or split. Do not take if broken, cracked

• If a dose is missed, do not replace missed dose; resume with the next scheduled daily dose

SIDE EFFECTS

GI: Diarrhea, abdominal pain, anorexia, nausea, vomiting, constipation, stomatitis, weight loss

CNS: Dizziness, drowsiness, fatigue, fever

MS: Arthralgia

INTEG: Rash, alopecia
GU: Renal failure (rare)
HEMA: Anemia, leukemia, neutropenia, thrombocytopenia
MISC: Infection

PHARMACOKINETICS

Protein binding 96.3%; half-life 18.3 hr; fecal excretion 97.1%; metabolized in liver by CYP3A4

INTERACTIONS

- **Increase:** abemaciclib effect—strong or moderate CYP3A4 inhibitors; avoid concomitant use
- **Decrease:** abemaciclib effect—strong or moderate CYP3A4 inducers; avoid concomitant use

NURSING CONSIDERATIONS

Assess:

- **Diarrhea:** at the first sign of loose stools, start antidiarrheal therapy, increase oral fluids
- **Neutropenia:** CBC baseline then q2wk for the first 2 mo, then monthly for the next 2 mo, and as needed
- **Venous thromboembolism:** monitor for signs, symptoms of thrombosis, pulmonary embolism; treat as needed
- **PE:** chest pain worse when breathing deeply or coughing, coughing up blood, dizziness, fainting, tachypnea, rapid heartbeat, irregular heartbeat, shortness of breath
- **Infection:** assess for UTI, lung infection, pharyngitis, conjunctivitis, sinusitis, vaginal infection, sepsis
- **Hepatotoxicity:** monitor LFTs baseline, then q2wk × 2 mo, monthly × next 2 mo, and then as needed; interruption in therapy or delay in treatment may be needed
- **Pregnancy/breastfeeding:** Avoid in females of reproductive potential during treatment and for at least 3 wk after last dose; can cause fetal harm or death; discontinue breastfeeding during treatment and for 3 wk after final dose. Presence in breast milk unknown. Obtain pregnancy test prior to treatment

Evaluate:

- Therapeutic outcome: decrease in size of cancerous tumor

Teach patient/family:

- **Infection:** to report the following to health care provider: increased temperature, fever, shaking, chills, cough, sore throat
- **Diarrhea:** to start antidiarrheal therapy at the first sign of loose stools, increase fluids, and notify health care provider
- **Thromboembolism:** to report immediately chest pain, worse when breathing deeply or coughing, coughing up blood, dizziness, fainting, tachypnea, rapid heartbeat, irregular heartbeat, shortness of breath, pain, swelling of the extremity with redness and warmth, discoloration including a bluish color
- **Pregnancy/breastfeeding:** not to use in pregnancy, breastfeeding; to use contraception during treatment and for at least 3 wk after last dose

⚠ HIGH ALERT

abiraterone (Rx)

(a′bir-a′ter-one)

Zytiga

Func. class.: Antineoplastic
Chem. class.: Androgen biosynthesis inhibitor

ACTION: Converted to abiraterone, which inhibits CYP17, the enzyme required for androgen biosynthesis; androgen-sensitive prostate cancer responds to treatment that decreases androgens

USES: Metastatic, castration-resistant prostate cancer in combination with predniSONE

CONTRAINDICATIONS: Pregnancy, women, children, breastfeeding
Precautions: Adrenal insufficiency, cardiac disease, MI, heart failure, hepatic disease, hypertension, hypokalemia, infection, surgery, ventricular dysrhythmia, stress, trauma

DOSAGE AND ROUTES

- **Adult males: PO** 1000 mg/day with predniSONE 5 mg bid and with GnRH (gonadotropin-releasing hormone analog) or bilateral orchiectomy; with strong CYP3A4 inducers 1000 mg bid

Hepatic dose

• **Adult males (Child-Pugh B, 7-9): PO** 250 mg/day with predniSONE; permanently discontinue if AST/ALT >5 × the upper limit of normal (ULN) or total bilirubin >3 × ULN; Child-Pugh C >10, do not use

Available forms: Tablets 250 mg

Administer:

PO route

• Give whole on empty stomach 2 hr prior to or 1 hr after meals with full glass of water; do not crush, break, chew

• **Pregnancy:** women who are pregnant or who may become pregnant should not touch tablets without gloves

• Store tablets at room temperature

SIDE EFFECTS

CV: Angina, dysrhythmia exacerbation, atrial flutter/fibrillation/tachycardia, AV block, chest pain, edema, heart failure, MI, hypertension, QT prolongation, sinus tachycardia, supraventricular tachycardia, ventricular tachycardia

ENDO: Hot flashes, adrenocortical insufficiency

GI: Diarrhea, dyspepsia, hepatotoxicity

GU: Increased urinary frequency, nocturia, UTI

META: Adrenocortical insufficiency, hyperbilirubinemia, hypertriglyceridemia, hypokalemia, hypophosphatemia

MS: Arthralgia, myalgia, fracture

RESP: Cough, upper respiratory infection

SYST: Infection

PHARMACOKINETICS

Onset rapid, peak 2 hr, duration unknown; 99% protein binding, converted to abiraterone (active metabolite), half-life 7%-17% hr; excreted 88% (feces), 5% (urine); high-fat food increases effect, give on empty stomach; increased effect in hepatic disease

INTERACTIONS

• **Decrease:** abiraterone effect—CYP3A4 inducers (carBAMazepine, phenytoin, rifAMPin, rifabutin, rifapentine, PHENobarbital); dose may need to be increased

• **Increase:** action of CYP2D6/CYP2C8 substrates—dextromethorphan, thioridazine, pioglitazone; doses of these products should be reduced; avoid concurrent use if possible

Drug/Food

Increase: abiraterone action—must be taken on an empty stomach

Drug/Lab

Increase: ALT, AST, bilirubin, triglycerides, cholesterol, alkaline phosphatase

Decrease: potassium, phosphate, testosterone, lymphocytes

NURSING CONSIDERATIONS

Assess:

• **Prostate cancer:** monitor prostate-specific antigen (PSA), serum potassium, serum bilirubin baseline and periodically

• **Hepatotoxicity:** monitor liver function tests (AST/ALT) at baseline, every 2 wk for 3 mo, monthly thereafter in no known hepatic disease; interrupt treatment in patients without known hepatic disease at baseline who develop ALT/AST >5 × ULN or total bilirubin >3 × ULN; patients with moderate hepatic disease at baseline, measure ALT, AST, bilirubin prior to the start of treatment, every week for 1 mo, every 2 wk for the following 2 mo, monthly thereafter; if elevations in ALT and/or AST >5 × ULN or total bilirubin >3 × ULN occur in patients with moderate hepatic impairment at baseline, discontinue and do NOT restart; obtain serum total bilirubin, AST/ALT if hepatotoxicity is suspected; elevations of AST, ALT, bilirubin from baseline provide more frequent monitoring

• Monitor B/P, pulse, edema, if hypertensive, control symptoms

• **Musculoskeletal pain, joint swelling, discomfort:** arthritis, arthralgia, joint swelling, and joint stiffness, some severe; muscle discomfort that includes muscle spasms, musculoskeletal pain, myalgia, musculoskeletal discomfort, and musculoskeletal stiffness may be relieved with analgesics

• Signs, symptoms of adrenocorticoid insufficiency (anorexia, nausea, vomiting, fatigue, weight loss); corticosteroids may need to be prescribed during stress, trauma, surgery; assess monthly for hypertension, hypokalemia, fluid retention

• **QT prolongation:** monitor ECG for QT prolongation, ejection fraction in patients

with cardiac disease; small increases in the QTc interval such as <10 ms have occurred; monitor for arrhythmia exacerbation

Evaluate:

• Therapeutic response: Decreasing spread, progression of prostate cancer

Teach patient/family:

• **Pregnancy:** that women must not come into contact with tablets; to wear gloves if product needs to be handled; that males should wear condoms and use another form of contraception if partner is pregnant during use of product and for 1 wk after discontinuing treatment

• To report chest pain, swelling of joints, burning/pain when urinating

• Not to use with other medications, herbs without prescriber approval

• To take 2 hr prior to or 1 hr after meals; to swallow tablet whole, take with water

• That this product, predniSONE, and a GnRH need to be used together

• Not to stop abruptly without prescriber consent

• That B/P, potassium, and possible fluid retention will be monitored at least monthly

• To immediately report jaundice of skin, eyes, clay-colored stools, dark urine; that lab work will be needed during at least first 3 mo

• To discuss all other products taken with all prescribers

• If dose is missed, skip and take next regularly scheduled dose

⚠ HIGH ALERT

acalabrutinib (Rx)

(a-Kal'a-broo-tin-ib)

Calquence

Func. class.: Antineoplastic

Chem. class.: Kinase inhibitor

ACTION: Second-generation kinase inhibitor, decreases proliferation of cancer cells

USES: For the treatment of mantle cell lymphoma (MCL) in patients who have received at least 1 prior therapy

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Serious infections, secondary malignancies, children, pregnancy, breastfeeding

Toxicity-related dosage changes

Refer to manufacturer's information

Available forms. Capsules 100 mg

Administer:

PO route

• Give whole; do not crush, chew, or break tablets

• Give without regard to food

• If dose is missed by >3 hr, skip and continue with regular schedule, do not take a double dose

• Store at room temperature

DOSAGE AND ROUTES

• **Adult: PO** 100 mg bid (approximately 12 hr apart) until disease progression

• **Hepatic dose:** Avoid use

SIDE EFFECTS

CNS: Headache, fatigue

EENT: Epistaxis

CV: Atrial fibrillation/flutter

GI: Anorexia, constipation, diarrhea, nausea, vomiting

HEMA: Thrombocytopenia, neutropenia, anemia

MS: Myalgia

RESP: Dyspnea, cough

INTEG: Rash

MISC: Infections, secondary malignancies

PHARMACOKINETICS

Onset rapid, peak 45 min, duration unknown, half-life 0.9 hr, active metabolite 6 hr, 97.5% protein binding

INTERACTIONS

Increase: Risk of bleeding: anticoagulants, antiplatelet, monitor for bleeding

Increase: Acalabrutinib level: CYP3A4 inhibitors (dilTIAZem, erythromycin, verapamil), avoid using together

Decrease: Acalabrutinib level: H2-receptor antagonists (raNITIdine), separate by 2 hr

Decrease: Acalabrutinib level: PPIs, avoid concurrent use

Decrease: Acalabrutinib level: Calcium antacids, separate by 2 hr

Decrease: Acalabrutinib level: CYP3A4 inducers, reduce dose, or avoid use

NURSING CONSIDERATIONS

Assess:

- For secondary malignancies (skin cancers)
- For atrial fibrillation/flutter
- For myelosuppression, obtain CBC monthly or more often
- For severe bleeding/hemorrhage, interruption for major surgeries may be needed
- For serious infection, fever, chills, flulike symptoms, antibiotics may be needed

Teach patient/family:

- If dose is missed, give when remembered if less than 3 hr, if more than 3 hr, skip and take the next dose at the regularly scheduled time, do not double, to swallow whole with a whole glass of water
- To notify prescriber of severe bleeding (blood in stool or urine; prolonged or uncontrolled), that product may be interrupted for surgery (fever, chills, flulike symptoms), antibiotics may be needed
- That lab tests and follow-up exams will be needed
- Teach patient to notify prescriber of secondary malignancy (skin cancer), to use sunscreen, protective clothing. Avoid prolonged exposure to sunlight
- To report palpitations, lightheadedness, dizziness, fainting, shortness of breath, or chest discomfort
- Take at least 2 hours prior to taking cimetidine (Tagamet), famotidine (Pepcid, in Duexis), nizatidine (Axid), or ranitidine (Zantac)
- To report if pregnancy is planned or suspected, not to breastfeed during or for 2 wk following last dose
- To notify other clinicians of prescription OTC drugs and dietary or herbal supplements

acamprosate (Rx)

(a-kam-pro′sate)

Func. class.: Alcohol deterrent

Chem. class.: Synthetic amino acid neurotransmitter analog

ACTION: Not completely understood; in vitro data suggest it has affinity for type A and type B GABA receptors, lowers neuronal excitability, centrally mediated

USES: Alcohol abstinence management

CONTRAINDICATIONS: Hypersensitivity to this product or sulfites, CCr ≤30 mL/min

Precautions: Pregnancy, breastfeeding, infants, children, ethanol intoxication, renal impairment, depression, suicidal ideation, driving or operating machinery, geriatric patients

DOSAGE AND ROUTES

- **Adult: PO** 666 mg tid

Renal dosage

- **Adult: PO** CCr 30-50 mL/min 333 mg tid; CCr <30 mL/min do not use

Available forms: Delayed-release tablets 333 mg

Administer:

- Without regard to food; do not crush, chew, break delayed-release tablets
- Use only after alcohol is stopped
- Store at room temperature

SIDE EFFECTS

CNS: Anxiety, depression, dizziness, headache, insomnia, paresthesias, suicidal ideation, tremors, abnormal dreams, chills, drowsiness

CV: Palpitations, hypertension, peripheral edema

EENT: Rhinitis, pharyngitis, abnormal vision

GI: Anorexia, constipation, diarrhea, dry mouth, abdominal pain, flatulence, nausea, vomiting, taste change, weight gain

GU: Impotence

INTEG: Rash, pruritus, increased sweating

MISC: Infection, flulike symptoms

MS: Back pain, myalgias, arthralgia

RESP: Dyspnea, bronchitis

PHARMACOKINETICS

Onset unknown, peak 3-8 hr, duration unknown, half-life 20-33 hr

INTERACTIONS

Drug/Lab

Increase: LFTs, blood glucose, bilirubin, uric acid

Decrease: HB/Hct, platelets

NURSING CONSIDERATIONS

Assess:

- **Mental status:** depression, abnormal dreams, suicidal thoughts/behaviors, length of alcohol use, date of discontinuing alcohol use
- B/P baseline and periodically
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; cautious use in breastfeeding, excretion unknown

Evaluate:

- Therapeutic response: continued alcohol abstinence

Teach patient/family:

- To notify prescriber of depression, abnormal thoughts, suicidal thoughts/behaviors
- To take without regard to food; not to break, crush, chew delayed-release tablets
- Not to engage in hazardous activities until effect is known; may impair thinking; monitor skills
- Not to use alcohol, to continue treatment for alcohol addiction
- **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected; to use effective contraception; breastfeeding effects are unknown

⚠ HIGH ALERT

acarbose (Rx)

(ay-car′bose)

Glucobay ✱, Prandase ✱, Precose

Func. class.: Oral antidiabetic

USES: Type 2 diabetes mellitus, alone or in combination with a sulfonylurea, metformin, insulin

CONTRAINDICATIONS: Breastfeeding, hypersensitivity, diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, ileus, colonic ulceration, partial intestinal obstruction, chronic intestinal disease, serum creatinine >2 mg/dL, CCr <25 mL/min

DOSAGE AND ROUTES

- **Adult: PO** 25 mg tid initially, with 1st bite of meal; maintenance dose may be increased to 50-100 mg tid; dosage adjustment at 4- to 8-wk intervals, individualized

acetaminophen (Rx, OTC) (Paracetamol)

(a-seat-a-mee′noe-fen)

222AF ✱, Abenol ✱, Acephen, Acephen Infant Feverall, ACET ✱, Acetab ✱, Apacet, APAP, Apra, Atasol ✱, Children's FeverAll, Fortolin ✱, Genapap, Infantaire, Mapap, NeoPAP, Novo-Gesic ✱, Pediaphen ✱, Pediatrix ✱, Q-Pap, Q-Pap Children's, Rapid Action Relief ✱, Redutemp, Ridenol, Robigesic ✱, Rounox ✱, Silapap, Taminol ✱, Tempra ✱, T-Painol, Tylenol, ✱ XS pain reliever

acetaminophen (IV) (Rx) Ofirmive

Func. class.: Nonopioid analgesic, antipyretic

Chem. class.: Nonsalicylate, paraaminophenol derivative

Do not confuse:

Acephen/Anacin/Aspirin 3/Anacin-3

ACTION: May block pain impulses peripherally that occur in response to inhibition of prostaglandin synthesis; does not possess antiinflammatory properties; antipyretic action results from inhibition of prostaglandins in the CNS (hypothalamic heat-regulating center)

USES: Mild to moderate pain or fever, arthralgia, dental pain, dysmenorrhea, headache, myalgia, osteoarthritis

Unlabeled uses: Migraine

CONTRAINDICATIONS: Hypersensitivity to this product, phenacetin aspartame, saccharin, tartrazine

Precautions: Pregnancy, breastfeeding, geriatric patients, anemia, renal/hepatic disease, chronic alcoholism

Black Box Warning: Hepatotoxicity

DOSAGE AND ROUTES

• **Adult/child >12 yr: PO/RECT** 325-650 mg q4-6hr prn, max 4 g/day; **weight ≥50 kg IV** 1000 mg q6hr or 650 mg q4hr prn, max single dose 1000 mg, min dosing interval 4 hr; **weight <50 kg IV** 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg, min dosing interval 4 hr, max 75 mg/kg/day from all sources; **EXTENDED RELEASE** 650-1300 mg q8hr as needed, max 4 g/day

• **Child ≥2 yr and <50 kg: IV** 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg, min dosing interval 4 hr, max 75 mg/kg/day from all sources

Renal dose

• **Adult: IV** CCr <30 mL/min reduce dose and prolong interval, CCr <10 mL/min **PO/RECT/IV** minimum interval of q8hr

Hepatic dose

• Adult: Mild to moderate: max 2000 mg/day; severe liver damage: contraindicated

Migraine (unlabeled)

• **Adult and adolescent: PO/RECT** 500-1000 mg, max 1 g/dose or max 4 g/day

Available forms: Rectal suppository 120, 325, 650 mg; soft chew tablets 80, 160 mg; capsules 500 mg; elixir 120, 160, 325 mg/5 mL; oral disintegrating tablets 80, 160 mg; oral drops 80 mg/0.8 mL, liquid 500 mg/5 mL, 160/5 mL, 1000/30 mL; extended release 650 mg, 80 mg/mL; tablets 325, 500, 650 mg; solution for injection 1000 mg/100 mL

Administer:

PO route

• Do not confuse 2 × 325 (650 mg) with 650-mg extended-release tablets

• Crushed or whole, do not crush extended-release product; chewable tablets may be chewed; give with full glass of water

• With food or milk to decrease gastric symptoms if needed

• Suspension after shaken well; check elixir, liquid, suspension concentration carefully; suspension and capsules are bioequivalent

Rectal route

• Store suppositories <80°F (27°C)

Intermittent IV INFUSION route

• No further dilution needed; do not add other medications to vial or infusion device

• For doses equal to single vial, a vented IV set may be used to deliver directly from vial; for doses less than a single vial, withdraw dose and place in an empty sterile syringe, plastic IV container, or glass bottle; infuse over 15 min

• Discard unused portion; if seal is broken, vial penetrated, or drug transferred to another container, give within 6 hr

Y-site compatibilities: Do not admix

SIDE EFFECTS

CNS: Agitation (child) (IV); headache, fatigue, anxiety (IV)

RESP: Dyspnea (IV), atelectasis (child) (IV)

CV: Hyper- and hypotension (IV)

GI: Nausea, vomiting, abdominal pain; hepatotoxicity, hepatic seizure (overdose), GI bleeding

GU: Renal failure (high, prolonged doses)

HEMA: Leukopenia, neutropenia, hemolytic anemia (long-term use), thrombocytopenia, pancytopenia

INTEG: Rash, urticaria, injection site pain

SYST: Stevens-Johnson syndrome, toxic epidermal necrolysis

TOXICITY: Cyanosis, anemia, neutropenia, jaundice, pancytopenia, CNS stimulation, delirium followed by vascular collapse, seizures, coma, death

PHARMACOKINETICS

85%-90% metabolized by liver, excreted by kidneys; metabolites may be toxic if overdose occurs; widely distributed; crosses placenta in low concentrations; excreted in breast milk; half-life 1-4 hr

PO: Onset 10-30 min, peak ½-2 hr, duration 4-6 hr, well absorbed
IV: Onset rapid, peak 30-120 min, duration 3-4 hr
RECT: Onset slow, peak 1-2 hr, duration 4-6 hr, absorption varies

INTERACTIONS

Increase: renal adverse reactions—NSAIDs, salicylates; consider lower dose
Increase: methemoglobinemia—nitric oxide, prilocaine; avoid concurrent use
Increase: hypoprothrombinemia—warfarin, long-term use, high doses of acetaminophen
Increase: hepatotoxicity—barbiturates, alcohol, carBAMazepine, hydantoins, rifAMPin, rifabutin, isoniazid, diflunisal, zidovudine, lamoTRIgine, imatinib, dasatinib, mipomersen; monitor for hepatotoxicity
Decrease: absorption—colestipol, cholestyramine
Decrease: zidovudine, lamoTRIgine effect
Drug/Herb
Increase: hepatotoxicity—St. John's wort, due to acetaminophen metabolism
Drug/Lab Test
Increase: LFTs, potassium, bilirubin, LDH, prothrombin time
Decrease: HB/Hct, WBC, RBC, platelets; albumin, magnesium, phosphate (pediatrics)

NURSING CONSIDERATIONS

Assess:

- **For fever and pain:** Type of pain, location, intensity, duration, aggravating/alleviating factors; assess for diaphoresis, fever baseline and periodically
- **Hepatic studies:** AST, ALT, bilirubin, creatinine before therapy if long-term therapy is anticipated; may cause hepatic toxicity at doses >4 g/day with chronic use
- **Renal studies:** BUN, urine creatinine, occult blood, albumin, if patient is on long-term therapy; presence of blood or albumin indicates nephritis, I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- **Blood studies:** CBC, PT if patient is on long-term therapy
- **Chronic poisoning:** rapid, weak pulse; dyspnea; cold, clammy extremities; report immediately to prescriber

Black Box Warning: Hepatotoxicity: occurs with high doses (>4 g/day); dark urine; clay-colored stools; yellowing of skin, sclera; itching; abdominal pain; fever; diarrhea if patient is on long-term therapy; may require liver transplant, those malnourished or using alcohol chronically are at higher chance of hepatotoxicity; consult poison control with suspected acute toxicity, draw 4-hr serum level and administration of acetylcysteine based on the 4-hr level on the Rumack-Matthew nomogram

- **Potentially fatal hypersensitivity, allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued
- Stevens-Johnson syndrome, toxic epidermal necrolysis may occur when beginning treatment or any other dose
- **Pregnancy/breastfeeding:** cautious use in pregnancy, breastfeeding (PO), use only if clearly needed (IV)

Evaluate:

- Therapeutic response: absence of pain using pain scoring; absence of fever

Teach patient/family:

Black Box Warning: Hepatotoxicity: not to exceed recommended dosage; the elixir, liquid, suspension come in several concentrations, read label carefully; acute poisoning with liver damage may result; tell parents of children to check products carefully; that acute toxicity includes nausea, vomiting, abdominal pain; prescriber should be notified immediately; that toxicity may occur with other combination products

- Not to use with excessive alcohol, herbals, OTC products without approval of prescriber
- **To recognize signs of chronic overdose:** bleeding, bruising, malaise, fever, sore throat

- That those with diabetes may notice blood glucose monitoring changes
- To notify prescriber of pain or fever lasting more than 3 days
- Not to be used in patients <2 yr unless approved by prescriber
- **Hypersensitivity:** to stop product, call prescriber if rash occurs
- **Pregnancy/breastfeeding:** May be used when breastfeeding, short-term

TREATMENT OF OVERDOSE:

Product level, gastric lavage; administer oral acetylcysteine to prevent hepatic damage *(see acetylcysteine monograph)*; monitor for bleeding

acetaZOLAMIDE (Rx)

(a-set-a-zole'a-mide)

Diamox

Func. class.: Diuretic, carbonic anhydrase inhibitor, antiglaucoma agent, antiepileptic

Chem. class.: Sulfonamide derivative

USES: Open-angle glaucoma, angle-closure glaucoma (preoperatively, if surgery delayed), mixed, tonic-clonic, myoclonic, refractory seizures, epilepsy (petit mal, grand mal, absence), edema in HF, product-induced edema, acute altitude sickness

CONTRAINDICATIONS: Hypersensitivity to sulfonamides, severe renal/hepatic disease, electrolyte imbalances (hyponatremia, hypokalemia), hyperchloremic acidosis, Addison's disease, long-term use for closed-angle glaucoma, adrenocortical insufficiency, metabolic acidosis, acidemia, anuria

DOSAGE AND ROUTES

Angle-closure glaucoma

- **Adult: PO/IV** 250 mg q4hr or 250 mg bid for short-term therapy

Chronic open-angle glaucoma

- **Adult: PO/IV** 250 mg 1-4 times per day or 500 mg EXTENDED RELEASE bid, max 1 g/day
- **Child (unlabeled): PO** 8-30 mg/kg/day in divided doses tid or qid, or 300-900 mg/m^2/day, max 1 g/day; **IV** 5-10 mg q6hr, max 1 g/day

Edema in heart failure, drug-induced edema

- **Adult: PO/IV** 250-375 mg/day
- **Child (unlabeled): PO/IV** 5 mg/kg/day or 150 mg/m^2 in AM

Adjunct for epilepsy and myoclonic, refractory, generalized tonic-clonic, absence or mixed seizures

- **Adult: PO/IV** 8-30 mg/kg/day in 1-4 divided doses, usual range 375-1000 mg/day; **EXTENDED RELEASE** not recommended with seizures

Altitude sickness

- **Adult: PO** 250 mg twice daily starting the day before ascent and continuing for 2 to 3 days after reaching the target altitude or until descent is initiated

Renal dose

- **Adult: PO/IV** CCr 50-80 mL/min give dose ≥q6hr regular release or IV; CCr 10-50 mL/min give dose q12hr; CCr <10 mL/min, avoid use

acetylcholine ophthalmic

See Appendix B

acetylcysteine (Rx)

(a-se-teel-sis'tay-een)

Acetadote, Mucomyst

Func. class.: Mucolytic; antidote—acetaminophen

Chem. class.: Amino acid L-cysteine

ACTION: Decreases viscosity of secretions by breaking disulfide links of mucoproteins; serves as a substrate in place of glutathione, which is necessary to inactivate toxic metabolites with acetaminophen overdose

USES: Acetaminophen toxicity; bronchitis; cystic fibrosis; COPD; atelectasis

Unlabeled uses: Prevention of contrast medium nephrotoxicity

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy, breastfeeding, hypothyroidism, Addison's disease, CNS depression, brain tumor, asthma, renal/hepatic disease, COPD, psychosis, alcoholism, seizure disorders, bronchospasms, anaphylactoid reactions, fluid restriction, weight <40 kg, increased intracranial pressure, status asthmaticus

DOSAGE AND ROUTES

Acetaminophen toxicity

- **Adult and child: PO** 140 mg/kg, then 70 mg/kg q4hr × 17 doses to total of 1330 mg/kg; **≥41-100 kg IV** loading dose 150 mg/kg over 60 min (dilution 150 mg/kg in 200 mL of D_5W); then 50 mg/kg over 4 hr (dilution 50 mg/kg in 500 mL D_5W); then 100 mg/kg over 16 hr (dilution 100 mg/kg in 1000 D_5W)
- **Adult/child 21-40 kg: IV** 150 mg/kg in 100 mL diluent over 1 hr, then 50 mg/kg in 250 mL over 4 hr, then 100 mg/kg in 500 mg over 16 hr
- **Infant/child 5-20 kg: IV** 150 mg/kg in 3 mL/kg diluent over 1 hr, then 50 mg/kg in 7 mL/kg diluent over 4 hr, then 100 mg/kg in 14 mL/kg diluent over 16 hr

Mucolytic

- **Adult and child 1-12 yr: INSTILL** 1-2 mL (10%-20% solution) q6-8hr prn or 3-5 mL (20% solution) or 6-10 mL (10% sol) tid or qid; **NEBULIZER** (face mask, mouthpiece, tracheostomy) 1-10 mL of a 20% sol, or 2-20 mL of a 10% sol, q2-8hr; **NEBULIZER** (tent, croupette) may require large dose, up to 300 mL/treatment

Tracheostomy care

- **Adult/child: INSTILL** 1-2 mL (10%-20% sol) q1-4hr directly into tracheostomy

Diagnostic bronchial lab studies

- **Adult/child: NEBULIZER** 2-3 uses of 1-2 mL of 20% sol or 2-4 mL of 10% sol

Prevention of radiocontrast-induced renal reactions (unlabeled)

- **Adult: PO** 600 mg bid × 2 days before radiocontrast

Available forms: Oral solution 10%, 20%; inj 20% (200 mg/mL); effervescent tablet for oral solution 500, 2500 mg

Administer:

PO route

- **Antidotal use:** give within 8 hr for best results; dilute 10% or 20% solution to a 5% solution with diet soda, may use water if giving via gastric tube; dilution of 10% solution 1:1, 20% sol 1:3, store open undiluted solution refrigerated ≤96 hr, repeat dose if vomited within 1 hr

PO route (effervescent tablets for oral solution)

- Dissolve in 100 mL water (50 mg/mL) **1-19 kg;** in 150 mL water **20-59 kg;** 300 mg/mL **≥60 kg**

Direct intratracheal instill route

- By syringe: 1-2 mL of 10%-20% solution up to q1hr
- Decreased dose to geriatric patients; metabolism may be slowed
- Only if suction machine is available
- Only after patient clears airway by deep breathing, coughing
- Assistance with inhaled dose: bronchodilator if bronchospasm occurs; mechanical suction if cough insufficient to remove excess bronchial secretions

IV route

- **21-hr regimen:** loading dose: dilute 150 mg/kg in 200 mL D_5W; maintenance dose 1: dilute 50 mg/kg in 500 mL D_5W; maintenance dose 2: dilute 100 mg/kg in 1000 mL D_5W; give loading dose over 15 min; give maintenance dose 1 over 4 hr; give maintenance dose 2 over 16 hr, administer sequentially without time between doses
- Store in refrigerator; use within 96 hr of opening

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* fever, chills
CV: Edema, flushing tachycardia
EENT: *Rhinorrhea,* pharyngitis
GI: *Nausea,* stomatitis, vomiting, anorexia
INTEG: Urticaria, rash, clamminess, pruritus

RESP: Bronchospasm, chest tightness, cough, dyspnea
MISC: Anaphylaxis, angioedema, unpleasant odor

PHARMACOKINETICS

IV: Excreted in urine, half-life 5.6 hr (adult), 11 hr (newborn), protein binding 83%, peak up to 60 min (PO), 5-10 min (INH)
Interactions
- Do not use with activated charcoal

NURSING CONSIDERATIONS

Assess:
- **Mucolytic use:** cough—type, frequency, character, including sputum; bronchospasm
- Rate, rhythm of respirations, increased dyspnea; sputum; discontinue if bronchospasm occurs
- VS, cardiac status including checking for dysrhythmias, increased rate, palpitations
- ABGs for increased CO_2 retention in asthma patients
- **Antidotal use:** use within 24 hr of acetaminophen toxicity, give within 10 hr of acetaminophen to minimize hepatotoxicity; monitor LFTs, PT, BUN, creatinine, glucose, electrolytes, acetaminophen levels; inform prescriber if dose is vomited or if vomiting is persistent; 150 mg/kg may be toxic, check acetaminophen level q4hr
- **Hypersensitivity:** anaphylaxis may occur with IV dose; if present, stop infusion, treat, restart; assess for dyspnea, swelling of face, lips, tongue; rash, itching
- Nausea, vomiting, rash; notify prescriber if these occur
- **Pregnancy/breastfeeding:** use only if clearly needed; cautious use in breastfeeding, excretion unknown

Evaluate:
- Therapeutic response: absence of purulent secretions when coughing, clear lung sounds (mucolytic use); absence of hepatic damage with acetaminophen toxicity

Teach patient/family:
- That foul odor and smell may be unpleasant
- To clear airway for inhalation
- To report vomiting because dose may need to be repeated
- **Acetaminophen toxicity:** Explain reason for product, expected result

aclidinium (Rx)

(a′kli-din′ee-um)

Tudorza Pressair, Tudorza Genuair

Func. class.: Anticholinergic, bronchodilator

Chem. class.: Synthetic quaternary ammonium compound

USES: Long-term maintenance treatment of bronchospasm in COPD, emphysema, chronic bronchitis, not indicated for initial treatment of acute episodes

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

- **Adults, including geriatric patients: ORAL INHALATION** 400 mcg (1 actuation) bid; doses should be 12 hr apart

aclidinium/formoterol (Rx)

Duaklir Pressair

Func. class.: Respiratory agent

Chem. class.: Respiratory corticosteroid; long-acting β_2-agonist; respiratory long-acting muscarinic antagonist

USES: Maintenance treatment of chronic obstructive pulmonary disease (COPD)

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

• **Adult: INH** 1 inhalation (400 mcg aclidinium and 12 mcg formoterol per actuation) inhaled bid (morning and evening). Max: 1 INH bid

acyclovir (Rx)

(ay-sye′kloe-veer)

Sitavig, Zovirax

Func. class.: Antiviral

Chem. class.: Purine nucleoside analog

Do not confuse:
Zovirax/Zyvox/Valtrex/Zostrix

ACTION: Converted to acyclovir monophosphate by virus-specific thymidine kinase then further converted to acyclovir triphosphate by other cellular enzymes

USES: Mucocutaneous herpes simplex virus, herpes genitalis (HSV-1, HSV-2), varicella infections, herpes zoster, herpes simplex encephalitis
Unlabeled uses: Bell's palsy, prevention of CMV, Epstein-Barr virus, esophagitis, hairy leukoplakia, prevention of herpes labialis, herpes simplex, herpes simplex ocular prophylaxis, keratoconjunctivitis, pharyngitis, pneumonitis, prevention of postherpetic neuralgia, proctitis, stomatitis, tracheobronchitis, varicella prophylaxis

CONTRAINDICATIONS: Hypersensitivity to this product, valACYclovir; milk protein (buccal)
Precautions: Pregnancy, breastfeeding, renal/hepatic/neurologic disease, electrolyte imbalance, dehydration, hypersensitivity to famciclovir, ganciclovir, penciclovir, valGANciclovir, obesity

DOSAGE AND ROUTES

Base dose in obese patients on ideal body weight, not actual body weight

Herpes simplex (recurrent)

• **Adult: PO** 400 mg 3×/day for 5 days or 200 mg 5×/day × 5 days

• **Adult and child >12 yr: IV INFUSION** 5 mg/kg over 1 hr q8hr × 7 days

• **Infant >3 mo/child <12 yr: IV INFUSION** 10 mg/kg q8hr × 7 days; if HIV infected, 5-10 mg/kg q8hr (moderate to severe)

• **Neonate: IV INFUSION** 10 mg/kg q8hr × 10 days, may use higher dose

Genital herpes, initial episodes

• **Adult: PO** 400 mg tid or 200 mg 5×/day × 7-10 days, may extend treatment if healing is not complete after 10 days; **TOP** × 5 days; **IV** 5 mg/kg q8hr or 750 mg/m^2/day divided q8hr × 5-7 days

Genital herpes, episodic treatment

• **Adult: PO** 400 mg tid or 800 mg bid × 5 days or 800 mg tid × 2 days; initiate within 1 day of lesion onset

Genital herpes, suppression therapy

• **Adult: PO** 400 mg bid for up to 12 mo or 200 mg 3-5 times daily for up to 12 mo

Genital herpes, initial limited, mucocutaneous HSV in immunocompromised patients, non–life-threatening

• **Adult/child ≥12 yr: TOP** cover lesions q3hr 6×/day

Herpes simplex encephalitis

• **Adult: IV** 10 mg/kg over 1 hr q8hr × 10 days

• **Child 3 mo-12 yr: IV** 10-15 mg/kg q8hr × 4-21 days

• **Child birth-3 mo: IV** 20 mg/kg q8hr × 21 days

• **Neonates/premature infants: IV** 10 mg/kg q12hr × 14-21 days

Herpes labialis, recurrent

• **Adult/child ≥12 yr: TOP** apply cream 5×/day for 4 days; start as soon as symptoms appear

Herpes labialis, recurrent in immunocompetent patients

• **Adult: Buccal** 50 mg as a single dose in upper gum region within 1 hr after prodromal symptoms and before cold sore formation

Herpes zoster (immunocompetent)

• **Adult: PO** 800 mg q4hr 5×/day while awake × 7-10 days; **IV** 10 mg/kg q8hr × 7 days

Herpes zoster (shingles) immunocompromised patients

- **Adult/adolescent: PO** 800 mg q4hr 5×/day for 7-10 days; **IV** 10-15 mg/kg q8hr × 10-14 days
- **Infant/child <12 yr: IV** 10 mg/kg/dose q8hr × 7-10 days

Herpes zoster (shingles) immunocompetent

- **Adult: PO** 800 mg q4hr 5×/day × 7-10 days; start within 48-72 hr of rash onset

Varicella (chickenpox)

- **Adult/child ≥2 yr: PO** 10 mg/kg/dose (max 800 mg) 4×/day × 5 days

Mucosal/cutaneous herpes simplex infections in immunosuppressed patients

- **Adult and child >12 yr: IV** 5 mg/kg q8hr × 7 days
- **Infant >3 mo/child <12: IV** 10 mg/kg q8hr × 7 days

Renal dose

- **Adult and child: PO/IV** CCr >50 mL/min 100% dose q8hr, CCr 25-50 mL/min 100% dose q12hr, CCr 10-25 mL/min 100% dose q24hr, CCr 0-10 mL/min 50% dose q24hr

Recurrent ocular herpes, prevention (unlabeled)

- **Adult/child ≥12 yr: PO** 600-800 mg every day × 8-12 mo

CMV prophylaxis (unlabeled)

- **Adult: IV** 500 mg/m^2 q8hr

Herpes simplex in pneumonitis/esophagitis/tracheobronchitis/proctitis/stomatitis/pharyngitis (unlabeled)

- **Adult and adolescent: IV** 5-10 mg/kg q8hr × 2-7 days or **PO** 200 mg q4hr 5×/day × 7-10 days or 400 mg 3-5×/day × ≥10 days
- **Child 6 mo-12 yr: IV** 1000 mg/day in 3-5 divided doses × 7-14 days

Herpes simplex prophylaxis for chronic suppression therapy (unlabeled)

- **Adult and adolescent: PO** 400 mg bid up to 12 mo

Available forms: Capsules 200 mg; tablets 400, 800 mg; powder for injection 500, 1000 mg; solution for injection 50 mg/mL; oral suspension 200 mg/5 mL; ointment/cream 5%; buccal tablet 50 mg

Administer:

PO route

- Do not break, crush, or chew capsules
- May give without regard to meals, with 8 oz of water
- Shake suspension before use

Buccal

- Use on the same side as the herpes labialis lesion; after removing tablet from blister, place rounded side of tablet to the upper gum above incisor tooth; hold in place for 30 sec; once adhered, the tablet will dissolve; if tablet falls off within 6 hr, reposition the same tablet

Topical route

- Use finger cot or glove to cover all lesions completely; do not get in eye; wash hands after use

Intermittent IV INFUSION route

- Increase fluids to 3 L/day to decrease crystalluria; most critical during first 2 hr after IV
- Reconstitute 10 mL compatible solution/500 mg or 20 mL/1 g of product, 50 mg/mL, shake, further dilute in 50-125 mL compatible solution; use within 12 hr; give over at least 1 hr by infusion pump to prevent nephrotoxicity; do not reconstitute with solution containing benzyl alcohol in neonates
- Store at room temperature for up to 12 hr after reconstitution; if refrigerated, solution may show a precipitate that clears at room temperature; yellow discoloration does not affect potency

Y-site compatibilities: Alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, bivalirudin, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, cefazolin, cefonicid, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cholesteryl sulfate complex, cimetidine, clindamycin, dexamethasone sodium phosphate, dimenhyDRINATE, DOXOrubicin, doxycycline, erythromycin, famotidine, filgrastim, fluconazole, gallium, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone,

imipenem/cilastatin, LORazepam, magnesium sulfate, melphalan, methylPREDNISolone sodium succinate, metoclopramide, metroNIDAZOLE, multivitamin, nafcillin, oxacillin, PACLitaxel, penicillin G potassium, PENTobarbital, perphenazine, piperacillin, potassium chloride, propofol, raNITIdine, remifentanil, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, voriconazole, zidovudine

SIDE EFFECTS

CNS: Tremors, confusion, lethargy, hallucinations, seizures, dizziness, headache, encephalopathic changes
EENT: Gingival hyperplasia
GI: Nausea, vomiting, diarrhea, increased ALT/AST, abdominal pain, colitis
GU: Hematuria, acute renal failure, changes in menses
HEMA: Thrombotic thrombocytopenia purpura, hemolytic uremic syndrome, leukopenia (immunocompromised patients)
INTEG: Rash, urticaria, pruritus, pain or phlebitis at IV site, unusual sweating, alopecia, Stevens-Johnson syndrome
MS: Joint pain
SYST: Angioedema, anaphylaxis

PHARMACOKINETICS

Distributed widely; crosses placenta; CSF concentrations are 50% of plasma; protein binding 9%-33%
PO: Absorbed minimally, onset unknown, peak 1.5-2 hr, half-life 2.5-3.3 hr (adult); 2-3 hr (child); up to 4 hr (neonates)
Buccal: Peak 8 hr
IV: Onset immediate, peak immediate, duration unknown, half-life 20 min-3 hr (terminal); metabolized by liver, excreted by kidneys as unchanged product (95%)

INTERACTIONS

Increase: CNS side effects—zidovudine
Increase: levels, toxicity—probenecid, monitor for toxicity
Increase: nephrotoxicity—aminoglycosides
Increase: concentrations of—entecavir, PEMEtrexed, tenofovir, theophylline
Decrease: action of hydantoins, valproic acid, monitor drug levels

Drug/Lab Test
Increase: BUN, creatinine
Decrease: WBC

NURSING CONSIDERATIONS

Assess:
- **Infection:** type of lesions, area of body covered, purulent drainage, frequency of lesions
- **Hepatic, renal studies:** AST, ALT; urinalysis, protein, BUN, creatinine, CCr, watch for increasing BUN and serum creatinine or decreased CCr; I&O ratio; report hematuria, oliguria, fatigue, weakness; may indicate nephrotoxicity; check for protein in urine during treatment
- Skin eruptions: rash, urticaria, itching
- Allergies before treatment, reaction to each medication; place allergies on chart in bright red letters
- Neurologic status with herpes encephalitis
- Provide adequate intake of fluids (2 L) to prevent deposits in kidneys, more likely to occur with rapid administration or in dehydration

Evaluate:
- Therapeutic response: absence of itching, painful lesions; crusting and healed lesions; decreased symptoms of chickenpox; healing, decreased pain with herpes zoster

Teach patient/family:
- To take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose
- That product may be taken orally before infection occurs; product should be taken when itching or pain occurs, usually before eruptions
- That sexual partners need to be told that patient has herpes because they can become infected; condoms must be worn to prevent reinfections
- Not to touch lesions to avoid spreading infection to new sites, not to use topical products on lesions, spreading may occur
- That product does not cure infection, just controls symptoms and does not prevent infecting others
- That product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy

- That women with genital herpes are more likely to develop cervical cancer; to keep all gynecologic appointments
- **Topical:** Not to use around eyes, to use enough ointment to cover lesions q3hr/6× per day, use finger cot or glove to apply
- **Pregnancy/breastfeeding:** to identify if pregnancy is planned or suspected or if breastfeeding

TREATMENT OF OVERDOSE:

Discontinue product; hemodialysis

adalimumab (Rx)

(add-a-lim′yu-mab)

Humira, Humira Pen; Hyrimoz, (biosimilar); Abrilada (biosimilar); Hulio (biosimilar); Yusimly (biosimilar)

Func. class.: Antirheumatic agent (disease modifying), immunomodulator, anti-TNF

Chem. class.: Recombinant human IgG1 monoclonal antibody, DMARD

Do not confuse:
Humira/HumuLIN/HumaLOG
Humira Pen/Humapen Memoir

ACTION:

A form of human IgG1 monoclonal antibody specific for human tumor necrosis factor (TNF-α); elevated levels of TNF-α are found in patients with rheumatoid arthritis

USES:

Moderate to severe active rheumatoid arthritis who are ≥18 yr of age and who have not responded to other disease-modifying agents, juvenile rheumatoid arthritis (JRA), psoriatic arthritis, Crohn's disease, moderate to severe plaque psoriasis, ankylosing spondylitis, ulcerative colitis, noninfectious uveitis, moderate-severe hidradenitis suppurativa

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding, use of anakinra, abatacept

Precautions: Pregnancy, children, geriatric patients, CNS demyelinating disease, lymphoma, HF, hepatitis B carriers, mannitol hypersensitivity, latex allergy, neoplastic disease, TB

Black Box Warning: Active infections, risk of lymphomas/leukemias

DOSAGE AND ROUTES

Rheumatoid arthritis/ankylosing spondylitis/psoriatic arthritis

- **Adult: SUBCUT** 40 mg every other week or every week if not combined with methotrexate

Juvenile rheumatoid arthritis

- **Child ≥2 yr/adolescent ≥30 kg: SUBCUT** 40 mg every other week
- **Child ≥2 yr/adolescent ≥15 kg to <30 kg: SUBCUT** 20 mg every other week
- **Child ≥2 yr/adolescent 10-<15 kg: SUBCUT** 10 mg every other week

Crohn's disease/ulcerative colitis

- **Adult: SUBCUT** 160 mg given as 4 injections on day 1 or 2 injections each on days 1 and 2, then 80 mg at wk 2 and 40 mg every other week starting at wk 4

Pediatric Crohn's disease

- **Child >6 yr and ≥40 kg (88 lb): SUBCUT** 160 mg on day 1 (as 4 [40-mg] injections) or 40 mg (as 2 injections) (80 mg) × 2 days, then 80 mg after 2 wk (day 15), then 40 mg every other week (day 29)
- **Child >6 yr and 17-40 kg (37-88 lb): SUBCUT** 80 mg day 1 (as 2 [40-mg] injections), then 40 mg after 2 wk (day 15), then 20 mg every other week (day 29)

Plaque psoriasis/noninfectious uveitis

Adult: SUBCUT 80 mg baseline as 2 injections, then 40 mg every other week starting 1 wk after initial dose (plaque psoriasis)

Child >2 yr and ≥30 kg: SUBCUT 20 mg every other week

Child ≤2 yr and ≤15 kg: SUBCUT 10 mg every other week

Moderate hidradenitis suppurativa

Adult/adolescent and ≥60 kg: SUBCUT 160 mg 1 day or split over 2 days, then 80 mg on day 15, then on day 29 give 40 mg weekly

Adolescent and 30-60 kg: SUBCUT 80 mg on day 1 then 40 mg on day 8, then 40 mg every other week

Available form: Injection prefilled pens/syringes 10 mg/0.1 mL, 10 mg/0.2 mL, 20 mg/0.2 mL, 20 mg/0.4 mL, 40 mg/0.4 mL, 40 mg/0.8 mL, 80 mg/0.8 mL; single-use vial 40 mg/0.8 mL

Administer:

SUBCUT route

- Do not admix with other solutions or medications; do not use filter; protect from light; give at 45-degree angle using abdomen, thighs; rotate injection sites; discard unused portions
- Don't inject in bruised, red, tender, abraded areas; use in SUBCUT only

SIDE EFFECTS

CNS: *Headache,* Guillain-Barré syndrome, MS

CV: *Hypertension,* HF

EENT: *Sinusitis,* optic neuritis

GI: Abdominal pain, nausea

HEMA: Leukopenia, thrombocytopenia

INTEG: *Rash, injection site reaction*

MISC: Flulike symptoms, increased cancer risk, risk of infection (TB, invasive fungal infections, other opportunistic infections), infections may be fatal; Stevens-Johnson syndrome, anaphylaxis, hyperlipidemia

RESP: *URI,* pulmonary fibrosis, bronchitis

PHARMACOKINETICS

Absorption 65%, distributed to synovial fluid, half-life 2 wk, lower clearance with advancing age (40-75 yr), onset up to 24 wk (inflammation)

INTERACTIONS

Black Box Warning: Increase: serious infections—other TNF blockers, rilonacept

Increase: infection-azathioprine

- Do not use with abatacept, anakinra; serious infections may occur
- Do not give concurrently with live virus vaccines; immunizations should be brought up to date before treatment

Drug/Lab Test

Increase: ALT, cholesterol, lipids

NURSING CONSIDERATIONS

Assess:

- **RA:** pain; stiffness; ROM; swelling of joints prior to, during treatment
- **Crohn's disease/ulcerative colitis:** bowel pattern, cramping, abdominal pain, bleeding
- For injection site pain, swelling, redness—usually occurs after 2 injections (4-5 days); use cold compress to relieve pain/swelling

Black Box Warning: Infections (fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds), stop treatment if some serious infections including sepsis occur, may be fatal; patients with active infections should not be started on this product

- May reactivate hepatitis B in chronic carriers, may be fatal

Black Box Warning: Latent TB before therapy; treat before starting this product

- **Anaphylaxis, latex allergy:** stop therapy if lupus-like syndrome develops
- **Blood dyscrasias:** CBC, differential periodically

Black Box Warning: Neoplastic disease (lymphomas/leukemia) in children, adolescents; hepatosplenic T-cell lymphoma is more likely in adolescent males with Crohn's disease or ulcerative colitis

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints, decreased joint destruction

Teach patient/family:

- About self-administration if appropriate: injection should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard; review provided medication guide with patient
- To refrigerate in container that product was received in; to dispose of needles and equipment as instructed
- That if medication is not taken when due, inject dose as soon as remembered and inject next dose as scheduled

- Not to take any live virus vaccines during treatment
- To report signs of infection, allergic reaction, TB immediately
- To advise all health care professionals of Rx, OTC, herbals, supplements taken
- **Pregnancy/breastfeeding:** To advise health care professional if pregnancy is planned or suspected or if breastfeeding; to register if pregnant at 877-311-8972
- **Prefilled pen use:** Using an alcohol swab, clean area, do not use if solution is cloudy or particulate is present, remove gray cap, the pen is activated, pinch skin and place at 90-degree angle, press button, hold until solution is inserted, remove, dispose of properly
- To do regular skin assessments and report changes to provider

adefovir (Rx)

(add-ee-foh'veer)

Hepsera

Func. class.: Antiviral

Chem. class.: Nucleoside

ACTION: Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

USES: Chronic hepatitis B

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, labor, breastfeeding, children, geriatric patients, dialysis, females, obesity, organ transplant

Black Box Warning: Severe renal disease, impaired hepatic function, lactic acidosis, HIV, hepatitis B exacerbation

DOSAGE AND ROUTES

Chronic hepatitis B

- **Adult/adolescent: PO** 10 mg/day, optimal duration unknown

Renal dose

- **Adult: PO** CCr ≥50 mL/min 10 mg q24hr; CCr 30-49 mL/min 10 mg q48hr; CCr 10-29 mL/min 10 mg q72hr; hemodialysis 10 mg q7days after dialysis

Available forms: Tablets 10 mg

Administer:

- By mouth without regard for food
- Take with full glass of water
- Store in cool environment; protect from light

SIDE EFFECTS

CNS: *Headache*

GI: *Dyspepsia,* abdominal pain, nausea, vomiting, diarrhea, hepatomegaly, flatulence, pancreatitis

GU: Hematuria, glycosuria, nephrotoxicity, Fanconi syndrome, renal failure

MISC: Fever, rash, weight loss, cough

PHARMACOKINETICS

PO: Rapidly absorbed from GI tract, peak 1¾ hr, excreted by kidneys 45%, terminal half-life 7.48 hr

INTERACTIONS

- Do not use in combination with emtricitabine/tenofovir, emtricitabine/rilpivirine, emtricitabine/efavirenz/tenofovir

Increase: serum concentrations and possible nephrotoxicity—aminoglycosides, memantine, emtricitabine, efavirenz, dofetilide, digoxin, cycloSPORINE, aMILoride, quiNINE, quiNIDine, procainamide, PEMEtrexed, midodrine, metFORMIN, NSAIDs, vancomycin, trospium, triamterene, tenofovir, tacrolimus, ranitidine, cimetidine, morphine

Black Box Warning: Increase: lactic acidosis, severe hepatomegaly, NNRTIs, NRTIs, antiretroviral protease inhibitors

Drug/Lab Test

Increase: ALT, AST, amylase, creatine kinase

NURSING CONSIDERATIONS

Assess

Black Box Warning: Nephrotoxicity: increasing CCr, BUN

Black Box Warning: HIV antibody testing before beginning treatment, HIV resistance may occur in chronic hepatitis B patients

Black Box Warning: For lactic acidosis, severe hepatomegaly with stenosis; for use of NNRTIs, NRTIs, antiretroviral protease inhibitors (PIs), lactic acidosis with severe hepatomegaly is more common in females, obese patients, and with prolonged nucleoside use

- Geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

Black Box Warning: For exacerbations of hepatitis after discontinuing treatment, monitor LFTs, hepatitis B serology

- Pregnancy: if planned or suspected; if pregnant call the Pregnancy Registry: 800-258-4263

Evaluate:

- Therapeutic response: decreased symptoms of chronic hepatitis B, improving LFTs

Teach patient/family:

- That optimal duration of treatment is unknown; that product is not a cure; that transmission may still occur
- To avoid use with other medications unless approved by prescriber
- To notify prescriber of decreased urinary output
- Not to stop abruptly unless directed; worsening of hepatitis may occur
- To report immediately dyspnea, nausea, vomiting, abdominal pain, weakness, dizziness, cold extremities
- To notify prescriber if pregnancy is planned or suspected; avoid breastfeeding

⚠ HIGH ALERT

adenosine (Rx)

(a-den´oh-seen)

Adenocard

Func. class.: Antidysrhythmic

Chem. class.: Endogenous nucleoside

ACTION: Slows conduction through AV node, can interrupt reentry pathways through AV node, and can restore normal sinus rhythm in patients with paroxysmal supraventricular tachycardia (PSVT)

USES: PSVT, as a diagnostic aid to assess myocardial perfusion defects in CAD, Wolff-Parkinson-White syndrome

Unlabeled uses: Wide-complex tachycardia diagnosis

CONTRAINDICATIONS: Hypersensitivity, second- or third-degree AV block, sick sinus syndrome, bradycardia, asystole, COPD, asthma, severe respiratory conditions

Precautions: Pregnancy, breastfeeding, children, geriatric patients

DOSAGE AND ROUTES

Converting paroxysmal supraventricular tachycardia to sinus rhythm

- **Adult and child >50 kg (110 lb): IV BOL** 6 mg; if conversion to normal sinus rhythm does not occur within 1-2 min, give 12 mg by rapid **IV BOL;** may repeat 12-mg dose again in 1-2 min
- **Infant and child <50 kg (110 lb): IV BOL** 0.1 mg/kg; if not effective, increase dose by 0.05-0.1 mg/kg q2min to a max of 0.3 mg/kg/dose
- **Neonate: IV BOL** 0.05 mg/kg by rapid **IV BOL,** may increase by 0.05 mg/kg q2min, max 0.3 mg/kg/dose

Diagnostic use

- **Adult/child >50 kg:** IV 140 mcg/kg/min × 6 min (0.84 mg/kg total)

Available forms: 3 mg/mL sol for injection

Administer:

IV, direct route

- Warm to room temperature; crystals will dissolve
- Undiluted; give 6 mg or less by rapid injection over 1-2 sec; if using an IV line, use port near insertion site, flush with NS (20 mL), then elevate arm, dose reduc-

tion recommended if given by central line
• Store at room temperature; solution should be clear; discard unused product

IV intermittent infusion
Diagnostic
• Use 30-mL vial undiluted (3 mg/mL), give at 140 mcg/kg/min over 6 min (total 0.84 mg/kg)
• Thallium-201 should never be given after 3 min of infusion

SIDE EFFECTS

CNS: Light headedness, dizziness, arm tingling, numbness, headache; seizures
CV: Chest pain, pressure, atrial tachydysrhythmias, sweating, palpitations, hypotension, *facial flushing,* AV block, cardiac arrest, ventricular dysrhythmias, atrial fibrillation
GI: *Nausea,* metallic taste
RESP: *Dyspnea, chest pressure,* hyperventilation, bronchospasm (asthmatics)
MS: Back pain

PHARMACOKINETICS

Cleared from plasma in <30 sec, half-life 10 sec, converted to inosine/adenosine monophosphate

INTERACTIONS

Increase: risk for higher degree of heart block—carBAMazepine
Increase: risk for ventricular fibrillation—digoxin, verapamil; monitor ECG
Increase: effects of adenosine—dipyridamole; adenosine dose may need to be reduced
Decrease: activity of adenosine—theophylline or other methylxanthines (caffeine); adenosine dose may need to be increased
Drug/Lifestyle
Increase: tachycardia, hypertension (smoking)
Drug/Herb
Increase: adenosine effect—ginger
Decrease: adenosine effect—guarana, green tea

NURSING CONSIDERATIONS

Assess:
• **Cardiopulmonary status:** B/P, pulse, respiration, rhythm, ECG intervals (PR, QRS, QT); check for transient dysrhythmias (PVCs, PACs, sinus tachycardia, AV block)
• **Respiratory status:** rate, rhythm, lung fields for crackles; watch for respiratory depression; bilateral crackles may occur in HF patient; increased respiration, increased pulse, product should be discontinued
• CNS effects: dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued
• **Pregnancy/breastfeeding: identify if pregnancy is planned or suspected, or if breastfeeding; use only if benefits outweigh fetal risk; do not breastfeed**
Evaluate:
• Therapeutic response: normal sinus rhythm or diagnosis of perfusion defect
Teach patient/family:
• To report facial flushing, dizziness, sweating, palpitations, chest pain; usually transient; chest pressure may occur immediately after administration
• To report IV discomfort
• **Pregnancy/breastfeeding:** to advise prescriber if pregnancy is planned or suspected or if breastfeeding; do not breastfeed

TREATMENT OF OVERDOSE:

Defibrillation, vasopressor for hypotension, aminophylline

⚠ HIGH ALERT

ado-trastuzumab emtansine (Rx)

(a'doe-tras-tooz'ue-mab) em-tan'seen

Kadcyla

Func. class.: Antineoplastic-biologic response modifier
Chem. class.: Signal transduction inhibitors (STIs), humanized anti-HER2 antibody

Do not confuse:
ado-trastuzumab/trastuzumab

ACTION: Humanized anti-HER2 monoclonal antibody that is linked to DM1, a small molecule microtubular inhibitor; once the antibody is bound to the HER2 receptor, the complex is internalized and the DM1 is released to bind with tubulin to lead to apoptosis

USES: Breast cancer; metastatic with overexpression of HER2, who previously received trastuzumab and a taxane, separately or in combination

CONTRAINDICATIONS: Hypersensitivity to this product, Chinese hamster ovary cell protein

Black Box Warning: Pregnancy

Precautions: Breastfeeding, children, pulmonary disease, acute bronchospasm, anticoagulant, Asian patients, asthma, COPD, extravasation, fever, hepatitis, human antihuman antibody, hypotension, neuropathy, interstitial lung disease/pneumonitis; extravasation; thrombocytopenia

Black Box Warning: Heart failure, hepatotoxicity

DOSAGE AND ROUTES

• **Adult: IV** 3.6 mg/kg over 30-90 min q3wk ×14 wk; give first infusion over 90 min; if tolerated, give over 30 min

Dosage adjustments for toxicities

Hepatotoxicity:

• **AST/ALT >5 to ≤20 × ULN:** withhold, resume at a reduced dose when AST/ALT is ≤5 × ULN; first dose reduction: reduce the dose to 3 mg/kg; second dose reduction: reduce the dose to 2.4 mg/kg; requirement for further dose reduction: discontinue **AST/ ALT >20× ULN:** discontinue

• **Total bilirubin >3 to ≤10× ULN:** withhold, resume treatment at a reduced dose when total bilirubin recovers to ≤1.5; first dose reduction: reduce the dose to 3 mg/kg; second dose reduction: reduce the dose to 2.4 mg/kg; requirement for further dose reduction: discontinue treatment

• **Total bilirubin >10× ULN:** permanently discontinue; permanently discontinue treatment in patients with AST/ALT >3× ULN and total bilirubin >2× ULN; permanently discontinue treatment in patients diagnosed with nodular regenerative hyperplasia (NRH)

• **Left ventricular ejection fraction (LVEF):** *LVEF 40%-45% and decrease is <10% from baseline:* continue; repeat LVEF assessment within 3 wk; *LVEF 40%-45% and decrease is ≥10% from baseline:* withhold; repeat LVEF assessment within 3 wk; if LVEF remains ≥10% from baseline, discontinue; *LVEF <40%:* withhold; repeat LVEF assessment within 3 wk; if LVEF remains <40%, discontinue; *symptomatic heart failure (HF):* discontinue

Thrombocytopenia:

• **Platelet count 25,000/mm^3 to <50,000/mm^3:** withhold; resume at same dose when platelet count recovers to ≥75,000/mm^3

• **Platelet count <25,000/mm^3:** withhold; resume at a reduced dose when platelet count recovers to ≥75,000/mm^3: first reduction: reduce the dose to 3 mg/kg; second reduction: reduce the dose to 2.4 mg/kg; requirement for further reduction: discontinue

Pulmonary toxicity:

• Permanently discontinue in interstitial lung disease or pneumonitis

Peripheral neuropathy:

• Withhold in grade 3 or 4 peripheral neuropathy; resume upon resolution to ≤grade 2

Available forms: lyophilized powder 100, 160 mg/vial

Administer:

IV route

• Visually inspect for particulate matter and discoloration before use

• Give as infusion with a 0.2- or 0.22-micron in-line filter; do not administer as an IV push or bolus

• Use cytotoxic handling procedures; do not mix with, or administer as an infusion with, other IV products

Reconstitution:

• Slowly inject 5 mL of sterile water for injection into each 100-mg vial or 8 mL

of sterile water for injection into each 160-mg vial to yield a single-use solution of 20 mg/mL
- Direct the stream of sterile water toward the wall of the vial
- Gently swirl the vial; do not shake
- After reconstitution, withdraw amount and dilute immediately in 250 mL of 0.9% sodium chloride; gently invert the bag to mix
- The reconstituted single-use product does not contain a preservative; use the diluted solution immediately or store at 36°F-46°F (2°C-8°C) for up to 24 hr after reconstitution; discard any unused drug after 24 hr; do not freeze

IV infusion
- Closely monitor for possible subcutaneous infiltration during administration
- **First infusion:** give over 90 min; the infusion rate should be slowed or interrupted if the patient develops an infusion-related reaction; observe for at least 90 min following the initial dose for fever, chills, or other infusion-related reactions; permanently discontinue for life-threatening infusion-related reactions
- **Subsequent infusions:** administer over 30 min if prior infusions were well tolerated; the infusion rate should be slowed or interrupted if the patient develops an infusion-related reaction; observe for at least 30 min after the infusion; permanently discontinue for life-threatening infusion-related reactions

SIDE EFFECTS

CNS: Dizziness, insomnia, neuropathy, chills, fatigue, fever, flushing, headache
CV: Hypertension, peripheral edema, left ventricular dysfunction
EENT: Blurred vision, conjunctivitis, stomatitis
GI: Diarrhea, nausea, vomiting, constipation, dyspepsia, hepatotoxicity
HEMA: Anemia, bleeding, thrombocytopenia
INTEG: Rash, infusion-related reactions
MS: Arthralgia, pain
RESP: Cough, dyspnea, pneumonitis, interstitial lung disease
SYST: Anaphylaxis
OTHER: Elevated LFTs, hand-foot syndrome

PHARMACOKINETICS

93% protein binding, metabolized in the liver by CYP3A4, half-life 4 days

INTERACTIONS

- **Do not give with other IV products; do not give with 5% dextrose**

Increase: bleeding risk—warfarin, platelet inhibitors, anticoagulants
Increase: ado-trastuzumab toxicity—CYP3A4 inhibitors (clarithromycin, ketoconazole, ritonavir, saquinavir, atazanavir); avoid concurrent use

NURSING CONSIDERATIONS

Assess:
- Pregnancy test, CBC, differential, LFTs

Black Box Warning: HF, other cardiac symptoms: dyspnea, coughing; gallop; obtain full cardiac workup including ECG, echo, MUGA; LVEF baseline and q3mo

- Symptoms of infection; may be masked by product
- CNS reaction: LOC, mental status, dizziness, confusion

Black Box Warning: Hypersensitivity reactions, anaphylaxis

Black Box Warning: Hepatotoxicity: monitor LFTs baseline and prior to each dose; fatal liver damage may occur; reduced dose or discontinuing treatment may be required; monitor for infusion reactions during and for 1.5 hr after infusion; slowing infusion may be needed; monitor LFTs, bilirubin baseline and prior to each dose

- **Infusion reactions that may be fatal:** fever, chills, nausea, vomiting, pain, headache, dizziness, hypotension; discontinue product
- **Pulmonary toxicity:** dyspnea, interstitial pneumonitis, pulmonary hypertension, ARDS; can occur after infusion reaction; those with lung disease may have more severe toxicity, discontinue in those with pneumonitis, interstitial lung disease
- **Bleeding:** monitor for bleeding; grade 3 or 4 bleeding with fatalities has occurred; check platelets baseline and prior to each dose

Black Box Warning: Hepatic disease: may be fatal; monitor LFTs, bilirubin baseline and before each dose

Evaluate:
- Therapeutic response: decrease in size, spread of breast cancer

Teach patient/family:
- Reason for product, expected result
- To take acetaminophen for fever
- To avoid hazardous tasks because confusion, dizziness may occur
- To report signs of infection: sore throat, fever, diarrhea, vomiting; bleeding; decreased heart function/SOB with exertion
- To report weight gain; swelling of the ankles, feet; fatigue; cough; bleeding

Black Box Warning: Pregnancy/breast-feeding: to use effective contraception while taking this product and for 7 mo after discontinuing this drug; to notify prescriber if pregnancy is planned or suspected; not to breastfeed; advise patient to enroll in Mother Pregnancy Registry (800-690-6720)

- **Infusion reactions:** to report pain at infusion site

aducanumab-avwa (Rx)

(a-due-KAN-ue-mab-avwa)

Aduhelm

Func. class.: Alzheimer agent

Chem. class.: Amyloid beta–directed antibody

ACTION:

A human immunoglobulin gamma 1 (IgG1) monoclonal antibody directed against amyloid beta, reduces amyloid beta plaques

USES:

Alzheimer disease

CONTRAINDICATIONS

None

Precautions: Amyloid-related imaging abnormalities (ARIAs), hypersensitivity, angioedema

DOSAGE AND ROUTES

- **Adult: IV** Titration, 1 mg/kg IV over 1 hour every 4 weeks and at least 21 days apart for infusions 1 and 2; then 3 mg/kg IV over 1 hour every 4 weeks and at least 21 days apart for infusions 3 and 4; and then 6 mg/kg IV over 1 hour every 4 weeks and at least 21 days apart for infusions 5 and 6

Available forms: Injection 170 mg/1.7 mL (100 mg/mL), 300 mg/3 mL (100 mg/mL) solution single-dose vials

Administer:
- Titrate
- Obtain a recent (within 1 yr) brain MRI before use and before the 7th and 12th infusions. If severe ARIA-H is observed, may continue with caution only after a clinical evaluation and a follow-up MRI demonstrate radiographic stabilization
- Dilution in 100 mL of 0.9% Sodium Chloride Injection, USP, is required before administration. Give over 1 hr, use a 0.2- or 0.22-micron in-line filter
- Storage: Store in original carton until use, protect from light, refrigerated, do not freeze or shake; combined time out of refrigeration with protection from light max 24 hr at room temperature

SIDE EFFECTS

CNS: Headache
CV: Edema
HEMA: Microhemorrhage
MS: Falls
Syst: ARIA

INTERACTIONS

None known

PHARMACOKINETICS

Onset, peak, duration unknown

NURSING CONSIDERATIONS

Assess:
- **ARIA:** Assess for headache, confusion, dizziness, vision changes, nausea; notify prescriber
- **Hypersensitivity:** Assess for itching, rash, angioedema

Evaluate:
- Therapeutic response: Decreasing symptoms of Alzheimer disease (confusion)

Teach patient/family:
- **ARIA:** Teach patient that ARIA may occur with temporary swelling in areas of the brain, small spots of bleeding on the brain; to report headache, confusion, dizziness, vision changes, nausea. That MRIs will be needed
- **Hypersensitivity:** Inform patient that hypersensitivity, including angioedema, urticaria, may occur, to contact health care provider

afamelanotide (Rx)

(a'fa-me-lan'oh-tide)

Scenesse

Func. class.: Dermatologic agent

Chem. class.: Melanocortin receptor agonist

ACTION:

Increases production of eumelanin in the skin without exposure to sunlight or artificial UV light

USES:

To increase light exposure in those with phototoxic reactions from erythropoietic protoporphyria

CONTRAINDICATIONS

None

Precautions: Not approved in children

DOSAGE AND ROUTES

- **Adult:** SUBCUT 16 mg implanted above the anterior suprailiac crest q2mo

Available forms: Implant, SUBCUT 16 mg

Administer:
- This product should be implanted by a health care professional proficient in the SUBCUT implantation procedure
- Patients should maintain sun and light protection measures during treatment to prevent phototoxic reactions
- Monitor patient for 30 min after implant
- Leave dressing in place for 24 hr
- Store in refrigerator, protect from light

SIDE EFFECTS

CNS: Dizziness, fatigue, drowsiness

GI: Nausea

INTEG: Site reaction, melanocytic nevus, hyperpigmentation, skin irritation/discoloration

ENDO: Porphyria

RESP: Oropharyngeal pain, cough, respiratory tract infection

PHARMACOKINETICS

Onset unknown, peak 36 hr, duration 96 hr, half-life 15 hr

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:
- **Skin pigmentation:** Increased skin pigmentation and darkening of preexisting nevi and ephelides may occur; obtain a full-body skin examination (twice yearly)
- **Phototoxic reactions:** Maintain sun and light protection measures during treatment to prevent phototoxic reactions
- **Pregnancy/breastfeeding:** Not known if safe in pregnancy or breastfeeding

Evaluate:
- Therapeutic response: Prevention of phototoxic reactions

Teach patient/family:
- To contact their health care provider if implant is expelled
- To remove dressing 24 hr after implant
- To monitor site and report reactions to their health care provider
- To maintain sun and light protection measures during treatment
- That darkening of preexisting nevi or other skin abnormalities may occur
- To schedule twice-yearly full-body skin exams

⚠ HIGH ALERT

afatinib (Rx)

(a-fat'i-nib)

Gilotrif

Func. class.: Antineoplastic biologic response modifiers

USES: Treatment of non–small-cell lung cancer whose tumors have epidermal

growth factor receptor exon 19 deletions or 21 substitution mutations

CONTRAINDICATIONS: Pregnancy, hypersensitivity

DOSAGE AND ROUTES

• **Adult: PO** 40 mg daily until disease progression or unacceptable toxicity

Dose adjustments for toxicities:

• **Hepatotoxicity:** Hold in worsening liver function; when toxicity resolves to grade 1 or less, resume at a reduced dose (10 mg/day less than the dose causing hepatotoxicity); permanently discontinue for severe drug-induced hepatic impairment or if hepatotoxicity persists at a dose of 20 mg/day

• **Grade 2 or higher renal toxicity (CCr >1.5 × ULN):** Hold until the toxicity resolves to grade 1 or less (CCr <1.5 × ULN), then resume at a reduced dose (10 mg/day less than the dose causing nephrotoxicity); permanently discontinue if nephrotoxicity persists at a dose of 20 mg/day

aflibercept (Rx)

(a-fli-ber′sept)

Eylea

Func. class.: Vascular endothelial growth factor inhibitor signal transduction inhibitor (STI) (ophthalmic)

USES: For treatment of neovascular (wet) age-related macular degeneration (AMD), macular edema after central retinal vein occlusion, diabetic retinopathy with diabetic macular edema

DOSAGE AND ROUTES

Neovascular age-related macular degeneration (wet)

Adult: Intravitreal injection 2 mg (0.05 mL) into affected eye q4wk × 12 wk, then 2mg q8wk

Diabetic macular edema/retinopathy

Adult: Intravitreal injection 2 mg (0.05 mL) q4wk × 5 injections, then 2 mg (0.05 mL) q8wk

Macular edema

Adult: Intravitreal injection: 2 mg (0.05 mL) q4wk

Available forms: Intravitreal injection 2 mg (0.05 mL) single-use vial

• **Adult: Intravitreal injection** 2 mg (0.05 mL) into affected eye(s) q4wk × 12 wk, then 2 mg (0.05 mL) q8wk

albuterol (Rx)

(al-byoo′ter-ole)

Airomir ✱, ProAir HFA, ProAir RespiClick, Proventil HFA, Ventolin Diskus ✱, Ventolin Nebules ✱, Ventolin HFA

Func. class.: Bronchodilator

Chem. class.: Adrenergic β_2-agonist, sympathomimetic, bronchodilator

Do not confuse:

albuterol/atenolol/Albutein

Proventil/Prinivil

ACTION: Causes bronchodilation by action on β_2 (pulmonary) receptors by increasing levels of cAMP

USES: Prevention of exercise-induced asthma, acute bronchospasm, bronchitis, emphysema, bronchiectasis, or other reversible airway obstruction

Unlabeled uses: Hyperkalemia in dialysis patients, COPD, emphysema

CONTRAINDICATIONS: Hypersensitivity to sympathomimetics

Precautions: Pregnancy, breastfeeding, cardiac/renal disease, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, angle-closure glaucoma, seizures, exercise-induced bronchospasm (aerosol) in children <12 yr, hypoglycemia, tachydysrhythmias, severe cardiac disease, heart block

DOSAGE AND ROUTES

Bronchospasm prophylaxis/treatment

• **Adult and child ≥4 yr: INH** (metered-dose inhaler) 2 puffs (180 mcg) q4-6hr as needed; **>12 yr INH** (powdered inhaler) (ProAir RespiClick) 180 mcg (2 INH) q4-6hr as needed

- **Adult and child ≥13 yr: PO** (ext rel) 4-8 mg q12hr, max 32 mg/day; **PO** (regular release) 2-4 mg tid, max 32 mg/day
- **Child 6-12 yr: PO** (extended release) 4 mg q12hr, max 24 mg/day; **PO** (regular release) 6-13 yr 2 mg tid-qid, max 24 mg/day
- **Child 2-5 yr: PO** 0.1 mg/kg tid, max 12 mg/day
- **Adult and child ≥15 yr: PO** (syrup) 2-4 mg tid-qid, max 32 mg/day
- **Child 6-14 yr: PO** (syrup) 2 mg tid-qid, max 24 mg/day
- **Child 2-5 yr: PO** (syrup) 0.1 mg/kg tid, max 12 mg/day

Asthma (unlabeled)

- **Child <4 yr: INH** (metered-dose inhaler) 180-600 mcg q2 min, max 6 doses; persistent asthma 2 puffs (HFA) q4-6hr

To prevent exercise-induced bronchospasm (not ProAir RespiClick)

- **Adult/child ≥4 yr: INH** 2 puffs before exercise, max 12 puffs/24 hr
- **Adult/child ≥12 yr: INH (ProAir RespiClick)** 2 puffs 15-30 min prior to exercise

Other respiratory conditions

- **Adult and child ≥12 yr: INH** (metered-dose inhaler) 1 puff q4-6hr; **PO** 2-4 mg tid-qid, max 32 mg; **NEB/IPPB** 2.5 mg tid-qid
- **Geriatric: PO** 2 mg tid-qid, may increase gradually to 8 mg tid-qid
- **Child 2-12 yr: INH** (metered-dose inhaler) 0.1 mg/kg tid (max 2.5 mg tid-qid); **NEB/IPPB** 0.1-0.15 mg/kg/dose tid-qid or 1.25 mg tid-qid for child 10-15 kg or 2.5 mg tid-qid for child >15 kg

Hyperkalemia (unlabeled)

- **Adult: ORAL INH** (albuterol nebulizer solution) 10-20 mg over 15 min

Available forms: INH aerosol 100 mcg/actuation, INH powder 108 mcg/actuation; syrup 2 mg/5 mL; tablets 2, 4 mg; ext rel 4, 8 mg; INH sol 0.63 mg/3 mL, 1.25 mg/3 mL; 2.5 mg/3 mL, 0.5 mg/mL, 1 mg/mL, 2 mg/mL, 5 mg/1 mL

Administer:

- Store in light-resistant container; do not expose to temperatures of more than 86°F (30°C)

PO route

- Do not break, crush, or chew extended-release tablets; give with meals to decrease gastric irritation
- **Oral solution** to children (no alcohol, sugar)

Inhalation route

- For geriatric patients and children, a spacing device is advised
- After shaking metered-dose inhaler, exhale, place mouthpiece in mouth, inhale slowly while depressing inhaler, hold breath, remove, exhale slowly; give INH at least 1 min apart
- **NEB/IPPB** dilute 5 mg/mL solution/2.5 mL 0.9% NaCl for INH; other solutions do not require dilution; for NEB O_2 flow or compressed air 6-10 L/min, 1 treatment lasts 10 min; IPPB 5-20 min

ProAir Respistick:

- Prior to using for the first time, check that the number "200" is showing. Do not wash or put any part of the inhaler in water; if the mouthpiece needs cleaning, wipe with a dry cloth or tissue; when there are "20" doses left, the counter will change to red; refill

SIDE EFFECTS

CNS: *Tremors, anxiety,* insomnia, headache, stimulation, *restlessness*
CV: Angina, hypo/hypertension, dysrhythmias, chest pain
EENT: Dry nose, irritation of nose and throat
GI: Nausea, vomiting
MISC: Hyperglycemia
RESP: Paradoxical bronchospasm

PHARMACOKINETICS

Extensively metabolized in the liver and tissues, crosses placenta, breast milk, blood-brain barrier, half-life 2.7-6 hr, well absorbed
PO: Onset ½ hr, peak 2-3 hr, duration 4-6 hr
PO-ER: Onset ½ hr, peak 2-3 hr, duration 8-12 hr
INH: Onset 5-15 min, peak 1.5-2 hr, duration 2-6 hr, half-life 4 hr

INTERACTIONS

Increase: digoxin level—digoxin
Increase: CNS stimulation—CNS stimulants
Increase: ECG changes/hypokalemia—potassium-losing diuretics
Increase: severe hypotension—oxytocics
Increase: toxicity—theophylline
Increase: action of aerosol bronchodilators
Increase: action of albuterol—tricyclics, MAOIs, other adrenergics; avoid use together
Increase: CV effects—atomoxetine, selegiline
Decrease: albuterol—other β-blockers
Drug/Herb
Increase: stimulation—caffeine (cola nut, green/black tea, guarana, yerba maté, coffee, chocolate)
Drug/Lab Test
Decrease: potassium

NURSING CONSIDERATIONS

Assess:
- **Respiratory function:** vital capacity, pulse oximetry, forced expiratory volume, ABGs, VBGs; lung sounds, heart rate and rhythm, B/P, sputum (baseline and peak); whether patient has received theophylline therapy before giving dose
- Patient's ability to self-medicate
- Trouble breathing with wheezing, hold medication, notify prescriber if bronchospasm occurs
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected; use only if necessary; avoid breastfeeding

Evaluate:
- Therapeutic response: absence of dyspnea, wheezing; improved airway exchange; improved ABGs, VBGs

Teach patient/family:
- To use exactly as prescribed; to take missed dose when remembered, alter dosing schedule; not to use OTC medications; that excess stimulation may occur, to use this product before other medications, allow 5 min between each
- About use of inhaler: review package insert with patient; use demonstration, return demonstration; shake, prime before first use and when not used for >2 wk; release 4 test sprays into air, away from the face; about when empty and when to renew, a bad taste may occur
- To avoid getting aerosol in eyes (blurring of vision may result) or use near flames or sources of heat
- Do not wash inhaler, wipe with dry cloth, to discard product when counter changes to red
- To avoid smoking, smoke-filled rooms, persons with respiratory infections
- That paradoxical bronchospasm may occur; to stop product immediately, call prescriber, usually from first dose of new inhaler
- To limit caffeine products such as chocolate, coffee, tea, colas
- **Pregnancy/breastfeeding:** to advise prescriber if pregnancy is planned or suspected, or if breastfeeding
- To notify health care professional immediately if product does not relieve symptoms, corticosteroids may be needed

TREATMENT OF OVERDOSE:

Administer β_1-adrenergic blocker, IV fluids

albumin, human 5% (Rx)
(al-byoo′min)
AlbuKed 5%, Albuminex 5%, AlbuRx 5%, Flexbumin 5%, Albutein 5%, Plasbumin-5
albumin, human 25%
Albutein 25%, Plasbumin-25
Func. class.: Plasma volume expander

USES: Restores plasma volume after burns, hyperbilirubinemia, shock, hypoproteinemia, prevention of cerebral edema, cardiopulmonary bypass procedures, ARDS, nephrotic syndrome

CONTRAINDICATIONS: Hypersensitivity, HF, severe anemia, renal insufficiency, pulmonary edema

DOSAGE AND ROUTES

Burns

- **Adult: IV** dose to maintain plasma albumin at 3-4 mg/dL

Hypovolemic shock

- **Adult: IV** rapidly give 5% solution, when close to normal, infuse at ≤2-4 mL/min (25% sol ≤1 mL/min)
- **Child: IV** 0.5-1 g/kg/dose 5% solution, may repeat as needed, max 6 g/kg/day

Nephrotic syndrome

- **Adult: IV** 100-200 mL of 25% and loop diuretic × 7-10 days

Hypoproteinemia

- **Adult: IV** 25 g, may repeat in 15-30 min, or 50-75 g of 25% albumin infused at ≤2 mL/min
- **Child and infant: IV** 0.5-1 g/kg/dose over 2-4 hr, may repeat q1-2days

Hyperbilirubinemia/erythroblastosis fetalis

- **Child: IV** 1 g/kg 1-2 hr before transfusion

⚠ HIGH ALERT

alectinib (Rx)

[al-ek′ti-nib]

Alecensa, Alecensaro

Func. class.: Antineoplastics

Chem. class.: Tyrosine kinase inhibitor

ACTION: Targets ALK, RET genes, decreasing proliferation of cancer cells

USES: For the treatment of metastatic, ALK-positive, non–small-cell lung cancer (NSCLC), pregnancy, breastfeeding

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

PRECAUTIONS: **Child:** Liver disease, pulmonary disease

DOSAGE AND ROUTES

- **Adult: PO** 600 mg bid, with food, until disease progression or unacceptable toxicity

Hepatic Dose

Adult: Child-Pugh Class C 450 mg bid

Available forms: Capsules 150 mg

Administer

- Use cytotoxic handling procedures
- Give capsule whole; do not open, cut, or break
- Use with food
- Do not double doses; if dose is missed, give at next regularly scheduled time
- Storage: Protect from light, store at room temperature below 86°F (30°C)

SIDE EFFECTS

CV: Bradycardia, edema

CNS: Headache, fatigue

HEMA: Anemia, neutropenia, lymphopenia

GI: Vomiting, nausea, anorexia, constipation, diarrhea, hepatotoxicity, increased weight

META: Hypocalcemia, hyperglycemia, hypokalemia, hyponatremia

MS: Myalgia

RESP: Dyspnea, cough

INTEG: Rash, photosensitivity

PHARMACOKINETICS

Onset unknown, peak 4 hr, duration unknown, 99% protein binding, metabolized by the liver, excreted by the kidney

INTERACTIONS

Increased: bradycardia, other products causing bradycardia, monitor carefully

NURSING CONSIDERATIONS

Assess:

- **Bradycardia:** Heart rate <50 beats per minute. Monitor heart rate and B/P regularly. If symptomatic bradycardia (non-life-threatening) occurs, withhold treatment until recovery to asymptomatic bradycardia or to a heart rate of ≥60 beats per minute
- **Hepatotoxicity:** Monitor liver function tests (ALT, AST, and total bilirubin) every 2 wk during the first 3 mo and then once a mo and as needed; monitor more fre-

quently in patients who develop transaminase and bilirubin elevations. May require therapy interruption, dose reduction, or permanent discontinuation

- **Myalgia:** Monitor for muscle pain, tenderness, or weakness. Assess CPK every 2 wk for the first mo of therapy and then as needed
- **Photosensitivity:** Patients should avoid sun exposure (during treatment and for 7 days after the final dose) and use a sunscreen
- **Pulmonary toxicity:** Monitor for ILD/pneumonitis; evaluate worsening of respiratory symptoms or signs/symptoms of ILD/pneumonitis (cough, dyspnea, fever). Immediately interrupt for confirmed ILD/pneumonitis; permanently discontinue if these occur
- **Renal toxicity:** Monitor for renal toxicity, may require discontinuation
- **Pregnancy/breastfeeding:** Do not use during pregnancy or breastfeeding, use contraception during and for 1 wk after last dose if of childbearing potential; males should use contraception during and for 3 mo after last dose if female partner is of childbearing potential

Patient/family teaching

- To report constipation, vomiting, nausea, diarrhea, weight gain, headache if these are severe or do not go away
- To report liver problems like dark urine, fatigue, lack of appetite, nausea, abdominal pain, light-colored stools, vomiting, or yellow skin
- To report symptoms of infection
- To report lung problems like shortness of breath or other trouble breathing, cough that is new or worse
- To report kidney problems like unable to pass urine, blood in the urine, change in amount of urine passed, or weight gain
- To report high blood sugar like confusion, fatigue, increased thirst, increased hunger, passing a lot of urine, flushing, fast breathing, or breath that smells like fruit
- To report electrolyte problems like mood changes, confusion, muscle pain or weakness, abnormal heartbeat, seizures, lack of appetite, or severe nausea or vomiting
- To report severe loss of strength and energy
- To report slow heartbeat, dizziness, passing out
- To report muscle pain, back pain, muscle weakness
- To report swelling in arms, legs, or vision changes
- To report allergic reactions, like rash; hives; itching; red, swollen, blistered; wheezing; tightness in the chest or throat; trouble breathing, swallowing, or talking; unusual hoarseness; or swelling of the mouth, face, lips, tongue, or throat
- To notify your prescriber if pregnancy is planned or suspected, or if breastfeeding

alendronate (Rx)

(al-en-drone′ate)

Binosto, Fosamax, Fosamax plus D, Fosavance

Func. class.: Bone-resorption inhibitor

Chem. class.: Bisphosphonate

Do not confuse:

Fosamax/Flomax

ACTION: Decreases rate of bone resorption and may directly block dissolution of hydroxyapatite crystals of bone; inhibits osteoclast activity

USES: Treatment and prevention of osteoporosis in postmenopausal women, treatment of osteoporosis in men, Paget's disease, treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen and in men who are on continuing corticosteroid treatment with low bone mass

CONTRAINDICATIONS: Hypersensitivity to bisphosphonates, delayed esophageal emptying, inability to sit or stand for 30 min, hypocalcemia, pregnancy, breastfeeding, children, CCr <35 mL/min

Precautions: Esophageal disease, ulcers, gastritis, poor dental health, increased esophageal cancer risk

DOSAGE AND ROUTES

Osteoporosis in postmenopausal women

- **Adult and geriatric: PO** 10 mg/day or 70 mg/wk

Paget's disease

- **Adult and geriatric: PO** 40 mg/day × 6 mo; consider retreatment for relapse

Prevention of osteoporosis in postmenopausal women (excluding Binosto and oral solution)

Adult/postmenopausal female: PO 5 mg/day or 35 mg/wk

Glucocorticoid-induced osteoporosis in those receiving glucocorticosteroids

- **Adult: PO** 5 mg/day; those not receiving estrogen 10 mg/day

Androgen deprivation therapy/osteoporosis prevention

Adult: PO 70 mg weekly

Renal dose

- **Adult: PO** CCr ≤35 mL/min, not recommended

Available forms: Tablets 5, 10, 35, 40, 70 mg; tablets 70 mg with 2800 IU vitamin D_3, 70 mg with 5600 IU vitamin D_3; oral sol 70 mg/75 mL; effervescent tablet 70 mg

Administer:

- For 6 mo to be effective for Paget's disease
- Store in cool environment, out of direct sunlight
- **Tablet:** take with 8 oz of water 30 min before first food, beverage, or medication of the day
- Do not lie down for ≥30 min after dose; do not take at bedtime or before rising
- **Liquid:** use oral syringe or calibrated device; give in AM with ≥2 oz of water ≥30 min before food, beverage, or medication
- **Effervescent tablet:** Dissolve in 4 oz of water, after 5 min, stir and drink

SIDE EFFECTS

RESP: Asthma exacerbation
CV: Atrial fibrillation
INTEG: Rash, photosensitivity
CNS: Headache
GI: Abdominal pain, constipation, nausea, vomiting, esophageal ulceration, acid reflux, dyspepsia, esophageal perforation, diarrhea, esophageal cancer
META: Hypophosphatemia, hypocalcemia
MS: Bone pain, osteonecrosis of the jaw, bone fractures

PHARMACOKINETICS

Protein binding 78%, rapidly cleared from circulation, taken up mainly by bones, eliminated primarily through kidneys, bound to bone, half-life >10 yr

INTERACTIONS

Increase: GI adverse reactions—NSAIDs, salicylates, H_2 blockers, proton pump inhibitors, gastric mucosal agents; monitor for GI reactions
Decrease: absorption—antacids, calcium supplements; give alendronate at least 30-60 min before other products

Drug/Food

Decrease: absorption when used with caffeine, orange juice, food; take food at least 30 min after alendronate

Drug/Lab Test

Decrease: calcium, phosphate

NURSING CONSIDERATIONS

Assess:

- Hormonal status of women before treatment, history of fractures
- **For osteoporosis:** bone density test before and during treatment
- **For Paget's disease:** increased skull size, bone pain, headache; decreased vision, hearing; alkaline phosphatase

levels, baseline and periodically, 2× upper limit of normal is indicative of Paget's disease
• **For hypercalcemia:** paresthesia, twitching, laryngospasm; Chvostek's, Trousseau's signs; monitor calcium, vitamin D baseline and during treatment, correct prior to use
• Dental status: regular dental exams should be performed; dental extractions (cover with antiinfectives before procedure)
• **MS pain:** may occur in a few days or years later, symptoms usually resolve after discontinuing

Evaluate:
• Therapeutic response: increased bone mass, absence of fractures

Teach patient/family:
• To remain upright for 30 min after dose to prevent esophageal irritation; if dose is missed, skip dose, do not double doses or take later in day; to take in AM before food, other meds; to take with 6-8 oz of water only (no mineral water)
• To take calcium, vitamin D if instructed by health care provider
• To use sunscreen, protective clothing to prevent photosensitivity
• To avoid smoking, alcohol intake, which increase osteoporosis
• To perform weight-bearing exercise to increase bone density
• To maintain good oral hygiene, to use antiinfectives before dental procedures as directed by prescriber
• **Pregnancy/breastfeeding:** to inform prescriber if pregnancy is planned or suspected; that cautious use is advised in breastfeeding

alfuzosin (Rx)

(al-fyoo′zoe-sin)

Uroxatral, Xatral

Func. class.: Urinary tract, antispasmodic, α_1-agonist

USES: Symptoms of benign prostatic hyperplasia

DOSAGE AND ROUTES

• **Adult: PO EXTENDED RELEASE** 10 mg/day

Available forms: Tablets, extended release 10 mg

alirocumab (Rx)

(al′-i-rok′-ue-mab)

Praluent

Func. class.: Antilipemic

USES: Heterozygous, familial hypercholesterolemia, atherosclerotic disease

DOSAGE AND ROUTES

• **Adult: SUBCUT** 75 mg q2wk, may increase to 150 mg q2wk if needed after 4-8 wk or 300 mg q4wk

Available forms: Injection: 75 mg/mL, 150 mg/mL (single-dose pens/syringes)

aliskiren (Rx)

(a-lis′kir-en)

Rasilez, Tekturna

Func. class.: Antihypertensive

Chem. class.: Direct renin inhibitor

ACTION: Renin inhibitor that acts on the renin-angiotensin system (RAS)

USES: Hypertension, alone or in combination with other antihypertensives

Black Box Warning: Pregnancy

Precautions: Breastfeeding, children, geriatric patients, angioedema, aortic/renal artery stenosis, cirrhosis, CAD, dialysis, hyper/hypokalemia, hyponatremia, hypotension, hypovolemia, renal/hepatic disease, surgery, diabetes

DOSAGE AND ROUTES

• **Adult/child ≥6 yr and >50 kg: PO** 150 mg/day, may increase to 300 mg/day if needed, max 300 mg/day

Child ≥6 yr and 20-50 kg: PO 75 mg daily, max 150 mg/day

Available forms: Tablets 150, 300 mg

Administer:

• May use with other antihypertensives

• Do not use with a high-fat meal

• Daily with a full glass of water; titrate up to achieve correct dose

• Do not discontinue abruptly; correct electrolyte/volume depletion before treatment

• Store in tight container at room temperature

SIDE EFFECTS

CV: Orthostatic hypotension, hypotension

CNS: Headache, dizziness, seizures

GI: *Diarrhea*

GU: Renal stones, increased uric acid

INTEG: Rash

META: Hyperkalemia

MISC: Angioedema, cough

PHARMACOKINETICS

Poorly absorbed, bioavailability 2.5%, peak 1-3 hr, steady state 7-8 days, 91% excreted unchanged in the feces, half-life 24 hr

INTERACTIONS

• **Do not use with ACE inhibitors, angiotensin II receptor antagonists in diabetes mellitus**

Increase: potassium levels—ACE inhibitors, angiotensin II receptor antagonists, potassium supplements, potassium-sparing diuretics

Increase: hypotension—other antihypertensives, diuretics

Increase: aliskiren levels—atorvastatin, itraconazole, ketoconazole, cycloSPORINE; concurrent use is not recommended

Decrease: levels of warfarin

Drug/Food

Decrease: aliskiren effect—high-fat meal, grapefruit

Drug/Lab Test

Increase: uric acid, BUN, serum creatinine, potassium

NURSING CONSIDERATIONS

Assess:

• Renal studies: uric acid, serum creatinine, BUN may be increased; hyperkalemia may occur; correct salt depletion, hyperkalemia, volume before starting therapy

• **Allergic reactions:** angioedema may occur (swelling of face; trouble breathing, swallowing)

• Daily dependent edema in feet, legs; weight, B/P, orthostatic hypotension

• **Diabetes:** identify the use of ACE inhibitors, angiotensin II receptor antagonists; if in use, do not use aliskiren

Evaluate:

• Therapeutic response: decrease in B/P

Teach patient/family:

• About the importance of complying with dosage schedule even if feeling better; that if dose is missed, take as soon as possible; that if it is almost time for the next dose, take only that dose; do not double dose; do not take with high-fat meal or grapefruit

• How to take B/P and normal reading for age group

• Not to use OTC products including herbs, supplements unless approved by prescriber

• **To report to prescriber immediately:** dizziness, faintness, chest pain, palpitations, uneven or rapid heartbeat, headache, severe diarrhea, swelling of tongue or lips, trouble breathing, difficulty swallowing, tightening of the throat

• Not to operate machinery or perform hazardous tasks if dizziness occurs

• To rise slowly to avoid faintness

Black Box Warning: Pregnancy: To notify if pregnancy is planned or suspected; if pregnant, product will need to be discontinued

allopurinol (Rx)

(al-oh-pure'i-nole)

Aloprim, Zyloprim

Func. class.: Antigout drug, antihyperuricemic

Chem. class.: Xanthine oxidase inhibitor

Do not confuse:
Zyloprim/Zovirax/zolpidem

ACTION: Inhibits the enzyme xanthine oxidase, reducing uric acid synthesis

USES: Chronic gout, hyperuricemia associated with malignancies, recurrent calcium oxalate calculi, uric acid calculi

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, renal/hepatic disease

DOSAGE AND ROUTES

Increased uric acid levels in malignancies

- **Adult/child >10 yr: PO** 600-800 mg/day in divided doses for 2-3 days; start up to 1-2 days before chemotherapy; **IV INFUSION** 200-400 mg/m^2/day, 24-48 hr before chemotherapy, may be divided at 6-, 8-, 12-hr intervals; max 600 mg/day
- **Child 6-10 yr: PO** 300 mg/day, adjust dose after 48 hr; max 400 mg/day
- **Child <6 yr: PO** 150 mg/day, adjust dose after 48 hr
- **Child ≤10 yr: IV INFUSION** 200 mg/m^2/day, initially as a single dose or divided q6-12hr

Recurrent calculi

- **Adult: PO** 200-300 mg/day in a single dose or divided bid-tid

Uric acid nephropathy prevention

- **Adult and child >10 yr: PO** 600-800 mg/day × 2-3 days

Gout (mild)

- **Adult: PO** 100 mg/day, titrating upward, max 800 mg/day

Renal dose

- **Adult: PO/IV** CCr 81-100 mL/min 300 mg/day; CCr 61-80 mL/min 250 mg/day; CCr 41-60 mL/min 200 mg/day; CCr 21-40 mL/min 150 mg/day; CCr 10-20 mL/min 100-200 mg/day; CCr 3-9 mL/min 100 mg/day or 100 mg every other day; CCr <3 mL/min 100 mg q24hr or longer or 100 mg every 3rd day

Available forms: Tablets, scored 100, 300 mg; powder for injection 500 mg/vial

Administer:

PO route

- With meals to prevent GI symptoms; may crush, add to foods or fluids
- Begin 1-2 days before antineoplastic therapy

Intermittent IV INFUSION route

- Use in tumor lysis prior to start of chemotherapy (24-48 hr)
- Reconstitute 30-mL vial with 25 mL of sterile water for inj; dilute to desired concentrations (≤6 mg/mL) with 0.9% NaCl for inj or D_5W for inj; begin infusion within 10 hr

Y-site compatibilities: Acyclovir, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, atenolol, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, caspofungin, ceFAZolin, cefoTEtan, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, CISplatin, cyclophosphamide, DACTINomycin, DAUNOrubicin citrate liposome, dexamethasone, dexmedetomidine, DOCEtaxel, DOXOrubicin liposomal, enalaprilat, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, granisetron hydrochloride, heparin, hydrocortisone phosphate, hydrocortisone succinate,

HYDROmorphone, ifosfamide, linezolid injection, LORazepam, mannitol, mesna, methotrexate, metroNIDAZOLE, milrinone, mitoXANtrone, morphine, nesiritide, octreotide, oxytocin, PACLitaxel, pamidronate, pantoprazole, PEMEtrexed, piperacillin, piperacillin-tazobactam, plicamycin, potassium chloride, raNITIdine, sodium acetate, sulfamethoxazole-trimethoprim, teniposide, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, vancomycin, vasopressin, vinBLAStine, vinCRIStine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

GI: *Nausea, vomiting, malaise,* diarrhea, hepatitis
INTEG: Rash
CV: Hypo- and hypertension, HF (IV use)
CNS: Drowsiness
GU: Renal failure
MISC: Hypersensitivity, bone marrow depression
MS: Acute gouty attack

PHARMACOKINETICS

Protein binding <1%, half-life 1-2 hr
PO: Peak 1.5 hr; excreted in feces, urine
IV: Peak up to 30 min

INTERACTIONS

Increase: rash—ampicillin, amoxicillin; avoid concurrent use
Increase: action of oral anticoagulants, theophylline
Increase: hypersensitivity, toxicity—ACE inhibitors, thiazides
Increase: bone marrow depression—(mercaptopurine, azaTHIOprine)
Increase: xanthine nephropathy, calculi—rasburicase

NURSING CONSIDERATIONS

Assess:

- **For gout:** joint pain, swelling; may use with NSAIDs for acute gouty attacks; effect may take several weeks
- CBC, AST, ALT, BUN, creatinine before starting treatment, periodically
- I&O ratio; increase fluids to 2 L/day to prevent stone formation and toxicity
- For rash, hypersensitivity reactions, discontinue allopurinol immediately, after rash is resolved, treatment may continue at a lower dose

Evaluate:

- Therapeutic response: decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

Teach patient/family:

- To take as prescribed; if dose is missed, take as soon as remembered; do not double dose; tablets may be crushed
- To increase fluid intake to 2 L/day
- To report skin rash, stomatitis, malaise, fever, aching; product should be discontinued
- To avoid hazardous activities if drowsiness or dizziness occurs
- To avoid alcohol, caffeine; will increase uric acid levels
- An alkaline diet may be required
- That follow-up examinations and blood work will be needed
- To identify triggers and avoid
- To avoid large doses of vitamin C; kidney stone formation may occur
- To reduce dairy products, refined sugars, sodium, meat if taking for calcium oxalate stones; to identify triggers and avoid

almotriptan (Rx)

(al-moh-trip'tan)
Func. class.: Antimigraine agent, abortive
Chem. class.: 5-HT_1-receptor agonist, triptan

ACTION: Binds selectively to the vascular 5-$HT_{1B/1D/1F}$-receptors, exerts antimigraine effect

USES: Acute treatment of migraine with or without aura (adult/adolescent/child ≥12 yr)

CONTRAINDICATIONS: Hypersensitivity, acute MI, angina, CV disease, CAD, stroke, vasospastic angina, ischemic heart disease or risk for, peripheral vascular syndrome, uncontrolled hypertension, basilar or hemiplegic migraine

Precautions: Pregnancy, postmenopausal women, men >40 yr, breastfeeding, children <18 yr, geriatric patients, risk factors for CAD, MI; hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, sulfonamide hypersensitivity, cardiac dysrhythmias, Raynaud's disease, tobacco smoking, Wolff-Parkinson-White syndrome

DOSAGE AND ROUTES

• **Adult, adolescent, and child ≥12 yr: PO** 6.25 or 12.5 mg; may repeat dose after 2 hr; max 2 doses/24 hr or 4 treatment cycles within any 30-day period; max of 25 mg/day

Hepatic/renal dose

• **Adult: PO** (CCr 10-30 mL/min) 6.25 mg initially, max 12.5 mg

Available forms: Tablets 6.25, 12.5 mg

Administer:

• Avoid using more than 2×/24 hr; rebound headache may occur

• Swallow tablets whole; do not break, crush, chew tablets, without regard to food

SIDE EFFECTS

CNS: *Dizziness,* headache, seizures, paresthesias

CV: Coronary artery vasospasm, MI, ventricular fibrillation, ventricular tachycardia

GI: Nausea, xerostomia

INTEG: Sweating, rash

PHARMACOKINETICS

Onset of pain relief 2 hr; peak 1-3 hr; duration 3-4 hr; bioavailability 70%; protein binding 35%; metabolized in the liver (metabolite), metabolized by MAO-A, CYP2D6, CYP3A4; excreted in urine (40%), feces (13%); half-life 3-4 hr

INTERACTIONS

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, sibutramine

Increase: vasospastic effects—ergot, ergot derivatives, other 5-HT1 agonists; avoid concurrent use

Increase: almotriptan effect—MAOIs; do not use together

Increase: plasma concentration of almotriptan—(CYP3A4 inhibitors) itraconazole, ritonavir, erythromycin, ketoconazole; avoid concurrent use in renal/hepatic disease

Drug/Herb

• Avoid use with feverfew

Increase: serotonin syndrome—St. John's wort

NURSING CONSIDERATIONS

Assess:

• **Migraine:** pain location, aura, duration, intensity, nausea, vomiting; quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

• **Serotonin syndrome:** in those taking SSRIs, SNRIs; agitation, confusion, hallucinations, diaphoresis, hypertension, diarrhea, fever, tremors; usually occurs when dose is increased

• B/P; signs/symptoms of coronary vasospasms

• For stress level, activity, recreation, coping mechanisms

• **Neurologic status:** LOC, blurring vision, nausea, vomiting, tingling, hot sensation, burning, feeling of pressure, numbness, flushing preceding headache

• **Tyramine foods** (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches

Evaluate:

• Therapeutic response: decrease in severity of migraine

Teach patient/family:

- To report chest pain, drowsiness, dizziness, tingling, flushing
- To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding
- That if 1 dose does not relieve migraine, to take another after 2 hr, max 4 treatment cycles in 30 days; do not take MAOIs for ≥24 hr
- That product does not prevent or reduce number of migraine attacks; use to relieve attack only
- **Serotonin syndrome:** To report immediately signs of serotonin syndrome
- To report immediately chest tightness or pain
- Not to drive or operate machinery until reaction is known, drowsiness, dizziness may occur
- To inform all health care professionals of all OTC, Rx, herbals, supplements taken

⚠ HIGH ALERT

alogliptin (Rx)

(al′oh-glip′tin)

Nesina

Func. class.: Antidiabetic

Chem. class.: Dipeptidyl peptidase-4 (DPP-4) inhibitor

ACTION: A dipeptidyl-peptidase-IV (DDP-IV) inhibitor potentiates the effects of the incretin hormones by inhibiting their breakdown by DDP-IV

USES: Type 2 diabetes mellitus (T2DM)

CONTRAINDICATIONS: Hypersensitivity, ketoacidosis, type 1 diabetes

Precautions: Pregnancy, breastfeeding, hepatic disease, burns, diarrhea, fever, GI obstruction, hyper/hypoglycemia, hyper/hypothyroidism, hypercortisolism, children, ileus, malnutrition, pancreatitis, surgery, trauma, vomiting, kidney disease, adrenal insufficiency, angioedema

DOSAGE AND ROUTES

- **Adult: PO** 25 mg/day

Renal dose

- **Adult: PO** CCr 30-59 mL/min: 12.5 mg every day; CCr <30 mL/min: 6.25 mg every day; intermittent hemodialysis: 6.25 mg every day; give without regard to the timing of hemodialysis

Available forms: Tablets 6.25, 12.5, 25 mg

Administer:

- Without regard to food

SIDE EFFECTS

CNS: Headache

GI: Pancreatitis, hepatotoxicity

CV: Heart failure

SYST: Rash, hypersensitivity, angioedema, Stevens-Johnson syndrome, anaphylaxis

PHARMACOKINETICS

20% protein binding, excreted unchanged (urine), peak 1-2 hr, duration up to 24 hr, effect decreased in liver disease and increased in kidney disease, half-life 21 hr

INTERACTIONS

Increase: hypoglycemia—insulin, androgens, pegvisomant, sulfonylureas; dosage adjustment may be needed

Decrease: hypoglycemia—danazol, thiazides; adjust dose

Drug/Lab Test

Increase: LFTs

Decrease: glucose

NURSING CONSIDERATIONS

Assess:

- **Diabetes:** monitor blood glucose, glycosylated hemoglobin A1c (A1c), LFTs, serum creatinine/BUN baseline and throughout treatment
- **Pancreatitis:** can occur during use; monitor for severe abdominal pain, with or without vomiting
- **Hypersensitivity reactions:** angioedema, Stevens-Johnson syndrome; product should be discontinued
- **HF:** Assess for risk of HF in those with known HF or kidney disease

Evaluate:

- Positive therapeutic response: decrease in polyuria, polydipsia, polyphagia,

clear sensorium, absence of dizziness, improvement in A1c

Teach patient/family:

- **Hepatotoxicity:** To report yellowing of skin, eyes, dark urine, clay-colored stools, nausea, vomiting
- That diabetes is a lifelong condition, product does not cure disease
- That all food in diet plan must be eaten to prevent hypoglycemia; to continue with weight control, dietary medical nutrition therapy, physical activity, hygiene
- To carry emergency ID with prescriber, medications, and condition listed
- To test blood glucose using a blood glucose meter, and urine ketones
- To report allergic reactions, nausea, vomiting, abdominal pain, dark urine
- **Hypersensitivity:** To notify health care professional and stop taking product if rash, trouble breathing, swelling of face, lips, tongue occur
- To notify all health care professionals of OTC, Rx, herbs, supplements used
- **Pregnancy/breastfeeding:** To report if pregnancy is planned or suspected, or if breastfeeding

alosetron (Rx)

(ah-loss′a-tron)

Lotronex

Func. class.: Anti-IBS agent

USES: Severe, chronic, diarrhea-predominant irritable bowel syndrome (IBS) in women who have failed conventional therapy

CONTRAINDICATIONS: Crohn's disease, severe hepatic disease, diverticulitis, toxic megacolon, GI adhesions/strictures/obstruction/perforation, thrombophlebitis, ulcerative colitis

Black Box Warning: Ischemic colitis, severe constipation

DOSAGE AND ROUTES

- **Adult woman: PO** 0.5 mg bid, may increase to 1 mg bid after 4 wk if well tolerated; if symptoms are not controlled after 4 wk of treatment with 1 mg bid, discontinue

Available forms: Tablets 0.5 mg, 1 mg

⚠ HIGH ALERT

alpelisib (Rx)

(al-peh-lih′-sib)

Piqray

Func. class.: Antineoplastic

Chem. class.: Small molecule antineoplastic phosphatidylinositol-3-kinase (PI3K) inhibitors

ACTION: In breast cancer cell lines, inhibits the phosphorylation of PI3K downstream targets, including Akt, and showed activity in cell lines harboring a *PIK3CA* mutation

USES: Hormone receptor (HR)–positive, *HER2*–negative, *PIK3CA*-mutated, advanced or metastatic breast cancer in men and postmenopausal women after progression on or after an endocrine-based regimen, in combination with fulvestrant

CONTRAINDICATIONS: Hypersensitivity, pregnancy

Precautions: Breastfeeding, chronic lung disorders, contraceptive requirement, diabetes mellitus, diarrhea, hyperglycemia, infertility, interstitial lung disease, male-mediated teratogenicity

DOSAGE AND ROUTES

Males and postmenopausal females: PO 300 mg PO daily with food, in combination with fulvestrant (500 mg IM on days 1, 15, and 29 and monthly thereafter) until disease progression or unacceptable toxicity

Available forms: Tablets 200, 250, 300 mg

Administer:

- Give with food at approximately the same time each day

• Do not crush, chew, or split; do not use any tablet that is broken, cracked, or otherwise not intact
• If a dose is missed, it can be taken with food within 9 hr after the time it is usually taken. After more than 9 hr, skip the dose for that day and resume dosing on the following day at the usual time
• If vomiting occurs, do not administer an additional dose on that day. Resume dosing the following day at the usual time

SIDE EFFECTS

CNS: *Fever, headache*
ENDO: Hypoglycemia, hyperglycemia
INTEG: *Rash, pruritus*
GU: Renal dysfunction
GI: *Nausea, vomiting, diarrhea, abdominal pain, anorexia, weight loss*
SYST: Infection, anaphylaxis, Stevens-Johnson syndrome

PHARMACOKINETICS

89% protein binding, half-life 8-9 hr; 81% excreted in feces (36% unchanged, 32% as metabolite), 14% excreted in urine (2% unchanged, 7.1% metabolite); affected by CYP2C9, CYP3A4, BCRP; peak 2-4 hr

INTERACTIONS

Avoid use with CYP3A4 inhibitors, inducers, substrates

Drug/Lab Test
Increase: LFTs

NURSING CONSIDERATIONS

Assess:
• **Diabetes mellitus:** Fasting blood glucose and hemoglobin A1c (HbA1c) should be monitored before starting treatment and any antidiabetic treatment change; continue to monitor blood glucose weekly for the first 2 wk, then q4wk; monitor HbA1c q3mo
• **Severe diarrhea:** May use with antidiarrheal medication (loperamide). An interruption of therapy, dose reduction, or discontinuation of therapy may be necessary
• **Severe hypersensitivity reactions (anaphylaxis and anaphylactic shock):** Monitor for severe hypersensitivity reactions (dyspnea, flushing, rash, fever, or tachycardia); permanently discontinue if this occurs
• **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding. Obtain pregnancy testing before use

Evaluate:
• Therapeutic response: Decreased disease progression in breast cancer

Teach patient/family:
• **Pregnancy/breastfeeding:** To report planned or suspected pregnancy; to use effective contraception during treatment and for at least 1 mo after the last dose; to avoid breastfeeding
• To report new or worsening side effects
• To take tablets whole, not to crush or chew; to take with food
• Preexisting chronic lung disease (CLD); severe pneumonitis/interstitial lung disease: Advise patients to immediately report any new or worsening respiratory symptoms (hypoxia, cough, dyspnea)
• Diarrhea: Teach patients to begin antidiarrheal treatment, increase oral fluids, and notify their health care provider if diarrhea occurs

⚠ HIGH ALERT

ALPRAZolam (Rx)

(al-pray′zoe-lam)

Xanax, Xanax XR

Func. class.: Antianxiety
Chem. class.: Benzodiazepine (short/intermediate acting)

Controlled Substance Schedule IV

Do not confuse:
ALPRAZolam/LORazepam
Xanax/Zantac

ACTION: Depresses subcortical levels of CNS, including limbic system, reticular formation

USES: Anxiety, panic disorders with or without agoraphobia, anxiety with depressive symptoms

Unlabeled uses: Premenstrual dysphoric disorders, insomnia, PMS, alcohol withdrawal syndrome

CONTRAINDICATIONS:

Pregnancy, breastfeeding, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis, addiction

Precautions: Geriatric patients, debilitated patients, hepatic disease, obesity, severe pulmonary disease

DOSAGE AND ROUTES

Anxiety disorder

- **Adult: PO** 0.25-0.5 mg tid, may increase q3-4days if needed, max 4 mg/day in divided doses
- **Geriatric: PO** 0.25 mg bid; increase by 0.125 mg as needed

Panic disorder

- **Adult: PO** 0.5 mg tid, may increase up to 1 mg/day q3-4days, max 10 mg/day; **EXTENDED RELEASE** (Xanax XR) give daily in AM, 0.5-1 mg initially, maintenance 3-6 mg/day, max 10 mg/day

Hepatic dose

- Reduce dose by 50%-60%

Premenstrual dysphoric disorders/ PMS (unlabeled)

- **Adult: PO** 0.25 mg bid-tid starting on day 16-18 of menses, taper over 2-3 days when menses occurs, max 4 mg/day

Available forms: Tablets 0.25, 0.5, 1, 2 mg; extended-release tablets (Xanax XR) 0.5, 1, 2, 3 mg; orally disintegrating tablets 0.25, 0.5, 1, 2 mg; oral solution 1 mg/mL

Administer:

- Tablets may be crushed, mixed with food, fluids if patient is unable to swallow medication whole; do not break, crush, chew extended release (XR), give extended-release tablets in AM; conversion from regular-release tablets to extended release is at same dose
- With food or milk for GI symptoms; high-fat meal will decrease absorption
- To discontinue, decrease by 0.5 mg q3days
- May divide total daily doses into more times/day if anxiety occurs between doses
- **Orally disintegrating tablets:** place on tongue to dissolve and swallow; protect from moisture, discard unused portion of tablet if split
- **Oral solution:** mix with water, juice, applesauce, or other soft foods; use calibrated dropper supplied

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, stimulation, poor coordination, suicide

EENT: *Blurred vision*

GI: Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea, weight gain/loss

GU: Decreased libido

INTEG: Rash, dermatitis

PHARMACOKINETICS

PO: Well absorbed; widely distributed; onset 30 min; peak 1-2 hr; duration 4-6 hr; *oral disintegrating tablet* peak 1.5-2 hr; therapeutic response 2-3 days; metabolized by liver (CYP3A4), excreted by kidneys; crosses placenta, breast milk; half-life 12-15 hr, protein binding 80%

INTERACTIONS

Increase: ALPRAZolam action—CYP3A4 inhibitors (cimetidine, disulfiram, erythromycin, FLUoxetine, isoniazid, itraconazole, ketoconazole, metoprolol, propranolol, valproic acid); do not use together

Black Box Warning: Increase: CNS depression—anticonvulsants, alcohol, antihistamines, sedative/hypnotics, opioids; avoid concurrent use

Decrease: sedation—xanthines

Decrease: ALPRAZolam action—CYP3A4 inducers (barbiturates, carBAMazepine rifAMPin), adjust dose as needed

Decrease: action of levodopa

Drug/Herb

Increase: CNS depression—kava, melatonin, St. John's wort, valerian

Drug/Food

Increase: product level—grapefruit juice; avoid concurrent use

Drug/Lab Test

Increase: AST/ALT, alkaline phosphatase

NURSING CONSIDERATIONS

Assess:

- Mental status: anxiety, mood, sensorium, orientation, affect, sleeping pat-

tern, drowsiness, dizziness, especially in geriatric patients both before and during treatment, **suicidal thoughts, behaviors**

• Hepatic, blood studies: renal studies, AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase, CBC; may cause neutropenia, decreased Hct, increased LFTs

Black Box Warning: For use with other CNS depressants or opioids, monitor for respiratory depression

• **Physical dependency, withdrawal symptoms:** anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness; withdrawal seizures may occur after rapid decrease in dose or abrupt discontinuation

• **Beers:** avoid in older adults; increased risk of cognitive impairment

Evaluate:

• Therapeutic response: decreased anxiety, restlessness, sleeplessness, panic attacks

Teach patient/family:

• Not to double doses; to take exactly as prescribed; if dose is missed, take within 1 hr as scheduled; that product may be taken with food

• Not to use for everyday stress or for more than 4 mo unless directed by prescriber; not to take more than prescribed amount; that product may be habit forming; that memory impairment is a result of long-term use

• To avoid OTC preparations unless approved by prescriber, not to use with grapefruit juice

• Not to discontinue medication abruptly after long-term use

• To avoid driving, activities that require alertness because drowsiness may occur

• To avoid alcohol, other psychotropic medications unless directed by prescriber

• To rise slowly or fainting may occur, especially among geriatric patients

• That drowsiness may worsen at beginning of treatment

• **Oral disintegrating tablet:** to place on tongue and allow to dissolve; swallow; if only half tablet required, discard other half

• **Oral solution:** to mix with water, juice, or other soft foods; to use measuring device supplied

• **Pregnancy/breastfeeding:** If planned or suspected; not to use in pregnancy, to avoid breastfeeding

TREATMENT OF OVERDOSE:

Lavage, VS, supportive care, flumazenil

alprostadil (Rx)

(al-pros´ta-dil)

Caverject, Caverject Impulse, Edex, Muse, Prostin VR Pediatric

Func. class.: Hormone

USES: To maintain patent ductus arteriosus (temporary treatment), erectile dysfunction

CONTRAINDICATIONS: Hypersensitivity, respiratory distress syndrome, those at risk for priapism

Black Box Warning: Apnea

DOSAGE AND ROUTES

Patent ductus arteriosus (Prostin VR Pediatric)

• **Infant: IV INFUSION** 0.05-0.1 mcg/kg/min until desired response, then reduce to lowest effective amount, max 0.4 mcg/kg/min

Erectile dysfunction of vasculogenic or mixed etiology, psychogenic

• **Men: INTRACAVERNOSAL** 2.5 mcg, may increase by 2.5 mcg, may then increase by 5-10 mcg until adequate response occurs (max 60 mcg/dose); **INTRAURETHRAL** 125-250 mcg, max 2 doses/24 hr, max dose 1000 mcg; administer as needed to achieve erection

Available forms: injection 500 mcg/mL; intracavernosal injection 10 mcg/vial, 20 mcg/vial, 40 mcg/vial; urethral suppository 125, 250, 500, 1000 mcg

⚠ HIGH ALERT

alteplase (Rx)

(al-ti-plaze′)

Activase, Activase rt-PA 🍁, Cathflo Activase

Func. class.: Thrombolytic enzyme
Chem. class.: Tissue plasminogen activator (TPA)

Do not confuse:
alteplase/Altace
Activase/Cathflo Activase/TNKase

ACTION: Produces fibrin conversion of plasminogen to plasmin; able to bind to fibrin, convert plasminogen in thrombus to plasmin, which leads to local fibrinolysis, limited systemic proteolysis

USES: Lysis of obstructing thrombi associated with acute MI, ischemic conditions that require thrombolysis (i.e., PE, unclotting arteriovenous shunts, acute ischemic CVA), central venous catheter occlusion (Cathflo)
Unlabeled uses: Arterial thromboembolism, deep vein thrombosis (DVT), occlusion prophylaxis, percutaneous coronary intervention (PCI)

CONTRAINDICATIONS: Active internal bleeding, history of CVA, severe uncontrolled hypertension, intracranial/intraspinal surgery/trauma (within 3 mo), aneurysm, brain tumor, platelets <100,000 mm^3, bleeding diathesis including INR >1.7 or PR >15 sec, arteriovenous malformation, subarachnoid hemorrhage, intracranial hemorrhage, uncontrolled hypertension, seizure at onset of stroke
Precautions: Pregnancy, breastfeeding, children, geriatric patients, neurologic deficits, mitral stenosis, recent GI/GU bleeding, diabetic retinopathy, subacute bacterial endocarditis, arrhythmias, diabetic hemorrhage retinopathy, CVA, recent major surgery, hypertension, acute pericarditis, hemostatic defects, significant hepatic disease, septic thrombophlebitis, occluded AV cannula at seriously infected site

DOSAGE AND ROUTES

MI (standard infusion) (Activase)
- **Adult >65 kg:** 100 mg total given over 3 hr as follows: 60 mg given over first hour (6- to 10-mg bolus over 1-2 min), then 20 mg given over second hour, then 20 mg over third hour
- **Adult <65 kg:** 1.25 mg/kg over 3 hr: 0.75 mg/kg over first hour (0.075-0.125 mg/kg given as a bolus over first 1-2 min), then 0.25 mg/kg over second hour, then 0.25 mg/kg over third hour, max 100 mg

MI (accelerated infusion) (Activase)
- **Adult ≥67 kg:** 100 mg total dose: give 15-mg **IV BOL,** then 50 mg over 30 min, then 35 mg over 60 min
- **Adult <67 kg:** 15-mg **IV BOL,** then 0.75 mg/kg (max 50 mg) over 30 min, then 0.5 mg/kg (max 35 mg) over next 60 min

Pulmonary embolism (Activase)
- **Adult: IV** 100 mg over 2 hr, then heparin

Acute ischemic stroke (Activase)
- **Adult/child IV** 0.9 mg/kg, max 90 mg; give as **INFUSION** over 1 hr, give 10% of dose **IV BOL** over first minute

Occluded venous access devices (Cathflo Activase)
- **Adult/child ≥30 kg: IV** 2 mg/2 mL instilled in occluded catheter, may repeat if needed after 2 hr
- **Child 10-29 kg: IV** 110% of lumen volume, max 2 mg/2 mL instilled in occluded catheter, may repeat if needed after 2 hr

Deep venous thrombosis (DVT) (Activase) (unlabeled)
- **Adult: IV** 4 mcg/kg/min as 2-hr infusion, then 1 mcg/kg/min × 33 hr

Percutaneous coronary intervention (PCI) (unlabeled)
- **Adult: INTRACARDIAC** 20 mg over 5 min, then 50 mg over the next 60 min

Occlusion prophylaxis (unlabeled) (Cathflo Activase)
- **Adult/child>30 kg: IV** Do not exceed 2 mg in 2 mL; may use up to 2 doses 120 min apart
- **Adult/child ≤30 kg: IV** 110% lumen volume (max 2 mg/2 mL) in occluded catheter, may repeat after 2 hr

Available forms: Powder for injection 50 mg (29 million international units/vial), 100 mg (58 million international units/vial); Cathflo Activase: lyophilized powder for injection 2 mg

Administer: (Activase)

Intermittent IV INFUSION route

- After reconstituting with provided diluent, add amount of sterile water for injection (no preservatives) 20-mg vial/20 mL or 50-mg vial/50 mL to make 1 mg/mL, mix by slow inversion or dilute with NaCl, D_5W to a concentration of 0.5 mg/mL; 1.5 to <0.5 mg/mL may result in precipitation of product; use 18G needle; flush line with NaCl after administration, give over 3 hr for MI, 2 hr for PE
- Pressure for 30 sec to minor bleeding sites; 30 min to sites of arterial puncture followed by pressure dressing; inform prescriber if this does not attain hemostasis; apply pressure dressing
- Store powder at room temperature or refrigerate; protect from excessive light
- Heparin therapy after thrombolytic therapy is discontinued, TT, ACT, or APTT less than 2× control (about 3-4 hr); treatment can be initiated before coagulation study results obtained, infusion should be discontinued if pretreatment INR >1.7, PT >15 sec, or elevated APTT is identified
- Use reconstituted IV solution within 8 hr or discard
- Avoid invasive procedures, injections, rectal temperature

- **Cathflo Activase:** Use product after other options used for declotting a line; reconstitute by using 2.2 mL of sterile water provided and injecting in vial, direct flow into powder (1 mg/mL), foam will disappear after standing; swirl, do not shake, solution will be pale yellow or clear, use within 8 hr, instill 2 mL of reconstituted solution into occluded catheter, try to aspirate after ½ hr; if unable to remove, allow 2 hr, a second dose may be used; aspirate 5 mL of blood to remove clot and product, irrigate with normal saline

SIDE EFFECTS

INTEG: Urticaria, rash

SYST: GI, GU, intracranial, retroperitoneal bleeding, anaphylaxis, fever

PHARMACOKINETICS

Cleared by liver, 80% cleared within 10 min of product termination, onset immediate, half-life 35 min, peak 1 hr

INTERACTIONS

Increase: bleeding—anticoagulants, salicylates, dipyridamole, other NSAIDs, abciximab, eptifibatide, tirofiban, clopidogrel, ticlopidine, some cephalosporins, plicamycin, valproic acid; monitor for bleeding

Drug/Herb

Increase: risk for bleeding—feverfew, garlic, ginger, ginkgo, ginseng, green tea

Drug/Lab Test

Increase: PT, APTT, TT

NURSING CONSIDERATIONS

Assess:

- Treatment is not recommended in patients with acute ischemic stroke >4.5 hr after symptom onset, with minor neurologic deficit, or with rapidly improving symptoms
- VS, B/P, pulse, respirations, neurologic signs, temperature at least q4hr; temperature >104°F (40°C) indicates internal bleeding; monitor rhythm; ventricular dysrhythmias may occur with hyperperfusion; monitor heart, breath sounds, neurologic status, peripheral pulses; assess neurologic status, neurologic change may indicate intracranial bleeding
- **For bleeding:** during first hour of treatment and 24 hr after procedure: hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis; guaiac all body fluids, stools; do not use 150 mg or more total dose, intracranial bleeding may occur; do not use in severe uncontrolled hypertension, aneurysm, head trauma, for MI, pulmonary embolism; obtain noncontrast CT of brain or MRI to take out intracranial hemorrhage prior to systemic use
- **Hypersensitivity:** fever, rash, itching, chills, facial swelling, dyspnea, notify prescriber immediately; stop product, keep resuscitative equipment nearby; mild reaction may be treated with antihistamines

• Previous allergic reactions or streptococcal infection; alteplase may be less effective
• **Blood studies (Hct, platelets, PTT, PT, TT, APTT) before starting therapy; PT or APTT must be less than 2× control before starting therapy; TT or PT q3-4hr during treatment**
• **MI:** ECG continuously, cardiac enzymes, radionuclide myocardial scanning/coronary angiography; chest pain intensity, character; monitor those with major early infarct signs on CT scan with substantial edema, mass effect, midline shift
• **PE:** pulse, B/P, ABGs, rate/rhythm of respirations
• **Occlusion:** have patient exhale then hold breath when connecting/disconnecting syringe to prevent air embolism
• **Pregnancy/breastfeeding:** usually considered contraindicated in pregnancy except in serious conditions; use cautiously in breastfeeding

Evaluate:
• Therapeutic response: lysis of thrombi, adequate hemodynamic state, absence of HF, cannula/catheter lack of occlusion

Teach patient/family:
• The purpose and expected results of the treatment; to report adverse reactions, bleeding

aluminum hydroxide (OTC)

AlternaGel, Alu-Cap, Almagel Plus 🍁, Alu-Tab, Amphojel, Basaljel, Diavol Plus 🍁, Gelusil 🍁, Mucaine 🍁

Func. class.: Antacid, hypophosphatemic

Chem. class.: Aluminum product, phosphate binder

ACTION: Neutralizes gastric acidity; binds phosphates in GI tract; these phosphates are then excreted

USES: Antacid, hyperphosphatemia in chronic renal failure; adjunct in gastric, peptic, duodenal ulcers; hyperacidity, reflux esophagitis, heartburn, stress ulcer prevention in critically ill, GERD
Unlabeled uses: GI bleeding

CONTRAINDICATIONS: Hypersensitivity to product or aluminum products
Precautions: Pregnancy, breastfeeding, geriatric patients, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, sodium-restricted diets, GI bleeding, hypokalemia

DOSAGE AND ROUTES

Antacid
• **Adult: PO** 500-1500 mg 3-6× daily, max 6 doses/day

Hyperphosphatemia
• **Adult: PO** Suspension 30-40 mL (regular) or 15-20 mL (concentrated) tid-qid
• **Child: PO** 50-150 mg/kg/day in 4-6 divided doses

Available forms: Suspension 320 mg/5 mL, 450 mg/5 mL, 600 mg/5 mL, 675 mg/5 mL; capsules 475, 500 mg; tablets 300, 500, 600 mg
Administer: 2 tsp (10 mL) will neutralize 20 mEq of acid

PO route
• Give 2 hr before or 6 hr after fluoroquinolones
• **Hyperphosphatemia:** Give with 8 oz water, meals unless contraindicated
• Laxatives or stool softeners if constipation occurs, especially for geriatric patients
• After shaking suspension

NG route
• By nasogastric tube if patient unable to swallow

SIDE EFFECTS

GI: *Constipation,* anorexia, fecal impaction
META: *Hypophosphatemia*

PHARMACOKINETICS

PO: Onset 20-40 min, duration 1-3 hr, excreted in feces, onset 20-40 min, peak 30 min, duration 1-3 hr

INTERACTIONS

Decrease: effectiveness of—allopurinol, amprenavir, cephalosporins, corticosteroids, delavirdine, digoxin, fluoroquinolones, gabapentin, gatifloxacin, H_2 antagonists, iron salts, isoniazid, ketoconazole, penicillAMINE, phenothiazines, phenytoin, quiNIDine, quinolones, tetracyclines, thyroid hormones, ticlopidine, anticholinergics; separate by at least 4-6 hr

Drug/Food

Decrease: product effect—high-protein meal

NURSING CONSIDERATIONS

Assess:

- **GI pain:** location, intensity, duration, character, aggravating, alleviating factors; monitor for blood in stools, emesis, sputum in ulcer disease
- Phosphate, calcium levels because product is bound in GI system
- **Hypophosphatemia:** anorexia, weakness, fatigue, bone pain, hyporeflexia
- Constipation; increase bulk in diet if needed, may use stool softeners or laxatives; record amount and consistency of stools
- **Pregnancy/breastfeeding:** may use occasionally at recommended dose in pregnancy, breastfeeding

Evaluate:

- Therapeutic response: absence of GI pain, decreased acidity, healed ulcers, decreased phosphate levels

Teach patient/family:

- Not to use for prolonged periods for patients with low serum phosphate or patients on low-sodium diets; to shake liquid well
- That stools may appear white or speckled
- To check with prescriber after 2 wk of self-prescribed antacid use
- To separate from other medications by 2 hr
- **Hyperphosphatemia:** to avoid phosphate foods (most dairy products, eggs, fruits, carbonated beverages) during product therapy
- To notify prescriber of black tarry stools, which may indicate bleeding

alvimopan (Rx)

(al-vim′oh-pan)

Entereg

Func. class.: Functional GI disorder agent

USES: Prevention of postoperative ileus

CONTRAINDICATIONS: Those who have taken therapeutic doses of opioids for more than 7 consecutive days immediately before starting alvimopan, end-stage renal disease, Child-Pugh C

DOSAGE AND ROUTES

- **Adult/geriatric patient: PO** 12 mg 30 min-5 hr before surgery, then 12 mg bid beginning the day after surgery; max 7 days or hospital discharge; max 15 doses

Opiate agonist–induced constipation (unlabeled)

- **Adult: PO** 0.5 mg or 1 mg every day

Renal/hepatic dosage

- **Adult: PO** do not use in end-stage renal disease or Child-Pugh Class C

Available forms: Capsules 12 mg

amantadine (Rx)

(a-man′ta-deen)

Gocovri, Osmolex ER

Func. class.: Antiviral, antiparkinsonian agent

Chem. class.: Tricyclic amine

Do not confuse:

amantadine/raNITIdine/rimantidine/amiodarone

ACTION: Prevents uncoating of nucleic acid in viral cell, thereby preventing penetration of virus to host; causes release of DOPamine from neurons

USES: Prophylaxis or treatment of influenza type A, EPS, parkinsonism, Parkinson's disease

CONTRAINDICATIONS:
Hypersensitivity, breastfeeding, children <1 yr, eczematic rash

Precautions: Pregnancy, geriatric patients, epilepsy, HF, orthostatic hypotension, psychiatric disorders, renal/hepatic disease, peripheral edema, CV disease

DOSAGE AND ROUTES
Parkinson's disease

- **Adult: PO** 100 mg bid (monotherapy); after 7 days may increase to 400 mg in divided doses; Osmolex SR: initial dosage 129 mg daily in the AM; may increase weekly, max 322 mg daily in the AM

Influenza type A

- **Adult and child ≥13 yr: PO** 200 mg/day in single dose or divided bid
- **Geriatric: PO** No more than 100 mg/day
- **Child 1-8 yr: PO** 4.4-8.8 mg/kg/day divided bid-tid, max 150 mg/day

Drug-induced EPS

- **Adult: PO** 100 mg bid, up to 300 mg/day in divided doses; **EXTENDED RELEASE** Osmolex ER: 129 mg once daily in the morning, initially. May increase at weekly intervals as needed. Max: 322 mg/day

Amantadine: Drug-induced EPS extended release dosing should remove Gocovri and add Osmolex ER: 129 mg PO once daily in the morning, initially. May increase at weekly intervals as needed. Max: 322 mg/day. Gocovri is indicated/dosed for Parkinson's disease with drug induced dyskinesia in patients receiving levodopa, or adjunct therapy for "off" episodes for patients on carbidopa/levodopa

Renal dose

- **Adult: PO** CCr 30-50 mL/min 200 mg first day then 100 mg/day; CCr 15-29 mL/min 100 mg first day, then 100 mg on alternate days; CCr 15 mL/min reduce dose and interval to 200 mg q7days

Available forms: Capsules 100 mg; oral solution 50 mg/5 mL; tablets 100 mg; extended release (Osmolex ER) 129, 193, 258 mg; extended release (Gocovri) 68.5, 137 mg

Administer:

- **Prophylaxis:** before exposure to influenza; continue for 10 days after contact; **treatment:** initiate within 24-48 hr of onset of symptoms, continue for 24-48 hr after symptoms disappear
- After meals for better absorption to decrease GI symptoms; at least 4 hr before bedtime to prevent insomnia
- In divided doses to prevent CNS disturbances: headache, dizziness, fatigue, drowsiness
- Store in tight, dry container

SIDE EFFECTS
CNS: *Headache, dizziness,* drowsiness, fatigue, *anxiety,* psychosis, *depression, hallucinations,* tremors, seizures, confusion, *insomnia*

CV: *Orthostatic hypotension,* HF

EENT: Blurred vision

GI: *Nausea, vomiting,* constipation, dry mouth, anorexia

GU: *Frequency, retention*

HEMA: Leukopenia, agranulocytosis

INTEG: Photosensitivity, dermatitis, livedo reticularis

PHARMACOKINETICS
PO: Onset 48 hr, peak 1-4 hr, half-life 24 hr, not metabolized, excreted in urine (90%) unchanged, crosses placenta, excreted in breast milk

INTERACTIONS
Increase: anticholinergic response—atropine, other anticholinergics; reduce dose of anticholinergics

Increase: CNS stimulation—CNS stimulants

Decrease: amantadine effect—metoclopramide, phenothiazines

Decrease: renal excretion of amantadine—triamterene, hydroCHLOROthiazide

Decrease: effect—S/B H1N1 influenza A virus vaccine; avoid use 2 wk before or 48 hr after amantadine

Drug/Lab Test

Increase: BUN, creatinine, alkaline phosphatase, CK, LDH, bilirubin, AST, ALT, GGT

NURSING CONSIDERATIONS
Assess:

- Mental status: may cause increased psychiatric disorders especially in the elderly
- **HF:** weight gain, jugular venous distention, dyspnea, crackles

• Skin eruptions, photosensitivity after administration of product
• Serum creatinine, BUN in renal impairment
• Reaction to each medication
• Signs of infection
• **Livedo reticularis:** mottling of the skin, usually red; edema; itching in lower extremities, usually in Parkinson's disease
• **Parkinson's disease:** gait, tremors, akinesia, rigidity, may be effective if anticholinergics have not been effective
• **Toxicity:** confusion, behavioral changes, hypotension, seizures

Evaluate:
• Therapeutic response: absence of fever, malaise, cough, dyspnea with infection; tremors, shuffling gait with Parkinson's disease

Teach patient/family:
• To change body position slowly to prevent orthostatic hypotension
• About aspects of product therapy: to report dyspnea, weight gain, dizziness, poor concentration, dysuria, complex sleep behaviors
• To avoid hazardous activities if dizziness, blurred vision occurs
• **Parkinson's disease:** to take product exactly as prescribed; parkinsonian crisis may occur if product is discontinued abruptly; not to double dose; if a dose is missed, not to take within 4 hr of next dose; capsules may be opened and mixed with food
• To avoid alcohol
• **Pregnancy/breastfeeding:** Avoid use in pregnancy; identify if pregnancy is suspected; avoid breastfeeding

TREATMENT OF OVERDOSE:

Maintain airway, administer EPINEPHrine, aminophylline, O_2, IV corticosteroids, physostigmine

ambrisentan (Rx)

(am-bri-sen'tan)

Letairis, Volibris

Func. class.: Antihypertensive

ACTION:

Endothelin-A receptor antagonist; endothelin-A is a vasoconstrictor

USES:

Pulmonary arterial hypertension, alone or in combination with other antihypertensives in WHO class II (significant exertion), III (mild exertion)

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, idiopathic pulmonary fibrosis (IPF)

Black Box Warning: Pregnancy

Precautions: Children, females, geriatric patients, hepatitis, anemia, heart failure, jaundice, peripheral edema, hepatic disease, pulmonary disease

DOSAGE AND ROUTES

• **Adult: PO** 5 mg/day; may increase q4wk to max 10 mg/day if needed

Hepatic dose
• **Adult: PO** Discontinue if AST/ALT >5× ULN, or if elevations are accompanied by bilirubin >2× ULN, or other signs of liver dysfunction

Available forms: Tablets 5, 10 mg

Administer:
• Do not break, crush, chew tablets
• Daily with a full glass of water without regard to food
• Do not discontinue abruptly

Black Box Warning: Only those facilities enrolled in the LEAP program (866-664-5327) may administer this product

• Store in tight container at room temperature

SIDE EFFECTS

CNS: *Headache,* fever, flushing, fatigue
CV: Orthostatic hypotension, hypotension, *peripheral edema,* palpitations
EENT: Sinusitis, rhinitis
GI: Abdominal pain, constipation, anorexia, hepatotoxicity
GU: Decreased sperm counts
HEMA: *Anemia*
INTEG: Rash, angioedema
RESP: Pharyngitis, dyspnea, pulmonary edema, veno-occlusive disease (VOD)

PHARMACOKINETICS

Rapidly absorbed, peak 2 hr, protein binding 99%, metabolized by CYP3A4, CYP2C19, UGTa, terminal half-life 15 hr, effective half-life 9 hr

INTERACTIONS

• Possibly increase ambrisentan: cimetidine, clopidogrel, efavirenz, felbamate, FLUoxetine, modafinil, OXcarbazepine, ticlopidine

Increase: hypotension—other antihypertensives, diuretics, MAOIs

Increase: ambrisentan—CYP3A4 inhibitors (amprenavir, aprepitant, atazanavir, clarithromycin, conivaptan, cycloSPORINE, dalfopristin, danazol, darunavir, erythromycin, estradiol, imatinib, itraconazole, ketoconazole, nefazodone, nelfinavir, quinupristin, ritonavir, RU-486, saquinavir, tamoxifen, telithromycin, troleandomycin, zafirlukast); CYP2C19/CYP3A4 (chloramphenicol, delavirdine, fluconazole, fluvoxaMINE, isoniazid, voriconazole)

Decrease: ambrisentan—CYP3A4 inducers (carBAMazepine, PHENobarbital, phenytoin, rifAMPin)

Decrease: ambrisentan absorption—mefloquine, niCARdipine, propafenone, quiNIDine, ranolazine, tacrolimus, testosterone

Drug/Herb

• Need for ambrisentan dosage change: St. John's wort, ephedra (ma huang)

Drug/Food

• Avoid use with grapefruit products

Drug/Lab Test

Increase: LFTs, bilirubin

Decrease: Hct, HB

NURSING CONSIDERATIONS

Assess:

• **Pulmonary status:** improvement in breathing, ability to exercise; pulmonary edema that may indicate veno-occlusive disease

• Blood studies: CBC with differential; Hct, HB may be decreased

• Liver function tests: AST, ALT, bilirubin

Black Box Warning: Assess pregnancy status before giving this product and monthly and 1 mo after concluding therapy; pregnancy

• **Hepatotoxicity:** nausea, vomiting, abdominal pain/cramping, jaundice, anorexia, itching

• **Beers:** use in older adults cautiously; may exacerbate syncope

Evaluate:

• Therapeutic response: decrease in B/P; decreased shortness of breath

Teach patient/family:

• The importance of complying with dosage schedule even if feeling better

• The importance of follow-up with labs

• That sperm count may be decreased

Black Box Warning: To notify if pregnancy is planned or suspected (if pregnant, product will need to be discontinued, pregnancy test done monthly); to use 2 contraception methods while taking this product and for 1 mo after concluding therapy

• Not to use OTC products, including herbs, supplements, unless approved by prescriber

• To take tablet whole; not to crush, chew

• **To report to prescriber immediately:** dizziness, faintness, chest pain, palpitations, uneven or rapid heart rate, headache, edema, weight gain

• **To report hepatic dysfunction:** nausea/vomiting, anorexia, fatigue, jaundice, right upper quadrant abdominal pain, itching, fever, malaise

amikacin (Rx)
(am-i-kay'sin)
Amiglyde-V
amikacin liposome (Rx)
Arikayce
Func. class.: Antiinfective
Chem. class.: Aminoglycoside

Do not confuse:
amikacin/Kineret

ACTION: Interferes with protein synthesis in bacterial cells by binding to ribosomal subunits, which causes misreading of genetic code; inaccurate peptide sequence forms in protein chain, thereby causing bacterial death

USES: Severe systemic infections of CNS, respiratory tract, GI tract, urinary tract, bone, skin, soft tissues caused by *Staphylococcus aureus* (MSSA), *Pseudomonas aeruginosa, Escherichia coli, Enterobacter, Acinetobacter, Providencia, Citrobacter, Serratia, Proteus, Klebsiella pneumoniae*

Unlabeled uses: *Mycobacterium avium* complex (MAC) (intrathecal or intraventricular) in combination; actinomycotic mycetoma, febrile neutropenia, cystic fibrosis

CONTRAINDICATIONS: Pregnancy, hypersensitivity to aminoglycosides, sulfites

Precautions: Breastfeeding, neonates, geriatric patients, myasthenia gravis, Parkinson's disease, mild to moderate infections, dehydration

Black Box Warning: Hearing impairment, renal/neuromuscular disease

DOSAGE AND ROUTES

• **Adult/child: IV INFUSION** 15 mg/kg/day in 2-3 divided doses q8-12hr in 100-200 mL D_5W over 30-60 min, max 1.5 g/day; **pulse dosing** (once-daily dosing) may be used with some infections; **IM** 10-15 mg/kg/day in divided doses q8-12hr; or extended-interval dosing as an alternative dosing regimen

• **Neonate: IV/IM** 10 mg/kg initially, then 7.5 mg/kg q8-12hr

Renal dose (extended-interval dosing)

• **Adult: IV** CCr 40-59 mL/min 15 mg/kg q36hr; CCr 20-39 mL/min 15 mg/kg q48hr; <20 mL/min adjust based on serum concentrations and MIC (use traditional dosing)

***Mycobacterium avium* complex (MAC)**

• **Adult and adolescent: IM/IV** 15-20 mg/kg/day or 5× per week; **NEB (Arikayce)** 590 mg daily in combination

• **Child: IV** 15-30 mg/kg/day divided q12-24hr as part of multiple-drug regimen, max 1.5 g/day

Actinomycotic mycetoma (unlabeled)

• **Adult: IM/IV** 15 mg/kg/day in 2 divided doses × 3 wk with co-trimoxazole for 5 wk; repeat cycle once, may be repeated 2×

Available forms: Injection 50, 250 mg/mL; suspension for oral inhalation 590 mg/8.4 mL

Administer:

• Obtain C&S before administration; begin treatment before results are received

IM route

• Inject in large muscle mass; rotate injection sites

• Obtain peak 1 hr after IM, trough before next dose

Inhalation route (nebulizer)

• Use Lamira Nebulizer System

• May pretreat with short-acting β_2-antagonists

• Allow to warm to room temperature

• Shake well, pour medication into reservoir

• Press and hold on/off button

• Insert mouthpiece, take slow deep breaths, a beep will be heard when done

• Clean after use

Intermittent IV INFUSION route

• Dilute 500 mg of product/100-200 mL of D_5W, 0.9% NaCl and give over ½-1 hr; dilute in sufficient volume to allow for infusion over 1-2 hr (infants); flush after administration with D_5W or 0.9% NaCl; solution clear or pale yellow; discard if precipitate or dark color develops

• In children, amount of fluid will depend on ordered dose; in infants, infuse over 1-2 hr

• In evenly spaced doses to maintain blood level, separate from penicillins by at least 1 hr

Y-site compatibilities: Acyclovir, alatrofloxacin, aldesleukin, alemtuzumab, alfentanil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol,

calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IL-2, imipenem/cilastin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, PEMEtrexed, penicillin G, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, vertigo
EENT: *Ototoxicity,* deafness
GU: Nephrotoxicity
HEMA: Eosinophilia, anemia
INTEG: *Rash,* burning, urticaria, dermatitis, alopecia
RESP: Apnea
SYST: Hypersensitivity

PHARMACOKINETICS

IM: Onset rapid, peak 1 hr, leads to unpredictable concentrations, IV preferred
IV: Onset immediate, peak 15-30 min, half-life 2 hr, prolonged up to 7 hr in infants; not metabolized; excreted unchanged in urine; crosses placenta; removed by hemodialysis

INTERACTIONS

Increase: masking ototoxicity: dimenhyDRINATE, ethacrynic acid
Increase: neurotoxicity—NSAIDs

Black Box Warning: Increase: nephrotoxicity—cephalosporins, acyclovir, vancomycin, amphotericin B, cycloSPORINE, loop diuretics, cidofovir

Black Box Warning: Increase: ototoxicity—IV loop diuretics

Black Box Warning: Increase: neuromuscular blockade, respiratory depression—anesthetics, nondepolarizing neuromuscular blockers

Decrease: amikacin effect in renal disease—parenteral penicillins, cephalosporins do not combine

Drug/Lab Test
Increase: BUN, creatinine, AST/ALT, alkaline phosphatase, bilirubin, LDH

NURSING CONSIDERATIONS

Assess:

- Weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight; in those underweight and not obese, use total body weight (TBW) instead of ideal body weight
- IV site for thrombophlebitis including pain, redness, swelling q30min; change site if needed; apply warm compresses to discontinued site

Black Box Warning: Nephrotoxicity: renal impairment; obtain urine for CCr, BUN, serum creatinine; in renal impairment; nephrotoxicity may be reversible if product is stopped at first sign; I&O ratio; urinalysis daily for proteinuria, cells, casts; report sudden change in urine output

Black Box Warning: Ototoxicity: deafness: audiometric testing, ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

- **Dehydration:** high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine, keep well hydrated 2000 mL/day
- **Overgrowth of infection:** increased temperature, malaise, redness, pain, swelling, perineal itching, diarrhea, stomatitis, change in cough, sputum
- **Vestibular dysfunction:** nausea, vomiting, dizziness, headache; product should be discontinued if severe

Black Box Warning: Neuromuscular blockade; respiratory paralysis may occur; more common in those receiving anesthetics, neuromuscular blockers; use of calcium salts may be used to reverse effect

Evaluate:

- Therapeutic response: absence of fever, draining wounds; negative C&S after treatment

Teach patient/family:

- To report headache, dizziness, symptoms of overgrowth of infection, renal impairment, symptoms of nephrotoxicity, hepatotoxicity
- **Ototoxicity:** To report loss of hearing; ringing, roaring in ears; feeling of fullness in head
- **To report hypersensitivity:** rash, itching, trouble breathing, facial edema; notify health care provider
- **Pregnancy/breastfeeding:** tell prescriber if pregnancy is planned or suspected or if breastfeeding; do not use in pregnancy, breastfeeding

TREATMENT OF HYPERSENSITIVITY: Hemodialysis, exchange transfusion in the newborn, monitor serum levels of product, may give ticarcillin or carbenicillin

aMILoride (Rx)

(a-mill'oh-ride)

Midamor

Func. class.: Potassium-sparing diuretic

Chem. class.: Pyrazine

Do not confuse:

aMILoride/amLODIPine/amiodarone

ACTION: Inhibits sodium, potassium ion exchange in the distal tubule, cortical collecting duct, resulting in inhibition of sodium reabsorption and decreasing potassium secretion

USES: Edema in HF in combination with other diuretics, for hypertension, adjunct with other diuretics to maintain potassium

CONTRAINDICATIONS: Anuria, hypersensitivity, diabetic nephropathy, renal failure

Black Box Warning: Hyperkalemia

Precautions: Pregnancy, breastfeeding, children, geriatric patients, dehydration,

diabetes, respiratory acidosis, hyponatremia, impaired renal function

DOSAGE AND ROUTES

- **Adult: PO** 5-10 mg/day in 1-2 divided doses; may be increased to 10-20 mg/day if needed
- **Infant/child (6-20 kg): PO** 0.4-0.625 mg/kg daily, max 20 mg/day, dose daily max 20 mg/day

Renal dose

- **Adult: PO** CCr 10-50 mL/min reduce dose by 50%; CCr <10 mL/min contraindicated

Available forms: Tablets 5 mg

Administer:

- In AM to avoid interference with sleep if using as diuretic; if second daily dose is needed, give in late afternoon
- With food; if nausea occurs, absorption may be decreased slightly

SIDE EFFECTS

CNS: *Headache,* dizziness, weakness, paresthesias, tremors, depression, anxiety, encephalopathy

CV: *Orthostatic hypotension,* dysrhythmias, chest pain

ELECT: Hyperkalemia, dehydration, hyponatremia

GI: *Nausea, diarrhea,* dry mouth, *vomiting, anorexia,* cramps, constipation, abdominal pain, jaundice

INTEG: *Rash, pruritus,* Stevens-Johnson syndrome, toxic epidermal necrolysis

MS: Cramps

PHARMACOKINETICS

Absorption variable 20%-90%; widely distributed; onset 2 hr; peak 6-10 hr; duration 24 hr; excreted in urine, feces; half-life 6-9 hr, crosses placenta

INTERACTIONS

Black Box Warning: Hyperkalemia: avoid concurrent use with other potassium-sparing diuretics, potassium products, ACE inhibitors, salt substitutes, cycloSPORINE, tacrolimus; if using together, monitor potassium level

Increase: lithium toxicity: lithium; monitor lithium levels

Increase: action of antihypertensives

Decrease: effect of aMILoride—NSAIDs; avoid concurrent use

Drug/Herb

Increase: effect—hawthorn, horse chestnut

Drug/Food

- Possible hyperkalemia: foods high in potassium, potassium-based salt substitutes

Drug/Lab Test

Increase: LFTs, BUN, potassium, sodium, bilirubin, calcium, cholesterol

Decrease: Potassium, magnesium, sodium

Interference: GTT

NURSING CONSIDERATIONS

Assess:

- Heart rate; B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, sodium, chloride; glucose (serum), BUN, CBC, serum creatinine, blood pH, ABGs, periodic ECG

Black Box Warning: Hyperkalemia: fatigue, weakness, paresthesia, confusion, dyspnea, dysrhythmias, ECG changes; including hyperacute T waves; monitor potassium level at baseline and dosage changes, hyperkalemia is more common in renal disease, geriatric patients, diabetes; if potassium ≥5.5 mEq/L, immediately notify prescriber; discontinue aMILoride 3 days before GTT

- **Fluid volume status:** distended neck veins; crackles in lungs; color, quality, and specific gravity of urine; skin turgor; adequacy of pulse; moist mucous membranes; bilateral lung sounds; peripheral pitting edema; dehydration; symptoms of decreasing output; thirst; hypotension; dry mouth should be reported

• **Hypokalemia:** weakness, polyuria, polydipsia, fatigue, ECG U wave
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected or if breastfeeding; use only if clearly needed
• **Beers:** avoid in older adults; may decrease sodium, increase potassium, decrease Ccr; use with caution; may exacerbate or cause inappropriate antidiuretic hormone secretion/hyponatremia; monitor sodium level carefully

Evaluate:
• Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used for HF; decreased B/P; prevention of hypokalemia (diuretics)

Teach patient/family:
• To take as prescribed; if dose is missed, to take when remembered within 1 hr of next dose; to take with food or milk for GI symptoms; to take early in day to prevent nocturia; to avoid alcohol; not to use other products unless approved by prescriber
• To maintain a weekly record of weight, notify health care professional of weight loss >5 lb
• About adverse reactions: to report muscle cramps, weakness, nausea, dizziness, blurred vision
• **Hyperkalemia:** to avoid potassium-rich foods: oranges, bananas, salt substitutes, dried fruits, potassium supplements; refer to dietician for assistance, planning
• To rise slowly from sitting to standing to avoid orthostatic hypotension
• To avoid hazardous activities if dizziness occurs
• To continue other medical treatments (exercise, weight loss, relaxation techniques, cessation of smoking)
• To continue taking medication even if feeling better, this product controls symptoms but does not cure condition, to use as directed, not to double or skip doses
• Not to exercise in hot weather or stand for prolonged periods since orthostatic hypotension is enhanced
• How to take own B/P, pulse, and record

TREATMENT OF OVERDOSE: Lavage if taken orally, monitor electrolytes, administer sodium bicarbonate for potassium >6.5 mEq/L, IV glucose, Kayexalate as needed; monitor hydration, CV, renal status

amino acids (Rx)

(a-mee´noe)

amino acid infusions (crystalline) (Rx)
Aminosyn, Aminosyn II, Aminosyn-PF, Clinisol, FreAmine III, Premasol, Travasol, TrophAmine

amino acid infusions/dextrose (Rx)
Aminosyn II with dextrose, Clinimix, Amino Acid Infusions/electrolytes

aminosyn with electrolytes (Rx)
Aminosyn II with electrolytes, FreAmine III with electrolytes, ProcalAmine with electrolytes, Travasol with electrolytes

amino acid infusions/electrolytes/dextrose (Rx)
Aminosyn II with electrolytes in dextrose

amino acid infusions (hepatic failure) (Rx)
HepatAmine, Hepatasol

amino acid infusions (high metabolic stress) (Rx)
Aminosyn-HBC, FreAmine HBC

amino acid infusions (renal failure) (Rx)
Aminosyn-RF, NephrAmine

Func. class.: Nutritional supplement/protein

ACTION: Needed for anabolism to maintain structure, decrease catabolism, promote healing

Black Box Warning: Central infusions: administration by central venous catheter should be used only by those familiar with technique and complications

USES: Hepatic encephalopathy, cirrhosis, hepatitis, nutritional support in cancer; burn or solid organ transplant patients; to prevent nitrogen loss when adequate nutrition by mouth, gastric, or duodenal tube cannot be obtained

CONTRAINDICATIONS: Hypersensitivity, severe electrolyte imbalances, anuria, severe liver damage, maple syrup urine disease, PKU, azotemia, genetic disease of amino acid metabolism

Precautions: Pregnancy, breastfeeding, children, renal disease, diabetes mellitus, HF, sulfite sensitivity

DOSAGE AND ROUTES

Nutritional support (cirrhosis, hepatic encephalopathy, hepatitis)

- **Adult: IV** 80-120 g/day amino acids/12-18 g nitrogen of hepatic failure formula

TPN

- **Adult: IV** 1-1.5 g/kg/day

Metabolic stress (severe)

- **Adult: IV** 1.5 g/kg; use formula for high metabolic stress

Renal failure (nutritional support)

- **Adult: IV** Aminosyn-RF 300-600 mL/70% dextrose/day; NephrAmine 250-500 mL/70% dextrose/day; the total daily dosage is calculated based on the daily protein requirements, as well as the patient's metabolic and clinical response. Check product instructions for specific directions
- **Child: IV** 2-3 g/kg/day

Available forms:

Injection: 250, 500, 1000, 2000 mL, containing amino acids in various concentrations; amino acid infusions, crystalline: Aminosyn: 3.5%, 5%, 7%, 8.5%, 10%; Aminosyn II: 3.5%, 5%, 7%, 8.5%, 10%, 15%; Aminosyn-PF: 7%, 10%; Clinisol: 15%; FreAmine III: 8.5%, 10%; Premasol: 6%, 10%; Travasol: 10%; TrophAmine: 6%, 10%

Amino acid infusion/dextrose: Aminosyn II: 3.5% in 5% dextrose, 4.25% in 20% dextrose, 4.25% in 10% dextrose, 4.25% in 25% dextrose; Clinimix: 2.75% in 5% dextrose, 4.25% in 5% dextrose, 4.25% in 10% dextrose, 4.25% in 20% dextrose, 4.25% in 25% dextrose, 5% in 10% dextrose, 5% in 15% dextrose, 5% in 20% dextrose, 5% in 25% dextrose

Amino acid infusions/electrolytes: Aminosyn: 3.5%, 7%, 8.5%; Aminosyn II: 3.5%, 7%, 8.5%; FreAmine III: 3%, 8.5%; ProcalAmine: 3%; Travasol: 3.5%, 5.5%, 8.5%

Amino acid infusions/electrolytes/dextrose: Aminosyn II: 3.5% with electrolytes in 5% dextrose, 3.5% with electrolytes in 25% dextrose, 4.25% with electrolytes in 10% dextrose, 4.25% with electrolytes in 20% dextrose, 4.25% with electrolytes in 25% dextrose; amino acid infusions (hepatic failure): HepatAmine: 8%; Hepatasol: 8%

Amino acid infusions (high metabolic stress): Aminosyn-HBC 7%; Freamine HBC: 6.9%; amino acid infusions (renal failure): Aminosyn-RF: 5.2%; NephrAmine: 5.4%

Administer:

Continuous IV INFUSION route

- Up to 40% protein and dextrose (up to 12.5%) via peripheral vein; stronger solution requires central IV administration
- TPN only mixed with dextrose to promote protein synthesis
- Immediately after mixing under strict aseptic technique, use infusion pump, in-line filter (0.22 µm) unless mixed with fat emulsion and dextrose (3 in 1); use careful monitoring technique; do not speed up infusion; pulmonary edema, glucose overload will result

SIDE EFFECTS

CNS: Dizziness, headache, confusion, loss of concentration, fever

CV: Hypertension, HF/pulmonary edema, flushing, thrombosis
ENDO: Hyperglycemia, rebound hypoglycemia, electrolyte imbalances, hyperosmolar hyperglycemic nonketotic syndrome, alkalosis, hypophosphatemia, hyperammonemia, dehydration, hypocalcemia
GI: Nausea, abdominal pain, cholestasis
GU: Glycosuria osmotic diuresis
INTEG: Extravasation necrosis, phlebitis at injection site

INTERACTIONS

Individual Drugs
Decrease: Protein-sparing effects—tetracycline
Drug/Lab Test
Increase: LFTs, ammonia, glucose
Decrease: Potassium, phosphate, glucose

NURSING CONSIDERATIONS

Assess:
- Electrolytes (potassium, sodium, phosphate, chloride, magnesium, bicarbonate, blood glucose, ammonia, ketones)
- Renal/hepatic studies: BUN, creatinine, ALT, AST, bilirubin
- Weight changes, triglycerides before and after infusion; vitamin A level with renal disease
- **Injection site for extravasation:** redness along vein, edema at site, necrosis, pain, hard tender area; site should be changed immediately; discontinue infusion, culture tubing and solution
- **Sepsis:** chills, fever, increased temperature, if sepsis is suspected
- **For impending hepatic coma:** asterixis, confusion, uremic fetor, lethargy
- **Hyperammonemia:** nausea, vomiting, malaise, tremors, anorexia, seizures
- Change of dressing and IV tubing every 24-48 hr to prevent infection if chills, fever, other signs of infection occur

Evaluate:
- Therapeutic response: weight gain, decrease in jaundice with liver disorders, increased LOC

Teach patient/family:
- Reason for use of TPN
- To report chills, sweating at once; risk for infection is higher
- About infusion pump, how to care for tubing/site; and blood glucose

⚠ HIGH ALERT

amiodarone (Rx)

(a-mee-oh′da-rone)
Corderone, Nexterone, Pacerone
Func. class.: Antidysrhythmic (class III)
Chem. class.: Iodinated benzofuran derivative

Do not confuse:
amiodarone/amantadine

ACTION: Prolongs duration of action potential and effective refractory period, noncompetitive α- and β-adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

USES: Hemodynamically unstable ventricular tachycardia, supraventricular tachycardia, ventricular fibrillation not controlled by first-line agents
Unlabeled uses: Atrial fibrillation treatment/prophylaxis, atrial flutter, cardiac arrest, cardiac surgery, CPR, heart failure, PSVT, Wolff-Parkinson-White (WPW) syndrome, supraventricular tachycardia

CONTRAINDICATIONS: Pregnancy, breastfeeding, neonates, infants, severe sinus node dysfunction, hypersensitivity to this product/iodine/benzyl alcohol, cardiogenic shock, second- to third-degree AV block, bradycardia
Precautions: Children, goiter, Hashimoto's thyroiditis, electrolyte imbalances, HF, respiratory disease, torsades de pointes

Black Box Warning: Hepatotoxicity, cardiac arrhythmias, pneumonitis, pulmonary fibrosis; requires an experienced clinician

DOSAGE AND ROUTES

Ventricular dysrhythmias
Adult: PO Loading dose 800-1600 mg/day for 1-3 wk, then 600-800 mg/day for

1 mo, maintenance 400 mg/day; **IV** loading dose **(first rapid)** 150 mg over the first 10 min, then slow 360 mg over the next 6 hr, **maintenance** 540 mg given over the remaining 18 hr, decrease rate of the slow infusion to 0.5 mg/min

Supraventricular tachycardia

- **Adult:** PO 600-800 mg/day × 1 wk until desired response, then decrease to 400 mg/day × 3 wk, then 200-400 mg/day (maintenance)
- **Child:** PO 10 mg/kg/day × 10 days or until desired response, then decrease to 5 mg/kg/day for several weeks, then decrease to 2.5 mg/kg/day or lower (maintenance)

Conversion of atrial fibrillation to sinus rhythm (unlabeled)

- **Adult: IV** 5-7 mg/kg over 30-60 min, then 1.2-1.8 mg/kg **CONTINUOUS IV INFUSION** or **PO** divided doses

Available forms: Tablets 100, 200, 400 mg; injection 50 mg/mL

Administer:

PO route

- May be used with/without food but be consistent

IV, direct route

- **Peripheral:** max 2 mg/mL for more than 1 hr; preferred through central venous line with in-line filter; concentrations of more than 2 mg/mL should be given by central line
- **Cardiac arrest:** give 300 mg IV bolus; diluted to a total volume of 20 mL D_5W; may repeat 150 mg after 3-5 min

Intermittent IV INFUSION route

- **Rapid loading:** add 3 mL (150 mg), 100 mL D_5W (1.5 mg/mL), give over 10 min
- **Slow loading:** add 18 mL (900 mg), 500 mL D_5W (1.8 mg/mL), give over next 6 hr

Continuous IV INFUSION route

- After 24 hr, dilute 50 mL to 1-6 mg/mL, give 1-6 mg/mL at 1 mg/min for the first 6 hr, then 0.5 mg/min

Y-site compatibilities: Amikacin, clindamycin, DOBUTamine, DOPamine, doxycycline, erythromycin, esmolol, gentamicin, insulin, isoproterenol, labetalol, lidocaine, metaraminol, metroNIDAZOLE, midazolam, morphine, nitroglycerin, norepinephrine, penicillin G potassium, phenylephrine, potassium chloride, procainamide, tobramycin, vancomycin

SIDE EFFECTS

CNS: *Headache, dizziness,* involuntary movement, *tremors, peripheral neuropathy,* malaise, *fatigue,* ataxia, *paresthesias,* insomnia, confusion, hallucinations

CV: *Hypotension, bradycardia,* HF, dysrhythmias

EENT: *Corneal microdeposits,* dry eyes

ENDO: *Hypo*/hyperthyroidism

GI: *Nausea, vomiting,* diarrhea, abdominal pain, *anorexia, constipation,* hepatotoxicity, pancreatitis

GU: Epididymitis, ED

INTEG: Rash, photosensitivity, blue-gray skin discoloration, alopecia, spontaneous ecchymosis, toxic epidermal necrolysis, urticaria, pancreatitis, phlebitis (IV)

MISC: Flushing, abnormal taste or smell, edema, abnormal salivation

RESP: Pulmonary fibrosis/toxicity, ARDS

PHARMACOKINETICS

PO: Onset 1-3 wk, peak 3-7 hr; **IV:** Onset 2 hr, peak 3-7 hr; half-life 26-107 days, increased in geriatric patients, metabolized by liver (an inhibitor of CYP1A2, CYP3A4, CYP2C8, CYP2C9, CYP2C19, CYP2A6, CYP2B6, CYP2D6, P-glycoprotein), excreted by kidneys, 99% protein binding

INTERACTIONS

Increase: QT prolongation—azoles, fluoroquinolones, macrolides, loratadine, traZODone

Increase: amiodarone concentrations, possible serious dysrhythmias—protease inhibitors; reduce dose

Increase: myopathy—HMG-CoA reductase inhibitors; monitor for myopathy

Increase: bradycardia, sinus arrest, AV block—β-blockers, calcium channel blockers; use cautiously

Increase: levels of cycloSPORINE, dextromethorphan, digoxin, disopyramide,

flecainide, methotrexate, phenytoin, procainamide, quiNIDine, theophylline, class I antidysrhythmics
Increase: anticoagulant effects—dabigatran, warfarin, dose may need to be decreased (warfarin)
Drug/Herb
• St. John's wort may decrease amiodarone level
Drug/Food
• **Toxicity:** grapefruit juice
Drug/Lab Test
Increase: T_4, ALT, AST, GGT alkaline phosphatase, cholesterol, lipids, PT, INR
Decrease: T_3

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Cardiac dysrhythmias: ECG continuously to determine effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias, B/P continuously for hypo/hypertension; report dysrhythmias, slowing heart rate; monitor amiodarone level: therapeutic 1-2.5 mcg/mL; toxic >2.5 mcg/mL

Black Box Warning: Pulmonary toxicity: dyspnea, fatigue, cough, fever, chest pain; product should be discontinued; for ARDS, pulmonary fibrosis, crackles, tachypnea, increased at higher doses (>400 mg/day), toxicity is common, monitor chest x-ray, PFTs with diffusion capacity

• **Stevens-Johnson syndrome:** monitor for rash, blistering; discontinue immediately, notify prescriber

Black Box Warning: Hepatotoxicity: monitor hepatic enzymes; rarely fatal hepatotoxicity has occurred

• Electrolytes (sodium, potassium, chloride); hepatic studies: AST, ALT, bilirubin, alkaline phosphatase; for dehydration, hypovolemia; monitor PT, INR if using warfarin

• CNS symptoms: confusion, psychosis, numbness, depression, involuntary movements; product should be discontinued

• **Hypothyroidism:** lethargy; dizziness; constipation; enlarged thyroid gland; edema of extremities; cool, pale skin

• **Hyperthyroidism:** restlessness; tachycardia; eyelid puffiness; weight loss; frequent urination; menstrual irregularities; dyspnea; warm, moist skin; may cause fatal thyrotoxicosis, cardiac dysrhythmias; may need to discontinue product

• Ophthalmic exams at baseline and periodically (PO); to prevent corneal deposits, use methylcellulose

• Cardiac rate, respirations: rate, rhythm, character, chest pain; start with patient hospitalized and monitored up to 1 wk; for rebound hypertension after 1-2 hr

• **Beers:** Avoid as first-line therapy for atrial fibrillation in older adults unless heart failure or substantial left ventricular hypertrophy is present

Evaluate:

• Therapeutic response: decrease in ventricular tachycardia, supraventricular tachycardia, fibrillation

Teach patient/family:

• To take this product as directed; to avoid missed doses; not to use with grapefruit juice; not to discontinue abruptly, not to use other drugs, herbs without prescriber approval, many interactions

• To use sunscreen or stay out of sun to prevent burns; that dark glasses may be needed for photophobia

• To report side effects immediately; more common at high dose and longer duration

• That skin discoloration is usually reversible

• To report vision changes, weight change, rash, blistering, numbness, temperature intolerance

• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding; not to be used in pregnancy, breastfeeding

TREATMENT OF OVERDOSE:

O_2, artificial ventilation, ECG, administer DOPamine for circulatory depression,

administer diazePAM, thiopental for seizures, isoproterenol

amisulpride (Rx)

(a′mi-sul′pride)

Barhemsys

Func. class.: Antiemetic

ACTION:

Blocks dopamine receptors (dopamine-2 and dopamine-3). Decrease chemoreceptor trigger zone (CTZ) responsible for vomiting

USES:

Prevention/treatment of postoperative nausea/vomiting

CONTRAINDICATIONS:

Hypersensitivity

Precautions: QT prolongation, pregnancy, child, renal disease, infertility, preexisting arrhythmias/cardiac conduction disorders, hypokalemia, hypomagnesemia, congestive heart failure

DOSAGE AND ROUTES

Prevention of postoperative nausea/vomiting

Adult: IV 5 mg as a single dose given over 1-2 min at the time of induction of anesthesia

Treatment of postoperative nausea/vomiting

Adult: IV 10 mg as a single dose given over 1-2 min for nausea/vomiting after surgery

Renal dose

Adult: IV CCr <30 mL/min: Avoid use

Available forms: Injection 5 mg/2 mL (2.5 mg/mL), 10 mg/4 mL (2.5 mg/mL) single-dose vial

Administer:

- Visually inspect for particulate matter and discoloration, discard if present
- Dilution is not needed
- Protect from light, give within 12 hr of removing from carton

Solution compatibilities. Water for injection, D_5W, 0.9% NaCl

SIDE EFFECTS

CNS: Chills, agitation, seizures, confusion, insomnia, somnolence, EPS, confusion, psychiatric symptoms

CV: Postural hypotension bradycardia, torsades de pointes, ventricular tachycardia, prolonged QT

META: Hypokalemia, hypomagnesemia

GI: Abdominal distention, increased LFTs

HEMA: Agranulocytosis

SYST: Neuroleptic malignant syndrome, angioedema, hypersensitivity

PHARMACOKINETICS

Onset rapid, peak end of dose, duration unknown, half-life 4-5 hr, protein binding 25%-30%

INTERACTIONS

Increase: antagonism—DOPamine agonists (levodopa), avoid using together

Increase: QT prolongation—drugs that increase QT prolongation (ondansetron), monitor ECG

NURSING CONSIDERATIONS

Assess:

- **QT prolongation:** Monitor ECG if other QT prolongation medications are used or history of QT prolongation
- **Pregnancy/breastfeeding:** Identify if pregnant or breastfeeding

Evaluate:

- Therapeutic response: Absence of nausea/vomiting

Teach patient/family:

- **QT prolongation:** Instruct patients to contact their health care provider immediately about change in their heart rate, lightheadedness, syncope
- Teach patients to report to their health care provider if they are taking drugs that prolong the QT interval
- **Pregnancy/breastfeeding:** Suggest pumping and discarding breast milk for 48 hr after product use

amitriptyline (Rx)

(a-mee-trip'ti-leen)

Elavil, Levate

Func. class.: Antidepressant—tricyclic

Chem. class.: Tertiary amine

Do not confuse:
amitriptyline/nortriptyline/aminophylline

ACTION: Blocks reuptake of norepinephrine, serotonin into nerve endings, thereby increasing action of norepinephrine, serotonin in nerve cells

USES: Major depressive disorder

CONTRAINDICATIONS: Hypersensitivity to tricyclics; recovery phase of myocardial infarction

Precautions: Pregnancy, breastfeeding, geriatric patients, seizure disorders, prostatic hypertrophy, schizophrenia, psychosis, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, renal/hepatic/cardiac disease, hyperthyroidism, electroshock therapy, elective surgery

Black Box Warning: Children <12 yr, suicidal patients

DOSAGE AND ROUTES

Depression

- **Adult: PO** Initially, 75 mg/day divided, or 50-100 mg daily at bedtime, max outpatient 150 mg/day, max inpatient 300 mg/day
- **Adolescents: PO** 10 mg tid and 20 mg at bedtime, then titrate
- **Geriatric: PO** Initially, 10-25 mg at bedtime; may increase by 10-25 mg weekly, max 150 mg/day

Available forms: Tablets 10, 25, 50, 75, 100, 150 mg

Administer:

- Increase fluids, bulk in diet if constipation, urinary retention occur, especially in geriatric patients
- With food, milk for GI symptoms
- Crushed if patient unable to swallow medication whole, give with food, fluids
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once-daily dosing; use tapering when withdrawing product
- Store at room temperature; do not freeze

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, weakness, *insomnia,* EPS (geriatric patients), seizures, suicidal thoughts, anxiety

CV: *Orthostatic hypotension,* ECG changes, tachycardia, hypertension, palpitations, dysrhythmias, QT prolongation

EENT: *Blurred vision,* tinnitus, mydriasis

GI: *Constipation, dry mouth,* weight gain, nausea, vomiting, paralytic ileus, epigastric distress, hepatitis, diarrhea, constipation

GU: *Urinary retention,* sexual dysfunction

HEMA: Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, aplastic anemia

INTEG: Rash, urticaria, sweating, photosensitivity

SYST: Hypersensitivity

PHARMACOKINETICS

Onset 45 min; peak 2-12 hr, protein binding >95%; metabolized by liver to nortriptyline; excreted in urine, feces; crosses placenta; excreted in breast milk; half-life 30-46 hr; antidepressant action up to 30 days, peak 2-6 wk, duration up to several weeks

INTERACTIONS

Increase: Hyperpyretic crisis, seizures, hypertensive episode—MAOIs; do not use within 14 days of MAOIs

Increase: risk for agranulocytosis—antithyroid agents

Increase: QT prolongation—procainamide, quiNIDine, amiodarone, tricyclics, class IA, III antidysrhythmics; may need dosage change

Increase: amitriptyline levels, toxicity—cimetidine, FLUoxetine, phenothiazines, oral contraceptives, antidepressants, carBAMazepine, class IC antidysrhythmics, ritonavir

Increase: effects of direct-acting sympathomimetics (EPINEPHrine), alcohol, barbiturates, benzodiazepines, CNS depressants, opioids, sedative/hypnotics

Increase: serotonin syndrome—linezolid, methylene blue; use cautiously

Increase: hypertensive crisis—cloNIDine

Drug/Herb

Increase: serotonin syndrome—SAM-e, St. John's wort, yohimbe; avoid concurrent use

Increase: CNS depression—kava, hops, chamomile, lavender, valerian

Drug/Lab Test

Increase: blood glucose, LFTs

Decrease: WBCs, platelets, granulocytes, blood glucose

NURSING CONSIDERATIONS

Assess:

- B/P lying, standing; pulse if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs more frequently with CV disease; ECG baseline and frequently in cardiac patients; avoid use immediately after MI
- **Blood studies:** CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy, thyroid function tests
- **Hepatic studies:** AST, ALT, bilirubin
- Weight weekly; appetite may increase with product
- EPS primarily in geriatric patients: rigidity, dystonia, akathisia
- Paralytic ileus, glaucoma exacerbation

Black Box Warning: Suicidal thinking, behavior: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic; suicidal tendencies are higher in those ≤24 yr, restrict amount of product available, avoid use in child <12 yr

- Urinary retention, constipation: constipation is most likely to occur in children and geriatric patients
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
- **Alcohol consumption:** if alcohol is consumed, hold dose until morning
- **Pain syndromes (unlabeled):** intensity, location, severity; use pain scale; product may be taken for 1-2 mo before effective
- **Sexual dysfunction:** erectile dysfunction, decreased libido
- **Beers** Avoid in older adults; highly anticholinergic, sedating, orthostatic hypotension

Evaluate:

- Therapeutic response: decrease in depression, absence of suicidal thoughts

Teach patient/family:

- To take medication as directed (usually at bedtime); not to double dose; that therapeutic effects may take 2-3 wk; not to discontinue medication quickly after long-term use, usually used for at least 3-4 mo: may cause nausea, headache, malaise
- To use caution when driving, performing other activities that require alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing (especially geriatric patients); how to manage anticholinergic effects
- To avoid alcohol, other CNS depressants
- To wear sunscreen or large hat when outdoors; photosensitivity occurs
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding

Black Box Warning: To watch for suicide; advise to watch closely for suicidal thinking, behavior, making a plan or attempts, panic attacks, change in mood

- That follow-up examinations will be needed
- That all health care professionals should be notified the product is being used

TREATMENT OF OVERDOSE:

ECG monitoring, lavage; administer anticonvulsant, sodium bicarbonate

amLODIPine (Rx)

(am-loe′di-peen)

Katerzia, Norvasc

Func. class.: Antianginal, antihypertensive, calcium channel blocker

Chem. class.: Dihydropyridine

Do not confuse:
amLODIPine/aMILoride

ACTION: Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, peripheral vascular smooth muscle; dilates coronary vascular arteries; increases myocardial O_2 delivery in patients with vasospastic angina

USES: Chronic stable angina pectoris, hypertension, variant angina (Prinzmetal's angina)

CONTRAINDICATIONS: Hypersensitivity to this product or dihydropyridine, severe aortic stenosis, severe obstructive CAD

Precautions: Pregnancy, breastfeeding, children, geriatric patients, HF, hypotension, hepatic injury, GERD

DOSAGE AND ROUTES

Coronary artery disease

- **Adult: PO** 5-10 mg/day
- **Geriatric: PO** 5 mg/day, max 10 mg/day

Hypertension

- **Adult: PO** 2.5-5 mg/day initially, max 10 mg/day
- **Geriatric: PO** 2.5 mg/day, may increase to 5 mg/day, max 10 mg/day
- **Child 6-17 yr (unlabeled): PO** 2.5-5 mg/day
- **Child 1-5 yr (unlabeled): PO** 0.1 mg/kg/dose daily initially, max 0.6 mg/kg/dose

Hepatic dose

- **Adult: PO** 2.5 mg/day; may increase to 10 mg/day (antihypertensive); 5 mg/day, may increase to 10 mg/day (antianginal)

Available forms: Tablets 2.5, 5, 10 mg; suspension 1 mg/mL

Administer:

- Once a day without regard to meals

SIDE EFFECTS

CNS: *Headache,* fatigue, dizziness, somnolence

CV: *Peripheral edema,* bradycardia, hypotension, angina, edema, palpitations

GI: Nausea, abdominal pain, anorexia, gingival hyperplasia, dyspepsia

INTEG: Rash, pruritus

OTHER: Flushing

PHARMACOKINETICS

Peak 6-12 hr; half-life 30-50 hr; increased in geriatric patients, hepatic disease; metabolized by liver (CYP3A4); excreted in urine (90% as metabolites); protein binding >93%

INTERACTIONS

Increase: amLODIPine level—strong CPY3A4 inhibitors (clarithromycin, ketoconazole, ritonavir)

Increase: level of cycloSPORINE

Increase: myopathy—simvastatin

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P, pulse, respirations, ECG; some patients have developed severe angina, acute MI after calcium channel blockers if obstructive CAD is severe
- Fluid volume status, peripheral edema, dyspnea, jugular vein distention, crackles
- **Angina:** intensity, location, duration of pain
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, or if breastfeeding

Evaluate:

- Therapeutic response: decreased anginal pain, decreased B/P, increased exercise tolerance

Teach patient/family:

- To take product as prescribed, not to double or skip dose, to take even if feeling better
- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem

- To avoid OTC, Rx, herbs, supplements unless directed by prescriber
- To comply in all areas of medical regimen: diet, exercise, stress reduction, product therapy, smoking cessation
- **To notify prescriber of irregular heartbeat; shortness of breath; swelling of feet, face, hands; severe dizziness; constipation; nausea; hypotension; if chest pain does not improve, use nitroglycerin when angina is severe**
- To use correct technique when monitoring pulse; to contact prescriber if pulse <50 bpm
- To change positions slowly to prevent orthostatic hypotension
- To continue with good oral hygiene to prevent gingival disease
- To use sunscreen, protective clothing to prevent photosensitivity
- To notify all health care providers of use of this product

TREATMENT OF OVERDOSE:
Defibrillation, β-agonists, IV calcium inotropic agents, diuretics, atropine for AV block, vasopressor for hypotension

amoxicillin (Rx)
(a-mox-i-sill'in)

Amoxil, Moxatag

Func. class.: Antiinfective, antiulcer

Chem. class.: Aminopenicillin

ACTION:
Interferes with cell wall replication of susceptible organisms; bactericidal: lysis mediated by bacterial cell wall autolysins

USES:
Treatment of skin, respiratory, GI, GU infections, otitis media, gonorrhea; for gram-positive cocci *(Staphylococcus aureus, Streptococcus pyogenes, Streptococcus faecalis, Streptococcus pneumoniae),* gram-negative cocci *(Neisseria gonorrhoeae, Neisseria meningitidis),* gram-positive bacilli *(Corynebacterium diphtheriae, Listeria monocytogenes),* gram-negative bacilli *(Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Salmonella);* gastric ulcer, β-lactase–negative organisms; prophylaxis of bacterial endocarditis; for treatment of ulcers due to *Helicobacter pylori*

Unlabeled uses: Lyme disease, anthrax treatment and prophylaxis, cervicitis, *Chlamydia trachomatis,* dental abscess/infection, dyspepsia, nongonococcal urethritis, periodontitis, typhoid fever

CONTRAINDICATIONS:
Hypersensitivity to penicillins

Precautions: Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins, carbapenems; severe renal disease, mononucleosis, phenylketonuria, diabetes, geriatric patients, asthma, child, colitis, dialysis, eczema, pseudomembranous colitis, syphilis

DOSAGE AND ROUTES

Tonsillitis and/or pharyngitis (rheumatic fever prophylaxis) secondary to *Streptococcus pyogenes*

- **Adult/adolescent/child ≥12 yr: PO** (Moxatag 775-mg extended-release tablets) 775 mg/day, given within 1 hr of completing a meal, for 10 days
- **Adult: PO** (immediate-release) 1 g/day or 500 mg bid for 10 days
- **Infant/child/adolescent: PO** (immediate-release) 25 mg/kg/dose (max 500 mg/dose) bid for 10 days

Sinusitis

- **Child ≥2 yr/adolescent: PO** (immediate release) **standard-dose therapy,** 45 mg/kg/day divided q12h; **high-dose therapy,** 80-90 mg/kg/day divided q12h (max 2 g/dose)
- **Child <2 yr: PO** Treat with amoxicillin/clavulanate, not amoxicillin alone

Acute otitis media

- **Adult: PO** (immediate-release) 500 mg q12h or 250 mg q8h for mild/moderate infections; 875 mg q12h or 500 mg q8h for severe infections
- **Infant ≥6 mo/child/adolescent: PO** (immediate-release) 80-90 mg/kg/day divided q12h

• **Infant 4-5 mo: PO** (immediate-release) 80-90 mg/kg/day divided q12h for 10 days
• **Infant ≤3 mo: PO** (immediate-release) 30 mg/kg/day divided q12h

Most respiratory Infections

• **Adult: PO** (immediate-release) 500 mg q12h or 250 mg q8h (mild-moderate infections); 875 mg 12 hr or 500 mg q8hr (severe infections)
• **Infant >3 mo/child/adolescent: PO** (immediate-release) 20 mg/kg/day divided q8h (max 250 mg/dose) or 25 mg/kg/day divided q12h (max 500 mg/dose)
• **Neonate/infant ≤3 mo: PO** (immediate-release) 30 mg/kg/day divided q12h

H. pylori

• **Adult: PO** 1000 mg bid with lansoprazole 30 mg bid with clarithromycin 500 mg bid × 14 days or 1000 mg bid with omeprazole 20 mg bid, with clarithromycin 500 mg bid × 14 days or 1000 mg bid with esomeprazole 40 mg daily with clarithromycin 500 mg bid × 10 days; or 1000 mg tid with lansoprazole 30 mg tid × 14 days

Gonorrhea

• **Adult/child ≥40 kg: PO** × 3 g single dose
• **Child >2 yr and <40 kg: PO** 50 mg/kg with probenecid 25 mg/kg single dose

Endocarditis prevention

• **Adult: PO** 2 g 60 min prior to procedure
• **Child: PO** 50 mg/kg 60 min prior to procedure, max adult dose

UTI, including cystitis

Mild to moderate infections caused by highly susceptible organisms

• **Adult: PO** (immediate-release) 500 mg q12h or 250 mg q8h
• **Infant >3 mo/child/adolescent: PO** (immediate-release) 20 mg/kg/day divided q8h (max 250 mg/dose) or 25 mg/kg/day divided q12h (max 500 mg/dose)
• **Neonate/infant ≤3 mo: PO** (immediate-release) 30 mg/kg/day divided q12h

Renal disease

• **Adult: PO** CCr 10-30 mL/min 250-500 mg q12hr; CCr <10 mL/min 250-500 mg q24hr; do not use 775-, 875-mg strength if CCr <30 mL/min

Available forms: Capsules 250, 500 mg; chewable tablets 125, 200, 250, 400 mg; tablets, 500, 875 mg; extended-release tablets (Moxatag) 775 mg; powder for suspension 125, 200, 250, 400 mg/5 mL; suspension 50 mg/mL

Administer:

PO route

• Identify allergies before use
• **Suspension:** shake well before each dose; use calibrated spoon, oral syringe, or measuring cup; may be used alone, mixed in drinks; use immediately; discard unused portion after 14 days, store in refrigerator
• Give around the clock; capsules may be emptied, mixed with liquids if needed without regard to food
• **Extended release:** do not crush, chew, break; take with food

SIDE EFFECTS

CNS: Seizures, agitation, confusion, dizziness, insomnia
GI: *Nausea, vomiting, diarrhea,* pseudomembranous colitis
HEMA: Anemia, bone marrow depression, granulocytopenia, hemolytic anemia, eosinophilia, thrombocytopenia, agranulocytosis
INTEG: *Urticaria, rash*
SYST: Anaphylaxis, serum sickness, overgrowth of infection, anaphylaxis, hypersensitivity

PHARMACOKINETICS

PO: Peak 1-2 hr, duration 6-8 hr, half-life 1-1⅓ hr extended in renal disease, metabolized in liver, excreted in urine, crosses placenta, enters breast milk

INTERACTIONS

Increase: rash—allopurinol
Increase: amoxicillin level—probenecid; used for this reason
Increase: anticoagulant action—warfarin
Increase: methotrexate levels—methotrexate; monitor for toxicity
Decrease: contraceptive effect possible—hormonal contraceptives
Drug/Lab Test

Increase: AST/ALT, alkaline phosphatase, LDH, eosinophils
Decrease: HB, WBC, platelets
Interference: urine glucose test (Clinitest, Benedict's reagent)

NURSING CONSIDERATIONS

Assess:

- C&S may be drawn before product therapy; product may be given as soon as culture is taken
- **CDAD:** bowel pattern before, during treatment; diarrhea, cramping, blood in stool; report to prescriber immediately, product should be discontinued, may occur even weeks after discontinuing product
- Skin eruptions after administration of penicillin to 1 wk after discontinuing product; rash is more common if allopurinol is taken concurrently
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected or if breastfeeding; use only if clearly needed; appears in breast milk, use cautiously in breastfeeding; advise those taking oral contraceptives to use alternative contraceptive since contraceptive may be decreased
- **Anaphylaxis:** rash, itching, dyspnea, facial/laryngeal edema

Evaluate:

- Therapeutic response: absence of infection; prevention of endocarditis, resolution of ulcer symptoms

Teach patient/family:

- That capsules may be opened, contents taken with fluids; that chewable form is available; to take as prescribed, not to double dose
- All aspects of product therapy: to complete entire course of medication to ensure organism death; that culture may be taken after completed course of medication
- To report sore throat, fever, fatigue, diarrhea (superinfection or agranulocytopenia), blood in stool, abdominal pain (pseudomembranous colitis)
- That product must be taken in equal intervals around the clock to maintain blood levels; to take without regard to food, that capsules may be opened, contents taken with fluids; that chewable form is available; to take as prescribed, not to double dose
- To wear or carry emergency ID if allergic to penicillins

TREATMENT OF ANAPHYLAXIS: Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

amoxicillin/clavulanate (Rx)

(a-mox-i-sill´in)

Augmentin, Augmentin ES, Augmentin XR, Clavulin

Func. class.: Broad-spectrum antiinfective
Chem. class.: Aminopenicillin β-lactamase inhibitor

ACTION: Bacteriocidal, interferes with cell wall replication of susceptible organisms; lysis mediated by bacterial cell wall autolytic enzymes, combination increases spectrum of activity against β-lactamase–resistant organisms

USES: Lower respiratory tract infections, sinus infections, pneumonia, otitis media, impetigo, skin infection, UTI; effective for *Actinomyces* sp., *Bacillus anthracis, Bacteroides* sp., *Bordetella pertussis, Borrelia burgdorferi; Brucella* sp., *Burkholderia pseudomallei, Clostridium perfringens/tetani, Corynebacterium diphtheriae, Eikenella corrodens, Enterobacter* sp., *Enterococcus faecalis, Erysipelothrix rhusiopathiae, Escherichia coli, Eubacterium* sp., *Fusobacterium* sp., *Haemophilus ducreyi/parainfluenzae (positive/negative betalactamase), Helicobacter pylori, Klebsiella* sp., *Lactobacillus* sp., *Listeria monocytogenes, Moraxella catarrhalis, Neisseria gonorrhoeae/meningitidis, Nocardia brasiliensis, Peptococcus* sp., *Peptostreptococcus* sp., *Prevotella*

melaninogenica, Propionibacterium sp., *Shigella* sp., *Staphylococcus aureus (MSSA)/epidermidis/saprophyticus, Streptococcus agalactiae (group B streptococci)/dysgalactiae/pneumoniae/pyogenes (group A streptococci), Treponema pallidum, Vibrio cholerae, Viridans streptococci*

Unlabeled uses: Actinomycotic mycetoma, chancroid, dental infections, dentoalveolar infection, melioidosis, pericoronitis, SARS

CONTRAINDICATIONS:

Hypersensitivity to penicillins, severe renal disease, dialysis

Precautions: Pregnancy, breastfeeding, neonates, children, hypersensitivity to cephalosporins; renal/GI disease, asthma, colitis, diabetes, eczema, leukemia, mononucleosis, viral infections, phenylketonuria

DOSAGE AND ROUTES

Most infections

• **Adult/child >40 kg:** 250 mg q8hr or 500 mg q12hr

Recurrent/persistent otitis media *(Streptococcus pneumoniae, Haemophilus, Moraxella catarrhalis)*

• **Child ≥3 mo: PO** 90 mg/kg/day (600 mg amoxicillin/42.9 mg clavulanate/5 mL) q12hr × 10 days

Lower respiratory infections, otitis media, sinusitis, skin/skin structure infections, UTIs

• **Adult: PO** 250-500 mg q8hr or 500-875 mg q12hr, depending on severity of infection

• **Child ≤40 kg: PO** 20-90 mg/kg/day in divided doses q8-12hr

Community-acquired pneumonia or acute bacterial sinusitis

• **Adult: PO** 2000 mg/125 mg (Augmentin XR) q12hr × 7-10 days (pneumonia), 10 days (sinusitis)

Renal disease

• **Adult: PO** CCr 10-30 mL/min dose q12hr; CCr <10 mL/min dose q24hr; do not use 875-mg strength or ext rel if CCr <30 mL/min; Augmentin XR is contraindicated with renal disease

Available forms: Tablets 250, 500, 875 mg amoxicillin/125 mg clavulanate; chewable tablets 200 mg amoxicillin/28.5 clavulanate, 400 mg amoxicillin/57 mg clavulanate; powder for oral suspension 250 mg amoxicillin/28.5 mg clavulanate, 200 amoxicillin mg/28.5 clavulanate mg, 400 amoxicillin mg/57 clavulanate mg, 600/42.9 mg/5 mL clavulanate extended-release tablets (XR) 1000 mg amoxicillin/62.5 mg clavulanate; powder for oral suspension (ES) 600 mg amoxicillin/42.9 mg clavulanate

Administer:

PO route

• Do not break, crush, chew extended-release product

• Only as directed; two 250-mg tablets not equivalent to one 500-mg tablet due to strength of clavulanate

• Shake suspension well before each dose; may be used alone, mixed in drinks; use immediately, discard unused portion of suspension after 14 days, store in refrigerator

• Give around the clock

• Give with light meal for increased absorption, fewer GI effects, confusion, behavioral changes

SIDE EFFECTS

CNS: Headache, fever, seizures, agitation, insomnia

GI: *Nausea, diarrhea, vomiting,* increased AST/ALT, CDAD

GU: *Vaginitis*

HEMA: Anemia, bone marrow depression, granulocytopenia, leukopenia, eosinophilia, thrombocytopenic purpura

INTEG: *Rash,* urticaria

SYST: Anaphylaxis, respiratory distress, serum sickness

PHARMACOKINETICS

PO: Peak 1-2.5 hr, duration 8-12 hr, half-life 1-1⅓ hr, metabolized in liver, excreted in urine, crosses placenta, excreted in breast milk, removed by hemodialysis

INTERACTIONS

Increase: amoxicillin levels—probenecid, used for this reason

Increase: anticoagulant effect—warfarin; monitor closely, dose adjustment may be needed
Increase: skin rash—allopurinol
Decrease: contraceptive effect—oral contraceptives
Drug/Food
Decrease: absorption by a high-fat meal
Drug/Lab Test
Increase: AST/ALT, alkaline phosphatase, LDH
Interference: urine glucose tests (Clinitest, Benedict's reagent, cupric SO_4)

NURSING CONSIDERATIONS

Assess:
- **Infection:** For signs/symptoms of infection (characteristics of wounds, sputum, urine, stool, WBC >10,000/mm^3, earache, fever, obtain baseline and during treatment
- **Superinfection:** Perineal itching, fever, malaise, redness, pain, swelling, rash, diarrhea, change in cough sputum; if large doses are given or geriatrics
- Hepatic studies: AST, ALT baseline, periodically in hepatic disease, discontinue if hepatitis occurs
- Blood studies: WBC
- C&S may be drawn before product therapy; product may be given as soon as culture is taken
- **CDAD:** bowel pattern before, during treatment; diarrhea, cramping, blood in stools; report to prescriber
- **Anaphylaxis:** rash, itching, dyspnea, facial/laryngeal edema; skin eruptions after administration of penicillin to 1 wk after discontinuing product, adrenaline, suction, tracheostomy set, endotracheal intubation equipment on unit

Evaluate:
- Therapeutic response: absence of infection

Teach patient/family:
- To take as prescribed, not to double or skip doses
- All aspects of product therapy: to complete entire course of medication to ensure organism death, that culture may be taken after completed course of medication
- That product must be taken in equal intervals around the clock to maintain blood levels
- To report sore throat, fever, fatigue (superinfection or agranulocytosis); diarrhea, cramping, blood in stools (pseudomembranous colitis)
- To wear or carry emergency ID if allergic to penicillins
- **Pregnancy/breastfeeding:** To notify health care professional if pregnancy is planned or suspected or if breastfeeding; to use another form of contraception if taking oral contraceptives, effect maybe decreased

TREATMENT OF HYPERSENSITIVITY: Withdraw product, maintain airway, administer EPINEPHrine, O_2, IV corticosteroids for anaphylaxis

⚠ HIGH ALERT

amphotericin B lipid complex (ABLC) (Rx)

(am-foe-ter′i-sin)

Abelcet

Func. class.: Antifungal
Chem. class.: Amphoteric polyene

Do not confuse:
Abelcet/amphotericin B

ACTION: Increases cell membrane permeability in susceptible fungi by binding sterols; alters cell membrane, thereby causing leakage of cell components, cell death

USES: Indicated for the treatment of invasive fungal infections in patients who cannot tolerate or have failed conventional amphotericin B therapy; broad-spectrum activity against many fungal, yeast and mold pathogen infections, including *Aspergillus, Zygomycetes, Fusarium, Cryptococcus,* and many hard-to-treat *Candida* species; *Aspergillus fumigatus, Aspergillus* sp., *Blastomyces dermatitidis, Candida albicans,*

Candida guilliermondii, Candida sp., *Candida stellatoidea, Candida tropicalis, Coccidioides immitis, Cryptococcus* sp., *Histoplasma* sp., sporotrichosis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Anemia, breastfeeding, cardiac disease, children, electrolyte imbalance, geriatric patients, hematologic/hepatic/renal disease, hypotension, pregnancy

DOSAGE AND ROUTES

- **Adult: IV** 3-5 mg/kg/day

Renal dose

- **Adult: IV** CCr <10 mL/min give 5 mg/kg q24-36hr

Available forms: Suspension for injection 5 mg/mL

Administer:

- **Do not confuse the 4 different types; these are not interchangeable:** conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome
- May premedicate with acetaminophen, diphenhydrAMINE
- Use only after C&S confirms organism

IV route

- Give product only after C&S confirms organism, product needed to treat condition; make sure product is used for life-threatening infections
- Handle with aseptic technique, amphotericin B lipid complex (ABLC) has no preservatives; visually inspect parenteral products for particulate matter and discoloration before use

Filtration and dilution:

- Before dilution, store at 36°F-46°F (2°C-8°C), protected from moisture and light; do not freeze; the diluted, ready-for-use admixture is stable for up to 48 hours at 36°F-46°F (2°C-8°C) and an additional 6 hr at room temperature; do not freeze
- Prepare by shaking the vial until no yellow sediment remains
- Transfer the amount of drug from the required number of vials into one or more sterile syringes using an 18-gauge needle
- Attach the provided 5-micron filter needle to the syringe; inject the syringe contents through the filter needle into an IV bag containing the D_5W injection; each filter needle may be used on the contents of no more than four 100-mg vials
- The suspension must be diluted with D_5W injection (1 mg/mL); for pediatric patients and patients with cardiovascular disease, the final concentration may be 2 mg/mL; DO NOT USE SALINE SOLUTIONS OR MIX WITH OTHER DRUGS OR ELECTROLYTES
- The diluted ready-for-use admixture is stable for up to 48 hr at 36°F-46°F (2°C-8°C) and an additional 6 hr at room temperature; do not freeze

IV INFUSION

- Flush IV line with D_5W injection before use or use a separate IV line; DO NOT USE AN IN-LINE FILTER
- Before infusion, shake the bag until thoroughly mixed; max rate 2.5 mg/kg/hr; if the infusion time exceeds 2 hr, mix by shaking the infusion bag every 2 hr

Y-site compatibilities: acyclovir, allopurinol, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bumetanide, buprenorphine, busulfan, butorphanol, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, digoxin, diphenhydrAMINE, DOCEtaxel, doxacurium, DOXOrubicin liposomal, enalaprilat, EPINEPHrine eptifibatide, ertapenem, etoposide, famotidine, fentaNYL, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, insulin, regular ketorolac, lepirudin, lidocaine, linezolid, LORazepam, mannitol, melphalan, meperidine, methotrexate, methylPREDNISolone, metoclopramide,

mitoMYcin, mivacurium, nafcillin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, PACLitaxel, pamidronate, pantoprazole, PEMEtrexed, pentazocine, PENTobarbital, PHENobarbital, phentolamine, piperacillin-tazobactam, procainamide, raNITIdine, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, trimethobenzamide, verapamil, vinBLAStine, vinCRIStine, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache, fever, chills,* confusion, anxiety, insomnia
CV: Hypotension, cardiac arrest, chest pain, hypertension, tachycardia, edema
GI: *Nausea, vomiting, anorexia,* diarrhea, cramps, bilirubinemia
GU: Nephrotoxicity
HEMA: Anemia, thrombocytopenia, agranulocytosis, leukopenia
INTEG: *Burning, irritation,* pain, necrosis at injection site with extravasation, rash, pruritus, dermatitis
META: Hyponatremia, hypomagnesemia, hypokalemia
MS: Arthralgia, myalgia, generalized pain, weakness, weight loss
RESP: Dyspnea, wheezing, respiratory failure
SYST: Toxic epidermal necrolysis, exfoliative dermatitis, anaphylaxis, sepsis, infection

PHARMACOKINETICS

IV: half-life 7 days

INTERACTIONS

- Do not use with cidofovir

Increase: nephrotoxicity—other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B), antineoplastics, pentamidine, salicylates, tacrolimus, tenofovir; use cautiously
Increase: hypokalemia—corticosteroids, digoxin, skeletal muscle relaxants, thiazides, loop diuretics; monitor electrolytes
Decrease: amphotericin B lipid complex—azole antifungals; may still be used concurrently in serious resistant infections

Drug/Lab Test

Increase: AST/ALT, alkaline phosphatase, BUN, creatinine, LDH, bilirubin
Decrease: magnesium, potassium, HB, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- VS every 15-30 min during first infusion; note changes in pulse, B/P
- Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk; BUN, creatinine 2-3 ×/wk
- Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered
- **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dL or if serum creatinine is >3 mg/dL, product may be discontinued, dosage reduced, I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- **For hepatotoxicity:** increasing AST, ALT, alkaline phosphatase, bilirubin
- **For allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) should be administered
- **For hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- **Infusion reactions:** fever, chills, pain, swelling at site

Evaluate:

- Therapeutic response: resolution of infection, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection), frequent blood draws will be needed
- To notify prescriber of bleeding, bruising, or soft tissue swelling, neurologic, renal symptoms
- **Pregnancy/breastfeeding:** to advise prescriber if pregnancy is planned or suspected; not to breastfeed

⚠ HIGH ALERT

amphotericin B liposomal (LAmB) (Rx)

(am-foe-ter´i-sin)

AmBisome

Func. class.: Antifungal

Chem. class.: Amphoteric polyene

Do not confuse:
AmBisome/amphotericin B

ACTION: Increases cell membrane permeability in susceptible fungi by binding to membrane sterols; alters cell membrane, thereby causing leakage of cell components, cell death

THERAPEUTIC OUTCOME

Resolution of infection

USES: Empiric therapy for presumed fungal infection in febrile neutropenic patients; treatment of cryptococcal meningitis in HIV-infected patients; treatment of *Aspergillus* sp., *Candida* sp., and/or *Cryptococcus* sp. infections refractory to amphotericin B deoxycholate, or in patients where renal impairment or unacceptable toxicity precludes the use of amphotericin B deoxycholate *(Aspergillus flavus, Aspergillus fumigatus, Blastomyces dermatitidis, Candida albicans, Candida krusei, Candida lusitaniae, Candida parapsilosis, Candida tropicalis, Cryptococcus neoformans);* treatment of visceral leishmaniasis

Unlabeled uses: Coccidioidomycosis, histoplasmosis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Anemia, breastfeeding, cardiac disease, children, electrolyte imbalance, geriatric patients, hematologic/hepatic/renal disease, hypotension, pregnancy, severe bone marrow depression

DOSAGE AND ROUTES

Systemic fungal infections

- **Adults and children: IV** 3-6 mg/kg/dose q24hr

Esophageal candidiasis (unlabeled) in HIV-infected patients

- **Adults/adolescents: IV** 3-4 mg/kg/dose q24hr for 14 to 21 days

Cryptococcal meningitis in HIV patients

- **Adults/adolescents/children/infants: IV** 6 mg/kg/dose q24hr

Visceral leishmaniasis

- **Adult: IV** 3 mg/kg q24hr on days 1-5, then 3 mg/kg q24hr on days 14, 21 (immunocompetent); 4 mg/kg q24hr on days 1-5, then 4 mg/kg q24hr on days 10, 17, 24, 31, 38 (immunosuppressed)

Severe disseminated (nonmeningeal) or diffuse pulmonary coccidioidomycosis (unlabeled) in HIV-infected patients

- **Adults: IV** 3-5 mg/kg/dose q24hr

Histoplasmosis (unlabeled)

Adults: IV 3 mg/kg/dose daily depending on the type of histoplasmosis and concomitant conditions

Infant/child/adolescent: **IV** 3-5 mg/kg/dose daily

Renal dose

- **Adult: IV** CCr <10 mL/min use 3 mg/kg q24hr

Available forms: Powder for injection 50-mg vial

Administer:

- **Do not confuse the 4 different types; these are not interchangeable:** conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome
- May premedicate with acetaminophen, diphenhydrAMINE

IV route

- Give after C&S confirms organism and product needed to treat condition
- Use for life-threatening infections
- Administer by IV infusion only; use aseptic technique, as LAmB does not contain any preservatives
- Visually inspect for particulate and discoloration

Reconstitution

- LAmB *must* be reconstituted using sterile water for injection (without a bacteriostatic agent); DO NOT RECONSTITUTE WITH SALINE OR ADD SALINE TO THE

RECONSTITUTED SUSPENSION, DO NOT MIX WITH OTHER DRUGS; doing so can cause a precipitate to form

- Reconstitute vials containing 50 mg of LAmB/12 mL of sterile water (4 mg/mL)
- Immediately after the addition of water, SHAKE VIGOROUSLY; the suspension should be yellow and translucent; visually inspect vial for particulate matter and continue shaking until completely dispersed
- Store suspension for up to 24 hr refrigerated if using sterile water for injection; do not freeze

Filtration and dilution

- Calculate the amount of reconstituted (4 mg/mL) suspension to be further diluted and withdraw this amount into a sterile syringe
- Attach the provided 5-micron filter to the syringe; inject the syringe contents through the filter into the appropriate amount of D_5W injection; use only one filter per vial
- The suspension must be diluted with D_5W injection (1-2 mg/mL) before administration; for infants and small children, lower concentrations (0.2-0.5 mg/mL) may be appropriate to provide sufficient volume for infusion
- Use injection of LAmB within 6 hr of dilution with D_5W

IV INFUSION

- Flush line with D_5W injection before infusion; if this cannot be done, then a separate IV line must be used
- An in-line membrane filter may be used with pore diameter if the filter is not less than 1 micron
- Administer using a controlled infusion device over a period of 120 min; infusion time may be reduced to 60 min in patients who tolerate the infusion; if discomfort occurs, the duration of infusion may be increased
- Store protected from moisture and light; diluted solution is stable for 24 hr at room temperature

Acetaminophen and diphenhydrAMINE

- 30 min before infusion to reduce fever, chills, headache

Y-site compatibilities: Acyclovir, amifostine, aminophylline, anidulafungin, atropine, azithromycin, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, CARBOplatin, carmustine, ceFAZolin, ceFOXitin, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diphenhydrAMINE, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, fosphenytoin, furosemide, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, isoproterenol, ketorolac, levorphanol, lidocaine, linezolid, mesna, methotrexate, methylPREDNISolone, metoprolol, milrinone, mitoMYcin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, oxytocin, palonosetron, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENObarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, raNITIdine, SUFentanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, trimethoprim-sulfamethoxazole, vasopressin, vinCRIStine, voriconazole, zidovudine

SIDE EFFECTS

CNS: *Headache, fever, chills,* peripheral nerve pain, insomnia
CV: Hypotension, cardiac arrest, tachycardia, edema, flushing
GI: *Nausea, vomiting, anorexia,* diarrhea, cramps, GI hemmorrhage, hyperbilirubinemia
GU: Nephrotoxicity
HEMA: Anemia, thrombocytopenia, agranulocytosis, leukopenia
INTEG: *Burning, irritation,* pain, necrosis at injection site with extravasation, flushing, dermatitis, skin rash (topical route)
MS: Arthralgia, myalgia
RESP: Dyspnea, cough
SYST: Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, anaphylaxis

PHARMACOKINETICS

IV: Metabolized in liver; excreted in urine (metabolites), breast milk; protein

binding 90%; poorly penetrates CSF, bronchial secretions, aqueous humor, muscle, bone; half-life 4-6 days

INTERACTIONS

Increase: nephrotoxicity—other nephrotoxic antibiotics (aminoglycosides, antineoplastics, CISplatin, vancomycin, cycloSPORINE, polymyxin B)

Increase: hypokalemia—corticosteroids, digoxin, skeletal muscle relaxants, thiazides, loop diuretics

Decrease: amphotericin B liposomal—azole antifungals, may be used concurrently in serious resistant infections

NURSING CONSIDERATIONS

Assess:

- VS every 15-30 min during first infusion; note changes in pulse, B/P
- Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk, BUN, creatinine 2-3×/wk
- Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered
- **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dL or if serum creatinine is >3 mg/dL, product may be discontinued, dosage reduced; I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- **For hepatotoxicity:** increasing AST, ALT, alkaline phosphatase, bilirubin, monitor LFTs
- **For allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- **For hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- **Infusion reaction:** chills, fever, pain, swelling at site

Evaluate:

- Therapeutic response: resolution of infection, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection), that frequent blood draws will be needed
- To notify prescriber of bleeding, bruising, or soft tissue swelling, renal, neurologic side effects
- **Pregnancy/breastfeeding:** To notify health care professional if pregnancy is planned or suspected, not to breastfeed

ampicillin (Rx)

(am-pi-sill'in)

Func. class.: Antiinfective—broad-spectrum

Chem. class.: Aminopenicillin

ACTION: Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells, bursts from osmotic pressure; lysis mediated by cell wall autolysins

USES: Effective for gram-positive cocci *(Staphylococcus aureus, Streptococcus pyogenes, Streptococcus faecalis, Streptococcus pneumoniae)*, gram-negative cocci *(Neisseria meningitidis)*, gram-negative bacilli *(Haemophilus influenzae, Proteus mirabilis, Salmonella, Shigella, Listeria monocytogenes)*, gram-positive bacilli; meningitis, GI/GU/respiratory infections, endocarditis, septicemia, otitis media, skin infection, bacterial endocarditis

CONTRAINDICATIONS: Hypersensitivity to penicillins, antimicrobial resistance

Precautions: Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins, renal disease, mononucleosis

DOSAGE AND ROUTES

Systemic infections

- **Adult and child ≥40 kg: PO** 250-500 mg q6hr; **IV/IM** 2-8 g/day in divided doses q4-6hr
- **Child <40 kg: PO** 50-100 mg/kg/day in divided doses q6-8hr; **IV/IM** 100-150 mg/kg/day in divided doses q6hr

Bacterial meningitis

- **Adult and adolescent: IM/IV** 150-200 mg/kg/day in divided doses q3-4 hr; IDSA dose **IV** 2 g q4hr
- **Infant and child: IM/IV** 150-200 mg/kg/day in divided doses q3-4hr; IDSA dose IV 200-400 mg/kg/day in divided doses q6hr
- **Neonate >7 days and >2000 g: IM/IV** 200 mg/kg/day in divided doses q6hr; IDSA dose; **IV** 200 mg/kg/day in divided doses q6-8hr

Prevention of bacterial endocarditis

- **Adult: IM/IV** 2 g 30 min prior to procedure
- **Child: IM/IV** 50 mg/kg 30 min prior to procedure, max 2 g

GI/GU infections other than *N. gonorrhoeae*

- **Adult and child >20 kg: PO** 500 mg q6hr, may use larger dose for more serious infections
- **Child <40 kg: PO** 50 mg/kg/day in divided doses q6-8hr

Renal disease

- **Adult and child:** CCr 10-50 mL/min extend to q6-12hr; CCr <10 mL/min extend to q12-16hr

Available forms: Powder for injection 125, 250, 500 mg, 1, 2, 10 g/vial; capsules 250, 500 mg; powder for oral suspension 125, 250 mg/5 mL

Administer:

- Check allergies before using; obtain C&S before using; begin before results are received

PO route

- Give in even doses around the clock, store caps in tight container, store after reconstituting in refrigerator up to 2 wk, 1 wk room temperature
- Tablets may be crushed or capsules opened and mixed with water
- On empty stomach with plenty of water for best absorption (1-2 hr before meals or 2-3 hr after meals)
- Shake suspension well before each dose; store after reconstituting in refrigerator up to 2 wk, 1 wk room temperature

IM route

- **Reconstitute** by adding 0.9-1.2 mL/125-mg vial; 0.9-1.9 mL/250-mg vial; 1.2-1.8 mL/500-mg vial; 2.4-7.4 mL/1-g vial; 6.8 mL/2-g vial

IV route

IV direct

- After diluting with sterile water 0.9-1.2 mL/125-mg product, administer over 3-5 min (up to 500 mg), 10-15 min (>500 mg)

Intermittent IV INFUSION route

- May be diluted in 50 mL or more of D_5W, D_5 0.45% NaCl to a concentration of 30 mg/mL or less; IV solution is stable for 1 hr; give at prescribed rate, do not give in same tubing as aminoglycosides, separate by ≥1 hr

Y-site compatibilities: Acyclovir, alemtuzumab, alprostadil, amifostine, aminocaproic acid, anidulafungin, argatroban, atenolol, azithromycin, bivalirudin, bleomycin, CARBOplatin, carmustine, CISplatin, clarithromycin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, dexmedetomidine, dexrazoxane, DOCEtaxel, doxacurium, doxapram, DOXOrubicin liposome, eptifibatide, etoposide, etoposide phosphate, filgrastim, fludarabine, fluorouracil, foscarnet, gallium, gatifloxacin, gemcitabine, gemtuzumab, granisetron, hetastarch, ifosfamide, irinotecan, lepirudin, leucovorin, levoFLOXacin, linezolid, mannitol, mechlorethamine, melphalan, methotrexate, metroNIDAZOLE, milrinone, octreotide, ofloxacin, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, perphenazine, potassium acetate, propofol, remifentanil, riTUXimab, rocuronium, sodium acetate, teniposide, thiotepa, tigecycline, tirofiban, TNA, trastuzumab, vecuronium, vinBLAStine, vinCRIStine, vitamin B/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Seizures (high doses)

GI: *Nausea, vomiting, diarrhea,* CDAD, stomatitis
HEMA: Anemia, bone marrow depression, granulocytopenia, leukopenia, eosinophilia
INTEG: *Rash, urticaria*
MISC: Anaphylaxis, serum sickness

PHARMACOKINETICS

Half-life 50-110 min; excreted in urine, bile, breast milk; crosses placenta; removed by dialysis
PO: Peak 2 hr, duration 6-8 hr
IM: Peak 1 hr, duration 6-8 hr
IV: Peak rapid, duration 6-8 hr

INTERACTIONS

Increase: bleeding—oral anticoagulants, monitor INR/PT
Increase: ampicillin concentrations—probenecid, used for this action
Increase: ampicillin-induced skin rash—allopurinol, monitor for rash
Decrease: ampicillin level—H_2 antagonists, proton pump inhibitors, separate by 2 hr
Drug/Lab Test
Increase: eosinophils, ALT, AST
Decrease: conjugated estrogens during pregnancy, HB, WBC, platelets
False positive: urine glucose, direct Coomb's test
Interference: urine glucose (Clinitest, Benedict's reagent, cupric SO_4)

NURSING CONSIDERATIONS

Assess:
• **Infection:** characteristics of wound, sputum; urine, stool, earache, fever WBC baseline, periodically; C&S before product therapy, product may be taken as soon as culture is taken
• Hepatic studies: AST, ALT
• Blood studies: WBC, RBC, HB, Hct, bleeding time
• **CDAD:** bowel pattern before/during treatment
• Skin eruptions after administration of penicillin to 1 wk after discontinuing product; identify allergies before using
• Respiratory status: rate, character, wheezing, tightness in chest
• **Anaphylaxis:** rash, itching, dyspnea, facial swelling; stop product, notify prescriber, have emergency equipment available
Evaluate:
• Therapeutic response: absence of fever, draining wounds, resolution of infection
Teach patient/family:
• To take oral ampicillin on empty stomach with full glass of water; to use alternative contraception
• All aspects of product therapy: to complete entire course of medication to ensure organism death (10-14 days); that culture may be taken after completed course of medication
• To report sore throat, fever, fatigue, diarrhea (may indicate superinfection); to report rash, other signs of allergy
• That product must be taken in equal intervals around the clock to maintain blood levels
• To wear or carry emergency ID if allergic to penicillins
• **CDAD:** diarrhea with blood or pus; notify prescriber
• **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding; to use additional contraception if using oral contraception, effect may be decreased

TREATMENT OF ANAPHYLAXIS: Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

ampicillin, sulbactam (Rx)

Unasyn
Func. class.: Antiinfective—broad-spectrum
Chem. class.: Aminopenicillin with β-lactamase inhibitor

ACTION: Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells, bursts from osmotic pressure; lysis due to cell wall autolytic enzymes; combination extends spectrum of activity by β-lactamase inhibition

USES: Skin infections, intraabdominal infections, cellulitis, diabetic foot ulcer, nosocomial pneumonia, gynecologic infections; *Acinetobacter* sp., *Actinomyces* sp., *Bacillus anthracis, Bacteroides* sp., *Bifidobacterium* sp., *Bordetella pertussis, Borrelia burgdorferi, Brucella* sp., *Clostridium* sp., *Corynebacterium diphtheriae/xerosis, Eikenella corrodens, Enterococcus faecalis, Erysipelothrix rhusiopathiae, Escherichia coli, Eubacterium* sp., *Fusobacterium* sp., *Gardnerella vaginalis, Haemophilus influenzae (β-lactamase negative/positive), Helicobacter pylori, Klebsiella* sp., *Lactobacillus* sp., *Leptospira* sp., *Listeria monocytogenes, Moraxella catarrhalis, Morganella morganii, Neisseria gonorrhoeae, Pasteurella multocida, Peptococcus* sp., *Peptostreptococcus* sp., *Porphyromonas* sp., *Prevotella* sp., *Propionibacterium sp., Proteus mirabilis, Proteus vulgaris, Providencia rettgeri, Providencia stuartii, Salmonella* sp., *Shigella* sp., *Staphylococcus aureus (MSSA)/epidermidis/saprophyticus, Streptococcus agalactiae/dysgalactiae/pneumoniae/pyogenes, Treponema pallidum,* viridans streptococci

CONTRAINDICATIONS: Hypersensitivity to penicillins, sulbactam

Precautions: Pregnancy, breastfeeding, neonates, hypersensitivity to cephalosporins/carbapenems, renal disease, mononucleosis, viral infections, syphilis

DOSAGE AND ROUTES

- **Adult/adolescent/child ≥40 kg: IM/IV** 1.5-3 g q6hr, max 4 g/day sulbactam
- **Child ≤40 kg: IV** 150-300 mg/kg/day divided q6hr

Renal disease

- **Adult ≥40 kg: IM/IV** CCr 15-30 mL/min dose q12hr; CCr 5-15 mL/min dose q24hr

Available forms: Powder for injection 1.5 g (1 g ampicillin, 0.5 g sulbactam), 3 g (2 g ampicillin, 1 g sulbactam), 15 g (10 g ampicillin, 5 g sulbactam)

Administer:

IM route

- Reconstitute by adding 3.2 mL sterile water/1.5-g vial; 6.4 mL/3-g vial, give deep in large muscle, aspirate
- Do not use IM in child

Direct IV route

- After diluting 1.5 g/3.2 mL sterile water for injection or 3 g/6.4 mL (250 mg ampicillin/125 mg sulbactam), allow to stand until foaming stops; may give over 15 min, inject slowly

Intermittent IV INFUSION route

- Dilute further in 50 mL or more of D_5W, NaCl; administer within 1 hr after reconstitution; give over 15-30 min, separate doses from aminoglycosides by ≥1 hr

Y-site compatibilities: Alemtuzumab, amifostine, aminocaproic acid, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, CARBOplatin, carmustine, cefepime, CISplatin, codeine, cyclophosphamide, cytarabine, DAPTOmycin, DAUNOrubicin liposome, dexmedetomidine, DOCEtaxel, doxacurium, DOXOrubicin liposomal, eptifibatide, etoposide, fenoldopam, filgrastim, fludarabine, fluorouracil, foscarnet, gallium, gatifloxacin, gemcitabine, granisetron, hetastarch, irinotecan, levoFLOXacin, linezolid, methotrexate, metroNIDAZOLE, octreotide, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, remifentanil, riTUXimab, rocuronium, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TNA, TPN, trastuzumab, vecuronium, vinCRIStine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Coma, seizures (high dose)

GI: *Nausea, vomiting, diarrhea,* abdominal pain, CDAD, hepatotoxicity

HEMA: Anemia, bone marrow depression, granulocytopenia, leukopenia, eosinophilia
INTEG: Injection site reactions, rash, urticaria
MISC: Anaphylaxis, serum sickness, Stevens-Johnson syndrome

PHARMACOKINETICS

IV: Peak 5 min, IM 1 hr; half-life 50-110 min (ampicillin) 1-1.4 hr (sulbactam), 10%-50% metabolized in liver, 75%-85% of both products excreted in urine, excreted in breast milk, crosses placenta

INTERACTIONS

Increase: bleeding risk—oral anticoagulants; check INR, PT
Increase: ampicillin-induced skin rash—allopurinol, check for rash
Increase: ampicillin level—probenecid
Increase: methotrexate level—methotrexate
Decrease: contraception effect—oral contraceptives, use additional contraception
Drug/Lab Test
False positive: urine glucose, urine protein

NURSING CONSIDERATIONS

Assess:
- For previous sensitivity to penicillin or cephalosporins, cross-sensitivity is common
- **Infection:** characteristics of wound, sputum; take temperature, WBC count, check allergies before using; C&S before product therapy, product may be given as soon as culture is taken
- **CDAD:** bowel pattern before, during treatment
- Hepatic studies: AST, ALT if on long-term therapy or impaired liver function
- **Anaphylaxis:** skin eruptions after administration of ampicillin to 1 wk after discontinuing product

Evaluate:
- Therapeutic response: absence of fever, draining wounds; negative C&S

Teach patient/family:
- To report superinfection: vaginal itching; loose, foul-smelling stools; black furry tongue
- **CDAD:** to report immediately to health care provider symptoms of fever, diarrhea with pus, blood, mucus; may occur up to 4 wk after treatment
- To wear or carry emergency ID if allergic to penicillin products
- **Pregnancy/breastfeeding:** If pregnancy is planned or suspected; use additional contraception if using oral contraceptives

TREATMENT OF ANAPHYLAXIS: Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

anakinra (Rx)

(an-ah-kin′rah)

Kineret

Func. class.: Antirheumatic (DMARD), immunomodulator

USES: Reduction in signs and symptoms of moderate to severe active rheumatoid arthritis in patients ≥18 yr who have not responded to other disease-modifying agents, neonatal-onset multisystem inflammatory disease

CONTRAINDICATIONS: Hypersensitivity to *Escherichia coli*–derived proteins, latex; sepsis

DOSAGE AND ROUTES

Rheumatoid arthritis
- **Adult: SUBCUT** 100 mg/day at same time of the day

Neonatal-onset multisystem inflammatory disease
- **Adult/child: SUBCUT** 1-2 mg/kg/day, may increase by 0.5-1 mg to max 8 mg/kg/day

Renal dose
- **Adult: SUBCUT** CCr <30 mL/min 100 mg every other day

Available forms: Injection 100 mg/0.67 mL prefilled syringe

⚠ HIGH ALERT

anastrozole (Rx)

(an-a-stroh′zole)

Arimidex

Func. class.: Antineoplastic

Chem. class.: Aromatase inhibitor

ACTION: Highly selective nonsteroidal aromatase inhibitor that lowers serum estradiol concentrations; many breast cancers have strong estrogen receptors

USES: Advanced breast carcinoma in estrogen receptor–positive patients (postmenopausal); patients with advanced disease taking tamoxifen, adjunct therapy
Unlabeled uses: Breast cancer risk reduction (postmenopausal women)

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity
Precautions: Children, geriatric patients, premenopausal women, osteoporosis, hepatic/cardiac disease

DOSAGE AND ROUTES

• **Adult: PO** 1 mg/day, max 5 yr, may also combine with tamoxifen for up to 10 yr
Breast cancer risk reduction (postmenopausal women) (unlabeled)
Adult: PO 1 mg/day × 5 yr
Available forms: Tablets 1 mg
Administer:
• Use cytotoxic handling procedures
• Give without regard to meals at same time of day
• Store in light-resistant container at room temperature

SIDE EFFECTS

CNS: *Hot flashes, headache, lightheadedness,* depression, dizziness, confusion, insomnia, anxiety, fatigue, mood changes
CV: Chest pain, *hypertension,* thrombophlebitis, *edema,* angina
GI: *Nausea, vomiting,* altered taste leading to anorexia, diarrhea, constipation, abdominal pain, dry mouth
GU: Vaginal bleeding, vaginal dryness, pelvic pain
INTEG: *Rash,* Stevens-Johnson syndrome, anaphylaxis, angioedema
MISC: Hypercholesterolemia
MS: Bone pain, myalgia, back pain, arthralgia, fractures
RESP: Cough, sinusitis, dyspnea
EENT: Pharyngitis

PHARMACOKINETICS

Peak 4-7 hr; half-life 50 hr; metabolized in liver 85%, excreted in feces, urine, terminal half-life 50 hr

INTERACTIONS

• Do not use with oral contraceptives, estrogen, tamoxifen, androstenedione, DHEA, may decrease the action of anastrozole
Drug/Lab Test
Increase: AST, ALT, cholesterol

NURSING CONSIDERATIONS

Assess:
• Bone mineral density, cholesterol, lipid panel, periodically
• **Serious skin reactions:** Stevens-Johnson syndrome
• **Pregnancy:** Identify that patient is not pregnant before starting
Evaluate:
• Therapeutic response: decreased tumor size, spread of malignancy
Teach patient/family:
• To report any complaints, side effects to prescriber
• That vaginal bleeding, pruritus, hot flashes are reversible after discontinuing treatment
• To report continued vaginal bleeding immediately
• That tumor flare—increase in size of tumor, increased bone pain—may occur and will subside rapidly; may take analgesics for pain
• **Pregnancy/breastfeeding:** to tell prescriber if pregnancy is planned or suspected; do not use in pregnancy and for 3 wk after last dose or breastfeeding during or for 15 days after product is stopped
• To take adequate calcium and vitamin D due to risk for bone loss/fractures
• That follow-up exams will be needed

antithymocyte

See lymphocyte immune globulin

anidulafungin (Rx)

(a-nid-yoo-luh-fun'jin)

Eraxis

Func. class.: Antifungal, systemic

Chem. class.: Echinocandin

ACTION: Inhibits fungal enzyme synthesis; causes direct damage to fungal cell wall

USES: Esophageal candidiasis, *Candida albicans, C. glabrata, C. parapsilosis, C. tropicalis*

CONTRAINDICATIONS: Hypersensitivity to product, other echinocandins

Precautions: Pregnancy, breastfeeding, children, severe hepatic disease

DOSAGE AND ROUTES

Candidemia and other *Candida* infections

- **Adult: IV** 200-mg loading dose on day 1, then 100 mg/day, continue treatment for 2 weeks after documented clearance of Candida from bloodstream and resolution of symptoms

Esophageal candidiasis

- **Adult: IV** 200 mg/day × 14-21 days

Available forms: Powder for injection, lyophilized 50 mg/vial, 100 mg/vial for IV use

Administer:

IV route

- Obtain C&S tests before starting treatment
- Visually inspect prepared infusions for particulate matter and discoloration, do not use if present; give by IV infusion only, after dilution
- **Reconstitution:** Reconstitute each 50-mg or 100-mg vial/15 mL or 30 mL of sterile water for injection, respectively (3.33 mg/mL)
- **Storage:** Reconstituted solutions are stable for up to 24 hr at room temperature
- **Dilution:** Do not use any other diluents besides D_5W or sodium chloride 0.9% (NS)
- **Preparation of the 100-mg daily infusion:** Withdraw the contents of one 100-mg reconstituted vial OR two 50-mg reconstituted vials and add to an IV infusion bag or bottle containing 100 mL of D_5W or NS to give a total infusion volume of 130 mL
- **Preparation of a 50-mg daily infusion:** Withdraw the contents of one 50-mg reconstituted vial and add to an IV infusion bag or bottle containing 50 mL of D_5W or NS to give a total infusion volume of 65 mL
- **Storage:** Diluted solutions are stable for up to 48 hr at temperatures up to 77°F (25°C) or for 72 hr if stored frozen

Intermittent IV Infusion

- Do not mix or co-infuse with other medications
- Administer as a slow IV infusion at a rate of 1.4 mL/min or 84 mL/hr; the minimum duration of infusion is 180 min for the 200-mg dose, 90 min for the 100-mg dose, and 45 min for the 50-mg dose
- Store reconstituted vials at 59°F-86°F (15°C-30°C) for up to 24 hr, do not freeze (dehydrated alcohol); store reconstituted vials at 36°F-46°F (2.2°C-7.7°C) (sterile water) for up to 24 hr, do not freeze

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamy-

cin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin liposome, DAUNOrubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levoFLOXacin, lidocaine, linezolid injection, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANTRONE, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, rocuronium, sodium acetate, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, *headache,* fever, depression
CV: DVT, hypotension, chest pain, edema
GI: *Nausea, anorexia, vomiting, diarrhea*
META: Hypokalemia
RESP: Dyspnea, cough
HEMA: Anemia, thrombocytopenia
INTEG: *Rash,* urticaria, itching, flushing
META: Hyperkalemia
GU: UTI
EENT: Oral candidiasis
MS: *Back pain*

PHARMACOKINETICS

Steady state after loading dose, half-life 40-50 hr, protein binding 99%, crosses placenta, no metabolism, onset up to 24 hr

INTERACTIONS

None known

Drug/Lab Test

Increase: amylase, bilirubin, creatinine, lipase, PT, alkaline phosphatase, AST, ALT
Decrease: Magnesium, potassium, glucose

NURSING CONSIDERATIONS

Assess:

- **Infection:** clearing of cultures during treatment; obtain culture at baseline and throughout treatment; product may be started as soon as culture is taken, those with HIV pharyngeal candidiasis may need additional antifungals
- Hepatic studies before, during treatment: bilirubin, AST, ALT, alkaline phosphatase, as needed; also uric acid
- **GI symptoms:** frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given

Evaluate:

- Therapeutic response: decreased symptoms of *Candida* infection, negative culture

Teach patient/family:

- The reason for product, expected result

• **Anaphylaxis:** To report anaphylaxis symptoms immediately
• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is suspected, planned; to avoid breastfeeding

anifrolumab-fnia (Rx)

(an-i-FROL-ue-mab-fnia)

Saphnelo

Func. class.: Monoclonal antibody
Chem. class.: Type 1 interferon receptor antagonist

ACTION:

Binds to subunit 1 of the type I interferon, inhibition of type I IFN, blocks plasma cell differentiation and normalizes peripheral T-cells

USES:

Systemic lupus erythematosus

CONTRAINDICATIONS

Anaphylaxis
Precautions: Serious infections, hypersensitivity, malignancy, pregnancy, breastfeeding

DOSAGE AND ROUTES

• **Adult: IV INF** 300 mg over 30 min q4wk
Available forms: Injection: 300 mg/2 mL (150 mg/mL) in a single-dose vial
Administer:
IV INF route
• Visually inspect for particulates and discoloration, product should be clear to opalescent, colorless to slightly yellow; discard if cloudy, discolored or visible particles are present
• Do not shake
• Withdraw and discard 2 mL of solution from a 100 mL 0.9% NaCl injection, USP infusion bag
• Withdraw 2 mL of solution from the vial and add to the infusion bag, mix the solution by gentle inversion, do not shake
• Discard any unused portion
• Use immediately after preparation; if not used immediately, store diluted solution at room temperature (59°F-77°F, 15°C-25°C) for ≤4 hr, or refrigerated (36°F-46°F, 2°C-8°C) for ≤24 hr; do not freeze, protect from light; if refrigerated, allow to come to room temperature before use
• Give over 30 min; use an infusion line containing a sterile, low-protein-binding 0.2 or 0.22 micron in-line filter
• Flush with 25 mL normal saline after completion, do not admix or administer through same line
• Dispose of any equipment as per agency policy

SIDE EFFECTS

• **RESP:** Nasopharyngitis, URI, bronchitis, cough
• **INTEG:** Infusion-related reactions
• **SYST:** Herpes zoster

INTERACTIONS

Avoid use with other biologic therapies, live, live-attenuated vaccines

PHARMACOKINETICS

Onset, peak, duration unknown

NURSING CONSIDERATIONS

Assess:
• **Serious infections:** Assess for active and chronic infections, avoid starting treatment in those with active infections
• **Hypersensitivity:** Serious hypersensitivity reactions, including anaphylaxis and angioedema have been reported
• **Malignancy:** Assess history of past or present malignancies, assess risk factors for malignancy before use
• **Immunizations:** Avoid use of live or live-attenuated vaccines in patients receiving, bring immunizations up to date before use
Evaluate:
• Therapeutic response: Decreasing effects of SLE
Teach patient/family:
• **Serious, chronic infections:** Teach patient to report signs, symptoms of infections (flulike symptoms, URI, bronchitis, or worsening of chronic infections)
• **Hypersensitivity:** Inform patient to report any allergic reactions, including itching, rash, trouble breathing, immediately to health care provider

• **Malignancy:** Consider the individual benefit and risk in patients with known risk factors for malignancy before prescribing
• **Immunization:** Bring immunizations up to date before use
• **Pregnancy/breastfeeding:** Notify health care provider if pregnancy is planned or suspected or if breastfeeding

antihemophilic factor Fc fusion protein (Rx)

(an-tee-hee-moe-fil′ik fak′tor)

Eloctate

Func. class.: Hemostatic

USES: Hemophilia A (congenital factor VIII deficiency), control/prevention of bleeding, perioperative management of surgical bleeding

DOSAGE AND ROUTES

Hemophilia A (congenital factor VIII deficiency)

• **Adults, adolescents, children, infants, and neonates: IV INFUSION** Infuse dose ≤10 mL/min; dose (IU) = body weight (kg) × desired factor VIII increase (IU/dL or % of normal) × 0.5 (IU/kg per IU/dL) *OR* estimated increment of factor VIII (IU/dL or % of normal) = [total dose (IU)/body weight (kg)] × 2 (IU/dL per IU/kg)

Control/prevention of bleeding

• **Adults, adolescents, children, infants, and neonates:** Dose and duration of treatment depend on the severity of the factor VIII deficiency, the location and extent of bleeding, and the patient's clinical condition

Perioperative management of surgical bleeding

• **Adults, adolescents, children, infants, and neonates:** Dose and duration of treatment depend on the severity of the factor VIII deficiency, the location and extent of bleeding, and the patient's clinical condition

Routine bleeding prophylaxis to prevent/reduce the frequency of bleeding episodes

• **IV** Initially, 50 IU/kg q4days; adjust dose based on response

⚠ HIGH ALERT

apalutamide (Rx)

(a′puh-loo′tuh-mide)

Erleada

Func. class.: Antineoplastic

Chem. class.: Anti-androgen receptor inhibitor

ACTION: An androgen receptor inhibitor that binds directly to the ligand-binding domain of the androgen receptor. It inhibits androgen receptor translocation and DNA binding and impedes androgen receptor–mediated transcription

USES: For the treatment of nonmetastatic castration-resistant prostate cancer

CONTRAINDICATIONS: Pregnancy

Precautions: Bone fractures, breastfeeding, contraception requirements, driving or operating machinery, geriatric patients, infertility, male-mediated teratogenicity, reproductive risk, seizure disorder, seizures

DOSAGE AND ROUTES

Nonmetastatic, castration-resistant prostate cancer

• **Adults: PO** 240 mg daily until disease progression or toxicity; a gonadotropin-releasing hormone (GnRH) analog should be given concurrently or a bilateral orchiectomy should have been performed

Available forms: Tablet 60 mg

SIDE EFFECTS

CNS: Fatigue

CV: Hypertension, peripheral edema, heart failure, MI

GI: Diarrhea, anorexia, nausea, weight loss

GU: Hot flashes
HEMA: Anemia, leukopenia, lymphopenia
INTEG: Rash
META: Hypercholesterolemia, hypertriglyceridemia, hyperkalemia
MS: Arthralgia, bone fractures

PHARMACOKINETICS

96% plasma protein binding, primarily metabolized by CYP2C8 and CYP3A4 to its active metabolite, half-life 3 days, excreted 65% urine (unchanged), 24% feces (unchanged)

INTERACTIONS

Decrease: effects of CYP3A4 substrates—abemaciclib, cycloSPORINE, tacrolimus, sirolimus, DOCEtaxel, tamoxifen, PACLitaxel, cyclophosphamide, DOXOrubicin, erlotinib, etoposide, ifosfamide, teniposide, vinBLAStine, vinCRIStine, vindesine, imatinib, irinotecan, sorafenib, sunitinib, vemurafenib, temsirolimus, anastrozole, gefitinib, azole antifungals, macrolides, clarithromycin, erythromycin, telithromycin, dapsone, tricyclic antidepressants, SSRIs, some miscellaneous antidepressants, antipsychotics, opioids, benzodiazepines, some hypnotics, busPIRone, statins, calcium channel blockers, class I/III antidysrhythmics, PDE5 inhibitors, sex hormone agonists/antagonists, H1-receptor antagonists, protease inhibitors, non-nucleoside reverse transcriptase inhibitors; avoid concurrent use

NURSING CONSIDERATIONS

Assess

- **Possible bone fractures:** monitor and manage patients at risk for bone fractures; consider the use of bone-targeted agents. Falls and fractures are possible
- **Seizures:** use with caution in those with pre-existing seizure disorders; permanently discontinue if seizure occurs
- **Geriatric patients:** may be at increased risk for related adverse reactions; monitor closely for adverse reactions
- **Pregnancy/breastfeeding:** contraindicated in pregnancy, male infertility is a possibility

Evaluate:

- Therapeutic response: decrease in prostatic size, decrease in spread of cancer

Teach patient/family

- **Male-mediated teratogenicity:** that product is not indicated for use in females; that males with female partners of reproductive potential should avoid pregnancy and use effective contraception during and for at least 3 mo after treatment; that product may impair male fertility
- **Seizures:** about an increase in the risk of seizure and the risk of engaging in any activity where sudden loss of consciousness could cause harm to themselves or others (driving or operating machinery). It is unknown whether antiepileptic medications will prevent seizures

⚠ HIGH ALERT

apixaban (Rx)

(a-pix′-a-ban)

Eliquis

Func. class.: Anticoagulant
Chem. class.: Factor Xa inhibitor

ACTION: Inhibits factor Xa and thereby decreases thrombin and clot formation

USES: Deep venous thrombosis (DVT) after hip or knee replacement, to prevent stroke and embolism in atrial fibrillation (nonvalvular)

CONTRAINDICATIONS: Hypersensitivity, active bleeding
Precautions: Breastfeeding, dialysis, hepatic/renal disease, labor, pregnancy, surgery, prosthetic heart valves

Black Box Warning: Abrupt discontinuation, epidural, spinal anesthesia, lumbar puncture

DOSAGE AND ROUTES

DVT or pulmonary embolism (PE)

- **Adult: PO** 10 mg bid × 7 days, then 5 mg bid ≥6 mo, to reduce recurrence >6 mo 2.5 mg bid

Stroke prophylaxis and systemic embolism prophylaxis

- **Adult: PO** 5 mg bid; in those with any 2 of the following—age ≥80 yr, body weight ≤60 kg, or serum creatinine ≥1.5 mg/dL—reduce the dose to 2.5 mg bid. Also decrease the dose to 2.5 mg bid (strong inhibitor of both CYP3A4 and P-glycoprotein)

Reduction in risk of recurrent DVT and/or PE after completion of treatment for acute DVT or PE

- **Adult:** 2.5 mg bid daily after at least 6 mo of treatment for DVT or PE

DVT prophylaxis and PE prophylaxis in patients undergoing knee or hip replacement surgery

- **Adult:** 2.5 mg bid × 12 days after knee replacement surgery or for 35 days after hip replacement surgery. Give initial dose 12-24 hr after surgery

Renal dose:

- No dosage adjustment needed when used for treatment/prevention of venous thromboembolism
- **Adult: PO** serum CCr ≥1.5 mg/dL, ≤60 kg, and/or ≥80 yr; if 2 of these 3 characteristics are present, then decrease dose to 2.5 mg bid

Hemodialysis end-stage renal disease maintained on hemodialysis

- **Adult: PO** 5 mg bid; reduce to 2.5 mg bid if patient is ≥80 yr or ≤60 kg

Available forms: Tablets 2.5, 5 mg

Administer:

- May be taken without regard to food
- If unable to swallow whole, may crush and suspend the tablet in 60 mL 5% dextrose solution; give immediately via NG
- If a dose is missed, it should be taken as soon as possible on the same day. Twice-daily dosing should be resumed. Do not double the dose to make up for a missed dose.

SIDE EFFECTS

CNS: Syncope, intracranial bleeding
CV: Hypotension
HEMA: Severe bleeding
INTEG: Rash
MISC: Hypersensitivity

PHARMACOKINETICS

Peak 3-4 hr, half-life 12 hr

INTERACTIONS

Increase: bleeding risk—antiplatelets, other anticoagulants, salicylates, NSAIDs, SNRIs, SSRIs, thrombolytics; avoid concurrent use

Increase: apixaban effect—CYP3A4 inhibitors, P-gp; give 2.5 mg apixaban

Decrease: apixaban effect—strong inducers of CYP3A4 and also P-glycoprotein (carBAMazepine, ketoconazole, itraconazole, phenytoin, rifAMPin); use lower dose

Drug/Herb

Decrease: apixaban effect—St. John's wort; avoid concurrent use

Drug/Lab Test

Increase: PT, PTT, INR, coagulation studies

NURSING CONSIDERATIONS

Assess:

- **Bleeding:** bleeding may occur from any body system; may be fatal if severe

Black Box Warning: Neurologic status: monitor for impairment, including numbness, paresthesia, weakness, confusion, back pain, bowel/bladder impairment; notify prescriber immediately

Black Box Warning: Abrupt discontinuation: do not discontinue abruptly; if bleeding occurs, consider using another anticoagulant to prevent thromboembolic events

Black Box Warning: Epidural, spinal anesthesia, lumbar puncture: avoid use in these conditions, risk of hematoma and permanent paralysis, may be increased with use of other anticoagulants, thrombolytics, antiplatelets

- **Hypersensitivity:** rash, itching, chills, fever; report to prescriber
- **Beers:** avoid in older adults; may cause increased risk of bleeding, decreased creatinine clearance

Evaluate:

Therapeutic response: prevention/treatment of DVT, adequate anticoagulation

Teach patient/family:

Black Box Warning: Not to discontinue without prescriber approval; stroke, clots may occur

- **Bleeding:** to report bleeding, bruising, confusion, weakness, numbness of limbs
- To avoid OTC products, supplements, herbs unless approved by prescriber; serious product interactions may occur
- To carry emergency ID with product taken; to inform all health providers of product use
- To report hypersensitivity reactions: rash, chills, fever, itching
- **Pregnancy/breastfeeding:** To avoid breastfeeding; it is not known if the product appears in breast milk; to notify prescriber if pregnancy is planned or suspected

apomorphine (Rx)

(ah-poe-more'feen)

Apokyn, Kynmobi, Movapo

Func. class.: Antiparkinson agent

Chem. class.: DOPamine agonist, non-ergot

USES: For use as rescue of "off" episodes associated with advanced Parkinson's disease

CONTRAINDICATIONS: Hypersensitivity to this product, sulfites, or benzyl alcohol, IV use, major psychotic disorder; concurrent treatment with drugs of the $5\text{-}HT_3$ antagonist class (e.g., ondansetron, granisetron, alosetron)

DOSAGE AND ROUTES

- **Adult: Test dose: SUBCUT** 0.2 mL (2 mg) (test dose) where B/P can be closely monitored (before dose and 20, 40, 60 min after); if tolerated and patient responds, then begin with 0.2 mL (2 mg); may increase by 1 mg every few days, max 0.6 mL (6 mg)
- **Usual dosage: SUBCUT** 0.3-0.6 mL (3-6 mg), average frequency tid
- **SL:** 10 mg as needed at ≥2 hr for "off episodes" up to a max 5 doses daily

Available forms: Solution for injection 10 mg/mL with benzyl alcohol

apraclonidine ophthalmic

See Appendix B

apremilast (Rx)

(a-pre'mi-last)

Otezla

Func. class.: Musculoskeletal agents: disease-modifying antirheumatic drugs (DMARDs)

Chem. class.: Phosphodiesterase-4 inhibitors

ACTION: A phosphodiesterase-4 (PDE4) inhibitor specific for cyclic adenosine monophosphate (cAMP). Inhibition of PDE4 results in an increase in intracellular concentration of cAMP, with a partial inhibition of proinflammatory mediators and an increase in the production of some antiinflammatory mediators

USES: Treatment of active psoriatic arthritis; severe plaque psoriasis (in those not a candidate for phototherapy)/oral ulcers in Behcet disease

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, depression/suicidal, renal disease (CCr <30 mL/min)

DOSAGES AND ROUTES

Active psoriatic arthritis/severe plaque psoriasis/oral ulcers in Behcet's disease

- **Adult: PO** day 1: 10 mg **PO** AM; day 2: 10 mg AM and PM; day 3: 10 mg AM and 20 mg PM; day 4: 20 mg AM and PM; day 5: 20 mg AM and 30 mg PM; day 6 and thereafter: 30 mg bid

Renal dose

- **Adult: PO** CCr ≥30 mL/min: no change; CCr <30 mL/min: 30 mg every day. Initially, 10 mg AM days 1-3; 20 mg AM days 4 and 5; 30 mg every day for day 6 and thereafter

Available forms: Tablets 10, 20, 30 mg; starter pack

Administer:

- Give whole; do not crush, break, or chew; give without regard to meals

SIDE EFFECTS

CNS: *Headache,* depression, suicidal ideation, fatigue, insomnia

GI: Diarrhea, nausea, vomiting, abdominal pain, frequent bowel movements, dyspepsia, weight loss

RESP: URI, pharyngitis, bronchitis

SYST: Hypersensitivity reactions

MS: Back pain

PHARMACOKINETICS

68% protein binding; metabolized by CYP3A4; half-life 6-9 hr; excreted urine 58%, feces 39%; peak 2.5 hr

INTERACTIONS

Decrease: apremilast—CYP3A4 inducers (rifAMPin, isoniazid, pyrazinamide, barbiturates, phenytoin, carBAMazepine, enzalutamide); avoid concurrent use

Drug/Herb

Decrease: apremilast—CYP3A4 inducers (St. John's wort); avoid concurrent use

NURSING CONSIDERATIONS

Assess:

- **Psoriatic arthritis/severe plaque psoriasis:** assess for hypersensitivity reactions
- For depression and suicidal ideation, mood changes
- For renal failure or severe renal impairment (CrCl <30 mL/min), dosage reduction is required
- For significant or unexplained weight loss; report weight loss, as therapy may need to be discontinued
- **Pregnancy and breastfeeding:** if pregnancy is planned or suspected; use only if benefits outweigh fetal risk; if used during pregnancy, call 877-311-8972; cautious use in breastfeeding

Evaluate:

- Therapeutic response: resolution of symptoms of psoriatic arthritis or plaque psoriasis

Teach patient/family:

- To report new rash, hypersensitivity reactions; report change in urine output, renal disease history
- To be alert for depression and suicidal ideation, mood changes; if these occur, notify prescriber immediately

aprepitant (PO) (Rx)

(ap-re'pi-tant)

Cinvanti, Emend

fosaprepitant (IV) (Rx)

Emend

Func. class.: Antiemetic

Chem. class.: Substance P/neurokinin antagonist

Do not confuse:

aprepitant/fosaprepitant

ACTION: Selective antagonist of human substance P/neurokinin 1 (NK_1) receptors that decreases emetic reflex

USES: Prevention of nausea/vomiting associated with cancer chemotherapy (highly emetogenic/moderately emetogenic), including high-dose CISplatin; used in combination with other antiemetics; postoperative nausea/vomiting

CONTRAINDICATIONS: Hypersensitivity to this product, polysorbate 80, pimozide

Precautions: Pregnancy, breastfeeding, children, geriatric patients, hepatic disease

DOSAGE AND ROUTES

Prevention of nausea/vomiting after chemotherapy

• **Adult: PO** Day 1 (1 hr before chemotherapy) aprepitant 125 mg with 12 mg dexamethasone **PO,** with 32 mg ondansetron **IV;** day 2 aprepitant 80 mg with 8 mg dexamethasone **PO;** day 3 aprepitant 80 mg with 8 mg dexamethasone **PO;** day 4 only dexamethasone 8 mg **PO; Adult: IV** (Cinvanti): (HEC) On day 1 130 mg over 30 min before chemotherapy; 3-day regimen (MEC) on day 1 100 mg over 30 min, given 30 min before chemotherapy, on day 2 and 3 80 mg PO 1 hr before chemotherapy, given in AM if no chemotherapy is given **Child ≥12 yr: PO capsules** 125 mg 1 hr prior to chemotherapy; suspension 3 mg/kg 1 hr prior to chemotherapy, max 125 mg

IV INFUSION

150 mg fosaprepitant over 15 min, 30 min prior to chemotherapy

Prevention of postoperative nausea/vomiting

• **Adult: PO** 40 mg within 3 hr of induction of anesthesia

Available forms: Capsules 40, 80, 125 mg; lyophilized powder for injection, 150 mg; combo pack capsules 80-125 mg; powder for oral suspension 125 mg/pouch

Administer:

• Give with dexamethasone and a 5-HT3 antagonist

PO route

• Do not break, crush, or chew

• PO on 3-day schedule, give with full glass of water 1 hr before chemotherapy, with or without food, given with other antiemetics

• Do not open or break capsules

• **Suspension:** Use for children unable to swallow capsules, administer slowly, store at room temperature

• Store at room temperature; keep in original bottles, blisters

Intermittent IV INFUSION route (Fosaprepitant-Emend)

• Use IV on day 1 of 3-day regimen

• **Reconstitution:** use aseptic technique; inject 5 mL 0.9% NaCl into the vial, directing stream to wall of vial to prevent foam; swirl (do not shake)

• Prepare infusion bag 145 mL/150 mg; do not dilute, reconstitute with calcium, magnesium, including LR, Hartmann's solution

• Withdraw entire volume from vial, transfer to infusion bag; total volume 115 mL (1 mg/1 mL)

• Gently invert bag; reconstituted solution stable for 24 hr at lower room temperature or (<77°F/<25°C)

• Visually inspect for particulates, discoloration

• Infuse over 30 min, stable for 24 hr at room temperature, 30 min prior to chemotherapy, pediatrics use CVAD

• Monitor for IV site reactions

Aprepitant (Cinvanti)

• Withdraw 18 mL for the 130-mg dose or 14 mL for the 100-mg dose from the vial and transfer it into an infusion bag filled with 100 mL of 0.9% NaCl or D_5W

• Gently invert the bag 4 to 5 times. Avoid shaking

• Before using, inspect the bag for particulate matter and discoloration. Discard if present

SIDE EFFECTS

CNS: *Headache, dizziness,* insomnia, weakness, headache, fever

CV: Bradycardia, hypo/hypertension

GI: *Diarrhea, constipation,* abdominal pain, *nausea,* vomiting, heartburn

HEMA: Anemia

INTEG: Pruritus, rash, urticaria, injection reaction

MISC: Fatigue, dehydration, fever, alopecia

PHARMACOKINETICS

Absorption 60%-65%, peak 4 hr (PO) infusion's end (IV), metabolized in liver by CYP3A4 enzymes to active metabolite, half-life 9-12 hr, 95% protein bound, not excreted in kidneys, crosses blood-brain barrier

INTERACTIONS

Increase: levels of each product—ALPRAZolam, midazolam, triazolam; decrease benzodiazepine dose

Increase: aprepitant action—CYP3A4 inhibitors (ketoconazole, itraconazole, nefazodone, troleandomycin, clarithromycin, ritonavir, nelfinavir, diltiaZEM)
Increase: action of CYP3A4 substrates (pimozide, dexamethasone, methylPREDNISolone, midazolam, ALPRAZolam, triazolam, DOCEtaxel, PACLitaxel, etoposide, irinotecan, imatinib, ifosfamide, vinorelbine, vinBLAStine, vinCRIStine), avoid concurrent use
Decrease: aprepitant action—CYP3A4 inducers (rifAMPin, carBAMazepine, phenytoin)
Decrease: action of CYP2C9 substrates (warfarin, phenytoin), hormonal contraceptives
Decrease: action of both products—PARoxetine
Drug/Food
Decrease: effect—grapefruit juice
Drug/Lab
Increase: AST/ALT, alkaline phosphatase
Decrease: HB,WBC

NURSING CONSIDERATIONS

Assess:
- **For hypersensitivity reactions:** pruritus, rash, urticaria, anaphylaxis
- CV status: hypo/hypertension, bradycardia, tachycardia, DVT
- For absence of nausea, vomiting during chemotherapy
- For drug/herb/supplement interactions, as there are many
- CBC, LFTs, creatinine baseline and periodically

Evaluate:
- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy, or post-op

Teach patient/family:
- To take only as prescribed; to take first dose 1 hr prior to chemotherapy or within 3 hr of surgery to prevent nausea, vomiting
- To report all medications and herbals to prescriber before taking this medication
- That those patients also taking warfarin should have clotting monitored closely during 2-wk period after administration of aprepitant
- **Pregnancy/breastfeeding:** to use nonhormonal form of contraception while taking this agent and for 1 mo thereafter; oral contraceptive effect may be decreased; to avoid breastfeeding

arformoterol (Rx)

(ar-for-moe′ter-ole)
Brovana
Func. class.: Long-acting adrenergic β_2-agonist, sympathomimetic, bronchodilator

USES: Maintenance bronchospasm prevention in COPD, including chronic bronchitis, emphysema

CONTRAINDICATIONS: Hypersensitivity to sympathomimetics, product, racemic formoterol; tachydysrhyhmias, severe cardiac disease, heart block, children, monotherapy in asthma

DOSAGE AND ROUTES

COPD
- **Adult: NEB** 15 mcg, bid, AM, PM, max 30 mcg/day

Available forms: solution for inhalation 15 mcg/2 mL vials

⚠ *HIGH ALERT*

argatroban (Rx)

(are-ga-troe′ban)
Func. class.: Anticoagulant
Chem. class.: Direct thrombin inhibitor

Do not confuse:
argatroban/Aggrastat

ACTION: Direct inhibitor of thrombin; it reversibly binds to thrombin active site

USES: Anticoagulation prevention/treatment of thrombosis in heparin-induced thrombocytopenia; adjunct to percutaneous coronary intervention (PCI) in those with history of HIT, deep vein thrombosis, pulmonary embolism

CONTRAINDICATIONS:
Hypersensitivity, overt major bleeding

Precautions: Pregnancy, breastfeeding, children, intracranial bleeding, renal function impairment, hepatic disease, severe hypertension, after lumbar puncture, spinal anesthesia, major surgery/trauma, congenital/acquired bleeding, GI ulcers, abrupt discontinuation

DOSAGE AND ROUTES
Prevention/treatment of thrombosis (heparin-induced thrombocytopenia)

• **Adult: CONT IV INFUSION** 2 mcg/kg/min; adjust dose until steady-state aPTT is 1.5-3 × initial baseline, max 100 sec, max dose 10 mcg/kg/min

Hepatic dose

• **Adult: CONT INFUSION** 0.5 mcg/kg/min; adjust rate based on aPTT

Percutaneous coronary intervention (PCI) in HIT

• **Adult: IV INFUSION** 25 mcg/kg/min and bolus of 350 mcg/kg given over 3-5 min, check ACT 5-10 min after bolus completed, proceed if ACT >300 sec; if ACT <300 sec, give another 150 mcg/kg blous, increase infusion rate to 30 mcg/kg/min, recheck ACT in 5-10 min; if ACT >450 sec, decrease infusion rate to 15 mcg/kg/min, recheck ACT in 5-10 min; when ACT is therapeutic, continue for duration of procedure

Available forms: Injection 100 mg/mL (2.5 mL; must dilute 100-fold), 50 mg/50 mL, 125 mg/125 mL

Administer:

• Avoid all IM injections that may cause bleeding

IV, direct route

• **For PCI:** 350 mg/kg blous and continuous infusion of 25 mcg/kg/min; check ACT 5-10 min after bolus

Intermittent IV INFUSION route

• **Dilute** in 0.9% NaCl, D_5W, LR to a final concentration of 1 mg/mL; **dilute** each 2.5-mL vial 100-fold by mixing with 250 mL of diluent, mix by repeated inversion of the diluent bag for 1 min; may briefly be slightly hazy

• Protect from sunlight

• Dosage adjustment may be made after review of aPTT, max 10 mcg/kg/min

SIDE EFFECTS
CNS: *Fever,* intracranial bleeding, headache

CV: Atrial fibrillation, coronary thrombosis, MI, myocardial ischemia, coronary occlusion, ventricular tachycardia, bradycardia, *chest pain, hypotension*

GI: *Nausea, vomiting, abdominal pain, diarrhea,* GI bleeding

HEMA: Bleeding

SYST: Anaphylaxis

PHARMACOKINETICS
Metabolized in liver, distributed to extracellular fluid, 54% plasma protein binding, half-life 39-51 min, excreted in feces, peak 1-2 hr (anticoagulant action)

INTERACTIONS
Increase: bleeding risk—antiplatelets, NSAIDs, salicylates, dipyridamole, clopidogrel, ticlopidine, heparin, warfarin, glycoprotein IIb/IIIa antagonists (abciximab, tirofiban, eptifibatide), thrombolytics (alteplase, reteplase, urokinase, tenecteplase), other anticoagulants; avoid using concurrently

Drug/Herb

Increase: bleeding risk—ginger, garlic, ginkgo, horse chestnut

Drug/Lab

Decrease: HB/Hct

NURSING CONSIDERATIONS
Assess:

• Obtain baseline aPTT prior to treatment, do not start if aPTT ratio ≥2.5, then aPTT 4 hr after initiation of treatment and at least daily thereafter; if aPTT is above target, stop infusion for 2 hr, then restart at 50%, take aPTT in 4 hr; if below target, increase infusion rate of 0.21 mg/kg/hr without checking for coagulation abnormalities, do not use with other parenteral anticoagulants

• **Bleeding:** gums; petechiae; ecchymosis; black, tarry stools; hematuria/epistaxis; decreased B/P, Hct; vaginal bleeding, possible hemorrhage

• **Anaphylaxis:** dyspnea, rash during treatment

• Fever, skin rash, urticaria

• **Pregnancy/breastfeeding:** if pregnancy is planned or suspected; if pregnant, use only if benefits outweigh fetal risk; do not breastfeed, excretion unknown

Evaluate:

• Therapeutic response: prevention of thrombosis

Teach patient/family:

• Reason for product, expected results

• To use a soft-bristle toothbrush to avoid bleeding gums; avoid contact sports; use electric razor; avoid IM injection

• To report any signs of bleeding: gums, under skin, urine, stool; trouble breathing, wheezing, skin rash

• **Pregnancy/breastfeeding:** to notify prescriber if planning to become pregnant, breastfeeding

• Not to use OTC meds, herbal products unless approved by prescriber

• To notify prescriber of hepatic/GI disease, recent surgery, injury

ARIPiprazole (Rx)

(a-rip-ip-pra′zol)

Abilify, Abilify Discmelt, Abilify Maintena, Abilify MyCite

Aripiprazole lauroxil

Aristada, Aristada Initio

Func. class.: Antipsychotic

Chem. class.: Quinolinone

Do not confuse:

ARIPiprazole/RABEprazole

ACTION: Exact mechanism unknown; may be mediated through both DOPamine type 2 (D_2, D_3) and serotonin type 2 ($5\text{-}HT_{1A}$, $5\text{-}HT_{2A}$) antagonism, DOPamine system stabilizer

USES: Schizophrenia and bipolar disorder (adults and adolescents), mania, major depressive disorder, short-term mania or mixed episodes of bipolar disorder; irritability in patients with autism

CONTRAINDICATIONS: Breastfeeding, hypersensitivity, seizure disorders

Precautions: Pregnancy, geriatric patients, renal/hepatic/cardiac disease, neutropenia

Black Box Warning: Children with depression; suicidal ideation; dementia

DOSAGE AND ROUTES

Major depressive disorder

• **Adult: PO** 2-5 mg/day as an adjunct to other antidepressant treatment; adjust by 5 mg at ≥1 wk (range, 2-15 mg/day)

Schizophrenia (Abilify Maintena PO/IM)

• **Adult: PO** 10-15 mg/day; if needed, dosage may be increased to 30 mg/day after 2 wk; maintenance 15 mg/day; periodically reassess; **IM/extended release** (monthly injection suspension) 400 mg monthly

• **Adolescent 13-17 yr: PO** 2 mg/day, may increase to 5 mg after 2 days, then 10 mg after 2 more days, max 30 mg/day

Schizophrenia (Aristada/Aristada INITIO)

• Use PO first before using these products to raise tolerability to product

• May give IM 1 dose of Aristada INITIO 675 mg (in either deltoid or gluteal muscle) and 1 dose of PO ARIPiprazole 30 mg with the first Aristada injection

• The first Aristada injection may be given on the same day as Aristada INITIO or up to 10 days after

• Avoid injecting both Aristada INITIO and Aristada concomitantly into the same site

OR

• Give 21 consecutive days of PO ARIPiprazole with the first Aristada injection

• Depending on individual patient's needs, treatment with Aristada can be initiated at a dose of 441 mg (monthly in deltoid or gluteal), 662 mg (monthly in gluteal), or 882 mg (monthly or every 6 wk in gluteal) or 1064 mg (every 2 mo in gluteal). The 441-mg, 662-mg, 882-mg, and 1064-mg doses correspond to 300 mg, 450 mg, 600 mg, and 724 mg of ARIPiprazole, respectively

Schizophrenia, bipolar disorder

- **Adult: PO** 15 mg/day, may increase to 30 mg if needed (monotherapy); adjunctive to lithium or valproate **PO** 10-15 mg daily, may increase to 30 mg if needed
- **Child >10 yr, adolescent: PO** 2 mg, titrate to 5 mg/day after 2 days to target of 10 mg/day after another 2 days

Agitation with bipolar disorder/ schizophrenia

- **Adult: IM** 9.75 mg as a single dose, may start with a lower dose, max 30 mg/day

Irritability associated with autism

- **Child ≥6 yr, adolescent: PO** 2 mg/day, increase to 5 mg/day after 1 wk, may increase to 10-15 mg/day if needed; dose changes should not occur more frequently than q1wk

Tourette's syndrome

- **Child 6-18 yr ≥50 kg: PO** 2 mg/day × 2 days, then increase to 5 mg/day, target 10 mg/day on day 8
- **Child 6-18 yr <50 kg: PO** 2 mg/day, increase to 5 mg/day after 2 days; may increase to 10 mg/day; adjust dose ≥1 wk

Potential CYP2D6 inhibitor, strong CYP3A4 inhibitors

- **Adult: PO** reduce to 50% of usual dose; increase dose when CYP2D6, CYP3A4 inhibitors withdrawn

Combination of strong CYP3A4/ CYP2D6 inhibitors

- **Adult: PO** reduce to 25% of usual dose

Available forms: Tablets 2, 5, 10, 15, 20, 30 mg; injection 9.75 mg/1.3 mL; orally disintegrating tablet 10, 15 mg; oral solution 1 mg/mL; suspension for injection 441 mg/1.6 mL, 662 mg/2.4 mL, 882 mg/3.2 mL in prefilled syringes (Aristada); 675 mg/2.4 mL (Arisada Initio); Tablet 2, 5, 10, 15, 20, 30 mg (Abilify MyCite with sensor)

Administer:

PO route

- Store in tight, light-resistant container
- May be given without regard to meals
- **Orally disintegrating tablets:** do not open blister until ready to use, do not push tablet through foil; place on tongue, allow to dissolve, swallow, do not divide
- **Oral liquid:** use calibrated measuring device
- **Oral solution:** can be substituted for tablet mg per mg, up to 25-mg dose. Patients receiving 30-mg tablets should receive 25 mg, immediate release of solution

IM (extended release) route

- **Mycite tablets:** May give without regard to meals
- Swallow tablets whole; do not divide, crush, or chew
- The tablets are embedded with an ingestible event marker (IEM) intended to track drug ingestion with a wearable sensor (Mycite patch) and smartphone app
- Although most ingestions will be detected within 30 min, it may take up to 2 hr for the app and web portal to detect ingestion of the tablet. If the tablet is not detected after ingestion, do not repeat the dose
- It is not recommended to use the tablets to track drug ingestion in "real time" or during an emergency because detection may be delayed or not occur
- **Mycite patch:** The patch detects the signal from the IEM sensor embedded in the tablet after ingestion and transmits data to a smartphone
- Apply only when instructed by the Mycite app to the left side of the body just above the lower edge of the rib cage
- Ensure that the app is paired with the patch before use. The status of the patch is indicated by a status icon in the app to inform the user that the patch is properly adhered and fully functioning
- Do not place the patch where the skin is scraped, cracked, inflamed, or irritated or in an area that overlaps the most recently removed patch
- Do not remove the patch when showering, swimming, or exercising
- Change the patch weekly or sooner if needed. The app will prompt you to change the patch and will direct you to apply and remove the patch correctly
- Remove the patch when having an MRI and replace it with a new one as soon as possible. If there is skin irritation, remove the patch

- Give IM only; inject slowly, deeply into muscle mass; discard unused portion; do not give IV or SUBCUT
- Available as ready to use
- Extended release monthly (Abilify Maintena)

SIDE EFFECTS

CNS: *Drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, *lightheadedness, akathisia, tremor,* suicidal ideation, tardive dyskinesia, EPS
CV: Orthostatic hypotension, tachycardia, chest pain, hypertension, peripheral edema
EENT: *Blurred vision, rhinitis*
GI: *Constipation, nausea, vomiting, weight gain*
INTEG: *Rash, dry skin, sweating*
META: Hyperglycemia
MS: Myalgia
RESP: *Cough,* dyspnea, hypercholesterolemia
HEMA: Agranulocytosis, anemia, leukemia
SYST: Death among geriatric patients with dementia, hypersensitivity

PHARMACOKINETICS

PO: Absorption 87%; extensively metabolized by liver to a major active metabolite by CYP3A4/CYP2D6; plasma protein binding >99%; half-life 75 hr; excretion via urine 25%, feces 55%; clearance decreased in geriatric patients

INTERACTIONS

Increase: effects of ARIPiprazole—CYP3A4 inhibitors (ketoconazole, erythromycin), CYP2D6 inhibitors (quiNIDine, FLUoxetine, PARoxetine); reduce dose of ARIPiprazole
Increase: sedation—other CNS depressants, alcohol
Increase: EPS—other antipsychotics, lithium
Decrease: ARIPiprazole level—famotidine, valproate
Decrease: effects of ARIPiprazole—CYP3A4 inducers (carBAMazepine); dose of ARIPIprazole may need to be increased
Increase: antihypertensive effect—antihypertensives; monitor B/P

Drug/Herb
Decrease: ARIPiprazole effect—St. John's wort
Drug/Lab
False positive: amphetamine drug screen

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Mental status before initial use; children/young adults may exhibit suicidal thoughts/behaviors; smallest amount of product should be given; elderly with dementia-related psychosis are at increased risk of death

- AIMS assessment, neurologic function, LFTs, weight, lipid profile, blood glucose monthly
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P standing and lying; also pulse, respirations; take q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes
- Dizziness, faintness, palpitations, tachycardia on rising
- EPS, including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
- **Neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity; notify prescriber immediately
- **Beers:** avoid in older adults, high risk of delirium, CVA; may use in schizophrenia, bipolar disorder, or short-term as antiemetic in chemotherapy

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position gradually

- To avoid hot tubs, hot showers, tub baths; hypotension may occur
- To avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use with alcohol, CNS depressants because increased drowsiness may occur
- To avoid hazardous activities if drowsy, dizzy
- About compliance with product regimen
- To report impaired vision, tremors, muscle twitching
- That examinations and blood work will be needed during treatment
- That weight gain may occur, to notify health care professional of large weight gain
- That heat stroke may occur in hot weather; to take extra precautions to stay cool

Black Box Warning: To report suicidal thoughts/behaviors, dementia immediately

- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected; pregnant patient should be enrolled in the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388; avoid breastfeeding; use only if benefits outweigh fetal risk

TREATMENT OF OVERDOSE:
Lavage if orally ingested; provide airway; *do not induce vomiting*

armodafinil (Rx)
(ar-moe-daf'in-il)

Nuvigil

Func. class.: CNS stimulant

Controlled Substance Schedule IV

ACTION:
May inhibit dopamine reuptake, unknown

USES:
Narcolepsy, obstructive sleep apnea/hypoapnea syndrome, circadian rhythm disruption (shift-work sleep problems)

CONTRAINDICATIONS:
Hypersensitivity to this product or modafinil

DOSAGE AND ROUTES
Narcolepsy, obstructive sleep apnea/hypoapnea syndrome
- **Adult and adolescent ≥17 yr: PO** 150-250 mg in AM

Circadian rhythm disruption (shift-work sleep problems)
- **Adult and adolescent ≥17 yr: PO** 150 mg at start of shift

Available forms:
Tablets 50, 150, 200, 250 mg

Administer
- Give with or without food consistently at same time of the day

SIDE EFFECTS
CV: Increased B/P, pulse, palpitations
CNS: Anxiety, dizziness, depression, fatigue, headache, insomnia, migraine, paresthesia, tremor, suicidal thoughts/behaviors, mania, hallucinations, delusions
GI: Anorexia, nausea, vomiting, constipation, diarrhea, dry mouth
GU: Polyuria
RESP: Dyspnea
INTEG: Dermatitis, allergic reactions, Stevens-Johnson syndrome
MISC: Flulike symptoms

PHARMACOKINETICS
Onset unknown, peak 2 fasting hr, duration unknown, half-life 15 hr, 60% protein binding

INTERACTIONS
Increased: Levels of drugs metabolized by CYP2C19 (diazepam, phenytoin, propranolol), monitor carefully, dosage reduction may be needed
Increased: Level of armodafinil—CYP3A4 inhibitors (erythromycin)
Decrease: Levels of drugs metabolized by CYP3A4 (midazolam, cyclosporine)
Decrease: Level of armodafinil—CYP3A4 inducers (carbamazepine, rifampin)
Decrease: Effect of hormonal contraceptives, use alternative contraception

Drug/Food
Decrease: Onset of medication: food
Drug/Lab
Increase: Alkaline phosphatase, GGT

NURSING CONSIDERATIONS

Assess:
- Cardiac status: Monitor for changes in B/P, pulse, ECG, chest pain
- Monitor for Stevens-Johnson syndrome/toxic epidermal necrolysis (red, swollen, blistered, or peeling skin [with or without fever]; red or irritated eyes; or sores in mouth, throat, nose, or eyes), to stop product immediately and notify prescriber
- Monitor for suicidal thoughts/behaviors, mania, hallucinations, delusions
- Monitor for continued sleepiness or inability to stay awake
- Identify all products taken, OTC, Rx, supplements, herbal products, to avoid drug interactions
- DRESS: Monitor for rash, fever, facial swelling, lymphadenopathy; although rare, occurs with other system involvement

Teach patient/family:
- To report trouble sleeping, nausea, dry mouth, depression, swollen glands, behavioral changes, chest pain, dark urine, change in vision, yellow skin, trouble breathing, bruising, bleeding
- To report Stevens-Johnson syndrome/toxic epidermal necrolysis (red, swollen, blistered, or peeling skin [with or without fever]); red or irritated eyes; or sores in mouth, throat, nose, or eyes; to stop product immediately and notify prescriber
- To report immediately suicidal thoughts/behaviors, mania, hallucinations, delusions
- To use alternative contraception if taking hormonal contraceptives during and for 1 mo after last dose
- To notify prescriber if pregnancy is planned or suspected, or if breastfeeding
- To use product at the same time of the day, with or without food consistently
- To avoid driving or other hazardous activities until response is known, dizziness may occur
- To report all products taken to other health care providers

Evaluate:
- Therapeutic response: Ability to stay awake

asciminib (Rx)

(as-KIM-i-nib)
Scemblix
Func. class.: Antineoplastic
Chem. class.: Kinase inhibitor

ACTION:

Inhibits the ABL1 kinase activity of a fusion protein by binding to the ABL pocket, showed activity against wild-type BCR-ABL1 and several mutant forms of the kinase, including the T315I mutation

USES:

Philadelphia chromosome–positive myeloid leukemia

CONTRAINDICATIONS

Hypersensitivity, pregnancy, breastfeeding
Precautions: Myelosuppression, pancreatic/CV toxicity, hypertension, pregnancy

DOSAGE AND ROUTES

PH+ CML in CP
- **Adult: PO** 80 mg daily or 40 mg bid

Ph+ CML in CP with T315I Mutation
- **Adult: PO** 200 mg bid

Available forms: Film-coated tablets 20, 40 mg
Administer:
- Avoid food for at least 2 hr before and 1 hr after use
- Swallow tablets whole; do not break, crush, or chew
- Skip any missed dose and take the next dose at the regular time if missed by >12 hr for daily dosing or >6 hr with bid dosing

SIDE EFFECTS

RESP: URI
GI: Nausea, vomiting, diarrhea, abdominal pain, anorexia, constipation
MS: MS pain
CNS: Fatigue, dizziness, fever
INTEG: Rash

INTERACTIONS

Increase: adverse reactions—strong CYP3A4 inhibitors, certain substrates of CYP3A4, certain P-gp substrates
Avoid use with itraconazole oral solution, with substrates of CYP2C9
Drug/Lab Test:
Increase: Triglycerides, creatine kinase, alanine aminotransferase, lipase, amylase
Decrease: Platelets, neutrophils, HCT

PHARMACOKINETICS

97% protein binding, half-life 5.5-9 hr, peak 2.5 hr, onset, duration unknown

NURSING CONSIDERATIONS

Assess:
- **Hypersensitivity:** Monitor patients for signs and symptoms of hypertension, B/P often and provide treatment as needed
- **CV toxicity:** Monitor those with history of CV risk factors for adverse reactions, QTc prolongation
- **Myelosuppression:** Monitor CBC baseline and q2mo during first 3 mo and monthly thereafter during therapy and interrupt treatment or reduce dose if needed, severe thrombocytopenia and neutropenia may occur
- **Toxicity and pancreatitis:** Monitor serum lipase and amylase baseline and during treatment. Interrupt, then resume at reduced dose or discontinue based on severity. Evaluate for pancreatitis when lipase elevation is accompanied by abdominal pain, nausea, vomiting
- **Hypertension:** Monitor B/P baseline and often, manage hypertension with antihypertensives as prescribed, interrupt, reduce dose, or stop if not medically controlled
- **Pregnancy/breastfeeding:** Obtain pregnancy test in females of reproductive potential, can cause fetal harm. Advise females of reproductive potential of the potential risk and to use effective contraception during and for 1 wk after last dose; to discontinue breastfeeding during and for 1 wk after last dose, may cause infertility

Evaluate:
- Therapeutic response: Prevention of increase in CML

Teach patient/family:
- **Hypersensitivity:** Advise patient to report immediately itching, rash, trouble breathing
- **CV toxicity:** Teach patient to report
- **Myelosuppression:** Advise patient to report excessive fatigue
- **Pancreatitis and toxicity:** Teach patient to report severe abdominal pain, nausea, vomiting
- **Pregnancy/breastfeeding:** Teach patient product can cause fetal harm, that females of reproductive potential should use effective contraception during and for 1 wk after last dose; to discontinue breastfeeding during and for 1 wk after last dose

asenapine (Rx)

(a-sen´a-peen)

Saphris, Secuado

Func. class.: Antipsychotic, atypical; DOPamine-serotonin antagonist
Chem. class.: Dibenzapine

ACTION: Unknown; may be mediated through both DOPamine type 2 (D2) and serotonin type 2 (5-HT2A) antagonism

USES: Bipolar 1 disorder, schizophrenia

CONTRAINDICATIONS: Breastfeeding, hypersensitivity
Precautions: Pregnancy, children, geriatric patients, cardiac/renal/hepatic disease, breast cancer, Parkinson's disease, dementia, seizure disorder, CNS depression, agranulocytosis, QT prolongation, torsades de pointes, suicidal ideation, substance abuse, diabetes mellitus

Black Box Warning: Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Schizophrenia
- **Adult: SL** 5 mg bid, may increase to 10 mg bid after 1 wk, max 20 mg/day

Acute mania/mixed episodes (bipolar 1 disorder, monotherapy)

• **Adult: SL** 10 mg bid, may decrease to 5 mg bid as needed, max 20 mg/day; with lithium or valproate 5 mg bid, may increase to 10 mg bid
• **Child 10-17 yr: SL** 2.5 mg bid, may increase after 3 days to 5 mg bid, then after 3 more days 10 mg bid can be tolerated

Available forms: SL tablet 2.5, 5, 10 mg; transdermal 3.8 mg/24 hr, 5.7 mg/24 hr, 7.6 mg/24 hr

Administer:
• Anticholinergic agent to be used for EPS
• Store in tight, light-resistant container
• **SL tablet:** remove tablet; place tablet under tongue; after it dissolves, swallow; advise patient not to chew, crush, swallow tablets; not to eat, drink for 10 min

Transdermal
• Open when ready to use, apply patch to clean, dry skin on hip, upper arm, upper back, abdomen; use for 24 hr

SIDE EFFECTS

CNS: *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, dizziness, suicidal ideation
CV: Orthostatic hypotension, tachycardia; QT prolongation
ENDO: Hyperglycemia
GI: *Nausea,* vomiting, oral hypoesthesia/paresthesia (SL)
HEMA: Agranulocytosis, anemia, leukopenia
INTEG: Serious allergic reactions (anaphylaxis, angioedema)

PHARMACOKINETICS

Extensively metabolized by the liver by CYP3A4/UGTA14, protein binding 95%, peak 0.5-1.5 hr, half-life 24 hr, excreted urine 50%, feces 40% (metabolites)

INTERACTIONS

Increase: sedation—other CNS depressants, alcohol
Increase: EPS—CYP2D6 inhibitors/substrates (SSRIs)
Increase: serotonin syndrome—SSRIs
Increase: Seizure risk—buPROPion
Increase: EPS—other antipsychotics
Increase: asenapine excretion—carBAMazepine
Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine; avoid concurrent use
Decrease: asenapine action—CYP2D6 inducers (carBAMazepine, barbiturates, phenytoins, rifAMPin)

Drug/Herb
Increase: CNS depression—kava
Increase: EPS—betel palm, kava

Drug/Lab Test
Increase: prolactin levels, glucose, cholesterol, LFTs, lipids, triglycerides
Decrease: sodium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Mental status before initial administration; watch for suicidal thoughts and behaviors; dementia and death may occur among elderly patients

• Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
• B/P standing and lying; also pulse, respirations; take these during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur
• Dizziness, faintness, palpitations, tachycardia on rising
• **EPS,** including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
• **Neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity
• Weight, thyroid function studies, serum prolactin, lipid profile, serum electrolytes, creatinine, pregnancy test, neurologic function, LFTs, glycosylated hemoglobin A1c, CBC, blood glucose, AIMS assessment baseline and periodically
• Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program

because fainting is possible; patient should not stand still for a long time
• **Beers:** avoid use in older adults; high risk of delirium, CVA, worsening parkinsonian symptoms, increased CNS effects; may use in schizophrenia, bipolar disorder, or as antiemetic in chemotherapy

Evaluate:
• Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:
• That orthostatic hypotension may occur; to rise from sitting or lying position gradually
• To avoid hot tubs, hot showers, tub baths; hypotension may occur
• To avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
• To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; to avoid use of alcohol, opioids, increased drowsiness may occur
• That weight gain is common
• How to take prescribed product
• To avoid hazardous activities if drowsy, dizzy
• About compliance with product regimen
• That heat stroke may occur in hot weather; to take extra precautions to stay cool
• To notify provider if history of diabetes in patient or family; if so, blood sugar should be checked before starting this product

Black Box Warning: To report suicidal thoughts/behaviors, dementia immediately

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; identify if pregnancy is planned or suspected; if pregnant, register at National Pregnancy Registry for Atypical Antipsychotics (866-961-2388)

TREATMENT OF OVERDOSE: Lavage if orally ingested; provide airway; *do not induce vomiting*

⚠ HIGH ALERT

asparaginase *Erwinia chrysanthemi* (Rx)

Erwinaze, Kidrolase

Func. class.: Antineoplastic, natural and semisynthetic

USES: Treatment of acute lymphocytic leukemia (ALL) in combination with other chemotherapeutic agents in patients who have developed hypersensitivity to *Escherichia coli*–derived asparaginase

CONTRAINDICATIONS: Hypersensitivity, breastfeeding, history of serious pancreatitis, bleeding, or serious thrombosis with prior L-asparaginase therapy

DOSAGE AND ROUTES

• **Adult, adolescent, child ≥2 yr (substitute for pegaspargase): IM** 25,000 IU/m^2 3×/wk (Monday/Wednesday/Friday) × 6 doses for each planned dose of pegaspargase within a treatment
• **Adult (substitute for L-asparaginase *E. coli*): IM** 25,000 IU/m^2 for each scheduled dose of native *E. coli* asparaginase within a treatment

Available forms: powder for injection 10,000 IU/vial

aspirin (acetylsalicylic acid, ASA) (OTC)

(as′pir-in)

Acuprin, Asaphen, Asatab, A.S.A. Ascriptin Enteric, Aspergum, Aspir-Low, Aspir-trin, Bayer Aspirin, Easprin, Ecotrin, Entrophen, Halfprin, Lowprin, Novasen, Rivasa, Sloprin, St. Joseph Adult, Zorpin

Func. class.: Nonopioid analgesic, nonsteroidal antiinflammatory, antipyretic, antiplatelet

Chem. class.: Salicylate

Do not confuse:
Aspirin/Anacin Adult Low/Anacin-3

ACTION: Blocks pain impulses by blocking COX-1 in CNS, reduces inflammation by inhibition of prostaglandin synthesis; antipyretic action results from vasodilation of peripheral vessels; decreases platelet aggregation

USES: Mild to moderate pain or fever, including rheumatoid arthritis (RA), osteoarthritis, thromboembolic disorders; TIAs, rheumatic fever, post-MI, prophylaxis of MI, ischemic stroke, angina, acute MI, Kawasaki disease
Unlabeled uses: Colorectal cancer prophylaxis, venous thromboembolism extended treatment to prevent recurrence

CONTRAINDICATIONS: Pregnancy, breastfeeding, children <12 yr, children with flulike symptoms, hypersensitivity to salicylates, tartrazine (FD&C yellow dye #5), GI bleeding, bleeding disorders, vitamin K deficiency, peptic ulcer, acute bronchospasm, agranulocytosis, increased intracranial pressure, intracranial bleeding, nasal polyps, urticaria
Precautions: Abrupt discontinuation, acetaminophen/NSAIDs hypersensitivity, acid/base imbalance, alcoholism, ascites, asthma, bone marrow suppression in elderly patients, dehydration, G6PD deficiency, gout, heart failure, anemia, renal/hepatic disease, pre/postoperatively, gastritis

DOSAGE AND ROUTES

Pain/fever
- **Adult: PO/RECT** 325-1000 mg q4hr prn, max 4 g/day
- **Child 2-11 yr: PO** 10-15 mg/kg/dose q4hr, max 4 g/day

RA, osteoarthritis, other inflammatory conditions
- **Adult: PO** 2.4 g/day in divided doses q4-6hr, maintenance 3.6-5.4 g/day; **EXTENDED RELEASE** 650 mg q8hr or 800 mg q12hr; target salicylate level 150-300 mcg/mL

Juvenile RA
- **Child: PO/RECT** 90-130 mg/kg/day in divided doses, target salicylate level 150-300 mcg/mL

Thromboembolic disorders
- **Adult: PO** 325-650 mg/day or bid

Transient ischemic attacks
- **Adult: PO** 50-325 mg/day (grade 1A)

Evolving MI with ST segment elevation (STEMI)
- **Adult: PO** 160-325 mg nonenteric, chewed and swallowed immediately, maintenance 75-162 mg daily

MI, stroke prophylaxis
- **Adult: PO** 50-325 mg/day

Prevention of recurrent MI/antiplatelet
- **Adult: PO** 80-325 mg/day

CABG
- **Adult: PO** 325 mg/day starting 6 hr postprocedure, continue for 1 yr

PTCA
- **Adult: PO** 325 mg 2 hr before surgery, then 160-325 mg daily

Prevention of colorectal cancer in those who are carriers of hereditary nonpolyposis colon cancer Lynch syndrome (unlabeled)
Adult: PO 600 mg daily × 2 yr

Venous thromboembolism to prevent recurrence (unlabeled)
Adult: PO 100 mg/day

Available forms: capsules 325 ✱; capsules extended release 162.5; tablets 81, 162.5, 325, 500, 650, 975 mg; chewable tablets 81 mg; suppository 60, 120, 150 ✱, 160 ✱, 200, 300, 600, 650 ✱ mg; enteric-coated tablets 81, 162 ✱, 325, 500 mg; delayed-release tablets 81, 325, 500 mg ✱

Administer:
PO route
- Do not break, crush, or chew enteric product
- Crushed or whole (regular PO product), chewable tablets may be chewed
- With food or milk to decrease gastric symptoms; separate by 2 hr from enteric products
- With 8 oz of water; sit upright for ½ hr after dose to facilitate product passing into stomach

Rectal route
- Place suppository in refrigerator for at least 30 min before removing wrapper

SIDE EFFECTS

CNS: Confusion, seizures, headache, intracranial hemorrhage
CV: Tachycardia, hypotension, dysrhythmias
EENT: Tinnitus, hearing loss
ENDO: Hypoglycemia, hypokalemia
GI: *Nausea, vomiting,* GI bleeding, pancreatitis, hepatotoxicity
HEMA: Thrombocytopenia, leukopenia, DIC, increased PT, aPTT, bleeding time
INTEG: *Rash,* urticaria, bruising
SYST: Reye's syndrome (children), anaphylaxis, laryngeal edema, angioedema

PHARMACOKINETICS

Enteric metabolized by liver; inactive metabolites excreted by kidneys; crosses placenta; excreted in breast milk; half-life 15-20 min, up to 30 hr in large dose; rectal products may be erratic; protein binding 90%
PO: Onset 15-30 min, peak 1-2 hr, duration 4-6 hr, well absorbed
PO: Enteric coated: onset 10-30 min, duration 2-4 hr
RECT: Onset slow, duration 4-6 hr

INTERACTIONS

Increase: gastric ulcer risk—corticosteroids, antiinflammatories, NSAIDs, alcohol
Increase: bleeding—alcohol, plicamycin, cefamandole, thrombolytics, ticlopidine, clopidogrel, tirofiban, eptifibatide, anticoagulants; monitor for bleeding
Increase: effects of insulin, methotrexate, thrombolytic agents, penicillins, phenytoin, valproic acid, oral hypoglycemics, sulfonamides; monitor for increased effects of each product
Increase: salicylate levels—urinary acidifiers, ammonium chloride, nizatidine
Increase: hypotension—nitroglycerin
Decrease: effects of aspirin—antacids (high doses), urinary alkalizers, corticosteroids; monitor for decreased effects
Decrease: antihypertensive effect—ACE inhibitors, monitor B/P
Decrease: effects of probenecid, spironolactone, sulfinpyrazone, sulfonylamides, NSAIDs, β-blockers, loop diuretics

Drug/Herb

Increase: risk of bleeding—feverfew, garlic, ginger, ginkgo, ginseng *(Panax),* horse chestnut

Drug/Food

Increase: risk of bleeding—fish oil (omega-3 fatty acids)
- Foods that acidify urine may increase aspirin level

Drug/Lab Test

Increase: coagulation studies, LFTs, serum uric acid, amylase, CO_2, urinary protein
Decrease: serum potassium, cholesterol
Interference: VMA, 5-HIAA, xylose tolerance test, TSH, pregnancy test

NURSING CONSIDERATIONS

Assess:
- **Pain:** character, location, intensity; ROM before and 1 hr after administration
- **Fever:** temperature before and 1 hr after administration
- Hepatic studies: AST, ALT, bilirubin, creatinine if patient is receiving long-term therapy
- Renal studies: BUN, urine creatinine; I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- Blood studies: CBC, Hct, HB, PT if patient is receiving long-term therapy
- **Hepatotoxicity:** dark urine, clay-colored stools, yellowing of skin, sclera, itching, abdominal pain, fever, diarrhea if patient is receiving long-term therapy
- **Allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued; patients with asthma, nasal polyps, allergies: severe allergic reaction may occur
- **Ototoxicity:** tinnitus, ringing, roaring in ears; audiometric testing needed before, after long-term therapy
- **Salicylate level:** therapeutic level 150-300 mcg/mL for chronic inflammation
- **Beers:** avoid chronic use in older adults; GI bleeding may occur

- **Pregnancy/breastfeeding:** do not use in first trimester; may cause fetal harm; use only if benefits outweigh fetal risks (second/third trimester); avoid breastfeeding

Evaluate:

- Therapeutic response: decreased pain, inflammation, fever

Teach patient/family:

- To report any symptoms of hepatotoxicity, renal toxicity, visual changes, ototoxicity, allergic reactions, bleeding (long-term therapy)
- To avoid if allergic to tartrazine
- Not to exceed recommended dosage; acute poisoning may result
- To read labels on other OTC products because many contain aspirin, salicylates
- That the therapeutic response takes 2 wk (arthritis)
- To report tinnitus, confusion, diarrhea, sweating, hyperventilation
- To avoid alcohol ingestion; GI bleeding may occur
- That patients who have allergies, nasal polyps, asthma may develop allergic reactions
- To discard tablets if vinegar-like smell is detected
- That medication is not to be given to children or teens with flulike symptoms or chickenpox, because Reye's syndrome may develop
- To take with a full glass of water
- **Pregnancy/breastfeeding:** to inform prescriber if pregnancy is planned or suspected; avoid breastfeeding

TREATMENT OF OVERDOSE:

Lavage, monitor electrolytes, VS

atazanavir (Rx)

(at-a-za-na'veer)

Reyataz

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease, which prevents maturation of the infectious virus

USES:

HIV-1 infection in combination with other antiretroviral agents

CONTRAINDICATIONS:

Hypersensitivity, Child-Pugh Class C

Precautions: Pregnancy, breastfeeding, children, geriatric patients, hepatic disease, alcoholism, drug resistance, AV block, diabetes, dialysis, females, hemophilia, hypercholesterolemia, immune reconstitution syndrome, lactic acidosis, pancreatitis, cholelithiasis, serious rash

DOSAGE AND ROUTES

Antiretroviral-naive patients

- **Adult: PO** 400 mg/day (unable to take ritonavir); 300 mg with ritonavir 100 mg/day
- **Child ≥6 yr/adolescent ≥40 kg: PO** 300 mg with ritonavir 100 mg daily, or 400 mg/day (unable to take ritonavir)
- **Child ≥6 yr/adolescent Capsules, ≥6 years, ≥35-39 kg:** atazanavir 300 mg with ritonavir 100 mg orally once daily with food
- **Child ≥6 yr/adolescent Capsules, ≥6 years, 15 kg to less than 35 kg:** atazanavir 200 mg with ritonavir 100 mg orally once daily with food

Antiretroviral-experienced patients

- **Adult: PO** 300 mg with ritonavir 100 mg daily
- **Pregnant adults/adolescents (second/third trimester) with H_2 blocker or tenofovir: PO** 400 mg with ritonavir 100 mg daily
- **Child ≥6 yr/adolescent ≥40 kg: PO** 300 mg with ritonavir 100 mg daily
- **Child ≥6 yr/adolescent 20 to <40 kg: PO** 200 mg with ritonavir 100 mg daily
- **Children and adolescents ≥25 kg: PO** (oral powder) 300 mg q24hr with ritonavir 100 mg q24hr
- **Children 15 to 24 kg: PO** (oral powder) 250 mg q24hr with ritonavir 80 mg q24hr
- **Infants and children ≥3 mo and 5 to 14 kg: PO** (oral powder) 200 mg q24hr with ritonavir 80 mg q24hr

Hepatic dose

• **Adult: PO** Child-Pugh B: 300 mg/day; Child-Pugh C: do not use

Renal dose

• **Adult: PO** Therapy-naive and HD: 300 mg daily; with ritonavir: 100 mg daily; therapy experienced and HD: do not use

Available forms: Capsules 100, 150, 200, 300 mg; oral powder 50 mg/packet

Administer:

• **Capsules:** With food; 2 hr before or 1 hr after antacid or didanosine; swallow capsule whole, do not open

• **Oral powder:** Use with food or beverage; mix 1 tablespoon of food with powder, feed, then add another tablespoon of food to container, mix, and feed; or mix with 30 mL of liquid, give, then add another 15 mL of liquid to cup to remove residual, give; use within 1 hr of mixing

SIDE EFFECTS

CNS: Headache, depression, dizziness, insomnia, peripheral neuropathy

CV: Increased PR interval

GI: Vomiting, *diarrhea, abdominal pain, nausea,* hepatotoxicity, cholelithiasis

INTEG: *Rash,* Stevens-Johnson syndrome, *photosensitivity,* DRESS

MISC: Fatigue, fever, arthralgia, back pain, cough, lipodystrophy, pain, gynecomastia, nephrolithiasis; lactic acidosis, hyperbilirubinemia (pregnancy, females, obesity), immune reconstitution syndrome

PHARMACOKINETICS

Rapidly absorbed, absorption increased with food, peak 2½ hr, 86% protein bound, extensively metabolized in liver by CYP3A4, 27% excreted unchanged in urine/feces (minimal), half-life 7 hr

INTERACTIONS

Increase: levels, toxicity of immunosuppressants (cycloSPORINE, sirolimus, tacrolimus), sildenafil, antifungals (itraconazole, ketoconazole, voriconazole), tricyclic antidepressants, warfarin, calcium channel blockers, clarithromycin, clorazepate, diazePAM, irinotecan, HMG-CoA reductase inhibitors, antidysrhythmics, midazolam, triazolam, ergots, pimozide, other protease inhibitors; monitor for toxicity (amprenavir, darunavir, fosamprenavir, indinavir, nelfinavir, ritonavir, saquinavir)

Increase: effects of estrogens, oral contraceptives (unboosted), decreased (boosted with ritonavir)

Increase: atazanavir levels—CYP3A4 substrates, CYP3A4 inhibitors

Increase: hyperbilirubinemia—indinavir

Decrease: telaprevir level when used with atazanavir and ritonavir

Increase: QT prolongation—salmeterol, clarithromycin, romiDEPsin, ranolazine; dose reduction of each of these products may be needed

Increase: effect of alfuzosin, ARIPiprazole, benzodiazepine, brentuximab, cabazitaxel, carBAMazepine, cilostazol, colchicine, corticosteroids, eletriptan, eplerenone, crizotinib, DOCEtaxel, ixabepilone, iloperidone, lurasidone, maraviroc, muscarinic receptor antagonists, nilotinib, opioids, vinca alkaloids (vinCRIStine, vinBLAStine), vilazodone, vasopressin antagonists, dasatinib, lapatinib, SORAfenib, traZODone, risperIDONE, raltegravir, QUEtiapine

Decrease: atazanavir levels—CYP3A4 inducers, rifAMPin, antacids, didanosine, efavirenz, proton pump inhibitors, H_2-receptor antagonists; give atazanavir 2 hr before or 1 hr after these products

Drug/Herb

Decrease: atazanavir levels—St. John's wort; avoid concurrent use

Increase: myopathy, rhabdomyolysis—red yeast rice

Drug/Lab Test

Increase: AST, ALT, total bilirubin, amylase, lipase, CK

Decrease: HB, neutrophils, platelets

Drug/Food

• Increased drug bioavailability (to be taken with food)

NURSING CONSIDERATIONS

Assess:

• **For hepatic failure; hepatic studies:** ALT, AST, bilirubin; do not use in Child-Pugh C

• For lactic acidosis, hyperbilirubinemia (females, pregnancy, obesity); if pregnant, call Antiretroviral Pregnancy Registry 800-258-4263; do not breastfeed; use

additional contraception when boosted with ritonavir
- PR interval in those taking calcium channel blockers, digoxin, monitor ECG
- For signs of infection, anemia, nephrolithiasis
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Viral load, CD4 count throughout treatment
- Monitor blood glucose in those with diabetes
- Monitor for opportunistic infections/autoimmune disorder during treatment
- **Serious rash (Stevens-Johnson syndrome, DRESS):** most rashes last 1-4 wk; if serious, discontinue product
- **Immune reconstitution syndrome:** time of onset is variable when given with combination antiretroviral therapy

Evaluate:
- Therapeutic response: increasing CD4 counts; decreased viral load, resolution of symptoms of HIV-1 infection

Teach patient/family:
- To take as prescribed with other antiretrovirals as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose or share with others
- That product must be taken daily to maintain blood levels for duration of therapy
- To report yellowing of skin, sclera
- To notify prescriber if diarrhea, nausea, vomiting, rash occurs; dizziness, lightheadedness may occur; ECG may be altered
- That product interacts with many products, including St. John's wort; to advise prescriber of all products, herbal products used
- That redistribution of body fat may occur, the effect is not known
- That product does not cure HIV-1 infection, prevent transmission to others; only controls symptoms
- That if taking phosphodiesterase type 5 inhibitor with atazanavir, there may be increased risk of phosphodiesterase type 5 inhibitor–associated adverse events (hypotension, prolonged penile erection); to notify physician promptly of these symptoms
- **Pregnancy/breastfeeding:** that registration with Antiretroviral Pregnancy Registry is strongly encouraged for pregnant patients; to notify prescriber if pregnancy is planned or suspected; to use additional contraception when boosted with ritonavir

⚠ HIGH ALERT

atenolol (Rx)

(a-ten′oh-lole)

Tenormin, Tenorectic

Func. class.: Antihypertensive, antianginal

Chem. class.: β-Blocker, β_1-, β_2-blocker (high doses)

Do not confuse:
atenolol/albuterol
Tenormin/thiamine/Imuran

ACTION: Competitively blocks stimulation of β-adrenergic receptor within vascular smooth muscle; produces negative chronotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, negative inotropic activity decreases O_2 consumption in myocardium; decreases action of renin-aldosterone-angiotensin system at high doses, inhibits β_2 receptors in bronchial system at higher doses

USES: Hypertension, angina pectoris; suspected or known MI (IV use); MI prophylaxis
Unlabeled uses: Migraine prophylaxis, supraventricular tachycardia prophylaxis (PSVT), unstable angina, alcohol withdrawal, lithium-induced tremor

CONTRAINDICATIONS: Pregnancy, hypersensitivity to β-blockers, cardiogenic shock, second- or third-degree heart block, sinus bradycardia, cardiac failure

Precautions: Breastfeeding, major surgery, diabetes mellitus, thyroid/renal disease, HF, COPD, asthma, well-compensated heart failure, dialysis, myasthenia gravis, Raynaud's disease, pulmonary edema

Black Box Warning: Abrupt discontinuation

DOSAGE AND ROUTES

Hypertension

- **Adult: PO** 25-50 mg/day, increasing q1-2wk to 100 mg/day; may increase to 200 mg/day for **angina**, up to 100 mg/day for hypertension
- **Child: PO** 0.8-1 mg/kg/dose initially; range, 0.8-1.5 mg/kg/day; max 2 mg/kg/day; max 2mg/kg/day up to 100mg/day
- **Geriatric: PO** 25 mg/day initially

MI

- **Adult: PO** 100 mg/day in 1-2 divided doses; may need for 1-3 yr after MI

Renal disease

- **Adult: PO** CCr 15-35 mL/min, max 50 mg/day; CCr <15 mL/min, max 25 mg/day; hemodialysis 25-50 mg after dialysis

PSVT prophylaxis (unlabeled)

- **Child: PO** 0.3-1.3 mg/kg/day

Cardiac risk reduction during surgery (unlabeled)

- **Adult: PO** 50 mg, start before planned procedure, titrate to heart rate, continue 7-30 days after procedure

Unstable angina (unlabeled)

- **Adult: PO** 50-200 mg/day

Ethanol withdrawal prevention (unlabeled)

- **Adult: PO** 50-100 mg/day

Migraine prophylaxis (unlabeled)

- **Adult: PO** 50-150 mg/day, titrate to response

Lithium-induced tremor (unlabeled)

- **Adult: PO** 50 mg/day

Available forms: Tablets 25, 50, 100 mg

Administer:

PO route

- Before meals, at bedtime; tablet may be crushed, swallowed whole, same time of day
- Reduced dosage with renal dysfunction
- Store protected from light, moisture; place in cool environment

SIDE EFFECTS

CNS: *Insomnia, fatigue, dizziness, mental changes,* memory loss, depression, lethargy, drowsiness, strange dreams

CV: Profound hypotension, bradycardia, HF

ENDO: Hypo- and hyperglycemia

GI: *Nausea, diarrhea,* vomiting, constipation

GU: Impotence, decreased libido, urinary frequency

INTEG: Rash

RESP: Bronchospasm, dyspnea, wheezing, pulmonary edema

PHARMACOKINETICS

PO: Peak 2-4 hr; onset 1 hr; duration 24 hr; half-life 6-7 hr; excreted unchanged in urine, feces (50%); protein binding 5%-15%

INTERACTIONS

- Mutual inhibition: sympathomimetics (cough, cold preparations)

Increase: hypotension, bradycardia—reserpine, hydrALAZINE, methyldopa, prazosin, anticholinergics, digoxin, diltiaZEM, verapamil, cardiac glycosides, calcium channel blockers, antihypertensives; monitor and adjust dose if needed

Increase: hypoglycemia—insulins, oral antidiabetics

Increase: hypertension—amphetamines, ePHEDrine, pseudoephedrine

Increase: toxicity risk—dolasetron; lidocaine (IV)

Decrease: atenolol effect—salicylates, rifamycins, penicillins, NSAIDs, calcium carbonate, aluminum antacids

Drug/Herb

Increase: atenolol effect—hawthorn

Decrease: atenolol effect—ephedra (ma huang)

Drug/Lab Test

Increase: BUN, potassium, triglycerides, uric acid, ANA titer, platelets, alkaline phosphatase, creatinine, LDH, AST/ALT

Decrease: glucose

NURSING CONSIDERATIONS

Assess:

- I&O, weight daily; watch for HF (rales/crackles, jugular vein distention, weight gain, edema)
- **Hypertension:** B/P, pulse q4hr; note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes (<50 bpm); ECG
- **Hypoglycemia:** may be masked in diabetes mellitus (tachycardia, sweating)

Black Box Warning: Taper gradually, do not discontinue abruptly, may precipitate angina, MI

- If pregnancy is planned or suspected; do not use in pregnancy, breastfeeding

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk, increased activity tolerance, decreased anginal pain

Teach patient/family:

Black Box Warning: Not to discontinue product abruptly, taper over 2 wk (angina); to take at same time each day as directed

- Not to use OTC products unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever
- To take pulse at home; advise when to notify prescriber (heart rate <50 bpm)
- To limit alcohol, smoking, sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies, conditions being treated
- To avoid hazardous activities if dizziness is present
- To change position slowly to limit orthostatic hypotension
- That product may mask symptoms of hypoglycemia in diabetic patients
- **Pregnancy/breastfeeding:** if pregnancy is planned or suspected; do not use in pregnancy, breastfeeding; to use contraception while taking this product; to avoid breastfeeding

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, dextrose for hypoglycemia, digoxin, O_2, diuretic for cardiac failure, hemodialysis

⚠ HIGH ALERT

atezolizumab (Rx)

(a-te-zoe-liz′ue-mab)

Tecentriq

Func. class.: Antineoplastic

Chem. class.: Monoclonal antibody

ACTION:

Binds to PD-1, resulting in an antitumor response

USES:

Treatment of locally advanced or metastatic urothelial carcinoma, including bladder cancer and other urinary system cancers, in patients who progress during or following platinum-containing chemotherapy for advanced disease, or within 12 months of neoadjuvant or adjuvant platinum-containing chemotherapy; triple-negative breast cancers (PD-1 expression) in combination; nonsquamous NSCLC with no EGFR or ALK gene aberrations

CONTRAINDICATIONS:

Hypersensitivity

DOSAGE AND ROUTES

Breast cancer (triple negative), locally advanced or metastatic

- **Adult: IV:** 840 mg on days 1 and 15 q4wk with protein-bound paclitaxel until disease progression or unacceptable toxicity

Hepatocellular carcinoma, unresectable or metastatic

- **Adult: IV:** 1200 mg q3wk with bevacizumab on the same day until disease progression or unacceptable toxicity; if bevacizumab is discontinued due to unacceptable toxicity, may continue atezolizumab monotherapy at 840 mg q2wk or 1200 mg q3wk or 1680 mg

q4wk until disease progression or unacceptable toxicity

Melanoma, unresectable or metastatic (BRAF V600 mutation-positive)

- **Adult: IV:** 840 mg q2wk with cobimetinib and vemurafenib until disease progression or unacceptable toxicity; before starting atezolizumab, patients should receive 28 days of cobimetinib and vemurafenib

Non–small-cell lung cancer (NSCLC), metastatic

- **Adult: IV:** First-line treatment NSCLC (single agent): 840 mg q2wk or 1200 mg q3wk or 1680 mg q4wk; continue until disease progression or unacceptable toxicity; first-line treatment, non-squamous NSCLC: 1200 mg on day 1 q3wk with bevacizumab, paclitaxel, and carboplatin × 4 to 6 cycles, then atezolizumab 1200 mg on day 1, followed by bevacizumab q3wk until disease progression or unacceptable toxicity; previously treated NSCLC: 840 mg q2wk or 1200 mg q3wk or 1680 mg q4wk; continue until disease progression or unacceptable toxicity

Small cell lung cancer (extensive stage), first-line treatment

- **Adult: IV:** Induction: 1200 mg on day 1 q3wk with carboplatin and etoposide × 4 cycles, then maintenance therapy of monotherapy of atezolizumab at 840 mg q2wk or 1200 mg q3wk or 1680 mg q4wk; continue until disease progression or unacceptable toxicity

Urothelial carcinoma, locally advanced or metastatic

- **Adult: IV:** 840 mg q2wk or 1200 mg q3wk or 1680 mg q4wk; continue until disease progression or unacceptable toxicity

AVAILABLE FORMS:

Injection 840 mg/14 mL, 1200 mg/20 mL single-dose vials

ADMINISTER

IV Route

- Visually inspect parenteral products for particulate matter and discoloration prior to use, discard if present
- Withdraw 20 mL of product and dilute with 250 mL in a polyvinyl chloride (PVC), polyethylene (PE), or polyolefin (PO) infusion bag containing 0.9% sodium chloride injection
- Mix by gentle inversion; do not shake
- *Storage after dilution:* Store diluted solution at room temperature for no more than 6 hr (including infusion time) or under refrigeration 36°F to 46°F (2°C to 8°C) for no more than 24 hr from the time of preparation
- Give atezolizumab prior to chemotherapy or other antineoplastic agents when given on the same day
- Do not infuse through the same IV line with other drugs
- Give first dose with or without a sterile, nonpyrogenic, low protein-binding in-line filter (0.2 to 0.22 micron) over 60 min; do not administer atezolizumab as an IV push or bolus. If tolerated, all subsequent infusions may be infused over 30 min
- Interrupt or slow administration for grade 2 infusion–related reactions; the infusion may resume when symptoms have resolved to grade 0 or 1, permanently discontinue atezolizumab for grade 3 or 4 infusion–related reactions

SIDE EFFECTS

CV: Peripheral edema, venous thromboembolism

CNS: Confusion, fatigue, fever

GI: Nausea, vomiting, abdominal pain, constipation, anorexia, diarrhea, obstruction, immunomediated colitis, immunomediated hepatitis, increased LFTs

GU: Hematuria, UTI, obstruction

HEMA: Anemia, lymphopenia

MS: Back/neck pain, arthralgia, myalgia

RESP: Dyspnea, cough, immunomediated pneumonitis, ILD

INTEG: Rash, pruritus, Stevens-Johnson syndrome

MISC: Infection, infusion-related reactions, hypo/hyperthyroidism

PHARMACOKINETICS

Onset unknown, peak unknown, duration unknown, half-life 27 days

Interactions
None known

NURSING CONSIDERATIONS

Assess:

- **Adrenal insufficiency:** Monitor for adrenal insufficiency (fatigue, joint/muscle pain, dizziness, nausea) usually within 5.7 mo. Withhold for grade 2 or higher and give systemic corticosteroids (1 to 2 mg/kg/day prednisone or equivalent) followed by a taper and administer hormone replacement as indicated
- **Cardiovascular toxicity:** Monitor for myocarditis. May require treatment interruption, discontinuation, systemic corticosteroids, and/or other immunosuppressive therapy (ASCO)
- **Diabetes mellitus:** For type 1 diabetes, initiate insulin treatment as indicated. Monitor for hyperglycemia and other signs/symptoms of diabetes; withhold therapy for grade 2 or higher hyperglycemia
- **Gastrointestinal toxicity:** Immune-mediated colitis or diarrhea (defined as requiring systemic corticosteroids) has occurred. Monitor for signs/symptoms of colitis and diarrhea. Withhold treatment for grade 2 or 3 diarrhea or colitis. For grade 2 or higher diarrhea or colitis, if symptoms persist for >5 days or recur, administer systemic corticosteroids (1 to 2 mg/kg/day prednisone equivalent). Discontinue permanently for grade 4 diarrhea or colitis
- **Hepatotoxicity:** Immune-mediated hepatitis and liver test abnormalities, including grades 3 and 4 and fatal cases, have occurred. Monitor for signs/symptoms of hepatitis (during and after treatment), including liver function tests (AST, ALT, and bilirubin). Give systemic corticosteroids (1 to 2 mg/kg/day prednisone or equivalent) followed by a taper for grade 2 or higher transaminase and/or bilirubin elevations. For grade 2 toxicity, withhold treatment until grade 1 or resolved or corticosteroid dose is ≤10 mg/day prednisone (or equivalent); permanently discontinue for grade 3 or 4 immune-mediated hepatitis
- **Infection:** Monitor for signs/symptoms of infection. Withhold treatment for grade 3 or higher infections; may resume once clinically stable
- **Infusion-related reactions:** Monitor for signs/symptoms of infusion reactions. Interrupt or slow the infusion in those with grade 1 or 2 infusion reactions; may premedicate with subsequent doses. Permanently discontinue for grade 3 or 4 infusion reactions
- **Ocular toxicity:** Uveitis and iritis have been reported. May require systemic corticosteroids to reduce the risk of permanent vision loss
- **Pulmonary toxicity:** Immune-mediated pneumonitis and interstitial lung disease may occur. Monitor for signs (with radiographic imaging) and symptoms of pneumonitis. Give systemic corticosteroids (1 to 2 mg/kg/day prednisone or equivalent) followed by a taper for grade 2 or higher pneumonitis. For grade 2 toxicity, withhold treatment until grade 1 or resolved or corticosteroid dose is ≤10 mg/day prednisone (or equivalent); permanently discontinue for grade 3 or 4 pneumonitis
- **Thyroid disorders:** Hypothyroidism, hyperthyroidism, and acute thyroiditis (rare) have occurred. Monitor thyroid function prior to and periodically during treatment. For hypothyroidism, initiate thyroid replacement. For grade 2 or higher hyperthyroidism, withhold

Teach patient/family:

- To report all severe reactions, as these may require corticosteroids or discontinuation (infection, immune-mediated reactions, allergic reactions)
- To report of infusion reaction (back pain, neck pain, chills, tremors, dizziness, passing out, fever, flushing, itching, rash, shortness of breath, swelling of the face, or wheezing)
- To report bowel problems (black, tarry, or bloody stools; fever; mucus in stools; vomiting; vomiting blood; severe abdominal pain; constipation; or diarrhea)
- To report liver problems (dark urine, fatigue, lack of appetite, nausea, abdominal pain, light-colored stools, vomiting, or yellow skin)

• To report UTI (blood in the urine, burning or painful urination, passing a lot of urine, fever, lower abdominal pain, or pelvic pain)
• To report lung problems (like shortness of breath or other trouble breathing, cough that is new or worse)
• To report kidney problems (unable to pass urine, blood in the urine, change in amount of urine passed, or weight gain)
• To report Stevens-Johnson syndrome/toxic epidermal necrolysis (red, swollen, blistered, or peeling skin [with or without fever]; red or irritated eyes; or sores in mouth, throat, nose, or eyes)
• To report mood changes, behavioral changes, weight changes, constipation, deeper voice, dizziness, passing out, cold sensation, severe fatigue, hair loss, persistent headache, or decreased sex drive
• To report pancreatitis (severe abdominal pain, severe back pain, severe nausea, or vomiting)
• To report signs of an allergic reaction (rash; hives; itching; red, swollen, blistered, or peeling skin with or without fever; wheezing; tightness in the chest or throat; trouble breathing, swallowing, or talking; unusual hoarseness; or swelling of the mouth, face, lips, tongue, or throat)

Evaluate

• Therapeutic response: Decreasing progression of cancer

atogepant (Rx)

(a-TOE-je-pant)

Qulipta

Func. class.: Migraine agent

Chem. class.: Calcitonin gene-related peptide

ACTION:

Centrally, CGRP is involved in transmission through neurons and pain modulation in the brainstem

USES:

Migraine prevention

CONTRAINDICATIONS

None

Precautions: Breastfeeding, pregnancy, hepatic disease, CYP3A4 inhibitors, OATP inhibitors

DOSAGE AND ROUTES

• **Adult: PO** 10, 30, or 60 mg daily; if used with strong CYP3A4 inhibitor: 10 mg daily; strong and moderate CYP3A4 inducers: 30 mg or 60 mg daily; OATP inhibitors: 10 mg or 30 mg daily

Available forms: Tablets 10, 30, 60 mg

Administer:

• Take without regard to food

SIDE EFFECTS

• **CNS:** Fatigue
• **GI:** Nausea, constipation

INTERACTIONS

Dose modifications may be needed with CYP3A4 inhibitors or OATP inhibitors

PHARMACOKINETICS

Onset, duration unknown, peak 1-2 hr; half-life 11 hr

NURSING CONSIDERATIONS

Assess:

• **Migraines:** Identify severity, triggers, nausea, auras, and if this product lessens the number of migraines
• **Pregnancy/breastfeeding:** May cause fetal harm, discontinue breastfeeding
• **Severe hepatic disease:** Avoid use in patients with severe hepatic impairment

Evaluate:

• Therapeutic response: Prevention of migraine

Teach patient/family:

• **Migraines:** Teach patient to keep a record of number of migraines, triggers, character
• **Pregnancy/breastfeeding:** Teach patient to report if pregnancy is planned or suspected or if breastfeeding
• **Interactions:** Inform patients that this product may interact with some other drugs and that dosage modifications may be recommended when used with some other drugs. Advise patients to report to their health care provider the use of other Rx, OTC, herbals, grapefruit juice

atomoxetine (Rx)

(at-o-mox′eh-teen)

Strattera

Func. class.: Psychotherapeutic—miscellaneous (ADHD)

Chem. class.: Selective norepinephrine reuptake inhibitor

Do not confuse:
atomoxetine/atorvastatin

ACTION: Selective norepinephrine reuptake inhibitor; may inhibit the presynaptic norepinephrine transporter

USES: Attention-deficit/hyperactivity disorder

CONTRAINDICATIONS: Hypersensitivity, closed-angle glaucoma, MAOI therapy, history of pheochromocytoma

Precautions: Pregnancy, breastfeeding, hepatic disease, angioedema, bipolar disorder, dysrhythmias, CAD, hypo/hypertension, arteriosclerosis, cardiac disease, cardiomyopathy, heart failure, jaundice

Black Box Warning: Children <6 yr, suicidal ideation

DOSAGE AND ROUTES

ADHD

- **Adult and child >6 yr and >70 kg: PO** 40 mg/day, increase after 3 days to target daily dose of 80 mg in AM or evenly divided doses AM, late afternoon; max 100 mg/day
- **Child >6 yr and ≤70 kg: PO** 0.5 mg/kg/day, increase after 3 days to target daily dose of 1.2 mg/kg in AM or evenly divided doses AM, late afternoon; max 1.4 mg/kg/day or 100 mg/day, whichever is less

Hepatic dose

- **Adult/Child PO Child-Pugh B:** reduce dose by 50%; Child-Pugh C: reduce dose by 75%

Strong CYP2D6 inhibitors

Adult/child: PO, reduce dose if needed

Available forms: Capsules 10, 18, 25, 40, 60, 80, 100 mg

Administer:

- Whole; do not break, crush, chew
- Gum, hard candy, frequent sips of water for dry mouth
- Without regard to food

SIDE EFFECTS

CNS: *Insomnia,* dizziness, irritability, crying, mood swings, fatigue, lethargy, paresthesia, suicidal ideation

CV: *Palpitations,* hot flushes, tachycardia, increased B/P, palpitations, orthostatic hypotension, QT prolongation

GI: Dyspepsia, nausea, anorexia, dry mouth, weight loss, vomiting, diarrhea, constipation, hepatotoxicity

GU: Urinary hesitancy, retention, dysmenorrhea, erectile disturbance, ejaculation failure, impotence, prostatitis

INTEG: Sweating, rash

MISC: Rhabdomyolysis, angioneurotic edema, anaphylaxis

PHARMACOKINETICS

Peak 1-2 hr duration up to 24 hr, metabolized by liver, some are poor metabolizers, excreted by kidneys, 98% protein binding, half-life 5 hr

INTERACTIONS

Increase: hypertensive crisis—MAOIs or within 14 days of MAOIs, vasopressors

Increase: cardiovascular effects of albuterol, pressor agents

Increase: effects of atomoxetine—CYP2D6 inhibitors (amiodarone, cimetidine [weak], clomiPRAMINE, delavirdine, gefitinib, imatinib, propafenone, quiNIDine [potent], ritonavir, citalopram, escitalopram, FLUoxetine, sertraline, PAROxetine, thioridazine, venlafaxine)

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Mental status: mood, sensorium, affect, stimulation, memory loss, confusion, insomnia, aggressiveness, suicidal ideation in children/young adults, to notify prescriber immediately

- VS, B/P; check patients with cardiac disease more often for increased B/P
- **Hepatic injury:** may cause liver failure: monitor LFT; assess for jaundice, pruritus, flulike symptoms, upper right quadrant pain

- **Priapism:** monitor for urinary function (hesitancy, retention), sexual changes
- Appetite, sleep, speech patterns
- **ADHD:** For increased attention span, decreased hyperactivity with ADHD, growth rate, weight; therapy may need to be discontinued

Evaluate:

- Therapeutic response: decreased hyperactivity (ADHD), improved attention

Teach patient/family:

- To avoid OTC preparations, other medications, herbs, supplements unless approved by prescriber; no tapering needed when discontinuing product
- To avoid alcohol ingestion
- To avoid hazardous activities until stabilized on medication
- To get needed rest; patients will feel more tired at end of day; not to take dose late in day, insomnia may occur

Black Box Warning: To report suicidal ideation immediately

- To notify prescriber immediately if erection >4 hr
- To report immediately fainting, chest pain, difficulty breathing
- **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected, or if breastfeeding; avoid in pregnancy or breastfeeding

atorvastatin (Rx)

(a-tore'va-stat-in)

Lipitor

Func. class.: Antilipidemic

Chem. class.: HMG-CoA reductase inhibitor (statin)

Do not confuse:

atorvastatin/atomoxetine

Lipitor/Loniten/ZyrTEC

ACTION: Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis; high doses lead to plaque regression

USES: As adjunct for primary hypercholesterolemia (types Ia, Ib), elevated triglyceride levels, prevention of CV disease by reduction of heart risk in those with mildly elevated cholesterol, heterozygous familial hypercholesterolemia in pediatric patients, intensive lipid-lowering after an ACS event, non-cardioembolic stroke/TIA, to reduce total/LDL cholesterol in homozygous familial hypercholesterolemia

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, active hepatic disease

Precautions: Previous hepatic disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalance

DOSAGE AND ROUTES

- **Adult: PO** 10-20 mg/day, usual range 10-80 mg/day, dosage adjustments may be made in 2- to 4-wk intervals, max 80 mg/day; patients who require >45% reduction in LDL may be started at 40 mg/day; concurrent use with clarithromycin, itraconazole, saquinavir/ritonavir, derunavir, fosamprenivir, fosamprenavir/ritonavir max 20 mg/day
- **Child 10-17 yr: PO** 10 mg daily, adjust q4wk, max 20 mg/day

Available forms: Tablets 10, 20, 40, 80 mg

Administer:

- Total daily dose at any time of day without regard to meals
- Store in cool environment in tight container protected from light

SIDE EFFECTS

CNS: Headache, asthenia, insomnia

EENT: Lens opacities

GI: *Abdominal cramps, constipation, diarrhea, flatus, heartburn,* dyspepsia, liver dysfunction, pancreatitis, nausea, increased serum transaminase

GU: Impotence, UTI

INTEG: Rash

MISC: Hypersensitivity; gynecomastia (child)

MS: Arthralgia, myalgia, rhabdomyolysis, myositis

RESP: Pharyngitis, sinusitis

PHARMACOKINETICS

Peak 1-2 hr, metabolized in liver, highly protein-bound, excreted primarily in urine, half-life 14 hr, protein binding 98%

INTERACTIONS

Increase: rhabdomyolysis—azole antifungals, cycloSPORINE, erythromycin, niacin, gemfibrozil, clofibrate, amiodarone, boceprevir, nelfinavir, lopinavir/ritonavir, macrolides, tacrolimus, telaprevir; use lower dose
Increase: serum level of digoxin
Increase: toxicity, decreased metabolism of HMG-CoA: colchicine, diltiazem, fibric acid derivatives, protease inhibitors
Increase: levels of oral contraceptives
Increase: levels of atorvastatin, myopathy—CYP3A4 inhibitors
Increase: effects of warfarin
Decrease: atorvastatin levels—colestipol, antacids, cholestyramine
Drug/Herb
Decrease: effect—St. John's wort
Drug/Food
• Possible toxicity when used with grapefruit juice (large amounts); oat bran may reduce effectiveness
Drug/Lab Test
Increase: ALT, AST, CK

NURSING CONSIDERATIONS

Assess:
• **Hypercholesterolemia:** diet, obtain diet history including fat, cholesterol in diet; cholesterol triglyceride levels periodically during treatment; check lipid panel 6-12 wk after changing dose
• Hepatic studies q1-2mo, at initiation, 6, 12 wk after initiation or change in dose, periodically thereafter; AST, ALT, LFTs may be increased
• Bowel status: constipation, stool softeners may be needed; if severe, add fiber, water to diet
• **Rhabdomyolysis:** for muscle pain, tenderness, obtain CPK baseline; if markedly increased, product may need to be discontinued; many drug interactions may increase possibility for rhabdomyolysis
• **Pregnancy/breastfeeding:** do not breastfeed or use in pregnancy
Evaluate:
• Therapeutic response: decrease in LDL, total cholesterol, triglycerides, CAD; increase in HDL:LDL ratio
Teach patient/family:
• That compliance is needed for positive results to occur, not to skip or double doses
• That blood work and eye exam will be necessary during treatment
• To report blurred vision, severe GI symptoms, headache, muscle pain, and weakness; to avoid alcohol
• That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, or if breastfeeding

atovaquone (Rx)

(a-toe'va-kwon)

Mepron

Func. class.: Antiprotozoal
Chem. class.: Analog of ubiquinone

ACTION: Interferes with DNA/RNA synthesis in protozoa

USES: *Pneumocystis jiroveci* infections in patients intolerant of trimethoprim-sulfamethoxazole; prophylaxis

CONTRAINDICATIONS: Hypersensitivity or history of developing life-threatening allergic reactions to any component of the formulation, benzyl alcohol sensitivity
Precautions: Pregnancy, breastfeeding, neonates, hepatic disease, GI disease, respiratory insufficiency

DOSAGE AND ROUTES

Acute, mild, moderate
***Pneumocystis jiroveci* pneumonia**
• **Adult and adolescent 13-16 yr: PO** 750 mg with food bid for 21 days
***Pneumocystis jiroveci* pneumonia, prophylaxis**
• **Adult and adolescent >13 yr: PO** 1500 mg/day with meal
Available forms: Suspension 750 mg/5 mL
Administer:
• If vomiting occurs after ingestion, notify prescriber

• With high-fat food to increase absorption of product and higher plasma concentrations
• Oral suspension; shake gently before using
• All contents of foil pouch, pour in spoon or directly into mouth

SIDE EFFECTS

CNS: *Dizziness, headache, anxiety, insomnia,* asthenia, fever
CV: Hypotension
GI: *Nausea, vomiting, diarrhea,* anorexia, increased AST/ALT, acute pancreatitis, constipation, abdominal pain
HEMA: Anemia, neutropenia
INTEG: Pruritus, urticaria, *rash*
META: Hypoglycemia, hyponatremia
OTHER: Cough, dyspnea

PHARMACOKINETICS

Excreted unchanged in feces (94%), protein binding (99%), half-life 2-3 days, peak 1-8 hr

INTERACTIONS

Increase: level of—zidovudine; monitor for toxicity
Decrease: effect of atovaquone—metoclopramide, rifAMPin, rifabutin, tetracycline; avoid concurrent use
Drug/Food
• Increased absorption with food
Drug/Lab Test
Increase: AST, ALT, alk phos
Decrease: glucose, neutrophils, HB, sodium

NURSING CONSIDERATIONS

Assess:
• **Infection:** WBC, vital signs; sputum baseline, periodically; obtain specimens needed before giving first dose
• Bowel pattern before, during treatment
• Respiratory status: rate, character, wheezing, dyspnea; risk for respiratory infection
• Allergies before treatment, reaction to each medication
Evaluate:
• Therapeutic response: C&S negative
• Decreased infection signs/symptoms
Teach patient/family:
• To take with food to increase plasma concentrations
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected; use cautiously in breastfeeding
• To take product as prescribed, not to skip or double dose

atovaquone/proguanil (Rx)

(a-toe′va-kwon)

Malarone, Malarone Pediatric

Func. class.: Antimalarial
Chem. class.: Aromatic diamide derivative

ACTION: The constituents of Malarone, atovaquone, and proguanil hydrochloride interfere with 2 different pathways involved in DNA/RNA synthesis in protozoa

USES: Malaria, malaria prophylaxis

CONTRAINDICATIONS: Hypersensitivity to this product, malaria prophylaxis in patients with severe renal impairment
Precautions: Pregnancy, breastfeeding, children, hepatic/GI/renal disease

DOSAGE AND ROUTES

Treatment of acute, uncomplicated *Plasmodium falciparum* malaria
Malarone adult-strength tablets
• **Adult/adolescent/child >40 kg: PO** 4 adult-strength tablets every day as a single dose × 3 consecutive days
• **Child 31-40 kg: PO** 3 adult-strength tablets every day as a single dose × 3 consecutive days
• **Child 21-30 kg: PO** 2 adult-strength tablets every day as a single dose × 3 consecutive days
• **Infant/child 11-20 kg: PO** 1 adult-strength tablet every day × 3 consecutive days
Malarone Pediatric tablets
• **Infant/child 11-20 kg: PO** 4 pediatric tablets every day × 3 consecutive days
• **Infant/child 9-10 kg: PO** 3 pediatric tablets every day × 3 consecutive days

• **Infant/child 5-8 kg: PO** 2 pediatric tablets every day × 3 consecutive days

***P. falciparum* malaria prophylaxis, including chloroquine resistance areas**

Malarone adult-strength tablets

• **Adult/adolescent/child >40 kg: PO** 1 adult-strength tablet every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

Malarone Pediatric tablets

• **Child 31-40 kg: PO** 3 pediatric tablets every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

• **Child 21-30 kg: PO** 2 pediatric tablets every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

• **Infant/child 11-20 kg: PO** 1 pediatric tablet every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

Renal dose

• **Adult: PO** CCr <30 mL/min, do not use for prophylaxis

Available forms: Tablets (adult) 250 mg atovaquone/proguanil 100 mg; tablets (pediatric) 62.5 atovaquone/proguanil 25 mg

Administer:

• Give with food or with milk or milk-based drink (nutritional supplement shake) to enhance oral absorption of atovaquone; food with high fat content is desired

• Give dose at the same time each day; administer a repeat dose if vomiting occurs within 1 hr after dosing

• Tablets may be crushed and mixed with condensed milk for children unable to swallow whole tablets

SIDE EFFECTS

CNS: *Dizziness, headache, anxiety, insomnia,* asthenia, fever

CV: Hypotension

GI: *Nausea, vomiting, diarrhea,* anorexia, increased AST/ALT, acute pancreatitis, constipation, abdominal pain

INTEG: Pruritus

OTHER: Cough, dyspnea

PHARMACOKINETICS

Atovaquone excreted unchanged in feces (94%), highly protein-bound (99%), proguanil 75% protein-bound, 40%-60% excreted in urine, hepatic metabolism; half-life 2-3 days

INTERACTIONS

Increase: level of warfarin; monitor INR

Decrease: effect of atovaquone—rifAMPin, rifabutin, tetracycline, metoclopramide; avoid using concurrently

Drug/Lab

Increase: AST, ALT, alkaline phosphatase

Decrease: glucose, neutrophils, HB

NURSING CONSIDERATIONS

Assess:

• **Malaria:** identify when the patient will be entering an area with malaria

• Bowel pattern before, during treatment

• Respiratory status: rate, character, wheezing, dyspnea; risk for respiratory infection

• Allergies before treatment, reaction to each medication

• CBC, LFTs, serum amylase, creatinine/BUN, sodium; increases in LFTs can persist for 4 wk after discontinuation of treatment

• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected; avoid in breastfeeding if possible

Evaluate:

• Therapeutic response: resolution/prevention of malaria

Teach patient/family:

• To take with food to increase plasma concentrations, at same time of day

• To take whole course of treatment

• That product may be crushed and mixed with fluid if unable to swallow

⚠ HIGH ALERT

atracurium (Rx)

(a-tra-kyoor′ee-um)

Func. class.: Neuromuscular blocker (nondepolarizing)

USES: Facilitation of endotracheal intubation, skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Respiratory insufficiency

DOSAGE AND ROUTES

- **Adult and child >2 yr: IV BOLUS** 0.4-0.5 mg/kg, then 0.08-0.1 mg/kg 20-45 min after first dose if needed for prolonged procedures; give smaller doses with halothane
- **Child 1 mo-2 yr: IV BOLUS** 0.3-0.4 mg/kg

Available forms: Injection 10 mg/mL

⚠ HIGH ALERT

atropine (Rx)

(a'troe-peen)

Atro-Pen

Func. class.: Antidysrhythmic, anticholinergic parasympatholytic, antimuscarinic

Chem. class.: Belladonna alkaloid

ACTION: Blocks acetylcholine at parasympathetic neuroeffector sites; increases cardiac output, heart rate by blocking vagal stimulation in heart; dries secretions by blocking vagus

USES: Bradycardia <40-50 bpm, bradydysrhythmia, reversal of anticholinesterase agents, insecticide poisoning, blocking cardiac vagal reflexes, decreasing secretions before surgery, antispasmodic with GU, biliary surgery, bronchodilator, AV heart block
Unlabeled uses: Stress endocardiopathy

CONTRAINDICATIONS: Hypersensitivity to belladonna alkaloids, closed-angle glaucoma, GI obstructions, myasthenia gravis, thyrotoxicosis, ulcerative colitis, prostatic hypertrophy, tachycardia/tachydysrhythmias, asthma, acute hemorrhage, severe hepatic disease, myocardial ischemia, paralytic ileus
Precautions: Pregnancy, breastfeeding, children <6 yr, geriatric patients, renal disease, HF, hyperthyroidism, COPD, hypertension, intraabdominal infection, Down syndrome, spastic paralysis, gastric ulcer

DOSAGE AND ROUTES

Symptomatic bradycardia

- **Adult: IV BOLUS** 0.5-1 mg given q3-5min, max 3 mg
- **Child: IV BOLUS** 0.02 mg/kg, may repeat ×1; max single dose 0.5 mg, max total dose 1 mg

Bradysystolic arrest

Adult: IV 1 mg q3-5min, max total dose 3 mg

Organophosphate/carbamate/nerve agent poisoning

- **Adult and child: IM/IV** 1-2 mg q20-30min until muscarinic symptoms disappear; may need 6 mg every hr
- **Adult and child >90 lb, usually >10 yr: AtroPen** 2 mg
- **Child 40-90 lb, usually 4-10 yr: AtroPen** 1 mg
- **Child 15-40 lb: AtroPen** 0.5 mg
- **Infant <15 lb: IM/IV** 0.05 mg/kg q5-20min as needed

Presurgery

- **Adult and child >20 kg: SUBCUT/IM/IV** 0.4-0.6 mg 30-60 min before anesthesia
- **Child <20 kg: IM/SUBCUT** 0.01 mg/kg up to 0.4 mg, ½-1 hr preop, max 0.6 mg/dose

Stress endocardiography (unlabeled)

Adult: IV 0.25-0.5 up to a total dose of 1-2 mg until 85% of target HR is achieved

Available forms: Injection 0.05, 0.1, 0.4, 0.8, 1 mg/mL; AtroPen 0.25, 0.5, 1, 2 mg/0.7 mL Injection prefilled autoinjectors

Administer:

IM route

- Atropine flush may occur in children and is not harmful, usually 15-20 min after use

AtroPen

- Use no more than 3 AtroPen injections unless under the supervision of trained medical provider

• Use as soon as symptoms appear (tearing, wheezing, muscle fasciculations, excessive oral secretions), may use through clothing

IV route

• Undiluted or diluted with 10 mL sterile water; give at 0.6 mg/min through **Y**-tube or 3-way stopcock; do not add to IV solution; may cause paradoxical bradycardia for 2 min

Y-site compatibilities: Amrinone, etomidate, famotidine, heparin, hydrocortisone, meropenem, nafcillin, potassium chloride, SUFentanil, vitamin B/C

Endotracheal route

• Dilute with 5-10 mL of 0.9% NaCl, inject into endotracheal tube, then positive pressure ventilation

SIDE EFFECTS

CNS: Headache, dizziness, involuntary movement, confusion, flushing, drowsiness
CV: Tachycardia, bradycardia
EENT: Blurred vision, photophobia, dry eyes
GI: Dry mouth, constipation
RESP: Tachypnea, pulmonary edema
GU: Retention, hesitancy, impotence
INTEG: Flushing, decreased sweating

PHARMACOKINETICS

Half-life 4-5 hr, excreted by kidneys unchanged (50%), metabolized in liver, crosses placenta, excreted in breast milk
IM/SUBCUT: Onset 15-50 min, peak 30 min, duration 4-6 hr, well absorbed
IV: Peak 2-4 min, duration 4-6 hr

INTERACTIONS

Increase: mucosal lesions—potassium chloride tablet; avoid concurrent use
Increase: anticholinergic effects—tricyclics, amantadine, antiparkinson agents, phenothiazines, antidysrhythmics
Increase: altered response—β-blockers
Decrease: absorption—ketoconazole, levodopa
Decrease: effect of atropine—antacids

NURSING CONSIDERATIONS

Assess:

• I&O ratio; check for urinary retention, daily output
• VS during treatment, ECG for ectopic ventricular beats, PVC, tachycardia in cardiac patients
• For bowel sounds, constipation, abdominal distention, if constipation occurs add fluids, bulk in diet
• **Beers:** avoid in older adults; highly anticholinergic, high risk of delirium, in men decreased urinary flow

Evaluate:

• Therapeutic response: decreased dysrhythmias, increased heart rate, secretions; GI, GU spasms; bronchodilation

Teach patient/family:

• To report blurred vision, chest pain, allergic reactions, constipation, urinary retention; to use sunglasses to protect the eyes
• Not to perform strenuous activity in high temperatures; heat stroke may result
• To take as prescribed; not to skip or double doses
• Not to operate machinery if drowsiness occurs
• Not to take OTC products, herbals, supplements without approval of prescriber
• Not to freeze or expose to light (Atro-Pen)
• To use sunglasses for photophobia
• **Pregnancy/breastfeeding:** identify if pregnant or if breastfeeding; use only if benefits outweigh fetal risk

TREATMENT OF OVERDOSE:

O_2, artificial ventilation, ECG; administer DOPamine for circulatory depression; administer diazePAM or thiopental for seizures; assess need for antidysrhythmics

atropine ophthalmic

See Appendix B

avacopan (Rx)

(a-va-KOE-pan)

Tavneos

Func. class.: Immunomodulating agent
Chem. class.: Complement 5a receptor (C5aR) antagonist

ACTION:
Blocks C5a-mediated neutrophil activation and migration. The precise mechanism is unknown

USES:
Antineutrophil cytoplasmic autoantibody (ANCA)–associated vasculitis in combination

CONTRAINDICATIONS
Hypersensitivity
Precautions: Hepatotoxicity, angioedema, hepatitis B virus reactivation, serious infections

DOSAGE AND ROUTES
• **Adult: PO** 30 mg (three 100 mg capsules bid with food; reduce to 30 mg daily when used with strong CYP3A4 inhibitors
Available forms: Capsule 10 mg
Administer:
• Capsules should not be crushed, chewed, or opened
• If a dose is missed, wait until the usual scheduled time to take the regular dose, do not double

SIDE EFFECTS
CNS: Headache, paresthesia, fatigue, dizziness
GI: Nausea, diarrhea, vomiting, abdominal pain
CV: Hypotension
INTEG: Rash

INTERACTIONS
Avoid use with strong and moderate CYP3A4 enzyme inducers, strong CYP3A4 enzyme inhibitors: Reduce avacopan dose to 30 mg daily
Sensitive CYP3A4 substrates: Monitor for adverse reactions and reduce dose of sensitive CYP3A4 substrates

PHARMACOKINETICS
Protein binding: 99.99%

NURSING CONSIDERATIONS
Assess:
• Monitor LFTs, alkaline phosphatase, total bilirubin baseline
• Monitor hepatitis B virus (HBV) serology: Screen patients for HBV infection by measuring HBsAg and anti-HBc baseline
Evaluate:
• Therapeutic response: Decreasing vasculitis
Teach patient/family:
• Instruct the patient to swallow whole, not to chew or crush. If a dose is missed, take at next regular dose time, to discuss all OTC, Rx, and herbals taken
• **Hypersensitivity:** Advise patients to seek immediate medical attention for angioedema (swelling of face, extremities, eyes, lips, tongue; and difficulty in swallowing or breathing) and to stop the drug immediately
• **Hepatotoxicity:** Advise patients to contact their health care provider immediately for signs or symptoms of liver problems; yellowing of the skin or the white part of the eyes, dark or brown urine, pain on the upper right side of the abdomen, bleeding or bruising anywhere
• **Infections:** Inform patients that serious infections have been reported, including reactivation of hepatitis B infection. Instruct patients to contact their health care provider immediately if they develop any signs or symptoms of an infection
• **Breastfeeding:** Teach patient to consider benefits/risk during breastfeeding

avanafil (Rx)
(a-van′a-fil)
Stendra
Func. class.: Impotence agent

USES: Treatment of erectile dysfunction

CONTRAINDICATIONS: Hypersensitivity, severe renal/hepatic disease, current nitrates/nitrites, patients <18 yr

DOSAGE AND ROUTES
Erectile dysfunction
• **Adult: PO** 100 mg 30 min before sexual activity, dose may be reduced to

50 mg or increased to 200 mg; usual max dose frequency is 1 time/day

Dosage adjustments

Potent CYP3A4 inhibitors/nitrates

- Do not use

Moderate CYP3A4 inhibitors/ α-blockers

- Max 50 mg/day

Hepatic dosage/severe renal disease

Child-Pugh C: Not recommended

Available forms: Tablets 50,100, 200 mg

⚠ HIGH ALERT

avapritinib (Rx)

(a'va-pri' ti-nib)

Ayvakit

Func. class.: Antineoplastic

Chem. class.: Tyrosine kinase inhibitor

ACTION: Blocks PDGFRA and KIT exon 11, 11/17, 17 mutations

USES: Unresectable/metastatic GI stromal tumor (GIST) with these mutations

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

Precautions: Intracranial hemorrhage

DOSAGE AND ROUTES

- **Adult:** PO 300 mg daily on an empty stomach, continue until disease progression or unacceptable toxicity

Systemic mast cell disease

- **Adult: PO** 200 mg daily on empty stomach, continue until disease progression or unacceptable toxicity

Available forms: Tablet 100 mg, 200 mg, 300 mg

Administer:

- Give on an empty stomach, at least 1 hr before or 2 hr after a meal
- If a dose is missed, do not take if next dose is due within 8 hr
- Give antiemetics to prevent nausea and vomiting
- Store at room temperature

SIDE EFFECTS

CV: Edema

INTEG: Alopecia, hair discoloration, rash

GI: Abdominal pain, constipation, anorexia, diarrhea, dysgeusia, dyspepsia, nausea/vomiting

CNS: CNS toxicity, cognitive dysfunction, dizziness, fatigue, headache, memory impairment, mood/sleep disorder, fever

MS: Asthenia

EENT: Tearing, periorbital edema

RESP: Dyspnea, pleural effusion

PHARMACOKINETICS

Onset unknown, peak 2-4 hr, duration unknown, half-life 32-57 hr, protein binding 98.8%

INTERACTIONS

Increase avapritinib effect: Moderate/strong CYP3A4 inhibitors, avoid using together

Decrease avapritinib effect: Moderate/strong CYP3A4 inducers, avoid using together

Drug/Lab: Increase: LFTs, bilirubin, serum creatinine, INR, PTT, thrombocytopenia

Decrease: Serum albumin, serum magnesium, serum phosphate, serum potassium/sodium, neutrophils, leukocytes

NURSING CONSIDERATIONS

Assess:

- Assess for PDGFRA exon 18 mutations before use
- Assess for pregnancy before use in females of reproductive potential, males with female partners of reproductive potential should use contraception during and for 6 wk after last dose
- Monitor CNS effects (cognitive impairment, dizziness, sleep/mood/speech disorders), intracranial hemorrhage

Evaluate:
• Therapeutic response: Decrease in spread of GI stromal tumor
Teach patient/family:
• To report adverse reactions immediately: Severe headache, cognitive changes, shortness of breath, change in vision
• About reason for treatment, expected results
• That effect on male infertility is unknown
• Not to stop or change dose
• To avoid hazardous activities until response is known, dizziness may occur
• To take on empty stomach
• To avoid OTC products unless approved by prescriber
• To notify prescriber if pregnancy is planned or suspected; not to breastfeed; to use effective contraception during and for 6 wk after last dose, females of reproductive potential and males with female partners of reproductive potential

axicabtagene ciloleucel (Rx)

(ax-i-cab′tay-jeen-sye-lo′loo-sel)

Yescarta

Func. class.: Antineoplastic, cellular immunotherapies

USES: For the treatment of non-Hodgkin's lymphoma

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Cytokine release syndrome

DOSAGE AND ROUTES

Large B-cell lymphoma
• **Adult: IV** 2×10^6 CAR-positive viable T cells per kg of body weight (max dose of 2×10^8 CAR-positive viable T cells) as a single IV dose
Therapeutic drug monitoring: management of treatment-related toxicity; refer to package insert

Available forms: Infusion bag: 2×10^6 chimeric antigen receptor–positive T cells/kg

A

HIGH ALERT

axitinib (Rx)

Inlyta

Func. class.: Antineoplastics, biologic response modifiers, signal transduction inhibitors (STIs)

Chem. class.: Tyrosine kinase inhibitor

ACTION: Inhibits receptor tyrosine kinases including vascular endothelial growth factor receptor 1 (VEGFR-1), VEGFR-2, and VEGFR-3; inhibits tumor growth and phosphorylation of VEGFR-2 and VEGF-mediated endothelial cell proliferation

USES: Treatment of advanced renal cell cancer after failure of 1 prior systemic therapy

CONTRAINDICATIONS: Pregnancy, breastfeeding
Precautions: Risk for or history of thromboembolic disease, recent bleeding, untreated brain metastasis, recent GI bleeding, GI perforation, fistula, surgery, moderate hepatic disease, uncontrolled hypertension, hyper/hypothyroidism, proteinuria, infertility, end-stage renal disease (CrCl <15 mL/min); not intended for use in adolescents, children, infants, neonates

DOSAGE AND ROUTES

Advanced renal cell carcinoma after failure of 1 systemic therapy
• **Adult: PO** 5 mg bid (at 12-hr intervals), may increase to 7 mg bid and then to 10 mg bid in intervals of 6 wk
First-line treatment of advanced renal cell cancer, with pembrolizumab
• **Adults: PO** 5 mg bid with pembrolizumab 200 mg IV on day 1 q3wk or 400 mg IV on day 1 q6wk. The axitinib dosage may be increased to 7 mg bid and then to 10 mg bid q6wk or longer in normotensive patients
First-line treatment of advanced renal cell cancer, with avelumab
• **Adults: PO** 5 mg bid with avelumab 800 mg IV over 1 hr q2wk until disease progression or unacceptable toxicity.

The axitinib dosage may be increased to 7 mg bid and then to 10 mg bid in normotensive patients

• **Adult receiving a strong CYP3A4/5 inhibitor:** Reduce dose by ½, adjust as needed

Available forms: Tablets 1, 5 mg

Administer:

• Premedicate with antihistamine and acetaminophen 30-60 min prior to each dose
• Use safe handling precautions
• Give with or without food; swallow tablet whole with a glass of water
• If patient vomits or misses a dose, an additional dose should not be taken; the next dose should be taken at the usual time
• Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache, reversible posterior leukoencephalopathy syndrome (RPLS), fatigue

CV: Hypertension, arterial thromboembolic events (ATE), venous thromboembolic events (VTE)

ENDO: Hypothyroidism, hyperthyroidism

GI: Lower GI bleeding/perforation/fistula, abdominal pain, constipation, diarrhea, dysgeusia, dyspepsia, dysphonia, hemorrhoids, nausea, mucosal inflammation, stomatitis, vomiting, increased ALT/AST

GU: Proteinuria

HEMA: Bleeding, intracranial bleeding, anemia, polycythemia, decreased/increased hemoglobin, lymphopenia, thrombocytopenia, neutropenia

INTEG: Palmar-plantar erythrodysesthesia (hand and foot syndrome), rash, dry skin, pruritus, alopecia, erythema

MISC: Weight loss, dehydration, metabolic and electrolyte laboratory abnormalities

MS: Asthenia, arthralgia, musculoskeletal pain, myalgia

RESP: Cough, dyspnea

PHARMACOKINETICS

Absorption: bioavailability 58%; distribution: protein binding >99%; metabolized in liver by CYP3A4/5, CYP1A2, CYP2C19, and UGT1A1; metabolites are carboxylic acid, sulfoxide, and *N*-glucuronide; excretion 41% in feces and 23% in urine, 12% unchanged; half-life: 2.5-6.1 hr; steady state 2-3 days; onset unknown, peak 2.5-4.1 hr, increased in moderate hepatic disease; duration unknown

INTERACTIONS

Increase: effect of axitinib—CYP3A4/5 inhibitors, strong/moderate (ketoconazole, boceprevir, chloramphenicol, conivaptan, delavirdine, fosamprenavir, imatinib, indinavir, isoniazid, itraconazole, dalfopristin, quinupristin, posaconazole, ritonavir, telithromycin, tipranavir [boosted with ritonavir], darunavir [boosted with ritonavir], aldesleukin [IL-2], amiodarone, aprepitant, fosaprepitant, atazanavir, bromocriptine, clarithromycin, crizotinib, danazol, diltiaZEM, dronedarone, erythromycin, fluvoxaMINE, lanreotide, lapatinib, miconazole, miFEPRIStone, nefazodone, nelfinavir, niCARdipine, octreotide, pantoprazole, saquinavir, tamoxifen, verapamil, voriconazole, grapefruit juice); avoid using together, or reduce axitinib

Decrease: effect of axitinib—CYP3A4/5 inducers, strong/moderate (rifAMPin, carBAMazepine, dexamethasone, phenytoin, PHENobarbital, rifabutin, rifapentine, St. John's wort, ethanol, bexarotene, bosentan, efavirenz, etravirine, griseofulvin, metyraPONE, modafinil, nafcillin, nevirapine, OXcarbazepine, vemurafenib, pioglitazone, topiramate); avoid using together

Increase or decrease: effect of axitinib—CYP3A4/5 inhibitors and inducers (quiNINE)

Drug/Lab Test

Increase: creatinine, lipase, amylase, potassium

Decrease: bicarbonate, calcium, albumin, glucose, phosphate, sodium

Increase or decrease: sodium, glucose

Drug/Food

Increase: drug effect—grapefruit or grapefruit juice

Drug/Herb

Decrease: effect of axitinib—St. John's wort

NURSING CONSIDERATIONS

Assess:

• **Bleeding:** monitor for GI bleeding or perforation; temporarily discontinue therapy if any bleeding that requires treatment

• **Surgery:** discontinue ≥24 hr before surgery; may be resumed after adequate wound healing
• **Hepatic/renal disease:** dosage should be reduced in patients with moderate (Child-Pugh Class B) hepatic disease; monitor liver function tests (ALT, AST, bilirubin) before and periodically during therapy; monitor CCr before and during treatment
• **Hypertension:** B/P should be well controlled before starting treatment; monitor for hypertension and administer antihypertensive therapy as needed before and during therapy; dose should be reduced for persistent hypertension; therapy should be discontinued if B/P remains elevated after a dosage reduction or if there is evidence of hypertensive crisis; after discontinuation, monitor B/P for hypotension in those receiving antihypertensives
• **Hyper/hypothyroidism:** monitor thyroid function tests before and periodically during therapy; thyroid disease should be treated with thyroid medications
• Monitor for proteinuria before and periodically during therapy; product may need to be decreased or discontinued if moderate to severe proteinuria occurs
• **RPLS:** monitor for headache, seizures, visual changes, confusion, drowsiness, hemiplegia, discontinue product if these occur
• **Pregnancy/breastfeeding:** determine if the patient is pregnant or breastfeeding before using this product; may also cause infertility; do not use in pregnancy and for 1 wk after last dose or breastfeeding; obtain pregnancy test in women of childbearing potential before starting therapy

Evaluate:
• Therapeutic response: decreased spread of malignancy

Teach patient/family:
• That product will be discontinued ≥24 hr before surgery; may be resumed after adequate wound healing
• To notify prescriber of bleeding that is severe or that requires treatment
• That laboratory testing will be required before and periodically during product use
• How to monitor B/P and that B/P products should be continued as directed by prescriber
• That product may be taken without regard to meals
• To report all adverse reactions, including neurologic, GI bleeding
• To avoid use with grapefruit/grapefruit juice, St. John's wort
• Pregnancy/breastfeeding: to use contraception during treatment, and for 1 wk after last dose or to avoid use of this product; to notify prescriber if pregnancy is planned or suspected; not to breastfeed

⚠ HIGH ALERT

azaCITIDine (Rx)

(a-za-sie-ti'deen)

Onureg, Vidaza

Func. class.: Antineoplastic
Chem. class.: Pyrimidine nucleoside analogue

Do not confuse:
azaCITIDine/azaTHIOprine

ACTION: Cytotoxic by producing damage to double-strand DNA during DNA synthesis

USES: Myelodysplastic syndrome (MDS), acute myelogenous leukemia (AML)

CONTRAINDICATIONS: Pregnancy, hypersensitivity to product or mannitol, advanced malignant hepatic tumors

Precautions: Breastfeeding, children, geriatric patients, renal/hepatic disease, baseline albumin <30 g/L; a man should not father a child while taking product

DOSAGE AND ROUTES

Myelodysplastic syndrome/AML
• **Adult:** PO 300 mg daily on days 1-14 (28-day cycle); **SUBCUT/IV** 75 mg/m^2/day × 7

days q4wk, dose may be increased to 100 mg/m^2 if no response seen after 2 treatment cycles; minimum treatment, 4 cycles

Available forms: Powder for injection 100 mg; tablets 200, 300 mg

Administer:

- Use cytotoxic handling procedures

SUBCUT route

- **Reconstitute** with 4 mL sterile water for injection (25 mg/mL), inject diluents slowly into vial, invert vial 2-3 times, gently rotate; solution will be cloudy, use immediately; divide doses >4 mL into 2 syringes; invert contents 2-3 times, gently roll syringe between the palms for 30 sec immediately before administration, rotate injection site

Intermittent IV INFUSION route

- **Reconstitute** each vial with 10 mL sterile water for injection, shake well until all solids are dissolved, withdraw solution (10 mg/mL), inject in 50-100 NS or LR infusion, run over 10-40 min

SIDE EFFECTS

CNS: *Anxiety, depression, dizziness, fatigue, headache, fever, insomnia*

CV: Cardiac murmur, hypotension, tachycardia, peripheral edema, *chest pain*

GI: *Diarrhea, nausea, vomiting,* anorexia, *constipation,* abdominal pain, distention, tenderness, hemorrhoids, mouth hemorrhage, tongue ulceration, stomatitis, dyspepsia, hepatotoxicity, hepatic coma

GU: Renal failure, renal tubular acidosis, dysuria, UTI

HEMA: Leukopenia, anemia, thrombocytopenia, neutropenia, febrile neutropenia, ecchymosis, petechiae

INTEG: *Irritation at site, rash,* sweating, pyrexia, pruritus

META: Hypokalemia

MS: Weakness, arthralgia, muscle cramps, myalgia, back pain

RESP: Cough, *dyspnea, pharyngitis,* pleural effusion

PHARMACOKINETICS

Rapidly absorbed, peak ½ hr, metabolized in the liver, half-life 4 hr, excreted in urine

INTERACTIONS

Increase: bone marrow suppression—other antineoplastics

Increase: bleeding—anticoagulants

Drug/Lab

Increase: BUN, creatinine

Decrease: WBC, platelets, neutrophils, potassium

NURSING CONSIDERATIONS

Assess:

- For CNS symptoms: fever, headache, chills, dizziness
- **Bone marrow suppression/hematologic response:** CBC with differential, baseline WBC ≥3000/mm^3, absolute neutrophil count (ANC) ≥1500/mm^3, platelets >75,000/mm^3, adjust dose based on nadir; ANC <500/mm^3, platelets <25,000/mm^3, give 50% dose next course; ANC 500-1500/mm^3, platelets 25,000-50,000/mm^3, give 67% next course; bruising, bleeding, blood in stools, urine, sputum, emesis; myelodysplastic syndrome (MDS), splenomegaly
- Buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Myelodysplastic syndrome:** severe anemia, cytopenias, splenomegaly
- **TLS:** Monitor for TLS even with allopurinol, monitor electrolytes, uric acid, serum creatinine baseline and periodically
- Blood studies: BUN, bicarbonate, creatine, LFTs
- Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: improvement in blood counts with refractory anemia, or refractory anemia with excess blasts

Teach patient/family:

- To avoid crowds, persons with known infections; not to receive immunizations
- To avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids

• To report stomatitis; any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms, infection site reactions, pruritus, fever

• **Pregnancy/breastfeeding:** to use contraception during and for 6 mo after therapy; not to breastfeed; not to father a child while receiving product

azaTHIOprine (Rx)

(ay-za-thye′oh-preen)

Azasan, Imuran

Func. class.: Immunosuppressant

Chem. class.: Purine antagonist

Do not confuse:
azaTHIOprine/azaCITIDine

ACTION: Produces immunosuppression by inhibiting purine synthesis in cells

USES: Renal transplants to prevent graft rejection, refractory rheumatoid arthritis

Unlabeled uses: Chronic ulcerative colitis, Crohn's disease, autoimmune hepatitis, dermatomyositis, thrombocytopenic purpura, lupus nephritis, polymyositis, pulmonary fibrosis, systemic lupus erythematosus (SLE), Wegener's granulomatosis, vasculitis, atopic dermatitis

CONTRAINDICATIONS: Pregnancy, hypersensitivity, breastfeeding

Precautions: Severe renal/hepatic disease, geriatric patients, thiopurine methyltransferase deficiency, infection, bone marrow suppression; must be used by an experienced clinician

Black Box Warning: Neoplastic disease

DOSAGE AND ROUTES

Immunosuppression in kidney transplantation

• **Adult and child: PO/IV** 3-5 mg/kg/day, then maintenance **(PO)** of ≥1-3 mg/kg/day

Child/adolescent (unlabeled): PO 1-2 mg/kg/day with tacrolimus and corticosteroids

Renal dose

• **Adult: PO** Give lower dose in tubular necrosis in immediate postcadaveric transplant period

Refractory rheumatoid arthritis

• **Adult: PO** 1 mg/kg/day, may increase dose after 2 mo by 0.5 mg/kg/day and then q4wk, max 2.5 mg/kg/day

Lupus nephritis/SLE/Wegener's granulomatosis/idiopathic pulmonary fibrosis/multiple sclerosis (unlabeled)

• **Adult: PO** 2-3 mg/kg/day

Atopic dermatitis (unlabeled)

• **Adult/adolescent ≥16 yr: PO** 2.5 mg/kg/day

Crohn's disease, ulcerative colitis (unlabeled)

• **Adult/child: PO** 50 mg/day; may increase by 25 mg/day q1-2wk up to 2-3 mg/kg/day, if tolerated

Available forms: Tablets 50, 75, 100 mg; powder for injection 50 mg, 100 mg/vial

Administer:

• For several days before transplant surgery

• All medications PO if possible; avoid IM injection because bleeding may occur

PO route

• With meals to reduce GI upset

IV route

• Prepare in biologic cabinet with gown, gloves, mask

Direct IV

• **Dilute** to 10 mg/mL with 0.9% NaCl, 0.45% NaCl, D_5W, **give** over 5 min

Intermittent IV INFUSION route

• **Reconstitute** 100 mg/10 mL of sterile water for injection; rotate to dissolve; **further dilute** with 50 mL or more saline or glucose in saline, **give** over ½-1 hr

Y-site compatibilities: Alfentanil, atracurium, atropine, benztropine, calcium gluconate, cycloSPORINE, enalaprilat, epoetin alfa, erythromycin, fentaNYL, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, insulin, mannitol, mechlorethamine, metoprolol, naloxone,

nitroglycerin, oxytocin, penicillin G, potassium chloride, propranolol, protamine, SUFentanil, trimethaphan, vasopressin

SIDE EFFECTS

CNS: Progressive multifocal leukoencephalopathy
EENT: Retinopathy
Resp: Pulmonary edema
GI: *Nausea, vomiting,* stomatitis, esophagitis, pancreatitis, hepatotoxicity, jaundice, hepatic veno-occlusive disease
HEMA: Leukopenia, thrombocytopenia, anemia, pancytopenia, bleeding
INTEG: Rash, alopecia
MISC: Serum sickness, Raynaud's symptoms, secondary malignancy, infection, chills, fever
MS: Arthralgia, muscle wasting

PHARMACOKINETICS

Metabolized in liver, excreted in urine (active metabolite), crosses placenta, half-life 3 hr

INTERACTIONS

Increase: leukopenia—ACE inhibitors, sulfamethoxazole-trimethoprim; monitor for increased leukopenia
Increase: myelosuppression—cycloSPORINE, antineoplastics; monitor for increased myelosuppression
Increase: action of azaTHIOprine—allopurinol; decrease dose of allopurinol, or avoid using
Decrease: immune response—vaccines, toxoids
Drug/herb
Decrease: product's effect—cat's-claw, echinacea; avoid concurrent use
Drug/Lab Test
Increase: LFTs
Decrease: uric acid
Interference: CBC, differential count

NURSING CONSIDERATIONS

Assess:
- **For infection:** increased temperature, WBC; sputum, urine, vital signs baseline and during treatment
- I&O, weight daily, report decreasing urine output; toxicity may occur
- **Bone marrow suppression:** severe leukopenia, pancytopenia, thrombocytopenia; HB, WBC, platelets during treatment monthly; if leukocytes are <3000/mm^3 or platelets <100,000/mm^3, product should be discontinued, CBC
- **Hepatotoxicity:** if dark urine, jaundice, itching, light-colored stools, increased LFTs, product should be discontinued; hepatic studies: alkaline phosphatase, AST, ALT, bilirubin
- **Arthritis:** pain; ROM; swelling; mobility before, during treatment

Evaluate:
- Therapeutic response: absence of graft rejection, immunosuppression in autoimmune disorders

Teach patient/family:
- To take as prescribed; not to miss doses; if dose is missed on daily regimen, to skip dose; if taking multiple doses/day, to take as soon as remembered
- That therapeutic response may take 3-4 mo with RA; to continue with prescribed exercise, rest, other medications
- To report fever, rash, severe diarrhea, chills, sore throat, fatigue because serious infections may occur; report unusual bleeding, bruising; signs/symptoms of renal/hepatic toxicity
- To avoid vaccinations, bring up to date before use
- To avoid crowds to reduce risk for infection
- That treatment is ongoing to prevent transplant rejection
- To avoid use with OTC, herbals, supplements unless approved by prescriber
- **RA:** Advise patient to continue with other prescribed treatment, other medications, physical therapy

azelaic acid (Rx)

(aze-eh-lay'ik)

Azelex, Finacea

Func. class.: Antiacne agent
Chem. class.: Dicarboxylic acid

USES: Mild to moderate inflammatory acne vulgaris, rosacea

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

Adult/child ≥12 yr: Apply a thin film and massage into affected areas bid AM and PM
Available forms: Cream 20%, gel 15%

azelastine (ophthalmic) (Rx)

(ah-zell′ah-steen)
Optivar
Func. class.: Antihistamine (ophthalmic)
Chem. class.: H_1 receptor antagonist

ACTION: Decreases the allergic response by inhibiting histamine release

USES: Pruritus from allergic conjunctivitis

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, child <3 yr

DOSAGE AND ROUTES

• **Adult/child ≥3 yr: OPHTH** 1 drop into each affected eye bid
Available forms: Ophthalmic solution: 0.05%
Administer:
• Tip of dropper should not touch the eye
• Store upright and tightly closed at room temperature

SIDE EFFECTS

CNS: Headache
EENT: Eye burning/stinging/irritation, blurred vision, rhinitis, bitter taste
INTEG: Pruritus
RESP: Asthma, dyspnea, wheezing

PHARMACOKINETICS

Onset 3 min, duration 8 hr, half-life 22 hr, protein binding 88%

NURSING CONSIDERATIONS

Assess:
• Eyes: for itching, redness, use of soft or hard contact lenses
Evaluate:
• Therapeutic response: absence of redness, itching in the eyes
Teach patient/family:
• To use in the eyes only; not to touch dropper to eye/eyelid
• Not to wear contact lenses if eyes are red and itching
• To wait at least 10 min before inserting contact lenses; soft contact lenses can absorb preservative

azelastine nasal agent

See Appendix B

azilsartan (Rx)

(a-zill-sar′tain)
Edarbi
Func. class.: Antihypertensive-ARB

USES: Hypertension, alone or in combination with other antihypertensives

CONTRAINDICATIONS

Black Box Warning: Pregnancy

DOSAGE AND ROUTES

• **Adult: PO** 80 mg/day, may give an initial dose of 40 mg/day in patients receiving high-dose diuretic therapy
Available forms: Tablets 40, 80 mg

azithromycin (Rx)

(ay-zi-thro-my′sin)
AzaSite, Zithromax, Zmax
Func. class.: Antiinfective
Chem. class.: Macrolide

Do not confuse:
azithromycin/erythromycin
Zithromax/Zinacef

ACTION: Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis; much greater spectrum of activity than erythromycin; more effective against gram-negative organisms

USES: Mild to moderate infections of the upper respiratory tract, lower respiratory tract; uncomplicated skin and skin structure infections caused by *Bacillus anthracis, Bacteroides bivius, Bordetella pertussis, Borrelia burgdorferi, Campylobacter jejuni, CDC coryneform group G, Chlamydia trachomatis, Chlamydophila pneumoniae, Clostridium perfringens, Gardnerella vaginalis, Haemophilus ducreyi, influenzae* (beta-lactamase negative/positive), *Helicobacter pylori, Klebsiella granulomatis, Legionella pneumophila, Moraxella catarrhalis, Mycobacterium avium-intracellulare, Mycoplasma genitalium/hominis/pneumoniae, Neisseria gonorrhoeae, Peptostreptococcus* sp., *Prevotella bivia, Rickettsia tsutsugamushi, Salmonella typhi, Staphylococcus aureus (MSSA)/epidermidis, Streptococcus* sp., *Toxoplasma gondii, Treponema pallidum, Ureaplasma urealyticum, Vibrio cholerae, Viridans streptococci;* **PO:** acute pharyngitis/tonsillitis (group A streptococcal); acute skin/soft tissue infections; community-acquired pneumonia; **Ophthalmic:** bacterial conjunctivitis

Unlabeled uses: Babesiosis, cholera, COPD, cystic fibrosis, dental abscess/infection, granuloma inguinale, Lyme disease, lymphogranuloma venereum, MAC, periodontitis, pertussis, prostatitis, shigellosis, syphilis, typhoid fever

CONTRAINDICATIONS: Hypersensitivity to azithromycin, erythromycin, any macrolide, hepatitis, jaundice

Precautions: Pregnancy, breastfeeding; geriatric patients; renal/hepatic/cardiac disease; <6 mo for otitis media; <2 yr for pharyngitis, tonsillitis, QT prolongation, ulcerative colitis, torsades de pointes, sunlight exposure, sodium restriction, myasthenia gravis, CDAD, contact lenses, hypokalemia, hypomagnesemia

DOSAGE AND ROUTES

Most infections
- **Adult: PO** 500 mg on day 1, then 250 mg/day on days 2-5 for a total dose of 1.5 g or 500 mg a day × 3 days
- **Child 2-15 yr: PO** 10 mg/kg on day 1, then 5 mg/kg × 4 days

MAC in HIV:
Adult: PO 500-600 mg daily

Cervicitis, chlamydia, chancroid, nongonococcal urethritis, syphilis
- **Adult: PO** 1 g single dose

Gonorrhea
- **Adult: PO** 1 g single dose with ceftriaxine 250 mg IM

Lower respiratory tract infections
- **Adult: PO** 500 mg day 1, then 250 mg × 4 days
- **Child: PO** 5-12 mg/kg/day × 5 days

Bacterial conjunctivitis
- **Adult/child ≥1 yr: Ophthalmic** Instill 1 drop in affected eye bid × 2 days, then 1 drop in eye daily × 5 days

Lyme disease (unlabeled)
- **Adult: PO** 500 mg/day × 7 days

Traveler's diarrhea
- **Adult: PO** 1000 mg as a single dose

Pertussis (unlabeled)
- **Adult: PO** 500 mg on day 1, then 250 mg/day for 2-5 days
- **Infant ≥6 mo and child: PO** 10 mg/kg/day (max 500 mg) on day 1, then 5 mg/kg/day (max 250 mg) on days 2-5
- **Infant <6 mo: PO** 10 mg/kg/day × 5 days

Cystic fibrosis (unlabeled)
Adult: PO 500 mg (≥40 kg); 250 mg (<40 kg) 3×/wk or 250 mg daily

COPD (unlabeled)
Adult: PO 250-500 mg 3×/wk or 250 mg daily

Available forms: Tablets 250, 500, 600 mg; powder for injection 500 mg; suspension 100, 200 mg/5 mL, 1 g single-dose powder for suspension; extended-release

powder for suspension 2 (ZMAX); ophthalmic drops 1% solution

Administer:

Ophthalmic route

- Store in refrigerator
- Do not touch dropper to eye

PO route

- **Suspension** 1 hr before meal or 2 hr after meal; reconstitute 1 g packet for suspension with 60 mL water, mix, rinse glass with more water and have patient drink to consume all medication; packets not for pediatric use
- Store at room temperature

Intermittent IV INFUSION route

- **Reconstitute** 500 mg of product with 4.8 mL sterile water for injection (100 mg/mL); shake, **dilute** with 250 or 500 mL 0.9% NaCl, 0.45% NaCl, or LR to 1-2 mg/mL; diluted solution stable for 24 hr or 7 days if refrigerated
- **Give** 1 mg/mL solution over 3 hr or 2 mg/mL solution over 1 hr; never give IM or as bolus
- Reconstituted product is stable for 24 hr at room temperature or 7 days refrigerated

Y-site compatibilities: Acyclovir, alatrofloxacin, alemtuzumab, alfentanil, aminocaproic acid, aminophylline, amphotericin B liposome/lipid complex, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoTEtan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, cimetidine, cisatracurium, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, doripenem, doxacurium, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, EPINEPHrine, epiRUBicin, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, fenoldopam, fluconazole, fluorouracil, foscarnet, fosphenytoin, gallium, ganciclovir, gatifloxacin, gemcitabine, granisetron, haloperidol, heparin, hydrocortisone phosphate/succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, irinotecan, isoproterenol, labetalol, lepirudin, magnesium sulfate, mannitol, meperidine, meropenem, mesna, mechlorethamine, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, milrinone, minocycline, mivacurium, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, PENTobarbital, phenylephrine, piperacillin, potassium acetate/phosphates, procainamide, prochlorperazine, promethazine, propranolol, raNITIdine, remifentanil, rocuronium, sodium acetate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, telavancin, teniposide, thiotepa, ticarcillin, tigecycline, tirofiban, TPN, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, headache, seizures, fatigue

CV: Palpitations, chest pain, QT prolongation, torsades de pointes (rare)

EENT: Hearing loss, tinnitus

GI: *Nausea, diarrhea,* hepatotoxicity, abdominal pain, stomatitis, heartburn, dyspepsia, flatulence, melena, cholestatic jaundice, CDAD

GU: Vaginitis, nephritis

HEMA: Anemia, leukopenia, thrombocytopenia

INTEG: Rash, urticaria, pruritus, photosensitivity, pain at injection site

SYST: Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

PO: Peak 2-4 hr, duration 24 hr

IV: Peak end of infusion; duration 24 hr; half-life 11-57 hr; excreted in bile, feces, urine primarily as unchanged product; may be inhibitor of P-glycoprotein

INTERACTIONS

Increase: ergot toxicity—ergotamine

Increase: dysrhythmias—pimozide; fatal reaction, do not use concurrently
Increase: QT prolongation—amiodarone, quiNIDine, nilotinib, droperidol, methadone, propafenone, fluoroquinolones, lithium, paliperidone
Increase: effects of oral anticoagulants, digoxin, theophylline, methylPREDNISolone, cycloSPORINE, bromocriptine, disopyramide, triazolam, carBAMazepine, phenytoin, tacrolimus, nelfinavir
Decrease: clearance of triazolam
Decrease: absorption of azithromycin—aluminum, magnesium antacids, separate by ≥2 hr

Drug/Lab Test
Increase: CPK, ALT, AST, bilirubin, BUN, creatinine, alkaline phosphatase, potassium, blood glucose

Drug/Food
Decrease: absorption—food (suspension)
Decrease: blood glucose, potassium, sodium

NURSING CONSIDERATIONS

Assess:
- I&O ratio; report hematuria, oliguria with renal disease
- Hepatic studies: AST, ALT, CBC with differential
- Renal studies: urinalysis, protein, blood
- C&S before product therapy; product may be taken as soon as culture is taken; C&S may be repeated after treatment
- **QT prolongation, torsades de pointes:** assess for patients with serious bradycardia, ongoing proarrhythmic conditions, or elderly; more common in these patients
- **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema; discontinue if rash develops, treat symptomatically
- **Superinfection:** sore throat, mouth, tongue; fever, fatigue, diarrhea, anogenital pruritus
- **CDAD:** diarrhea, abdominal pain, fever, fatigue, anorexia; obtain CBC, serum albumin
- Bowel pattern before, during treatment
- Respiratory status: rate, character; wheezing, tightness in chest: discontinue product
- Cardiovascular death has occurred in those with serious bradycardia or ongoing hypokalemia, hypomagnesemia; avoid use
- **Pregnancy/breastfeeding:** use only if clearly needed; cautious use in breastfeeding, excreted in breast milk

Evaluate:
- Therapeutic response: C&S negative for infection; decreased signs of infection

Teach patient/family:
- To report sore throat, fever, fatigue, severe diarrhea, anal/genital itching (may indicate superinfection)
- Not to take aluminum-magnesium–containing antacids simultaneously with this product (PO)
- To notify nurse of diarrhea, dark urine, pale stools; yellow discoloration of eyes, skin; severe abdominal pain
- To complete dosage regimen
- To take ZMAX 1 hr before or 2 hr after a meal; shake well before use
- To use protective clothing or stay out of the sun, photosensitivity may occur

TREATMENT OF HYPERSENSITIVITY: Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

azithromycin ophthalmic
See Appendix B

aztreonam (Rx)
(az-tree′oh-nam)
Azactam, Cayston
Func. class.: Antibiotic—miscellaneous
Chem. class.: Monobactam

ACTION: Bactericidal, inhibits cell wall synthesis

USES: UTI; septicemia; skin, muscle, bone infection; lower respiratory tract, intraabdominal infections; other infections caused by gram-negative organisms

CONTRAINDICATIONS: Hypersensitivity to product, severe renal disease

DOSAGE AND ROUTES

Urinary tract infections

- **Adult: IM/IV** 500 mg-1 g q8-12hr

Systemic infections

- **Adult: IM/IV** 1-2 g q8-12hr
- **Child: IM/IV** 90-120 mg/kg/day in divided doses q6-8hr; max 8 g/day **IV**

Severe systemic infections

- **Adult: IM/IV** 2 g q6-8hr; max 8 g/day; continue treatment for 48 hr after negative culture or until patient is asymptomatic

Cystic fibrosis with *Pseudomonas aeruginosa*

- **Adult, adolescent, child ≥7 yr: NEB** 75 mg tid × 28 days, then 28 days off; give q4hr or more; give bronchodilator before aztreonam

Available forms:

Inhalation 75-mg ampule (Cayston); injection 500 mg, 1-g, 2-g vials; injection premixed 1 g/50 mL, 2 g/50 mL

Administer:

IV Route

- Visually inspect parenteral products for particulate matter and discoloration prior to administration whenever solution and container permit
- For IV push, reconstitute each vial with 6 to 10 mL of sterile water for injection
- For intermittent IV infusion, reconstitute with at least 3 mL of sterile water for injection per g of aztreonam. FURTHER DILUTION IS NECESSARY FOR IV INFUSION
- Shake immediately and vigorously
- Storage: Use within 48 hr if kept at room temperature 59°F-98°F (15°C-30°C) or within 7 days if kept under refrigeration 38°F-48°F (2°C-8°C)

Intermittent IV Infusion

- Further dilute the appropriate dose in a compatible IV solution
- If using a volume control administration set, the final dilution of aztreonam max 20 mg/mL
- Shake immediately and vigorously

Premixed Galaxy IV Solution

- Thaw frozen containers at room temperature 77°F (25°C) or under refrigeration 36°F-46°F (2°C-8°C).
- Contents of the solution may precipitate in the frozen state and should dissolve with little or no agitation once the solution has reached room temperature
- Storage: The thawed solution is stable for 48 hr at room temperature or 14 days under refrigeration

Intermittent IV Injection Route

- Slowly inject directly into a vein or the tubing of a suitable administration set over 3 to 5 min

Intermittent IV Infusion Route

- Infuse appropriate dose IV over 20 to 60 min
- For neonates, an infusion time of 15 min has been recommended
- For premixed bags, do not use plastic containers in series connections, as this could result in an embolism

IM Route

- Reconstitute vials with at least 3 mL of an appropriate diluent per g of aztreonam
- Shake immediately and vigorously
- In adults, inject doses of 1 g or less deeply into a large muscle upper outer quadrant of the gluteus maximus or lateral part of the thigh
- Do not admix with any local anesthetic agent

Inhalation Route

- Do not reconstitute aztreonam for inhalation until ready to use
- Twist the tip off of the provided 1 mL sterile diluent (0.17% sodium chloride) ampule and squeeze contents into the aztreonam vial

• Gently swirl until the contents have completely dissolved
• Have patient use a bronchodilator before nebulized solution. A short-acting bronchodilator can be administered 15 min to 4 hr before aztreonam. A long-acting bronchodilator can be administered 30 min to 12 hr before aztreonam.
• Administer aztreonam immediately after reconstitution using an Altera Nebulizer System only. Do not administer via any other nebulizer
• Do not mix with any other drugs
• Administration typically takes 2-3 min via the nebulizer mouthpiece

SIDE EFFECTS

CV: Hypotension, chest pain, thrombophlebitis
CNS: Confusion, headache, insomnia, fever, seizures
EENT: Nasal congestion, sore throat
GI: Pseudomembranous colitis, diarrhea, abdominal pain, nausea, vomiting
RESP: Cough dyspnea, bronchospasm
HEMA: Anemia, thrombocytopenia, neutropenia, pancytopenia
INTEG: Rash, injection site reactions, allergic reactions

PHARMACOKINETICS

IV: onset unknown, peak immediate, duration unknown; **IM:** onset unknown, peak <1 hr, duration unknown; inhalation: onset unknown, 1 hr, duration unknown; half-life 1½-2 hr

INTERACTIONS

Increase: Synergism: aminoglycosides, monitor renal studies
Increase: Antagonism: cefoxitin, imipenem, avoid concurrent use

NURSING CONSIDERATIONS

Assess:
• Monitor LFTs and renal function studies
• Monitor for overgrowth of infection and superinfection
• Monitor for allergic reactions, also those allergic to penicillin and cephalosporins
• May use with other antiinfectives for coverage of gram-positive and anaerobic infections
• Monitor for CDAD that can occur up to 2 mo after using

Teach patient/family:
• That IM injection is painful
• To report continuing signs/symptoms of infection
• To use bronchodilator, then inhalation product
• To report if pregnancy is planned or suspected or if breastfeeding

Evaluate:
• Therapeutic response: Decreased signs/symptoms of UTI or cystic fibrosis

bacitracin topical

See Appendix B

baclofen (Rx)

(bak′loe-fen)

Gablofen, Lioresal Intrathecal, Lyvispah

Func. class.: Skeletal muscle relaxant, central acting

Chem. class.: GABA chlorophenyl derivative

Do not confuse:
baclofen/Bactroban/bacitracin

ACTION: Inhibits synaptic responses in CNS by stimulating GABAb receptor subtype, which decreases neurotransmitter function; decreases frequency, severity of muscle spasms

USES: Spasticity with spinal cord injury, multiple sclerosis
Unlabeled uses: Neuropathic pain, trigeminal neuralgia

CONTRAINDICATIONS: Hypersensitivity, epidural, IM, IV, SUBCUT administration
Precautions: Pregnancy, breastfeeding, geriatric patients, peptic ulcer disease, renal/hepatic disease, stroke, seizure disorder, diabetes mellitus, psychosis, abrupt discontinuation (intrathecal), CNS depressants, especially opiates

DOSAGE AND ROUTES

Spasticity in multiple sclerosis/ spinal cord injury

- **Adult/child ≥12 yr: PO** 5 mg tid × 3 days, then 10 mg tid × 3 days, then 15 mg tid × 3 days, then 20 mg tid × 3 days, then titrated to response, max 80 mg/day (20 mg qid); **INTRATHECAL** use implantable intrathecal infusion pump; use screening trial of 3 separate bolus doses if needed 24 hr apart (50 mcg, 75 mcg, 100 mcg)
- **Child <8 yr:** As above; max 60 mg/day
- **Child >2-7 yr: PO** 10-15 mg/day divided q8hr; titrate q3days by 5-15 mg/day to max 40 mg/day
- **Child: INTRATHECAL** initial test dose same as adult; for small children, initial dose of 25 mcg/dose may be used; 25-1200 mcg/day infusion titrated to response in screening phase

Neuropathic pain including trigeminal neuralgia (unlabeled)

- **Adult: PO** 10 mg tid, may increase by 10 mg every other day; max 80 mg/day

Renal dose

- **Adult:** PO/IT CCr 50-80 mL/min: reduce dose by 33%; CCr 30-50 mL/min: reduce dose by 50%

Available forms: Tablets 5, 10, 20 mg; IT injection 50 mcg/mL, 500 mcg/mL, 1000 mcg/mL, 2000 mcg/mL; oral granules 5-, 10-, 20-mg packets

Administer:

PO route

- With meals for GI symptoms
- Store in a tight container at room temperature

IT route

For screening, dilute to 50 mcg/mL with NaCl for injection (preservative free); give test dose over 1 min; watch for decreasing muscle tone, frequency of spasm; if inadequate, use 2 more test doses q24hr, those with inadequate response should not receive chronic IT therapy; **maintenance infusion** via implantable pump of 500-2000 mcg/mL because individual titration is required, may cause tolerance and need to taper over 2-4 wk and then restart

- Do not give IT dose by injection, IV, IM, SUBCUT, epidural

Black Box Warning: Do not discontinue IT abruptly; may be fatal

SIDE EFFECTS

CNS: *Dizziness, weakness, fatigue, drowsiness,* headache, *disorientation,* insomnia, paresthesias, tremors; seizures (IT)
CV: Hypotension, bradycardia, flushing, edema

EENT: Nasal congestion, blurred vision, tinnitus
GI: *Nausea,* constipation, dry mouth, anorexia, weight gain
GU: Urinary frequency, hematuria
INTEG: Rash, pruritus
RESP: Dyspnea
MISC: Hypersensitivity, sweating, hyperglycemia

PHARMACOKINETICS

IT: Peak 4 hr, duration 4-8 hr, half-life 2½-4 hr, PO; 1.5-4 hr IT partially metabolized in liver, excreted in urine (unchanged), protein binding 30%; CSF levels with plasma levels 100× that of the oral route

INTERACTIONS

Increase: CNS depression—alcohol, tricyclics, opiates, barbiturates, sedatives, hypnotics, MAOIs, antihistamines; increases CNS depression; avoid concurrent use

Black Box Warning: Increased respiratory depression, death—opiates; avoid concurrent use; limit quantity provided

Increase: hypotension—antihypertensives
Drug/Herb
Increase: CNS depression—kava, valerian, chamomile
Drug/Lab Test
Increase: AST, ALT, alkaline phosphatase, blood glucose, CK

NURSING CONSIDERATIONS

Assess:
• **MS:** Assess for spasms, spasticity, improvement should occur

• **Black Box Warning: Abrupt discontinuation;** serious adverse reactions may occur (intrathecal), may cause spasticity/rigidity, fever, change in mental status, death

• **Black Box Warning: Intrathecal:** Have emergency equipment nearby; assess test dose and titration; if no response, check pump, catheter for proper functioning, when switching to IT, avoid overdose by discontinuing other PO antispasmodic by tapering

• B/P, weight, blood glucose, hepatic function periodically
• **Seizures (IT):** for increased seizure activity with seizure disorders; product decreases seizure threshold; EEG in epileptic patients
• **Withdrawal symptoms:** agitation, tachycardia, insomnia, hyperpyrexia
• **Allergic reactions:** rash, fever, respiratory distress
• Severe weakness, numbness in extremities
• **CNS depression:** dizziness, drowsiness
Evaluate:
• Therapeutic response: decreased pain, spasticity, ability to perform ADLs
Teach patient/family:

• **Black Box Warning: IT:** Not to discontinue medication quickly; hallucinations, spasticity, tachycardia will occur; product should be tapered off over 1-2 wk, especially intrathecal form; teach proper care of IT site

• **Black Box Warning:** Not to take with alcohol, other CNS depressants, opioids

• To avoid hazardous activities if drowsiness, dizziness occurs; to rise slowly to prevent orthostatic hypotension; if taken with opioids and suppressed breathing, dizziness occurs, request emergency services
• To avoid using OTC medications; not to take cough preparations, antihistamines unless directed by prescriber; to take PO with food or milk
• To notify prescriber if nausea, headache, tinnitus, insomnia, confusion, constipation, inadequate or painful urination continues
• **MS:** may require 1-2 mo for full response
• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected; avoid breastfeeding, pregnancy

TREATMENT OF OVERDOSE:

Induce emesis in conscious patient, dialysis, physostigmine to reduce life-threatening CNS side effects

baloxavir marboxil (Rx)

(ba lox′a′veer mar box′el)

Xofluza

Func. class.: Antiviral—influenza
Chem. class.: Endonuclease inhibitor

ACTION: Baloxavir, the active metabolite of baloxavir marboxil, is responsible for the drug's antiviral activity; inhibits the activity of polymerase acidic (PA) protein, an influenza virus–specific enzyme

USES: Treatment of acute uncomplicated influenza A virus or influenza B virus infection

CONTRAINDICATIONS: Hypersensitivity
Precautions: Bacterial infections, child <12 yr

DOSAGE AND ROUTES

• **Adult/adolescent/child >12 yr ≥80 kg:** **PO** 80 mg single dose; **40-79 kg:** 40 mg single dose
Available forms: Tablets 20 mg, 40 mg
Administer:
• Begin treatment within 48 hr of symptom onset
• Administer with or without food
• Avoid with dairy products, calcium-fortified beverages, laxatives, antacids, or oral supplements (calcium, iron, magnesium, selenium, zincs), other calcium-containing agents

SIDE EFFECTS

CNS: Headache
GI: Diarrhea, nausea, vomiting
RESP: Bronchitis, nasopharyngitis

PHARMACOKINETICS

Protein binding >92%, metabolized by metabolic pathway by UGT1A3, CYP3A4, excretion urine 14.7%, feces 80%, onset unknown, peak 4 hr, duration unknown, half-life 79 hr

INTERACTIONS

• Avoid use with laxatives, antacids, oral supplements (calcium, iron, magnesium, selenium, zinc), dairy products, may decrease baloxavir level
• Avoid use with live attenuated influenza vaccines

NURSING CONSIDERATIONS

Assess:
• **Flulike symptoms:** duration, onset, specific symptoms (fever, cough, muscle aches and pains)
• **Pregnancy/breastfeeding:** no adverse effects in animals regarding pregnancy and breastfeeding; influenza may pose health hazard to mother and fetus

Evaluate:
• **Therapeutic response:** relief of symptoms of influenza A or B

Teach patient/family:
• **Pregnancy/lactation:** to notify health care provider if pregnancy is planned or suspected, or if breastfeeding
• To take within 48 hr of flu symptoms
• To avoid use with laxatives, antacids, oral supplements (calcium, iron, magnesium, selenium, zinc), dairy products
• To avoid use with live attenuated influenza vaccines

baricitinib (Rx)

(bar i sye'ti nib)

Olumiant

Func. class.: Antirheumatic, antiinflammatory
Chem. class.: JAK inhibitor

ACTION: An oral Janus kinase (JAK) inhibitor. Janus kinases are enzymes that transmit signals arising from cytokine or growth factor receptor interactions

USES: Treatment of moderately to severely active rheumatoid arthritis in patients who have had an inadequate response to 1 or more tumor necrosis factor (TNF) antagonists

CONTRAINDICATIONS: Hypersensitivity
Precautions: Vaccinations, lipid elevations, anemia, lymphopenia, neutropenia, GI perforation, viral reactivation, TB

Black Box Warning: Hepatitis exacerbation, hepatotoxicity, lactic acidosis, HIV

DOSAGE AND ROUTES

• **Adult: PO** 2 mg daily; may give with or without methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs)
Available forms: Tablets 2 mg
Administer:
• Without regard to food

SIDE EFFECTS

EENT: Rhinitis, sinusitis
GI: Nausea, GI perforation, hepatotoxicity
INTEG: Skin cancer
RESP: Pulmonary embolism
SYST: Infection, new primary malignancy

PHARMACOKINETICS

Protein binding 45%-50%, metabolized by CYP3A4, excreted 75% urine, 20% feces, half-life 24 hr

INTERACTIONS

Increase: effect of product—strong OAT3 inhibitors (probenecid)

NURSING CONSIDERATIONS

Assess:
• For pain, swelling in joints, ADLs, aggravating factors
• CBC with differential, hemoglobin/hematocrit, LFTs, serum cholesterol profile, serum creatinine/BUN, tuberculin skin test baseline and periodically
• For new primary malignancies, skin cancer screening exam
• **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding
Evaluate:
• Therapeutic response: decreased pain, swelling of joints; slowing of destruction of joints; increased physical function
Teach patient/family:
• About the potential benefits and risk of this product
• **Infections:** that infections are more common; to report any symptoms of infection to health care provider
• **New malignancies:** that product may increase the risk of new cancers, including lymphoma; to notify health care provider
• **Thrombosis:** that DVT and PE may occur; to report any symptoms to health care provider
• That lab work will be needed on a continuing basis
• **Pregnancy/breastfeeding:** not to breastfeed during therapy

basiliximab (Rx)

(bas-ih-liks′ih-mab)
Simulect
Func. class.: Immunosuppressant

USES: Acute allograft rejection in renal transplant patients when used with cycloSPORINE and corticosteroids

CONTRAINDICATIONS: Mannitol, murine protein hypersensitivity
Precautions: Pregnancy, children, geriatric patients, human antimurine antibody, infections, breastfeeding, neoplastic disease, vaccination

Black Box Warning: Requires a specialized care setting and experienced clinician

DOSAGE AND ROUTES

Acute kidney transplant rejection prophylaxis
• **Adults, adolescents, and children ≥35 kg: IV** 20 mg within 2 hr before transplantation, then 20 mg IV 4 days after surgery
• **Children and adolescents <35 kg: IV** 10 mg within 2 hr before transplantation, then 10 mg IV 4 days after transplantation

For acute liver transplant rejection prophylaxis (unlabeled)

• **Adults: IV** 20 mg within 2 hr of graft reperfusion, then 20 mg IV 4 days after transplantation

Available forms: injection 10, 20 mg vials

beclomethasone, inhalation (Rx)

(be-kloe-meth´a-sone)

QVAR RediHaler

beclamethasone nasal (Rx)

Beconase AQ, Beclovent, Rivanase AQ, Vanceril

Func. class.: Antiasthmatic

Chem. class.: Corticosteroid

Do not confuse:

beclomethasone/betamethasone

ACTION: Prevents inflammation by suppression of the migration of polymorphonuclear leukocytes, fibroblasts, and the reversal of increased capillary permeability and lysosomal stabilization; does not suppress hypothalamus and pituitary function

USES: Chronic asthma, allergic/vasomotor rhinitis, nasal polyps

CONTRAINDICATIONS: Hypersensitivity, status asthmaticus (primary treatment)

Precautions: Pregnancy, breastfeeding, children <12 yr, nasal disease/surgery, nonasthmatic bronchial disease; bacterial, fungal, viral infections of mouth, throat, lungs; HPA suppression, osteoporosis, Cushing's syndrome, diabetes mellitus, measles, cataracts, corticosteroid hypersensitivity, glaucoma, herpes infection

DOSAGE AND ROUTES

Chronic asthma

• **Adult and child >12 yr: INH** 40-80 mcg bid (alone) or 40-160 mcg bid (previous inhaled corticosteroids); max 320 mcg bid; **Nasal:** 1-2 sprays in each nostril bid

• **Child 4-11 yr: INH** 40 mcg bid; max 80 mcg bid; **Nasal** 1-2 sprays in each nostril bid

Seasonal, perennial rhinitis; nasal polyp recurrence

• **Adult/child ≥12 yr: Nasal** 1-2 sprays in each nostril bid

• **Child 6-12 yr: Nasal** 1 spray in each nostril bid, may increase to 2 sprays bid as needed, decrease to 1 spray each nostril bid after symptoms are controlled

Available forms: Oral inhalation 40, 80/actuation; nasal suspension 42 mcg/spray

Administer:

• **Oral inhalation:** No shaking, spacer, or priming needed

• **Nasal:** Shake, invert, tilt head backward, insert nozzle into nostril, compress activator, inhale through nose, exhale through mouth

SIDE EFFECTS

CNS: *Headache,* psychiatric/behavioral changes (child)

EENT: *Hoarseness, candidal infection of oral cavity, sore throat,* loss of taste/smell, dysgeusia, pharyngitis, rhinitis, sinusitis, cataracts, fungal infections, epistaxis

ENDO: HPA suppression

GI: Dry mouth, dyspepsia

MISC: Angioedema, adrenal insufficiency, facial edema, Churg-Strauss syndrome (rare)

RESP: Bronchospasm, wheezing, cough

Nasal

CNS: Headache, dizziness

EENT: Nasal burning/irritation, sneezing

GI: Dry mouth, esophageal candidiasis

RESP: Cough

PHARMACOKINETICS

INH: Onset 1-4 wk, peak ½ hr; duration unknown; excreted in feces, urine (metabolites); half-life 2.8 hr; crosses placenta; metabolized in lungs, liver (by CYP3A)

NURSING CONSIDERATIONS

Assess:

- **Bronchospasm:** use short-acting bronchodilator
- **Fungal infections:** assess mucous membranes often for infection
- Adrenal function periodically for HPA axis suppression during prolonged therapy; monitor growth/development, taper corticosteroids
- **Vision changes:** monitor for vision changes, cataracts may occur
- Decreased bone density; monitor with bone density test
- **Bronchospasm:** discontinue immediately and treat with short-acting bronchodilator
- Provide gum, rinsing of mouth for dry mouth
- **Beers:** avoid in older adults; high risk of delirium

Evaluate:

- Therapeutic response: decreased dyspnea, wheezing, dry crackles; nasal polyps are reduced

Teach patient/family:

- To take as prescribed, not to double or skip doses, not to use for acute asthma
- To gargle/rinse mouth after each use to prevent oral fungal infections
- To notify prescriber if therapeutic response decreases; dosage adjustment may be needed
- Proper administration technique and cleaning technique, no need to prime
- About all aspects of product usage, including cushingoid symptoms
- About **adrenal insufficiency symptoms:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, depression
- To check growth in child on long-term therapy
- To taper PO products before starting inhalation products
- That peak response may take up to 1 mo
- To carry medical alert ID with corticosteroid user listed
- Not be used to treat acute bronchospasm
- **Allergic reaction:** To inform health care professional of rash; itching; swelling of face, lips; trouble breathing
- **Pregnancy/breastfeeding:** To notify prescriber if pregnancy is planned or suspected; may breastfeed

bedaquiline (Rx)

(bed-ak′-wi-leen)

Sirturo

Func. class.: Antiinfective/antituberculotic

USES: For use as part of a combination regimen to treat pulmonary multidrug-resistant tuberculosis infection (MDR-TB) in adults/children when other effective treatment regimens are not available

CONTRAINDICATIONS: Hypersensitivity

Precautions: Alcoholism, bradycardia, breastfeeding, arrhythmias, cardiac disease, children, coronary artery disease, diabetes mellitus, females, geriatric patients, heart failure, hepatic disease, hypertension, hypocalcemia, hypokalemia, hypomagnesemia, malnutrition, MI, pregnancy, syncope, thyroid disease

Black Box Warning: QT prolongation, increased mortality risk

DOSAGE AND ROUTES

- **Adults/child ≥ 5 yr and ≥30 kg: PO** 400 mg daily × 2 wk, then reduce dose to 200 mg 3×/wk with food (≥48 hr between doses). Total duration is 24 wk
- **Child ≥5 yr and 15-30 kg: PO** 200 mg daily for 2 wk, then 100 mg 3 times a week spaced 48 hr apart for 22 wk, total duration 24 wk

Available forms: Tablets 20, 100 mg

belantamub mafodotin-blmf (Rx)

(bel-an´ta-mab ma-foe-doe´tin)

Blenrep

Func. class.: Antineoplastic agent

Chem. class.: Anti-BCMA

ACTION:

A humanized antibody targeted against B-cell maturation antigen (BCMA) that is expressed on multiple myeloma cells

USES:

Treatment of relapsed/refractory multiple myeloma in those who have received ≥4 prior therapies

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning: Ocular toxicity, restricted access

Precautions: Bleeding, breastfeeding, driving/operating machinery, geriatric, pregnancy, infusion-related reactions, requires a specialized care setting, requires an experienced clinician, thrombocytopenia, visual impairment

DOSAGE AND ROUTES

Multiple myeloma

Adult IV: 2.5 mg/kg q3wk until disease progression/unacceptable toxicity

Available forms. IV solution preservative-free 100-mg/vial

Administer:

- Allow to warm to room temperature for 10 min
- Reconstitute 100 mg/2 mL SWFI (50 mg/mL); gently swirl
- Solution should be clear to opalescent, colorless-yellow-brown liquid; discard if particulates are observed
- Withdraw needed amount and dilute in a 250-mL NS infusion bag (0.2-2 mg/mL), use only infusion bag of PVC or polyolefin
- Mix by gentle inversion; do not shake
- Solutions diluted for infusion should be clear and colorless; discard if particulate matter is observed
- Do not admix
- Give over ≥30 min using PVC or polyolefin infusion set, may use a polyethersulfone-based filter (0.2 micron)
- Do not give with other medications
- If refrigerated, allow to warm to room temperature prior to use; use within 6 hr including time to warm and infusion time
- Assess for infusion-related reactions
- Store vials refrigerated; reconstituted solution may be stored refrigerated or room temperature for ≤4 hr; discard if not diluted within 4 hr; solutions diluted for infusion may be stored refrigerated ≤24 hr

SIDE EFFECTS

CNS: Fatigue, fever, asthenia

GI: Constipation, anorexia, diarrhea, nausea, vomiting, increased LFTs

GU: Increased serum creatinine, renal insufficiency, albuminuria

META: Decreased serum albumin, hypokalemia, hyponatremia, increased gamma-glutamyl transferase, hyperglycemia, hypercalcemia

HEMA: Decreased hgb, decreased neutrophils, lymphocytopenia, thrombocytopenia

MS: Arthralgia, back pain, increased CPK

EENT: Blurred vision, decreased visual acuity, dry eye syndrome, epithelial keratopathy, eye irritation, photophobia

RESP: URI, pneumonia

MISC: Infusion-related reaction, sepsis

PHARMACOKINETICS

Onset of response 1.4 mo, peak end of infusion, duration of response ≥6 mo, half-life 14 days

INTERACTIONS

Increased: myelosuppression—BCG (intravesical), chloramphenicol (ophthalmic), cladribine, clozapine, deferiprone, promazine, salicylates

NURSING CONSIDERATIONS

Assess:

- Monitor CBC at baseline and as needed
- Obtain hepatitis B virus screening with hepatitis B surface antigen (HBsAg), hepatitis B core antibody (anti-HBc), total Ig or

IgG, and antibody to hepatitis B surface antigen (anti-HBs) prior to use, may start treatment before results are received
• Monitor for bleeding, infusion site reactions

Black Box Warning: REMS: Ocular toxicity: is available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the BLENREP REMS; obtain ophthalmic exams (visual acuity/slit lamp) baseline within 3 wk of first dose, prior to each dose, and for worsening ocular symptoms

• **Pregnancy/breastfeeding:** Obtain pregnancy testing prior to use in females of reproductive potential; contraception is needed during and for 4 mo after the last dose; males with female partners of reproductive potential should use contraception during and for 6 mo after the last dose

Evaluate:
• Therapeutic response: Decreasing spread of multiple myeloma

Teach patient/family:
• To use preservative-free lubricant eye drops and avoid contact lenses, that ophthalmic testing will be needed during treatment
• Identify if pregnancy is planned or suspected, or if breastfeeding; discuss contraception

belatacept (Rx) REMS

(bel-a-ta′sept)

Nulojix

Func. class.: Immunosuppressant
Chem. class.: Fusion protein

ACTION: Activated T-lymphocytes are the mediators of immunologic rejection. This product is a selective T-cell costimulation blocker; blocks the CD28 mediated costimulation of T lymphocytes by binding to CD80 and CD86 on antigen-presenting cells; inhibits T-lymphocyte proliferation and the production of the cytokines

USES: Kidney transplant rejection prophylaxis given with basiliximab induction, mycophenolate mofetil, corticosteroids

CONTRAINDICATIONS: Hypersensitivity, Epstein-Barr virus (EBV) seronegative, EBV status unknown
Precautions: Breastfeeding, child/infant/neonate, pregnancy, diabetes mellitus, progressive multifocal leukoencephalopathy, immunosuppression, sunlight exposure, TB

Black Box Warning: Infection, organ transplant, requires an experienced clinician and specialized care setting, secondary malignancy, posttransplant lymphoproliferation disorder (PLD), immunosuppression

DOSAGE AND ROUTES

• **Adult: IV** 10 mg/kg give over 30 min the day of transplantation (day 1) but before transplantation, on day 5 96 hr after the day 1 dose, at the end of wk 2, at the end of wk 4, at the end of wk 8, and at the end of wk 12; *maintenance* 5 mg/kg rounded to the nearest 12.5-mg increment; give over 30 min at the end of wk 16 and q4wk ± 3 days thereafter

Available forms: Powder for injection 250 mg

Administer:

Black Box Warning: Only providers skilled in the use of immunosuppressants and the management of transplants should use these products

IV route
• Visually inspect for particulate matter, discoloration; discard if present
• Calculate the number of vials required
• Reconstitute each vial/10.5 mL of either sterile water for injection, 0.9% sodium chloride, D_5W, using the silicone-free disposable syringe provided and an 18-21G needle; for additional silicone-free disposable syringes, call 888-685-6549;

discard any solution prepared using siliconized syringes
• Inject diluent into the vial and direct the stream to the glass wall; rotate and invert with gentle swirling; do not shake, when reconstituted (25 mg/mL), product should be clear to slightly opalescent and colorless to pale yellow; do not use if opaque particles, discoloration, or other foreign particles are present
• Calculate the total volume of the reconstituted 25 mg/mL solution required; further dilute with a volume of infusion fluid equal to the volume of the reconstituted drug solution required; use either NS or D_5W if drug was reconstituted with SWFI; use NS if drug was reconstituted with NS; use D_5W if drug was reconstituted with D_5W; with the same silicone-free disposable syringe; final concentrations 2-10 mg/mL; but total infusion volumes ranging from 50 to 250 mL may be used; discard any unused solution; after reconstitution, immediately transfer the reconstituted solution to the infusion bag or bottle; complete within 24 hr
• Give over 30 min; use an infusion set and a sterile, nonpyrogenic, low–protein-binding filter (0.2-1.2 mm); use a separate line
• Store refrigerated, protected from light ≤24 hr; max 4 hr of the total 24 hr can be at room temperature and room light

SIDE EFFECTS

CV: Hypo/hypertension
CNS: Progressive multifocal leukoencephalopathy (PML), headache, fever
GI: Abdominal pain, constipation, diarrhea, nausea, vomiting
GU: Proteinuria
HEMA: Anemia, neutropenia, leukopenia
INTEG: Infusion reaction
META: Hyperglycemia, hyper/hypokalemia
SYST: Secondary malignancy, posttransplant lymphoproliferation disorder, wound dehiscence

PHARMACOKINETICS

Half-life, 6.1-15.1 days steady state by wk 8 after transplantation and by mo 6 during maintenance phase, peak infusion end

INTERACTIONS

• **Increase:** effect, toxicity—mycophenolic acid
• Do not use 30 days before or with this product: live virus vaccines

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Transplant rejection: flulike symptoms, decreasing urinary output, malaise; some may experience pain in area (rare; monitor BUN/creatinine)

Black Box Warning: Infection: monitor for fever, chills, increased WBC, wound dehiscences; immunosuppression occurs

Black Box Warning: Posttransplant lymphoproliferation disorder: may lead to secondary malignancy (lymphoma) or infectious mononucleosis–like lesions (mood change, confusion, memory loss, change in gait, talking); treat with antivirals or immunosuppressant; product may need to be discontinued

• **PML:** apathy, confusion, ataxia
• **Pregnancy/breastfeeding:** use only if benefits outweigh risk to the fetus; pregnant females should enroll in the National Transplant Pregnancy Registry by calling 877-955-6877; use adequate contraception during treatment and for 4 mo after last dose; discontinue breastfeeding or product; excretion in breast milk is unknown

Evaluate:

• Therapeutic response: absence of renal transplant rejection

Teach patient/family:

• Reason for product and expected result; use REMS guidelines
• To avoid exposure to sunlight, tanning beds; risk of secondary malignancy, including skin cancer
• To avoid crowds, persons with known infections
• That repeated lab test will be needed
• To avoid with vaccines; to inform providers of all OTC, prescription medications, herbs, supplements
• That immunosuppressants will be needed for life to prevent rejection; to

call provider immediately if symptoms of rejection/infection arise

belimumab (Rx)

(be-lim′ue-mab)

Benlysta

Func. class.: Immunosuppressant, monoclonal antibody

Chem. class.: Disease-modifying antirheumatic drugs (DMARDs)

ACTION: Inhibits B-lymphocyte stimulator (BLyS), needed for B-cell survival

USES: Active, autoantibody-positive, systemic lupus erythematosus (SLE) in combination with standard therapy

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children/infants, geriatric patients, patients of African descent, depression, immunosuppression, infection, suicidal ideation, vaccination, secondary malignancy, cardiac disease; requires experienced clinician

DOSAGE AND ROUTES

• **Adult: IV** 10 mg/kg over 1 hr q2wk for the first 3 doses, then q4wk; **SUBCUT** 200 mg weekly

• **Child/adolescent 5-17 yr:** IV 10 mg/kg/dose over 1 hr q2wk × 3 doses, then q4wk

Available forms: Powder for IV injection 120, 400 mg; SUBCUT autoinjector 200 mg/mL, prefilled syringe

Administer:

• Only health care providers prepared to manage anaphylaxis should administer this product; may give premedication for prophylaxis against infusion and hypersensitivity reactions (antihistamine, antipyretic)

Intermittent IV INFUSION route

• Visually inspect for particulate matter and discoloration whenever solution and container permit

• **Give** as IV infusion only; do not give IV bolus or push; give over 1 hr and slow or stop if infusion reactions occur

• Do not give with any other agents in the same IV line

• Allow to stand at room temperature for 10-15 min before using

• **Reconstitute** with the appropriate amount of sterile water for injection (80 mg/mL); add 1.5 mL of sterile water (120 mg/vial) or 4.8 mL of sterile water (400 mg/vial)

• Direct the stream of sterile water toward the side of the vial; gently swirl for 60 sec, allow to sit during reconstitution, gently swirl for 60 sec until powder is dissolved; do not shake

• Solution should be opalescent and colorless to pale yellow and without particles; small air bubbles are expected; protect from sunlight

• **Dilution:** dilute only in normal saline for injection, 0.45% NaCl, lactated Ringer's; dilute reconstituted solution with enough compatible solution to 250 mL; from a 250-mL infusion bag or bottle of compatible solution, withdraw and discard a volume equal to the volume of the reconstituted solution required for dose; add the required volume of the reconstituted solution to the infusion bag/bottle; gently invert to mix

• Discard any unused solution

• Store in refrigerator or at room temperature; total time from reconstitution to completion of infusion max 8 hr

SUBCUT route

• Allow 30 min to reach room temperature

• Inspect for particulate matter and discoloration; product should be clear to opalescent and colorless to pale yellow. It is normal to see air bubbles

• Do not use the autoinjector or prefilled syringe if dropped on a hard surface

• Protect from light and store refrigerated at 36°F-46°F (2°C-8°C) until time of use. Do not freeze. Do not shake. Avoid exposure to heat

• Do not administer where skin is tender, bruised, erythematous, or hard

• Rotate injection site with each dose

• **Missed dose:** if a dose is missed, administer as soon as possible. Do not give 2 doses on same day

SIDE EFFECTS

CNS: Headache, dizziness, *depression,* fever, *insomnia, migraine,* suicidal ideation, progressive multifocal leukoencephalopathy
GU: UTI
CV: Bradycardia
GI: *Nausea, diarrhea*
MISC: Rash, allergic reactions, myalgia
SYST: Anaphylaxis, angioedema, antibody formation, secondary malignancy, infection, influenza, infusion reactions

INTERACTIONS

• Don't use with cyclophosphamide (IV)
• Don't use with live virus vaccines within 30 days of belimumab; response to vaccine will be decreased

Drug/Herb
• Decrease belimumab effect—echinacea

Drug/Lab Test
Decrease: leukocytes

PHARMACOKINETICS

Half-life 19.4 days, SUBCUT 18.3 days. Onset, peak duration unknown

NURSING CONSIDERATIONS

Assess:
• **SLE improvement:** monitor for decreasing fever, malaise, fatigue, joint pain, myalgias
• **Progressive multifocal leukoencephalopathy:** apathy, confusion, ataxia, cognitive problems; if diagnosed, discontinue
• **Suicidal ideation:** more common in those with preexisting depression
• **Infection:** determine if a chronic or acute infection is present, may be fatal; do not begin therapy if any products are being used for a chronic infection; leukopenia may occur and susceptibility to infections is increased
• **Anaphylaxis** (angioedema, rash, pruritus, wheezing), infusion site reactions: if these occur, stop infusion
• **African descent patients:** use cautiously in these patients; may not respond to this product
• **Pregnancy/breastfeeding:** determine if pregnant or if pregnancy is planned or suspected; if pregnant, enroll in registry (877-681-6296); do not breastfeed; contraception is required during and for 4 mo after conclusion of therapy

Evaluate:
• Positive response: decreasing symptoms of SLE; decreasing fatigue, fever, malaise

Teach patient/family:
• To seek treatment immediately for serious hypersensitive reactions
• Not to receive live vaccinations during treatment; bring up to date before treatment
• That compliance is required
• **Infection:** To report fever, shortness of breath, diarrhea, urinary frequency/burning, sweating, chills; to avoid others with known infections
• To report history of cancer in patient or family
• SUBCUT injection technique, must give at same time of day every week
• To take as prescribed, not to double or skip doses; if dose is missed, then take as soon as remembered, then resume correct schedule, provide "Medication Guide" and go over with patient

⚠ HIGH ALERT

belinostat (Rx)

(beh-lih'noh-stat')

Beleodaq

Func. class.: Antineoplastic-biologic response modifier
Chem. class.: Histone deacetylase inhibitor

Do not confuse:
belinostat/beractant

ACTION: A class I and II inhibitor of the histone deacetylase (HDAC) enzymes. Overexpression of HDACs is present in some cancer cells. HDAC inhibitors have been shown to activate differentiation, inhibit the cell cycle, and induce apoptosis

USES: For the treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL)

CONTRAINDICATIONS:
Hypersensitivity, pregnancy

Precautions: Hematologic toxicity (thrombocytopenia, leukopenia, neutropenia, lymphopenia, anemia), serious infections (pneumonia, sepsis), fatal hepatic toxicity, tumor lysis syndrome (TLS), breastfeeding

DOSAGE AND ROUTES
• **Adult: IV** 1000 mg/m^2 over 30 min on days 1-5 q21days. Reduce the dose to 750 mg/m^2 in those who are homozygous for the UGT1A1∗28 allele. Cycles should be repeated until disease progression or unacceptable toxicity

Available forms: Powder for injection 500 mg (single-use vial)

Administer:

Intermittent IV route

• Reconstitution: Add 9 mL of sterile water for injection/500 mg, swirl until there are no visible particles (50 mg/mL); stable at room temperature for up to 12 hr

• Withdraw amount from the reconstituted vial and further dilute in 250 mL 0.9% sodium chloride for injection, the final solution is stable at room temperature for up to 36 hr, including infusion time; use a 0.22-micron in-line filter; give over 30 min; if pain occurs at infusion site, run over 45 min

Dose adjustments due to treatment-related toxicity

Hematologic toxicities:

• Do not begin the next cycle until the neutrophil count (ANC) is ≥1000/mm^3 and platelet count ≥50,000/mm^3

• ANC nadir ≥500/mm^3 *and* platelet count nadir ≥25,000/mm^3: no dose adjustment

• ANC nadir <500/mm^3 (any platelet count): begin next cycle of treatment at a reduced dose of 750 mg/m^2

• Platelet nadir <25,000/mm^3 (any ANC): begin next cycle of treatment at a reduced dose of 750 mg/m^2

SIDE EFFECTS
CNS: Fatigue, headache, dizziness, fever, chills

CV: Hypotension, QT prolongation

GI: *Constipation, anorexia, abdominal pain, nausea, vomiting, diarrhea,* hepatotoxicity

HEMA: Anemia, thrombocytopenia, neutropenia

RESP: Dyspnea, cough

INTEG: Injection site reactions, rash, phlebitis

MISC: Hypokalemia

SYST: Multiorgan failure, tumor lysis syndrome (TLS), serious infections

PHARMACOKINETICS
Half-life of 1.1 hr; 92.9%-95.8% protein bound, 80%-90% metabolized by hepatic UGT1A1; metabolized in the liver, 40% excreted renally, primarily as metabolites; onset, peak, duration unknown

INTERACTIONS
Increase: belinostat—strong UGT1A1 inhibitors (atazanavir, indinavir); avoid concurrent use if possible

Increase: QT prolongation—drugs that prolong QT, assess often

Drug/Lab

Increase: creatinine, LDH

Decrease: platelets, neutrophils, RBC, potassium

NURSING CONSIDERATIONS
Assess:

• **Hematologic toxicity (thrombocytopenia, leukopenia, neutropenia, lymphopenia, anemia):** monitor CBC before starting and every week. Dose modifications may be necessary in patients with bone marrow suppression and should be determined by the ANC and platelet count nadirs of the previous cycle. Platelet counts should be ≥50,000/mm^3 and ANC >1000/mm^3 before starting each cycle

• **Serious infections (pneumonia, sepsis):** may be fatal. Do not use in those with an active infection. Use caution in patients with a history of extensive or intensive chemotherapy, as they may be at higher risk of life-threatening infections; monitor for dyspnea, cough, characteristics of sputum

• **Fatal hepatic toxicity:** monitor LFTs before the start of each cycle. Those with signs of hepatic disease may require dose modification or discontinuation

• **Tumor lysis syndrome (TLS):** those with high tumor burden or advanced-stage disease are at greater risk for development of TLS; consider tumor lysis prophylaxis with antihyperuricemic agents and hydration beginning 12-24 hr before treatment; for TLS treatment, administer aggressive IV hydration, antihyperuricemic agents, correct electrolyte abnormalities, and monitor renal function
• **Renal studies:** monitor BUN/creatinine periodically; if renal disease is present, use cautiously
• **Pregnancy/breastfeeding:** consider discontinuing breastfeeding; identify whether the patient is pregnant before using; do not use if pregnant

Evaluate:
• Therapeutic response: prevention of spread of disease

Teach patient/family:
• To avoid use in breastfeeding; not to use in pregnancy; that fertility may be impaired
• To report infusion site reactions, rash, severe constipation or diarrhea, abdominal pain, nausea, vomiting
• **Bleeding:** to report increased bruising, bleeding, melanotic or dark tarry stools
• **Tumor lysis syndrome:** to report immediately fatigue, dark urine, nausea, weakness, confusion, change in heart rate
• **Infection:** to report sore throat, cough, trouble breathing, flulike symptoms
• **Hepatic toxicity:** to report dark urine, anorexia, yellow skin/eyes, itching, abdominal pain
• That compliance is needed with product and lab testing

belumosudil (Rx)

Rezurock

Func. class.: Immunosupressant

USES:
Graft versus host disease when other treatments have not worked

DOSAGE AND ROUTES
• **Adult/child** ≥12 yr 200 mg daily

Available forms: Tablet 200 mg

belzutifan (Rx)

(bel-ZOO-ti-fan)

Welireg

Func. class.: Misc. antineoplastic

Chem. class.: Kinase inhibitor

ACTION:
Inhibits hypoxia-inducible factor that plays a role in oxygen sensing by regulating genes that promote adaptation to hypoxia

USES:
Von Hippel-Lindau disease who require therapy for renal cell carcinoma, NS hemangioblastomas/pancreatic neuroendocrine tumors not requiring immediate surgery

CONTRAINDICATIONS
Hypersensitivity

BBW: Pregnancy

Precautions: Anemia, hypoxia, breastfeeding

DOSAGE AND ROUTES
• **Adult: PO** 120 mg daily until disease progression or unacceptable toxicity

Available forms: Tabs 40 mg

Administer:
• Take at the same time each day, use without regard to food
• Swallow tablets whole. Do not chew, crush, split
• If a dose is missed, take as soon as possible on the same day. Resume the regular daily dose schedule the next day. Do not take dose to make up for a missed dose
• If vomiting occurs after taking, do not retake the dose. Take the next dose on the next day

SIDE EFFECTS
CNS: Fatigue, headache, dizziness

GI: Nausea

RESP: Hypoxia

HEMA: Anemia

INTERACTIONS
Increased: belzutifan effect—UGT2B17 or CYP2C19 inhibitors, monitor for anemia and hypoxia

Increased: contraceptive failure—hormonal contraceptives, use alternative contraceptive measures
Avoid use with sensitive CYP3A4 substrates

PHARMACOKINETICS
Peak 1-2 hr

NURSING CONSIDERATIONS
Assess:
• **Hypoxia:** Monitor O_2 saturation baseline and periodically; for decreased O_2 saturation with exercise (pulse oximeter <88% or PaO_2 ≤55 mm Hg), consider withholding until pulse oximetry with exercise is greater than 88%, then resume at the same dose or at a reduced dose. For decreased oxygen saturation at rest (pulse oximeter <88% or PaO_2 ≤55 mm Hg) or urgent intervention indicated, withhold until resolved and resume at a reduced dose or discontinue. For life-threatening hypoxia or for recurrent symptomatic hypoxia, permanently discontinue
• **Anemia:** Monitor for anemia baseline and periodically. Closely monitor patients who are dual UGT2B17/CYP2C19 poor metabolizers, transfusions may be needed, HB <9 g/dL, withhold until ≥9 g/dL, then resume at reduced dose or permanently discontinue depending on the severity of anemia. For life-threatening anemia or when urgent intervention is indicated, withhold until HB ≥9 g/dL, then resume at a reduced dose or permanently discontinue

Black Box Warning: Pregnancy/lactation: Obtain a pregnancy test before starting treatment. A nonhormonal contraceptive should be used during and for 1 wk after last dose. Both males and females should use contraceptives; infertility may occur, and it is not known if it is reversible

Evaluate:
• Therapeutic response: Prevention of spread of cancer

Teach patient/family:
• Teach the patient to take without regard to food, if vomiting occurs do not retake dose
• Laboratory testing will be needed, if blood counts are low, a transfusion may be needed
• Advise health care provider if tired, short of breath, chest pain or rapid heartbeat occurs

Black Box Warning: Pregnancy/lactation: Do not use in pregnancy, use a nonhormonal contraceptive during and for 1 wk after last dose. Because hormonal contraceptives may not work, both males and females should use effective contraception; infertility may occur and it isn't known if reversible

bempedoic acid (Rx)
(bem´pe-doe´ik as´id)
Nexletol
Func. class.: Antilipemic
Chem. class.: Adenosine triphosphate–citrate lyase inhibitor

ACTION:
Lowers low-density lipoprotein cholesterol (LDL-C) by inhibiting cholesterol synthesis in the liver

USES:
Atherosclerotic CV disease, heterozygous familial hypercholesterolemia, as an adjunct to diet and statin therapy

CONTRAINDICATIONS
Hypersensitivity
Precautions: Severe renal/hepatic disease, myopathy, tendon rupture, children, hyperuricemia

DOSAGE AND ROUTES
• **Adult: PO** 180 mg daily
Available forms: Tabs 180 mg
Administer:
• Give without regard to food

• Store in original package (with desiccant) at room temperature

SIDE EFFECTS

ENDO: Hyperuricemia
CV: Atrial fibrillation
GI: Abdominal distress
GU: BPH
HEMA: Anemia, leukopenia
MS: Back/limb pain, muscle spasm, gout
RESP: URI

PHARMACOKINETICS

Onset/duration unknown, peak 3.5 hr, half-life 21 hr

INTERACTIONS

Increase: effect of—OATP1B1/1B3 (SLCO1B1/1B3) inhibitors, avoid combination
Increase: myopathy risk—pravastatin, simvastatin, avoid pravastatin doses of >40 mg/day, simvastatin doses >30 mg/day
Drug/Lab Test:
Increase: LFTs, BUN, serum creatinine, CK

NURSING CONSIDERATIONS

Assess:
• Monitor lipid panel 3-4 mo after starting treatment
• **Myopathy/tendon rupture:** Assess for muscle tenderness, spasms, weakness; monitor doses of statins; notify provider immediately of tendon rupture, discontinue product
• **Hyperuricemia:** Monitor uric acid levels if needed and assess for signs/symptoms of gout, if indicated use urate-lowering products
• **Pregnancy/breastfeeding:** Do not use in pregnancy, avoid breastfeeding
Evaluate:
• Therapeutic response: Decrease in LDL-C levels
Teach patient/family:
• **Hyperuricemia:** Teach patients about the risk of elevated serum uric acid levels, with possibility of gout, that lab exams will be needed, to contact prescriber if signs/symptoms of gout develop
• **Tendon rupture risk:** Advise patients of tendon rupture, to rest at the first sign of tendinitis or tendon rupture, immediately contact provider
• Myopathy risk (simvastatin or pravastatin): Teach patients to notify providers if they are taking simvastatin or pravastatin, myopathy risk is increased with use of these products
• Pregnancy/breastfeeding: Teach patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding

benazepril (Rx)

(ben-aze′uh-pril)

Lotensin

Func. class.: Antihypertensive
Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse:
benazepril/Benadryl
Lotensin/lovastatin

ACTION: Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, thus preventing conversion of angiotensin I to angiotensin II

USES: Hypertension, alone or in combination with thiazide diuretics

CONTRAINDICATIONS: Breastfeeding, children, hypersensitivity to ACE inhibitors, hereditary angioedema

Black Box Warning: Pregnancy

Precautions: Geriatric patients, impaired renal/hepatic function, dialysis patients, hypovolemia, blood dyscrasias, HF, asthma, bilateral renal artery stenosis, Black patients

DOSAGE AND ROUTES

Hypertension
• **Adult: PO** 10 mg/day initially, then 20-40 mg/day divided bid or daily (without a diuretic); reduce initial dose to 5 mg **PO** daily (with a diuretic); increase as needed, max 80 mg/day
• **Child ≥6 yr: PO** 0.2 mg/kg/day, increase as needed; max 0.6 mg/kg/day or 40 mg/day, whichever is lower.

Renal dose

- **Adult:** PO CCr <30 mL/min or CCr >3 mg/dL, use 5 mg daily, max 40 mg/day
- **Child ≥6 yr:** PO CCr <30 mL/min, do not use

Available forms: Tablets 5, 10, 20, 40 mg

Administer:

- May give without regard to food
- Do not discontinue product abruptly
- Black patients' response to this drug is less, may need to be combined with other products
- Store in a tight container at 86°F (30°C) or less

SIDE EFFECTS

CNS: Insomnia, headache, dizziness, fatigue
CV: Hypotension, postural hypotension
GI: Nausea, constipation, vomiting, diarrhea
GU: Increased BUN, creatinine, decreased libido, impotence, renal insufficiency
INTEG: Rash, flushing, sweating
MISC: Angioedema, Stevens-Johnson syndrome, hypersensitivity, dry cough

PHARMACOKINETICS

Onset 1 hr, peak 1-2 hr fasting, 2-4 hr after food, duration 24 hr; protein binding 89%-95%; half-life 10-11 hr; metabolized by liver (metabolites); excreted in urine 33%

INTERACTIONS

Increase: hypotension—phenothiazines, nitrates, acute alcohol ingestion, diuretics, other antihypertensives; may need to reduce dose, monitor B/P
Increase: hyperkalemia—potassium-sparing diuretics, potassium supplements; monitor potassium, BUN, creatinine
Increase: hypotension, hyperkalemia in diabetes, renal disease—aliskiren; do not use in diabetes, avoid use in GFR <60 mL/min
Increase: myelosuppression—azaTHIOprine
Increase: serum levels of lithium, digoxin; may cause toxicity; monitor lithium or digoxin levels
Decrease: hypotensive effects—NSAIDs, COX-2 inhibitors; monitor B/P

Drug/Herb

Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—ephedra (ma huang); avoid concurrent use

Drug/Lab Test

Increase: AST, ALT, alkaline phosphatase, bilirubin, uric acid, blood glucose, potassium, BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P, pulse at baseline, periodically; orthostatic hypotension, syncope when used with diuretic; notify prescriber of changes; monitor compliance
- **Renal studies:** protein, BUN, creatinine; increased levels may indicate nephrotic syndrome; monitor urine for protein; LFTs, uric acid, glucose may be increased; diuretic should be discontinued 3 days before use; if hypertension is not controlled, a diuretic can be added; measure B/P at peak 2-4 hr and trough (before next dose); this product is less effective in patients of African descent; CBC, ALT/AST, alkaline phosphatase
- Potassium levels, although hyperkalemia rarely occurs
- **Allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help; Stevens-Johnson syndrome; angioedema is more common in patients of African descent
- Renal symptoms: polyuria, oliguria, frequency, dysuria

Evaluate:

- Therapeutic response: decrease in B/P; decreased HF (unlabeled)

Teach patient/family:

- Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes that contain potassium without consulting prescriber
- The importance of complying with dosage schedule, even if feeling better

Black Box Warning: To notify prescriber of pregnancy; product will need to be discontinued immediately; do not breastfeed

• To rise slowly to sitting or standing position to minimize orthostatic hypotension
• To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, bruising, bleeding, swelling of face, tongue, lips, difficulty breathing, signs of infection, cough
• To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P; to use caution in hot weather, strenuous exercise; to consume adequate fluids
• That product may cause dizziness, fainting, light headedness; that this may occur during first few days of therapy
• That product may cause skin rash or impaired perspiration
• **Diabetes:** blood glucose, glucose may be decreased, especially during early treatment
• **Hypertension:** how to take B/P and normal readings for age group
• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected or if breastfeeding, not to use in pregnancy, breastfeeding

TREATMENT OF OVERDOSE:
0.9% NaCl IV infusion, hemodialysis

⚠ HIGH ALERT

bendamustine (Rx)
(ben-da-muss′teen)
Bendeka, Treanda
Func. class.: Antineoplastic alkylating agent

USES:
Chronic lymphocytic leukemia, indolent B-cell non-Hodgkin's lymphoma that has progressed or within 6 mo use of rituximab regimen

CONTRAINDICATIONS:
Pregnancy, fetal harm may occur; breastfeeding, children, hepatic disease, renal impairment, hypersensitivity to product or mannitol
Precautions: Hyperuricemia, infusion-related reactions, myelosuppression, infection, skin reactions

DOSAGE AND ROUTES
Chronic lymphocytic leukemia
• **Adult: IV INFUSION** 100 mg/m^2 over 30 min (Treanda) or 10 min (Bendeka) on days 1, 2 q28days up to 6 cycles
Non-Hodgkin's lymphoma
• **Adult: IV INFUSION** 120 mg/m^2 over 60 min (Treanda) or 10 min (Bendeka) on days 1, 2 q21days up to 8 cycles
Mantle cell lymphoma (unlabeled)
• **Adult: IV INFUSION** 90 mg/m^2 on days 1, 2 with rituximab on day 1 q28days for 6 cycles

Renal/hepatic dose
• **Adult: IV INFUSION** CCr <30 mL/min, do not use; AST or ALT 2.5-10 × ULN or bilirubin 1.5-3 × ULN, do not use
Available forms: Solution for injection 100-mg/4-mL vials; lyophilized powder for injection: 25-, 100-mg single-use vials

benzocaine topical
See Appendix B

benzonatate (Rx)
(ben-zoe′na-tate)
Tessalon Perles, Zonatuss
Func. class.: Antitussive, nonopioid

USES:
Nonproductive cough

CONTRAINDICATIONS:
Hypersensitivity

DOSAGE AND ROUTES
• **Adult and child >10 yr: PO** 100-200 mg up to tid; max 600 mg/day
Available forms: Capsules 100, 150, 200 mg

benztropine (Rx)
(benz′troe-peen)
Cogentin
Func. class.: Anticholinergic, antiparkinson agent
Chem. class.: Tertiary amine

Do not confuse:
benztropine/bromocriptine

ACTION: Blockade of central acetylcholine receptors, balances cholinergic activity

USES: Parkinson's symptoms, EPS associated with neuroleptic products, acute dystonic reactions

CONTRAINDICATIONS: Children <3 yr, hypersensitivity, closed-angle glaucoma, dementia, tardive dyskinesia
Precautions: Pregnancy, breastfeeding, geriatric patients, tachycardia, renal/hepatic disease, substance abuse history, dysrhythmias, hypo/hypertension, myasthenia gravis, GI/GU obstruction, peptic ulcer, megacolon, prostate hypertrophy, psychosis

DOSAGE AND ROUTES

Drug-induced EPS (not tardive dyskinesia)
• **Adult: IM/IV/PO** 1-4 mg daily/bid; give **PO** dose as soon as possible
• **Child >3 yr: IM/IV/PO** 0.02-0.05 mg/kg/dose 1-2×/day

Transient EPS
• **Adult: PO/IM/IV** 1-2 mg bid or tid, after ≤2 wk discontinue and see if still required

Parkinson's symptoms
• **Adult: PO/IM** 0.5-1 mg at bedtime; increase by 0.5 mg q5-6days titrated to patient response, max 6 mg/day

Acute dystonic reactions
• **Adult: IM/IV** 1-2 mg, may increase to 1-2 mg bid **(PO)**

Postencephalitic parkinsonism
• **Adult: PO/IM/IV** 2 mg/day in 1 dose or divided, max 6 mg/day

Available forms: Tablets 0.5, 1, 2 mg; injection 1 mg/mL in 2-mL ampule

Administer:

PO route
• With or after meals to prevent GI upset; may give with fluids other than water
• At bedtime to avoid daytime drowsiness with parkinsonism
• Store at room temperature

IM route
• Inject deeply in muscle; use filtered needle to remove solution from ampule

IV, direct route
• Use in emergencies, not used often; rate 1 mg/min

Y-site compatibilities: Alfentanil, amikacin, aminophylline, ascorbic acid injection, atracurium, atropine, azaTHIOprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride, gluconate, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, ePHEDrine, epinephrine, epoetin alfa, erythromycin lactobionate, esmolol, famotidine, fentaNYL, fluconazole, folic acid (as sodium salt), gentamicin, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydrOXYzine, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, ketorolac, labetalol, lactated Ringer's, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, minocycline, morphine, multiple vitamins injection, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, Ringer's injection, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tobramycin, tolazoline, urokinase, vancomycin, vasopressin, verapamil

SIDE EFFECTS

CNS: Hallucinations, depression, dizziness, memory loss; *confusion;* delirium (geriatric headache, sedation)
CV: Palpitations, tachycardia, hypotension, bradycardia

EENT: Blurred vision, photophobia
GI: *Dry mouth, constipation,* nausea
GU: Urinary hesitancy/retention
INTEG: Rash
MISC: Decreased sweating

PHARMACOKINETICS

PO: Onset 1 hr, peak 7 hr, duration 24 hr
IM/IV: Onset 15 min, duration 6-10 hr

INTERACTIONS

Increase: anticholinergic effect— antihistamines, phenothiazines, tricyclics, disopyramide, quiNIDine; reduce dose
Decrease: absorption—antidiarrheals, antacids
Decrease: anticholinergic effect of—cholinergics; monitor response
Drug/Herb
Increase: anticholinergic action—jimsonweed, *Scopola*

NURSING CONSIDERATIONS

Assess:
• **Parkinsonism:** EPS, shuffling gait, muscle rigidity, involuntary movements, loss of balance, tardive dyskinesia; may exacerbate symptoms
• Monitor vital signs
• I&O ratio; commonly causes decreased urinary output; urinary hesitancy, retention; palpate bladder if retention occurs
• Constipation: increase fluids, bulk, exercise if this occurs, paralytic ileus may occur
• Mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy
• Use caution during hot weather; product may increase susceptibility to heat stroke by decreasing sweating
• With benztropine "buzz" or "high," patients may imitate EPS
• Hard candy, gum, frequent drinks to relieve dry mouth
• **Withdrawal symptoms:** do not discontinue abruptly; taper
• **Beers:** avoid in older adults; high risk of delirium, CNS effects, decreased urinary flow
• **Pregnancy/breastfeeding:** Unknown
Evaluate:
• Therapeutic response: absence of involuntary movements after 2 days of treatment

Teach patient/family:
• To report urinary hesitancy/retention, dysuria
• That tablets may be crushed, mixed with food; may take whole dose at bedtime if approved by prescriber
• Not to discontinue product abruptly; to taper off over 1 wk or withdrawal symptoms may occur (EPS, tremors, insomnia, tachycardia, restlessness); to take as directed; not to double dose
• To avoid driving, other hazardous activities; drowsiness/dizziness may occur
• To avoid OTC medications: cough, cold preparations with alcohol, antihistamines, antacids, antidiarrheals within 2 hr unless directed by prescriber
• To change positions slowly to prevent orthostatic hypotension
• To use good oral hygiene, frequent sips of water, sugarless gum for dry mouth
• To avoid strenuous exercise or activities in hot weather; overheating may occur
• That routine exams will be needed
• To separate antacids by 2 hr of this product

bepotastine (Rx)

(beh-pot'uh-steen)

Bepreve

Func. class.: Antihistamine (ophthalmic)
Chem. class.: Histamine-1 receptor antagonist

USES:

Ocular pruritus associated with signs/symptoms of allergic conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity
Precautions: Pregnancy, breastfeeding, children, contact lenses

DOSAGE AND ROUTES

• **Adult/child ≥2 yr: OPHTH** Instill 1 drop in affected eye bid, max 2 drops/day in each eye
Available forms: Opthalmic solution 1.5%

betamethasone (augmented) topical

See Appendix B

betamethasone dipropionate (Rx)

(bay-ta-meth´a-sone)

Betaderm, Betagel, Betaprolene Cream, Betaflam, Betesol, Celestoderm V, Diprolene, Diprolene AF, Sernivo

betamethasone valerate

Luxiq

Func. class.: Corticosteroid, topical

ACTION: Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES: Inflammation/itching corticosteroid-responsive dermatoses on the skin/scalp

CONTRAINDICATIONS: Hypersensitivity, use of some preparations on face, axilla, groin

Precautions: Pregnancy, skin infections

DOSAGE AND ROUTES

• **Adult: TOP** 1-2 times/day (dipropionate) or 1-3 times/day (valerate); or apply spray 0.05% bid up to 4 wk (plaque psoriasis, mild to moderate)

Available forms: dipropionate: gel, lotion, ointment, cream, spray 0.05%; **valerate:** cream, lotion, ointment 0.1%, foam 0.12%

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration, erythema

MISC: Hyperglycemia, glycosuria, Cushing's syndrome, HPA axis suppression

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

• **Skin reactions:** burning, pruritus, folliculitis, dermatitis

• **HPA axis suppression:** usually rare with topical products

Evaluate:

• Decreased itching; inflammation on the skin, scalp

Teach patient/family:

Topical route:

• That betamethasone valerate may be used with occlusive dressings for psoriasis or recalcitrant conditions; not to use dipropionate with occlusive dressings

• Avoid use of topical corticosteroids on face

Cream/ointment/lotion:

• To apply sparingly in a thin film, using gloves, and to rub gently into the cleansed, slightly moist affected area

• Not to use on broken, wet skin; area of infection; face or groin; axilla

Gel:

• To apply sparingly in a thin film, using gloves, and to rub gently into the cleansed, slightly moist affected area

Scalp foam:

• Gently massage into affected area until foam disappears; repeat until entire affected scalp area is treated

• That treatment should be limited to 2 wk

⚠ HIGH ALERT

betaxolol (Rx)

(beh-tax´oh-lol)

Betoptic-S, Kerlone

Func. class.: Antiglaucoma

Chem. class.: Beta-blocker

USES: Treatment of chronic open-angle glaucoma and ocular hypertension; **PO** for hypertension

CONTRAINDICATIONS: Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome

Precautions: Abrupt discontinuation, children, pregnancy, breastfeeding, asthma,

COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, angle-closure glaucoma

DOSAGE AND ROUTES

Chronic open-angle glaucoma

- **Adult:** Instill 1-2 drops in the affected eye(s) bid

Hypertension

- **Adult: PO** 10 mg/day, may increase to 20 mg after 1-2 wk; may be used with or without diuretics

Geriatric

- **PO** Initially, 5 mg/day, may increase 5 mg/day q2wk, max 20 mg/day

Available forms: Opthalmic solution 0.5%; tablets 10, 20 mg; opthalmic suspension 0.25%

bethanechol (Rx)

(be-than'e-kole)

Duvoid

Func. class.: Urinary tract stimulant, cholinergic

Chem. class.: Synthetic choline ester

ACTION: Stimulates muscarinic ACH receptors directly; mimics effects of parasympathetic nervous system stimulation; stimulates gastric motility, micturition; increases lower esophageal sphincter pressure

USES: Urinary retention (postoperative, postpartum), neurogenic atony of bladder with retention

Unlabeled uses: Ileus, GERD, anticholinergic syndrome

CONTRAINDICATIONS: Hypersensitivity, severe bradycardia, asthma, severe hypotension, hyperthyroidism, peptic ulcer, parkinsonism, seizure disorders, CAD, COPD, coronary occlusion, mechanical obstruction, peritonitis, recent urinary/GI surgery, GI/GU obstruction

Precautions: Pregnancy, breastfeeding, children <8 yr, hypertension

DOSAGE AND ROUTES

- **Adult: PO/SUBCUT** 10-50 mg bid-qid
- **Child (unlabeled): PO** 0.5 mg/kg/day in 3-4 divided doses

Ileus (unlabeled)

- **Adult: PO** 10-20 mg tid-qid

Available forms: Tablets 5, 10, 25, 50 mg

Administer:

- To avoid nausea, vomiting, take on an empty stomach
- Only after all other cholinergics have been discontinued; cholinergic effects at higher doses may be cumulative
- Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache, malaise

CV: Hypotension, bradycardia, reflex tachycardia, cardiac arrest, circulatory collapse

EENT: Miosis, increased salivation, lacrimation, blurred vision

GI: *Nausea, bloody diarrhea, belching, vomiting, cramps, fecal incontinence*

GU: Urgency

INTEG: Rash, urticaria, flushing, increased sweating

RESP: Acute asthma, dyspnea, bronchoconstriction

PHARMACOKINETICS

PO: Onset 30-90 min, peak 60-90 min, duration 6 hr

INTERACTIONS

Increase: severe hypotension—ganglionic blockers; avoid concurrent use

Increase: action or toxicity—cholinergic agonists, anticholinesterase agents; avoid concurrent use

Decrease: action of anticholinergics, procainamide, quiNIDine, belladonna; monitor for adequate effect

Drug/Lab Test

Increase: AST, lipase/amylase, bilirubin

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** retention, urgency
- B/P, pulse: observe after parenteral dose for 1 hr; may need to use atropine SUBCUT 0.6 mg or IV push slowly for bronchoconstriction
- I&O ratio: check for urinary retention, urge incontinence

• **Toxicity:** bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs
• **Orthostatic hypotension:** monitor frequently, monitor ambulation to prevent falling
• **Pregnancy/breastfeeding:** use only if clearly needed; discontinue breastfeeding or product

Evaluate:
• Therapeutic response: absence of urinary retention, abdominal distention

Teach patient/family:
• To take product exactly as prescribed; 1 hr before meals or 2 hr after meals to avoid nausea
• To make position changes slowly; orthostatic hypotension may occur
• To avoid driving, hazardous activities until effects are known

TREATMENT OF OVERDOSE:
Administer atropine 0.6-1.2 mg IV or IM (adult)

⚠ HIGH ALERT

betrixaban (Rx)
(be-trix′-a-ban)

Bevyxxa

Func. class.: Anticoagulant
Chem. class.: Selective factor Xa inhibitor

ACTION:
Inhibits factor Xa; neutralization of factor Xa interrupts blood coagulation and thrombin formation

USES:
Prevention/treatment of deep venous thrombosis' PE in at-risk, acutely ill, hospitalized medical patients

CONTRAINDICATIONS:
Hypersensitivity, active major bleeding

Precautions: Pregnancy, breastfeeding, children, geriatric patients, hepatic disease, renal disease

Black Box Warning: Spinal/epidural anesthesia, lumbar puncture

DOSAGE AND ROUTES

DVT prophylaxis, pulmonary embolism prophylaxis in at-risk, acutely ill, hospitalized medical patients
• **Adult: PO** 160 mg once, followed by 80 mg/day for 35-42 days

Renal dose
Adult: PO CCr 15-<30 mL/min 80 mg, then 40 mg daily × 35-42 days

Concomitant use of P-gp inhibitors: Reduce initial dose to 80 mg as a single dose, then 40 mg once daily for 35-42 days

Available forms: Capsules 40, 80 mg

Administer:
• Give with food at same time of day
• If a dose is missed, take as soon as remembered on the same day; do not double
• Store at room temperature

PHARMACOKINETICS
Onset unknown, peak 3-4 hr, duration >72 hr, protein binding 60%, half-life 19-27 hr; excreted in urine 11%, feces 85%

INTERACTIONS
Increase: bleeding risk—salicylates, NSAIDs, abciximab, eptifibatide, tirofiban, clopidogrel, dipyridamole, quiNIDine, valproic acid, P-gp inhibitors

Drug/Herb
Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, kava

Drug/Lab
Decrease: potassium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Monitor patients who have received epidural/spinal anesthesia or lumbar puncture for neurologic impairment, including spinal hematoma; may lead to permanent disability or paralysis

• **Hepatic impairment:** avoid use
• **Renal impairment:** dose reduction is required

• For bleeding: gums, petechiae, ecchymosis, black tarry stools, hematuria; decreased Hct; notify prescriber
• For risk of hemorrhage if coadministering with other products that may cause bleeding
• For hypersensitivity: rash, fever, chills; notify prescriber
• Monitor QTc interval if needed in cardiac patients
• **Pregnancy/breastfeeding:** consider risks of bleeding and stroke; use only if benefits outweigh risks; consider potential adverse effects before breastfeeding
• **Beers:** avoid in older adults; increased risk of bleeding, lower CCr

Evaluate:
• Therapeutic response: prevention of DVT

Teach patient/family:
• To use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
• To report any signs of bleeding: gums, under skin, urine, stools; bleeding risk may continue up to 72 hr after stopping therapy
• To avoid OTC products containing aspirin, NSAIDs
• To take with food

Black Box Warning: Spinal/epidural hematoma: in those that received spinal/epidural anesthesia; weakness in lower extremities, bowel bladder involvement

⚠ HIGH ALERT

bevacizumab (Rx)

(beh-va-kiz′you-mab)

Avastin; MVASi (biosimilar), Zirabev (biosimilar)

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Monoclonal antibody

Do not confuse:
Avastin/Astelin

ACTION: Monoclonal antibody selectively binds to and inhibits activity of human vascular endothelial growth factor (VEGF) to reduce microvascular growth and metastatic disease progression

USES: Non–small-cell lung cancer (NSCLC), metastatic carcinoma of the colon or rectum, renal cell carcinoma, glioblastoma

Unlabeled uses: Adjunctive for ovarian cancer, (wet) macular degeneration, unresectable malignant pleural mesothelioma, diabetic macular edema

CONTRAINDICATIONS: Hypersensitivity, serious bleeding, hypertensive crisis, recent surgery

Precautions: Pregnancy, breastfeeding, children, geriatric patients, HF, blood dyscrasias, CV disease, hypertension, surgery, thromboembolic disease, hamster protein/murine hypersensitivity

Black Box Warning: GI perforation, wound dehiscence, bleeding

DOSAGE AND ROUTES

Non–small-cell lung cancer
• **Adult: IV** 15 mg/kg over 60-90 min with CARBOplatin and PACLitaxel q3wk

Platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (Avastin only)
• **Adult: IV** 10 mg/kg q2wk with PACLitaxel and pegylated liposomal DOXOrubicin or topotecan weekly; or 15 mg/kg q3wk with topotecan

Platinum-sensitive recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (Avastin only)
• **Adult: IV** 15 mg/kg q3wk with CARBOplatin and PACLitaxel for ≤6 cycles 8 cycles, then continue bevacizumab (single agent): 15 mg/kg q3wk until progression

Stage III/IV epithelial ovarian, fallopian tube, or primary peritoneal cancer after resection (Avastin only)
• **Adult: IV** 15 mg/kg q3wk with CARBOplatin and PACLitaxel for ≤6 cy-

cles, then 15 mg/kg q3wk (single agent) for 22 cycles

Metastatic colorectal cancer with fluoropyrimidine-irinotecan–based or fluoropyrimidine-oxaliplatin–based or fluoropyrimidine-oxaliplatin–based treatment for second-line after progression

- **Adult: IV** 5 mg/kg q2wk or 7.5 mg/kg q3wk

Persistent, recurrent, or metastatic cervical cancer with PACLitaxel and CISplatin or PACL itaxel and topotecan

- **Adult: IV** infusion 15 mg/kg q3wk

First- or second-line treatment of metastatic colon or rectal cancer with 5-FU

- **Adult: IV** infusion 5 mg/kg q14days if used with bolus irinotecan, 5-FU, and leucovorin; or 10 mg/kg q14days if used with oxaliplatin, F-FU, and leucovorin (FOLOX 4); rates vary

With CARBOplatin and PACLitaxel as first-line in treatment of unresectable, recurrent, locally advanced, or metastatic nonsquamous NSCLC

- **Adult: IV** infusion 15 mg q3wk

Unresectable or metastatic hepatocellular cancer (HCC) in patients who have not received prior systemic therapy, with atezolizumab

- **Adult: IV** 15 mg/kg on day 1, q3wk give with atezolizumab (840 mg IV q2wk or 1200 mg IV q3wk or 1680 mg IV q4wk) until disease progression or unacceptable toxicity

Unresectable malignant pleural mesothelioma (unlabeled)

- **Adult: IV** 15mg/kg q3wk with CISplatin and pemetrexed for up to 6 cycles, then bevacizumab 15 mg/kg q3wk maintenance until disease progression or toxicity

Diabetic macular edema (unlabeled)

- **Adult: Intravitreal** 1.25 mg (0.05 mL), repeat q4wk depending on response

Neovascular (wet) age-related macular degeneration (AMD) (unlabeled)

- **Adult/geriatric patients: INTRAVITREAL INJECTION** 1.25 mg (0.05 mL) monthly into affected eye × 3 mo

Available forms: Solution for injection 25 mg/mL

Administer:

Intermittent IV INFUSION route

- Do not give by IV bolus, IV push; do not shake vial, do not admix, do not freeze
- Withdraw amount of product to be given, dilute in 100 mL 0.9% NaCl, discard any unused portion

Black Box Warning: Wound dehiscence: discontinue 28 days prior to elective surgery, do not give for ≥28 days after surgery; make sure wound is healed before giving product

- Give as IV infusion over 90 min for first dose and 60 min thereafter if well tolerated; subsequent infusion may be given over 30 min; do not admix with dextrose
- Store refrigerated up to 8 hr (diluted)

SIDE EFFECTS

CNS: *Asthenia, dizziness,* abnormal gait, syncope, headache, confusion

CV: Deep vein thrombosis, arterial thrombosis, hypo/hypertension, heart failure

GI: Nausea, vomiting, *anorexia, diarrhea,* constipation, *abdominal pain,* colitis, taste change, dyspepsia, stomatitis, GI hemorrhage/perforation

GU: Proteinuria, vaginal hemorrhage

HEMA: Leukopenia, neutropenia, thrombocytopenia

META: Bilirubinemia, hypokalemia

MISC: Exfoliative dermatitis, *alopecia*

RESP: Dyspnea, upper respiratory tract infection, hemoptysis

INTEG: Skin discoloration, infusion reactions, dry skin, skin ulcer, palmar-plantar erythrodysesthesia

PHARMACOKINETICS

Half-life 20 days, steady-state 100 days

INTERACTIONS

• Avoid concurrent use with SUNItinib; microangiopathic hemolytic anemia may occur

Increase: CV toxicity antineoplastics

Increase: osteonecrosis of the jaw—biophosphates

Decrease: immune response to live virus vaccines

Drug/Lab

Increase: bilirubin

Decrease: neutrophil, platelets, WBC, potassium

NURSING CONSIDERATIONS

Assess:

• B/P; take frequently if hypertension develops, discontinue if hypertensive crisis occurs

• For symptoms of infection; may be masked by product

• **CNS reaction:** dizziness, confusion

• **HF:** crackles, jugular venous distention, dyspnea during treatment

• **GU status (proteinuria):** nephrotic syndrome may occur; monitor urinalysis for increasing protein level; product should be held if protein ≥2 g/24 hr; resume when <2 g/24 hr

Black Box Warning: Wound dehiscence: hold for ≥28 days until incision is healed, discontinue 28 days prior to elective surgery; if wound dehicence occurs discontinue

Black Box Warning: GI perforation (constipation, fever, abdominal pain, nausea, vomiting), **serious bleeding** (bleeding from any orifice, stroke, deep vein thrombosis), **nephrotic syndrome, hypertensive crisis;** product should be discontinued permanently; surgery should be postponed

• **Thromboembolic events:** monitor for stroke, TIA, MI; usually occurs in geriatric patients who used this product previously

• **Fistulas:** may occur within 6 mo of beginning treatment, may be fatal

• **Reversible posterior leukoencephalopathy syndrome (RPLS):** discontinue if this disorder develops (headache, vision changes, seizures, altered mental status); MRI may be ordered, occurs 16 hr-1 yr after beginning treatment

• **Pregnancy/breastfeeding:** drug may lead to fetal harm; do not use in pregnancy, do not breastfeed during and for 6 mo after last dose; use contraception during and for 6 mo after last dose

Evaluate:

• Therapeutic response: decrease in size of tumors

Teach patient/family:

• To avoid hazardous tasks because confusion, dizziness may occur

• To report signs of infection: sore throat, fever, diarrhea, vomiting

Black Box Warning: Hemorrhage/bleeding: to report bleeding, changes in urinary patterns, edema, abdominal pain

• To avoid live virus vaccines

• About the need to discontinue product 1 mo before surgery and not to restart until wound is healed

• **Pregnancy/breastfeeding:** that fetal harm may occur, not to breastfeed, not to become pregnant while taking this product or for 6 mo after discontinuing treatment; discuss possible infertility with patient

bezlotoxumab (Rx)

(bez'loe-tox'ue-mab)

Zinplava

Func. class.: Antidiarrheal

USES: For *Clostridium difficile* infection (CDI) in patients who are receiving antibacterial treatment of CDI and are at a high risk for CDI recurrence

CONTRAINDICATIONS: Hypersensitivity

Precautions: Breastfeeding, pregnancy, heart failure

DOSAGE AND ROUTES

• **Adult: IV** 10 mg/kg as a single dose

Available forms: Solution for injection 25 mg/mL

bictegravir/emtricitabine/tenofovir alafenamide (Rx)

(bik-teg′-ra-veer/em-try-sye′tah-been/ten-of′oh-veer al′e′fen′ a-mide)

Biktarvy

Func. class.: HIV antivirals

Chem. class.: Integrase strand transfer inhibitor (INSTI); nucleoside and nucleotide reverse transcriptase inhibitor (NRTI) combinations

ACTION: A 3-drug combination of bictegravir (BIC), an HIV-1 integrase strand transfer inhibitor (INSTI), and emtricitabine (FTC) and tenofovir alafenamide (TAF), both HIV-1 nucleoside analog reverse transcriptase inhibitors (NRTIs)

USES: Complete regimen for the treatment of HIV-1 infection in adults who have no antiretroviral treatment history or to replace the current antiretroviral regimen in those who are virologically suppressed (HIV-1 RNA <50 copies per mL)

CONTRAINDICATIONS: Do not use with dofetilide, rifAMPin; hypersensitivity

Precautions: Alcoholism, breastfeeding, Graves' disease, pregnancy, hepatic impairment, HIV resistance, immune reconstitution syndrome, infection resistance, osteoporosis, renal impairment, lactic acidosis/severe hepatomegaly with steatosis, suicidal ideation

Black Box Warning: Hepatitis B and HIV coinfection, hepatitis B exacerbation

DOSAGE AND ROUTES

• **Adult:** 1 tablet daily

Available forms: Tablets 50 mg bictegravir, 200 mg emtricitabine, 25 mg tenofovir alafenamide

Administer:

• With or without food

• Do not use 2 hr before or after dairy products or antacids that contain aluminum, magnesium, or calcium

SIDE EFFECTS

CNS: Fatigue, abnormal dreams, headache, depression, suicidal ideation

GI: Nausea, vomiting, diarrhea, steatosis, hepatomegaly, exacerbation of HBV infection

HEMA: Immune reconstitution syndrome

MISC: Lactic acidosis, rash

PHARMACOKINETICS

Bictegravir: Protein binding >99%, elimination via metabolism, mediated by CYP3A and UGT1A1 enzymes; excreted in feces (60.3%), urine (35%), half-life 17.3 hr

Emtricitabine: Protein binding <4%, excreted in urine (70%), feces (13.7%), half-life 10 hr

Tenofovir AF: Protein binding 80%, elimination via metabolism (more than 80% of dose), excreted in feces (31.7%), elimination of metabolite via kidneys (70%-80%) by a combination of glomerular filtration and active tubular secretion, half-life 0.51 hr; metabolite half-life of 150-180 hr

INTERACTIONS

• Do not use with other antiretrovirals for HIV, rifAMPin

Increase: effect of metFORMIN

Increase: effect of this HIV combination product—OCT2 and MATE1 (dofetilide); CYP3A4 inhibitors, UGT1A1 inhibitors

Decrease: concentration of this HIV combination product—carBAMazepine, OXcarbazepine, phenobarbital, phenytoin; use alternative anticonvulsants

Decrease: concentration of this HIV combination product—products that inhibit P-gp and BCRP

Drug/Herb
Avoid use with St. John's wort

NURSING CONSIDERATIONS

Assess:

- **HIV:** symptoms and change in severity; opportunistic infections may occur with HIV; assess for these infections throughout therapy
- **Osteoporosis and bone mineral loss:** assess those who have had prior fractures, osteoporosis, or mineral bone loss
- **Hepatitis B infection:** before use, test for hepatitis B virus infection; monitor hepatitis B serology, plasma hepatitis C RNA
- **Lab testing:** before use and periodically during treatment, assess serum creatinine, estimated CCr, urine glucose, urine protein, serum phosphorus in those with chronic kidney disease
- Monitor blood glucose, CBC with differential, CD4+ T-cell count, LFTs, plasma HIV RNA, pregnancy testing (if applicable), serum bilirubin (total and direct), serum cholesterol, BUN, serum lipid profile, urinalysis

Black Box Warning: Exacerbations of HBV in coinfection with HBV: monitor for several months after treatment especially in hepatotoxicity

- **Pregnancy/breastfeeding:** for pregnant women, therapy should begin immediately after HIV diagnosis. Therapy may be initiated before drug resistance testing results are available; modify based on the assay
- **Depression and suicidal ideation:** although rare, has occurred in those with depression before treatment
- **Immune reconstitution syndrome:** that patients may develop an inflammatory response to opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia [PCP], or TB), autoimmune disorders (Graves' disease, polymyositis, and Guillain-Barré syndrome); response may occur during or many months after starting treatment

Evaluate:

- Therapeutic response: improving signs and symptoms of HIV, improving CD4+ counts, plasma HIV RNA with only moderate side effects

TEACH PATIENT/FAMILY

- To take as directed, not to skip or double doses; if missed, to take when remembered; not to share with others
- That product is not a cure; that patient is still infective and may transmit infection to others via sexual contact, blood transfusions, or sharing needles; to practice safe sex, as using a condom will prevent transmission from person to person; not to donate blood
- That lab testing will be required periodically during treatment
- **Lactic acidosis/hepatomegaly with stenosis:** to report immediately nausea, vomiting, abdominal pain, severe weakness
- To inform all health care providers of OTC, Rx, herbal products, supplements taken; not to start or stop without consent of prescriber; to avoid St. John's wort
- Not to use antacids, dairy products 2 hr before or after this product
- **Pregnancy/breastfeeding:** to notify health care provider if pregnancy is planned or suspected; if pregnant, to enroll in the Antiretroviral Pregnancy Registry (800-258-4263); to avoid breastfeeding

bimatoprost (ophthalmic/topical) (Rx)

(by-mat'oh-prost)

Durysta, Latisse, Lumigan

Func. class.: Antiglaucoma agent

Do not confuse:
bimatoprost/travoprost

USES: Increased intraocular pressure in those with open-angle glaucoma/ocular hypertension (Lumigan); eyelash hypotrichosis (Latisse)

CONTRAINDICATIONS: Hypersensitivity to this product, benzalkonium chloride
Precautions: Children, intraocular inflammation, closed-angle glaucoma, macular edema, contact lenses, ocular infection, surgery, trauma; corneal abrasion, iritis, urethritis

DOSAGE AND ROUTES

Increased intraocular pressure/ ocular hypertension (Lumigan)
• **Adult: OPHTH Instill** 1 drop in each affected eye (conjunctival sac) every night
Eyelash hypotrichosis (Latisse)
• **Adult: Apply** 1 drop to skin of upper eyelid margin at base of eyelashes every night using a new supplied disposable sterile applicator
Available forms: Ophthalmic solution 0.01%; topical solution 0.03%; implant

binimetinib (Rx)

(bih′-nee-meh′-tih-nib)
Mektovi
Func. class.: Antineoplastic

USES: Treatment of unresectable/metastatic melanoma (BRAF V600E or V600K mutations) with encorafenib

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

• **Adult: PO** 45 mg bid with encorafenib **PO** 450 mg daily until disease progression
Available forms: Tablets 15 mg

bisacodyl (Rx, OTC)

(bis-a-koe′dill)
Peglyte, Bisacolax, Bisacolax, Correctol, Carter's Little Pills, Codulax, Dacodyl, Doxidan, Dulcolax, Ex-Lax Ultra, Femilax, Fleet, Laxative for Women, Silver Bullet Suppository, The Magic Bullet, Soflax-Ex
Func. class.: Laxative, stimulant
Chem. class.: Diphenylmethane

Do not confuse:
Dulcolax (bisacodyl)/Dulcolax (docusate)

ACTION: Acts directly on intestine by increasing peristalsis; thought to irritate colonic intramural plexus

USES: Short-term treatment of constipation; bowel or rectal preparation for surgery, examination

CONTRAINDICATIONS: Hypersensitivity, abdominal pain, nausea, vomiting, appendicitis, acute surgical abdomen, ulcerated hemorrhoids, acute hepatitis, fecal impaction, intestinal/biliary tract obstruction
Precautions: Pregnancy, breastfeeding, rectal fissures, severe CV disease

DOSAGE AND ROUTES

• **Adult and child ≥12 yr: PO** 5-15 mg in PM or AM; may use up to 30 mg for bowel or rectal preparation; **RECT** 10 mg as a single dose; 30-mL enema
• **Child 3-11 yr: PO** 5-10 mg as a single dose; **RECT** 5-10 mg as a single dose
Available forms: Tablets delayed release 5, 10 mg; enteric-coated tablets 5 mg; suppository 5, 10 mg; rectal solution 10 mg/30 mL
Administer:
PO route
• Use lowest dose
• Swallow tablets whole with full glass of water; do not break, crush, chew tablets

• Take alone only with water for better absorption; do not take within 1 hr of other products or within 1 hr of antacids, milk, H_2 antagonists; do not take enteric product with proton-pump inhibitors
• In AM or PM

Rectal route

• Insert high in rectum end first, effect in 15 min-1 hr

SIDE EFFECTS

CNS: Muscle weakness
GI: *Nausea, anorexia, cramps,* diarrhea, rectal burning (suppositories)
META: Protein-losing enteropathy (extended use), hypokalemia (extended use), tetany

PHARMACOKINETICS

Small amounts absorbed/metabolized by liver; excreted in urine, bile, feces, breast milk
PO: Onset 6-10 hr
RECT: Onset 15-60 min

INTERACTIONS

Increase: gastric irritation—antacids, milk, H_2 blockers, gastric acid pump inhibitors
Decrease: absorption with antacids, H_2 blockers, gastric acid pump inhibitors

Drug/Food

• Increase irritation—dairy products, separate by 2 hr

Drug/Lab

Increase: sodium phosphate
Decrease: calcium, magnesium

Drug/Herb

Increase: laxative action—flexibility of the valley, pheasant's eye, senna, squill

NURSING CONSIDERATIONS

Assess:

• Blood, urine electrolytes if product is used often by patient
• I&O ratio to identify fluid loss
• Cause of constipation; identify whether fluids, bulk, exercise missing from lifestyle; determine use of constipating products
• **GI symptoms:** cramping, rectal bleeding, nausea, if these symptoms occur, product should be discontinued
• Multiple products/routes may be used for bowel prep

Evaluate:

• Therapeutic response: decrease in constipation, removal of stool from colon

Teach patient/family:

• Not to use laxatives for long-term therapy because bowel tone will be lost; 1-wk use is usually sufficient
• That normal bowel movements do not always occur daily
• Not to use in presence of abdominal pain, nausea, vomiting
• To notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness
• To take with a full glass of water; if using with dairy products separate by 2 hr; to separate from other foods by 1 hr
• Identify bulk, water, constipating products, exercise in patient's life

bismuth subsalicylate (OTC)

(bis´muth sub-sal-iss´uh-late)

Bismatrol, Kaopectate, Kao-Tin, Peptic Relief, Pepto-Bismol, Pink Bismuth, Kaopectolin, K-Pek, Maalox Total Stomach Relief, Stomach Relief

Func. class.: Antidiarrheal, weak antacid
Chem. class.: Salicylate

Do not confuse:
Kaopectate/Kayexalate

ACTION: Inhibits the prostaglandin synthesis responsible for GI hypermotility, intestinal inflammation; stimulates absorption of fluid and electrolytes; binds toxins produced by *Escherichia coli*

USES: Relief of diarrhea, heartburn, indigestion, nausea, upset stomach

CONTRAINDICATIONS: Children <3 yr, children with chickenpox, history of GI bleeding, flulike symptoms, hypersensitivity to product or salicylates, PUD

Precautions: Pregnancy, breastfeeding, geriatric patients, gout, diabetes mellitus, bleeding disorders, previous hypersensitivity to NSAIDs, *Clostridium difficile*–associated diarrhea when used with antiinfectives for *Helicobacter pylori*

DOSAGE AND ROUTES

Antidiarrheal/gastric distress

• **Adult/adolescent: PO** 524 mg (2 tablets or 30 mL) q30-60min as needed, max 8 doses/day; or 1050 mg (30 mL) hourly as needed, max 4 doses/day

H. pylori

• **Adult/adolescent: PO** 525 mg qid, max 4.2 g/24 hr; given with metroNIDAZOLE or tetracycline and acid-suppressive therapy × 14 days

Traveler's diarrhea (unlabeled)

• **Adult: PO** 30 mL q30min (8×/day regular strength, 4×/day max strength)

Available forms: Tablets 262 mg; chewable tablets 262 mg; liquid 262 mg/15 mL, 525 mg/15 mL

Administer:

• Increase fluids to rehydrate patient

• **Suspension:** shake liquid before using; use measuring cup, syringe

• Tablets can be chewed, dissolved in mouth; caplets to be swallowed whole with water

SIDE EFFECTS

CNS: Confusion, twitching, neurotoxicity (high doses)

EENT: Hearing loss, tinnitus, metallic taste, blue gums, black tongue

GI: Increased fecal impaction (high doses), dark stools, constipation, diarrhea, nausea

HEMA: Increased bleeding time

MISC: Reye's syndrome

PHARMACOKINETICS

PO: Onset 1 hr, peak 2 hr, duration 4 hr

INTERACTIONS

Increase: toxicity—salicylates, methotrexate

Increase: effect of anticoagulants (PO), antidiabetics (PO)

Decrease: absorption of tetracycline, quinolones, phenytoin; separate for ≥2 hr

Drug/Lab Test

Interference: radiographic studies of GI system

NURSING CONSIDERATIONS

Assess:

• **Diarrhea:** bowel pattern before product therapy, after treatment

• **GI status:** abdominal pain, nausea, heartburn, bowel sounds

• **Pregnancy/breastfeeding:** avoid in pregnancy; do not breastfeed

• Electrolytes K, Na, Cl if diarrhea is severe or continues long term; assess skin turgor, other signs of dehydration

Evaluate:

• Therapeutic response: decreased diarrhea, absence of diarrhea when traveling; resolution of ulcers

Teach patient/family:

• To chew, dissolve tablets in mouth; not to swallow whole; to shake liquid before using, maintain hydration

• To avoid other salicylates unless directed by prescriber; not to give to children, possibility of Reye's syndrome

• That stools may turn black; that tongue may darken; that impaction may occur in debilitated patients

• To stop use if symptoms do not improve within 2 days or become worse, or if diarrhea is accompanied by high fever

• To separate quinolones, phenytoin, tetracyclines by ≥2 hr

⚠ HIGH ALERT

bisoprolol (Rx)

(bis-oh'pro-lole)

Func. class.: Antihypertensive

Chem. class.: β_1-blocker

Do not confuse:

bisoprolol/buPROPion/busPIRone

ACTION: Blocks stimulation of β_1-adrenergic receptors within cardiac muscle (decreases rate of SA node discharge, increases recovery time), slows

conduction of AV node, decreases heart rate, which decreases O_2 consumption in myocardium; decreases renin-angiotensin-aldosterone system; inhibits beta 2 receptors (bronchial/vascular smooth muscle) at high doses

USES: Mild to moderate hypertension
Unlabeled uses: Heart failure with reduced ejection fraction

CONTRAINDICATIONS:

Hypersensitivity to beta-blockers, cardiogenic shock, heart block (second, third degree), sinus bradycardia, acute cardiac failure
Precautions: Pregnancy, breastfeeding, children, major surgery, diabetes mellitus, HF, thyroid/renal/hepatic disease, COPD, asthma, well-compensated heart failure, aortic or mitral valve disease, peripheral vascular disease, myasthenia gravis, abrupt discontinuation

DOSAGE AND ROUTES

Hypertension
• **Adult: PO** 5 mg/day; reduce to 2.5 mg in bronchospastic disease; may increase to 20 mg/day if necessary; max 20 mg/day
Heart failure with reduced injection fraction (unlabeled)
Adult: PO 1.25 mg daily, max 10 mg daily
Renal/hepatic dose
• **Adult: PO** CCr <40 mL/min 2.5 mg, titrate upward
Available forms: Tablets 5, 10 mg
Administer:
• Take apical pulse before each dose, if <50 bpm, withhold
• Do not crush, swallow whole; may give without regard to meals, at same time of day
• Store protected from light, moisture; at room temperature

SIDE EFFECTS

CNS: Insomnia, fatigue, dizziness, headache
CV: Bradycardia, HF, postural hypotension, peripheral edema, cold extremities
EENT: Blurred vision, dry mouth
ENDO: Hypoglycemia
GI: Nausea, diarrhea, vomiting
INTEG: Rash, sweating
RESP: Dyspnea, cough

PHARMACOKINETICS

Onset 1-2 hr, peak 2-4 hr, duration unknown, half-life 9-12 hr, 50% excreted unchanged in urine, protein binding 30%-36%, metabolized in liver to inactive metabolites

INTERACTIONS

Increase: myocardial depression—calcium channel blockers, phenytoin (IV), verapamil
Increase: antihypertensive effect—ACE inhibitors, alpha-blockers, calcium channel blockers, diuretics, nitrates
Increase: bradycardia—digoxin, amiodarone cloNIDine, dilTIAZem, verapamil, reserpine, guanethidine
Increase: antidiabetic effect—antidiabetics; may mask hypoglycemic symptoms
Increase: peripheral ischemia—ergots
Decrease: antihypertensive effect—NSAIDs, salicylates
Drug/Herb
Increase: Beta-blocking effect—hawthorn
Decrease: Beta-blocking effect—ephedra, licorice root
Drug/Lab Test
Increase: AST, ALT, blood glucose, BUN, uric acid, potassium, creatinine, phosphorus

NURSING CONSIDERATIONS

Assess:
• **Hypertension:** B/P, pulse during beginning treatment, periodically thereafter; pulse: note rate, rhythm, quality; apical/radial pulse prior to administration; notify prescriber of any significant changes (pulse <50 bpm); monitor ECG baseline and periodically
• Baselines of renal, hepatic studies prior to beginning therapy
• **Heart failure:** I&O, weight daily; increased weight, jugular venous distention, dyspnea, crackles, edema in feet, legs daily, avoid use in severe heart failure
• Skin turgor, dryness of mucous membranes for hydration status, especially for geriatric patients

- **Abrupt discontinuation:** Taper over 1 wk, abrupt discontinuation may increase angina
- **Surgery:** Do not discontinue before surgery
- **Pregnancy/breastfeeding:** Use only if clearly needed in pregnancy, use cautiously in breastfeeding

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk

Teach patient/family:

- Not to discontinue product abruptly, taper over 1 wk; may cause precipitate angina, rebound hypertension; evaluate noncompliance
- Not to use OTC products that contain alpha-adrenergic stimulants (e.g., nasal decongestants, OTC cold preparations) unless directed by prescriber
- To report slow heart rate, dizziness, confusion, depression, fever, cold extremities
- To take pulse at home; advise when to notify prescriber
- To avoid alcohol, smoking; to limit sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies
- To avoid hazardous activities if dizziness is present
- **To report symptoms of heart failure:** difficulty breathing especially on exertion or when lying down, night cough, swelling of extremities
- That if diabetic, product may mask signs of hypoglycemia or alter blood glucose levels

Pregnancy/breastfeeding: To notify health care professional if pregnancy is planned or suspected or if breastfeeding

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia; IV theophylline for bronchospasm; digoxin, O_2, diuretic for cardiac failure; hemodialysis, IV glucose for hypoglycemia; IV diazePAM or phenytoin for seizures

⚠ HIGH ALERT

bivalirudin (Rx)

(bye-val-i-rue′din)

Angiomax

Func. class.: Anticoagulant

Chem. class.: Direct thrombin inhibitor

ACTION:

Direct inhibitor of thrombin that is highly specific; able to inhibit free and clot-bound thrombin

USES:

Unstable angina in patients undergoing percutaneous transluminal coronary angioplasty (PTCA), used with aspirin; heparin-induced thrombocytopenia, with/without thrombosis syndrome, PCI with IIb/IIIa

Unlabeled: ST-elevation MI (primary PCI), non-ST elevation, ACS (moderate-high risk) early invasive strategy

CONTRAINDICATIONS:

Hypersensitivity, active bleeding, cerebral aneurysm, intracranial hemorrhage, recent surgery, CVA

Precautions: Pregnancy, breastfeeding, children, geriatric patients, renal function impairment, hepatic disease, asthma, blood dyscrasias, thrombocytopenia, GI ulcers, hypertension, inflammatory bowel disease, vitamin K deficiency, asthma

DOSAGE AND ROUTES

Anticoagulation in unstable angina in those undergoing PTCA or PCI with provisional use of platelet glycoprotein inhibitor

- **Adult: IV BOLUS** 0.75 mg/kg, then **IV INFUSION** 1.75 mg/kg/hr for 4 hr; another **IV INFUSION** may be used at 0.2 mg/kg/hr for ≤20 hr; this product is intended to be used with aspirin (325 mg/day) adjusted to body weight

Patients undergoing PCI at risk for HIT/HITTS or ST elevation in patients undergoing primary PCI (unlabeled)

Adult: IV BOLUS 0.75 mg/kg, then continuous infusion 1.75 mg/kg/hr for duration of procedure, may give another infu-

sion after 4 hr of 0.2 mcg/kg/hr up to 20 hr, give with aspirin 325 mg

ST-elevation MI (undergoing primary PCI) (unlabeled)

Adults: 0.75 mg/kg/IV bolus, then 1.75 mg/kg IV infusion for duration. May give additional 0.3 mg/kg bolus dose if needed. May continue bolus dose if needed. May continue infusion at 1.75 mg/kg for up to 4 hr after procedure. If infusion is continued, may continue infusion at 0.2 mg/kg for up to 20 hr

Non-ST-elevation ACS (moderate to high risk) (early invasive strategy) (unlabeled)

Adults: If initiating during PCI, give 0.75 mg/kg IV bolus, followed by 1.75 mg/kg/hr IV infusion for duration of procedure. May give additional 0.3 mg/kg bolus dose if needed. May continue infusion at 1.75 mg/kg for up to 4 hr after procedure. If infusion is continued and an additional infusion is necessary, may continue infusion at a reduced dose of 0.2 mg/kg for up to 20 hr. If unfractionated heparin was given before procedure, wait 30 min before using bivalirudin. If initiating before PCI or diagnostic angiography, give 0.1 mg/kg IV bolus, then by 0.25 mg/kg IV infusion, continue until angiogram or PCI

Renal dose

- **Adult: IV** CCr ≥30 mL/min no adjustment; CCr 10-29 mL/min consider reducing to 1 mL/kg/hr; hemodialysis 0.25 mg/kg/hr, same bolus dose

Available forms: Injection, lyophilized 250 mg/vial

Administer:

- Before PTCA; give with aspirin (325 mg)
- Store reconstituted vials in refrigerator for up to 24 hr; store diluted concentrations at room temperature for 24 hr

IV, direct route

- Dilute by adding 5 mL of sterile water for injection/250 mg bivalirudin, swirl until dissolved, further dilute in 50 mL of D_5W or 0.9% NaCl (5 mg/mL), give by bolus injection 0.75 mg/kg, then intermittent infusion

Continuous IV INFUSION route

- To each 250-mg vial add 5 mL of sterile water for injection, swirl until dissolved, further dilute in 500 mL D_5W or 0.9% NaCl (0.5 mg/mL); give infusion after bolus dose at a rate of 1.75 mg/kg/hr; may give an additional infusion at 0.2 mg/kg/hr

Y-site compatibilities: Abciximab, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atenolol, atracurium, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoprostenol, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE,

midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache, insomnia, anxiety, nervousness*
CV: *Hypo/hypertension, bradycardia,* ventricular fibrillation
GI: *Nausea, vomiting, abdominal pain, dyspepsia*
HEMA: Hemorrhage, thrombocytopenia
MISC: Pain at injection site, pelvic pain, urinary retention, fever, anaphylaxis, infection
MS: *Back pain*
GU: Urinary retention, renal failure, oliguria

PHARMACOKINETICS

Excreted in urine, half-life 25 min, onset rapid, peak immediate duration 1 hr, no protein binding

INTERACTIONS

Increase: bleeding risk—abciximab, anticoagulants, aspirin, thrombolytics, cephalosporins, use together cautiously

Drug/Herb

Increase: bleeding risk—angelica, chamomile, devil's claw, dong quai, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, saw palmetto; avoid concurrent use

NURSING CONSIDERATIONS

Assess:

- **Bleeding:** check arterial and venous sites, IM injection sites, catheters; all punctures should be minimized; fall in B/P or Hct may indicate hemorrhage; hematoma, hemorrhage at puncture site are more common in the elderly; monitor coagulation studies, Hct before use; baseline and periodic ACT, aPTT, PT, INR, TT, platelets, HB, Hct
- CV status: B/P; watch for hypo/hypertension, bradycardia
- Neurologic status: any focal or generalized deficits should be reported immediately
- **PCI use:** possible thrombosis, stenosis, unplanned stent, prolonged ischemia, decreased reflow
- **Renal function:** dosage reductions may be required

Pregnancy/breastfeeding: use only if clearly needed, use cautiously in breastfeeding

Evaluate:

- Therapeutic response: anticoagulation with PTCA, PCI; resolution of heparin-induced thrombocytopenia, thrombosis syndrome

Teach patient/family:

- About the reason for the product and expected results
- To report black, tarry stools; blood in urine; difficulty breathing
- Not to use any OTC, herbal products unless approved by prescriber
- Not to use hard-bristle toothbrush or regular razor to avoid any injury; hemorrhage may result
- **Pregnancy/breastfeeding:** Report if pregnancy is planned or suspected or if breastfeeding

⚠ HIGH ALERT

bleomycin (Rx)

(blee-oh-mye'sin)
Func. class.: Antineoplastic, antibiotic
Chem. class.: Glycopeptide

ACTION: Inhibits synthesis of DNA, RNA, protein; derived from *Streptomyces verticillus;* phase specific to the G_2 and M phases; a nonvesicant, sclerosing agent

USES: Squamous cell carcinoma of head, neck, penis, cervix, vulva; Hodgkin's/non-Hodgkin's disease; testicular carcinoma; as a sclerosing agent for malignant pleural effusion

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity
Precautions: Patients >70 yr old, renal/hepatic disease, respiratory disease, max lifetime dose 400 units, fever

Black Box Warning: Pulmonary fibrosis; requires specialized care setting, experienced clinician

DOSAGE AND ROUTES

Test dose

• **Adult/child (unlabeled): IM/IV/SUBCUT** ≤2 units for first 2 doses followed by 24 hr of observation

Non-Hodgkin's lymphoma, testicular cancer, squamous cell carcinoma

• **Adult/child: SUBCUT/IV/IM** After test dose 0.25-0.5 unit/kg 1-2×/wk or 10-20 units/m^2, then 1 unit/day or 5 units/wk; max total dose of 400 units during lifetime

Hodgkin's lymphoma

• **Adult/adolescent ≥15 yr: SUBCUT/IV/IM** After test dose 5-20 units/m^2 may be given in combination

• **Child (unlabeled): SUBCUT/IV/IM** After test dose 5-10 units/m^2 dose will vary

Malignant pleural effusion

• **Adult: BOLUS INTRAPLEURAL** 60 units as a single dose

Renal dose

• **Adult/child:** CCr 40-50 mL/min reduce dose by 30%; CCr 30-39 mL/min reduce dose by 40%; CCr 20-29 mL/min reduce dose by 45%; CCr 10-19 mL/min reduce dose by 55%; CCr 5-10 mL/min reduce dose by 60%

Available forms: Powder for injection, 15, 30 units/vial

Administer:

• Antiemetic 30-60 min prior to giving product to prevent vomiting

• Topical or systemic analgesics for pain of stomatitis as ordered; antihistamines and antipyretics for fever, chills

• May be given IM, SUBCUT, IV, intrapleurally, intralesionally, intraarterially

IM/SUBCUT route

• After reconstituting 15 units/1-5 mL or 30 units/2-10 mL of 0.9% NaCl or bacteriostatic water for injection, max concentrations 5 units/mL, rotate injection sites; do not use products that contain benzyl alcohol when giving to neonates or that contain dextrose because of loss of potency

IV route

• Use cytotoxic handling procedures

• After reconstituting 15- or 30-unit vial with 5 or 10 mL of NS, respectively, inject slowly over 10 min or, after further dilution with 50-100 mL 0.9% NaCl, give at prescribed rate

• For patients with lymphoma, give 2 test doses of 2-5 units before initial dose; monitor for anaphylaxis

• Store for 2 wk after reconstituting if refrigerated or for 24 hr at room temperature; discard unused portions

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin,

diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Pain at tumor site, headache, confusion, *fever*, chills, malaise
CV: Hypotension, peripheral vasoconstriction
GI: *Nausea, vomiting, anorexia, stomatitis, weight loss*
GU: Hemolytic-uremic syndrome
INTEG: *Rash, alopecia,* hyperpigmentation
RESP: Fibrosis, pneumonitis, wheezing, pulmonary toxicity
SYST: Anaphylaxis

PHARMACOKINETICS

Half-life 2-4 hr; when CCr is >35 mL/min, half-life is increased with lower clearance; metabolized in liver; 70% excreted in urine (unchanged) **IV, IM, SUBCUT:** Peak 30-60 min

INTERACTIONS

• Avoid live virus vaccines concurrently; adverse reactions may occur
Increase: bleomycin toxicity—cisplatin
Increase: oxygen requirements—anesthesia
Decrease: serum phenytoin levels—phenytoin, fosphenytoin; check drug level periodically
Drug/Lab Test
Increase: uric acid

NURSING CONSIDERATIONS

Assess:
• IM test dose of 1-2 units in patients with lymphoma before first 2 doses
• CBC, differential baseline and periodically, thrombocytopenia, leukopenia may occur (nadir 12 days)

Black Box Warning: Pulmonary toxicity/fibrosis: risk increases >70 yr; pulmonary function tests; chest x-ray before, during therapy, should be obtained q2wk during treatment; pulmonary diffusion capacity for carbon monoxide (DLCO) monthly, if <40% of pretreatment value, stop treatment; treat pulmonary infection before treatment; dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy, more common in the elderly, radiation therapy, pulmonary disease; usually occurs with cumulative doses >400 units

• Temperature; fever may indicate beginning infection
• Renal status: serum creatinine/BUN; CBC
• Effects of alopecia, skin color alterations on body image; discuss feelings about body changes
• Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
• Local irritation, pain, burning, discoloration at injection site
• **Anaphylaxis:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing, wheezing, hypotension; have emergency equipment available

Black Box Warning: Idiosyncratic reaction: severe reaction in those with lymphoma, hypotension, mental confusion, fever, chills, wheezing in lymphoma

Black Box Warning: Requires a specialized care setting and experienced clinician due to severe reactions

• Rinsing of mouth tid-qid with water, club soda; brushing of teeth with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
• **Pregnancy/breastfeeding:** do not use in pregnancy/breastfeeding

Evaluate:
• Therapeutic response: decrease in size of tumor

Teach patient/family:
• To report any changes in breathing, coughing, fever
• That hair may be lost during treatment and that wig or hairpiece may make patient feel better; that new hair may be different in color, texture
• To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily and report symptoms; to report decreased urination
• That continuing exams and lab work will be needed
• **Skin toxicity:** To report rash, color changes, sensitivity, irritation
• **Stomatitis:** Teach patient that mouth ulcerations, redness may occur, use soft toothbrush
• **Pregnancy/breastfeeding:** to use contraception during treatment; to avoid breastfeeding
• Not to receive vaccines during treatment

⚠ HIGH ALERT

bortezomib (Rx)

(bor-tez´oh-mib)

Velcade

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Proteasome inhibitor

ACTION: Reversible inhibitor of chymotrypsin-like activity; causes delay in tumor growth by disrupting normal homeostatic mechanisms

USES: Multiple myeloma previously untreated or when at least 2 other treatments have failed; mantle cell lymphoma in patients who have received ≥1 prior therapy

CONTRAINDICATIONS: Pregnancy, breastfeeding; hypersensitivity to product, boron, mannitol

Precautions: Children, geriatric patients, peripheral neuropathy, cardiac/hepatic disease, hypotension, tumor lysis syndrome, thrombocytopenia, infection, diabetes mellitus, bone marrow suppression, intracranial bleeding, injection site irritation

DOSAGE AND ROUTES

Multiple myeloma (previously untreated)

• **Adult: IV BOL/SUBCUT** Give for nine 6-wk cycles; cycles 1-4, 1.3 mg/m²/dose given on days 1, 4, 8, 11, then a 10-day rest period (days 12-21), then give again on days 22, 25, 29, 32, then a 10-day rest period (days 33-42); given with melphalan (9 mg/m²/day on days 1-4) and predniSONE (60 mg/m²/day on days 1-4); during cycles 5-9, give bortezomib 1.3 mg/m²/dose on days 1, 8, 22, 29 with melphalan (9 mg/m²/day on days 1-4) and predniSONE (60 mg/m²/day on days 1-4); this 6-wk cycle is

considered 1 course; at least 72 hr should elapse between consecutive doses

Mantle cell lymphoma in combination (previously untreated)

• **Adult: IV BOL/SUBCUT** 1.3 mg/m^2/dose on days 1, 4, 8, 11 followed by a 10-day rest period (days 12-21); ×6 (3-wk) cycles with rituximab 375 mg/m^2, cyclophosphamide 750 mg/m^2, DOXOrubicin 50 mg/m^2 all on day 1, and predniSONE 100 mg/m^2 daily on days 1-5, give bortezomib before rituximab

Relapsed multiple myeloma or mantle cell lymphoma

• **Adult: IV BOL/SUBCUT** 1.3 mg/m^2/2 × per wk on days 1, 4, 8, 11 followed by a 10-day rest period

Hepatic dose

• **Adult: IV** bilirubin >1.5 × ULN, reduce to 0.7 mg/m^2 during cycle 1; consider dose escalation to 1 mg/m^2 or further reduction to 0.5 mg/m^2 during next cycles based on tolerability

Available forms: Lyophilized powder for injection 3.5 mg

Administer:

• IV and SUBCUT concentrations are different

IV bolus route

• **Reconstitute** each vial with 3.5 mL of 0.9% NaCl (1 mg/mL); solution should be clear/colorless; **inject** as bolus over 3-5 sec

• Store unopened product at room temperature, protect from light

• Wear protective clothing during handling, preparation; avoid contact with skin

• Check for extravasation at injection site

SUBCUT route

• Reconstitute with 1.4 mL of NS to a final concentration of 2.5 mg/mL; if injection site reaction occurs, reconstitute vial with 3.5 mL of NS to a final concentration of 1 mg/mL or consider IV administration; use within 8 hr

• Administer calculated dose into the thigh or abdomen; rotate sites with each injection; inject at least 1 inch from old sites

• Space apart consecutive doses by at least 72 hr. Consider SUBCUT in patients with preexisting peripheral neuropathy or at high risk for the condition

SIDE EFFECTS

CNS: Posterior reversible encephalopathy syndrome (PRES), progressive multifocal leukoencephalopathy (PML), dizziness, headache, *peripheral neuropathy,* fever, headache, *fatigue, malaise, weakness*

CV: *Hypotension,* edema

GI: Abdominal pain, *constipation, diarrhea, nausea, vomiting,* anorexia, hepatotoxicity

HEMA: *Anemia,* neutropenia, thrombocytopenia

MISC: Tumor lysis syndrome

RESP: Cough, pneumonia, dyspnea

PHARMACOKINETICS

Half-life 9-15 hr, protein binding 83%, metabolized by CYP450 enzymes (3A4, 2D6, 2C19, 2C9, 1A2), onset, peak, duration unknown

INTERACTIONS

Increase: risk for bleeding—anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics

Increase: peripheral neuropathy—amiodarone, antivirals (amprenavir, atazanavir, didanosine, lamiVUDine, 3TC, ritonavir, stavudine, zidovudine), chloramphenicol, CISplatin, colchicine, cycloSPORINE, dapsone, disulfiram, DOCEtaxel, gold salts, HMG-CoA reductase inhibitors, iodoquinol, INH, metroNIDAZOLE, nitrofurantoin, oxaliplatin, PACLitaxel, penicillamine, phenytoin, sulfaSALAzine, thalidomide, vinBLAStine, vinCRIStine, zalcitabine ddc, isoniazid, statins, others

Drug/Herb

Increase: toxicity or decrease efficacy—St. John's wort

Drug/Lab

Increase: LFTs, glucose

Decrease: platelets

NURSING CONSIDERATIONS

Assess:

• VS baseline and frequently, hypotension may occur, patients who are dehydrated are at greater risk

• **GI toxicity:** nausea, vomiting, diarrhea, constipation, may require antiemetics, antidiarrheals

- **Thrombocytopenia, neutropenia:** CBC baseline and periodically, platelets before each dose, dose adjustment may be required (nadir 11 platelets)
- **Peripheral neuropathy:** discomfort, burning, stinging in extremities; may use SUBCUT in those at risk
- **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding during or for 2 mo after last dose
- **Fatal pulmonary toxicity:** assess for risk factors or new or worsening pulmonary symptoms
- **Tumor lysis syndrome:** usually in patients with a high tumor burden (hyperkalemia, hyperuricemia, hyperphosphatemia, renal failure)
- **PRES:** headache, malaise, confusion, seizures, blindness, hypertension, usually occurs within a few hours up to 1 yr after starting treatment, most symptoms do not need treatment, MRI confirms
- **PML:** for new infections of the brain

Evaluate:
- Therapeutic response: improvement of multiple myeloma symptoms

Teach patient/family:
- To monitor blood glucose levels if diabetic
- To contact prescriber about new or worsening peripheral neuropathy, severe vomiting, diarrhea, easy bruising, bleeding, infection
- To avoid driving, operating machinery until effect is known
- To avoid using other medications unless approved by prescriber
- About bleeding risk; to report bruising, bleeding
- To immediately report headache, confusion, lethargy (PRES)
- **Pregnancy/breastfeeding:** To use contraception while taking this product and for 2 mo after last dose; not to breastfeed during and for 2 mo after last dose

bosentan (Rx) REMS

(boh´sen-tan)

Tracleer

Func. class.: Vasodilator

Chem. class.: Endothelin receptor antagonist

Do not confuse:
Tracleer/Tricor

ACTION: Peripheral vasodilation occurs via the antagonism of the effect of endothelin on endothelium and vascular smooth muscle

USES: Pulmonary arterial hypertension with WHO class III, IV symptoms
Unlabeled uses: Septic shock to improve microcirculatory blood flow, functional class II pulmonary arterial hypertension

CONTRAINDICATIONS: Hypersensitivity, CVA, CAD

Black Box Warning: Pregnancy

Precautions: Breastfeeding, children, geriatric patients, mitral stenosis, anemia, edema, jaundice, hypovolemia, hypotension

Black Box Warning: Hepatic disease, requires an experienced clinician, contraceptive requirements, pregnancy testing, only those registered with the Tracleer REMS program (866-228-3546) may use this product

DOSAGE AND ROUTES

Pulmonary hypertension (pulmonary arterial hypertension WHO Group 1)
- **Adults/adolescents >40 kg: PO** tablet 62.5 mg bid × 4 wk, then increase to 125 mg bid
- **Adults/adolescents ≤40 kg: PO** tablet 62.5 mg bid

Persistent pulmonary hypertension of the newborn (PPHN) (unlabeled)
- **Premature and term neonates ≥34 wk gestation: PO** 1 mg/kg/dose bid
- **Children 21-40 kg (unlabeled): PO** tablet 62.5 mg bid
- **Infants/children 10-20 kg (unlabeled): PO** 31.25 mg daily for 4 wk
- **Infants <10 kg (unlabeled): PO** 2 mg/kg/dose bid, initiate at half of maintenance dose and increase to target dosage after 4 wk
- **Children 3-12 yr and 25-40 kg: PO** tablet for suspension 64 mg bid

• **Children 3-12 yr and 17-24 kg: PO** tablet for suspension 48 mg bid
• **Children 3-12 yr and 9-16 kg: PO** tablet for suspension 32 mg bid
• **Children 3-12 yr and 4-8 kg: PO** tablet for suspension 16 mg bid

Hepatic dose

• **Adult: PO** baseline AST/ALT <3 × ULN no dosage change, monitor LFTs monthly, reduce or interrupt if elevated; AST/ALT >3 and ≤5 × ULN repeat test, if confirmed reduce to 62.5 mg bid or interrupt; monitor LFTs q2wk, if interrupted, restart when LFTs <3 × ULN, check LFTs within 3 days; increase in AST/ALT >5 and ≤5 × ULN; during treatment repeat test to confirm, discontinue, monitor LFTs q2wk until LFTs <3 × ULN, restart at starting dose; AST/ALT >8 × ULN discontinue permanently

Available forms: Tablets 62.5, 125 mg; tablet for oral suspension 32 mg

Administer:

• Give without regard to meals
• Only available through the TAP program; 866-228-3546
• Use water to disperse tablets for oral suspension
• Do not stop product abruptly; taper
• Store at room temperature

SIDE EFFECTS

CNS: Headache, flushing, fatigue, fever
CV: Hypotension, chest pain, palpitations, edema of lower limbs, fluid retention
GI: Abnormal hepatic function, diarrhea, dyspepsia, hepatotoxicity
HEMA: Anemia, leukopenia, neutropenia, lymphopenia, thrombocytopenia
INTEG: Pruritus, anaphylaxis, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis
MISC: Oligospermia, tumor lysis syndrome, respiratory infection, arthralgia
SYST: Secondary malignancy

PHARMACOKINETICS

Metabolized by inducer of CYP2C9, CYP3A4, possibly CYP2C19; metabolized by the liver; terminal half-life 5 hr; steady-state 3-5 days

INTERACTIONS

• Do not coadminister cycloSPORINE with bosentan; bosentan is increased, cycloSPORINE is decreased
• Do not coadminister glyBURIDE with bosentan; glyBURIDE is decreased significantly, bosentan is also decreased, hepatic enzymes may be increased

Increase: bosentan effects—CYP2C9, CYP3A4 inhibitors, avoid using together
Increase: bosentan level—ketoconazole, assess for adverse reactions
Decrease: effects of warfarin, hormonal contraceptives, statins, use 2 forms of contraception if using with hormonal contraceptives

Drug/Lab Test

Black Box Warning: Increase: ALT, AST

Decrease: Hb, Hct

NURSING CONSIDERATIONS

Assess:

• **Serious skin toxicities:** angioedema occurring 8-21 days after initiating therapy
• B/P, pulse during treatment until stable
• Blood studies: Hct, HB after 1 mo, 3 mo, then every 3 mo; may be decreased
• **Pulmonary hypertension/HF:** fluid retention, weight gain, increased leg edema; may occur within weeks

Black Box Warning: Hepatic toxicity: vomiting, jaundice; product should be discontinued; hepatic studies: AST, ALT, bilirubin; hepatic enzymes may increase; if ALT/AST >3 × and ≤5 × ULN, decrease dose or interrupt treatment and monitor AST/ALT q2wk; if bilirubin >2 × ULN or signs of hepatitis or hepatic disease are present, stop treatment

Black Box Warning: Experienced clinician: must be enrolled in the Tracleer REMS program (866-228-3546) and comply with requirements

Black Box Warning: Pregnancy: perform pregnancy testing prior to and during treatment in all female patients of childbearing potential, do not use unless a negative serum or urine pregnancy test is confirmed during the first 5 days of a normal menstrual period and at least 11 days after the last unprotected sex then monthly; do not use hormonal contraceptive as sole method

• **Beers:** use with caution in older adults; syncope may be exacerbated

Evaluate:

• Therapeutic response: decrease in pulmonary hypertension

Teach patient/family:

• To report jaundice, dark urine, joint pain, fatigue, malaise, bruising, easy bleeding, fluid retention

Black Box Warning: Patient must use nonhormonal contraception during and ≥1 mo after conclusion of treatment and another method, discuss risk of low sperm count, obtain monthly pregnancy test, do not breastfeed

• That lab work will be required periodically

• To take without regard to food; not to take new meds/herbs without prescriber approval; to take in AM or PM

⚠ HIGH ALERT

bosutinib (Rx)

(boe-sue′ti-nib)

Bosulif

Func. class.: Antineoplastic biologic response modifiers

Chem. class.: Signal transduction inhibitors (STIs), tyrosine kinase inhibitor

USES: Treatment of CML (chronic accelerator phase); Philadelphia chromosome–positive patients in blast-cell crisis

Contraindications: Pregnancy, hypersensitivity

DOSAGE AND ROUTES

Newly diagnosed chronic phase PHxCML

• **Adult: PO** 400 mg daily with food, may increase to 600 mg/day in those who have not developed grade 3 toxicity or who do not reach complete hematologic response by wk 8 or complete cytogenic response (CCyR) by wk 12

Chronic accelerated or blast phase Philadelphia chromosome–positive (PH+) CML

Adult: PO 500 mg daily with food, may use escalation to 600 mg daily in those not reaching hematologic response by wk 8 or complete cytogenia response by wk 12

Hepatic dosage

• **Adult: PO** Any baseline hepatic impairment: start at 200 mg/day; liver transaminase >5 × ULN, hold dose until levels are ≤2.5 × ULN, then resume at 400 mg/day; liver transaminase level ≥3 × ULN and bilirubin >2 × ULN and alkaline phosphatase <2 × ULN, discontinue

Available forms: 100, 400, 500 mg tablets

bremelanotide injection (Rx)

(bre′me-lan′oh-tide)

Vyleesi

Func. class.: Sexual dysfunction agent

Chem. class.: Melanocortin receptor agonists

ACTION: Nonselectively activates several receptor subtypes. The mechanism is unknown. It may activate selected brain pathways involved in normal sexual responses

USES: Premenopausal women with acquired, generalized hypoactive sexual desire disorder

CONTRAINDICATIONS: Hypersensitivity, men, postmenopausal women, cardiac disease

Precautions: Pregnancy, breastfeeding, contraception requirement, geriatric, hepatic disease, hypertension, renal dysfunction, skin hyperpigmentation

DOSAGE AND ROUTES

• **Adult premenopausal women: SUBCUT** 1.75 mg as needed, at least 45 min prior to anticipated sexual activity; max: 1 dose/24 hr

Available forms: Autoinjector solution for injection 1.75 mg/0.3 mL

Administer:
SUBCUT route
• Visually inspect parenteral products for particulate matter and discoloration before use. Do not use injections that are unusually cloudy, discolored, or contain particulate; injection is clear and colorless
• Inject SUBCUT into the abdomen or thigh. Do not administer within 2 inches around the umbilicus or where the skin is tender, bruised, red, hard, thick, or scaly
• The dose is administered at least 45 min before anticipated sexual activity
• Not to be used more than 1 dose/24 hr. No more than 8 doses/mo
• Discard the used autoinjector in a sharps container after use

SIDE EFFECTS

CNS: *Flushing, headache*
INTEG: *Injection site reactions*
GI: *Nausea,* hepatitis
GU: Hot flashes
CV: Hypertension

PHARMACOKINETICS

21% binds to human serum protein, half-life 1.9-4 hr; metabolism involves multiple hydrolyses of the amide bond of the cyclic peptide; excreted 64.8% urine, 22.8% feces

INTERACTIONS

Decreased: effect of naltrexone; do not use together

NURSING CONSIDERATIONS

Assess:
• **Sexual arousal:** identify characteristics of lack of sexual arousal, length of time, other treatments administered in the past
• **Hypertension/cardiac disease:** monitor B/P before starting treatment and periodically ensure B/P is well controlled
• **Nausea/vomiting:** is a common side effect, may require an antiemetic; product may need to be discontinued for persistent or severe nausea or antiemetic therapy initiated for those patients who are bothered by nausea
• **Skin hyperpigmentation:** may be more common in those with darker skin and with daily dosing, more common on face, gingiva, and breast; may be permanent
• **Severe hepatic/renal disease (Child-Pugh C; score 10-15) or severe renal impairment (eGFR <30 mL/min/1.73 m²):** may have an increase in severity of adverse reactions
• **Pregnancy/breastfeeding:** contraception requirements are advised; females of childbearing potential should be counseled regarding appropriate methods of contraception while on therapy; discontinue if pregnancy is suspected; pregnant women are encouraged to call the Bremelanotide Pregnancy Exposure Registry at (877) 411-2510; avoid breastfeeding—no data are available regarding safety
Evaluate:
• Therapeutic response
• Sexual arousal
Teach patient/family:
• **Sexual arousal:** report if product has resolved lack of sexual arousal
• **Hypertension/cardiac disease:** teach patient that B/P will be evaluated periodically
• **Nausea/vomiting:** teach patient to report nausea and vomiting, may require an antiemetic
• **Skin hyperpigmentation:** teach patient to report skin hyperpigmentation; product may need to be discontinued
Train the patient on the use of the autoinjector, to read the manufacturer-provided instructions for use
• **Pregnancy/breastfeeding:** counsel patients on need for contraception; females of childbearing potential should be counseled regarding appropriate methods of contraception while on therapy; advise patient to discontinue if pregnancy is suspected; pregnant women are encouraged to call the Bremelanotide Pregnancy Exposure Registry at (877) 411-2510; avoid breastfeeding

⚠ HIGH ALERT

brentuximab vedotin (Rx)

(bren-tuk′see-mab)

Adcetris

Func. class.: Antineoplastic

Chem. class.: Monoclonal antibody

Controlled Substance Schedule IV

ACTION: The anticancer activity is due to the binding of tubulin and disrupts the microtubule network within the cell, inducing cell cycle arrest and apoptotic death of the cells

USES: Hodgkin's disease after failure of autologous stem cell transplant (ASCT) or after failure of at least 2 prior multiagent chemotherapy regimens in patients who are not ASCT candidates; non-Hodgkin's lymphoma (NHL); systemic anaplastic large cell lymphoma (sALCL) after failure of at least 1 prior multiagent chemotherapy regimen, previously untreated systemic ALCL or other CD30-expressing peripheral T-cell lymphoma (PTCL)

CONTRAINDICATIONS: Hypersensitivity, pregnancy

Precautions: Breastfeeding, children, infants, neonates, neutropenia, peripheral neuropathy, tumor lysis syndrome (TLS)

Black Box Warning: Progressive multifocal leukoencephalopathy

DOSAGE AND ROUTES

• **Adult: IV** 1.8 mg/kg q3wk until disease progression or unacceptable toxicity

Renal dose

• **Adult: IV** CCr <30 mL/min, avoid use

Hepatic dose

• **Adult: IV** (Child-Pugh A) 1.2 mg/kg q3wk, max 120 mg; (Child-Pugh B or C avoid use)

Available forms: Powder for injection 50 mg/vial

Administer:

Intermittent IV INFUSION route

• Visually inspect for particulate matter and discoloration whenever solution and container permit
• Only as an IV infusion, do not give as an IV push or bolus
• Use cytotoxic handling procedures
• Do not mix, or administer as an infusion, with other IV products
• Calculate the dose (mg) and the number of vials required. For patients weighing >100 kg, use 100 kg to calculate the dose; reconstitute each 50-mg vial per 10.5 mL of sterile water for injection (5 mg/mL)
• Direct the stream of sterile water toward the wall of the vial and not directly at the cake or powder; gently swirl the vial, do not shake
• Discard any unused portion left in the vial
• After reconstitution, dilute immediately with ≥100 mL of 0.9% sodium chloride, 5% dextrose, or lactated Ringer's solution to a final concentration (0.4 mg/mL-1.8 mg/mL)
• Infuse over 30 min
• Use the diluted solution immediately or store in refrigerator for ≤24 hr after reconstitution; do not freeze

SIDE EFFECTS

CNS: Headache, dizziness, *fever,* peripheral neuropathy, anxiety, chills, *fatigue,* insomnia, night sweats, progressive multifocal leukoencephalopathy

CV: Peripheral edema

GI: *Abdominal pain, nausea, vomiting,* constipation, *diarrhea,* weight loss, GI hemorrhage/perforation/obstruction

INTEG: *Rash,* pruritus, alopecia, xerosis

RESP: Pneumothorax, pneumonitis dyspnea, *cough*

SYST: Anaphylaxis, tumor lysis syndrome, Stevens-Johnson syndrome, infusion reactions, toxic epidermal necrolysis

HEMA: Anemia, neutropenia, thrombocytopenia, lymphadenopathy

PHARMACOKINETICS

Onset rapid, peak 1-3 days, duration unknown, protein binding is 68%-82%, only a small amount is metabolized; potent inhibitors or inducers of CYP3A4 may alter action; half-life is 4-6 days

INTERACTIONS

Increase: brentuximab action—CYP3A4 inhibitors, P-gp inhibitors, ketoconazole, boceprevir, delavirdine, isoniazid, indinavir, itraconazole, dalfopristin, quinupristin, telithromycin, tipranavir, rifAMPin, ritonavir

Increase: toxicity live virus vaccines

Increase: pulmonary toxicity—bleomycin; do not use together

Decrease: brentuximab action—CYP3A4 inducers

Drug/Herb

Increase: brentuximab component action—St. John's wort

Drug/Lab

Increase: ALT/AST, bilirubin

Decrease: WBC, platelets, RBCs

NURSING CONSIDERATIONS

Assess:

- **Pulmonary toxicity:** cough, trouble breathing, report immediately
- **Infection:** report immediately, fever, chills
- **Tumor lysis syndrome (TLS):** assess for hyperkalemia, hypophosphatemia, hypocalcemia; may develop renal failure; may use allopurinol or rasburicase to prevent TLS; monitor serum BUN/creatinine

Black Box Warning: Peripheral neuropathy, progressive multifocal leukoencephalopathy: assess for weakness or paralysis, vision loss, impaired speech, and cognitive deterioration; often fatal

- Monitor CBC and differential, LFTs, serum bilirubin (direct and indirect), electrolytes, uric acid, neurologic function
- **Bone marrow suppression:** monitor CBC before each dose
- **GI toxicity:** monitor for changes in bowel habits, bowel obstruction, constipation, pancreatitis
- **Anaphylaxis:** monitor for symptoms; high risk during administration
- **Stevens-Johnson syndrome:** monitor and report skin reactions or rash; discontinue if toxic epidermal necrolysis or Stevens-Johnson syndrome occurs
- **Pregnancy:** determine if pregnancy is planned or suspected; do not use in pregnancy/breastfeeding; reliable contraception should be used

Evaluate:

- Decreasing symptoms of Hodgkin's disease (decreased lymph nodes, night sweats, weight loss, splenomegaly, hepatomegaly)

Teach patient/family:

- To report immediately weakness, change in vision, impaired speech, peripheral neuropathy, neutropenia if severe, rash, change in bowel habits
- **Hepatotoxicity:** AST/ALT, bilirubin baseline and periodically; if elevated, product may need to be discontinued or decreased
- **Pulmonary toxicity:** dyspnea, cough; if these occur, product may need to be discontinued
- **Infusion site reactions:** check site frequently, if reaction occurs (redness, swelling at site), stop infusion, give antihistamines
- To use reliable contraception; not to breastfeed

brexanolone (Rx)

REMS

(brek-san′oh-lone)

Zulresso

Func. class.: Antidepressant

Chem. class.: GABA modulator

ACTION: Not fully known but thought to be related to its positive modulation of γ-aminobutyric acid A (GABA-A) receptors; GABA is a major inhibitory neurotransmitter in the brain

USES: Postpartum depression

CONTRAINDICATIONS: Hypersensitivity

Precautions: Abrupt discontinuation, driving or hazardous activities, breastfeeding, coadministration with other CNS depressants, alcohol use, hypoxia, pregnancy, renal failure, suicidal ideation

Black Box Warning: CNS depression, loss of consciousness; requires a specialized setting

DOSAGE AND ROUTES

Adult females: continuous IV: Give over a total of 60 hr (2.5 days) as follows: 0 to 4 hr: initiate with a dose of 30 mcg/kg/hr; 4 to 24 hr: increase dose to 60 mcg/kg/hr; 24 to 52 hr: increase dose to 90 mcg/kg/hr; 52 to 56 hr: decrease dose to 60 mcg/kg/hr; 56 to 60 hr: decrease dose to 30 mcg/kg/hr

Available forms: Solution for injection 100 mg/20 mL

Administer:

- The vials require dilution
- Visually inspect; vial should be clear, colorless without particulate matter and discoloration; do not use discolored vials or vials with particulate matter
- 5 infusion bags will be required for the 60-hr infusion; additional bags will be needed for those ≥90 kg
- Prepare and store in a polyolefin, non-DEHP, nonlatex bag only; do not use in-line filter
- Dilute in the infusion bag immediately after the initial puncture of the vial
- Withdraw 20 mL of product from the vial and place in the infusion bag; dilute with 40 mL of sterile water for injection, and further dilute with 40 mL of 0.9% sodium chloride injection (total volume of 100 mL) to achieve a target concentration of 1 mg/mL
- Immediately place the infusion bag in refrigerator until use
- Give as a continuous IV infusion over a total of 60 hr (2.5 days) via a dedicated line; do not inject other medications into the infusion bag or admix
- Use a programmable infusion pump, prime infusion sets with admixture prior to inserting into the pump and connecting to the venous catheter
- A health care provider must be available on site to continuously monitor
- Initiate treatment early enough during the day to allow for recognition of excessive sedation
- After the product is diluted, it can be stored in infusion bags under refrigerated conditions for up to 96 hr
- Each diluted product can be used for up to 12 hr of infusion time at room temperature; discard any unused product after 12 hr of infusion

SIDE EFFECTS

CNS: Sedation, drowsiness, loss of consciousness, suicidal ideation
CV: Tachycardia
RESP: Hypoxia
INTEG: Injection site reaction

PHARMACOKINETICS

Extensive distribution into tissues, protein binding >99%, extensively metabolized by non-CYP pathways including keto-reduction, glucuronidation, and sulfation; half-life 9 hr; excreted as metabolites in feces (47%) and urine (42%); less than 1% of the drug is excreted as unchanged

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:

- Monitor for hypoxia using continuous pulse oximetry with an alarm; if hypoxia occurs, discontinue and do not reinitiate

Black Box Warning: Assess for excessive sedation q2hr during planned, non-sleep periods, and stop the infusion if excessive sedation occurs until the symptom resolves; thereafter, the infusion may be resumed at the same or lower dose

- Available only through the Zulresso Risk Evaluation and Mitigation Strategy (Zulresso REMS) program; risks of serious adverse outcomes (excessive sedation or sudden loss/alteration of consciousness)

Black Box Warning: Requires a specialized care setting; health care settings must be certified in the REMS program; for further information, including a list of certified health care facilities, visit www.zulressorems.com or call 844-472-4379

• **Suicidal ideation:** assess for suicidal thoughts and behavior; more common in young adults

Evaluate:

• Therapeutic response: decrease in postpartum depression, improved mood

Teach patient/family:

• Reason for product and expected result

• To discuss all Rx, OTC, herbals and supplements with health care provider

• To report pain, inflammation at injection site

• **Excessive sedation and sudden loss of consciousness:** excessive sedation or loss of consciousness can occur; checking q2hr for these symptoms will be required; if these occur, tell your health care provider

• A family member or caregiver needs to help care for you and your children during the infusion

• Not to drive or engage in hazardous tasks while sleepiness occurs

• Not to use alcohol or other CNS depressants

• **Pregnancy/breastfeeding:** to identify if pregnancy is planned or suspected or if breastfeeding; if pregnant, register with the National Pregnancy Registry for Antidepressants at 844-405-6185 or visit https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/

brexpiprazole (Rx)

brex-pip′-ra-zole

Rexulti

Func. class.: Antipsychotic, atypical

ACTION: May exert its effects through a combination of partial agonist activity at dopaminergic D-2 receptors, serotonergic 5-HT1A receptors, antagonist activity at serotonergic 5-HT2A receptors

USES: Adjunctive treatment of major depressive disorder, schizophrenia

CONTRAINDICATIONS: Hypersensitivity

Precautions: Elderly patients, stroke, neuroleptic malignant syndrome, tardive dyskinesia, leukopenia, neutropenia, agranulocytosis, orthostatic hypotension, seizures, cognitive impairment

Black Box Warning: Dementia-related psychosis, suicidal ideation in children, adolescents, young adults

DOSAGE AND ROUTES

Schizophrenia

• **Adult: PO** Initially, 1 mg daily on days 1-4; increase to 2 mg daily on days 5-7, then increase to 4 mg daily on day 8 based on response and tolerability. Recommended dose range 2-4 mg/day (max: 4 mg/day)

Adjunctive treatment of major depressive disorder

• **Adult: PO** Initially, 0.5 to 1 mg daily; after titration to 1 mg/day, increase to target dose of 2 mg/day; titrate dosage at weekly intervals based on response and tolerability; max 3 mg/day

Hepatic dose

• **Adult: PO** Mild hepatic impairment: no change; moderate to severe hepatic impairment (Child-Pugh score ≥7): max 2 mg/day for major depressive disorder, 3 mg/day for schizophrenia

Renal dose

• **Adult: PO** CCr ≥60 mL/min: no change; CCr <60 mL/min, including end-stage renal disease (ESRD): max 2 mg/day for major depression, 3 mg/day for schizophrenia

Available forms: Tablets 0.25, 0.50, 1, 2, 3, 4 mg

Administer:

• Initiate treatment at low end of dosage range in geriatric adults

• Periodically reassess for need of continued maintenance therapy

• Give without regard to food
• If dose is missed, give when remembered; if close to next dose, skip missed dose and give regular dose

SIDE EFFECTS

CNS: Akathisia, fatigue, drowsiness, dizziness, tremor, sedation, insomnia, EPS
EENT: Blurred vision, dry mouth, nasopharyngitis
GI: Constipation, diarrhea, nausea, flatulence, abdominal cramping/pain
GU: UTI
MISC: Weight gain, myalgia

PHARMACOKINETICS

Half-life 91 hr, onset unknown, peak 4 hr, duration unknown

INTERACTIONS

Increase: temperature—anticholinergics
Increase: CNS depression—other CNS depressants, use cautiously
Increase: brexpiprazole effect—strong CYP2D6 inhibitors, strong CYP3A4 inhibitors, may need dose reduction

Drug/Herb:
Decrease: brexpiprazole effect—St. John's wort; may need to increase product dose

Drug/Food:
Increase: brexpiprazole effect—grapefruit juice; avoid using together

NURSING CONSIDERATIONS

Assess:
• **Hypersensitivity:** rash, facial swelling, urticaria, and anaphylaxis have been observed; discontinue immediately

Black Box Warning: Suicidal ideation: provide close supervision and control; give the smallest quantity to reduce the risk of overdose. In those who exhibit changes in symptoms, worsening of depression, suicidality, or other changes in mood or behavior, a decision should be made to change or discontinue treatment. If discontinuing, taper as rapidly as possible, abrupt discontinuation of drug can cause adverse symptoms. Children and young adults <24 yr are at increased risk

• **Tardive dyskinesia:** periodic evaluation for movement disorders (AIMS) is recommended. If signs and symptoms of tardive dyskinesia appear, consider discontinuation
• **Seizure disorder:** use cautiously in patients with history of seizure disorder or with conditions that may lower the seizure threshold. Conditions that lower the seizure threshold may be more prevalent in patients 65 yr or older
• **Orthostatic hypotension:** dizziness, light headedness, tachycardia, and occasionally syncope. Risks are generally greatest at beginning of treatment and during dose escalation. Patients at higher risk include those with dehydration, hypovolemia, treatment with antihypertensive medications, history of cardiac disease (HF, MI, CAD, ischemia, or conduction abnormalities), history of cerebrovascular disease, and patients who are antipsychotic-naive. Monitor orthostatic vital signs, such as pulse and B/P. Complete fall risk assessments in at-risk patients on long-term antipsychotic therapy
• **Hematologic disease:** those with a history of clinically significant low WBC count or drug-induced leukopenia/neutropenia should have frequent CBC assessments in first few months of treatment. Discontinue in patients with ANC $<1000/mm^3$
• **Pregnancy/breastfeeding:** use only when benefits outweigh fetal risks. Neonates exposed to antipsychotics in the third trimester of pregnancy are at risk for extrapyramidal and/or withdrawal symptoms after delivery. Enroll patient in National Pregnancy Registry for Psychiatric Medications (866-961-2388). Consider benefits/risks of breastfeeding

Teach patient/family:
• To use caution when driving or operating machinery or performing other tasks that require mental alertness until the effects are known
• To avoid ethanol ingestion during treatment. Somnolence could lead to falls with the potential for fractures and other injuries

• To watch for suicidal behaviors or thoughts by family or impulsive urges
• That dystonic reactions may occur
• To rise slowly from sitting or lying, orthostatic hypotension may occur
• To report if pregnancy is planned or suspected or if breastfeeding
• To report all products taken to prevent drug interactions

⚠ HIGH ALERT

brigatinib (Rx)

(bri-ga′-ti-nib)

Alunbrig

Func. class.: Antineoplastic

USES: Advanced ALK-positive metastatic non–small-cell lung cancer who have progressed on or are intolerant to crizotinib

DOSAGE AND ROUTES

• **Adult: PO** 90 mg/day × 7 days; if tolerated during the first 7 days, increase to 180 mg/day. Continue until disease progression or unacceptable toxicity

Available forms: Tablets 30, 90, 180 mg

brimonidine (ophthalmic) (Rx)

(bri-moe′ni-deen)

Alphagan P, Lumify, Mirvaso, Qoliana

Func. class.: Antiglaucoma

Chem. class.: Selective α_2 agonist

Do not confuse:
brimonidine/bimatoprost

ACTION: Select α-agonist that decreases aqueous humor and increases outflows

USES: Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS: Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome, within 14 days of MAOI therapy

Precautions: Breastfeeding, depression, cerebrovascular disease, hepatic/renal impairment, Raynaud's phenomenon, orthostatic hypotension, thromboangiitis obliterans

DOSAGE AND ROUTES

Reduce IOP/ocular HNT or open-angle glaucoma

• **Adult/child >2 yr:** Instill 1 drop in the affected eye(s) tid

Persistent erythmea of rosacea (Mirvaso)

Adult: Gel Apply pea-size amount of several areas of the face daily

Redness in eye from irritation

Adult/child ≥5 yr: Opthalmic solution 1 drop in affected eye q6-8h, no more than qid

Available forms: Ophthalmic solution 0.1%, 0.15%, 0.2%

SIDE EFFECTS

RESP: Cough, dyspnea, bronchitis, pharyngitis
CNS: Headache, dizziness, somnolence
CV: Hyper/hypotension, hypercholesterolemia
EENT: Eye stinging/burning, tearing, photophobia, change in vision, sinus infection, blurred vision, pruritus, photophobia, eyelid erythema, ocular pain, nasal dryness

PHARMACOKINETICS

Peak $^1/_2$-2 hr, half-life 2 hr

INTERACTIONS

Increase: intraocular pressure reduction—apraclonidine, dorzolamide, pilocarpine, timolol
Increase: effects of—CNS depressants
Decrease: B/P—beta-blockers, antihypertensives
Decrease: brimonidine effect—tricyclic antidepressants, may cause HTN crisis MAOIs, linezolid

NURSING CONSIDERATIONS

Assess:

- Glaucoma: monitor intraocular pressure
- Redness, flushing, whitening after gel, will resolve after discontinuation, do not use gel on wounds

Evaluate:

- Decreasing intraocular pressure

Teach patient/family:

- That drug is for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination
- Not to use alcohol
- To wait 15 min before inserting soft contact lenses
- To avoid hazardous activities until response is known
- To wash hands prior to and after use; to teach proper use
- That if more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart
- To avoid contamination or the spread of infection by not using dropper for more than one person

brinzolamide ophthalmic

See Appendix B

brivaracetam (Rx)

(briv-a-ra′se-tam)

Briviact

Func. class.: Anticonvulsant

Controlled Substance V

ACTION: The exact mechanism is not known, may occur in modulation of synaptic vesicle proteins; additional anticonvulsant activity may be related to the modulation of voltage-dependent sodium channels

USES: For the adjunctive treatment of partial seizures

CONTRAINDICATIONS: Hypersensitivity

Precautions: Abrupt discontinuation, breastfeeding, depression, driving or operating machinery, geriatric patients, hepatic disease, pregnancy, suicidal ideation

DOSAGE AND ROUTES

- **Adult/adolescent ≥16: PO/IV** 50 mg bid. Adjust dose to 25 mg bid or 100 mg bid based on clinical response; max 100 mg bid. Use **IV** when **PO** is temporarily not feasible
- **Child/adolescent 4-15 yr and ≥50 kg: PO** 25-50 mg bid. Child maintenance dosing for 20-49 kg is 0.5–2 mg/kg/dose twice daily. Initial dosing as listed is correct.

Child maintenance dosing for 11–19 kg is 0.5–2.5 mg/kg/dose twice daily. Initial dosing should be 0.5–1.25 mg/kg/dose twice daily.

- **Child/adolescent 4-15 yr and 20-49 kg: PO** 0.5-1 mg/kg/dose bid; maintenance 0.5–2mg/kg/dose twice daily
- **Child/adolescent 4-12 yr and 11-19 kg: PO** 0.5-1.25 mg/kg/dose bid; maintenance 0.5–2.5mg/kg/dose twice daily; max 5 mg/kg/day

With rifampin use: Adult/child: Increase brivaractan by up to double dose

Available forms:

- Tablets 10, 25, 50, 75, 100; oral solution 10 mg/mL; solution for injection 50 mg/5 mL (10 mg/mL), single-dose vial

Administer:

- May be administered without regard to meals
- To discontinue, gradually reduce the dose to minimize the risk for increased seizure frequency and status epilepticus

Tablets:

- Swallow tablets whole; do not crush or chew

Oral solution:

- No dilution is necessary
- Measure and administer oral solution using a calibrated measuring device
- A nasogastric tube or gastrostomy tube may be used for administration
- **Storage:** discard any unused solution 5 mo after first opening the bottle

IV screens

- Visually inspect, do not use if discoloration or particulate matter is present; injection is a clear, colorless solution
- May be given IV without further dilution or may be mixed with a diluent, including 0.9% NaCl injection, LR injection, or D_5 injection
- Infuse over 2 to 15 min
- **Storage:** after dilution, the solution may be stored ≤4 hr at room temperature and may be stored in polyvinyl chloride (PVC) bags; discard any unused injection vial contents; for single dose only

SIDE EFFECTS

CNS: Dizziness, drowsiness, ataxia, euphoria, fatigue, irritability, depression, emotional lability, hallucinations, psychosis, suicidal ideation

GI: Constipation, nausea, vomiting

HEMA: Leukopenia

INTEG: Angioedema, infusion site pain

RESP: Bronchospasm

PHARMACOKINETICS

Protein binding 20%, primarily metabolized by hydrolysis to form a hydroxy metabolite, metabolized by CYP2C19, excreted in urine, feces <1%, half-life 9 hr, all forms may be used interchangeably, peak 1 hr without food, high-fat meal slows absorption

INTERACTIONS

Increase: sedation—TCAs, antihistamines, benzodiazepines, other CNS depressants

Increase: possible toxicity—carBAMazepine

Decrease: brivaracetam absorption—sevelamer

Drug/Lab Test:

Increase: LFTs

Decrease: Hct/HB, WBC, RBC

NURSING CONSIDERATIONS

Assess:

- **Seizures:** type, location, duration, character; provide seizure precautions
- **Renal studies:** urinalysis, BUN, urine creatinine q3mo
- **Blood studies:** CBC, LFTs
- **Mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber
- Assistance with ambulation during early part of treatment; dizziness, drowsiness occurs, sedation
- **Hypersensitivity:** Angioedema, product should be discontinued immediately, treat
- **DRESS:** Rash, hepatitis, fever, eosinophilia, discontinue immediately, treat
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; pregnant patients should be registered at the North American Antiepileptic Drug Pregnancy Registry (888-233-2334); discontinue breastfeeding or product; excretion is unknown

Evaluate:

- Therapeutic response: decreased seizure activity

Teach patient/family:

- To carry emergency ID stating patient's name, medications taken, condition, prescriber's name and phone number
- How to use oral solution, use calibrated device to measure
- To notify prescriber if pregnancy is planned or suspected
- To avoid driving, other activities requiring alertness until response is known; drowsiness occurs when beginning therapy
- To obtain medical care immediately for angioedema, bronchospasm
- Not to discontinue quickly after long-term use; withdrawal seizure may occur; date bottle, throw away oral solution after 5 mo
- Not to breastfeed; to notify prescriber immediately if pregnancy is planned or suspected
- To report immediately suicidal thoughts/behaviors, psychotic symptoms (hallucination, delusions, or unusual behaviors)

brodalumab (Rx) REMS

(broe-dal'-ue-mab)

Siliq

Func. class.: Immunosuppressive

Chem. class.: Recombinant human IgG2 monoclonal antibody

Do not confuse:
Siliq/Actiq

ACTION: Human IgG2 monoclonal antibody that binds to interleukin-17 receptor A (IL-17RA) and prevents IL-17 cytokines from activating the receptor

USES: For the treatment of moderate to severe plaque psoriasis in adult patients who are candidates for phototherapy or systemic therapy and who have failed to respond or have lost response to other systemic therapies

CONTRAINDICATIONS: Hypersensitivity, Crohn's disease
Precautions: Pregnancy, breastfeeding, children, depression, geriatric patients, immunosuppression, infection, suicidal ideation, vaccination

Black Box Warning: Suicidal ideation

DOSAGE AND ROUTES

- **Adult: SUBCUT** 210 mg at wk 0, 1, and 2, then 210 mg q2wk; discontinue if inadequate response after 12-16 wk
- **Available forms:** Prefilled syringe 210 mg/1.5 mL

Administer:
SUBCUT route
- Remove prefilled syringe from refrigerator and allow to reach room temperature (about 30 min) without removing the needle cap; once brought to room temperature, do not return to the refrigerator
- If needed, the prefilled syringe may be stored at room temperature for up to 14 days
- Discard after 14 days
- Do not shake
- Visually inspect for particulate matter and discoloration; do not use if discolored, cloudy, or foreign particulate matter is present
- Do not use where skin is tender, bruised, red, hard, thick, scaly, or affected by psoriasis
- Each single-use prefilled syringe contains 210 mg/1.5 mL of product. Inject the entire 1.5 mL contents of the syringe. No preservatives are present; discard unused portion
- Protect from light, do not freeze

Black Box Warning: The drug is available only through a restricted program (Siliq Risk Evaluation and Mitigation Strategy [REMS] Program). Prescribers must be certified in the program. Patients must sign a patient-prescriber agreement form. For information, visit the Siliq REMS website or call 855-511-6135

SIDE EFFECTS

CNS: Headache, fatigue, suicidal ideation
EENT: Sinusitis
GI: Nausea, diarrhea
MS: Arthralgia
INTEG: Erythema, pruritus
HEMA: Bleeding, neutropenia
MISC: Infection, injection site reactions, antibody formation, pharyngitis, TB

PHARMACOKINETICS

Onset unknown, peak 3 days, duration unknown, half-life unknown

INTERACTIONS

- **Increase:** altered effect of each product—CYP450 enzymes (carBAMazepine, cyclosporine, ethosuximide, fosphenytoin, phenytoin, tacrolimus, theophylline, aminophylline, warfarin); monitor if products are initiated or discontinued; dose adjustments may be needed
- Do not give concurrently with live virus vaccines; bring immunizations up-to-date before treatment

Drug/Lab
Decrease: ANC

NURSING CONSIDERATIONS

Assess:
- For injection site pain, swelling, redness; use cold compress to relieve pain/swelling

• **Infection:** fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds; stop treatment if present; serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product
• **TB:** test for TB before starting product; do not use in active TB; for latent TB, give antituberculosis therapy before use of product; monitor closely for signs and symptoms of active TB infection during and after treatment
• **Pregnancy/breastfeeding:** no data for use in pregnancy, breastfeeding; excretion in breast milk unknown

Black Box Warning: Suicidal ideation: assess risks and benefits of treatment when considering use in those with a history of depression or psychosis

Evaluate:
• Therapeutic response: decrease in lesions
Teach patient/family:
• About self-administration if appropriate: injection should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard; not to use if dropped on hard surface, use new syringe
• That if medication is not taken when due, to inject dose as soon as remembered and inject the next dose as scheduled
• Not to take any live virus vaccines during treatment
• To report signs of infection (fever, sweats, or chills; muscle aches; weight loss; cough; warm, red, or painful skin or sores on the body different from psoriasis; diarrhea or stomach pain; shortness of breath; blood in phlegm [mucus]; burning in urination or urinating more often than normal); allergic reactions (itching, rash)
• To tell provider of all prescription and OTC medications, herbals, and supplements currently taken
• That a patient-prescriber agreement form is required to be signed

Black Box Warning: Suicidal ideation: to seek medical attention for suicidal ideation, new-onset or worsening depression, anxiety, or other mood changes

brolucizumab-dbll (Rx)

(broe-lue-siz′-ue-mab-dbll)

Beovu

Func. class.: Ophthalmic agent
Chem. class.: VEGF inhibitor

ACTION:

Binds to VEGF, suppresses endothelial cell proliferation, neovascularization, and vascular permeability

USES:

Neovascular (wet) age-related macular degeneration

CONTRAINDICATIONS

Ocular/periocular infections, active intraocular inflammation, hypersensitivity
Precautions: Endophthalmitis, retinal detachment, retinal vasculitis and/or retinal vascular occlusion, increased IOP, arterial thromboembolic events

DOSAGE AND ROUTES

• **Adult: Intravitreal injection** 6 mg (0.05 mL of 120 mg/mL solution) monthly × 3 doses, then 6 mg (0.05 mL) q8-12wk
Available forms: Intravitreal injection: 6 mg/0.05 mL solution single-dose vial
Administer:
• Given by ophthalmologist
• Inspect solution for discoloration or particulate matter, do not use if present
• Vial is for single use, discard unused portion
• Refrigerate vial, do not freeze. Store the vial in the outer carton to protect from light; before use, the unopened glass vial may be kept at room temperature for ≤24 hr

SIDE EFFECTS

EENT: Blurred vision, cataract, conjunc-

tival hemorrhage, eye pain, floaters

PHARMACOKINETICS
Onset, duration unknown, peak 24 hr, half-life 4.4 days

INTERACTIONS
None known

NURSING CONSIDERATIONS
Assess:
- Monitor IOP for 30 min after injection
- Assess for arterial thromboembolic events after injection
- **Pregnancy/breastfeeding:** Not to use in pregnancy, use contraception if woman is of childbearing potential; not to breastfeed during or for 1 mo after conclusion of treatment

Evaluate:
- Therapeutic response: Prevention of loss of sight

Teach patient/family:
- Inform patients that after injection endophthalmitis, retinal detachment, retinal vasculitis, retinal vascular occlusion may occur; if the eye becomes red, sensitive to light, painful, or change in vision occurs, immediately contact ophthalmologist
- Teach patients that temporary visual disturbances may occur after injection
- Advise patients not to drive or use machinery until reaction is known

bromfenac (ophthalmic) (Rx)
(brom′fen-ak)
BromSite, Prolensa, Xibrom
Func. class.: Antiinflammatory (ophthalmic)

USES: To reduce pain and inflammation after cataract surgery

CONTRAINDICATIONS: Hypersensitivity to this product, sulfites, NSAIDs, salicylates
Precautions: Bleeding disorders, complicated ocular surgery, corneal denervation, diabetes mellitus, rheumatoid arthritis, dry eye syndrome, pregnancy, breastfeeding
Do not administer while wearing contact lenses

DOSAGE AND ROUTES
- **Adult:** Instill 1 drop into affected eye twice daily (0.07%), daily (0.09%) beginning 24 hr prior to cataract surgery, continued on the day of surgery and through the first 14 days of the postoperative period

Available forms: Opthalmic solution 0.07%, 0.075%, 0.09%

⚠ HIGH ALERT

bromocriptine (Rx)
(broe-moe-krip′teen)
Cycloset, Parlodel
Func. class.: Antiparkinson agent
Chem. class.: Dopamine receptor agonist

Do not confuse:
Parlodel/pindolol/
bromocriptine/benztropine/brimonidine

ACTION: Inhibits prolactin release by activating postsynaptic dopamine receptors; activation of striatal dopamine receptors may be reason for improvement in Parkinson's disease

USES: Parkinson's disease, amenorrhea/galactorrhea caused by hyperprolactinemia, infertility, acromegaly, pituitary adenomas, adjunct for type 2 diabetes
Unlabeled uses: Neuroleptic malignant syndrome, mastalgia

CONTRAINDICATIONS: Basilar migraine, hemiplegic migraine, breastfeeding, uncontrolled hypertension, severe peripheral vascular disease; hypersensitivity to ergot, bromocriptine; preeclampsia/eclampsia
Precautions: Pregnancy, breastfeeding, children, renal/hepatic disease, pituitary tumors, peptic ulcer disease, sulfite hypersensitivity, pulmonary fibrosis, dementia, GI bleeding, bipolar disorder, abrupt

discontinuation, acute MI, angina, type 1 diabetes mellitus

DOSAGE AND ROUTES

Parkinson's disease (not Cycloset)

• **Adult: PO** 1.25 mg bid with meals; may increase q2-4wk by 2.5 mg/day, max 100 mg/day; levodopa should be continued while bromocriptine is being instituted

Amenorrhea/galactorrhea from hyperprolactinemia; hypogonadism, infertility (not Cycloset)

• **Adult, adolescent ≥16 yr: PO** 1.25-2.5 mg with meals; may increase by 2.5 mg q3-7days, usual range 2.5-15 mg/day, max 30 mg/day

• **Child 11-15 yr: PO** 1.25-2.5 mg daily

Acromegaly (not Cycloset)

• **Adult: PO** 1.25-2.5 mg at bedtime; may increase by 1.25-2.5 mg q3-7days; usual range 20-30 mg/day, max 100 mg/day

Pituitary adenoma (not Cycloset)

• **Adult/adolescent ≥16 yr: PO** 1.25 mg bid-tid; may increase over several weeks to 10-20 mg/day

Type 2 diabetes (Cycloset only)

• **Adult: PO** (initially) 0.8 mg daily in AM within 2 hr of waking; titrate by 0.8 mg/day no more than weekly to max 1.6-4.8 mg/day

• **CYP3A4 inhibitors:** max 1.6 mg daily if used with moderate inhibitors

Available forms: Capsules 5 mg; tablets 2.5 mg (Parodel), 0.8 mg (Cycloset)

Administer:

• With meal to prevent GI symptoms; Cycloset: give with food in AM within 2 hr of waking

• At bedtime so dizziness, orthostatic hypotension do not occur

• Store at room temperature in tight, light-resistant container

SIDE EFFECTS

CNS: *Headache,* depression, restlessness, anxiety, nervousness, confusion, seizures, *hallucinations,* dizziness, fatigue, drowsiness, abnormal involuntary movements, psychosis, weakness

CV: Orthostatic hypotension, decreased B/P, palpitations, extrasystole, shock, dysrhythmias, bradycardia, MI

EENT: Blurred vision, diplopia, burning eyes, nasal congestion

GI: *Nausea, vomiting, anorexia,* cramps, constipation, diarrhea, dry mouth, GI hemorrhage

GU: Frequency, retention, incontinence, diuresis

INTEG: *Rash on face, arms;* alopecia; coolness, pallor of fingers, toes; peripheral edema

META: Hypoglycemia

PHARMACOKINETICS

Onset 2 hr, peak 1-3 hr, duration 4-8 hr, 90%-96% protein bound, half-life 3 hr, metabolized by liver (inactive metabolites), 85%-98% excreted in feces, >90% undergoes first-pass metabolism

INTERACTIONS

• Disulfiram-like reaction: alcohol

Increase: action of antihypertensives, levodopa, chloramphenicol, probenecid, salicylates, sulfonamides; dose of both products may need to be adjusted

Decrease: action of bromocriptine—phenothiazines, oral contraceptives, progestins, estrogens, haloperidol, loxapine, methyldopa, metoclopramide, MAOIs, reserpine; dose may need to be decreased

Decrease/increase: effect of Cycloset—CYP3A4 inhibitors/inducers; use cautiously

Decrease: effect of Cycloset—butyrophenones, metoclopramide, phenothiazine, thioxanthenes; avoid concurrent use

Drug/Lab Test

Increase: growth hormone, AST, ALT, CK, BUN, uric acid, alkaline phosphatase

NURSING CONSIDERATIONS

Assess:

• B/P; establish baseline, compare with other readings; this product decreases B/P and causes orthostatic hypotension; obtain chest x-ray baseline

• **Monitor for reactions that usually occur at start of treatment (nausea, dizziness, orthostatic hypotension)**

• **Parkinson's symptoms:** pill rolling, shuffling gait, restlessness, tremors, postural instability before and during treatment

• **Neuroleptic malignant syndrome:** decrease in temperature and sweating, lower pulse rate, and lessening of seizures indicate resolution of symptoms
• Change in size of soft tissue volume with acromegaly
• **CNS symptoms:** CNS depression, hallucinations, vertigo; report symptoms immediately
• **Pregnancy:** fertility may occur before onset of menses after pregnancy; use pregnancy testing q4wk or if menstruation does not occur, use alternative contraceptive methods other than oral contraceptives/subdermal implants during treatment; do not use in breastfeeding

Evaluate:
• Therapeutic response (Parkinson's disease): decreased dyskinesia, drooling, spasm, rigidity

Teach patient/family:
• That tablets may be crushed, mixed with food; Cycloset to be taken within 2 hr of rising; that 8 wk are needed for full effect
• To change position slowly to prevent orthostatic hypotension
• To use contraceptives during treatment with this product; that pregnancy may occur; to use methods other than oral contraceptives/subdermal implants
• That therapeutic effect for Parkinson's disease may take 2 mo, titrate slowly
• To avoid hazardous activity if dizziness occurs
• To report symptoms of MI immediately
• To take with food, avoid alcohol

budesonide (Rx)

(byoo-des'oh-nide)

Inhalation

Pulmicort Respules, Pulmicort Flexhaler

Nasal

Rhinocort Allergy

Systemic

Entocort EC, Tarpeyo, Uceris

Func. class.: Glucocorticoid
Chem. class.: Nonhalogenated

ACTION: Prevents inflammation by depressing migration of polymorphonuclear leukocytes and fibroblasts, reversal of increased capillary permeability, and lysosomal stabilization; does not suppress hypothalamus or pituitary function

USES: Rhinitis; prophylaxis for asthma; Crohn's disease, ulcerative colitis, nasal polyps
Unlabeled uses: Microscopic colitis, laryngotracheobronchitis (croup)

CONTRAINDICATIONS: Hypersensitivity, status asthmaticus, acute bronchospasm
Precautions: Pregnancy, breastfeeding; children; TB; fungal, bacterial, systemic viral infections; ocular herpes simplex; nasal septal ulcers; hepatic disease, diabetes, GI disease, increased intraocular pressure

DOSAGE AND ROUTES

Rhinitis
• **Adult and child >12 yr: SPRAY/INH** 2 sprays in each nostril AM, PM or 4 sprays in each nostril AM

Asthma
• **Adult: INH** 360 mcg bid, max 720 mcg bid
• **Child 1-8 yr previously taking bronchodilator alone: NEB** (Respules) 0.5 mg daily or 0.25 mg bid; suspension via jet nebulizer, max 0.5 mg daily; previously using inhaled corticosteroid 0.5 mg daily or 0.25 mg bid suspension via jet nebulizer, max 0.5 mg bid

Crohn's disease/ulcerative colitis (Uceris)
• **Adult: PO** 9 mg/day AM × 8 wk

Primary nephropathy (Tarpeyo)
• **Adult: PO** 16 mg daily

Laryngotracheobronchitis (croup) (unlabeled)
• **Infant ≥3 mo-child ≤5 yr: NEB** (Pulmicort Respules INH suspension) 2 mg inhaled as a single dose

Available forms: Dry powder for INH 90, 100 🍁, 180, 200, 400 🍁; 32 mcg/actuation (Rhinocort Aqua) nasal spray; suspension for INH 0.5 mg/2 mL, 0.25 mg/2 mL; capsule 3 mg; extended-release tablet

(Uceris) 9 mg, rectal foam 2 mg/actuation; delayed-release capsule 4 mg

Administer:

PO route (Crohn's disease/ulcerative colitis)

- Swallow capsules whole; do not break, crush, chew; take in AM
- May repeat 8-wk course if needed; may taper to 6 mg/day for 2 wk before cessation
- Store at 59°F-86°F (15°C-30°C); keep away from heat, open flame

Rectal foam route

- Product is flammable, may use before bedtime, applicators are single use only

Inhalation route

- Prime inhaler before initial use only. Do not shake; do not use with spacer. After inhalation, rinse and spit with water

Nasal route

- Shake gently before use
- Prime by actuating 8 times before initial use
- Reprime if not used for 2 consecutive days. If not used for 14 days, rinse the applicator and reprime until a fine mist appears

SIDE EFFECTS

CNS: *Headache,* insomnia, hypertonia, syncope, dizziness, drowsiness

CV: Chest pain, hypertension, sinus tachycardia, palpitation

EENT: *Sinusitis, pharyngitis,* rhinitis, oral candidiasis

ENDO: Adrenal insufficiency, growth suppression in children

GI: Dry mouth, dyspepsia, nausea, vomiting, abdominal pain

MISC: Ecchymosis, fever, *hypersensitivity,* flulike symptoms, epistaxis, dysuria

MS: Back pain, myalgias, fractures

RESP: Nasal irritation, cough, nasal bleeding, *respiratory infections,* bronchospasm

PHARMACOKINETICS

Peak: Respules 4-6 wk, Rhinocort Aqua 2 wk, half-life 2-3.6 hr

Onset: Respules 2-8 days, Rhinocort Aqua 10 hr

Enters breast milk

INTERACTIONS

Increase: budesonide effect—CYP3A inhibitors; dose adjustment may be needed

- Avoid concurrent use of varicella live vaccine in pediatric patients

NURSING CONSIDERATIONS

Assess:

- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease thickness of secretions; check for oral candidiasis
- **Bronchospasm:** stop treatment, give bronchodilator
- **Crohn's disease/ulcerative colitis:** assess for improvement in symptoms, decreased stools, abdominal cramps, urgency
- **HPA axis suppression:** do not stop abruptly, taper
- Viral infections: corticosteroid use can mask infections
- Increased intraocular pressure: discontinue use if this occurs
- **Beers:** avoid in older adults; high risk of delirium
- **Pregnancy/breastfeeding:** fetal harm appears remote; excreted in breast milk; consider risk factors in continuing breastfeeding

Evaluate:

- Therapeutic response: absence of asthma, rhinitis

Teach patient/family:

- To notify prescriber of pharyngitis, nasal bleeding, oral candidiasis
- Not to exceed recommended dose because adrenal suppression may occur
- To carry emergency ID that identifies steroid use
- To read and follow package directions
- To prevent exposure to infections (especially viral)
- To use good oral hygiene if using nebulizer or inhaler
- To avoid breastfeeding
- That burning or stinging may occur with first few doses of inhalation use
- That product is not a bronchodilator and not to be used for asthma; to use regularly

- How to use as described in "Administer"
- To notify prescriber if symptoms persist after weeks, that results usually take 2 wk
- To notify prescriber if exposure to measles, chickenpox occurs

bumetanide (Rx)

(byoo-met'a-nide)

Bumex, Burinex

Func. class.: Loop diuretic, antihypertensive

Chem. class.: Sulfonamide derivative

ACTION: Acts on ascending loop of Henle by inhibiting reabsorption of chloride, sodium

USES: Edema in heart failure, renal disease, hepatic disease

CONTRAINDICATIONS: Hypersensitivity to sulfonamides, anuria, hepatic coma

Black Box Warning: Fluid and electrolyte depletion

Precautions: Pregnancy, breastfeeding, neonates, ascites, severe renal disease, hepatic cirrhosis, blood dyscrasias, ototoxicity, hyperuricemia, hypokalemia, hyperglycemia, oliguria, hypomagnesemia, hypovolemia

Black Box Warning: Dehydration

DOSAGE AND ROUTES

- **Adult and adolescent: PO** 0.5-2 mg/day; **IV/IM** 0.5-1 mg; may give second or third dose at 2-3 hr intervals, not to exceed 10 mg/day
- **Child and infant (unlabeled): PO/IM/IV** 0.015-0.1 mg/kg dose q6-24hr, max 10 mg/day
- **Neonates (unlabeled): PO/IM/IV** 0.01-0.05 kg/dose q12-24hr

Available forms: Tablets 0.5, 1, 2, 5 mg; injection 0.25 mg/mL

PO route

- Use in AM to prevent nocturia
- Without regard to food

IV, direct route

- Direct IV undiluted slowly over 1-2 min through Y-tube, 3-way stopcock, or hep-lock

Intermittent IV INFUSION route

- Dilute in LR, D_5W, 0.9% NaCl (rarely given by this method), give over 12 hr with renal disease; give at 4 mg/min or less, use infusion pump, protect from light

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amoxicillin, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin,

micafungin, miconazole, milrinone, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, rifampin, ritodrine, riTUXimab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, traMADol, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Headache,* fatigue, weakness, *dizziness, encephalopathy*
CV: *Hypotension,* ECG changes, dehydration
EENT: *Loss of hearing*
ELECT: *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia*
ENDO: *Hyperglycemia*
GI: Dry mouth, upset stomach, vomiting, diarrhea, nausea
GU: *Polyuria,* glycosuria
INTEG: *Rash, pruritus*
MS: *Myalgia, arthralgia*

PHARMACOKINETICS

Excreted by kidneys (50% unchanged), feces (20%); crosses placenta; excreted in breast milk; protein binding >72%; half-life 1-1½ hr
PO: Onset ½-1 hr, peak 1-2 hr, duration 3-6 hr
IM: Onset 40 min, peak 1-2 hr, duration 4-6 hr
IV: Onset 5 min, peak 15-30 min, duration 3-6 hr

INTERACTIONS

Increase: ototoxicity—aminoglycosides, avoid concurrent use
Increase: hypokalemia—corticosteroids, diuretics, laxatives (stimulants); monitor closely
Increase: diuresis—other diuretics, monitor for dehydration and electrolyte imbalances
Increase: toxicity—lithium, digoxin, monitor levels of each
Increase: hypotension, antihypertensives, nitrates
Decrease: diuretic effect—NSAIDs, monitor carefully
Decrease: antidiabetic effects—antidiabetics, monitor glucose

Drug/Herb

Increase: effect—hawthorn, horse chestnut, avoid using together
Decrease: effect of bumetanide—ginseng, ephedra

Drug/Lab

Increase: glucose
Decrease: chloride, potassium, sodium, calcium, phosphorus

NURSING CONSIDERATIONS

Assess

• For tinnitus, hearing loss, ear pain; obtain audiometric testing for long-term IV treatment

Black Box Warning: Dehydration: weight, I&O daily to determine fluid loss; if urinary output decreases or azotemia occurs, product should be discontinued; safest dosage schedule is alternate days

• B/P lying, standing; postural hypotension may occur

Black Box Warning: Fluid and electrolyte depletion: potassium, sodium, calcium; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, calcium, magnesium; severe electrolyte depletion should be corrected before starting treatment

• Blood glucose if patient is diabetic; blood uric acid levels in those with gout
• Improvement in edema of feet, legs, sacral area daily if medication is being used for HF
• Signs of metabolic alkalosis: drowsiness, restlessness
• **Hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness
• Rashes, temperature elevation daily
• Confusion, especially in geriatric patients; take safety precautions if needed
• **Digoxin toxicity** in patients taking digoxin products: anorexia, nausea, vomiting, confusion, paresthesia, muscle cramps; **lithium toxicity** in those taking lithium
• **Beers:** use cautiously in older adults; may cause or exacerbate syndrome of inappropriate antidiuretic hormone secretion

Evaluate:
• Therapeutic response: decreased edema, B/P

Teach patient/family:
• To increase fluid intake to 2-3 L/day unless contraindicated; to take potassium supplement; to rise slowly from lying or sitting position
• To recognize adverse reactions: muscle cramps, weakness, nausea, dizziness, edema, weight gain
• To take with food, milk for GI symptoms; to avoid alcohol
• To take early in day to prevent nocturia; if another dose is needed, take after noon, not to double or miss dose
• To take B/P, pulse, weight weekly
• That orthostatic hypotension may occur, to avoid rising rapidly
• To continue other medical regimens
• That continuing exams and blood work will be needed
• To notify other health care professionals of condition being treated, medications taken
• **Pregnancy/breastfeeding:** To report if pregnancy is planned or suspected or if breastfeeding

TREATMENT OF OVERDOSE:
Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

⚠ HIGH ALERT

buprenorphine (Rx)
REMS

(byoo-pre-nor′feen)

Belbuca, Buprenex, Butrans, Probuphine, Sublocade

Func. class.: Opioid analgesic, partial agonist

Chem. class.: Thebaine derivative

Controlled Substance Schedule III

B

ACTION:
Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors, partial agonist at μ-opioid receptor

USES:
Moderate to severe pain, opiate agonist withdrawal/dependence
Unlabeled uses: Cocaine withdrawal

CONTRAINDICATIONS:
Hypersensitivity, ileus, status asthmaticus

Black Box Warning: Respiratory depression

Precautions: Pregnancy, breastfeeding, substance abuse/alcoholism, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic/pulmonary disease, hypothyroidism, Addison's disease, QT prolongation, accidental exposure, neonatal opioid withdrawal syndrome

Black Box Warning: Potential for overdose/poisoning, substance abuse, IM, coadministration with other CNS depressants, implant insertion and removal

DOSAGE AND ROUTES
Moderate/severe pain
• **Adult/child ≥13 yr: IM/IV** 0.3 mg q4-6hr as needed: **TD** each patch is worn for 7 days (moderate-severe pain); **opioid-naive patients** (those taking <30 mg of oral morphine or equivalent before beginning treatment with TD buprenorphine),

5 mcg/hr q7days, overestimating dose can be fatal; **conversion from other opiate agonist therapy,** titrate from other opioids for up to 7 days to no more than 30 mg oral morphine or equivalent before beginning TD therapy, begin with 5 mcg/hr q7days; for those with daily dose of 30-80 mg oral morphine or equivalent, start with 10 mcg/hr q7days; for those taking >80 mg oral morphine or equivalent, start with 20 mcg/hr q7days

- **Geriatric/debilitated patients: IM/IV** 0.15 mg slowly
- **Child 2-12 yr: IM/IV** 2-6 mcg/kg q4-8hr, give IV over ≥2 min

Opioid dependence

Adult: SL 8 mg on day 1 and 16 mg on day 2, titrate in increments of 2 or 4 mg up or down to needed, maintenance dose 4-24 mg SL daily

Hepatic dose

Adult TD (mild-moderate): 5 mcg/hr system initially

Buccal (severe hepatic disease): decrease dose by 50%, titrate upward by 75 mcg q12hr ≥q4days

Available forms: Injection 0.3 mg/mL (1-mL vials); SL tablet 2, 8 mg as base; TD system 5, 7.5, 10, 15, 20 mcg/hr (weekly); dissolving film (buccal) 75, 150, 300, 450, 600, 750, 900 mcg; solution for injection, extended release 100 mg/0.5 mL, 300 mg/1.5 mL; SD implant 74.2 mg/implant

Administer:

SL route

- Do not chew; dissolve under tongue, use 2 or more at same time

Transdermal route (REMS)

- Apply to clean, dry, intact skin; each patch should be worn for 7 days, do not exceed dose, QTC prolongation may occur; do not apply direct heat source to patch, will increase absorption of product, may use first-aid tape if edge of patch is not adhering
- Apply to upper outer arm, upper chest/back, or side of chest

Subcut route (extended-release injection—Sublocade)

- Inject only in abdominal region. DO NOT use IM/IV
- Visually inspect for particulate matter, discoloration before use; product is clear, colorless to yellow to amber solution
- Give monthly with a minimum of 26 days between doses
- Use only the syringe and safety needle included. Do not attach the needle until time of use
- Do not inject into an area where skin is irritated, reddened, bruised, infected, or scarred
- Do not rub area after injection
- To avoid irritation, rotate injection site with each injection
- Injection site should be examined for infection, evidence of tampering, or attempts to remove the depot
- **Storage:** Store unopened prefilled syringes in the refrigerator in original packaging; do not freeze. Discard injection if left at room temperature for longer than 7 days

Subdermal route (Probuphine)

- Inserted in inner side of upper arm
- Maintenance dose must be 8 mg/day or less
- Use guideline from manufacturer
- Available from REMS program (844-859-6341), health care professional must complete training program
- Inserts are removed after 6 mo, if other insert is not used, use transmucosal

IM route

- In deep muscle mass

IV, direct route

- **Give** undiluted over ≥2 min, titrate to patient response; rapid injection will increase side effects
- With antiemetic if nausea, vomiting occur
- When pain is beginning to return; determine dosage interval by patient response

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride/gluconate, CARBOplatin,

cefamandole, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, D_5W-dextrose 5%, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin HCl, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, hallucinations, strange dreams*
CV: Palpitations, QT prolongation, hypo/hypertension
EENT: Tinnitus, blurred vision, *miosis,* diplopia
GI: *Nausea,* vomiting, anorexia, constipation, dry mouth, hepatotoxicity
GU: Urinary retention
INTEG: *Rash,* diaphoresis, pruritus
RESP: Respiratory depression, bronchospasm
MISC: Anaphylaxis, angioedema, dependency

PHARMACOKINETICS

Metabolized in liver by CYP3A4, excreted by kidneys and in feces, crosses placenta, excreted in breast milk, half-life 2½-3½ hr, 96% bound to plasma proteins
IM: Onset 15 min, peak 1 hr, duration 6-10 hr
SL: Onset, peak, duration unknown, half-life 37 hr
IV: Onset 1 min, peak 5 min, duration 6 hr, half-life 2.2 hr
TD: Half-life 26 hr
Epidural: Duration dose dependent

INTERACTIONS

Increase: effect with other CNS depressants—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, MAOIs
Increase: buprenorphine effect—CYP3A4 inhibitors (erythromycin, indinavir, ketoconazole, ritonavir, saquinavir)
Increase: QT prolongation—class IA, III antidysrhythmics
Increase: serotonin syndrome 5-HT3 antagonists, linezolid, methylene blue, MAOIs, SSRIs, SNRIs, tricyclics

Decrease: buprenorphine effect—CYP3A4 inducers (carBAMazepine, PHENobarbital, phenytoin, rifampin)

Drug/Herb
Increase: CNS depression—chamomile, kava, St. John's wort

NURSING CONSIDERATIONS

Assess:
• **Pain:** intensity, location, type before treatment, after 5, 15, 30 min (IV); need for pain medication, tolerance

Black Box Warning: Accidental exposure: keep away from children and pets; may be fatal

• I&O ratio; check for decreasing output; may indicate urinary retention
• Bowel pattern; severe constipation can occur
• CNS changes, dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction; withdrawal in opioid-dependent persons
• Allergic reactions: rash, urticaria

Black Box Warning: Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <12/min, may be fatal

Black Box Warning: Potential for overdose may occur from chewing, swallowing, snorting, or injecting extracted product from TD formulation

• **QT prolongation:** in those taking class Ia, III antidysrhythmics; patients with hypokalemia, cardiac instability (TD), max TD 20 mcg/hr q7day
• **Beers:** avoid in older adults unless safer alternatives are not available, may cause impaired psychomotor function, syncope
• **Pregnancy/breastfeeding:** avoid use in pregnancy and breastfeeding; in those using product and breastfeeding, watch infant for decreased respiration, lethargy, decreased heart rate

Evaluate:
• Therapeutic response: decrease in pain, decreased withdrawal symptoms

Teach patient/family:
• To report any symptoms of CNS changes, allergic reactions

Black Box Warning: That psychologic dependence leading to substance abuse may result when used for extended periods; that long-term use is not recommended

• That product can cause serious breathing problems; call provider right away if feeling faint, dizzy, or if breathing gets much slower than normal
• To avoid hazardous activities such as driving unless reaction is known
• Do not start new meds/herbs without prescriber approval; do not double, skip doses
• Start stool softener/laxatives to lessen constipation
• **SL route:** to place under tongue and allow to dissolve
• **Transdermal route:** how to apply and dispose of patch; not to use a heating pad or other heat source; do not cut

TREATMENT OF OVERDOSE:

Naloxone 0.4 mg ampule diluted in 10 mL 0.9% NaCl given by direct IV push 0.02 mg q2min (adult)

buPROPion (Rx)

(byoo-proe'pee-on)

Aplenzin, Forfivo XL, Wellbutrin XL, Zyban

Func. class.: Antidepressant—miscellaneous smoking deterrent
Chem. class.: Aminoketone

Do not confuse:
buPROPion/busPIRone
Zyban/Diovan

ACTION: Inhibits reuptake of DOPamine, norepinephrine, serotonin

USES: Depression (Wellbutrin), smoking cessation (Zyban); seasonal affective disorder, substance abuse, glaucoma, smoking, cardiac disease, heart failure

CONTRAINDICATIONS:

Hypersensitivity, head trauma, stroke, intracranial mass, eating disorders, seizure disorders

Precautions: Pregnancy, breastfeeding, geriatric patients, renal/hepatic disease, recent MI, cranial trauma, seizure disorder, substance abuse, glaucoma, smoking, cardiac disease, heart failure, head trauma, stroke, intracranial mass, Tourette's syndrome, tics, tobacco smoking, abrupt discontinuation

Black Box Warning: Children <18 yr, suicidal thinking/behavior (young adults)

DOSAGE AND ROUTES

Depression

- **Adult: PO** 100 mg bid initially, then increase after 3 days to 100 mg tid if needed, max 150 mg single dose; **ER/SR** initially 150 mg AM, increase to 300 mg/day if initial dose is tolerated, after no less than 4 days; after several weeks, titrate to 200 mg bid; **Aplenzin** 174 mg q AM, may increase to 348 mg q AM on day 4, may increase to 522 mg after several weeks if needed; **Forfivo XL** (not for initial treatment) 450 mg daily after titration with another product (300 mg/day × ≥2 wk)
- **Geriatric: PO** 50-100 mg/day, may increase by 50-100 mg q3-4days

Smoking cessation (Zyban)

- **Adult: SR** 150 mg daily × 3 days, then 150 mg bid for remainder of treatment

Seasonal affective disorder

- **Adult: PO (Wellbutrin XL)** 150 mg as a single dose in the AM, after 1 wk may be increased to 300 mg/day; (Aplenzin) 174 mg daily in AM, after 7 days may increase to 348 mg daily

Hepatic dose

Adult: PO (moderate-severe) Aplenzin max 174 mg every other day

Available forms: Tablets 75, 100 mg; extended-release tablet (XL) 100, 150, 200, 300, 450 mg; (SR-12 hr, XL-24 hr); tablet extended release (Aplenzin) 174, 348, 522 mg

Administer:

PO route

- When switching to Aplenzin from Wellbutrin, Wellbutrin SR or XL, use these equivalents: 174 mg buPROPion HBr = 150 mg buPROPion HCl; 348 mg buPROPion HBr = 300 mg buPROPion HCl; 522 mg buPROPion HBr = 450 mg buPROPion HCl
- **Wellbutrin immediate release,** separate by ≥6 hr, give in 3 divided doses; **Wellbutrin XL,** give daily in AM; **Zyban SR,** give in 2 divided doses, ≥8 hr apart; **Aplenzin ER,** give daily in AM, a larger dose of Aplenzin is needed because these products are not equivalent
- Do not break, crush, chew sustained-release, extended-release tablet
- At evenly spaced times to prevent seizures; seizure risk increases with high doses
- Increase fluids, bulk in diet if constipation occurs
- Do not use with SSRIs, linezolid, methylene blue, MAOIs
- With food, milk for GI symptoms
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- Avoid giving at night to prevent insomnia

SIDE EFFECTS

CNS: *Headache, agitation, dizziness, akinesia, confusion,* seizures, delusions, *insomnia, sedation, tremors,* suicidal/homicidal ideation, flushing

CV: *Dysrhythmias, hypertension,* palpitations, *tachycardia,* hypotension, chest pain, chills

EENT: *Blurred vision, auditory disturbance*

GI: *Nausea, vomiting,* anorexia, diarrhea, *dry mouth,* increased appetite, *constipation,* altered taste

GU: Impotence, urinary frequency, retention

INTEG: *Rash,* pruritus, *sweating*

MISC: *Hot flashes*

PHARMACOKINETICS

Onset 1-4 wk, half-life 14 hr (immediate release), extensively metabolized by liver, some conversion to active metabolites, protein binding 84%, excreted in urine and feces

INTERACTIONS

- Do not use within 14 days of MAOIs

Increase: adverse reactions: amantadine, haloperidol seizures—levodopa, MAOIs, phenothiazines, antidepressants, benzodi-

azepines, alcohol, theophylline, systemic steroids
Increase: serotonin syndrome—SSRIs, methylene blue, linezolid, traMADol, traZODone, tricyclic antidepressants, cyclobenzaprine; do not use together
Increase: action of citalopram
Decrease: effect of tamoxifen
Decrease: buPROPion effect—carBAMazepine, cimetidine, PHENobarbital, phenytoin or other products (CYP2D6); CYP2B6 inducers
Drug/Herb
Increase: CNS depression—kava, valerian
Drug/Lab Test
Positive: urine drug screen for amphetamine possible

NURSING CONSIDERATIONS

Assess:
• **Smoking:** for smoking cessation after 7-12 wk; if progress has not been made, product should be discontinued, begin smoking cessation while patient is still smoking, start smoking cessation after 7 days
• For increased risk of seizures; if patient has excessively used CNS depressants and OTC stimulants, dosage of buPROPion should not be exceeded
• Monitor weight regularly, monitor VS baseline and periodically

Black Box Warning: Mental status: mood, sensorium, affect, suicidal/homicidal tendencies, increase in psychiatric symptoms, assess for mania in those with bipolar disorder

• **Beers:** avoid in older adults; lowers seizure threshold, may be acceptable for those with well-controlled seizures for which other treatment has been ineffective
Evaluate:
• Therapeutic response: decreased depression, ability to perform daily activities, ability to sleep throughout the night, smoking cessation
Teach patient/family:
• That therapeutic effects may take 2-4 wk; not to increase dose without prescriber's approval; that treatment for smoking cessation lasts 7-12 wk
• To use caution when driving, performing other activities that require alertness; sedation, blurred vision may occur
• To avoid alcohol, other CNS depressants; alcohol may increase risk of seizures
• Not to chew, crush tablets
• That extended-release shell may be seen in stools, tablet odor is unpleasant
• That exams and lab work will be needed
• To notify health care professionals of all Rx, herbals, supplements taken, not to start new product unless discussed prior to use
• Not to use with nicotine patches unless directed by prescriber; may increase B/P
• To notify prescriber immediately if urinary retention occurs
• That risk of seizures increases when dose is exceeded or if used with alcohol or other CNS depressants; if patient has seizure disorder

Black Box Warning: That suicidal/homicidal ideas, behaviors, hostility, depression may occur in children or young adults, to report immediately

• **Serotonin syndrome:** monitor for increased B/P, pulse, fever, agitation, tremor, sweating, diarrhea; usually caused when combined with other products on interaction list; immediately stop drug and report symptoms to prescriber
• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is suspected, planned, or if breastfeeding

TREATMENT OF OVERDOSE:

ECG monitoring; lavage; administer anticonvulsant

burosumab-twza (Rx)

(bur-oh´sue-mab)
Crysvita
Func. class.: Fibroblast growth factor blocking antibody

USES: X-linked hypophosphatemia (XLH) in adult and pediatric patients 1 yr of age and older

CONTRAINDICATIONS: Use with oral phosphate or active vitamin D analogs; serum phosphorus is within or above the normal range for age; severe renal impairment or end-stage renal disease

DOSAGE AND ROUTES

- **Adult: SUBCUT** 1 mg/kg body weight rounded to nearest 10 mg (max 90 mg) q4wk
- **Child 1-18 yr: SUBCUT** 0.8 mg/kg body weight rounded to nearest 10 mg (max 90 mg) q2wk. Dose may be increased up to approximately 2 mg/kg (max 90 mg) q2wk to achieve normal serum phosphorus

Available forms: Solution for injection 10, 20, 30 mg/mL

⚠ HIGH ALERT

busPIRone (Rx)

(byoo-spye′rone)

Func. class.: Antianxiety, sedative

Chem. class.: Azaspirodecanedione

Do not confuse:
busPIRone/buPROPion

ACTION: Acts by inhibiting the action of serotonin (5-HT); has shown little potential for abuse; a good choice with substance abuse

USES: Generalized anxiety disorders

CONTRAINDICATIONS: Children <18 yr, hypersensitivity, MAOIs
Precautions: Pregnancy, breastfeeding, geriatric patients, impaired hepatic/renal function

DOSAGE AND ROUTES

Anxiety disorders

- **Adult: PO** 7.5 mg bid; may increase by 5 mg/day q2-3days, max 60 mg/day

Hepatic/renal dose

- **Adult: PO** Do not use in severe renal/hepatic disease

Available forms: Tablets 5, 7.5, 10, 15, 30 mg

Administer:

- With food, milk for GI symptoms; avoid grapefruit juice; give drug at same time of day, with/without food consistently
- Crushed if patient unable to swallow medication whole
- Sugarless gum, hard candy, frequent sips of water for dry mouth

SIDE EFFECTS

CNS: *Dizziness, headache, stimulation, insomnia, nervousness, numbness, paresthesia, incoordination*
CV: *Tachycardia, palpitations,* hypo/hypertension, chest pain
EENT: *Sore throat, tinnitus, blurred vision, nasal congestion;* change in taste, smell
GI: *Nausea, dry mouth, diarrhea, constipation,* increased appetite
GU: Frequency, hesitancy, change in libido
INTEG: *Rash,* edema, pruritus, alopecia, dry skin
MISC: *Sweating,* fatigue, fever
MS: *Pain, weakness,* muscle cramps, myalgia
RESP: Hyperventilation, chest congestion, shortness of breath

PHARMACOKINETICS

Onset, duration unknown; Peak 40-90 min, half-life 2-4 hr, rapidly absorbed, metabolized by liver (CYP3A4), excreted in feces, protein binding 86%

INTERACTIONS

Increase: busPIRone—CYP3A4 inhibitors (erythromycin, itraconazole, nefazodone, ketoconazole, ritonavir, verapamil, dilTIAZem, several other protease inhibitors), dosage decrease may be needed
Increase: B/P—procarbazine, MAOIs; avoid using together
Increase: CNS depression—psychotropic products, alcohol (avoid use), monitor closely if used together
Increase: serotonin syndrome—SSRIs, SNRIs, serotonin receptor agonists
Decrease: busPIRone effects—rifAMPin

Decrease: busPIRone action—CYP3A4 inducers (rifAMPin, phenytoin, PHENobarbital, carBAMazepine, dexamethasone), dosage increase may be needed

Drug/Herb
Increase: CNS depression—chamomile, kava kava, valerian
Drug/Food
Increase: peak concentration of busPIRone—grapefruit juice

NURSING CONSIDERATIONS

Assess:
- B/P lying, standing; pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- CNS reactions because some may be unpredictable
- Mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness; withdrawal symptoms when dose reduced, product discontinued
- Safety measures if drowsiness, dizziness occurs
- **Beers:** avoid in older adults with delirium or at high risk for delirium

Evaluate:
- Therapeutic response: decreased anxiety, restlessness, sleeplessness

Teach patient/family:
- That product may be taken consistently with/without food
- To avoid OTC products, alcohol ingestion, other psychotropic medications unless approved by prescriber; to avoid large amounts of grapefruit juice
- To avoid activities that require alertness because drowsiness may occur
- Not to discontinue medication abruptly after long-term use; if dose is missed, do not double
- To rise slowly because fainting may occur, especially among geriatric patients
- That drowsiness may worsen at beginning of treatment; that 2 wk of therapy may be required before therapeutic effects occur, max effect 3-6 wk
- **Serotonin syndrome:** to report immediately (fever, tremor, sweating, diarrhea, delirium)
- **Pregnancy/breastfeeding:** report if pregnancy is planned or suspected or if breastfeeding, use in pregnancy and breastfeeding isn't recommended

⚠ HIGH ALERT

busulfan (Rx)

(byoo-sul′fan)

Busulfex, Myleran

Func. class.: Antineoplastic alkylating agent

USES: Chronic myelocytic leukemia, bone marrow ablation, stem cell transplant preparation with CML

CONTRAINDICATIONS: Pregnancy, breastfeeding, blastic phase of chronic myelocytic leukemia, hypersensitivity

Precautions: Women of childbearing age, leukopenia, anemia, hepatotoxicity, renal toxicity, seizures, tumor lysis syndrome, hyperkalemia, hyperphosphatemia, hypocalcemia, hyperuricemia, radiation, chemotherapy, male-mediated teratogenicity, veno-occlusive disease (VOD), sinusoidal obstruction syndrome, head trauma

Black Box Warning: Thrombocytopenia, neutropenia, new primary malignancy, bone marrow suppression

DOSAGE AND ROUTES

Chronic myelocytic leukemia
- **Adult: PO** Induction dosing is 60 mcg/kg or 1.8 mg/m^2 every day; usual dose is 4 to 8 mg
- **Child: PO** 0.06-0.12 mg/kg/day or 1.8-4.6 mg/m^2/day

Allogenic hematopoietic stem cell transplantation
- **Adult: IV** 0.8 mg/kg over 2 hr, q6hr × 4 days (total 16 doses); give cyclophosphamide **IV** 60 mg/kg over 1 hr daily for 2 days starting after 16th dose of busulfan; **PO** (unlabeled) 1 mg/kg q6hr × 16 doses

• **Adolescent and child >12 kg (unlabeled): IV** 0.8 mg/kg over 2 hr q6hr × 16 doses (4 days), then high-dose cyclophosphamide 50 mg/kg/day × 4 days
• **Infant/child ≤12 kg (unlabeled): IV** 1.1 mg/kg over 2 hr q6hr × 16 doses (4 days), then high-dose cyclophosphamide 50 mg/kg/day × 4 days

Available forms: Injection 6 mg/mL, tablets 2 mg

butoconazole vaginal antifungal

See Appendix B

⚠ HIGH ALERT

butorphanol (Rx)

(byoo-tor'fa-nole)
Func. class.: Opioid analgesic
Chem. class.: Mixed opioid antagonist, partial agonist

Controlled Substance Schedule IV

ACTION: Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES: Moderate to severe pain, general anesthesia induction/maintenance, headache, migraine, preanesthesia

CONTRAINDICATIONS: Hypersensitivity to product, preservative; addiction (opioid)
Precautions: Pregnancy, breastfeeding, children <18 yr, addictive personality, increased intracranial pressure, renal/hepatic disease, ileus, COPD, potential for overdose

Black Box Warning: Coadministration with other CNS depressants, respiratory depression, accidental exposure (intranasal), neonatal opioid withdrawal syndrome, substance abuse

DOSAGE AND ROUTES

Moderate-severe pain
• **Adult: IM** 1-4 mg q3-4hr prn; **IV** 0.5-2 mg q3-4hr prn; **INTRANASAL** 1 spray in 1 nostril, may give another dose 1-1½ hr later; repeat if needed 3-4 hr after last dose
• **Geriatric: IV** ½ adult dose at 2× the interval; **INTRANASAL** if no relief after 90-120 min, may repeat with 1 spray

Anesthesia—maintenance in balanced anesthesia; anesthetic adjunct
• **Adult: IV** Initially, 2 mg shortly before anesthesia induction. Maintenance, 0.5-1 mg **IV** during anesthesia, up to 0.06 mg/kg; usual total dose, 4-12.5 mg (approximately 0.06 to 0.18 mg/kg)

Atrial cardioversion—pain
• **Adult: INTRANASAL** 1 mg 30 min before internal atrial defibrillation shock

Renal/hepatic dose
• **Adult:** INTRANASAL max 1 mg followed by 1 mg after 90-120 min; IM/IV give 50% of dose (0.5 mg IV, 1 mg IM), do not repeat within 6 hr

Available forms: Injection 1, 2 mg/mL; nasal spray 10 mg/mL

Administer:
• With antiemetic if nausea, vomiting occur
• When pain is beginning to return; determine dosage interval according to patient response
• Store in light-resistant container at room temperature

Nasal route
• Prime before first use, point sprayer away from the face, pump activator 7× until a fine, wide spray occurs; if not used for 48 hr, reprime by pumping 1-2×
• If more than 1 spray is needed, use other nostril
• Do not share with others
• Nasal congestion/irritation may occur

IM route
• Deeply in large muscle mass

IV direct route
• Undiluted at a rate of <2 mg/>3-5 min, titrate to patient response; inject directly in vein or tubing of free-flowing compatible IV infusion

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid injection, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, weakness, hallucinations,* insomnia (nasal)
CV: Palpitations, bradycardia, hypotension
EENT: Tinnitus, blurred vision, miosis, diplopia, nasal congestion, unpleasant taste
GI: *Nausea, vomiting, anorexia, constipation, cramps*
GU: Urinary retention
INTEG: Rash, urticaria, bruising, flushing, diaphoresis, pruritus
RESP: Respiratory depression

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-9 hr, protein binding 80%
IM: Onset 5-15 min, peak 30-60 min, duration 3-4 hr
INTRANASAL: Onset within 15 min, peak 1-2 hr, duration 4-5 hr
IV: Onset 1 min, peak 4-5 min, duration 2-4 hr

INTERACTIONS

Black Box Warning: Increase: CNS effects—alcohol, benzodiazepines, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, other CNS depressants, MAOIs

Increase: butorphanol effect—CYP3A4 inhibitors (azoles, macrolides, protease

inhibitors), monitor for severe respiratory depression
Increase: serotonin syndrome—SSRIs and other serotonergic agents, monitor for serotonin syndrome
Decrease: butorphanol effect—CYP3A4 inducers (carBAMazepine, phenytoin, rifAMPin), dosage increase may be needed
Drug/Herb
St. John's wort: Increased serotonin syndrome risk

NURSING CONSIDERATIONS

Assess:
• For decreasing output; may indicate urinary retention
• For withdrawal symptoms in opioid-dependent patients; PE, vascular occlusion, abscesses, ulcerations
• CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• Allergic reactions: rash, urticaria

Black Box Warning: Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

Black Box Warning: Neonatal opioid withdrawal: if mother used this product for prolonged periods during pregnancy, monitor neonate for withdrawal

Black Box Warning: Substance abuse: identify if there has been substance abuse (including alcoholism) in the past or present; addiction is more common in these patients

Black Box Warning: Accidental exposure (intranasal): keep out of reach of children

Black Box Warning: Avoid with benzodiazepines

• Need for pain medication, physical dependence
• Safety measures: night-light, call bell within easy reach, assistance with ambulation, especially for geriatric patients
• **Pregnancy/breastfeeding:** use only if benefits outweigh risks; usually compatible with breastfeeding
Evaluate:
• Therapeutic response: decrease in pain
Teach patient/family:

Black Box Warning: To report any symptoms of CNS changes, if using with other opioids, benzodiazepines, alcohol, or other CNS depressants, to seek medical care immediately for stupor, slow breathing, severe sleepiness

Black Box Warning: Accidental overdose: May be fatal, keep out of reach of children

• To report all products taken (OTC, Rx, herbs, supplements)
• That physical dependency may result when used for extended periods
• That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
• How to use nasal product
• To avoid hazardous activities, to have help getting out of bed or walking

TREATMENT OF OVERDOSE:

Naloxone 0.4-2 mg IV, IM/SUBCUT/O_2, IV fluids, vasopressors

cabozantinib (Rx)

(ka-boe-zan′ti-nib)

Cabometyx, Cometriq

Func. class.: Antineoplastic, biologic response modifier, signal transduction inhibitor

Chem. class.: Multi-tyrosine kinase inhibitor

ACTION: Blocks abnormal tyrosine kinase proteins (RET, MET, VEGFR-1, VEGFR-2, VEGFR-3, KIT, TRKB, FLT-3, AXL, TIE-2, ROS1, TYRO3, and MER); inhibits these receptor tyrosine kinases (RTKs) that are responsible for the control of cell migration, metabolism, proliferation, and differentiation

USES: In patients with progressive, metastatic medullary thyroid cancer, advanced renal cell cancer (RCC) who have received prior anti-angiogenic therapy

CONTRAINDICATIONS: Hypersensitivity, pregnancy

Black Box Warning: Bleeding, fistula, GI perforation

Precautions: Breastfeeding, contraception requirements, dental disease, dental work, diarrhea, encephalopathy, GI bleeding, hypertension, infertility, MI, proteinuria, reproductive risk, skin disease, surgery, thromboembolic disease, wound dehiscence

DOSAGE AND ROUTES

Progressive, metastatic medullary thyroid cancer (capsules only; do not substitute with tablets):

- **Adult: PO** 140 mg daily on an empty stomach until disease progression or unacceptable toxicity occurs

Advanced RCC in patients who have received prior anti-angiogenic therapy (tablets only; do not substitute with capsules):

- **Adult: PO** 60 mg daily on an empty stomach until disease progression or unacceptable toxicity

Hepatic dose

Cometriq capsules:

- Mild or moderate hepatic impairment (Child-Pugh class A or B): reduce the starting dose to 80 mg daily; severe hepatic impairment (Child-Pugh class C): do not use

Cabometyx tablets:

- Mild or moderate hepatic impairment (Child-Pugh class A or B): reduce the starting dose to 40 mg daily; severe hepatic impairment (Child-Pugh class C): do not use

Available forms: Capsules 60, 100, 140 mg; tablets 20, 40, 60 mg

Administer:

- Do not substitute tablets with capsules
- Take on an empty stomach; do not eat for at least 2 hr prior to and at least 1 hr after taking, swallow capsules and tablets whole; do not open or crush
- Do not take with grapefruit juice or nutritional supplements that are known to inhibit CYP450
- Do not take a missed dose within 12 hr of the next dose. If the next dose is in 12 hr or more, take the missed dose; if the next dose is in <12 hr, skip and take the next dose at the scheduled time

Cometriq capsules:

- **Strong CYP3A4 inhibitors:** Avoid concomitant use if possible. If a strong CYP3A4 inhibitor is required, reduce the daily dose by 40 mg; resume the prior dose after 2 to 3 days if the strong CYP3A4 inhibitor is discontinued
- **Strong CYP3A4 inducers:** If a strong CYP3A4 inducer is required, increase the daily dose by 40 mg as tolerated. Max 180 mg/day. Resume the prior dose after 2 to 3 days if the strong CYP3A4 inducer is discontinued

Cabometyx tablets:

- **Strong CYP3A4 inhibitors:** Reduce the daily dose by 20 mg; resume the prior dose after 2 to 3 days if the strong CYP3A4 inhibitor is discontinued
- **Strong CYP3A4 inducers:** Increase the daily dose by 20 mg as tolerated. Max 80 mg/day. Resume the prior dose after

2 to 3 days if the strong CYP3A4 inducer is discontinued

SIDE EFFECTS

RESP: Cough, dyspnea
CNS: Dizziness, headache, fatigue
CV: Hypertension, hypertriglyceridemia
EENT: Rash, erythema, hair discoloration, oral ulceration, stomatitis
META: Hyperbilirubinemia, hyperglycemia, hypocalcemia, hypokalemia, hypoalbuminemia, hypomagnesemia, hyponatremia, hypophosphatemia
MISC: Arthralgia, asthenia, dysgeusia, hand and foot syndrome, hypothyroidism, dysphonia
GI: Anorexia, nausea, vomiting, weight loss, abdominal pain, diarrhea, constipation, dyspepsia

HEMA: Thrombocytopenia, lymphopenia, neutropenia, anemia

PHARMACOKINETICS

Protein binding ≥99.7%, half-life 55 hr, excretion 54% feces (43% as unchanged drug), 21% urine, peak 2-5 hr
• Metabolized in the liver and is a substrate of CYP3A4

INTERACTIONS

• **Increase:** GI bleeding—warfarin, NSAIDs
• **Increase:** cabozantinib effects—CYP3A4 inhibitors (amprenavir, bocenavir, delavirdine, ketoconazole, indinavir, itraconazole, dalfopristin/quinupristin, ritonavir, tipranavir, fluconazole, isoniazid, miconazole)
• **Decrease:** cabozantinib effects—CYP3A4 inducers (rifAMPin, rifapentine, rifabutin, primadone, phenytoin, phenobarbital, nevirapine, nafcillin, modafinil, griseofulvin, etravirine, efavirenz, barbiturates, bexarotene, bosentan, carBAMazepine, enzalutamide, dexamethasone)

Drug/Food
Increase: cabozantinib effects—grapefruit juice
Drug/Herb
Decrease: cabozantinib effects—St. John's wort
Drug/Smoking
Decrease: cabozantinib effects—smoking, dose may need to be increased
Drug/Lab
Increase: INR, PT, AST, ALT, bilirubin

NURSING CONSIDERATIONS

Assess:

Black Box Warning: GI perforation/bleeding: some cases have been fatal, usually occurs in those using NSAIDs, taxanes, or those with diverticulitis or peptic ulcer disease, discontinue if these occur

• **Serious arterial and venous thromboembolic disease:** some have been fatal, permanently discontinue if myocardial infarction or any other arterial thromboembolic complication occurs
• **Wound dehiscence:** temporary suspension of therapy is recommended at least 28 days before scheduled surgery, including dental surgery. Resume based on adequate wound healing. Hold in those who develop wound dehiscence or wound healing complications
• **Hypertension:** monitor BP prior to and regularly during treatment, hold in those not adequately controlled; resume at a reduced dose. Permanently discontinue if malignant hypertension, hypertensive crisis, or persistent uncontrolled hypertension despite optimal management
• **Dental disease:** oral examination prior to starting therapy to evaluate for dental disease; good oral hygiene practices should be encouraged. Discontinue at least 28 days before invasive dental work or surgery. Osteonecrosis of the jaw (ONJ) has been reported; permanently discontinue capsules (Cometriq) in those who develop ONJ
• **Palmar-plantar erythrodysesthesia (hand and foot syndrome):** hold in those who develop intolerable grade 2 or grade 3 or 4 hand and foot syndrome, resume at a reduced dose when toxicity has improved to grade 1

- **Proteinuria:** monitor urine protein regularly; permanently discontinue in nephrotic syndrome
- **Severe diarrhea:** those with preexisting diarrhea should be treated prior to receiving this product; hold (Cabometyx) therapy for intolerable grade 2 diarrhea, for grade 3 or higher diarrhea that cannot be managed with standard antidiarrheal treatments until improvement to grade 1 or less; a dose reduction may be necessary. Fluid and electrolyte replacement if dehydrated
- **Reversible posterior leukoencephalopathy syndrome (RPLS):** assess for seizures, headache, visual disturbances, confusion, and altered mental status. Discontinue if RPLS is suspected or diagnosed; confirm by MRI
- **Pregnancy/breastfeeding:** assess if pregnancy is planned or suspected. Females of reproductive potential should avoid becoming pregnant during treatment; women who become pregnant while receiving product should be apprised of the potential hazard to the fetus
- Counsel patients about the reproductive risk and contraception requirements. Females and men with female partners who are able to become pregnant should avoid pregnancy and use effective contraception during and for ≥4 mo after the last dose. Obtain pregnancy testing prior to initiation; do not breastfeed

Evaluate:

- **Therapeutic response:** decreased spread of cancer

Teach patient/family:

- To report adverse reactions immediately, SOB, severe abdominal pain, persistent diarrhea, severe hypertension, bleeding
- About reason for treatment, expected results
- To use reliable contraception during treatment and for ≥4 mo after treatment

⚠ HIGH ALERT

calcitonin (salmon) (Rx)

Miacalcin

Func. class.: Parathyroid agent (calcium regulator)

Chem. class.: Polypeptide hormone

Do not confuse:

Calcitonin/calcitriol/calcifediol/calcium

ACTION: Decreases bone resorption, blood calcium levels; increases deposits of calcium in bones; opposes parathyroid hormone

USES: Paget's disease, postmenopausal osteoporosis, hypercalcemia

CONTRAINDICATIONS: Hypersensitivity to this product, fish

Precautions: Pregnancy, breastfeeding, children, hypotension, hypocalcemia, secondary malignancy

DOSAGE AND ROUTES

Postmenopausal osteoporosis

- **Adult: SUBCUT/IM** 100 units every other day; **INTRANASAL** 200 units (1 spray) daily, alternating nostrils daily

Paget's disease

- **Adult: SUBCUT/IM** 100 units/day; maintenance 50 units daily, every other day, or 3× per wk

Hypercalcemia

- **Adult: SUBCUT/IM** 4 units/kg q12hr, increase to 8 units/kg q12hr if response is unsatisfactory, may increase to 8 units/kg q6hr if needed after 2 more days

Available forms: Injection 200 units/mL; nasal spray 200 units/actuation

Administer:

- Store at <77°F (25°C); protect from light

SUBCUT route

- Rotate injection sites; use within 2 hr of reconstitution; **give** at bedtime to minimize nausea, vomiting

IM route

- After test dose of 10 units/mL, 0.1 mL intradermally; watch for 15 min; **give** only with EPINEPHrine, emergency meds available

• IM inject slowly into deep muscle mass; rotate sites; preferred route if volume is >2 mL; use within 2 hr of reconstitution

Nasal route

• Prime pump before first dose
• Use at bedtime; alternate nostrils daily, prime to get full spray before first dose, store in refrigerator
• Allow to come to room temperature before using
• Discard after 30 days

SIDE EFFECTS

CNS: Headache (nasal)
EENT: Eye pain (nasal)
GI: Nausea, diarrhea, vomiting, anorexia, (IM/SUBCUT)
GU: Nocturia, frequency
INTEG: Rash, flushing, reaction at injection site
MS: Backache, myalgia, arthralgia
RESP: Dyspnea, flulike symptoms, bronchospasm
SYST: Anaphylaxis, infection

PHARMACOKINETICS

IM/SUBCUT: Onset 15 min, peak 2 hr, duration 6-8 hr, metabolized by kidneys, excreted as inactive metabolites via kidneys

INTERACTIONS

Decrease: lithium effect; monitor lithium level
Decrease: effect of nasal spray—bisphosphonates (Paget's disease); monitor for adequate effect

NURSING CONSIDERATIONS

Assess:

• Anaphylaxis, hypersensitivity reaction (rash, fever, inability to breathe); emergency equipment should be nearby
• GI symptoms, polyuria, flushing, head swelling, tingling, headache; may indicate hypercalcemia
• Nutritional status; diet for sources of vitamin D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates
• **Postmenopausal osteoporosis:** vitamin D (50-135 international units/dL), alkaline phosphatase baseline, q3-6mo; monitor urine hydroxyproline with Paget's disease, biochemical markers of bone formation/absorption, radiologic evidence of fracture; bone density
• **Toxicity (can occur rapidly),** increased drug level; have parenteral calcium on hand if calcium level drops too low; check for tetany (irritability, paresthesia, nervousness, muscle twitching, seizures, tetanic spasms)

Evaluate:

• Therapeutic response: calcium levels 9-10 mg/dL, decreasing symptoms of Paget's disease

Teach patient/family:

SUBCUT route/IM route

• About the method of injection if patient will be responsible for self-medication; to rotate sites, not to inject into broken, irritated skin; provide written instructions
• To report difficulty swallowing, any changes in side effects to prescriber immediately
• To report immediately signs/symptoms of hypocalcemia: tetany, seizures
• **Pregnancy/breastfeeding:** to advise prescriber if pregnancy is planned or suspected or if breastfeeding
• **Postmenopausal osteoporosis:** to take vitamin D and calcium differential; that nausea, vomiting, and facial flushing occur often

Nasal route

• To use alternating nostrils; to use after allowing to warm to room temperature; to prime to get full spray; to discard after 30 days

calcitriol vitamin D_3 (Rx)

(kal-sih-try'ole)

Rocaltrol, Vectical

Func. class.: Parathyroid agent (calcium regulator)

Chem. class.: Vitamin D hormone

Do not confuse:
calcitriol/Calciferol/calcitonin/calcium

ACTION: Increases intestinal absorption of calcium; provides calcium for bones; increases renal tubular reabsorption of phosphate

USES: Hypocalcemia with chronic renal disease, hyperparathyroidism, pseudohypoparathyroidism, psoriasis, renal osteodystrophy

CONTRAINDICATIONS: Hypersensitivity, hyperphosphatemia, hypercalcemia, vitamin D toxicity
Precautions: Pregnancy, breastfeeding, renal calculi, CV disease

DOSAGE AND ROUTES

Hypocalcemia in long-term dialysis
- **Adult: PO** 0.25 mcg/day
- **Adult and child ≥13 yr IV** 0.5 mcg (0.01 mcg/kg) 3× per wk, may increase by 0.25-0.5 mcg/dose q2-4wk
- **Child 1-5 yr: PO** 0.25-2 mcg/day; **IV** 0.01-0.05 mcg/kg 3× per wk

Hypoparathyroidism
- **Adult and child ≥6 yr: PO** 0.25 mcg/day, may increase q2-4wk, maintenance 0.5-2 mcg/day
- **Child <1 yr: PO** 0.04-0.08 mcg/kg/day

Management of secondary parathyroidism with bone disease in predialysis (CCr 15-55 mL/min)
- **Adult/child ≥3 yr: PO** 0.25 mcg/day, may increase to 0.5 mcg/day

Mild-moderate plaque psoriasis
- **Adult:** Topical: apply to affected areas bid, max 200 g

Available forms: Capsules 0.25, 0.5 mcg; injection 1 mcg/mL; oral solution 1 mcg/mL; topical 3 mcg/g

Administer:

PO route
- Do not break, crush, chew capsules
- Give without regard to meals
- Store protected from light, heat, moisture

Topical route
- Rub into skin

IV route
- **Hypocalcemia:** Give by direct IV over 1 min through catheter at hemodialysis conclusion

SIDE EFFECTS

CNS: Drowsiness, headache, vertigo
CV: Hypertension, dysrhythmias, edema
EENT: Blurred vision, photophobia, rhinorrhea
ENDO: Hypercalcemia
GI: Nausea, vomiting, jaundice, anorexia, dry mouth, constipation, cramps, metallic taste, pancreatitis
GU: Polyuria
MS: Myalgia, arthralgia, weakness
SYST: Anaphylaxis
INTEG: Pain at injection site, rash, pruritus

PHARMACOKINETICS

IV: Onset immediate, duration 3-5 days
TOPICAL: Onset, peak, duration unknown
PO: Absorbed readily from GI tract, peak 10-12 hr, duration 3-5 days, half-life 5-8 hr, undergoes hepatic recycling, excreted in bile

INTERACTIONS

Increase: hypercalcemia—thiazide diuretics, calcium supplements
Increase: cardiac dysrhythmias—cardiac glycosides, verapamil; use cautiously
Increase: hypermagnesemia—magnesium antacids/supplements, avoid using together
Increase: toxicity—other vitamin D products, avoid using together
Increase: metabolism of vitamin D—phenytoin
Decrease: absorption of calcitriol—cholestyramine, mineral oil, fat-soluble vitamins; avoid concurrent use

Drug/Food
- Large amounts of high-calcium foods may cause hypercalcemia

Drug/Lab Test
Increase: AST/ALT, BUN, creatinine
False increase: Cholesterol
Interference: Alkaline phosphatase, electrolytes

NURSING CONSIDERATIONS

Assess:
- **Vitamin D deficiency:** Baseline and periodically
- May increase calcium; should be kept at 9-10 mg/dL, vitamin D 50-135 units/dL, phosphate 70 mg/dL; toxic reactions may occur rapidly

- Serum calcium, phosphate 2× per wk during beginning treatment; serum calcium magnesium, alkaline phosphatase and intact PTH ≤ monthly
- **Hypercalcemia:** dry mouth, metallic taste, polyuria, bone pain, muscle weakness, headache, fatigue, change in level of consciousness, dysrhythmias, increased respirations, anorexia, nausea, vomiting, cramps, constipation; **hypocalcemia:** paresthesia, twitching, Chvostek's sign, Trousseau's sign
- Nutritional status, diet for sources of vitamin D (milk, some seafood); calcium (dairy products, dark green vegetables), phosphates (dairy products) must be avoided
- Restrict sodium, potassium if required; restriction of fluids if required for chronic renal failure
- Height, weight in children, baseline and periodically if on long-term high-dose therapy

Evaluate:

- Therapeutic response: calcium 9-10 mg/dL; decreasing symptoms of hypocalcemia, hypoparathyroidism

Teach patient/family:

- **About symptoms of hypercalcemia:** renal stones, nausea, vomiting, anorexia, lethargy, thirst, bone or flank pain, confusion
- To follow prescribed diet, to avoid products with sodium: cured meats, dairy products, cold cuts, olives, beets, pickles, soups, meat tenderizers with chronic renal failure; products with potassium: oranges, bananas, dried fruit, peas, dark green leafy vegetables, milk, melons, beans
- To avoid OTC products that contain calcium, potassium, sodium with chronic renal failure, to take as prescribed, not to double or skip doses
- To monitor weight weekly; to maintain fluid intake
- To continue with exams and lab work
- To avoid large doses of vitamins or supplements
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected or if breastfeeding; do not breastfeed

TREATMENT OF OVERDOSE: Discontinue treatment, diuretics, hemodialysis

C

calcium carbonate (OTC)

Calcarb, Calci-Chew, Calci-Mix, Maalox Antacid, Mylanta, Oysterase, Os-Cal, Rolaids, Tums

Func. class.: Antacid, calcium supplement

Chem. class.: Calcium product

Do not confuse:
calcium/calcitriol/calcitonin

ACTION: Neutralizes gastric acidity

USES: Antacid, calcium supplement

CONTRAINDICATIONS: Hypersensitivity, hypercalcemia

Precautions: Pregnancy, breastfeeding, geriatric patients, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, hyperparathyroidism, bone tumors

DOSAGE AND ROUTES

Hypocalcemia prevention, osteoporosis

- **Adult: PO** 1-2 g
- **Adult 19-50 yr: PO** 1000 mg/day elemental calcium (2500 mg/day calcium carbonate)

Chronic hypocalcemia

- **Adult: PO** 2-4 g/day elemental calcium (5-10 g/day calcium carbonate) in 3-4 divided doses
- **Child: PO** 45-65 mg/kg/day elemental calcium (112.5-162.5 mg/kg/day calcium carbonate) in 4 divided doses
- **Neonate: PO** 50-150 mg/kg/day elemental calcium (125-375 mg/kg/day in 4-6 divided doses, max 1 g/day)

Supplementation

- **Child: PO** 45-65 mg/kg/day

Hyperphosphatemia (Acetate)

- **Adult: PO** 1334 mg with meals

Heartburn, dyspepsia, hyperacidity (OTC)

• **Adult: PO** 1-2 tablets q2hr, max 9 tablets/24 hr (Alka-Mints); chew 2-4 tablets q1hr prn, max 16 tablets (Tums regular strength); chew 2-4 tablets q1hr prn, max 10 tablets (Tums E-X)

Available forms: Calcium carbonate: chewable tablets 350, 420, 450, 500, 750, 1000, 1250 mg; tablets 500, 600, 650, 667, 1000, 1250, 1500 mg; **gum** 300, 450, 500 mg; **suspension** 1250 mg/5 mL; **capsules** 1250 mg; **powder** 6.5 g/packet

Administer:

PO route

• 1 g calcium carbonate = 400 mg elemental calcium = 10 mmol calcium = 20 mEq calcium

• Do not give enteric-coated within 1 hr of calcium carbonate

• **For ulcer treatment** (adjunct): give 1 and 3 hr after meals and at bedtime

• **For a phosphate binder:** give 1 hr after each meal or snack and at bedtime

• **For supplement:** give 1-1½ hr after meals; avoid oxalic acid foods (spinach, rhubarb), phytic acid (brans, cereals), or phosphorus (milk, dairy), may decrease calcium absorption

• **Suspension:** shake well; use calibrated measuring device

• Laxatives or stool softeners if constipation occurs

SIDE EFFECTS

GI: *Constipation,* anorexia, nausea, vomiting, diarrhea

GU: Calculi, hypercalciuria

PHARMACOKINETICS

⅓ of dose absorbed by small intestine, excreted in feces and urine, crosses placenta, must have adequate vitamin D for absorption

INTERACTIONS

Increase: digoxin toxicity—hypercalcemia

Increase: plasma levels of quiNIDine, amphetamines

Increase: hypercalcemia—thiazide diuretics, calcium supplements

Decrease: levels of salicylates, calcium channel blockers, ketoconazole, iron salts, tetracyclines, fluoroquinolones, phenytoin, etidronate, risedronate, atenolol PO, thyroid hormones

Drug/Food

Decrease: calcium supplement effect—cereal, spinach

Drug/Lab Test

Decrease: phosphates

False increase: chloride

False positive: benzodiazepines

False decrease: magnesium, oxalate, lipase

NURSING CONSIDERATIONS

Assess:

• Calcium (serum, urine), serum calcium should be 8.5-10.5 mg/dL, correct or use ionized calcium in low albumin or acid/base disorders, monitor weekly if used to treat electrolyte imbalances or use a daily supplement; urine calcium should be 150 mg/day, monitor weekly; serum phosphate

• **Milk-alkali syndrome:** nausea, vomiting, disorientation, headache

• Constipation; increase bulk in the diet if needed

• **Hypercalcemia:** headache, nausea, vomiting, confusion

• **Hypocalcemia:** paresthesia, twitching, colic, dysrhythmias, Chvostek's sign, Trousseau's sign

• Those taking digoxin for toxicity; monitor frequently

• Antacid—for abdominal pain, heartburn, indigestion before, after administration

Evaluate:

• Therapeutic response: absence of pain, decreased acidity; decreased hyperphosphatemia with renal failure

Teach patient/family:

• To increase fluids to 2 L unless contraindicated; to add bulk, liquids to diet for constipation; to notify prescriber of constipation

• Not to switch antacids unless directed by prescriber; not to use as antacid for >2 wk without approval by prescriber

• That therapeutic dose recommendations are figured as elemental calcium

• To avoid excessive use of alcohol, caffeine, tobacco

- To avoid spinach, cereals, dairy products in large amounts, other foods high in oxalates before taking the product; may interfere with absorption of calcium
- To take enteric product within 1 hr of calcium carbonate
- To take on regular schedule
- Pregnancy/breastfeeding: Notify prescriber if planned or suspected, hypocalcemia/hypercalcemia causes severe reactions
- To maintain vitamin D levels

CALCIUM SALTS

calcium acetate (Rx)
Calphron, PhosLo, Phoslyra
calcium chloride (Rx)
calcium citrate (OTC)
Citracal, Cal-C-Cap
calcium gluconate (Rx)
calcium lactate (Rx)
Cal-Lac
Func. class.: Electrolyte replacement—calcium product

ACTION: Calcium needed for maintenance of nervous, muscular, skeletal function; enzyme reactions; normal cardiac contractility; coagulation of blood; affects secretory activity of endocrine, exocrine glands

USES: Prevention and treatment of hypocalcemia, hypermagnesemia, hypoparathyroidism, neonatal tetany, cardiac toxicity caused by hyperkalemia, lead colic, hyperphosphatemia, vitamin D deficiency, osteoporosis prophylaxis, calcium antagonist toxicity (calcium channel blocker toxicity)
Unlabeled uses: Electrolyte abnormalities in cardiac arrest, CPR

CONTRAINDICATIONS: Hypercalcemia, digoxin toxicity, ventricular fibrillation, renal calculi
Precautions: Pregnancy, breastfeeding, children, respiratory/renal disease, cor pulmonale, digitalized patient, respiratory failure, diarrhea, dehydration

DOSAGE AND ROUTES

Acute hypocalcemia

- **Adult: IV** 7-14 mEq **for tetany** 4.5-16 mEq
- **Child/infant: IV** 1-7 mEq **for tetany** 0.5-0.7 mEq/kg tid-qid

For nutritional supplementation

PO (any oral calcium salt; dosage expressed as elemental calcium)

- **Adult: PO** 1-2 g mg/day
- **Child: PO** 45-65 mg/kg/day

Available forms: Calcium chloride: injection 10% (1.36 mEq); **calcium citrate:** tablets 250 mg; **calcium gluconate:** tablets 500, 650, 975, 1 g; injection 10% (0.45 mEq); **calcium lactate:** tablets 325, 500, 650 mg

Administer:

PO route (only acetate, carbonate, citrate, lactate, phosphate)

- Give in 3-4 divided doses with or 1 hr after meals, follow with full glass of water; if using as phosphate binder in renal dialysis, do not follow with water, do not give oral medications within 1 hr of oral calcium; **chewable tablet:** chew thoroughly; **effervescent tablet:** dissolve in full glass of water; **oral powder:** mix and give with food; **oral solution:** give before meals; **oral suspension:** shake well
- Store at room temperature

IV route

- Warm to room temperature
- Undiluted or diluted with equal amounts of NS to a 5% solution for injection, give 0.5-1 mL/min, give slowly, rapid administration may cause cardiac arrest
- Through small-bore needle into large vein, do not use scalp vein; if extravasation occurs, necrosis will result (IV)
- Remain recumbent ½ hr after IV dose, drop in B/P may result

Calcium chloride

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol,

atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, caspofungin acetate, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, ceftizoxime, chloramphenicol, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cloxacillin, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxapram, DOXOrubicin, doxycycline, edetate calcium disodium, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, furosemide, gallamine, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin sodium, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, kanamycin, labetalol, lactated Ringer's, lepirudin, leucovorin, lidocaine, lincomycin, linezolid, LORazepam, mannitol, meperidine, mephentermine, mesna, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoMYcin, mitoXANTRONE, mivacurium, morphine, moxifloxacin, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, nalorphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel (solvent/surfactant), pancuronium, papaverine, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium, potassium chloride, procainamide, prochlorperazine, promazine, promethazine, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, raNITIdine, Ringer's injection, rocuronium, streptomycin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, topotecan, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole

Calcium gluconate

Y-site compatibilities: Acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atracurium, atropine, azaTHIOprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, ceftAZidime, ceftizoxime, cefuroxime, chloramphenicol sodium succinate, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cloxacillin, codeine, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, DAUNOrubicin, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposomal, doxycycline, edetate calcium disodium, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid (as sodium salt), furosemide, gallamine, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin sodium, HYDROmorphone, hydrOXYzine, IDArubicin,

ifosfamide, insulin (regular), irinotecan, isoproterenol, kanamycin, ketamine, labetalol, lactated Ringer's injection, lepirudin, leucovorin, levoFLOXacin, lidocaine, lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, mephentermine, mesna, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, mitoMYcin, mitoXANTRONE, mivacurium, morphine, moxifloxacin, multiple vitamins injection, nafcillin, nalbuphine, nalorphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pancuronium, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, remifentanil, Ringer's, riTUXimab, rocuronium, sargramostim, sodium acetate, streptomycin, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN (2-in-1), trastuzumab, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole

SIDE EFFECTS

CV: Hypotension, bradycardia, dysrhythmias; cardiac arrest (IV)
GI: Vomiting, nausea, constipation
GU: Hypercalciuria, renal calculi
META: Hypercalcemia
INTEG: Pain, burning at IV site, severe venous thrombosis, necrosis, extravasation

PHARMACOKINETICS

Crosses placenta, enters breast milk, excreted via urine and feces, half-life unknown, protein binding 40%-50%

PO: Onset, peak, duration unknown, absorption from GI tract
IV: Onset immediate, duration ½-2 hr

INTERACTIONS

Increase: milk-alkali syndrome—antacids
Increase: dysrhythmias—digoxin glycosides
Increase: toxicity—verapamil, dilTIAzem
Increase: hypercalcemia—thiazide diuretics
Decrease: absorption of fluoroquinolones, tetracyclines, iron salts, phenytoin, thyroid hormones when calcium is taken PO
Decrease: effects of atenolol—verapamil
Drug/Herb
Increase: action/side effects—lily of the valley, pheasant's eye, shark cartilage, squill
Drug/Food
Decrease: calcium absorption—cereal, spinach
Drug/Lab Test
Increase: calcium

NURSING CONSIDERATIONS

Assess:
- **ECG** for decreased QT and T wave inversion: hypercalcemia, product should be reduced or discontinued, consider cardiac monitoring
- Calcium levels during treatment (8.5-11.5 g/dL is normal level); urine calcium if hypercalciuria occurs
- Cardiac status: rate, rhythm, CVP (PWP, PAWP if being monitored directly)
- **Hypocalcemia:** muscle twitching, paresthesia, dysrhythmias, laryngospasm
- **Digoxin therapy:** monitor frequently; an increase in calcium increases digoxin toxicity risk
- Store at room temperature

Evaluate:
- Therapeutic response: decreased twitching, paresthesias, muscle spasms; absence of tremors, seizures, dysrhythmias, dyspnea, laryngospasm; negative Chvostek's sign, negative Trousseau's sign

Teach patient/family:
- To increase fluids to 2 L/day unless contraindicated; to add bulk to diet for constipation; to notify prescriber of constipation

- Not to switch antacids unless directed by prescriber; not to use as antacid for >2 wk without approval by prescriber
- That therapeutic dose recommendations are figured as elemental calcium
- To avoid excessive use of alcohol, caffeine, tobacco

canagliflozin (Rx)

(kan´a-gli-floe´zin)

Invokana

Func. class.: Oral antidiabetic

Chem. class.: Sodium-glucose cotransporter 2 (SGLT2) inhibitor

ACTION: Blocks glucose reabsorption by the kidney, increases glucose excretion, lowers blood glucose concentrations by inhibiting proximal renal tubular sodium glucose transporter 2 (SGLT2)

USES: Type 2 diabetes mellitus, with diet and exercise; may use in combination; to reduce CV events in type 2 diabetes mellitus with CV disease

CONTRAINDICATIONS: Dialysis, renal failure, hypersensitivity, breastfeeding, diabetic ketoacidosis

Precautions: Pregnancy, children, renal/hepatic disease, hypothyroidism, hyperglycemia, hypotension, pituitary insufficiency, type 1 diabetes mellitus, malnutrition, fever, dehydration, adrenal insufficiency, geriatric patients

Black Box Warning: Lower limb amputation

DOSAGE AND ROUTES

Type 2 diabetes mellitus with diet and exercise

- **Adult: PO** 100 mg/day, may increase to 300 mg/day if needed

Reduction of CV

Risk in diabetes mellitus and to reduce risk of ESKD, doubling of serum creatinine, reduction of HF in hospitalizations, CV death in diabetic neuropathy with albuminuria ≥ 300 mg/day

- **Adult: PO** 100 mg daily in AM before meal, may increase to 300 mg/day if needed

Renal dose

- **Adult: PO** eGFR 30-59 mL/min/1.73 m^2, max 100 mg/day; <30 mL/min/1.73 m^2 do not use

Available forms: Tablets 100, 300 mg

Administer:

PO route

- Once daily with first meal of the day
- Correct volume depletion prior to use
- Adjust dose in times of stress, surgery, trauma
- Store at room temperature

SIDE EFFECTS

CV: Hypotension, orthostatic hypotension

GI: Pancreatitis, nausea, vomiting dehydration

GU: Cystitis, candidiasis, urinary frequency, polydipsia, polyuria, renal impairment UTI, genital fungal infections

INTEG: Photosensitivity, rash, pruritus

META: Hypercholesterolemia, lipidemia, hypoglycemia, hyperkalemia, hypermagnesemia, hyperphosphatemia, hypersensitivity, ketoacidosis

MISC: Bone fractures

PHARMACOKINETICS

99% protein binding, metabolized by UGT1A9, UGT2B4, excreted 33% in urine, peak 1-2 hr, half-life 10.6-13 hr depending on dose

INTERACTIONS

Increase: hypoglycemia—sulfonylureas, insulin, MAOIs, salicylates, fibric acid derivatives, bile acid sequestrants, ACE inhibitors, angiotensin II receptor antagonists, beta-blockers, SSRIs; monitor for hypoglycemia, monitor blood glucose closely, dosage may need to be decreased

Increase: hyperkalemia—potassium-sparing diuretics, ACE inhibitors, ARBs, monitor potassium regularly

Increase or decrease: glycemic control—androgens, lithium, bortezomib, quinolones; monitor for glycemic control

Decrease: effect hyperglycemia—digestive enzymes, intestinal absorbents, thiazide diuretics, loop diuretics, corticosteroids, estrogen, progestins, oral contraceptives, sympathomimetics, isoniazid,

phenothiazines; protease inhibitors, atypical antipsychotics, carbonic anhydrase inhibitors, cycloSPORINE, tacrolimus, baclofen, UGT inducers (PHENobarbital, phenytoin, rifAMPin, ritonavir); dose may need to be increased based on eGFR

Drug/Lab

Increase: urine glucose, potassium, lipids, cholesterol, magnesium phosphate, uric acid, serum creatinine

Decrease: serum glucose, eGFR

Drug/Herb

Decrease: canagliflozin level—St. John's wort

Black Box Warning: Lower limb amputation: Increased risk of amputation; monitor wound and feet closely for complications, provide foot care

NURSING CONSIDERATIONS

Assess:

- **Hypoglycemia** (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucagon
- **Ketoacidosis:** monitor for increased ketone levels; may occur with any glucose level, more common in those with severe illnesses
- **Necrotizing fasciitis (perineum):** requires immediate surgery
- **Volume depletion:** monitor for orthostatic hypotension, weakness, dizziness; may occur after beginning treatment; correct volume depletion before starting treatment
- For stress, surgery, or other trauma that may require a change in dose
- A1c q3mo; monitor serum glucose 1 hr PP throughout treatment; serum cholesterol, serum creatinine/BUN, serum electrolytes
- **Hyperkalemia (renal disease):** monitor potassium closely
- **Bone fractures:** monitor bone density, other conditions that may lead to bone fractures; fractures may occur within 3 mo of starting therapy
- **Renal impairment:** monitor more frequently in those with renal disease; increased creatinine, eGFR may be decreased; BUN may occur
- Monitor electrolytes, LDL, cholesterol and correct as needed
- **Fungal infections:** usually in those with other infections
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding, use only if clearly needed not to use in second/third trimester, do not breastfeed

Evaluate:

- Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait

Teach patient/family:

- The symptoms of hypo/hyperglycemia, what to do about each
- That medication must be taken as prescribed; explain consequences of discontinuing abruptly; that insulin may need to be used for stress, including trauma, fever, surgery, to take as soon as remembered if dose is missed unless close to next dose, then skip and take at next scheduled dose, do not double
- To avoid OTC medications and herbal supplements unless discussed with health care professional
- That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
- To carry emergency ID and glucose source
- That blood glucose monitoring is required to assess product effect
- **Renal injury:** edema in extremities decreased, dark urine, seek care immediately
- **Necrotizing fasciitis:** signs/symptoms of high temperature, genital swelling, pain, redness, seek care immediately

• **Hypersensitivity:** to notify prescriber immediately of itching, hives, rash, swelling of face/lips

Black Box Warning: Lower limb amputation risk: Inspect feet; monitor for new ulcerations, wounds; educate about foot care, to report injury to limbs, sores

• **Ketoacidosis:** to notify prescriber immediately of nausea, vomiting, lack of appetite, sleepiness, difficulty breathing
• **Yeast infections (women/men):** That yeast infections can occur with this product (women, vaginal; men, penile); to report discharge, itching, swelling
• **UTI:** to report immediately burning, pain on urination, hematuria, back pain, decreased urine
• **Pregnancy/breastfeeding:** Not to breastfeed; to advise prescriber if pregnancy is planned or suspected

candesartan (Rx)

(can-deh-sar′tan)

Atacand

Func. class.: Antihypertensive
Chem. class.: Angiotensin II receptor (type AT_1) antagonist

ACTION: Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT_1 receptor found in tissues

USES: Hypertension, alone or in combination; diabetic nephropathy in hypertension and type 2 diabetes

CONTRAINDICATIONS: Hypersensitivity, child GFR <30 mL/min/1.73 m^2, child <1 yr

Black Box Warning: Pregnancy

Precautions: Breastfeeding, children, geriatric patients, hypersensitivity to ACE inhibitors, volume/sodium depletion, renal/hepatic impairment, renal artery stenosis, hypotension, electrolyte abnormalities

DOSAGE AND ROUTES

Hypertension

• **Adult: PO** single agent 16 mg/day initially in patients who are not volume depleted, range 8-32 mg/day, with diuretic or volume depletion 8-32 mg/day as single dose or divided bid
• **Adolescent and child ≥6 yr and weight >50 kg: PO** 8-16 mg/day or divided bid, adjust to B/P; usual range 4-32 mg/day, max 32 mg/day
• **Child ≥6 yr, weight <50 kg: PO** 2-16 mg/day divided 1-2 doses, max 16 mg/day
• **Child ≥1 yr and <6 yr: PO** 0.2 mg/kg/day in 1 dose or in 2 divided doses, adjust to B/P, max 0.4 mg/kg/day

Heart failure (Class II to IV)

• **Adult: PO** 4 mg/day, double ≥2 wk, target dose 32 mg/day

Renal/hepatic disease

• **Adult: PO** ≤8 mg/day for severe renal disease/moderate hepatic disease; adjust dose as needed

Available forms: Tablets 4, 8, 16, 32 mg
Administer:

• Without regard to meals
• Oral liquid (compounded): shake well, do not freeze, use opened within 30 days

SIDE EFFECTS

CNS: *Dizziness,* fatigue, headache, syncope, insomnia
CV: Chest pain, peripheral edema, hypotension, palpitations
EENT: Sinusitis, rhinitis, pharyngitis
GI: *Diarrhea,* nausea, abdominal pain, vomiting
GU: Renal dysfunction
MS: Arthralgia, back pain, myalgia
SYST: Angioedema, hypersensitivity reactions

PHARMACOKINETICS

Onset unknown, peak 3-4 hr, protein binding 90%, half-life 9-12 hr, duration 24 hr, extensively metabolized, excreted in urine (33%) and feces (67%)

INTERACTIONS

Increase: lithium level—lithium
Increase: hyperkalemia—potassium, potassium-sparing diuretics, ACE inhibitors
Increase: hypotension—ACE inhibitors, beta-blockers, calcium channel blockers, alpha-blockers, MAOIs, diuretics
Decrease: hypotensive effect—COX-2 inhibitors, NSAIDs

Drug/Herb
Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—ephedra

Drug/Lab
Increase: albumin, ALT/AST, potassium, serum creatinine

NURSING CONSIDERATIONS

Assess
- **Hypotension:** B/P, pulse; note rate, rhythm, quality; notify prescriber of significant changes, if hypotension is significant, have patient lie down, effect of product may take 2 wk
- **Electrolytes:** potassium, sodium, calcium; baselines of renal/hepatic studies before therapy begins
- **Hydration:** skin turgor, dryness of mucous membranes, correct volume depletion
- **Blood studies:** BUN, creatinine, LFTs baseline, all may be increased
- **Serious hypersensitivity reaction:** angioedema, anaphylaxis: facial swelling, difficulty breathing (rare)
- **Hyperkalemia:** more common with other diuretics
- Response and adverse reactions, especially with renal disease; diuretic may be added
- **Heart failure:** monitor for jugular venous distention, weight, peripheral edema, dyspnea, crackles

Black Box Warning: Pregnancy/breast-feeding: This product can cause fetal death when given during pregnancy; do not breastfeed

Evaluate:
- Therapeutic response: decreased B/P, decreased heart failure–related complications, death

Teach patient/family:
- To notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur
- To avoid all OTC medications unless approved by prescriber; to inform all health care providers of use, full effect 4 wk, onset 2 wk; that product may be taken with or without meals; to store at room temperature, to comply with dosage schedule, even if feeling better
- To use proper technique for obtaining B/P; to understand acceptable parameters; to rise slowly to sitting or standing position to minimize orthostatic hypotension; that product may cause dizziness, fainting, light headedness
- To continue to follow other requirements, no smoking, lose weight, exercise
- To limit potassium foods or salt substitutes/supplements containing potassium unless discussed with health care professional

cangrelor (Rx)

(kan´grel-or)

Kengreal

Func. class.: Platelet aggregation inhibitor

Chem. class.: ADP receptor antagonist

ACTION: A direct competitive inhibitor of a platelet receptor, prevents further signaling and platelet activation, results in inhibition of platelet activation and aggregation, does not require hepatic conversion to an active metabolite

USES: For use as an adjunct to percutaneous coronary intervention (PCI) for myocardial infarction prophylaxis, repeat coronary revascularization, and stent thrombosis in patients who have not been treated with a P2Y12 platelet inhibitor and are not being given a glycoprotein IIb/IIIa inhibitor

CONTRAINDICATIONS:
Hypersensitivity, active bleeding
Precautions: Pregnancy, breastfeeding, children, increased bleeding risk, neutropenia, agranulocytosis, renal disease

DOSAGE AND ROUTES
Adjunct to PCI
• **Adult: IV BOLUS** 30 mcg/kg as a single dose, then follow immediately by 4 mcg/kg/min continuous IV infusion; the bolus should be given before PCI and maintenance infusion should be continued for ≥2 hr or for the duration of PCI, whichever is longer; use ticagrelor, prasugrel, or clopidogrel to maintain platelet inhibition
Available forms: Lyophilized powder for injection 50 mg
Administer:
• Visually inspect parenteral products for particulate matter and discoloration before use, use IV only
• **Reconstitution:** Reconstitute by adding 5 mL sterile water for injection to a 50-mg vial, swirl until dissolved, do not shake, allow foam to settle, solution should be clear and colorless to pale yellow; withdraw contents of reconstituted 50-mg vial and add to 250-mL bag of 0.9% sodium chloride injection or dextrose 5% injection resulting in a final infusion concentration of 200 mcg/mL; usually, 1 bag should be sufficient for most patients for ≥2 hr of dosing; those weighing >100 kg will require a minimum of 2 bags
• Use diluted product immediately. When stored at room temperature, diluted product stable for ≤12 hr in dextrose 5% injection and 24 hr in 0.9% sodium chloride injection, use a dedicated line
• Bolus injection should be administered rapidly (<1 min). The bolus volume may be withdrawn from the diluted infusion bag and given by IV push or using an infusion pump
• Ensure the bolus dose is completely administered prior to start of PCI
• Start the continuous IV infusion immediately after administration of the bolus; use infusion pump for the continuous IV infusion

SIDE EFFECTS
CNS: Intracranial bleeding
GI: GI bleeding
GU: Hematuria
HEMA: Bleeding
RESP: Wheezing, dyspnea, bronchospasm
SYST: Anaphylaxis, angioedema

PHARMACOKINETICS
Half-life 3-6 min; plasma protein binding 97%; effect on platelets 2 min, excreted in urine

INTERACTIONS
Do not give clopidogrel or prasugrel until infusion is discontinued
Increase: effect of warfarin, platelet inhibitors

NURSING CONSIDERATIONS
Assess:
• **Bleeding:** intracranial, retroperitoneal, other frank bleeding, after completion of infusion, platelet inhibition decreases rapidly within 1 hr; monitor Hct/HB
• **Hypersensitivity:** identify if patient has a known cangrelor hypersensitivity
• **Severe renal impairment:** decreased renal function may occur in severe renal impairment, CCr >30 mL/min; no dosage change is required
• **Pregnancy/breastfeeding:** identify whether the patient is pregnant or breastfeeding; it is not known whether product is excreted in breast milk, no well-controlled studies
Evaluate:
• Therapeutic response: platelet inhibition during PCI
Teach patient/family:
• Use and expected results
• **Pregnancy/breastfeeding:** to inform prescriber if pregnancy is planned or suspected, or if breastfeeding
• **Bleeding:** to report bleeding immediately (blood in stools, urine, gums, bruising)
• **Hypersensitivity:** to report immediately any difficulty breathing; hives; swelling of face, lips, mouth

cannabidiol (Rx)

(ka-na′bi-dye-ole)

Epidiolex

Func. class.: Anticonvulsant

USES: Seizures associated with Lennox-Gastaut syndrome or Dravet syndrome or tuberous sclerosis complex

CONTRAINDICATIONS: Hypersensitivity to this product or sesame seed oil

Precautions: Abrupt discontinuation, breastfeeding, depression, driving or operating machinery, hepatic disease, pregnancy, suicidal ideation

DOSAGE AND ROUTES

• **Adult/adolescent/child ≥2 yr: PO** Initially, 2.5 mg/kg bid; after 1 wk may increase to 5 mg/kg bid, may increase weekly by 2.5 mg/kg bid, max 10 mg/kg bid

• **Available forms:** Oral solution 100 mg/mL

⚠ HIGH ALERT

capecitabine (Rx)

(cap-eh-sit′ah-bean)

Xeloda

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Pyrimidine carbamate

Do not confuse:
Xeloda/Xenical

ACTION: Competes with physiologic substrate of DNA synthesis, thereby interfering with cell replication in the S phase of cell cycle (before mitosis); also interferes with RNA and protein synthesis; product is converted to 5-FU

USES: PACLitaxel- and anthracycline-resistant metastatic breast, colorectal cancer when 5-FU monotherapy is preferred; treatment of colorectal cancer patients who have undergone complete resection of their primary tumors

Unlabeled uses: Breast cancer (HER-2 negative) (adjuvant), pancreatic cancer (adjuvant locally advanced)

CONTRAINDICATIONS: Pregnancy, hypersensitivity to 5-FU, infants, severe renal impairment (CCr <30 mL/min)

Precautions: Breastfeeding, children, infections, radiation therapy, anticoagulation, geriatric patients, renal/hepatic/cardiac disease, Box DPD deficiency

Black Box Warning: Anticoagulant therapy

DOSAGE AND ROUTES

Breast cancer alone or with DOCEtaxel; metastatic colorectal cancer when fluoropyrimidine alone is preferred; Dukes Stage C colon cancer after resection when fluoropyrimidine alone is preferred

Adult: PO 2500 mg/m²/day divided q12hr after a meal × 2 wk, repeat q3wk; **Dukes C colon cancer** 8 cycles (24 wk), max 5600 mg/day

Renal dose

• **Adult: PO** CCr 30-50 mL/min, decrease initial dose to 75% of usual dose; CCr <30 mL/min, contraindicated

Primary breast cancer (adjuvant therapy) in those with HER-2 negative who have residual invasive disease containing an anthracycline or/and taxane (unlabeled)

• **Adult: PO** 1250 mg/m² bid on days 1 to 14 of a 21-day cycle × 6-8 cycles

Pancreatic adenocarcinoma (adjuvant) after rescetion (unlabeled)

• **Adult: PO** 1660 mg/m² divided bid on day 1-21 q28 days with gemcitabine × 6 cycles 8-12 wk after resection

Pancreatic cancer (locally advanced or metastatic)(unlabeled)
Adult: PO 1250 mg/m^2 bid on days 1-14 of a 3-wk cycle or 830 mg/m^2 bid with gemcitabine on days 1-21 of a 4-wk cycle
Available forms: Tablets 150, 500 mg
Administer:
- Swallow whole, take with water within 30 min of a meal
- Use cytotoxic handling procedures

SIDE EFFECTS

CNS: Dizziness, *headache, paresthesia, fatigue,* insomnia
CV: Venous thrombosis, edema, chest pain
GI: *Nausea, vomiting, anorexia, diarrhea, stomatitis, abdominal pain, constipation, dyspepsia,* hyperbilirubinemia, hepatitis
HEMA: Neutropenia, lymphopenia, thrombocytopenia, anemia
INTEG: *Dermatitis,* nail disorders, alopecia, rash
OTHER: *Eye irritation, edema*, limb pain, *pyrexia,* dehydration, renal impairment, Stevens-Johnson syndrome
RESP: *Cough, dyspnea,* pulmonary embolism

PHARMACOKINETICS

Readily absorbed, peak 1½ hr, food decreases absorption, extensively metabolized in the liver, elimination half-life 45 min

INTERACTIONS

Increase: toxicity—leucovorin fosphenytoin; monitor for toxicity
Increase: capecitabine levels—antacids (aluminum, magnesium)
Increase: phenytoin level—phenytoin; monitor phenytoin level

Black Box Warning: Increase: bleeding risk—anticoagulants, NSAIDs, salicylates, platelet inhibitors, thrombolytics; monitor PT and INR

Decrease: capecitabine effect—allopurinol; avoid using together

Drug/Food
Increase: absorption; give within 30 min of a meal
Drug/Lab Test
Increase: bilirubin
Decrease: HB/Hct/RBC, neutrophils, platelets, WBC

NURSING CONSIDERATIONS

Assess:
- **Bone marrow suppression,** CBC (RBC, Hct, HB), differential, platelet count weekly; withhold product if WBC is <1000/mm^3, platelet count is <50,000/mm^3, or RBC, Hct, HB low; notify prescriber of these results; frequently monitor INR in those receiving warfarin concurrently
- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- Infection: monitor temperature q4hr; fever may indicate beginning infection; no rectal temperatures
- Hepatic studies prior to, during therapy: bilirubin, ALT, AST, alkaline phophatase as needed or monthly

Black Box Warning: Bleeding: hematuria, heme-positive stools, bruising or petechiae of mucosa or orifices q8hr; monitor INR and PT in those taking coumarin-derivative anticoagulants; adjustment of dose may be needed , those >60 at higher risk of bleeding; dose may need to be decreased

- Dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy; personality changes with high doses
- **Hand and foot syndrome/Stevens-Johnson syndrome:** paresthesia, tingling, painful/painless swelling, blistering, erythema with severe pain of hands or feet, toxicity is divided into grade 1, 2, 3; if grade 2 or 3, product should be discontinued until grade 1
- **GI toxicity:** severe diarrhea (multiple times/day or at night), nausea, vomiting, stomatitis, fever; adjust dose, stop treatment if severe

- Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Fluid, electrolytes may need to be given; elderly patients are at greater risk of GI symptoms, dehydration
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To avoid foods with citric acid, hot temperature, or rough texture if stomatitis is present; to take with water within 30 min of end of meal; not to take if dose is missed
- How to take (on for 14 days then 7 days off, then start a new cycle); do not crush, cut
- Not to double dose if dose is missed
- **To immediately report severe diarrhea, vomiting, stomatitis, fever of more than 100°F (37.8°C), hand and foot syndrome, anorexia; stop taking product**
- **To report bleeding in those taking anticoagulants**
- **To report signs of infection:** increased temperature, sore throat, flulike symptoms, to avoid crowds, persons with known infections; signs of **anemia:** fatigue, headache, faintness, shortness of breath, irritability; **bleeding;** to avoid use of razors, commercial mouthwash
- To use OTC antidiarrheals for mild diarrhea (4-6 stools/day or diarrhea at night)
- **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected; to avoid pregnancy while taking this product, use adequate contraception during and for 6 mo after last dose; males should use contraception during and for 3 mo after last dose if partner is of child bearing potential; not to breastfeed
- That continuing exams and blood work will be needed

caplacizumab-yhdp (Rx)

(kap′luh-sih′-zoo-mab)

Cablivi

Func. class.: Hematologic agent

USES: Acquired thrombotic thrombocytopenia purpura (aTTP), in combination with plasma exchange and immunosuppressive therapy

CONTRAINDICATIONS Hypersensitivity

DOSAGE AND ROUTES

- **Adult: IV** 11 mg once at least 15 min before plasma exchange on the first day of treatment (initial dose); **SUBCUT** 11 mg daily starting after the completion of plasma exchange on day 1 and continuing for 30 days after the last daily plasma exchange; treatment may be extended for a maximum of 28 days after the initial treatment (maintenance dose)

Available forms: Single-dose vial 11 mg

capmatinib (Rx)

(kap-ma′ti-nib)

Tabrecta

Func. class.: Antineoplastic

USES: Treatment of metastatic non–small-cell lung cancer with a mutation of mesenchymal-epithelial transition (MET) exon 14 skipping

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

DOSAGE AND ROUTES

Adult: PO 400 mg bid, continue until disease progression or unacceptable toxicity

Available forms: Tablet 150, 250 mg

captopril (Rx)

(kap'toe-pril)
Func. class.: Antihypertensive
Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse:
captopril/carvedilol

ACTION: Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II

USES: Hypertension, HF, left ventricular dysfunction after MI, diabetic nephropathy, proteinuria
Unlabeled uses: Acute MI, hypertensive emergency/urgency, scleroderma renal crisis (SRC)

CONTRAINDICATIONS: Breastfeeding, children, hypersensitivity, heart block, potassium-sparing diuretics, bilateral renal artery stenosis, ACE inhibitors, ACE inhibitor–induced angioedema

Black Box Warning: Pregnancy

Precautions: Dialysis patients, hypovolemia, leukemia, scleroderma, SLE, blood dyscrasias, HF, diabetes mellitus, thyroid/renal/hepatic disease, African descent, pregnancy first trimester, collagen vascular disease, hyperkalemia, hyponatremia

DOSAGE AND ROUTES

Hypertension
- **Adult: PO** initial dose: 12.5-25 mg bid-tid; may increase to 50 mg bid-tid at 1-2 wk intervals; usual range: 25-150 mg bid-tid; max 450 mg/day
- **Child (unlabeled): PO** 0.3-0.5 mg/kg/dose, may titrate up to 6 mg/kg/day in 2-4 divided doses
- **Infant (unlabeled): PO** 0.15-0.3 mg/kg/dose initially, max 6 mg/kg/day
- **Neonate (unlabeled): PO** 0.01-0.1 mg/kg/dose, may increase as needed

Heart failure
- **Adult: PO** 25 mg bid; may increase to 50 mg tid; after 14 days, may increase to 150 mg tid if needed
- **Adolescent (unlabeled): PO** 6.25-12.5 mg q8-12hr titrated up to max 50-75 mg/dose
- **Child (unlabeled): PO** 0.1-2 mg/kg/dose q6-12hr, max 6 mg/kg/day
- **Infant (unlabeled): PO** 0.15-0.3 mg/kg/dose, max 6 mg/kg/day in 1-4 divided doses
- **Neonate (unlabeled): PO** 0.05-0.1 mg/kg q8-24hr titrate to 0.5 mg/kg q6-24hr, max 2 mg/kg/day

Diabetic nephropathy
- **Adult: PO** 25 mg tid

Renal dose
- **Adult: PO** CCr 10-50 mL/min, decrease dose by 25%; CCr <10 mL/min, decrease dose by 50%

Left ventricular dysfunction/acute MI (unlabeled) or post-MI
- **Adult: PO** 6.25-12.5 mg tid, increase to 25 mg tid gradually

Hypertensive emergency/urgency (unlabeled)
- **Adult: PO** 25 mg, may repeat q30min

Available forms: Tablets 12.5, 25, 50, 100 mg

Administer:
- Store in tight container at 86°F (30°C) or less
- 1 hr prior to or 2 hr after meals
- Correct volume depletion before starting treatment
- **Oral solution:** May crush 25-mg tablet, dissolve in 50-100 mL water; give within ½ hr; make sure tablet completely dissolved

SIDE EFFECTS

CNS: Fever, chills, dizziness, drowsiness, fatigue, headache, insomnia, weakness
CV: *Hypotension,* postural hypotension, *tachycardia,* angina
GI: Loss of taste, increased LFTs
GU: Impotence, dysuria, nocturia, proteinuria, nephrotic syndrome, acute reversible renal failure, polyuria, oliguria, urinary frequency
HEMA: Neutropenia, agranulocytosis, pancytopenia, thrombocytopenia, anemia

INTEG: Rash, pruritus
MISC: Angioedema, hyperkalemia
RESP: Bronchospasm, *dyspnea, cough*

PHARMACOKINETICS

Peak 1 hr; duration 2-6 hr; half-life <2 hr, increased in renal disease; metabolized by liver (metabolites); excreted in urine; crosses placenta; excreted in breast milk, small amounts; protein binding 25%-30%

INTERACTIONS

- Do not use with potassium-sparing diuretics, sympathomimetics, potassium supplements

Increase: possible toxicity—lithium, digoxin; monitor individual drug levels
Increase: hyperkalemia—aliskiren
Increase: hypoglycemia—insulin, oral antidiabetics; monitor blood glucose
Increase: hypotension—diuretics, other antihypertensives, acute alcohol ingestion, MAOIs
Decrease: captopril effect—antacids, COX-2 inhibitors, NSAIDs, salicylates

Drug/Herb
Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—black licorice, ephedra

Drug/Food
Decrease: absorption of captopril

Drug/Lab Test
Increase: AST, ALT, alkaline phosphatase, bilirubin, uric acid, potassium
Decrease: platelets, WBC, RBC, HB/Hct
False positive: urine acetone
Positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- **Blood dyscrasias:** blood studies: decreased platelets; CBC with differential at baseline, q2wk and periodically during 1 yr; if neutrophils <1000/mm^3, discontinue treatment (recommended with collagen-vascular or renal disease)
- **Hypertension:** B/P, pulse rates at baseline, frequently; notify prescriber of significant changes
- **Heart failure:** dyspnea, jugular venous distention, weight gain, edema, rales/crackles in lungs, increased B/P
- **Renal studies:** protein, BUN, creatinine electrolytes, watch for raised levels, if increased dose may need to be reduced
- **Angioedema/allergic reaction:** rash, fever, pruritus, urticaria; discontinue product if antihistamines fail to help; swelling of lips, mouth, face; difficulty breathing/swallowing (angioedema); provide supportive care; discontinue product
- Monitor AST, ALT, alkaline phosphatase, glucose, urine protein, bilirubin, uric acid baseline and periodically
- **Cough:** monitor for development of dry cough unexplained by other illness; notify prescriber
- Black patients may require higher dose and have higher incidence of angioedema

Renal disease/collagen vascular disorder (SLE, scleroderma): leukocytes, differential baseline and q2wk × 3 mo and periodically thereafter

Black Box Warning: Pregnancy/breastfeeding: Discontinue ACE inhibitors when pregnancy is detected; monitor fetal development regularly; do not breastfeed

Evaluate:

- Therapeutic response: decrease in B/P with hypertension; decreased edema, moist crackles (HF); decreased diabetic nephropathy symptoms

Teach patient/family:

- To take 1 hr prior to or 2 hr after meals; not to discontinue product abruptly; if dose is missed, take as soon as remembered but not if almost time for next dose; not to double doses, advise patient to tell all persons associated with care that product is being used
- Not to use OTC products (cough, cold, or allergy) unless directed by prescriber; to avoid salt substitutes, high-potassium or high-sodium foods
- To adhere to dosage schedule, even if feeling better
- To use cautiously in hot weather, make sure fluids are adequate
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

- To notify prescriber of fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema, rash, hoarseness, difficulty breathing
- **Infection:** to report fever, sore throat, flulike symptoms, other signs of infection
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur
- That dizziness, fainting, light headedness may occur during first few days of therapy; to avoid activities that require concentration
- How to take B/P and when to notify prescriber
- **Diabetes:** to monitor blood glucose often, hypoglycemia

Black Box Warning: Pregnancy/breastfeeding: to notify if pregnancy is planned or suspected; not to breastfeed, contraception should be used, if pregnancy occurs, discontinue medication

carbachol ophthalmic

See Appendix B

carBAMazepine (Rx)

(kar-ba-maz´e-peen)

Carbatrol, Carnexiv, Epitol, Equetro, Tegretol CR, TEGretol, TEGretol-XR

Func. class.: Anticonvulsant

Chem. class.: Iminostilbene derivative

Do not confuse:

carBAMazepine/OXcarbazepine

TEGretol/Tegrotol XR/Tequin/TRENtal

ACTION: Exact mechanism unknown; appears to decrease polysynaptic responses and block posttetanic potentiation

USES: Tonic-clonic, complex-partial, mixed seizures; trigeminal neuralgia; bipolar disorder

Unlabeled uses: Neurogenic pain

CONTRAINDICATIONS: Pregnancy, hypersensitivity to carBAMazepine or tricyclics, MAOI therapy, bone marrow suppression

Precautions: Breastfeeding, children <6 yr, glaucoma, AV or bundle branch block, cardiac/renal/hepatic disease, psychosis, alcoholism, hepatic porphyria

Black Box Warning: Hematologic disease, Asian patients or those with positive HLA-B 1502 or HLA-A 3101 alleles, agranulocytosis, leukopenia, neutropenia, thrombocytopenia

DOSAGE AND ROUTES—NTI

General tonic/clonic and complex partial seizures, mixed seizure patterns

- **Adult and child >12 yr: PO** 200 mg bid, may be increased by 200 mg/day in weekly intervals, give in divided doses q6-8hr; maintenance 800-1200 mg/day, max 1600 mg/day (adult); max child 12-15 yr 1000 mg/day; max child >15 yr 1200 mg/day; **EXTENDED RELEASE** give bid; rectal administration of **ORAL SUSPENSION** 200 mg/10 mL or 6 mg/kg as a single dose
- **Child 6-12 yr: PO** tablets 100 mg bid or **extended release** 50 mg qid; may increase by <100 mg weekly; max 1000 mg/day, usual dose 15-30 mg/kg/day
- **Child <6 yr: PO** 10-20 mg/kg/day in 2-3 divided doses or 4 divided doses (suspension), may increase every wk, do not use extended release, max 35 mg/kg/day

Diabetic neuropathy (unlabeled)

- **Adult: PO** 100 mg bid or 50 mg qid, titrate to 600-800 mg/day

Acute mania and mixed episodes in bipolar I disorder

- **Adult: PO** (Equetro only) 200 mg bid, increase by 200 mg/day until response, max 1600 mg/day

Trigeminal neuralgia

- **Adult: PO** 100 mg bid with meals; may increase 100 mg q12hr until pain subsides, max 1200 mg/day; maintenance 200-400 mg bid

Available forms: Chewable tablets 100, 200 mg; tablets 100, 200, 300, 400 mg; extended-release tablets (XR) 100, 100, 200, 400 mg; oral suspension 100 mg/5 mL; extended-release capsules 100, 200, 300 mg

Administer:

PO route

- When converting from tablets to oral suspension, give same amount/day, or regular release to extended release same amount
- Do not crush, chew extended-release tablet; extended-release capsule may be opened and beads sprinkled over food; patient should chew chewable tablet, not swallow it whole
- With food, milk to decrease GI symptoms

Suspension: Turn off NG/enteral feeding 15 min prior to and hold for 15 min after

- Mix an equal amount of water, D_5W, 0.9% NaCl when giving by NG tube; flush tube with 15-30 mL, do not give at same time as other liquid products or diluents
- Shake oral suspension before use
- Store at room temperature

SIDE EFFECTS

CNS: *Drowsiness,* dizziness, fatigue, headache, suicidal thoughts/behaviors

CV: Hypertension, AV block, hypotension

EENT: Dry mouth, blurred vision, diplopia, nystagmus

ENDO: SIADH (geriatric patients)

GI: *Nausea,* anorexia, increased hepatic enzymes, pancreatitis, hepatotoxicity

GU: Retention, increased BUN, renal dysfunction

HEMA: Thrombocytopenia, leukopenia, agranulocytosis, aplastic anemia, eosinophilia, lymphadenopathy

INTEG: *Rash,* Stevens-Johnson syndrome, urticaria, photosensitivity, toxic epidermal necrolysis, DRESS, alopecia, pruritus

RESP: Pulmonary hypersensitivity (fever, dyspnea, pneumonitis)

PHARMACOKINETICS

Onset slow; peak 4-5 hr (PO), 1.5 hr (suspension) metabolized by liver; excreted in urine, feces; crosses placenta, blood-brain barrier; excreted in breast milk; half-life 6-12 hr; protein binding 76%; metabolized by CYP3A4

INTERACTIONS

- **Increase:** CNS toxicity—lithium; avoid concurrent use
- **Fatal reaction:** MAOIs; do not use within 14 days of beginning carBAMazepine
- Do not use with nonnucleoside reverse transcriptase inhibitors (NNRTIs), nefazodone

Increase: carBAMazepine levels—CYP3A inhibitors (cimetidine, clarithromycin, danazol, dilTIAzem, erythromycin, FLUoxetine, fluvoxaMINE, isoniazid, valproic acid, verapamil, voriconazole), SSRIs, tricyclics; adjust dose if needed, or do not use together

Increase: effects of desmopressin, lithium, lypressin, vasopressin

Decrease: carBAMazepine effect—CYP1A2, CYP2C9 substrates

Decrease: effect of CYP3A inducers

Decrease: effects of benzodiazepines, doxycycline, felbamate, haloperidol, oral contraceptives, PHENobarbital, phenytoin, primidone, theophylline, thyroid hormones, warfarin; adjust dose as needed

Decrease: carBAMazepine levels—CYP3A4 inducers (CISplatin, darunavir, delavirdine, DOXOrubicin, felbamate, nefazodone, OXcarbazepine, PHENobarbital, phenytoin, primidone, rifAMPin, theophylline); monitor carBAMazepine effectiveness

Drug/Herb

Decrease: carBAMazepine metabolism, increased levels—echinacea

Decrease: anticonvulsant effect—St. John's wort

Drug/Food

Increase: peak concentration of carBAMazepine—grapefruit juice; avoid use

Drug/Lab Test

Decrease: serum calcium, sodium

Increase: cholesterol

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Asian patients for serious skin reaction; genetic test for HLA-B1502 allele prior to administration; these patients may develop toxic epidermal necrolysis, Stevens-Johnson syndrome, DRESS; may be fatal

- **Seizures:** character, location, duration, intensity, frequency, presence of aura, in mixed seizure disorder, worsening of symptoms may occur
- **Trigeminal neuralgia:** facial pain, including location, duration, intensity, character, activity that stimulates pain
- Renal studies: urinalysis, BUN, urine creatinine q3mo
- **Bipolar disorder:** assess for symptoms at baseline and during treatment
- **DRESS:** fever, lymphadenopathy with multiorgan involvement, including liver, kidney, cardiac; discontinue carBAMazepine

Black Box Warning: Bone marrow depression: blood studies: CBC reticulocyte counts every week for 4 wk, then q3-6mo if on long-term therapy; if myelosuppression occurs, product should be discontinued; blood dyscrasias: fever, sore throat, bruising, rash, jaundice, agranulocytosis, and aplastic anemia may occur

- Blood studies: ALT, AST, bilirubin; serum calcium, may be decreased and lead to osteoporosis; cholesterol periodically
- Drug levels during initial treatment or when changing dose; should remain at 4-12 mcg/mL; anorexia may indicate increased blood levels
- **Mental status:** mood, sensorium, affect, behavioral changes, **suicidal thoughts/behaviors;** if mental status changes, notify prescriber
- **Eye problems:** need for ophthalmic examinations prior to during, after treatment (slit lamp, funduscopy, tonometry)
- **Allergic reaction:** purpura, red, raised rash; if these occur, product should be discontinued; increased risk if past hypersensitivity to hydantoins
- **Toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse
- Hard candy, gum, frequent rinsing for dry mouth
- **Beers:** avoid use in older adults unless safer alternative is unavailable; ataxia, impaired psychomotor function may occur

Evaluate:
- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:
- To carry emergency ID stating patient's name, products taken, condition, prescriber's name, and phone number
- To avoid driving, other activities that require alertness usually for the first 3 days of treatment; dizziness, drowsiness may occur
- Not to discontinue medication quickly after long-term use; seizures may occur
- To immediately report chills, rash, light-colored stools, dark urine, yellowing of skin and eyes, abdominal pain, sore throat, mouth ulcers, bruising, blurred vision, dizziness, skin rash, fever
- That urine may turn pink to brown
- Not to use with grapefruit juice; to take on an empty stomach; that toxicity may occur
- That ophthalmic examinations will be needed; to report changes in vision
- **Pregnancy/breastfeeding:** to notify health care provider if pregnancy is planned or suspected; not to breastfeed; that if pregnant, patient should register with American Antiepileptic Drug Pregnancy Registry (888-233-2334), to use nonhormonal contraceptive

TREATMENT OF OVERDOSE: Lavage, VS

⚠ HIGH ALERT

CARBOplatin (Rx)

(kar-boe-pla´-tin)

Func. class.: Antineoplastic alkylating agent

Chem. class.: Platinum coordination compound

Do not confuse:
CARBOplatin/CISplatin

ACTION: Produces interstrand DNA cross-links and, to a lesser extent, DNA-protein cross-links; activity is not cell-cycle–phase specific

USES: Advanced ovarian cancer in combination with other agents; palliative treatment of ovarian carcinoma recurrent

after treatment with other antineoplastic agents

CONTRAINDICATIONS:

Pregnancy, breastfeeding, hypersensitivity, significant bleeding, aluminum products used to prepare or administer CARBOplatin

Black Box Warning: Severe bone marrow depression, platinum compound hypersensitivity (anaphylaxis)

Precautions: Geriatric patients, radiation therapy within 1 mo, other cancer chemotherapy within 1 mo, renal/hepatic disease, hearing impairment, infection

Black Box Warning: Anemia, chemotherapy-induced nausea/vomiting; requires a specialized care setting and an experienced clinician

DOSAGE AND ROUTES

Advanced ovarian cancer:

• **Adults: IV:** For patients with previously untreated ovarian cancer, 300 mg/m^2 on day 1 in combination with cyclophosphamide (600 mg/m^2 IV on day 1), repeated q4wk × 6 cycles. For patients with recurrent ovarian cancer, give CARBOplatin 360 mg/m^2 on day 1, repeated q4wk

ALL with ifosfamide, etoposide, rituximab (unlabeled):

• **Adults ≤21: IV:** CARBOplatin 635 mg/m^2 on day 3 with ifosfamide 3000 mg/m^2/day IV on days 3, 4, 5 (each dose mixed with mesna 600 mg/m^2 IV, then mesna 600 mg/m^2 IV over 15 min at 3, 6, 9, and 12 hr after the start of ifosfamide) and etoposide 100 mg/m^2/day IV on days 3, 4, 5, repeated each cycle. Rituximab 375 mg/m^2 IV on days 1 and 3 of cycles 1 and 2 and on day 3 only of cycle 3. Treatment was given up to a maximum of 3 cycles. Colony-stimulating factors were initiated on day 6 of each cycle, and intrathecal chemotherapy was also given as appropriate

Relapsed Wilms tumor with etoposide and ifosfamide (unlabeled):

• **Adults ≤21 yr, adolescents, and children: IV:** Ifosfamide 1800 mg/m^2/day × 5 days (on days 0, 1, 2, 3, 4), CARBOplatin 400 mg/m^2/day IV × 2 days (on days 0, 1), and etoposide 100 mg/m^2/day IV × 5 days (on days 0, 1, 2, 3, 4), repeated q21day

Neuroblastoma with etoposide, cyclophosphamide, and DOXOrubicin (unlabeled):

• **Infants/children: IV:** In cycles 1 and 7: CARBOplatin 560 mg/m^2 on day 1 (18 mg/kg/day in children <12 kg) plus etoposide 120 mg/m^2/day IV on days 1, 2, 3 (4 mg/kg/day in children <12 kg). Cycles 2 and 6: CARRBOplatin 560 mg/m^2 on day 1 (18 mg/kg/day <12 kg) plus cyclophosphamide 1000 mg/m^2 IV on day 1 (33 mg/kg/day in children <12 kg) and DOXOrubicin 30 mg/m^2 IV on day 1 (1 mg/kg/day in children <12 kg). Cycles 3 and 5: Cyclophosphamide 1000 mg/m^2 IV on day 1 (33 mg/kg/day in children <12 kg) plus etoposide 120 mg/m^2/day IV on days 1, 2, 3 (4 mg/kg/day in children <12 kg). Cycle 4: CARBOplatin 560 mg/m^2 IV on day 1 (18 mg/kg/day in children <12 kg) plus etoposide 120 mg/m^2/day IV on days 1, 2, 3 (4 mg/kg/day in children <12 kg) and DOXOrubicin 30 mg/m^2 IV on day 1 (1 mg/kg/day in children <12 kg). Cycle 8: Cyclophosphamide 1000 mg/m^2 IV on day 1 (33 mg/kg/day in children <12 kg) plus DOXOrubicin 30 mg/m^2 IV on day 1 (1 mg/kg/day in children <12 kg). All cycles given at 3-wk intervals. Patients given an additional 4 cycles. Patients with unfavorable biologic features received 8 cycles

Renal dose

Adult: (single agent) **IV INF** CCr 41-59 mL/min 250 mg/m^2; CCr 16-40 mL/min 200 mg mg/m^2; do not use if CCr <15 mL/min

Available forms: Solution for injection 10 mg/mL (50 mg/5 mL, 150 mg/15 mL, 450 mg/45 mL, 600 mg/60 mL)

Administer:

Black Box Warning: Give antiemetic 30-60 min prior to product and prn for vomiting

IV route

• Do not use needles or IV administration sets that contain aluminum;

may cause precipitate or loss of potency
- Use cytotoxic handling procedures
- Store protected from light at room temperature; reconstituted vials stable for 24 hr at room temperature, solutions further diluted in D_5W or NS are stable for 8 hr at room temperature. Paraplatin multidose (10 mg/mL) vials stable for up to 14 days after entry into vial
- **Reconstitute** CARBOplatin 50, 150, or 450 mg with 5, 15, or 45 mL, respectively, of sterile water for injection, D_5W, or NaCl (10 mg/mL); then further **dilute** with the same solution to 0.5-4 mg/mL; **give** over 15 min-1 hr (intermittent INFUSION)
- **Continuous IV INFUSION** give over 24 hr; max dose based on (GFR = 125 mg/mL)

Solution compatibilities: D_5/0.2% NaCl, D_5/0.45% NaCl, D_5/0.9% NaCl, 0.9% NaCl, D_5W, sterile water for injection

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levoFLOXacin, levorphanol, lidocaine, linezolid injection, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANTRONE, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, raNITIdine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, TPN, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Central neurotoxicity, *peripheral neuropathy,* dizziness, confusion

CV: Cardiac abnormalities (fatal CV events), stroke, HF, embolism

EENT: Tinnitus, hearing loss

GU: Nephrotoxicity

GI: *Severe nausea, vomiting,* diarrhea, weight loss, mucositis, anorexia, constipation, taste change

HEMA: Thrombocytopenia, leukopenia, neutropenia, anemia
INTEG: Dermatitis, rash
META: Hypomagnesemia, hypocalcemia, hypokalemia, hyponatremia, hyperuricemia
SYST: Anaphylaxis, hypersensitivity

PHARMACOKINETICS

Initial half-life 2-6 hr, postdistribution half-life 2½-6 hr, not bound to plasma proteins, excreted by the kidneys

INTERACTIONS

- Do not use with or within 3 mo of live virus vaccines

Increase: nephrotoxicity or ototoxicity—aminoglycosides, amphotericin B
Increase: toxicity—radiation, bone marrow suppressants; monitor for blood counts often
Increase: myelosuppression—myelosuppressives
Decrease: phenytoin levels; monitor levels

Drug/Lab Test

Increase: AST, BUN, alkaline phosphatase, bilirubin, creatinine
Decrease: platelets, neutrophils, WBC, RBC, HB/Hct, calcium, potassium, magnesium, phosphate

NURSING CONSIDERATIONS

Assess:

Black Box Warning: To be used only in a specialized care setting by a person experienced in the use of chemotherapeutic products

Black Box Warning: Bone marrow depression: CBC, differential, platelet count weekly; withhold product if neutrophil count is <2000/mm^3 or platelet count is <100,000/mm^3; notify prescriber of results; calcium, magnesium, phosphate, potassium, sodium, uric acid, CCr, bilirubin; CCr <60 mL/min may be responsible for increased bone marrow suppression; assess frequently for infection and treat active infection before use

Black Box Warning: Nausea/vomiting: may occur a few hours after administration; antiemetics are used; give fluids, food as tolerated

- Renal studies: BUN, creatinine, serum uric acid; urine CCr prior to, during therapy; I&O ratio; report fall in urine output to <30 mL/hr
- Hepatic studies prior to, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; jaundice of skin, sclera; dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning: Anaphylaxis: hypotension, rash, pruritus, wheezing, tachycardia may occur within a few minutes of use; notify prescriber after discontinuing; resuscitation equipment, corticosteroids, EPINEPHrine should be available

- **Peripheral neuropathy:** may be increased in geriatric patients
- **Beers:** use with caution in older adults; may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion or hyponatremia

Evaluate:

- Therapeutic response: decreasing size of tumor, spread of malignancy

Teach patient/family:

- To report ringing/roaring in the ears; numbness, tingling in face, extremities; weight gain
- **Pregnancy/breastfeeding:** that impotence or amenorrhea can occur; that this is reversible after treatment is discontinued; to notify prescriber if pregnancy is suspected or planned; that contraception should be used if patient is fertile; not to breastfeed during treatment
- To avoid OTC products with aspirin, NSAIDs, alcohol; not to receive live virus vaccines during treatment or for 3 mo after completion of treatment
- To notify prescriber immediately of fever, fatigue, sore throat, bleeding, bruising, chills, back pain, dyspnea,

tingling in extremities, blood in stools, urine, emesis
• To avoid crowds, persons with known infections; to avoid the use of razors, stiff-bristle toothbrushes

⚠ HIGH ALERT

carfilzomib (Rx)

(car-fil'zoe-mib)

Kyprolis

Func. class.: Antineoplastic biologic response modifier

Chem. class.: Signal transduction inhibitor (STI)

ACTION: Antiproliferative and proapoptotic activity

USES: Multiple myeloma in those who have received ≥2 therapies (including bortezomib and immunomodulatory agents)

CONTRAINDICATIONS: Pregnancy, hypersensitivity

DOSAGE AND ROUTES

• **Adult: IV** 20 mg/m^2 over 2-10 min on days 1, 2, 8, 9, 15, 16, then 12-day rest (days 17-28), then may increase to 27 mg/m^2 on days 1, 2, 8, 9, 15, 16 repeated every 28 days
• Refer to package insert for dosage adjustments for treatment-related toxicity

Available forms: Powder for injection 10, 30, 60 mg in single-dose vials

cariprazine (Rx)

(kar-ip'ra-zeen)

Vraylar

Func. class.: Antipsychotic, atypical

Do not confuse:
Vraylar/Valchlor

ACTION: May act on central dopamine and serotonin receptors

USES: Schizophrenia, manic or mixed episodes with bipolar I, unipolar depressive disorder, depressive episodes in bipolar I disorder

CONTRAINDICATIONS: Hypersensitivity, pregnancy

Precautions: Breastfeeding, orthostatic hypotension, opioids, tardive dyskinesia, seizures, CV disease, leukopenia, neutropenia, children, severe hepatic/renal disease

Black Box Warning: Children, dementia-related psychosis, suicidal ideation

DOSAGE AND ROUTES

Schizophrenia
• **Adult: PO** 1.5 mg on day 1, then may increase to 3 mg daily on day 2, may increase by either 1.5 mg or 3 mg to a max 6 mg daily

Unipolar, augmentation of antidepressant (unlabeled)
• **Adult: PO** 1.5 mg once daily, initially. May increase to 3 mg PO once daily on day 15 based on response/tolerability. Max: 3 mg/day

Depressive episodes in bipolar I disorder
• **Adult:** 1.5 mg daily, then may increase to 3 mg daily on day 15, max 3 mg/day

Adult: PO starting a strong CYP3A4 inhibitor while on a stable dose of this drug: Reduce the current dose of this drug by 50%; **initiating this drug while receiving a strong CYP3A4 inhibitor:** 1.5 mg daily on days 1 and 3, with no dose given on day 2; starting on day 4, 1.5 mg daily, max 3 mg/day; **withdrawing a strong CYP3A4 inhibitor while on this drug:** May need dose increase

Available forms: Capsules 1.5 mg, 3 mg, 4.5 mg, 6 mg

Administer
• Protect from light (3 mg and 4.5 mg)
• May give without regard to meals

SIDE EFFECTS

CNS: EPS, headache, fatigue, fever, dizziness, agitation, insomnia, restlessness

CV: Hypertension, tachycardia
GI: Nausea, vomiting, constipation, diarrhea, dry mouth, abdominal pain, weight gain, anorexia
GU: UTI
EENT: Blurred vision, dental pain, nasopharyngitis
MS: Back pain, arthralgia
INTEG: Rash, pruritus, urticaria, SJS, NMS
RESP: Cough

PHARMACOKINETICS

Onset unknown, peak 3-6 hr, duration unknown, half-life 48-96 hr, 1 day to 21 days metabolite

INTERACTIONS

Increase: CNS depression: CNS depressants, opioids
Increase: cariprazine effect: CYP3A4 inhibitors
Decrease: effect of cariprazine: dopamine agonists
Increase or decrease: cariprazine effect: CYP3A4 inducers
Drug/Herb
Increase: cariprazine side effects: kava kava
Decrease: cariprazine effect: St. John's wort
Drug/Food
Increase: cariprazine effect: grapefruit juice, avoid using together
Drug/Lab
Increase: LFTs, CK
Decrease: WBC

NURSING CONSIDERATIONS

Assess:

- **Hypersensitivity:** monitor for rash, pruritis, urticaria, edema of face, tongue, lips, throat
- **NMS:** elevated CK, hyperpyrexia, rigidity, delirium, renal failure, rhabdomyolysis, provide immediate medical intervention
- **Seizures:** monitor for seizures in those with underlying seizure disorders
- **EPS:** monitor for tardive dystonia (males), tardive dyskinesia (elderly females), may need to be discontinued, assess for involuntary movements
- **Blood studies:** monitor lipids, triglycerides, blood glucose, A1c, CBC, serum creatinine, pregnancy test, serum electrolytes, serum prolactin, thyroid function tests baseline and periodically
- **Hyperpyrexia:** monitor for overheating, dehydration, strenuous exercise
- **Pregnancy/breastfeeding:** Do not use in pregnancy, if pregnant, enroll in the National Registry for Atypical Antipsychotics (866-961-2388), effects in breastfeeding are unknown

Black Box Warning: Suicidal ideation: monitor for thoughts, behaviors in young adults, adolescents, and children

Black Box Warning: Dementia-related psychosis: do not use in these patients

Evaluate:

- Therapeutic response: decrease in symptoms of schizophrenia, depression, bipolar disorder

Teach patient/family:

- The need for continued follow-up
- To report hypersensitivity including rash, itching
- To avoid overheating, dehydration, strenuous exercise, make sure enough fluid is taken
- The signs of EPS and when to notify the provider
- To notify the provider of the signs of NMS, if seizures occur
- To rise slowly from lying or sitting to minimize orthostatic hypotension
- To notify provider if pregnancy is planned or suspected or if breastfeeding
- To avoid using with grapefruit juice
- To avoid driving or other hazardous tasks until results are known
- To discuss all OTC/Rx/herbs/supplements used with prescriber

Black Box Warning: Discuss the risks of taking opioids with benzodiazepines, to seek emergency services for severe sleepiness, stupor, slow breathing, or coma

carisoprodol (Rx)

(kar-eye-soe-proe′dole)

Soma

Func. class.: Skeletal muscle relaxant, central acting

Chem. class.: Meprobamate congener

Controlled Substance Schedule IV

Do not confuse:
Soma/Soma Compound

ACTION: Depresses CNS by blocking interneuronal activity in descending reticular formation, spinal cord, thereby producing sedation and possibly altering pain perception

USES: Relieving pain, stiffness with musculoskeletal disorders

CONTRAINDICATIONS: Hypersensitivity to these products or carbamates, intermittent porphyria
Precautions: Pregnancy, breastfeeding, geriatric patients, Asian patients, renal/hepatic disease, substance abuse, seizure disorder, CNS depression, abrupt discontinuation

DOSAGE AND ROUTES

- **Adult/adolescent ≥16 yr: PO** 250-350 mg qid, max 3 wk of use

Available forms: Tablets 250, 350 mg
Administer:

- With meals for GI symptoms
- For short term (2-3 wk), potential for habituation
- Store in tight container at room temperature

SIDE EFFECTS

CNS: *Dizziness, weakness, drowsiness,* headache, insomnia, irritability
CV: Postural hypotension, tachycardia
GI: *Nausea,* vomiting, hiccups, epigastric discomfort
HEMA: Eosinophilia, leukopenia
INTEG: Rash, facial flushing, erythema multiforme
RESP: Asthmatic attacks
SYST: Angioedema, anaphylaxis

PHARMACOKINETICS

PO: Onset ½ hr; peak 4 hr; duration 4-6 hr; extensively metabolized by liver, substrate of CYP2C19 Genetic warning, some Asians, Blacks, Whites are poor metabolizers; excreted in urine; crosses placenta; excreted in breast milk (large amounts); half-life 8 hr

INTERACTIONS

- Do not use together with meprobamate

Increase: CNS depression—alcohol, tricyclics, barbiturates, sedatives, hypnotics; avoid concurrent use
Increase: CNS depression, addiction: opiates
Increase: carisoprodol metabolite, decreasing carisoprodol effect—CYP2C19 inhibitors (FLUoxetine, fluvoxaMINE, isoniazid, modafinil)
Decrease: carisoprodol metabolism, increasing carisoprodol effect—CYP219 inducers (rifAMPin)
Drug/Herb
Increase: CNS depression—kava, valerian
Increase: metabolism of carisoprodol—St. John's wort
Drug/Lab Test
Increase: eosinophils
Increase: RBC, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Pain,** stiffness, mobility, activities of daily living at baseline and throughout treatment
- **Idiosyncratic reaction:** (weakness, dizziness, blurred vision, confusion, euphoria), anaphylaxis within a few minutes or hours of first to fourth dose, withhold and notify prescriber, usually seen in poor CYP2C19 metabolizers
- **Allergic reactions:** rash, fever, respiratory distress, anaphylaxis, angioedema
- **CNS depression:** dizziness, drowsiness, psychiatric symptoms, abuse potential
- **Abrupt discontinuation:** withdrawal reactions do occur but may be mild, dependence may occur
- **Beers:** avoid in older adults; may cause sedation, anticholinergic effects; may decrease urinary flow, cause retention (men)

Evaluate:
- Therapeutic response: decreased pain, spasticity; increased ROM

Teach patient/family:
- There is a high incidence of dependence when using this product
- To avoid hazardous activities if drowsiness, dizziness occur; not to drive while taking product; to avoid rapid position changes, postural hypotension occurs, not to use for >2-3 wk
- To avoid using OTC medications (cough preparations, antihistamines) unless directed by prescriber; not to take with alcohol, other CNS depressants; that there is a high incidence of dependence when using this product
- **Idiosyncratic reaction:** to report weakness, dizziness, blurred vision, confusion, euphoria; if these occur, to withhold product and call prescriber
- **To report allergic reaction immediately:** rash, swelling of tongue/lips, hives, dyspnea
- To take with food or milk for GI symptoms
- Do not take with opiates with CNS depressants, benzodiazepine, alcohol
- **Pregnancy/breastfeeding:** If pregnancy is planned or suspected or if breastfeeding

TREATMENT OF OVERDOSE:
Dialysis, lavage

⚠ HIGH ALERT

carmustine (Rx)
(kar-mus'teen)

BiCNU, Gliadel

Func. class.: Antineoplastic alkylating agent

Chem. class.: Nitrosourea

ACTION:
Alkylates DNA, RNA; able to inhibit enzymes that allow for the synthesis of amino acids in proteins; activity is not cell-cycle–phase specific

USES:
Brain tumors such as glioblastoma, medulloblastoma, brainstem glioma, astrocytoma, ependymoma, metastatic brain tumors; multiple myeloma (with predniSONE), non-Hodgkin's disease, Hodgkin's disease, other lymphomas; GI, breast, bronchogenic, renal carcinomas; wafer, as adjunct to surgery/radiation for patients newly diagnosed with high-grade malignant glioma

Unlabeled uses: Ablation, mycosis fungoides, stem cell transplant preparation

CONTRAINDICATIONS:
Pregnancy, breastfeeding, hypersensitivity, leukopenia, thrombocytopenia

Precautions: Dental disease, extravasation, females, infection, secondary malignancy, thrombocytopenia, renal disease

Black Box Warning: Bone marrow suppression, pulmonary fibrosis, bleeding, infection

DOSAGE AND ROUTES
- **Adult: IV** 75-100 mg/m^2 over 1-2 hr × 2 days or 150-200 mg/m^2 × 1 dose q6-8wk or 40-75 mg/m^2/day × 5 days q6wk **INTRACAVITARY** up to 8 wafers inserted into resection cavity

Nadir dose
- **Adult: IV** Reduce dose by 30% (WBC nadir) 2000-3000 mm^3 (platelet nadir) 25000-75000 mm^3; reduce dose by 50% (WBC nadir) <2,000 mm^3 (platelet nadir) <25,000 mm^3

Stem cell transplant/bone marrow ablation (unlabeled)
- **Adult: IV** 450-600 mg/m^2 as a single dose or 2 divided doses q12hr at a rate of no more than 3 mg/m^2/min

Available forms: Powder for injection 100 mg; wafer 7.7 mg (intracavitary)

Administer:
- Store reconstituted solution in refrigerator for 24 hr or at room temperature for 8 hr; protect from light
- Blood transfusions, RBC colony-stimulating factors to counter anemia
- Antiemetic, serotonin antagonists, dexamethasone

• All medications PO, if possible; avoid IM injection if platelets <100,000/mm^3

Black Box Warning: Carmustine should not be given at full dose until platelets >100,000/mm^3 and WBC >4000/mm^2

Wafer route

• Use cytotoxic handling procedures

• If wafers are broken into several pieces, they should not be used

• Foil pouches may be kept at room temperature for 6 hr if unopened

Intermittent IV INFUSION route

• Use cytotoxic handling procedures; do not use if an oil film appears on vial (decomposition), use gloves

• Do not use with PVC IV tubing, do not admix

• After **diluting** 100 mg product/3 mL ethyl alcohol (provided); dilute with 27 mL of sterile water for injection; then, **further dilute** with 100-500 mL 0.9% NaCl or D_5W, **give** 250 mL over ≥2 min, reduce rate if discomfort is felt; use only glass containers, protect from light

• **Flush** IV line after carmustine with 10 mL 0.9% NaCl to prevent irritation at site

Y-site compatibilities: Amifostine, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, aztreonam, bivalirudin, bleomycin, caspofungin, cefepime, codeine, DAPTOmycin, dexmedetomidine, DOCEtaxel, ertapenem, etoposide, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, levoFLOXacin, melphalan, meperidine, mitoXANTRONE, nesiritide, octreotide, ondansetron, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, piperacillin-tazobactam, riTUXimab, sargramostim, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

GI: *Nausea, vomiting, anorexia, stomatitis,* hepatotoxicity
GU: *Azotemia,* renal failure
HEMA: Thrombocytopenia, leukopenia, myelosuppression, anemia
INTEG: Pain, burning, hyperpigmentation at injection site, alopecia
RESP: Fibrosis, pulmonary infiltrate
SYST: Secondary malignant neoplastic disease

PHARMACOKINETICS

Degraded within 15 min; crosses blood-brain barrier; 70% excreted in urine within 96 hr; 10% excreted as CO_2, fate of 20% is unknown

INTERACTIONS

Increase: bleeding risk—aspirin, anticoagulants, platelet inhibitors
Increase: myelosuppression—myelosuppressive agents, cimetidine
Increase: toxicity—other antineoplastics, radiation, cimetidine
Increase: adverse reactions, decreased antibody reaction—live vaccines
Decrease: effects of digoxin, phenytoins
Drug/Lab Test
Increase: bilirubin, prolactin, uric acid, LFTs
Decrease: platelets, WBC, neutrophils, Hct

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow suppression: CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results, a lower dose may be needed

• Hepatic studies: AST, ALT, bilirubin; monitor regularly; hepatotoxicity occurs rarely

• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, or if breastfeeding; do not use in pregnancy, breastfeeding; contraception should be used

Black Box Warning: Pulmonary fibrosis/infiltrate: pulmonary function tests; chest x-ray films before, during therapy; chest film q2wk during treatment; monitor for dyspnea, cough, pulmonary fibrosis; infiltrate occurs after high doses or several low-dose courses (>1400 mg/m^2 cumulative dose), may occur months or years after treatment

Black Box Warning: Only to be used by an experienced clinician in cases of cancer, immune suppression

- Renal studies: BUN, serum uric acid; urine CCr before, during therapy; I&O ratio; report fall in urine output of 30 mL/hr, may use allopurinol for hyperuricemia with increased fluids
- Monitor for cold, cough, fever (may indicate beginning infection)
- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa, orifices q8hr
- Rinsing of mouth tid-qid with water or club soda; use of sponge brush for stomatitis
- Warm compresses at injection site for inflammation; reduce flow rate if patient complains of burning at infusion site

Evaluate:

- Therapeutic response: decreasing size of tumor, spread of malignancy

Teach patient/family:

Black Box Warning: To report any changes in breathing or coughing; to avoid smoking

- To avoid foods with citric acid, hot temperature, or rough texture if stomatitis is present; to report any bleeding, white spots, ulceration in mouth to prescriber; to examine mouth daily
- To avoid aspirin, ibuprofen, razors, commercial mouthwash
- To report signs of anemia (fatigue, irritability, shortness of breath, faintness); to report signs of infection (sore throat, fever); pulmonary toxicity can occur up to 15 yr after treatment
- Not to receive live vaccines during treatment
- That infusion can be painful to veins and that product contains ethanol
- To report chest pain
- **Pregnancy/breastfeeding:** to use contraception during treatment; not to breastfeed, discuss product impairing fertility

carteolol (ophthalmic) (Rx)

(kar′tee-oh-lol)

Func. class.: Antiglaucoma, beta-blocker

C

USES: Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS: Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome

Precautions: Abrupt discontinuation, children, pregnancy, breastfeeding, COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, angle-closure glaucoma

DOSAGE AND ROUTES

- **Adult:** Instill 1 drop in the affected eye(s) bid

Available forms: Opthalmic solution 1%

⚠ HIGH ALERT

carvedilol (Rx)

(kar-ved′i-lole)

Coreg, Coreg CR

Func. class.: Antihypertensive, alpha-/beta-adrenergic blocker

Do not confuse:
carvedilol/captopril

ACTION: A mixture of nonselective alpha-/beta-adrenergic blocking activity; decreases cardiac output, exercise-induced tachycardia, reflex orthostatic tachycardia; causes vasodilation, reduction in peripheral vascular resistance

USES: Essential hypertension alone or in combination with other antihypertensives, HF, LV dysfunction after MI, cardiomyopathy

Unlabeled uses: Angina, pediatric patients, atrial fibrillation/flutter

CONTRAINDICATIONS:

Hypersensitivity, asthma, class IV decompensated cardiac failure, second- or third-degree heart block, cardiogenic shock, severe bradycardia, pulmonary edema, severe hepatic disease, sick sinus symptoms

Precautions: Pregnancy, breastfeeding, children, geriatric patients, cardiac failure, hepatic injury, peripheral vascular disease, anesthesia, major surgery, diabetes mellitus, thyrotoxicosis, emphysema, chronic bronchitis, renal disease, abrupt discontinuation

DOSAGE AND ROUTES

Hypertension

- **Adult: PO** 6.25 mg bid × 7-14 days; may increase to 25 mg bid; max 50 mg/day; **EXTENDED RELEASE** capsule 20 mg/day, may double after 7-14 days to 40 mg/day, max 80 mg/day

Heart failure

- **Adult: PO** 3.125 mg bid × 2 wk; may increase to give 6.25 mg bid × 2 wk, then double q2wk to max dose of 25 mg bid <85 kg or 50 mg bid >85 kg; **EXTENDED RELEASE** capsules (Coreg CR) 10 mg/day × 2 wk, increase to 20, 40, 80 mg/day over successive intervals of 2 wk

Postmyocardial infarction
Left ventricular dysfunction

- **Adult: PO** 6.25 mg bid × 2 wk; titrate upward as tolerated q2wk; may increase to 12.5 mg bid, then titrate to 25 mg bid; **PO EXTENDED RELEASE** 20 mg daily; titrate upward after 3-10 days, increase to 40 mg daily; max 80 mg/day

Available forms: Tablets 3.125, 6.25, 12.5, 25 mg; extended-release capsule 10, 20, 40, 80 mg

Administer:

- With food to minimize orthostatic hypotension; regular tablets may be crushed or swallowed whole; give extended release every AM with food; do not break, crush, chew extended-release capsule; separate alcohol (including OTC products that contain ethanol) by ≥2 hr; capsules may be opened and sprinkled over applesauce
- Take apical pulse before use; notify prescriber if <50 bpm and hold dose
- Conversion from immediate release to extended release: 3.125 mg bid is 10 mg daily; 6.25 mg bid is 20 mg daily; 12.5 mg bid is 40 mg daily; 25 mg bid is 80 mg daily
- Do not discontinue before surgery

SIDE EFFECTS

CNS: *Dizziness, fatigue, weakness,* somnolence, insomnia, ataxia, drowsiness, memory loss, paresthesia, vertigo, depression

CV: Bradycardia, *postural hypotension,* HF, pulmonary edema

GI: *Diarrhea,* abdominal pain, constipation, nausea, vomiting

GU: Decreased libido, *impotence*

INTEG: Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis

MISC: Pruritus, *hyperglycemia,* weight gain, anaphylaxis, angioedema, lupus-like syndrome

RESP: Dyspnea, bronchospasm

EENT: Blurred vision, floppy iris syndrome, dry eyes

PHARMACOKINETICS

Peak 1-2 hr; duration 7-9 hr; extended release onset 30 min, peak 5 hr, readily and extensively absorbed PO; >98% protein binding; extensively metabolized (CYP2D6, CYP2C9) by liver; excreted through bile into feces; half-life 7-10 hr with increases in geriatric patients, hepatic disease; some individuals may be poor metabolizers

INTERACTIONS

Increase: conduction disturbances—calcium channel blockers

Increase: carvedilol level—CYP2D6 inhibitors (FLUoxetine, quiNIDine)

Increase: bradycardia, hypotension—levodopa, MAOIs

Increase: hypoglycemia—antidiabetic agents, monitor blood glucose level, dosage of antidiabetics may need to be decreased

Increase: concentrations of digoxin, cycloSPORINE, CYP2D6 inhibitors (FLUoxetine, quiNIDine)

Increase: toxicity of carvedilol—cimetidine, other antihypertensives, nitrates, acute alcohol ingestion; monitor for toxicity

Decrease: heart rate, B/P—cloNIDine; monitor B/P, pulse frequently
Decrease: carvedilol levels—rifAMPin, NSAIDs, thyroid medications; monitor B/P
Drug/Herb
Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—ephedra (ma huang)
Drug/Lab Test
Increase: blood glucose, BUN, potassium, triglycerides, uric acid, bilirubin, cholesterol, creatinine, LFTs, ANA titer
Decrease: sodium, HDL

NURSING CONSIDERATIONS

Assess:
- **Hypertension:** B/P when beginning treatment, periodically thereafter; pulse: note rate, rhythm, quality; apical/radial pulse before administration; in those with lower heart rate (<55 bpm) dose may need to be lowered; notify prescriber of significant changes; identify orthostatic hypotension when patient rises
- **Heart failure:** edema in feet, legs daily; fluid overload: dyspnea, weight gain, jugular venous distention, fatigue, crackles, monitor I&O

Evaluate:
- Therapeutic response: decreased B/P with hypertension; decreased anginal pain

Teach patient/family:
- To comply with dosage schedule even if feeling better; that improvement may take several weeks; not to crush, chew capsules; to take extended-release product with food
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To report slow pulse, dizziness, confusion, depression, fever, weight gain, SOB, cold extremities, rash, sore throat, bleeding, bruising
- To weigh, take pulse, B/P at home; to advise if weight gain of >2 lb/day or 5 lb/wk and when to notify prescriber
- Not to discontinue product abruptly; to taper over 1-2 wk; life-threatening dysrhythmias may occur
- To avoid hazardous activities until stabilized on medication; dizziness may occur
- To carry emergency ID with product name, prescriber information at all times
- To inform all health care providers of products, supplements taken; to avoid all OTC medications unless approved by prescriber
- That product may mask hypoglycemia, thyroid symptoms
- **Pregnancy/breastfeeding:** to notify provider if pregnancy is planned or suspected; to avoid breastfeeding

C

caspofungin (Rx)

(cas-po-fun′gin)

Cancidas

Func. class.: Antifungal, systemic
Chem. class.: Echinocandin

ACTION: Inhibits an essential component in fungal cell walls; causes direct damage to fungal cell wall

USES: Treatment of invasive aspergillosis and candidemia that has not responded to other treatment, including peritonitis, intraabdominal abscesses; susceptible species: *Aspergillus flavus, A. fumigatus, A. terreus, Candida albicans, C. glabrata, C. krusei, C. lusitaniae, C. parapsilosis, C. tropicalis,* esophageal candidiasis; empiric therapy for presumed fungal infection in febrile, neutropenic patients
Unlabeled uses: *Aspergillus niger,* fungal infections in premature neonates, neonates, infants, children <2 yr

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, children, geriatric patients, severe hepatic disease

DOSAGE AND ROUTES

Invasive aspergillosis
- **Adult: IV** loading dose 70 mg on day 1, then 50 mg/day maintenance dose,

depending on condition; max 70 mg/day; if receiving rifAMPin, carBAMazepine, dexamethasone, phenytoin, use 70 mg daily

- **Adolescent/child/infant ≥3 mo: IV INFUSION** 70 mg/m^2 loading dose, then 50 mg/m^2/day; max 70 mg/day
- **Neonate and infant <3 mo (unlabeled): IV** 25 mg/m^2/day

Esophageal candidiasis

- **Adult: IV** 70 mg loading dose then 50 mg × 14-21 days over 1 hr
- **Child 3 mo-17 yr:** IV 70 mg/m^2 loading dose over 1 hr, day 1, then 50 mg/m^2/day

Hepatic dose

- **Adult: IV** (Child-Pugh 7-9, class B) loading dose 70 mg, then 35 mg/day
- **Child 3 mo-17 yr: IV** 70 mg/m^2 loading dose, then 50 mg/m^2 daily; max 70 mg/m^2

Available forms: Powder for injection 50, 70 mg (single-use vials)

Administer:

- Do not mix or confuse with other medications; do not use dextrose-containing products to dilute; do not give as bolus

Intermittent IV INFUSION route

- Allow vial to warm to room temperature
- May administer loading dose on day 1
- **Reconstitute** 50-mg vial or 70-mg vial with 10.8 mL 0.9% NaCl, sterile water for injection, or bacteriostatic water for injection (5 mg/mL or [50-mg vial] 7 mg/mL [70-mg vial]), respectively; **swirl** to dissolve, withdraw 10 mL reconstituted solution, and **further dilute** with 250 mL 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, LR; **run** over 1 hr or more
- Store at room temperature for up to 24 hr or refrigerated for 48 hr; store reconstituted solution at room temperature for 1 hr before preparation of solution for administration
- Monitor for injection site reactions

SIDE EFFECTS

CNS: Dizziness, *headache,* fever, chills
CV: Sinus tachycardia, hypertension
GI: Abdominal pain, *nausea, anorexia, vomiting, diarrhea, increased AST/ALT, alkaline phosphatase*
GU: Renal failure
HEMA: Thrombophlebitis, vasculitis, anemia
INTEG: *Rash, pruritus, injection site pain*
META: Hypokalemia
MS: Myalgia
RESP: Acute respiratory distress syndrome (ARDS), pleural effusions
SYST: Anaphylaxis, histamine-related reactions, Stevens-Johnson syndrome

PHARMACOKINETICS

Metabolized in liver to inactive metabolites; excretion in feces, urine; half-life 9-11 hr; protein binding 97%

INTERACTIONS

Increase: caspofungin levels, hepatic toxicity—cycloSPORINE; avoid concurrent use
Decrease: levels of tacrolimus, sirolimus
Decrease: caspofungin levels—carBAMazepine, dexamethasone, efavirenz, nelfinavir, nevirapine, phenytoin, rifAMPin; caspofungin dose may need to be increased

Drug/Lab Test

Increase: AST, ALT, RBC, eosinophils, glucose, bilirubin, alkaline phosphatase, serum creatinine
Decrease: Hct/HB, WBC, potassium, magnesium

NURSING CONSIDERATIONS

Assess:

- **Infection:** clearing of cultures during treatment; obtain culture at baseline, throughout treatment; product may be started as soon as culture is taken (esophageal candidiasis); monitor cultures during hematopoietic stem cell transplantation (HSCT) for prevention of *Candida* infections
- Blood studies prior to, during treatment: bilirubin, AST, ALT, alkaline phosphatase, as needed; obtain baseline renal studies; CBC with differential, serum potassium
- **Hypersensitivity:** rash, pruritus, facial swelling; also for phlebitis; anaphylaxis (rare)
- GI symptoms: frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk, use cautiously in breastfeeding

Evaluate:

- Therapeutic response: decreased symptoms of *Candida, Aspergillus* infections

Teach patient/family:
• To inform prescriber of renal/hepatic disease
• To report bleeding, phlebitis, facial swelling, wheezing, difficulty breathing, itching, rash, hives, increasing warmth, flushing; anaphylaxis can occur
• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is suspected or planned; to use cautiously in breastfeeding

ceftaroline (Rx)
(sef-tar´oh-leen)
Teflaro
Func. class.: Antiinfective-cephalosporin derivative (fifth generation)

C

USES: Acute bacterial skin/skin structure infections (ABSSI), bacterial community-acquired pneumonia

CONTRAINDICATIONS: Cephalosporin hypersensitivity
Precautions: Child/infant/neonate, breastfeeding, elderly patients, antimicrobial resistance, carbapenem/penicillin hypersensitivity, coagulopathy, colitis, dialysis, diarrhea, GI disease, hypoprothrombinemia, IBS, pregnancy, pseudomembranous colitis, renal disease, ulcerative colitis, viral infection, vitamin K deficiency

DOSAGE AND ROUTES
• **Adult: IV** 600 mg q12hr × 5-14 days (skin/skin-structure infections) or × 5-7 days (bacterial community-acquired pneumonia)
• **Child 2-17 yr and >33 kg: IV** 400 mg q8hr or 600 mg q12hr; **2-17 yr and <33 kg;** 12 mg/kg q8hr
• **Child 2 mo to <2 yr: IV** 8 mg/kg q8hr
Renal dose
• **Adult: IV** CCr >30-≤50 mL/min, 400 mg q12hr; CCr ≥15-≤30 mL/min, 300 mg q12hr; CCr <15 mL/min, 200 mg q12hr, includes hemodialysis

⚠ HIGH ALERT

celecoxib (Rx)
(sel-eh-cox´ib)
CeleBREX
Func. class.: Nonsteroidal antiinflammatory, antirheumatic
Chem. class.: COX-2 inhibitor

Do not confuse:
CeleBREX/CeleXA/Cerebyx

ACTION: Inhibits prostaglandin synthesis by selectively inhibiting cyclooxygenase-2 (COX-2), an enzyme needed for biosynthesis

USES: Acute, chronic rheumatoid arthritis, osteoarthritis, acute pain, primary dysmenorrhea, ankylosing spondylitis, juvenile rheumatoid arthritis (JRA); acute migraine (Elyxyb)

CONTRAINDICATIONS: Pregnancy; hypersensitivity to salicylates, iodides, other NSAIDs, sulfonamides; for perioperative pain in CABG

Precautions: Breastfeeding, children <18 yr, geriatric patients, bleeding, GI/renal/hepatic/cardiac disorders, PVD, hypertension, severe dehydration, asthma, sulfa allergy, peptic ulcer disease, MI, stroke

Black Box Warning: GI bleeding/perforation, thromboembolism

DOSAGE AND ROUTES

Acute pain/primary dysmenorrhea

- **Adult: PO** 400 mg initially, then 200 mg if needed on first day, then 200 mg bid as needed on subsequent days; start with ½ dose for poor CYP2C9 metabolizers

Osteoarthritis

- **Adult: PO** 200 mg/day as a single dose or 100 mg bid

Rheumatoid arthritis

- **Adult: PO** 100-200 mg bid; start with ½ dose for poor CYP2C9 metabolizers

Ankylosing spondylitis

- **Adult: PO** 200 mg/day or in divided doses (bid)

Juvenile rheumatoid arthritis (JRA)

- **Adolescent/child ≥2 yr (>25 kg): PO** 100 mg bid
- **Child ≥2 yr (10-25 kg): PO** 50 mg bid

Migraine

- **Adult: PO** 120 mg (4.8 mL)

Hepatic disease

- **Adult: PO** (Child-Pugh B) reduce dose by 50%; (Child-Pugh C) do not use

Available forms: Capsules 50, 100, 200, 400 mg; oral solution 25 mg/mL

Administer:

- Do not break, crush, chew, or dissolve capsules; give with a full glass of water to enhance absorption; capsules may be opened into applesauce or soft food, ingest immediately with water
- With food, milk to decrease gastric symptoms (with higher doses [400 mg bid]); do not increase dose

SIDE EFFECTS

CNS: *Fatigue, nervousness,* insomnia, headache

CV: Stroke, MI, HF, hypertension, fluid retention

GI: Nausea, anorexia, dry mouth, GI bleeding/ulceration

INTEG: Serious (sometimes fatal) Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, rash

PHARMACOKINETICS

Well absorbed, crosses placenta, metabolized by CYP2C9 in liver, some patients may be poor metabolizers; very little excreted by kidneys/in feces, peak 3 hr, half-life 11 hr, protein binding ~97%

INTERACTIONS

Increase: bleeding risk—anticoagulants, SNRIs, SSRIs, antiplatelets, thrombolytics, salicylates, alcohol

Increase: adverse reactions—glucocorticoids, NSAIDs, aspirin

Increase: toxicity—lithium

Increase: celecoxib blood level—CYP2C9 inhibitors (fluconazole)

Decrease: effect of aspirin, ACE inhibitors, thiazide diuretics, furosemide

Drug/Lab Test

Increase: ALT, AST, BUN, cholesterol, glucose, potassium, sodium

Decrease: glucose, sodium, WBC, platelets

NURSING CONSIDERATIONS

Assess

- **Pain** of rheumatoid arthritis, osteoarthritis; check ROM, inflammation of joints, characteristics of pain, baseline and periodically

Black Box Warning: For cardiac disease that may be worse after taking product; MI, stroke; do not use with coronary artery bypass graft (CABG)

• CBC during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, restarted after hematologic recovery; LFTs, serum creatinine/BUN

• **For blood dyscrasias (thrombocytopenia):** bruising, fatigue, bleeding, poor healing

Black Box Warning: **GI toxicity:** black, tarry stools; abdominal pain; monitor stool guiac

• **Serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis; may be fatal, treat symptomatically; may recur after therapy is discontinued; if severe, may require discontinuing

• **Beers:** Avoid use in older adults; may increase risk of kidney injury, exacerbate heart failure, increase fluid retention

Evaluate:

• Therapeutic response: decreased pain, inflammation in arthritic conditions; decreased number of polyps

Teach patient/family:

Black Box Warning: Not to exceed recommended dose; to notify prescriber immediately of chest pain, skin eruptions; to stop product if these occur

• To check with prescriber to determine when product should be discontinued before surgery

• That product must be continued for prescribed time to be effective; to avoid other NSAIDs, aspirin, sulfonamides

Black Box Warning: To notify prescriber immediately of GI symptoms: black, tarry stools; cramping or rash; edema of extremities; weight gain or hepatotoxicity: nausea, pruritus, yellowing skin, eyes, lethargy; itching, upper abdominal pain

• To report bleeding, bruising, fatigue, malaise because blood abnormalities do occur

• **Pregnancy/breastfeeding:** to report if pregnancy is planned or suspected; avoid use in breastfeeding; not to use during pregnancy, breastfeeding; those who are pregnant should register at the Organization of Teratology of Information Specialists Autoimmune Diseases in Pregnancy Study (877-311-8972)

⚠ HIGH ALERT

cemiplimab-rwlc (Rx)

(seh-mip'lih-mab)

Libtayo

Func. class.: Antineoplastic—monoclonal antibody

Chem. class.: Programmed death receptor-1 (PD-1)/PD-L1

ACTION: Binds to the programmed death receptor-1 (PD-1) found on T cells. Blocking the PD-1/PD-L1 pathway improves the antitumor immune response by reducing immunosuppressive signals

USES: Squamous cell skin carcinoma in patients who are not candidates for curative surgery/radiation

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

Precautions: Adrenal insufficiency, autoimmune disease, colitis, contraception requirements, Crohn's disease, hepatitis, hyperthyroidism, immune-mediated reactions, infusion-related reactions, organ transplant, pneumonitis, pregnancy testing, renal impairment, reproductive risk, serious rash, type 1 diabetes mellitus, ulcerative colitis

DOSAGE AND ROUTES

• **Adult: IV** 350 mg over 30 min q3wk until disease progression

Available forms: Injection 350 mg/7 mL (50 mg/mL) single-dose vial

Administer

IV INFUSION route

• Visually inspect for particulate matter and discoloration before use; product is

clear to slightly opalescent, colorless to pale yellow and may contain trace amounts of translucent to white particles
• Do not shake vial

Dilution:
• Withdraw 7 mL and dilute with normal saline or D_5W (1 mg/mL to 20 mg/mL) mix by gentle inversion, do not shake
• Discard any unused portion
• **Storage:** Store unopened vial in refrigerator, protect from light, store at room temperature (up to 77°F [25°C]) for up to 8 hr or refrigerated (36-46°F [2-8°C]) for up to 24 hr from time of dilution. Do not freeze
• If refrigerated, allow to warm to room temperature
• Give diluted solution over 30 min through a sterile, in-line or add-on 0.2- to 0.5-micron filter

SIDE EFFECTS

CNS: Fatigue, asthenia
EENT: Immune-mediated optic nephritis
ENDO: Immune-mediated hypophysitis, immune-mediated hypothyroidism/hyperthyroidism, immune-mediated type 1 diabetes mellitus
GI: Anorexia, nausea, vomiting, abdominal pain, constipation, diarrhea, immune-mediated colitis, immune-mediated hepatitis
GU: Immune-mediated nephritis
HEMA: Anemia
INTEG: Rash, pruritus, infusion-related reactions
MS: Immune-mediated rhabdomyolysis, back pain, myalgia, MS pain
RESP: Immune-mediated pneumonitis

PHARMACOKINETICS

Onset, peak, duration unknown; half-life 19 days
Interaction: None known

NURSING CONSIDERATIONS

Assess:
• **Immune-mediated pneumonitis:** shortness of breath, chest pain, new or worsening cough periodically; if present, obtain x-ray; withhold until grade ≤1; usually treated with corticosteroids
• **Immune-mediated colitis:** severe diarrhea or abdominal pain, blood or mucus in stool. Therapy may need to be interrupted or discontinued based on severity; corticosteroids may be used; permanently discontinue if grade 4 toxicity
• **Immune-mediated hepatitis:** jaundice of skin/eyes, severe nausea/vomiting; obtain liver function tests prior to starting and periodically during therapy; if hepatitis occurs, therapy may need to be interrupted or discontinued based on severity of the toxicity; corticosteroids may be given
• **Infusion-related reactions:** fever, pruritus, wheezing, rigors; if severe grade 3 or 4, discontinue permanently
• **Immune-mediated dermatologic reactions:** erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis have occurred with similar products; interrupt or discontinue in patients who develop severe skin toxicity; provide corticosteroids followed by a 1-mo taper, starting when the toxicity resolves to grade ≤1
• **Immune-mediated hypophysitis:** continual headache, weakness, fatigue, blurred vision, dizziness; provide corticosteroids for grade 2; if severe (grade 3), withhold or discontinue until toxicity resolves to grade ≤1; permanently discontinue for grade 4
• **Immune-mediated nephritis:** monitor serum creatinine and BUN baseline and periodically; corticosteroids may be used for grade ≥2 nephritis; withhold for grade 2, resume when recovery is grade ≤1; discontinue for grade 4
• Blood glucose baseline and periodically; may cause hyperglycemia
• Thyroid function test baseline and periodically; may cause hypo/hyperthyroidism; corticosteroids may be used for grade 3 hypothyroidism; withhold product for severe grade 3, permanently discontinue for grade 4

• **Pregnancy/breastfeeding:** product should not be used in pregnancy and for 4 mo after last dose or breastfeeding and for 4 mo after last dose; perform pregnancy test in all women of childbearing potential

EVALUATE:

• Therapeutic response: decreased spread of skin cancer

Teach patient/family

• That product treats a type of skin cancer by working with your immune system

• To notify prescriber immediately of new or worsening cough, shortness of breath, chest pain, diarrhea; stools that are black, tarry, sticky, or have blood or mucus; abdominal pain, yellowing of skin/eyes, severe nausea/vomiting, bleeding or bruising more easily, unusual headaches, rapid heartbeat, increased sweating, extreme tiredness, weight gain/weight loss, dizziness/fainting, feeling hungrier or thirstier than usual, hair loss, feeling cold, constipation, skin rash with blisters

• To inform health care provider of all Rx, OTC, vitamins, and herbal products taken and not to take others without prescriber's approval

• That blood work and regular exams will be needed throughout treatment

• **Pregnancy/breastfeeding:** to inform health care provider if pregnancy is planned or suspected. That product should not be used in pregnancy or breastfeeding. That a pregnancy test is required before treatment begins and that a nonhormonal form of contraception will be needed to prevent pregnancy during treatment and for 4 mo after treatment ends. Not to breastfeed during treatment or for 4 mo after last dose

cephalexin
See cephalosporins—first generation

CEPHALOSPORINS—FIRST GENERATION

cefadroxil (Rx)
(sef-a-drox′ill)

ceFAZolin (Rx)
(sef-a′zoe-lin)

cephalexin (Rx)
(sef-a-lex′in)

Keflex, Panixine

Func. class.: Antiinfective
Chem. class.: Cephalosporin (first generation)

ACTION: Inhibits bacterial cell wall synthesis; renders cell wall osmotically unstable, leads to cell death; lysis mediated by cell wall autolytic enzymes

USES: **cefadroxil:** gram-negative bacilli: *Escherichia coli, Proteus mirabilis, Klebsiella* (UTI only); gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* upper, lower respiratory tract; urinary tract, skin infections; otitis media; tonsillitis; UTIs

ceFAZolin: gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella pneumoniae;* gram-positive organisms: *Staphylococcus aureus/epidermidis;* upper, lower respiratory tract; urinary tract, skin infections; bone, joint, biliary, genital infections; endocarditis, surgical prophylaxis, septicemia; *Streptococcus sp.*

cephalexin: gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella pneumoniae;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Streptococcus agalactiae, Staphylococcus aureus;* upper, lower respiratory tract; urinary tract, skin, bone infections; otitis media

CONTRAINDICATIONS: Hypersensitivity to cephalosporins, infants <1 mo

Precautions: Pregnancy, breastfeeding, hypersensitivity to penicillins, renal disease

DOSAGE AND ROUTES

cefadroxil

UTI

- **Adult: PO** 1-2 g/day or divided q12hr; loading dose of 1 g initially
- **Child: PO** 30 mg/kg/day in divided doses bid, max 2 g/day

Catheter-related bloodstream infections

- **Adult: IV** 2 g q8h

Renal dose

- **Adult: PO** CCr 25-50 mL/min, 1 g, then 500 mg q12hr; CCr 10-24 mL/min, 1 g, then 500 mg q24hr; CCr <10 mL/min, 1 g, then 500 mg q36hr

Available forms: Capsules 500 mg; tablets 1 g; oral suspension 250, 500 mg/5 mL

ceFAZolin

Surgical prophylaxis

- **Adult: IM/IV** <120 kg 1-2 g; >120 kg 3 g 30-60 min before surgery, then 0.5-1 g q6-8hr × 24 hr. Cefazolin surgical prophylaxis dosing can be 1-2 gm if patient is <120 kg, recommended 3 gm if patient is 120 kg or more.

Life-threatening infections

- **Adult: IM/IV** 1-2 g q6-8hr; max 12 g/day
- **Child >1 mo: IM/IV** 75-100 mg/kg/day in 3-4 divided doses; max 6 g/day

Mild/moderate infections

- **Adult: IM/IV** 250 mg-1 g q8hr, max 12 g/day
- **Child >1 mo: IM/IV** 50 mg/kg in 3-4 equal doses, max 6 g/day, or 2 g as a single dose

Renal dose

- **Adult: IM/IV** after loading dose, CCr 35-54 mL/min, dose q8hr; CCr 10-34 mL/min, 50% of dose q12hr; CCr <10 mL/min, 50% of dose q18-24hr
- **Child: IM/IV** CCr >70 mL/min, no dosage adjustment; CCr 40-70 mL/min after loading dose, reduce dose to 7.5-30 mg/kg q12hr; CCr 20-39 mL/min, give 3.125-12.5 mg/kg after loading dose q12hr; CCr 5-19 mL/min, 2.5-10 mg/kg after loading dose q24hr

Available forms: Powder for injection 500 mg, 1, 10, 20 g/vial; premixed infusion 500 mg, 1 g/50 mL, 500 mg/50 mL vial

cephalexin

Moderate infections

- **Adult: PO** 250-500 mg q6hr, max 4 g/day
- **Child: PO** 25-100 mg/kg/day in 4 equal doses, max 4 g/day

Moderate skin infections

- **Adult: PO** 500 mg q12hr

Severe infections

- **Adult: PO** 500 mg-1 g q6hr, max 4 g
- **Child: PO** 50-100 mg/kg/day in 4 equal doses, max 4 g/day

Renal dose

- **Adult: PO** CCr 10-40 mL/min, 250-500 mg then 250-500 mg q8-12hr; CCr <10 mL/min, 250-500 mg, then 250 mg q12-24hr

Available forms: Capsules 250, 500, 750 mg; tablets 250, 500 mg; oral suspension 125, 250 mg/5 mL

Administer:

cefadroxil

- For prescribed time to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- Shake suspension, refrigerate, discard after 2 wk
- Identify allergies before use
- After C&S specimen is obtained

ceFAZolin

- Obtain C&S specimen before use
- Identify allergies before use

IV route

- Check for irritation, extravasation often; dilute in 2 mL/500 mg or 2.5 mL/1 g sterile water for injection, inject over 3-5 min; may be further diluted with 50-100 mL of NS, D_5W solution, run over 10 min-1 hr by Y-tube or 3-way stopcock
- After C&S completed

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid,

aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, DOCEtaxel, doxacurium, doxapram, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lidocaine, linezolid, LORazepam, LR's injection, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G potassium/sodium, peritoneal dialysis solution, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, Plasma-Lyte M in dextrose 5%, polymyxin B, potassium chloride, procainamide, propofol, propranolol, raNITIdine, remifentanil, Ringer's injection, ritodrine, riTUXimab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, tenoxicam, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vinCRIStine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid

cephalexin

- Shake suspension, refrigerate, discard after 2 wk; use calibrated oral syringe, spoon, or measuring cup
- With food if needed for GI symptoms
- After C&S specimen is obtained
- Identify allergies before use

SIDE EFFECTS

CNS: Headache, dizziness, weakness, paresthesia, fever, chills, confusion, fatigue, hallucinations, seizures (with high doses)

GI: Nausea, vomiting, *diarrhea, anorexia*, abdominal pain, *Clostridium difficile-associated diarrhea (CDAD)*

GU: Vaginitis, pruritus, candidiasis

HEMA: Thrombocytopenia, anemia, neutropenia, eosinophilia, hemolytic anemia

INTEG: Rash, urticaria, dermatitis, injection site reactions

SYST: Anaphylaxis, serum sickness, superinfection, Stevens-Johnson syndrome

PHARMACOKINETICS

cefadroxil: Peak 1-1½ hr, duration 12-24 hr, half-life 1-2 hr, 20% bound by plasma proteins, crosses placenta, excreted in breast milk

ceFAZolin

IV: Onset 10 min, peak infusion's end, duration 6-12 hr, eliminated unchanged in urine, 75%-85% protein bound

IM: Peak 1-2 hr, duration 6-12 hr, half-life 1½-2 hr

cephalexin: Peak 1 hr, duration 6-12 hr, half-life 30-72 min, 5%-15% bound by plasma proteins, 80%-100% eliminated unchanged in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: toxicity—aminoglycosides, loop diuretics, probenecid

Drug/Lab Test

Increase: AST, ALT, alkaline phosphatase, LDH, BUN, creatinine, bilirubin

False positive: urinary protein, direct Coombs' test, urine glucose

Interference: cross-matching

NURSING CONSIDERATIONS

Assess:

- **Infection:** characteristics of wounds, sputum, urine, stools, WBC >10,000/mm^3, earache, fever; obtain baseline and periodically during treatment; obtain C&S before treatment starts, may start treatment before results are received
- Cross-sensitivity to penicillin and other cephalosporins; hypersensitivity reaction may occur
- **Nephrotoxicity:** increased BUN, creatinine; urine output: if decreasing, notify prescriber
- Blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- **CDAD:** bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- **Anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema; may occur a few days after therapy begins; discontinue product, notify prescriber immediately, keep emergency equipment nearby
- **Stevens-Johnson syndrome, toxic epidermal necrolysis:** painful, red rash; flulike symptoms, discontinue product, do not restart
- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: decreased symptoms of infection, negative C&S

Teach patient/family:

- To take all medication prescribed for length of time ordered; take missed dose as soon as remembered, unless close to next dose; do not double dose; use calibrated device for syrup, liquid, suspension
- To report vaginal itching; loose, foul-smelling stools; furry tongue occurs; may indicate superinfection
- To report immediately rash, flulike symptoms, blisters, stop product
- Diarrhea with mucus, blood (may indicate **CDAD**)

TREATMENT OF ANAPHYLAXIS: EPINEPHrine, antihistamines; resuscitate if needed

CEPHALOSPORINS—SECOND GENERATION

cefaclor (Rx)
(sef′a-klor)
cefoTEtan (Rx)
(sef′oh-tee-tan)
Cefotan
cefOXitin (Rx)
(se-fox′i-tin)
cefprozil (Rx)
(sef-proe′zill)
cefuroxime (Rx)
(sef-yoor-ox′eem)
Func. class.: Antiinfective
Chem. class.: Cephalosporin (second generation)

Do not confuse:
cefaclor/cephalexin
Cefotan/Ceftin
cefprozil/ceFAZolin/cefuroxime

ACTION: Inhibits bacterial cell wall synthesis, renders cell wall osmotically unstable, leads to cell death by binding to cell wall membrane

USES: **cefaclor:** gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella;* gram-positive organisms: *Streptococcus*

pneumoniae, Streptococcus pyogenes, Staphylococcus aureus; respiratory tract, urinary tract, skin, infections; otitis media

cefoTEtan: gram-negative organisms: *Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Citrobacter, Salmonella, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria, Serratia;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* lower, serious respiratory tract, urinary tract, skin, bone, joint, gynecologic, gonococcal, intraabdominal infections

cefOXitin: gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Proteus, Klebsiella, Bacteroides fragilis, Neisseria gonorrhoeae;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* anaerobes including *Clostridium;* lower respiratory tract, urinary tract, skin, bone, gynecologic, gonococcal infections; septicemia, peritonitis

cefprozil: pharyngitis/tonsillitis; otitis media; secondary bacterial infection of acute bronchitis; acute bacterial exacerbation of chronic bronchitis; uncomplicated skin and skin structure infections; acute sinusitis

cefuroxime: gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Neisseria, Proteus mirabilis, Klebsiella;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* serious lower respiratory tract, urinary tract, skin, bone, joint, gonococcal infections; septicemia, meningitis, surgery prophylaxis

CONTRAINDICATIONS: Hypersensitivity to cephalosporins or related antibiotics; seizures

Precautions: Pregnancy, breastfeeding, children, GI/renal disease, diabetes mellitus, coagulopathy, pseudomembranous colitis

DOSAGE AND ROUTES

cefaclor

- **Adult: PO** 250-500 mg q8hr, extended release 500 mg q12hr; max 1.5 g/day (capsule, oral suspension); 1 g/day (extended release)
- **Child >1 mo: PO** 20-40 mg/kg/day in divided doses q8hr or total daily dose may be divided and given q12hr, max 1 g/day

Available forms: Capsules 250, 500 mg; oral suspension 125, 250, 375 mg/5 mL; extended-release tablet 375, 500 mg

cefoTEtan

- **Adult: IM/IV** 1-3 g q12hr × 5-10 days

Renal dose

- **Adult: IM/IV** CCr 30-50 mL/min 1-2 g, then 1-2 g q8-12hr; CCr 10-29 mL/min 1-2 g, then 1-2 g q12-24hr; CCr 5-9 mL/min 1-2 g, then 0.5-1 g q12-24hr; CCr<5 mL/min 1-2 g, then 0.5-1 g q24-48hr

Perioperative prophylaxis

- **Adult: IV** 1-2 g ½-1 hr before surgery

Available forms: Injection 1, 2, 10 g; premixed 1 g/50 mL D_5W, 2 g/50 mL D_5W

cefOXitin

Perioperative prophylaxis

- **Adult: IV** 2 g 30-60 min prior to surgery, then 2g q6hr × 24 hr
- **Child/infant >3 mo: IV**/30-40 mg/kg 30-60 min prior to surgery then 30-40 mg/kg q6hr × 24 hr

Renal dose

- **Adult: IM/IV** after loading dose, CCr 30-50 mL/min, 1-2 g q8-12hr; CCr 10-29 mL/min, 1-2 g q12-24hr; CCr <10 mL/min, 0.5-1 g q12-24hr

Severe infections

- **Adult: IM/IV** 2 g q4hr
- **Child ≥3 mo: IM/IV** 80-160 mg/kg/day divided q4-6hr; max 12 g/day

Available forms: Powder for injection 1, 2 g; premixed 1 g/50 mL D_5W, 2 g/50 mL D_5W

cefprozil

Upper respiratory infections

- **Adult: PO** 500 mg q24hr × 10 days

Otitis media

- **Child 6 mo-12 yr: PO** 15 mg/kg q12hr × 10 days

Lower respiratory infections
- **Adult: PO** 500 mg q12hr × 10 days

Skin/skin structure infections
- **Adult/child ≥13 yr: PO** 250-500 mg q12hr × 10 days

Child 2-12 yr: PO 20 mg/kg q24hr × 10 days, max adult dose

Renal dose
- **Adult: PO** CCr <30 mL/min, 50% of dose

Available forms: Tablets 250, 500 mg; suspension 125, 250 mg/5 mL

cefuroxime
- **Adult/child: PO** 250 mg q12hr; may increase to 500 mg q12hr for serious infections
- **Adult: IM/IV** 750 mg-1.5 g q8hr for 5-10 days

Urinary tract infections
- **Adult: PO** 250 mg q12hr × 7-10 days

Otitis media
- **Child >3 mo-12 yr: PO** 250 mg q12hr × 10 days

Surgical prophylaxis
- **Adult: IV** 1.5 g ½-1 hr before surgery

Severe infections
- **Adult: IM/IV** 1.5 g q6hr; may give up to 3 g q8hr for bacterial meningitis
- **Child >3 mo: IM/IV** 50-100 mg/kg/day or **IM** in divided doses q6-8hr

Uncomplicated gonorrhea
- **Adult: IM** 1 g as single dose in 2 separate sites with oral probenecid

Early Lyme disease

Adult/child ≥13 yr: PO 500 mg q12hr × 20 days

Renal dose
- Dosage reduction indicated with severe renal impairment (CCr <20 mL/min)

Available forms: Tablets 125, 250, 500 mg; solution for injection 1.5 g/50 mL, 750 mg/50 mL; suspension 125, 250 mg/5 mL

Administer:
- Do not break, crush, or chew extended-release tablets or capsules
- On an empty stomach 1 hr before or 2 hr after a meal

cefaclor
- Identify allergies before use
- Obtain C&S specimen before use
- Shake suspension, refrigerate, discard after 2 wk
- For 10-14 days to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- After C&S completed
- Swallow extended release whole

cefoTEtan
- Identify allergies before use
- Obtain C&S specimen before use

Direct IV route
- IV direct after diluting 1 g/10 mL sterile water for injection, give over 3-5 min

Intermittent IV infusion route
- May be diluted further with 50-100 mL NS or D_5W; shake; run over ½-1 hr by Y-tube or 3-way stopcock; discontinue primary infusion during administration
- May be stored 96 hr refrigerated or 24 hr at room temperature

Y-site compatibilities: Allopurinol, amifostine, aztreonam, diltiazem, famotidine, filgrastim, fluconazole, fludarabine, heparin, insulin (regular), melphalan, meperidine, morphine, PACLitaxel, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa

cefOXitin
IV route

Direct IV route
- After diluting 1 g/10 mL or more D_5W, NS, give over 3-5 min

Intermittent IV infusion route may be diluted further with 50-100 mL NS or D_5W; run over ½-1 hr by Y-tube or 3-way stopcock; discontinue primary infusion during administration

Continuous infusion route give by continuous infusion at prescribed rate; may store 96 hr refrigerated or 24 hr at room temperature
- After C&S completed

Y-site compatibilities: Acyclovir, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cyclophosphamide, diltiazem, DOXOrubicin liposome, famotidine, fluconazole, foscarnet, HYDROmorphone, magnesium sulfate, meperidine, morphine, ondansetron, perphenazine, remifentanil, teniposide, thiotepa

cefprozil

PO route

- Without regard to meals
- Identify allergies before use
- Obtain C&S specimen before use, may start product before results are received
- Refrigerate/shake suspension before use; discard after 14 days

cefuroxime

PO route

- Identify allergies before use
- Obtain C&S specimen before use, may start product before results are received
- With food if needed for GI symptoms

Y-site compatibilities: Acyclovir, allopurinol, amifostine, atracurium, aztreonam, cyclophosphamide, diltiazem, famotidine, fludarabine, foscarnet, HYDROmorphone, melphalan, meperidine, morphine, ondansetron, pancuronium, perphenazine, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium

SIDE EFFECTS

CNS: Dizziness, headache, seizures

GI: *Diarrhea,* nausea, vomiting, anorexia, CDAD

HEMA: Leukopenia, thrombocytopenia, agranulocytosis, neutropenia, eosinophilia, hemolytic anemia

INTEG: Rash, urticaria, dermatitis, Stevens-Johnson syndrome, IV site reactions

SYST: Anaphylaxis, serum sickness, superinfection

PHARMACOKINETICS

cefaclor

PO: Peak ½-1 hr, half-life 36-54 min, 25% bound by plasma proteins, 60%-85% eliminated unchanged in urine, crosses placenta, excreted in breast milk (low concentrations)

cefoTEtan

IM/IV: Peak 1½-3 hr, half-life hr, 75%-90% protein binding, 50%-80% eliminated unchanged in urine, crosses placenta, excreted in breast milk

cefOXitin

Half-life ½-1 hr; 65%-80% protein binding 90%-100%; eliminated unchanged in urine; crosses placenta, blood-brain barrier; eliminated in breast milk; not metabolized

IM: Peak 15-30 min

IV: Peak infusion's end, duration 6-8 hr

cefprozil

PO: Peak 1.5 hr, protein binding 36%, half-life 1.3 hr (normal renal function), 2 hr (hepatic disease), 5½-6 hr (end-stage renal disease), extensively metabolized to an active metabolite, eliminated in urine 60%

cefuroxime

Peak **PO** 2 hr, **IM** 45 min, **IV** 2-3 min, 66% excreted unchanged in urine, half-life 1-2 hr in normal renal function

INTERACTIONS

Increase: effect/toxicity—aminoglycosides, probenecid

Increase: bleeding risk (cefoTEtan)—anticoagulants, thrombolytics, NSAIDs, antiplatelets

Decrease: absorption of cephalosporin—antacids

Drug/Lab Test

False increase: creatinine (serum urine), urinary 17-KS

False positive: urinary protein, direct Coombs' test, urine glucose testing (Clinitest)

Interference: cross-matching

NURSING CONSIDERATIONS

Assess:

- I&O ratio
- Blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Electrolytes: potassium, sodium, chlorine monthly if patient is on long-term therapy
- ***Clostridium difficile*–associated diarrhea (CDAD):** bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- **Anaphylaxis:** rash, flushing, urticaria, pruritus, dyspnea; discontinue product, notify prescriber, have emergency equipment available; cross-sensitivity may occur with penicillins or other beta-lactam antibiotics
- **Bleeding:** ecchymosis, bleeding gums, hematuria, stool guaiac daily

• **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

• Therapeutic response: negative C&S, decreased symptoms of infections

Teach patient/family:

• To complete full course of product therapy; to take missed dose as soon as remembered unless close to next dose, do not double dose; to use calibrated device for syrup, liquid suspension

• To report diarrhea with mucus, blood CDAD; symptoms of hypersensitivity, stools may change to red color

TREATMENT OF ANAPHYLAXIS: EPINEPHrine, antihistamines; resuscitate if needed

CEPHALOSPORINS—THIRD/FOURTH GENERATION

cefdinir (Rx)
(sef′dih-ner)
cefditoren (Rx)
(sef-dit′oh-ren)
Spectracef
cefepime (Rx) (fourth generation)
(sef′e-peem)
Maxipime
cefixime (Rx)
(sef-icks′ime)
Suprax
cefotaxime (Rx)
(sef-oh-taks′eem)
cefpodoxime (Rx)
(sef-poe-docks′eem)
cefTAZidime (Rx)
(sef′tay-zi-deem)
Fortaz, Tazicef
cefTRIAXone (Rx)
(sef-try-ax′one)

Func. class.: Broad-spectrum anti-infective
Chem. class.: Cephalosporin (third generation)

Do not confuse:
cefTAZidime/ceftizoxime

ACTION: Inhibits bacterial cell wall synthesis, renders cell wall osmotically unstable, leads to cell death

USES:

cefdinir: community-acquired pneumonia, otitis media, sinusitis, pharyngitis, skin and skin structure infections, acute exacerbations of chronic bronchitis, pneumonia, tonsillitis, *Citrobacter diversus, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Staphylococcus epidermidis, Streptococcus agalactiae* (group B), viridans streptococci alpha, *Haemophilus influenzae, Haemophilus parainfluenzae, Moraxella catarrhalis;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus* (MSSA)

cefditoren pivoxil: acute bacterial exacerbations of chronic bronchitis caused by *Haemophilus influenzae, Haemophilus parainfluenzae, Streptococcus pneumoniae, Moraxella catarrhalis;* pharyngitis/tonsillitis caused by *Streptococcus pyogenes;* uncomplicated skin and skin structure infections caused by *Staphylococcus aureus, Streptococcus pyogenes;* community-acquired pneumonia, viridans streptococci

cefixime: uncomplicated UTI *(Escherichia coli, Proteus mirabilis),* pharyngitis and tonsillitis *(Streptococcus pyogenes),* otitis media *(Haemophilus influenzae), Moraxella catarrhalis,* acute bronchitis and acute exacerbations of chronic bronchitis *(Streptococcus pneumoniae, H. influenzae),* uncomplicated gonorrhea

cefotaxime: *Haemophilus influenzae, Haemophilus parainfluenzae, Escherichia coli, Enterococcus faecalis, Neisseria gonorrhoeae, Neisseria meningitidis, Proteus mirabilis, Klebsiella, Citrobacter, Serratia, Salmonella, Shigella, Pseudomonas; Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* serious lower respiratory tract, urinary tract, skin, bone, gonococcal infections; bacteremia, septicemia, meningitis, skin, skin structure infections; CNS infections; perioperative

prophylaxis, intraabdominal infections, PID, UTI, ventriculitis

cefpodoxime: *Bacteroides, Neisseria gonorrhoeae, Haemophilus influenzae, Escherichia coli, Proteus mirabilis, Klebsiella;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* upper and lower respiratory tract, urinary tract, skin infections; otitis media; sexually transmitted diseases

cefTAZidime: *Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Pseudomonas aeruginosa, Proteus mirabilis, Klebsiella, Citrobacter, Enterobacter, Salmonella, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria, Serratia; Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* serious lower respiratory tract, urinary tract, skin, gynecologic, bone, joint, intraabdominal infections; septicemia, meningitis

ceftibuten: pharyngitis/tonsillitis, otitis media, secondary bacterial infection of acute bronchitis

cefTRIAXone: gram-negative bacilli: *Haemophilus influenzae, Escherichia coli, Enterobacter aerogenes, Proteus mirabilis, Klebsiella, Citrobacter, Enterobacter, Salmonella, Shigella, Acinetobacter, Bacteroides fragilis, Neisseria, Serratia;* gram-positive organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus;* serious lower respiratory tract, urinary tract, skin, gonococcal, intraabdominal infections; septicemia, meningitis, bone, joint infections; otitis media; PID

CONTRAINDICATIONS:

Hypersensitivity to cephalosporins, infants <1 mo

Precautions: Pregnancy, breastfeeding, children, hypersensitivity to penicillins, GI/renal disease, geriatric patients, pseudomembranous colitis, viral infection, vitamin K deficiencies, diabetes

DOSAGE AND ROUTES

cefdinir

Uncomplicated skin and skin structure infections/community-acquired pneumonia

- **Adult and child ≥13 yr: PO** 300 mg q12hr × 10 days or 600 mg q24hr
- **Child 6 mo-12 yr: PO** 7 mg/kg q12hr or 14 mg/kg q24hr × 10 days

Acute exacerbations of chronic bronchitis/acute maxillary sinusitis

- **Adult and child ≥13 yr: PO** 300 mg q12hr or 600 mg q24hr × 10 days

Pharyngitis/tonsillitis

- **Adult and child ≥13 yr: PO** 300 mg q12hr or 600 mg q24hr × 10 days
- **Child 6 mo-12 yr: PO** 7 mg/kg q12hr × 5-10 days or 14 mg/kg q24hr × 10 days

Renal dose

- **Adult/child >13 yr: PO** CCr <30 mL/min, 300 mg/day (adult); 7 mg/kg/day (child 6 mo-12 yr)

Available forms: Capsules 300 mg; suspension 125 mg, 250 mg/5 mL

cefditoren

- **Adult: PO** 200-400 mg bid × 10-14 days

Renal dose

- **Adult: PO** CCr 30-49 mL/min, max 200 mg bid; CCr <30 mL/min, max 200 mg daily

Available forms: Tablets 200, 400 mg

cefepime

Febrile neutropenia

- **Adult/adolescent >16 yr/child ≥40 kg: IV** 2 g q8hr × 7 days or until neutropenia resolves
- **Infant ≥2 mo/child/adolescent ≤16 yr and ≤40 kg: IV** 50 mg/kg/dose q8hr × 7 days or until neutropenia resolves

Urinary tract infections (mild to moderate)

- **Adult/adolescent >16 yr: IV/IM** 0.5-1 g q12hr × 7-10 days

Urinary tract infections (severe)

- **Adult/adolescent >16 yr/ IV** 2 g q12hr × 10 days

Pneumonia (moderate to severe)

- **Adult: IV** 1-2 g q 8-12hr × 10 days
- **Infant 2-11 mo/child/adolescent: IV** 50 mg/kg/dose q12hr (max: 2 g/dose) × 10 days
- **Infant 1 mo (unlabeled): IV** 50 mg/kg/dose q12hr
- **Neonates ≥36 wk gestation (unlabeled): IV** 50 mg/kg/dose q12hr
- **Neonates <36 wk gestation (unlabeled): IV** 30 mg/kg/dose q12hr

Complicated intraabdominal infections (peritonitis), biliary tract infections (cholangitis, cholecystitis)

- **Adults/adolescents 17 yr: IV** 2 g q12hr with metronidazole × 7-10 days; for infections caused by *Pseudomonas aeruginosa,* 2 g q8hr
- **Infants/child/adolescent 13-16 yr (unlabeled): IV** 50 mg/kg/dose q12hr (max: 2 g/dose) with metronidazole × 7-10 days; for infections caused by *Pseudomonas aeruginosa,* 50 mg/kg/dose q8hr (max: 2 g/dose)
- **Neonates ≥36 wk gestation (unlabeled): IV** 50 mg/kg/dose q12hr with metronidazole × 7-10 days
- **Neonates <36 wk gestation (unlabeled): IV** 30 mg/kg/dose q12hr with metronidazole × 7-10 days

Available forms: Powder for injection 500 mg, 1, 2 g; 1 g/50 mL, 2 g/100 mL

Moderate-severe skin/structure infections due to *Staphylococcus aureus* or *Streptococcus pyogenes* or for diabetic foot ulcer (unlabeled)

cefixime

- **Adult/adolescent/child >12 yr old >45 kg: PO** 400 mg/day divided q12-24hr
- **Child ≤45 kg/infant ≥6 mo: PO** 8 mg/kg/day divided q12-24hr

Renal dose

- **Adult: PO** CCr 21-59 mL/min, give 65% of dose; CCr <20 mL/min, give 50% of dose

Available forms: Powder for oral suspension 100 mg/5 mL, 200 mg/5 mL, 500 mg/mL; chewable tablets 100, 200 mg; capsules 400 mg

cefotaxime

- **Adult/adolescent/child ≥50 kg: IV/IM (uncomplicated infections)** 1 g q12hr, **(moderate-severe infection)** 1-2 g q8hr, **(severe infections)** 2 g q6-8hr, **(life-threatening infections)** 2 g q4hr, max 12 g/day
- **Adolescent/child <50 kg and infants: IV/IM** 50-180 mg/kg/day divided q6-8hr, max 2 g/dose; **(severe infections)** 200-225 mg/kg/day divided q4-6hr, max 12 g
- **Neonate >7 days: IV/IM** 50 mg/kg/dose q8-12hr

Uncomplicated gonorrhea

- **Adult: IM** 500 mg as a single dose

Rectal gonorrhea

Adult: Men IM 1 g as a single dose
Adult: Women IM 500 mg as a single dose

Renal dose

- **Adult: IM** CCr <20 mL/min 50% dose reduction

Available forms: Powder for injection 500 mg, 1, 2, 10 g; injection 1, 2 g premixed frozen

cefpodoxime

Pneumonia

- **Adult/child >12 yr: PO** 200 mg q12hr × 14 days

Chronic bronchitis

- **Adult/child ≥12 yr: PO** 200 mg q12hr × 10 days

Uncomplicated gonorrhea

- **Adult/child ≥12 yr: PO** 200 mg as a single dose

Acute maxillary sinusitis

- **Adult/child ≥12 yr: PO** 200 mg q12hr × 10 days
- **Child 2 mo-12 yr: PO** 5 mg/kg q12hr × 10-14 days

Skin and skin structure

- **Adult/child >12 yr: PO** 400 mg q12hr × 7-14 days

Pharyngitis and tonsillitis

- **Adult/child >12 yr: PO** 100 mg q12hr × 5-10 days
- **Child 5 mo-12 yr: PO** 5 mg/kg q12hr (max 100 mg/dose or 200 mg/day) × 5-10 days

Uncomplicated UTI

- **Adult/child >12 yr: PO** 100 mg q12hr × 7 days; dosing interval increased with severe renal impairment

Acute otitis media

- **Child 2 mo-12 yr: PO** 5 mg/kg q12hr × 5 days

Available forms: Tablets 100, 200 mg; granules for suspension 50 mg, 100 mg/5 mL

cefTAZidime

- **Adult/child >12 yr: IV/IM** 1-2 g q8hr
- **Child: IV/IM** 30-50 mg/kg q8hr, max 6 g/day
- **Neonate: IV/IM** 30-50 mg/kg q8-12hr

Renal dose

- **Adult: IM/IV** CCr 31-50 mL/min 1 g q12hr; CCr 16-30 mL/min 1 g q24hr; CCr 6-15 mL/min 1-g loading dose, then 0.5 g q24hr; CCr <5 mL/min 1-g loading dose, then 0.5 g q48hr

Available forms: Injection 500 mg, 1, 2, 6 g/vial

cefTRIAXone

UTI, lower respiratory infections, bone joint, skin/skin structure infections

- **Adult/child >12 yr: IM/IV** 1-2 g/day, max 4 g/24 hr
- **Child ≤12 yr: IM/IV** 50-75 mg/kg/day in equal doses q12-24hr

Uncomplicated gonorrhea

- **Adult:** 250 mg **IM** as single dose with azithromycin 1 g single dose or doxycycline 100 mg bid × 7 days
- Reduce dosage in severe renal impairment (CCr <10 mL/min)

Meningitis

- **Adult: IV** 4 g/day divided every 12 to 24 hr × 7-21 days
- **Child: IV/IM** 100 mg/kg/day × 7-14 days

Available forms: Injection 250, 500 mg, 1, 2; infusion 1,2 g/50 mL

Administer

cefdinir

- Oral suspension after adding 39 mL water to the 60-mL bottle or 65 mL water to the 120-mL bottle; discard unused portion after 10 days; give without regard to food, do not give within 2 hr of antacids, iron supplements
- After C&S completed

cefditoren

- For 10-14 days to ensure organism death, prevent superinfection
- With food; do not give with antacids
- After C&S completed

cefepime

Intermittent IV INFUSION route

- IV after diluting in 50-100 mL or more D_5W, NS; give over 30 min
- For 7-10 days to ensure organism death, prevent superinfection

Y-site compatibilities: DOXOrubicin liposome

cefixime

- For 10-14 days to ensure organism death, prevent superinfection
- Without regard to food
- Chew tablets before swallowing

cefotaxime

IV route

- IV after **diluting** 1 g/10 mL D_5W, NS, sterile water for injection, **give** over 3-5 min by Y-tube or 3-way stopcock; may be **diluted further** with 50-100 mL NS or D_5W; **run** over ½-1 hr; discontinue primary infusion during administration; may be **diluted** in larger volume of solution, given as a continuous infusion
- For 10-14 days to ensure organism death, prevent superinfection
- Thaw frozen container at room temperature or refrigeration; do not force thaw by immersion or microwave; visually inspect container for leaks

Y-site compatibilities: Acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, caffeine, calcium chloride/gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime (L-arginine), cefTRIAXone sodium, cefuroxime, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, DOCEtaxel, DOPamine, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, insulin (regular), isoproterenol, ketorolac, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANTRONE, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin,

nitroprusside, norepinephrine, normal saline, octreotide, ofloxacin, ondansetron, ornidazole, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pefloxacin, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, peritoneal dialysis solution, perphenazine, PHENobarbital, phenylephrine, phenytoin, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin, raNITIdine, remifentanil, Ringer's injection, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, sodium fusidate, sodium lactate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole

cefpodoxime

- Do not break, crush, or chew tablets due to taste
- For 10-14 days to ensure organism death, prevent superinfection
- With food for better absorption; do not give within 2 hr of antacids, H_2-receptor antagonists
- Shake suspension well, refrigerate, discard after 2 wk

cefTAZidime

IM route

- **Fortaz, vials:** reconstitute 500 mg or 1 g with 1.5 or 3 mL, respectively, of sterile or bacteriostatic water for injection or 0.5%-1% lidocaine (approx 280 mg/mL)
- **Tazicef vials:** reconstitute 1 g/3 mL sterile water for injection (approx 280 mg/mL)
- **Withdraw** dose while making sure needle remains in vial; **ensure** no CO_2 bubbles present; **inject** deeply in large muscle mass, **aspirate** before injection

IV route

- Visually inspect for particulate matter, discoloration, if possible
- **Fortaz, Tazicef packs: reconstitute** 1 or 2 g/100 mL sterile water for injection or other compatible IV solution (10 or 20 mg/mL, respectively); reconstitution is done in 2 stages: first, **inject** 10 mL of the diluent into the pack and **shake** well to dissolve and become clear; CO_2 pressure inside container will occur, **insert** vent needle to release pressure; **add** remaining diluents, **remove** vent needle
- **Fortaz, Tazicef vials: reconstitute** 500 mg, 1 g, 2 g with 5, 10 mL, respectively, of sterile water for injection or other compatible IV solution (100, 95-100, or 170-180 mg/mL, respectively); **shake** well to dissolve
- **Fortaz, ADD-Vantage vials (for IV only): reconstitute** 1 or 2 g with NS, ½ NS, D_5W in either 50- or 100-mL flexible diluent container; to release CO_2 pressure, **insert** vent needle after dissolving, **remove** vent before using

Direct intermittent IV INFUSION route

- **Vials: withdraw** dose while making sure needle remains in solution; make sure there are no CO_2 bubbles in syringe before injection; **inject** directly over 3-5 min or slowly into tubing of a free-flowing compatible IV solution

Intermittent IV INFUSION route

- **Vials: withdraw** dose while making sure needle opening remains in solution; make sure there are no CO_2 bubbles in syringe before injection; infusion packs and ADD-Vantage systems ready for infusion after reconstitution, **infuse** over 15-30 min

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anakinra, anidulafungin, atenolol, atropine sulfate, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefamandole, ceFAZolin, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, cimetidine, ciprofloxacin, CISplatin, clindamycin, codeine, cyanocobalamin,

cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, DOCEtaxel, DOPamine, doxacurium, doxapram, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isepamicin, isoproterenol, isosorbide, ketamine, ketorolac, labetalol, levoFLOXacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, morphine, moxalactam, multiple vitamins inj, nafcillin, nalbuphine, PACLitaxel, raNITIdine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, zidovudine

cefTRIAXone

- For 7-14 days to ensure organism death, prevent superinfection
- **IM** inject deeply in large muscle mass

IV route

- **IV** after **reconstituting** 250 mg/2.4 mL, 500 mg/4.8 mL, 1 g/9.6 mL, 2 g/19.2 mL D_5W, water for injection, 0.9% NaCl; **further dilute** with 50-100 mL (40 mg/mL) NS, D_5W, $D_{10}W$; shake; **run** over ½ hr
- Do not mix with calcium salts

Y-site compatibilities: Acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefoTAXime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, cephalothin, cephapirin, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin liposomal, doxycycline, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, fenoldopam, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, indomethacin, insulin (regular), isoproterenol, ketorolac, lansoprazole, levoFLOXacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, metARAMinol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, PHENobarbital, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, propofol, propranolol, pyridoxine, raNITIdine, remifentanil, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vinCRIStine, voriconazole, warfarin, zidovudine

SIDE EFFECTS

CNS: Headache, dizziness, seizures
GI: *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, CDAD; cholestasis (cefotaxime)
GU: Renal failure
HEMA: Thrombocytopenia, agranulocytosis, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia
INTEG: Rash, urticaria, dermatitis, injection site reaction
MS: Arthralgia (cefditoren)
SYST: Anaphylaxis, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

cefdinir
Unchanged in urine; crosses placenta, blood-brain barrier; eliminated in breast milk, not metabolized; 60%-70% protein binding, half-life 1.7 hr

cefditoren
Well absorbed when broken down (prodrug), wide distribution, half-life 100 min, onset rapid, peak 1.5-3 hr, duration 12 hr, 88% protein binding

cefepime
Peak 79 min; half-life 2 hr; 20% bound by plasma proteins; 90% excreted unchanged in urine; crosses placenta, blood-brain barrier; excreted in breast milk, not metabolized

cefixime
PO: Peak 2-8 hr, half-life 3-4 hr, 65%-70% protein binding, 50% eliminated unchanged in urine, crosses placenta, excreted in breast milk

cefotaxime
Half-life 1 hr, 35%-65% is bound by plasma proteins, 40%-65% is eliminated unchanged in urine in 24 hr, 25% metabolized in the liver to active metabolites, excreted in breast milk (small amounts)
IM: Onset 30 min
IV: Onset 5 min

cefpodoxime
Half-life 1-1.5 hr, 13%-38% bound by plasma proteins, 30% eliminated unchanged in urine in 8 hr, crosses placenta, excreted in breast milk

cefTAZidime
IM/IV: Half-life 1½-2 hr, 10% bound by plasma proteins, 80% eliminated unchanged in urine, crosses placenta, excreted in breast milk

cefTRIAXone
Half-life 6-9 hr, 58%-96% eliminated unchanged in urine, crosses placenta, excreted in breast milk
IM: Peak 1½-4 hr
IV: Peak 30 min

INTERACTIONS

Many products should not be used with calcium salts (mixed or administered) or H_2 blocker antacids (PO)
Increase: bleeding—anticoagulants, thrombolytics, NSAIDs (ceftriaxone)
Increase: toxicity—aminoglycosides, furosemide loop diuretics, probenecid
Decrease: absorption of cefdinir—iron
Drug/Food
Decrease: absorption—iron-rich cereal, infant formula
Drug/Lab Test
Increase: ALT, AST, alkaline phosphatase, LDH, bilirubin, BUN, creatinine
False increase: creatinine (serum urine), urinary 17-KS
False positive: urinary protein, direct Coombs' test, urine glucose
Interference: cross-matching

NURSING CONSIDERATIONS

Assess:
- **Infection:** characteristics of wounds, sputum, urine, stool, WBC >10,000/mm^3, fever; obtain baseline and periodically during treatment
- Cross-sensitivity to penicillin, other cephalosporins; hypersensitivity reaction may occur
- Obtain C&S prior to treatment, may start treatment before results are received
- Blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- **CDAD:** bowel pattern daily; if severe diarrhea occurs, product should be discontinued

- IV site for extravasation, phlebitis
- **Anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain, angioedema; may occur a few days after therapy begins
- **Serious skin disorders:** Rash, blisters; toxic epidermal necrolysis, Stevens-Johnson syndrome may occur
- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:
- Therapeutic response: decreased symptoms of infection; negative C&S

Teach patient/family:
- If diabetic, to check blood glucose
- To report sore throat, bruising, bleeding, joint pain, may indicate **blood dyscrasias (rare)**; diarrhea with mucus, blood, may indicate **CDAD**
- To complete full course of treatment, to take missed dose as soon as remembered unless close to next dose, do not double dose; to use calibrated device for suspension
- May turn stools red

TREATMENT OF ANAPHYLAXIS: EPINEPHrine, antihistamines; resuscitate if needed

ceritinib (Rx)

(cerr-ah-tin′ib)

Zykadia

Func. class.: Antineoplastic—miscellaneous

USES: Anaplastic lymphoma kinase (ALK)–positive metastatic non–small-cell lung cancer (NSCLC) in patients who have progressed on or are intolerant to crizotinib

CONTRAINDICATIONS: Pregnancy, hypersensitivity, QT prolongation

Precautions: Breastfeeding, children, geriatric patients, cardiac/hepatic disease, GI bleeding, bone marrow suppression, infection, diarrhea, hyperglycemia, diabetes mellitus, nausea/vomiting, pancreatitis, pneumonitis, QT prolongation, torsades de pointes, bradycardia, cardiac arrhythmias, electrolyte imbalances, corticosteroid therapy

DOSAGE AND ROUTES
- **Adult: PO** 450 mg daily on an empty stomach until disease progression or unacceptable toxicity. Decrease dose by ⅓, round to nearest 150 mg with strong 3A4 inhibitors or inducers

Available forms: Capsules 150 mg

C

cephradine

See cephalosporins—first generation

⚠ HIGH ALERT

certolizumab (Rx)

(ser′tue-liz′oo-mab)

Cimzia

Func. class.: GI antiinflammatory antirheumatic

Chem. class.: Anti–tissue necrosis factor (anti-TNF) agent

ACTION: Monoclonal antibody that neutralizes the activity of tumor necrosis factor α (TNF-α) found in Crohn's disease; decreases infiltration of inflammatory cells

USES: Crohn's disease (moderate to severe) that has not responded to conventional therapy, rheumatoid arthritis (moderate to severe), psoriatic arthritis, ankylosing spondylitis, moderate-severe plaque psoriasis in those that are candidates for systemic/phototherapy, nonradiographic axial spondyloarthritis with signs of inflammation

Unlabeled uses: Fistulizing Crohn's disease

CONTRAINDICATIONS: Influenza, IV administration, sepsis, hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, AIDS, coagulopathy, diabetes, fungal infection, heart failure, hepatitis, human antichimeric antibody, immunosuppression, leukopenia, MS, cancer, neurologic/renal disease, surgery, thrombocytopenia, TB, vaccinations

Black Box Warning: Infection, neoplastic disease in children

DOSAGE AND ROUTES

Crohn's disease (moderate to severe)

- **Adult: SUBCUT** 400 mg given as 2 injections at wk 0, 2, 4; if clinical response occurs, give 400 mg q4wk

RA (moderate to severe)/ankylosing spondylitis/psoriatic arthritis

- **Adult: SUBCUT** 400 mg (as 2 injections of 200 mg) once, then repeat at wk 2 and 4; maintenance, 200 mg q2wk or 400 mg q4wk

Moderate-severe plaque psoriasis

- **Adult: SUBCUT** 400 mg (as two 200-mg injections) every other wk
- **Adult <90 kg: SUBCUT** 400 mg (as two 200-mg injections) at wk 0, 2, 4, then 200 mg every other wk

Available forms: Solution for injection 200 mg/mL; prefilled syringe 400-mg kit

Administer:

SUBCUT route

- **TB testing:** Required prior use, should be done baseline, periodically, use in TB or active infection is contraindicated
- Give by SUBCUT injection only
- **Reconstitution:** Allow to warm to room temperature; add 1 mL sterile water for injection to each vial; 2 vials will be needed for patients with Crohn's disease
- Gently swirl; do not shake; full reconstitution may take up to 30 min; reconstituted product may remain at room temperature for up to 2 hr or refrigerated up to 24 hr
- If reconstituted product has been refrigerated, allow to warm to room temperature
- Use 2 syringes and two 20G needles
- Withdraw reconstituted solution from each vial into separate syringes; each will contain 200 mg; switch 20G to 23G needle; inject into 2 separate sites in abdomen or thigh
- Store in refrigerator; do not freeze

SIDE EFFECTS

CNS: Anxiety, bipolar disorder, suicidal ideation

CV: Heart failure, MI, cardiac dysrhythmia, angina, stroke, thrombophlebitis, hypertension

GI: Abdominal pain

HEMA: Anemia, pancytopenia

INTEG: *Rash, urticaria,* angioedema

MISC: Anaphylaxis, antibody formation, arthralgia, bleeding, infection, lupus-like symptoms, lymphadenopathy, malignancies, serum sickness

RESP: Upper respiratory tract infection, cough

PHARMACOKINETICS

Peak 54-171 hr, half-life 14 days

INTERACTIONS

- Do not administer live vaccines, toxoids concurrently

Increase: possible infections—abatacept, adalimumab, anakinra, etanercept, immunosuppressive agents, inFLIXimab, rilonacept; do not use concurrently

Increase: immunosuppressant toxicity—pimecrolimus, tofacitinib, tocilzumab

NURSING CONSIDERATIONS

Assess:

- Antinuclear antibody test (ANA), hepatitis B serology, CBC with differential, blood dyscrasias
- **Rheumatoid arthritis/ankylosing spondylitis:** pain, range of motion baseline and during treatment
- **Crohn's disease:** nausea, vomiting, abdominal pain, hepatitis, increased LFTs
- CV status: B/P, pulse, chest pain
- **Allergic reaction, anaphylaxis:** rash, dermatitis, urticaria, dyspnea, hypotension, fever, chills; discontinue if severe; administer EPINEPHrine, corticosteroids, antihistamines; assess for allergies to murine proteins prior to starting therapy

Black Box Warning: Fungal infection: fever, weight loss, diaphoresis, fatigue, dyspnea; discontinue if infection occurs; do not administer to patients with active infection

Black Box Warning: Identify TB, risk for HBV before beginning treatment; TB test should be obtained; if present, TB should be treated prior to certolizumab treatment

Hepatitis B virus: Carriers of HBV should be monitored; those at risk for HBV should be evaluated prior to use

Black Box Warning: Do not use in children; lymphoma may occur

Evaluate:
- Therapeutic response: absence of fever, mucus in stools; decreased inflammation in joints, ability to move without pain

Teach patient/family:
- Not to breastfeed while taking this product
- To notify prescriber of GI symptoms, hypersensitivity reactions, infections, fluid retention; redness, pain, swelling at injection site
- Not to operate machinery, drive if dizziness, vertigo occur
- Not to receive live virus vaccines while taking this product
- How to inject medications if given prefilled syringes for home use
- To discuss with provider all OTC, Rx, herbals, supplements taken
- To seek emergency services for anaphylaxis, angioedema, hypersensitivity
- To report immediately rash; itching; swollen lips, tongue, face
- To discuss possible secondary malignancy

Black Box Warning: Infection: To report immediately increased temperature, trouble breathing, cough or other flulike symptoms

- **Pregnancy/breastfeeding:** Those pregnant should enroll in the Mother to Baby Autoimmune Disease Study (877-311-8972)

cetirizine (Rx, OTC)

(se-teer′i-zeen)

All Day Allergy, ZyrTEC, ZyrTEC Children′s Allergy

Func. class.: Antihistamine (second generation, peripherally selective)

Chem. class.: Piperazine, H_1-histamine antagonist

Do not confuse:
cetirizine/sertraline/stavudine
ZyrTEC/Xanax/Zantac/Zocor/ZyPREXA/Zerit

ACTION: Acts on blood vessels, GI, respiratory system by competing with histamine for H_1-receptor site; decreases allergic response by blocking pharmacologic effects of histamine; minimal anticholinergic, sedative action

USES: Rhinitis, allergy symptoms, chronic idiopathic urticaria
Unlabeled uses: Asthma, atopic dermatitis

CONTRAINDICATIONS: Breastfeeding, newborn or premature infants, hypersensitivity to this product or hydrOXYzine, severe hepatic disease
Precautions: Pregnancy, children, geriatric patients, respiratory disease, angle-closure glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma

DOSAGE AND ROUTES

- **Adult and child ≥6 yr: PO** 5-10 mg/day
- **Child 2-5 yr: PO** 2.5 mg/day, may increase to 5 mg/day or 2.5 mg bid
- **Child 1-2 yr: PO** 2.5 mg/day, may increase to 2.5 mg q12hr
- **Geriatric: PO** 5 mg/day, may increase to 10 mg/day

Renal dose/hemodialysis dose
- **Adult: PO** CCr 11-31 mL/min, 5 mg/day

Hepatic dose
- **Adult: PO** 5 mg daily
- **Child 6-11 yr: PO** 2.5 mg daily

Available forms: Tablets 5, 10 mg; syrup 5 mg/5 mL, chewable tablets 5, 10 mg; oral disintegrating tablet 10 mg; capsules 10 mg

Administer:
- Without regard to meals
- Store in tight, light-resistant container
- **Chewable tablets:** chew before swallowing; may use with or without water
- **Syrup:** use calibrated measuring device

SIDE EFFECTS
CNS: *Headache, drowsiness,* sedation, *fatigue*
EENT: Pharyngitis, dry mouth
INTEG: Rash, eczema
RESP: Pharyngitis

PHARMACOKINETICS
Absorption rapid; onset ½ hr; peak 1-2 hr; duration 24 hr; protein binding 93%; half-life 8.3 hr, decreased in children, increased in renal/hepatic disease

INTERACTIONS
Increase: CNS depression—alcohol, opiates, sedative/hypnotics, other CNS depressants
Increase: anticholinergic/sedative effect—MAOIs
Drug/Lab Test
False negative: skin allergy tests

NURSING CONSIDERATIONS
Assess:
- **Allergy symptoms:** pruritus, urticaria, watering eyes at baseline and during treatment
- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness

Evaluate:
- Therapeutic response: absence of running or congested nose, rashes

Teach patient/family:
- About all aspects of product use; to notify prescriber if confusion, sedation, or hypotension occurs
- To avoid driving, other hazardous activity if drowsiness occurs; to take at night, as drowsiness may occur, especially in children
- To avoid alcohol, other CNS depressants, OTC antihistamines
- To avoid exposure to sunlight; burns may occur
- To use sugarless gum, candy, frequent sips of water to minimize dry mouth

TREATMENT OF OVERDOSE:
Administer diazePAM, vasopressors, phenytoin IV

⚠ HIGH ALERT

cetrorelix (Rx)
(set-roe-ree′lix)
Cetrotide
Func. class.: Gonadotropin-releasing hormone antagonist
Chem. class.: Synthetic decapeptide

USES: For inhibition of premature LH surges in women undergoing controlled ovarian hyperstimulation

CONTRAINDICATIONS:
Pregnancy, breastfeeding, hypersensitivity, latex allergy, renal disease, KRA5 mutation

DOSAGE AND ROUTES
Single-dose regimen
- **Adult: SUBCUT** 3 mg when serum estradiol level at appropriate stimulation response, usually on stimulation day 7; if hCG not given within 4 days after injection of 3 mg cetrorelix, give 0.25 mg daily until day of hCG administration

Multiple-dose regimen
- **Adult: SUBCUT** 0.25 mg given on stimulation day 5 (either morning or evening) or 6 (morning) and continued daily until day hCG is given

Available forms: Powder for injection 0.25 mg

⚠ HIGH ALERT

cetuximab (Rx)
(se-tux′i-mab)
Erbitux

Func. class.: Antineoplastic—miscellaneous
Chem. class.: Epidermal growth factor receptor inhibitor

ACTION: Not fully understood; binds to K-RAS wild-type epidermal growth factor receptors (EGFRs); inhibits phosphorylation and activation of receptor-associated kinase, thereby resulting in inhibition of cell growth

USES: Alone or in combination with irinotecan for K-RAS wild-type EGFRs expressing metastatic colorectal carcinoma, head/neck cancer

CONTRAINDICATIONS: Hypersensitivity to this product, murine proteins, RAS-mutant metastatic colorectal cancer or unknown RAS mutation
Precautions: Pregnancy, breastfeeding, children, geriatric patients; CV/renal/hepatic disease; ocular or pulmonary disorders, arrhythmias, CAD, radiation/platinum-based therapy, respiratory arrest

Black Box Warning: Infusion-related reactions, cardiac arrest

DOSAGE AND ROUTES

Squamous cell carcinoma of head/neck

- **Adult: IV INFUSION** 400 mg/m^2 loading dose over 120 min, max infusion rate 5 mL/min; weekly maintenance dose (all other infusions) is 250 mg/m^2 given over 60 min, max infusion rate 5 mL/min (10 mg/min); premedicate with an H_1-antagonist (diphenhydrAMINE 50 mg IV); dosage adjustments made for infusion reactions or dermatologic toxicity; other protocols used

KRAs mutation–negative (wild type), EGFR-expressing colorectal cancer

- **Adult: IV** 400 mg/m^2 over 2 hr, then give FOLFIRI after 1 hr, then 250 mg/m^2 over 60 min weekly

Available forms: Solution for injection 2 mg/mL

Administer:

- Premedicate with diphenhydramine 50 mg 30-60 min before first dose; use during infusion for reactions

Intermittent IV INFUSION route

- Use cytoxic handling procedures
- By IV infusion only; do not give by IV push or bolus; do not shake or dilute
- Do not dilute with other products
- Store refrigerated at 36°F-46°F (2.2°C to 7.7°C), discard unused portions
- **Infusion pump:** fill Erbitux into sterile evacuated container/bag, repeat until calculated volume is put into the container; use new needle for each vial; give through in-line filter (low protein binding 0.22 micrometer); prime before starting infusion, max rate 5 mL/min; flush line at end of infusion with 0.9% NaCl
- **Syringe pump:** use in-line filter (low protein binding 0.22 micrometer); connect infusion line, start infusion after priming; repeat until calculated volume given
- Use new needle and filter for each vial, max 5 mL/min rate; use 0.9% NaCl to flush line after infusion
- Do not piggyback
- Observe patient for adverse reactions for 1 hr after infusion

Black Box Warning: Infusion reactions (bronchospasm, stridor, urticaria, hypotension, MI): if mild (grade 1 or 2), reduce all doses by 50%; if severe (grade 3 or 4), permanently discontinue; monitor for at least 1 hr after completion of therapy; reactions usually occur during first dose; have emergency equipment nearby

SIDE EFFECTS

CNS: *Headache, insomnia, depression,* aseptic meningitis
CV: Cardiac arrest
GI: *Nausea, diarrhea, vomiting, anorexia, mouth ulceration, dehydration, constipation, abdominal pain*
HEMA: Leukopenia, anemia, neutropenia

INTEG: Rash, pruritus, acne, toxic epidermal necrolysis, angioedema, acute infusion reactions, other skin toxicities
MISC: *Conjunctivitis,* hypomagnesemia
RESP: Interstitial lung disease, *cough, dyspnea,* pulmonary embolus, respiratory arrest
SYST: Anaphylaxis, sepsis, infection, mucosal inflammation, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

Half-life 114 hr, steady state by third wkly infusion

INTERACTIONS

Drug/Lab Test
Increase: LFTs

NURSING CONSIDERATIONS

Assess:
• **Pulmonary changes:** lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed

Black Box Warning: Cardiac arrest: monitor electrolytes; in those undergoing radiation therapy, electrolytes may be decreased; monitor cardiac patients who receive this product and radiation therapy or platinum-based therapy with 5-FU (head, neck cancer)

• **Serious hypersensitivity reactions:** toxic epidermal necrosis, angioedema, anaphylaxis, Stevens-Johnson syndrome
• Monitor serum calcium, magnesium, potassium during and for 8 wk after treatment; low levels may occur from a few days to several months after treatment
• **GI symptoms:** frequency of stools, dehydration, abdominal pain, stomatitis
• **K-RAS mutations** with metastatic colorectal carcinoma; if K-RAS mutation on codon 12 or 13 detected, patient should not receive anti-EGFR antibody therapy
Evaluate:
• Therapeutic response: decreased growth, spread of EGFR-expressing metastatic colorectal, head/neck carcinoma

Teach patient/family:
• About the reason for treatment, expected results
• To wear sunscreen and hats to limit sun exposure; sun exposure can exacerbate any skin reactions
• To avoid crowds, persons with known infections
• **Pregnancy/breastfeeding: To report adverse reactions immediately:** shortness of breath, severe abdominal pain, skin eruptions; to use contraception (both female and male) during treatment and for 6 mo after treatment; not to breastfeed during treatment and for 2 mo after treatment

chlordiazePOXIDE (Rx)

(klor-dye-az-e-pox'ide)
Func. class.: Antianxiety
Chem. class.: Benzodiazepine, long-acting
Controlled Substance Schedule IV

USES: Short-term management of anxiety, acute alcohol withdrawal, preoperatively for relaxation

CONTRAINDICATIONS: Pregnancy, breastfeeding, children <6 yr, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis
Precautions: Geriatric patients, debilitated, renal/hepatic disease, suicidal ideation, abrupt discontinuation, respiratory depression, Parkinson's disease, myasthenia gravis

DOSAGE AND ROUTES

Mild anxiety
• **Adult: PO** 5-10 mg tid-qid
• **Geriatric: PO** 5 mg bid initially, increase as needed
• **Child >6 yr: PO** 5 mg bid-qid, max 10 mg bid-tid
Severe anxiety
• **Adult: PO** 20-25 mg 3-4 times per day, max 100 mg/day

Preoperatively
• **Adult: PO** 5-10 mg tid-qid on day before surgery
Alcohol withdrawal
• **Adult: PO** 50-100 mg q4-6hr prn, max 300 mg/day
Renal disease
• **Adult: PO** CCr <10 mL/min, give 50% dose
Available forms: Capsules 5, 10, 25 mg

chlordiazepoxide/amitriptyline (Rx)

Func. class.: Antianxiety, benzodiazepine

Controlled Substance Schedule IV

USES: Severe depression

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Children, opioid use

Dosage and Routes
Adult: PO 10 mg chlordiazepoxide/25 mg amitriptyline 3-6 times per day
Available forms: Tablets chlordiazepoxide 5 mg/amitriptyline 12.5 mg; 10 mg/amitriptyline 25 mg

chloroquine (Rx)

(klor′oh-kwin)
Func. class.: Antimalarial, antiprotozoal
Chem. class.: Synthetic 4-amino-quinoline derivative

ACTION: Inhibits parasite replication, transcription of DNA to RNA by forming complexes with DNA of parasite

USES: Malaria of *Plasmodium vivax, P. malariae, P. ovale, P. falciparum* (some strains); amebiasis
Unlabeled uses: Discoid lupus erythematosus, polymorphous light eruption, rheumatoid arthritis, ulcerative colitis

CONTRAINDICATIONS: Hypersensitivity, retinal field changes
Precautions: Pregnancy, breastfeeding, children, blood dyscrasias, severe GI/neurologic/cardiac disease, alcoholism, hepatic disease, G6PD deficiency, psoriasis, eczema, seizures, preexisting auditory damage, torsades de pointes, infection

DOSAGE AND ROUTES

Acute malaria attacks
• **Adult: PO** 1000 mg (600-mg base), then 500 mg (300-mg base) in 6-8 hr, then 500 mg (300-mg base) daily × 2 days for a total of 2.5 g (1.5-g base) in 3 days
• **Adult/adolescent of low body weight, child/infant: PO** 16.5 mg (10-mg base)/kg, max 600-mg base, then 8.3 mg (5-mg base)/kg, max 300-mg base 6 hr after first dose, then 8.3 mg (5-mg base)/kg, max 300-mg base 24 hr after first dose, then 8.3 mg (5-mg base)/kg, max 300-mg base 36 hr after first dose
Malaria prophylaxis (in areas with chloroquine-sensitive *P. falciparum*)
• **Adult: PO** 500 mg (300-mg base) weekly on same day of each wk starting 2 wk prior to travel and for 8 wk after leaving
Extraintestinal amebiasis
• **Adult: PO** 1 g (600-mg base) daily × 2 days, then 500 mg (300-mg base) for ≥2-3 wk
• **Child (unlabeled): PO** 16.6 mg (10-mg base)/kg (max 300-mg base) daily × 2-3 wk
Available forms: Tablets 250 mg (150-mg base), 500 mg (300-mg base) phosphate
Administer:
• Product in mg or base; they are different
PO route
• Prior to or after meals at same time each day to maintain product level
• Store in tight, light-resistant container at room temperature; keep injection in cool environment

SIDE EFFECTS

CNS: Headache, stimulation, fatigue, seizures, psychosis, hallucinations, insomnia

CV: Hypotension, heart block, asystole with syncope, ECG changes, cardiomyopathy
EENT: *Blurred vision, corneal changes, retinal changes, difficulty focusing,* tinnitus, vertigo, deafness, photophobia, corneal edema
GI: *Nausea, vomiting, anorexia,* diarrhea, cramps
HEMA: Thrombocytopenia, agranulocytosis, hemolytic anemia, leukopenia
INTEG: Pruritus, pigmentary changes, skin eruptions, lichen-planus–like eruptions, eczema, exfoliative dermatitis

PHARMACOKINETICS

Metabolized in liver; excreted in urine, feces, breast milk; crosses placenta
PO: Peak 1-3 hr, half-life 3-5 days

INTERACTIONS

• Reduced oral clearance and metabolism of chloroquine, cimetidine
Increase: QT prolongation, torsades de pointes—class IA, III antidysrhythmics
Increase: effects—2D6 inhibitors (amiodarone, chlorpheniramine, FLUoxetine, haloperidol, ritonavir, PARoxetine, terbinafine, ticlopidine); CYP3A4 inhibitors (diltiaZEM, verapamil, itraconazole, ketoconazole, erythromycin, doxycycline, clarithromycin)
Decrease: action of chloroquine—magnesium, aluminum compounds, kaolin; do not use concurrently
Decrease: effects of ampicillin, rabies vaccine (ID)
Drug/Lab Test
Decrease: HB, platelets, WBC

NURSING CONSIDERATIONS

Assess:
• **Infection:** resistance is common; not to be used for *P. falciparum* acquired in areas of resistance or where prophylaxis has failed
• Ophthalmic test if long-term treatment or dosage of >150 mg/day, baseline and periodically
• Screen for G6PD deficiency; identify risk of hemolysis
• Blood studies: LFTs; CBC, as blood dyscrasias occur, stop if severe dyscrasias occur; monitor for malaise, fever, bruising, bleeding (rare)
• **ECG** during therapy; watch for depression of T waves, widening of QRS complex in those with QT prolongation
• **Allergic reactions:** pruritus, rash, urticaria
• **For ototoxicity** (tinnitus, vertigo, change in hearing); audiometric testing should be done prior to, after treatment
• **For toxicity:** blurring vision; difficulty focusing; headache; dizziness; decreased knee, ankle reflexes; seizures, CV collapse; product should be discontinued immediately and IV fluids given
Evaluate:
• Therapeutic response: decreased symptoms of infection
Teach patient/family:
• To take with meals or immediately after meals
• To use sunglasses in bright sunlight to decrease photophobia
• That urine may turn rust or brown color
• To report hearing, visual problems; fever, fatigue, bruising, bleeding (may indicate blood dyscrasias)
• To keep away from pets, children; overdose is fatal
• **Pregnancy/breastfeeding:** to avoid use in pregnancy unless suppression of malaria is needed and benefits outweigh fetal risk; do not use in breastfeeding

TREATMENT OF OVERDOSE:

• Administer barbiturate (ultra-short-acting), vasopressor; tracheostomy may be necessary

chlorproMAZINE (Rx)
(klor-proe′ma-zeen)
Func. class.: Antipsychotic/antiemetic

Do not confuse:
chlorproMAZINE/chlorproPAMIDE/prochlorperazine

USES: Psychotic disorders, mania, schizophrenia, anxiety, intractable hiccups in adults, nausea, vomiting; preoperatively for relaxation; acute intermittent porphyria, behavioral problems in children, nonpsychotic, demented patients, Tourette's syndrome

CONTRAINDICATIONS: Children <6 mo, hypersensitivity, circulatory collapse, liver damage, cerebral arteriosclerosis, coronary disease, coma
Precautions: Pregnancy, breastfeeding, geriatric patients, seizure disorders, hypertension, hepatic/cardiac disease, prostatic enlargement, Parkinson's disease, pulmonary disease, severe hypo/hypertension, blood dyscrasias, brain damage, bone marrow depression, alcohol/barbiturate withdrawal, closed-angle glaucoma

Black Box Warning: Dementia; increased mortality in geriatric patients with dementia-related psychosis

DOSAGE AND ROUTES

Psychosis

- **Adult: PO** 10-50 mg q1-4hr initially then increase up to 2 g/day if necessary; **IM** 10-50 mg q1-4hr, usual dose 300-800 mg/day
- **Geriatric: PO** 10-25 mg daily-bid, increase by 10-25 mg/day q4-7days, max 800 mg/day
- **Child >6 mo: PO/IM** 0.56 mg/kg q4-6hr

Nausea and vomiting

- **Adult: PO** 10-25 mg q4-6hr prn; **IM** 12.5-25 mg q3hr prn, then 25-50 mg q6-8 hr prn if no hypotension, max 400 mg/day; **IV** 25-50 mg daily-qid
- **Child ≥6 mo: PO** 0.55 mg/kg q4-6hr; **IM** q6-8hr; **IM** ≤5 yr or ≤22.7 kg, 40 mg; max **IM** 5-10 yr or 22.7-45.5 kg, 75 mg

Intractable hiccups/acute intermittent porphyria

- **Adult: PO** 25-50 mg tid-qid; **IM** 25-50 mg (only if **PO** dose does not work); **IV** 25-50 mg in 500-1000 mL NS (only for severe hiccups)

Available forms: Tablets 10, 25, 50, 100, 200 mg; injection 25 mg/mL

C

cholestyramine (Rx)

(koe-less-tir′a-meen)

Prevalite

Func. class.: Antilipemic

Chem. class.: Bile acid sequestrant

Do not confuse:
Questran/Quarzan

ACTION: Adsorbs, combines with bile acids to form insoluble complex that is excreted through feces; loss of bile acids lowers LDL, cholesterol levels

USES: Primary hypercholesterolemia (esp. type IIa/IIb hyperlipoproteinemia), pruritus associated with biliary obstruction

CONTRAINDICATIONS: Hypersensitivity; complete biliary obstruction; hyperlipidemia III, IV, V
Precautions: Pregnancy, breastfeeding, children, PKU, renal disease, coagulopathy

DOSAGE AND ROUTES

- **Adult: PO** 4 g/day or bid, max 24 g/day
- **Child: PO** 240 mg/kg/day in 3 divided doses with food or drink, max 8 g/day titrated up over several weeks to decrease GI effects

Available forms: Powder for suspension 4 g cholestyramine/packet or scoop; tablet 1 g

Administer:

- Product daily or bid; give all other medications 1 hr prior to or 4-6 hr after cholestyramine to avoid poor absorption
- Product mixed with applesauce or stirred into beverage (2-6 oz), let stand for 2 min; do not take dry, avoid inhaling powder, avoid GI tube administration, take with food
- Supplemental doses of vitamin A, D, K if levels are low
- Doses are expressed in anhydrous cholestyramine resin; amount of resin varies with each product

SIDE EFFECTS

CNS: Headache, dizziness, drowsiness, vertigo, tinnitus, anxiety
GI: *Constipation, abdominal pain, nausea,* fecal impaction, hemorrhoids, flatulence, vomiting, steatorrhea, peptic ulcer
HEMA: Bleeding, increased PT
INTEG: Rash, irritation of perianal area, tongue, skin
META: Decreased vitamin A, D, K, red cell folate content; hyperchloremic acidosis
MS: Muscle, joint pain

PHARMACOKINETICS

PO: Excreted in feces, LDL lowered within 4-7 days, serum cholesterol lowered within 1 mo, duration 2-4 wk

INTERACTIONS

Decrease: absorption of warfarin, thiazides, cardiac glycosides, propranolol, corticosteroids, iron, thyroid hormones, acetaminophen, amiodarone, penicillin G, tetracyclines, clofibrate, gemfibrozil, oral vancomycin, glipiZIDE; vitamin A, D, E, K
Drug/Lab Test
Increase: AST, ALT, alkaline phosphatase
Decrease: sodium, potassium

NURSING CONSIDERATIONS

Assess:
- Cardiac glycoside level if both products administered, may need to adjust dose of cardiac glycoside if this product is increased or decreased
- For signs of vitamin A, D, K deficiency
- **Hypercholesterolemia:** fasting LDL, HDL, total cholesterol, triglyceride levels, electrolytes if receiving extended therapy; diet history
- **Pruritus:** for signs of itching
- Bowel pattern daily; increase bulk, water in diet for constipation; diarrhea may also occur
- **Pregnancy/breastfeeding:** no well-controlled studies; may decrease vitamin absorption (fat-soluble); use only if benefits outweigh fetal risks; cautious use in breastfeeding, vitamins may be decreased

Evaluate:
- Therapeutic response: decreased LDL, cholesterol level (hyperlipidemia); diarrhea, pruritus (excess bile acids)

Teach patient/family:
- **About the symptoms of hypoprothrombinemia:** bleeding mucous membranes, dark tarry stools, hematuria, petechiae; report immediately
- To take with food, never use dry
- That PKU patients should avoid Questran Light (contains aspartame and phenylalanine)
- About the importance of compliance
- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- That GI side effects will resolve with continued use

ciclesonide (inhalation/ intranasal) (Rx)

(si-cleh′son-ide)
Alvesco, Omnaris, Zetonna
Func. class.: Corticosteroid

ACTION: Inhibits inflammation in asthma by inhibiting leukotrienes
USES: Prevention of asthma during maintenance treatment, perennial/seasonal allergic rhinitis
CONTRAINDICATIONS: Hypersensitivity, nasal septic ulcers, nasal surgery, nasal trauma
Precautions: Children, TB, immunosuppression

DOSAGE AND ROUTES

Prevention of asthma (Alvesco)
- **Adult and child ≥12 yr in those previously taking bronchodilators alone: INH** 80 mcg bid, increase to max of 160 mcg bid after 4 wk, if needed
- **Adult and child ≥12 in those previously taking inhaled corticosteroids: INH** 80 mcg bid, increase to 320 mcg bid after 4 wk if needed
- **Adult and child ≥12 yr in those previously taking oral corticosteroids: INH** 320 mcg bid

Perennial allergic rhinitis
- **Adult and child ≥12 yr: Nasal** 2 sprays in each nostril daily (Omnaris) or 1 actuation (Zetonna) in each nostril daily

Seasonal allergic rhinitis

- **Adult and child ≥12 yr: Nasal** 1 actuation (Zetonna) in each nostril daily
- **Adult and child ≥6 yr: Nasal** 2 sprays (Omnaris) in each nostril daily

Available forms: Nasal aerosol solution 37 mcg/metered spray; **nasal suspension** 50 mcg/metered spray; **oral inhalation aerosol** 80 mcg, 160 mcg

Administer:

- Prime the inhaler before the initial use by releasing 3 sprays into the air away from the face and other people
- If the inhaler is not used for more than 10 consecutive days, it should be primed by releasing 3 sprays into the air
- The canister contains a dose counter. The inhaler should be discarded after the counter reads zero; although the canister is still operational and may contain medication, the accuracy of medication delivery cannot be assured
- When the dose indicator shows a red zone, approximately 20 inhalations are left, and a refill is required
- Instruct patient on proper inhalation technique
- To avoid the spread of infection, do not use the inhaler for more than 1 person

Intranasal inhalation administration

Omnaris:

- For intranasal use only
- Before the first use, shake the inhaler gently and prime the pump by actuating eight times
- If not used in 4 consecutive days, shake gently and prime with 1 spray or until fine mist appears
- Product should be discarded after 120 sprays following initial priming, or 4 mo after removal from pouch
- Blow nose gently if needed. Insert spray tip into nostril, and close the other nostril with finger. With head slightly tilted forward and bottle upright, press pump quickly and firmly while inhaling through nose. Avoid spraying into eyes and directly onto the nasal septum. After administration, wipe the applicator tip with a clean tissue and replace dust cap. If applicator is clogged or needs further cleaning, remove nasal applicator and rinse with warm water
- Dry and replace applicator and prime the unit with one spray or until a fine mist appears, then replace cap. To avoid the spread of infection, do not use the container for more than 1 person.

Zetonna:

- For intranasal use only
- Before the first use or if not used in 10 consecutive days, shake the inhaler gently and prime the pump by actuating 3 times
- Product should be discarded after 60 sprays following initial priming, or when the dose indicator reads zero
- Clean the nose piece weekly by wiping with a clean, dry tissue or cloth; do not wash or put any part of the canister or applicator in water
- Blow nose gently if needed. Insert spray tip into nostril, and close the other nostril with finger. With head slightly tilted back and bottle upright, press pump quickly and firmly while inhaling through nose. Avoid spraying into eyes and directly onto the nasal septum. To avoid the spread of infection, do not use the container for more than 1 person

Inhalation route

- Rinse mouth after use

Intranasal route

- Shake gently (Omnaris) before first use, then prime spraying 8 times, reprime with 1 spray if not used for 4 days
- Before first use (Zetonna), prime spraying 3 times, reprime with 3 sprays if not used for 10 days

SIDE EFFECTS

CNS: *Headache*

EENT: *Ear pain, sinusitis, nasal congestion, nosebleed*

META: *Growth retardation if used long-term*

MS: *Arthralgia, back pain*

PHARMACOKINETICS

INH: onset >4 wk, peak 1 hr, duration unknown

Nasal: onset 1-2 days, peak 1-5 wk, unknown

INTERACTIONS

Increase: hyperglycemia—ceritinib
Increase: effect of desmopressin, avoid using together
Increase: effect of CYP3A4 inhibitors

NURSING CONSIDERATIONS

Assess:
- **Nasal condition:** assess for dryness, discharge, sneezing, cough
- **Anaphylaxis, angioedema (assess for rash, trouble breathing):** discontinue treatment and notify provider immediately
- **HPA suppression:** monitor children for growth suppression in long-term therapy

Patient/family education:
- Teach patient to take as prescribed, not to skip or double doses
- Teach patient and caregiver how to use
- Advise patient to discuss with provider all OTC, Rx, herbs, supplements taken
- Advise patient to notify provider if pregnancy is planned or suspected, or if breastfeeding
- Inform patient that continuing follow-up exams may be needed

cidofovir (Rx)

(si-doh-foh'veer)

Func. class.: Antiviral
Chem. class.: Nucleotide analog

ACTION: Suppresses cytomegalovirus (CMV) replication by selective inhibition of viral DNA synthesis

USES: CMV retinitis in patients with HIV; used with probenecid

CONTRAINDICATIONS: Hypersensitivity to this product, probenecid, sulfa products; direct intraocular injection; proteinuria, renal disease/failure
Precautions: Pregnancy, breastfeeding, children <6 mo, geriatric patients, preexisting cytopenias, renal function impairment, platelet count <25,000/mm^3, dehydration

Black Box Warning: Neutropenia, infertility, secondary malignancy, pregnancy, nephrotoxicity, use only for CMV retinitis (AIDS)

DOSAGE AND ROUTES

- **Adult: IV INFUSION** Induction: 5 mg/kg over 1 hr weekly × 2 wk; maintenance: 5 mg/kg over 1 hr every other wk, give with probenecid

Renal dose
- **Adult: IV** CCr ≤55 mL/min, do not use; CCr increase of 0.3-0.4 mg/dL above baseline, decrease dose to 3 mg/kg; CCr increase of ≥0.5 mg/dL above baseline or ≥2+ proteinuria, discontinue

Available forms: Injection 75 mg/mL
Administer:

Black Box Warning: Use cytotoxic handling procedures

- Allow to warm to room temperature
- If product comes in contact with skin, wash with soap and water immediately
- If zidovudine is used, reduce dose to 50% on cidofovir treatment days

Intermittent IV INFUSION route
- **Dilute** in 100 mL 0.9% saline solution before administration; **give** probenecid PO 2 g 3 hr prior to the cidofovir infusion and 1 g at 2 and 8 hr after ending the cidofovir infusion; **give** 1 L of 0.9% saline solution IV with each INFUSION of cidofovir, give saline INFUSION over 1-2 hr period immediately prior to cidofovir; patient should be given a second L if the patient can tolerate the fluid load (second L given at time of cidofovir or immediately afterward, should be given over 1-3 hr)
- **Give** slowly; do not give by bolus IV, SUBCUT injection
- Use diluted solution within 24 hr, do not freeze; do not use solution with particulate matter or discoloration
- Do not admix

SIDE EFFECTS

CNS: *Fever, chills,* coma, confusion, abnormal thoughts, *dizziness,* bizarre dreams, *headache,* psychosis, tremors, somnolence, paresthesia, *amnesia, anxiety, insomnia,* seizures

CV: Dysrhythmias, hypo/hypertension
EENT: Retinal detachment with CMV retinitis
GI: Abnormal LFTs, *nausea, vomiting, anorexia, diarrhea,* abdominal pain, hemorrhage
GU: Hematuria, increased creatinine, BUN, nephrotoxicity
HEMA: Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia
INTEG: *Rash, alopecia, pruritus, acne,* urticaria, pain at injection site, phlebitis
RESP: Dyspnea

PHARMACOKINETICS

Terminal half-life 2.6 hr

INTERACTIONS

Black Box Warning: Nephrotoxicity: amphotericin B, foscarnet, aminoglycosides, pentamidine IV, NSAIDs, salicylates; wait 7 days after use to begin cidofovir

Drug/Lab
Increase: ALT, AST, alkaline phosphatase, glucose, cholesterol, BUN, creatinine, urine protein
Decrease: neutrophils, platelets, calcium, potassium

NURSING CONSIDERATIONS

Assess:

- Culture prior to initiating treatment; cultures of blood, urine, and throat may all be taken; CMV not confirmed by this method; diagnosis made by ophthalmic exam

Black Box Warning: Renal, hepatic, increased hemopoietic studies, BUN; serum creatinine, AST, ALT, creatinine, CCr, A-G ratio, baseline and drip treatment, blood counts q2wk; watch for decreasing granulocytes, HB; if low, discontinue and restart after recovery; blood transfusions may be required, renal failure can occur, Fanconi syndrome

- **For GI symptoms:** severe nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product
- **Electrolytes and minerals:** calcium, phosphorus, magnesium, sodium, potassium; watch closely for tetany during first administration

Black Box Warning: Blood dyscrasias (anemia, granulocytopenia); bruising, fatigue, bleeding, poor healing; leukopenia, neutropenia, thrombocytopenia: WBCs, platelets q2days during 2×/day dosing and every week thereafter; check for leukopenias with daily WBC count in prior leukopenia, with other nucleoside analogs, or for leukopenia counts <1000 cells/mm^3 at start of treatment

- **Allergic reactions:** flushing, rash, urticaria, pruritus
- Monitor serum creatinine or CCr at least q2wk; give only to those with creatinine levels ≤1.5 mg/dL, CCr >55 mL/min, urine protein <100 mg/dL

Black Box Warning: Pregnancy/breastfeeding: may cause fetal harm; use only if benefits outweigh fetal risk; do not use in breastfeeding; use contraception during and for 1 mo after last dose; males should use barrier method during and for 90 days after last dose

Evaluate:

- Therapeutic response: decreased symptoms of CMV

Teach patient/family:

- To notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate other infections
- To report perioral tingling, numbness in extremities, paresthesias; report rash immediately, mental/vision changes, urinary problems, abnormal bleeding
- That serious product interactions may occur if OTC products are ingested; check with prescriber
- That product is not a cure but will control symptoms
- That regular ophthalmic exams, renal studies must be continued
- That major toxicities may necessitate discontinuing product

• To use contraception during treatment, that infertility may occur, and that men should use barrier contraception for 90 days after treatment

TREATMENT OF OVERDOSE:
Discontinue product; use hemodialysis; increase hydration

⚠ HIGH ALERT

cilostazol (Rx)
(sih-los′tah-zol)
Func. class.: Platelet aggregation inhibitor
Chem. class.: Quinolinone derivative

ACTION:
Multifactorial effects (antithrombotic, antiplatelet vasodilation)

USES:
Intermittent claudication associated with PVD

CONTRAINDICATIONS:
Hypersensitivity, acute MI, active bleeding conditions, hemostatic conditions

Black Box Warning: HF

Precautions: Pregnancy, breastfeeding, children, geriatric patients, previous hepatic disease, cardiac/renal disease, increased bleeding risk, low platelet count, platelet dysfunction, smoking

DOSAGE AND ROUTES
• **Adult: PO** 100 mg bid or 50 mg bid if using products that inhibit CYP3A4 and CYP2C19
Available forms: Tablets 50, 100 mg
Administer:
• Give bid 30 min prior to or 2 hr after meals with a full glass of water; do not give with grapefruit juice

SIDE EFFECTS
CNS: *Dizziness, headache*
CV: *Palpitations, tachycardia,* postural hypotension, chest pain
GI: *Nausea,* vomiting, *diarrhea,* GI discomfort, colitis, cholelithiasis, ulcer, esophagitis, gastritis, anorexia, *flatulence, dyspepsia*
INTEG: *Rash,* Stevens-Johnson syndrome
RESP: *Cough, pharyngitis, rhinitis*

PHARMACOKINETICS
95%-98% protein binding; metabolism: hepatic extensively by CYP3A4, 2C19 enzymes (active metabolite); excreted in urine (74%), feces (20%); half-life 11-13 hr

INTERACTIONS
Increase: bleeding tendencies—anticoagulants, NSAIDs, thrombolytics, abciximab, eptifibatide, tirofiban, ticlopidine
Increase: cilostazol levels—CYP3A4, CYP2C19 inhibitors; dilTIAZem, erythromycin, clarithromycin, verapamil, protease inhibitors, omeprazole; exercise caution when coadministering with fluvoxaMINE, FLUoxetine, ketoconazole, isoniazid, gemfibrozil, omeprazole, itraconazole, voriconazole, fluconazole; reduce dose to 50 mg bid
Decrease: cilostazol levels—CYP3A4 inducers

Black Box Warning: Decrease: survival rates—when used with phosphodiesterase III inhibitors (milrinone) in those with heart failure class III, IV

Drug/Herb
Decrease: action—chamomile, coenzyme Q10, feverfew, garlic, ginger, ginkgo biloba, flax, goldenseal, St. John's wort
Drug/Food
• Do not use with grapefruit juice; toxicity may occur
Increase: cilostazol action—fatty meal; avoid giving with food

NURSING CONSIDERATIONS
Assess:

Black Box Warning: For underlying CV disease because CV risk is great; for CV lesions with repeated oral administration; do not administer to patients with HF of any severity; for severe headache, signs of toxicity

- Blood studies: CBC q2wk, Hct, HB, PT
- **Beers:** avoid in older adults; may promote fluid retention and/or exacerbate heart failure

Evaluate:

- Therapeutic response: improved walking distance, duration; decreased pain

Teach patient/family:

- To avoid hazardous activities until effect is known; dizziness may occur
- To report any unusual bleeding
- To report side effects such as diarrhea, skin rashes, subcutaneous bleeding
- That effects may take 2-4 wk; treatment of up to 12 wk may be required for necessary effect
- That reading the patient package insert is necessary
- That it is best to discontinue tobacco use, not to use grapefruit juice
- That there are many drug and herb interactions; to obtain approval from prescriber before use

cimetidine (OTC, Rx)

(sye-met'i-deen)

Tagamet HB

Func. class.: H_2-histamine receptor antagonist

Chem. class.: Imidazole derivative

ACTION: Inhibits histamine at H_2-receptor site in the gastric parietal cells, which inhibits gastric acid secretion

USES: Short-term treatment of duodenal and gastric ulcers and maintenance; management of GERD (PO) and Zollinger-Ellison syndrome; prevention of upper GI bleeding; prevent, relieve heartburn, acid indigestion

CONTRAINDICATIONS: Hypersensitivity to this product, H_2 blockers, benzyl alcohol

Precautions: Pregnancy, breastfeeding, children <16 yr, geriatric patients, organic brain syndrome, renal/hepatic disease

DOSAGE AND ROUTES

Short-term treatment of active ulcers

- **Adult/adolescents ≥16 yr: PO** 300 mg qid × 8-12 wk or 400 mg bid × 8 wk
- **Child: PO** 20-40 mg/kg/day, divided q6hr

Prophylaxis of duodenal ulcer

- **Adult and child >16 yr: PO** 400 mg at bedtime or 300 mg bid

GERD

- **Adult: PO** 800-1600 mg/day in divided doses × up to 12 wk

Hypersecretory conditions (Zollinger-Ellison syndrome)

- **Adult: PO** 300-600 mg q6hr; max 2400 mg/day

Heartburn

- **Adult/child ≥12 yr: PO** 200 mg up to bid, may use before eating, max 400 mg/day, max daily use up to 2 wk

Renal disease

- **Adult: PO** CCr <30 mL/min, 300 mg q12hr

Available forms: Tablets 100, 300, 400, 800 mg; oral liquid 300 mg/5 mL

Administer:

PO route

- With meals for prolonged product effect; antacids 1 hr prior to or 1 hr after cimetidine

SIDE EFFECTS

CNS: *Confusion, headache,* depression, dizziness, psychosis

CV: Bradycardia, tachycardia, dysrhythmias

GI: *Diarrhea,* abdominal cramps

GU: Gynecomastia, galactorrhea, impotence, increase in BUN, creatinine

INTEG: Urticaria, rash

RESP: Pneumonia

PHARMACOKINETICS

Half-life 1½-2 hr; 30%-40% metabolized by liver, excreted in urine (unchanged), crosses placenta, enters breast milk

PO: Onset 30 min, peak 45-90 min; duration 4-5 hr, well absorbed

INTERACTIONS

Increase: toxicity due to CYP450 pathway—benzodiazepines, beta-blockers, calcium channel blockers, carBAMazepine, chloroquine, lidocaine, metroNIDAZOLE, moricizine, phenytoin, quiNIDine, quiNINE, sulfonylureas, theophylline, tricyclics, valproic acid, warfarin

Increase: bone marrow suppression—carmustine

Decrease: absorption of cimetidine—antacids, sucralfate

Decrease: absorption—ketoconazole, itraconazole

Drug/Lab Test

Increase: alkaline phosphatase, AST, creatinine, prolactin

False positive: gastroccult, hemoccult tests

False negative: TB skin tests

NURSING CONSIDERATIONS

Assess:

- **Ulcer symptoms:** epigastric pain, duration, intensity; aggravating, ameliorating factors; blood in stools; emesis
- **Beers:** avoid in older adults with delirium or at high risk for delirium, adverse CNS reactions

Evaluate:

- Therapeutic response: decreased pain in abdomen; healing of ulcers; absence of gastroesophageal reflux; gastric pH of 5

Teach patient/family:

- That gynecomastia, impotence may occur, are reversible
- To avoid driving, other hazardous activities until stabilized on this medication; drowsiness or dizziness may occur
- To avoid OTC preparations: aspirin; cough, cold preparations; condition may worsen; OTC therapy is used for short term (2 wk)
- Not to smoke because smoking decreases effectiveness of product
- That product must be taken exactly as prescribed and continued for prescribed time to be effective; not to double dose; if taking OTC, not to take maximum dose >2 wk unless directed by prescriber
- To report diarrhea, black tarry stools, sore throat, rash, dizziness, confusion, delirium to prescriber
- To use increased fluids, bulk in diet to decrease constipation
- **Pregnancy/breastfeeding:** to report if pregnancy is planned or suspected or if breastfeeding, avoid breastfeeding

cinacalcet (Rx)

(sin-a-kal′set)

Sensipar

Func. class.: Hyperparathyroidism agent, calcium receptor agonist

Chem. class.: Polypeptide hormone

ACTION: Directly lowers PTH levels by increasing sensitivity of calcium-sensing receptors to extracellular calcium

USES: Hypercalcemia with parathyroid carcinoma, secondary hyperparathyroidism with chronic kidney disease for patient on dialysis, primary hyperparathyroidism

CONTRAINDICATIONS: Hypersensitivity, hypocalcemia

Precautions: Pregnancy, breastfeeding, children, seizure disorders, hepatic disease

DOSAGE AND ROUTES

Parathyroid carcinoma

- **Adult: PO** 30 mg bid, titrate q2-4wk, with sequential doses of 30 mg bid, 60 mg bid, 90 mg bid, 90 mg tid-qid to normalize calcium levels

Secondary hyperparathyroidism

- **Adult: PO** 30 mg/day, titrate no more frequently than q2-4wk with sequential doses of 30, 60, 90, 120, 180 mg/day

Primary hyperparathyroidism

- **Adult: PO** 30 mg bid, titrate q2-4wk to target calcium levels

Available forms: Tablets 30, 60, 90 mg

Administer:

- Swallow tablets whole; do not break, crush, or chew; use with food or right after a meal
- Can be used alone or in combination with vitamin D sterols, phosphate binders
- Storage at <77°F (25°C)

Chronic kidney disease: Titrate q2-4wk to target iPTH consistent with National Kidney Foundation–Kidney Disease Outcomes Quality Initiative (NKF-K/DOQI) for chronic kidney disease patient on dialysis of 150-300 pg/mL; if iPTH <150-300 pg/mL, reduce dose of cinacalcet and/or vitamin D sterols or discontinue treatment

SIDE EFFECTS

CNS: Dizziness, asthenia, seizures, paresthesia, fatigue, headache
CV: Dysrhythmia hypotension
GI: Nausea, diarrhea, vomiting, anorexia, constipation
MISC: Infection, dehydration, hypercalcemia, anemia, hypocalcemia
MS: Myalgia, bone fractures binding

PHARMACOKINETICS

93%-97% plasma; proteins metabolized by CYP3A4, 2D6, 1A2; half-life 30-40 hr; renal excretion of metabolites (80% renal, 15% in feces)

INTERACTIONS

Increase: cinacalcet levels—CYP3A4 inhibitors (ketoconazole, erythromycin, itraconazole), dose may need to be reduced
Increase: levels of CYP2D6 inhibitors (flecainide, vinBLAStine, thioridazine, tricyclics)
Drug/Food
Increase: action by high-fat meal

NURSING CONSIDERATIONS

Assess:
• **Hypocalcemia:** cramping, seizures, tetany, myalgia, paresthesia; calcium, phosphorous within 1 wk and iPTH 1-4 wk after initiation or dosage adjustment when maintenance established; measure calcium, phosphorus monthly; iPTH q1-3mo, target range 150-300 pg/mL for iPTH level; biochemical markers of bone formation/resorption; radiologic evidence of fracture; serum testosterone
• **Renal disease (without dialysis):** these patients should not receive treatment with this product; high risk of hypocalcemia
• Liver studies in those with liver disease
• If calcium <8.4 mg/dL, do not start; if calcium is 7.5-8.4 mg/dL, give calcium-containing phosphate binders, vitamin D sterols to increase calcium; if calcium <7.5 mg/dL or if symptoms of hypocalcemia continue and vitamin D cannot be increased, withhold until calcium reaches 8.0 mg/dL, symptoms resolve, start product at next lowest dose
• **Pregnancy/breastfeeding:** no well-controlled studies, use only if benefits outweigh fetal risk; those who are pregnant should enroll in Amgen's Pregnancy Surveillance Program (800-772-6436); discontinue breastfeeding or product, it is unknown if excreted in breast milk

Evaluate:
• Therapeutic response: calcium levels 9-10 mg/dL, decreasing symptoms of hypercalcemia

Teach patient/family:
• To take with food or shortly after a meal; to take tablets whole, not to take any other meds, supplements without prescriber approval
• **Hypocalcemia:** to report cramping, seizures, muscle pain, tingling, tetany immediately
• To continue exams and lab work

C

ciprofloxacin (Rx)

(sip-ro-floks'a-sin)

Cipro, Cipro XR

Func. class.: Antiinfective—broad spectrum
Chem. class.: Fluoroquinolone

Do not confuse:
ciprofloxacin/cephalexin

ACTION: Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; DNA gyrase inhibitor

USES: Infection caused by susceptible *Escherichia coli, Enterobacter cloacae, Proteus mirabilis, Klebsiella pneumoniae, Proteus vulgaris, Citrobacter freundii, Serratia marcescens, Pseudomonas aeruginosa, Staphylococcus aureus, Staphylococcus epidermidis, Enterobacter, Campylobacter*

jejuni, Salmonella, Streptococcus pyogenes, Bacillus anthracias; chronic bacterial prostatitis, acute sinusitis, postexposure inhalation anthrax, infectious diarrhea, typhoid fever, complicated intraabdominal infections, nosocomial pneumonia, urinary tract infections, plague

CONTRAINDICATIONS: Hypersensitivity to quinolones

Precautions: Pregnancy, breastfeeding, children, geriatric patients, renal disease, seizure disorder, stroke, CV disease, hepatic disease, QT prolongation, hypokalemia, colitis

Black Box Warning: Tendon pain/rupture, tendinitis, myasthenia gravis, nephrotoxicity

DOSAGE AND ROUTES

Uncomplicated urinary tract infections

- **Adult: PO** 250 mg q12hr × 3 days or **XL** 500 mg q24hr × 3 days

Mild-moderate UTI

- **Adult: PO** 250 mg q12hr or **IV** 200 mg q12hr × 7-14 days

Complicated/severe urinary tract infections

- **Adult: PO** 500 mg q12hr or **XL** 1000 mg q24hr × 7-14 days; **IV** 400 mg q12hr
- **Child/adolescent: PO** 10-20 mg/kg/dose q12hr × 10-21 days; not first choice in pediatric patients due to high incidence of adverse reactions

Respiratory, bone, skin, joint infections (mild-moderate)

- **Adult: PO** 500-750 mg q12hr × 7-14 days; **IV** 400 mg q12hr

Nosocomial pneumonia

- **Adult: IV** 400 mg q8hr × 10-14 days

Intraabdominal infections, complicated

- **Adult: PO** 500 mg q12hr × 7-14 days; **IV** 400 mg q12hr × 7-14 days, usually given with metroNIDAZOLE

Acute sinusitis, mild/moderate

- **Adult: PO** 500 mg q12hr × 10 days; **IV** 400 mg q12hr × 10 days

Inhalational anthrax (postexposure)

- **Adult: PO** 500 mg q12hr × 60 days; **IV** 400 mg q12hr × 60 days
- **Child: PO** 15 mg/kg/dose q12hr × 60 days, max 500 mg/dose; **IV** 10 mg/kg q12hr, max 400 mg/dose

Plague

- **Adult: IV** 400 mg q8-12hr or 500-750 mg q12hr × 14 days
- **Child 1-17 yr: IV** 10 mg/kg or **PO** 15 mg/kg q8-12hr × 10-21 days

Infectious diarrhea

- **Adult: PO** 500-750 mg q12hr × 5-7 days

Chronic bacterial prostatitis

- **Adult: PO** 500 mg q12hr × 28 days; **IV** 400 mg q12hr × 28 days

Renal disease

- **Adult:** CCr 30-50 mL/min, **PO** 250-500 mg q12hr; CCr 5-29 mL/min, **PO** 250-500 mg q18hr, **IV** 200-400 mg q18-24hr

Available forms: Tablets 100, 250, 500, 750 mg; extended-release tablets (XR) 500, 1000 mg; injection 200 mg/100 mL D_5W, 400 mg/200 mL D_5W; injection 200, 400 mg; oral suspension 250 mg, 500 mg/5 mL

Administer:

- Obtain C&S before use, may give first dose before results are received
- Use caution when giving with antidysrhythmics IA, III

PO route

- Do not break, crush, chew XR (extended release) product, use adequate fluids to prevent crystalluria
- Regular release and extended release are not interchangeable
- 2 hr prior to or 6 hr after antacids, zinc, iron, calcium
- Do not give oral suspension by GI tube
- Use adequate fluids to prevent crystalluria

IV route

- Over 1 hr as an infusion, comes in premixed plastic infusion container or diluted 20- or 40-mL vial to a final concentration of 0.5-2 mg/mL of NS or D_5W; give through Y-tube or 3-way stopcock, diluted vials can be stored for 14 days at room temperature or refrigerator; do not freeze

Y-site compatibilities: Amifostine, anakinra, anidulafungin, argatroban, arsenic, atenolol, aztreonam, bivalirudin, bleomycin, calcium gluconate, CARBOplatin, caspofungin, cefTAZidime, cisatracurium, CISplatin, clarithromycin, codeine, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doripenem, DOPamine, doxacurium, DOXOrubicin, epiRUBicin, eptifibatide, ertapenem, etoposide, fenoldopam, fludarabine, gallium, gemcitabine, gentamicin, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, irinotecan, lidocaine, linezolid, LORazepam, LR, mechlorethamine, meperidine, methotrexate, metoclopramide, metroNIDAZOLE, midazolam, midodrine, milrinone, mitoXANTRONE, mycophenolate, nesiritide, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, piperacillin, potassium acetate/chloride, promethazine, raNITIdine, remifentanil, rocuronium, sodium chloride, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TNA, tobramycin, trastuzumab, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Headache,* dizziness, fatigue, insomnia, depression, *restlessness,* seizures, suicidal ideation, pseudotumor cerebri, confusion, hallucinations
GI: *Nausea, diarrhea,* increased ALT/AST, flatulence, *vomiting,* abdominal pain, pancreatitis, hepatotoxicity, CDAD
GU: Vaginitis
INTEG: *Rash,* pruritus, urticaria, photosensitivity, toxic epidermal necrolysis, injection site reactions
MISC: Anaphylaxis, Stevens-Johnson syndrome, QT prolongation, pseudotumor cerebri
MS: Arthralgia, tendon rupture
META: Hypo- and hyperglycemia

PHARMACOKINETICS

PO: Peak 1-2 hr; half-life 4 hr; excreted in urine as active product, metabolites 35%-40%, 20%-40% protein binding

INTERACTIONS

Black Box Warning: Increase: tendinitis, tendon rupture—corticosteroids

Increase: nephrotoxicity—cycloSPORINE
Increase: ciprofloxacin levels—probenecid; monitor for toxicity
Increase: levels of theophylline, warfarin; monitor blood levels, reduce dose
Increase: hypoglycemia risk—antidiabetics
Increase: QT prolongation—astemizole, droperidol, class IA/III antidysrhythmics, tricyclics, tetracyclines, local anesthetics, phenothiazines, haloperidol, risperiDONE, sertindole, ziprasidone, alfuzosin, arsenic trioxide, beta-agonists, chloroquine, cloZAPine, cyclobenzapine, dasatinib, dolasetron, droperidol, flecainide, halogenated anesthetics, lapatinib, levomethadyl, macrolides, methadone, octreotide, ondansetron, paliperidone, palonosetron, pentamidine, propafenone, ranolazine, SUNItinib, tacrolimus, terfenadine, vardenafil, vorinostat; less likely than other quinolones
Decrease: ciprofloxacin absorption—antacids that contain magnesium, aluminum; zinc, iron, sucralfate, enteral feedings, calcium, sevelamer

Drug/Food
Increase: effect of caffeine
Decrease: absorption—dairy products, food

Drug/Lab Test
Increase: AST, ALT, BUN, creatinine, LDH, bilirubin, alkaline phosphatase, glucose, proteinuria, albuminuria
Decrease: WBC, glucose

NURSING CONSIDERATIONS

Assess:
- **Infection:** WBC, temperature before treatment, periodically
- **QT prolongation:** monitor for changes in QTc if taking other products that increase QT

Black Box Warning: Myasthenia gravis: avoid use in these patients, increases muscle weakness

• **CNS symptoms:** headache, dizziness, fatigue, insomnia, depression, seizures
• Renal, hepatic studies: BUN, creatinine, AST, ALT
• I&O ratio, urine pH <5.5 is ideal, to prevent crystalluria

Black Box Warning: Tendinitis, tendon rupture: discontinue at first sign of tendon pain, inflammation; increased in those >60 yr, those taking corticosteroids, organ transplants and children

• **Anaphylaxis:** fever, flushing, rash, urticaria, pruritus, dyspnea; discontinue immediately, have emergency equipment nearby
• **Pseudotumor cerebri:** may occur at excessive doses
• **Hepatotoxicity:** report immediately dark urine, jaundice, pruritus, clay-colored stools
• Limited intake of alkaline foods, products: milk, dairy products, alkaline antacids, sodium bicarbonate; caffeine intake if excessive cardiac or CNS stimulation
• Increase fluids to 3 L/day to avoid crystallization in kidneys
• ***Clostridium difficile*–associated diarrhea (CDAD):** monitor for diarrhea, abdominal pain, cramps, fever, bloody stools; usually occurs several weeks after completion of therapy; report to prescriber immediately
• **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk, discontinue breastfeeding or discontinue product

Evaluate:
• Therapeutic response: decreased pain, frequency, urgency, C&S; absence of infection

Teach patient/family:
• Not to take any products that contain magnesium, calcium (such as antacids), iron, aluminum with this product or 2 hr before, 6 hr after product; to drink fluids to prevent crystals in urine; not to crush, chew the extended-release product

Black Box Warning: To report tendon pain, chest pain, palpitations

• To complete full course of product therapy; not to double or miss doses
• To notify prescriber if rash occurs; discontinue product
• To notify prescriber if pregnancy is planned or suspected; not to breastfeed
• **Suicidal thoughts/behaviors:** To report immediately, suicidal thoughts, behaviors
• To contact prescriber if taking theophylline, warfarin
• That extended-release and regular-release products are not interchangeable
• Not to add or stop products without prescriber's approval
• To use calibrated measuring device for suspension

ciprofloxacin (ophthalmic) (Rx)

(sip-roe-flox´a-sin)

Ciloxan

Func. class.: Ophthalmic antiinfective

Do not confuse:
ciprofloxacin/gatifloxacin/levoFLOXAcin/moxifloxacin/ofloxacin

USES: Corneal ulcers, bacterial conjunctivitis

CONTRAINDICATIONS: Hypersensitivity to this product or fluoroquinolones
Precautions: Pregnancy, breastfeeding

DOSAGE AND ROUTES

Bacterial conjunctivitis
• **Adult/adolescent/child ≥1 yr: Ophthalmic (solution):** 1-2 drops in affected eye(s) every 2 hr while awake × 2 days, then every 4 hr while awake for the next 5 days
• **Adult/adolescent/child ≥2 yr: Ophthalmic (ointment):** ½-inch ribbon to conjunctival sac tid × 2 days, then ½ inch bid for next 5 days

Ophthalmic infection associated with corneal ulcer

• **Adult/adolescent/child ≥1 yr: Ophthalmic (solution):** 2 drops in affected eye(s) every 15 min × 6 hr, then every 30 min for the remainder of the first day; for the second day, 2 drops every hr; for days 3-14, 2 drops every 4 hr

⚠ HIGH ALERT

cisatracurium (Rx)

(sis-ah-trah-kyoo′ree-um)

Nimbex

Func. class.: Skeletal muscle relaxant

Chem. class.: Nondepolarizing neuromuscular blocker

ACTION: Antagonizes acetylcholine by binding to cholinergic receptors on the motor end plate, resulting in neuromuscular blockade

USES: To maintain neuromuscular blockade during mechanical ventilation and as an adjunct to general anesthesia

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, benzyl alcohol hypersensitivity, electrolyte imbalances, long-term use in ICU, trauma, or burns, dehydration, metabolic alkalosis, respiratory acidosis, myopathy, myasthenia gravis

DOSAGE AND ROUTES

Endotracheal intubation

• **Adult/adolescent (healthy): IV** 0.15-0.2 mg/kg, one time; CABG surgery with induced hypothermia use 50% of dose

• **Adult with myasthenia gravis: IV** use peripheral nerve stimulator monitoring and an initial dose ≤0.02 mg/kg

• **Child 2-12 yr: IV** 0.1-0.15 mg/kg over 5-10 sec during either halothane or opioid anesthesia

• **Infant/child ≤23 mo: IV** 0.15 mg/kg over 5-10 sec during either halothane or opioid anesthesia

To maintain neuromuscular blockade during prolonged surgical procedures:

• **Adult/adolescent/child ≥2 yr (healthy): IV** maintenance dose 0.03 mg/kg; maintenance dosing is generally required 40-50 min after an initial dose of 0.15 mg/kg **IV** or 50-60 min after an initial dose of 0.2 mg/kg; the need for maintenance doses should be determined by clinical criteria; max 0.02 mg/kg/min (neuromuscular disease)

Available forms: Injection solution 2, 10 mg/mL

Administer:

IV route

• Visually inspect for particulate matter and discoloration before use

• Only experienced clinicians, familiar with the use of neuromuscular blocking drugs, should administer or supervise the use of this product

• Use by rapid IV injection or by continuous IV infusion

IV INFUSION route

• Inject IV over 5-10 sec

Continuous IV INFUSION route

• Dilute with NS, D_5W, or D_5NS (0.1-0.4 mg/mL); adjust the rate of infusion according to peripheral nerve stimulation

• The amount of infusion solution required per minute depends on the concentration of cisatracurium in the infusion solution, the desired dose of cisatracurium, and the patient's weight

• Store Nimbex injection diluted to 0.1 mg/mL either under refrigeration or at room temperature for 24 hr; dilutions to 0.1 mg/mL or 0.2 mg/mL in D_5W/LR injection may be stored under refrigeration for 24 hr

• Not an analgesic, treat pain with other agents

SIDE EFFECTS

CV: Bradycardia, flushing, hypotension

RESP: Apnea, bronchospasm, prolonged neuromuscular block

PHARMACOKINETICS

Onset 2 min, peak 3-5 min, duration 25-44 min, half-life 22-30 min

INTERACTIONS

Increase: neuromuscular blockade—aminoglycosides, clindamycin, lithium, local anesthetics, magnesium salts, colistin, colistimethate, procainamide, quiNIDine, tetracyclines, bacitracin, capreomycin, polymyxin B, vancomycin; amphotericin B, CISplatin, corticosteroids, loop/thiazide diuretics (if hypokalemia is present)
Decrease: neuromuscular blockade—carBAMazepine, phenytoin; dose of cisatracurium may need to be increased

NURSING CONSIDERATIONS

Assess:
- **Neuromuscular function:** use nerve stimulator to monitor neuromuscular function; if no response, stop until response; not to be used for rapid-sequence endotracheal intubation
- **Sedation/pain:** those undergoing neuromuscular blockage (paralytics) must receive treatment with sedative and pain control before and during therapy
- **Electrolytes:** electrolytes and acid-base balance may be altered
- **Malignant hyperthermia:** those with a family history of malignant hyperthermia should not receive this product or it should be used cautiously
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; use caution in breastfeeding; excretion is unknown

Evaluate:
- Maintenance of neuromuscular blockade

Teach patient/family:
- Reason for product and expected results

⚠ HIGH ALERT

CISplatin (Rx)

(sis′pla-tin)
Func. class.: Antineoplastic alkylating agent
Chem. class.: Platinum complex

Do not confuse:
CISplatin/CARBOplatin

ACTION: Alkylates DNA, RNA; inhibits enzymes that allow for the synthesis of amino acids in proteins; activity not cell cycle–phase specific

USES: Advanced bladder cancer; adjunct in metastatic testicular cancer; adjunct in metastatic ovarian cancer, head and neck, lung cancer

CONTRAINDICATIONS: Pregnancy, breastfeeding

Black Box Warning: Bone marrow suppression, platinum compound hypersensitivity

Precautions: Geriatric patients, vaccination, infections, extravasation, peripheral neuropathy, radiation therapy

Black Box Warning: Chemotherapy-induced nausea/vomiting, children, nephrotoxicity, ototoxicity; requires a specialized care setting and an experienced clinician, peripheral neuropathy

DOSAGE AND ROUTES

Dosage protocols may vary

Metastatic testicular cancer
- **Adult: IV** 20 mg/m²/day × 5 days, repeat q3wk for 2 cycles or more, depending on response

Advanced bladder cancer
- **Adult: IV** 50-70 mg/m² q3-4wk, use 50 mg/m² q4wk in those who have been pretreated with radiation/other antineoplastics

Metastatic ovarian cancer
- **Adult: IV** 100 mg/m² q4wk or 75-100 mg/m² q3wk with cyclophosphamide

Hodgkin's/non-Hodgkin's lymphoma (unlabeled)
- **Adult/child: IV INFUSION** 100 mg/m² 24 hr continuous infusion day 1 of 4-day regimen with cytarabine/dexamethasone q3-4wk

Gastric cancer (unlabeled)
- **Adult: IV** 75 mg/m² on day 1 with DOCEtaxel 75 mg/m² and fluorouracil 750 mg/m² on days 1-5, q21days

Available forms: Injection 1 mg/mL

Administer:

IV route

- Do not use aluminum equipment during any preparation or administration, will form precipitate; do not refrigerate unopened powder or solution; protect from sunlight
- Prepare in biologic cabinet using gown, gloves, mask; do not allow product to come in contact with skin; use soap and water if contact occurs; use cytotoxic handling procedures
- Do not use with neuromuscular blockers, fatal
- Hydrate patient with 1-2 L 0.9% NaCl over 8-12 hr before treatment

Black Box Warning: Use EPINEPHrine, antihistamines, corticosteroids immediately for hypersensitivity reaction

- Antiemetic 30-60 min prior to product and prn; allopurinol to maintain uric acid levels, alkalinization of urine; diuretic (furosemide 40 mg IV) or mannitol after infusion

Intermittent IV INFUSION route

- Check solution for particulate and color, do not use if present or if discolored
- **Dilute** 10 mg/10 mL or 50 mg/50 mL sterile water for injection, withdraw prescribed dose; **dilute** ½ dose with 1000 mL $D_5$0.2NaCl, $D_5$0.45NaCl with 37.5 g mannitol; IV INFUSION is **given** over 3-4 hr; use a 0.45-µm filter; total dose 2 L over 6-8 hr; check site for irritation, phlebitis

Continuous IV INFUSION route

- **Give** over 24 hr × 5 days

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amikacin, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, carmustine, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levoFLOXacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANTRONE, mivacurium, nafcillin, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Seizures, *peripheral neuropathy*
EENT: *Tinnitus, hearing loss, vestibular toxicity,* blurred vision, altered color perception
GI: *Severe nausea, vomiting, diarrhea, weight loss,* hepatotoxicity
GU: Renal tubular damage, *renal insufficiency,* sterility
HEMA: Thrombocytopenia, leukopenia, pancytopenia, *anemia*
INTEG: *Alopecia,* dermatitis
META: *Hypomagnesemia, hypocalcemia, hypokalemia*
RESP: Fibrosis
SYST: Anaphylaxis

PHARMACOKINETICS

Absorption complete, metabolized in liver, excreted in urine, half-life 30-90 min, accumulates in body tissues for several months, enters breast milk

INTERACTIONS

Increase: bleeding risk—aspirin, NSAIDs, alcohol
Increase: myelosuppression—myelosuppressive agents, radiation
Increase: nephrotoxicity—aminoglycosides, loop diuretics, salicylates
Decrease: effects of phenytoin
Decrease: antibody response—live virus vaccines
Decrease: potassium, magnesium levels—loop diuretics

Drug/Lab Test

Increase: uric acid, BUN, creatinine
Decrease: CCr, calcium, phosphate, potassium, magnesium
Positive: Coombs' test

NURSING CONSIDERATIONS

Assess:

- Monitor vital signs often during infusion

Black Box Warning: Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results

Black Box Warning: Renal toxicity: BUN, creatinine, serum uric acid, urine CCr prior to, electrolytes during therapy; dose should not be given if BUN <25 mg/dL; creatinine <1.5 mg/dL; I&O ratio; report fall in urine output of <30 mL/hr; toxicity is cumulative; withhold until renal function returns to normal

Black Box Warning: Anaphylaxis: wheezing, tachycardia, facial swelling, fainting; discontinue product, report to prescriber; resuscitation equipment should be nearby, may occur within minutes; often EPINEPHrine, corticosteroids, antihistamines may alleviate symptoms

- **Infection:** monitor temperature; may indicate beginning infection; report signs of infection, cough, sore throat, fever
- **Hepatotoxicity:** report jaundice, dark urine, clay-colored stools, pruritus, abdominal pain
- Hepatic studies prior to, during therapy (bilirubin, AST, ALT, LDH) as needed
- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa, or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine)

Black Box Warning: Ototoxicity: more common in genetic variants TPMT 3B and 3C in children; use audiometric testing baseline and prior to each dose; tinnitus or loss of high-frequency sounds is usually first indication of ototoxicity

- Comprehensive oral hygiene
- **RPLS:** Headache, change in eyesight, confusion, seizures, increased B/P, usually occurs a few hours up to a year after treatment starts, discontinue treatment
- **Hyperuricemia in lymphoma:** increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation, promote elimination of product; usually occurs between 3-5 days after a dose, may use allopurinol

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- **To report signs of infection:** increased temperature, sore throat, flulike symptoms
- **To report signs of anemia:** fatigue, headache, faintness, SOB, irritability

- To report bleeding, bruising, petechiae; to avoid use of razors, commercial mouthwash; to avoid aspirin, ibuprofen, NSAIDs, alcohol; may cause GI bleeding
- That impotence or amenorrhea can occur but is reversible after discontinuing treatment

Black Box Warning: Ototoxicity: to report loss of hearing, ringing, or roaring in the ears

- To maintain adequate fluids; to report decreased urine output, flank pain
- That hair may be lost during treatment; a wig or hairpiece may make patient feel better; that new hair may be different in color, texture
- To report numbness, tingling in face or extremities; poor hearing; joint pain, swelling
- Not to receive vaccinations during treatment
- **Pregnancy/breastfeeding:** to use contraception during treatment and for 4 mo after treatment; that product may cause infertility; not to breastfeed

citalopram (Rx)

(sigh-tal'oh-pram)

CeleXA

Func. class.: Antidepressant

Chem. class.: Selective serotonin reuptake inhibitor (SSRI)

Do not confuse:
CeleXA/CeleBREX/Cerebyx/ZyPREXA

ACTION: Inhibits CNS neuron uptake of serotonin but not of norepinephrine; weak inhibitor of CYP450 enzyme system, thus making it more appealing than other products

USES: Major depressive disorder
Unlabeled uses: Obsessive-compulsive disorder in adolescents

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, geriatric patients, renal/hepatic disease, seizure disorder, hypersensitivity to escitalopram, bradycardia, recent MI, abrupt discontinuation, QT prolongation

Black Box Warning: Children, suicidal ideation

DOSAGE AND ROUTES

Depression

- **Adult: PO** 20 mg/day AM or PM, may increase if needed to 40 mg/day after 1 wk; maintenance: after 6-8 wk of initial treatment, continue for 24 wk (32 wk total), reevaluate long-term usefulness (max 40 mg/day); poor metabolizers of CYP2C19 or use of CYP2C19 inhibitors max 20 mg/day

Hepatic dose/geriatric

- **Adult: PO** 20 mg/day

OCD (unlabeled)

- **Adult: PO** 20-60 mg/day

Available forms: Tablets 10, 20, 40 mg; oral solution 10 mg/5 mL

Administer:

- With food or milk for GI symptoms
- Crushed if patient is unable to swallow medication whole
- Dosages at bedtime if oversedation occurs during the day; may take entire dose at bedtime
- Do not give within 14 days of MAOIs
- Store at room temperature; do not freeze

SIDE EFFECTS

CNS: *Headache, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration,* seizures, suicidal attempts, neuroleptic malignant–like syndrome reactions
CV: Tachycardia, QT prolongation, orthostatic hypotension, torsades de pointes
EENT: Visual changes
GI: *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, vomiting, flatulence, decreased appetite*
GU: *Dysmenorrhea, decreased libido,* amenorrhea, impotence
INTEG: *Sweating, rash, pruritus,* photosensitivity
MS: Arthritis, myalgia

RESP: *Infection, cough, dyspnea*
SYST: Hyponatremia (geriatric patients), serotonin syndrome

PHARMACOKINETICS

Metabolized in liver by CYP3A4, CYP2C19, some individuals are poor metabolizers; excreted in urine; steady state 1 wk; peak 4 hr; half-life 35 hr

INTERACTIONS

- **Increase fatal reactions:** do not use within 14 days of MAOIs

Increase: QTc interval—dofetilide, halofantrine, probucol, pimozide, quinolones, ziprasidone; do not use together
Increase: serotonin syndrome—serotonin receptor agonists, SSRIs, traMADol, lithium, MAOIs, traZODone, SNRIs (venlafaxine, DULoxetine), linezolid, methylene blue, tricyclics, fentaNYL, busPIRone, triptans, cyclobenzaprine
Increase: bleeding risk—NSAIDs, salicylates, thrombolytics, anticoagulants, antiplatelets
Increase: CNS effects—barbiturates, sedative/hypnotics, other CNS depressants
Increase: citalopram levels—macrolides, azole antifungals
Increase: plasma levels of beta-blockers
Decrease: citalopram levels—carBAMazepine, cloNIDine

Drug/Herb

Increase: serotonin syndrome—St. John's wort, SAM-e; fatal reaction may occur; do not use concurrently
Increase: CNS stimulation—yohimbe

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alkaline phosphatase
Decrease: VMA, 5-HIAA
False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Suicide: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic; risk for suicide is greater in children and those ≤24 yr; these patients should be evaluated weekly × 4 wk and then q3wk × 4 wk, give only a small amount of product

- **Serotonin syndrome:** increased heart rate, sweating, dilated pupils, tremors, twitching, hyperthermia, agitation, hyperreflexia, nausea, vomiting, diarrhea, coma, hallucinations; may be worse in those taking SSRIs, SNRIs, triptans, traZODone, traMADol, cyclobenzaprine, linezolid
- **QT prolongation:** Flattening T-wave, bundle branch block, AV block
- B/P lying, standing, pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Weight weekly; appetite may decrease or increase with product
- **Torsades de pointes, QT prolongation:** is dose-dependent; ECG for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients
- Alcohol consumption; if alcohol is consumed, hold dose until AM
- **Sexual dysfunction:** erectile dysfunction, decreased libido
- **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk, discontinue breastfeeding or discontinue product

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effect may take 4-6 wk; that patient may have increased anxiety first 5-7 days of therapy; not to discontinue abruptly
- To use caution when driving, performing other activities that require alertness because of drowsiness, dizziness, blurred vision; to report signs, symptoms of bleeding
- To use sunscreen, protective clothing to prevent photosensitivity
- To avoid alcohol, other CNS depressants

Black Box Warning: Suicide: that suicidal ideas, behavior may occur in children or young adults, to watch closely for suicidal thoughts, behaviors, notify prescriber immediately

• **About the effects of serotonin syndrome:** nausea/vomiting, tremors; if symptoms occur, to discontinue immediately, notify prescriber

cladribine (Rx)

(klad′-dri-been)

Mavenclad

Func. class.: Multiple sclerosis agent/antineoplastic

Chem. class.: Purine nucleoside antimetabolite

ACTION: May be lymphocyte depletion through cytotoxic effects on B and T lymphocytes through impairment of DNA synthesis

USES: Relapsing multiple sclerosis, active hairy-cell leukemia

CONTRAINDICATIONS: Breastfeeding, HIV, TB

Black Box Warning: Pregnancy

Precautions:

Contraceptive requirements, hepatic disease, infection, renal disease, progressive multifocal leukoencephalopathy, neonates, premature

Black Box Warning: Bone marrow suppression, neurotoxicity, nephrotoxicity, new primary malignancy, reproductive risk; requires an experienced clinician

DOSAGE AND ROUTES

Relapsing forms of multiple sclerosis

Adults: PO 1.75 mg/kg per treatment course divided into 2 cycles and given as divided doses of 1 or 2 tablets daily over 4 or 5 days for each cycle with second cycle starting 23 to 27 days after the last dose of first cycle; give a second course at least 43 wk after the last dose of the first course, second cycle for a cumulative dosage of 3.5 mg/kg; max: 20 mg (2 tablets)/cycle day

Active hairy-cell leukemia (orphan drug)

Adult: IV: 0.14 mg/kg/day over 2 hr for 5 days or 0.1 mg/kg/day continuous infusion for 7 days for 1 cycle or 0.09 mg/kg/day continuous infusion for 7 days for 1 cycle

Available forms: Tablet 10 mg, solution for injection 1 mg/mL

Administer:

• Follow cytotoxic handling and disposal procedures

• Separate all other products by ≥3 hr during the 4- or 5-day treatment cycles

PO route

• Use dry hands; wash hands after use; avoid prolonged contact with skin

• If a tablet is left on a surface, broken or fragmented, wash the area with water

• Take without regard to meals; swallow whole with water immediately after removal from blister; do not chew

IV route

• Visually inspect for particulate matter and discoloration prior to use; a precipitate may occur during the exposure of injection to low temperatures; it may be resolubilized by allowing the solution to warm to room temperature and by shaking vigorously

• Does not contain preservative

• The concentrate for injection must be diluted before use; do not use dextrose 5% injection, or benzyl alcohol in neonates; do not admix

Daily IV infusion:

• Add calculated daily dose of the concentrate through a sterile 0.22-micrometer disposable hydrophilic syringe filter to a polyvinyl chloride infusion bag containing 500 mL of 0.9% sodium chloride injection; discard any unused portion; vials are for single-use only; once solutions are diluted, administer or store at 35.6°F to 46.4°F (2°C to 8°C) for no more than 8 hr before the start of administration

• Infuse over 24 hr

• Admixtures are stable for at least 24 hr at room temperature under normal room fluorescent light in Baxter Viaflex PVC infusion containers

Seven-day IV infusion:

• Calculate the dose for a 7-day period and withdraw from the concentrate for injection; dilute in bacteriostatic 0.9% sodium chloride injection containing benzyl alcohol as a preservative; first the calculated 7-day dose and then the amount of diluent needed to bring the total volume to 100 mL should be passed through a sterile 0.22-micrometer disposable hydrophilic syringe filter as each solution is being added to the infusion reservoir; after completing solution preparation, clamp off the line, disconnect, and discard the filter; aspirate air bubbles from the reservoir using the syringe and a dry second sterile filter or a sterile vent filter assembly; reclamp the line, and discard the syringe and filter

• Discard unused portion of injection; vials are for single-use only; once solutions are diluted, administer or store at 35.6°F to 46.4°F (2°C to 8°C) for no more than 8 hr before the start of administration

• Infuse over 7 days

SIDE EFFECTS

CNS: Fatigue, fever, headache, neurotoxicity
HEMA: Anemia, neutropenia, thrombocytopenia, lymphopenia
GI: *Nausea*
GU: Nephrotoxicity
INTEG: *Rash*

PHARMACOKINETICS

Protein binding 20%; crosses blood-brain barrier; half-life 1 day; PO product effect is decreased by a high-fat meal

INTERACTIONS

• Do not use with live virus vaccines

• Duplicate effects: immunosuppressives, avoid using together

• Antiviral and antiretroviral drugs: avoid concomitant use

• BCRP or ENT/CNT inhibitors: may alter bioavailability; avoid using together

NURSING CONSIDERATIONS

Assess:

• **Progressive multifocal leukoencephalopathy (PML):** Assess for new or worsening neurologic, cognitive, or behavioral signs or symptoms, irreversible paraparesis and quadriparesis; may be more common in those who received continuous infusion at high doses (4 to 9 times the recommended dose for hairy cell leukemia)

Black Box Warning: Bone marrow suppression: assess for neutropenia, anemia, thrombocytopenia; usually reversible and dose dependent; during the first 2 wk after treatment initiation, mean platelet count, absolute neutrophil count (ANC) and HB declined, and then increased by day 15, wk 5, and wk 8; monitor hematologic parameters especially during the first 4 to 8 wk after treatment

Black Box Warning: Secondary malignancies: monitor for secondary malignancies

Black Box Warning: Pregnancy/breastfeeding: assess if pregnancy is planned or suspected or if breastfeeding

Evaluate:

Therapeutic response: Decrease in spread of malignancy

Teach patient/family:

• If a dose is missed, take the missed dose on the following day and extend the number of days in that treatment cycle; if 2 consecutive doses are missed, extend the treatment cycle by 2 days

Black Box Warning: Pregnancy/breastfeeding: advise females of reproductive potential to use effective contraception during treatment with PO product and for at least 6 mo after the last dose in each course; instruct women who are using systemic hormonal contraceptives to add a barrier method during PO product and for at least 4 wk after the last treatment; advise male patients of reproductive

potential to take precautions to prevent pregnancy of their partner during PO treatment and for at least 6 mo after the last dose in each treatment course; highly effective contraception is recommended during treatment with IV product

clarithromycin (Rx)

(klare-ith'row-my-sin)
Func. class.: Antiinfective
Chem. class.: Macrolide

ACTION: Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

USES: Mild to moderate infections of the upper and lower respiratory tract, uncomplicated skin and skin structure infections caused by *Streptococcus pneumoniae, Mycoplasma pneumoniae, Legionella pneumophila, Moraxella catarrhalis, Neisseria gonorrhoeae, Corynebacterium diphtheriae, Listeria monocytogenes, Haemophilus influenzae, Streptococcus pyogenes, Staphylococcus aureus, Mycobacterium avium* complex (MAC); complex infection in AIDS patients; *Mycobacterium avium intracellulare, Helicobacter pylori* in combination with omeprazole, *H. parainfluenzae*

CONTRAINDICATIONS: Hypersensitivity to this product or macrolide antibiotics, torsades de pointes, QT prolongation
Precautions: Pregnancy, breastfeeding, geriatric patients, renal/hepatic disease, heart disease

DOSAGE AND ROUTES

Acute exacerbation of chronic bronchitis
- **Adult: PO** 250-500 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

Pharyngitis/tonsillitis
- **Adult: PO** 250 mg q12hr × 10 days

Community-acquired pneumonia
- **Adult: PO** 250 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

Endocarditis prophylaxis
- **Adult: PO** 500 mg 1 hr prior to procedure
- **Child: PO** 15 mg/kg 1 hr prior to procedure

MAC prophylaxis/treatment
- **Adult: PO** 500 mg bid; will require an additional antiinfective for active infection

***H. pylori* infection**
- **Adult: PO** 500 mg with 30 mg lansoprazole and 1 g amoxicillin together q12hr × 10-14 days or 500 mg with omeprazole 20 mg and 1 g amoxicillin together q12hr × 10 days or 500 mg q8hr and omeprazole 40 mg daily × 14 days, continue omeprazole for 14 more days

Acute maxillary sinusitis
- **Adult: PO** 500 mg q12hr × 14 days

Acute otitis media
- **Child: PO** 7.5 mg/kg q12hr × 10 days, max 500 mg/dose for MAC

Renal dose
- **Adult/child: PO** CCr 30-60 mL/min decrease dose by 50% if using with ritonavir; <30 mL/min, reduce dose by 50%, if used with ritonavir reduce by 75%

Available forms: Tablets 250, 500 mg; oral suspension 125 mg/5 mL, 250 mg/5 mL; extended-release tablet (XL) 500 mg

Administer:
- Do not break, crush, or chew extended release
- Adequate intake of fluids (2 L) during diarrhea episodes
- q12hr to maintain serum levels
- Store at room temperature
- **Suspension:** Shake well, store at room temperature, discard after 2 wk
- **Extended release:** Give with food

SIDE EFFECTS

CV: Ventricular dysrhythmias, QT prolongation, torsades de pointes

GI: *Nausea, vomiting, diarrhea,* hepatotoxicity, *abdominal pain,* anorexia, *abnormal taste,* CDAD, pancreatitis
INTEG: Rash, urticaria, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema
MISC: *Headache,* hearing loss

PHARMACOKINETICS

Regular release: peak 2-2.5 hr; duration 12 hr; extended release: peak 5-7 hr; half-life 5-7 hr; metabolized by liver; excreted in bile, feces; possible inhibition of P-glycoprotein, protein binding 70%

INTERACTIONS

Increase: levels, toxicity—ALPRAZolam, benzodiazepines, busPIRone, carBAMazepine, cycloSPORINE, digoxin, disopyramide, ergots, felodipine, fluconazole, omeprazole, tacrolimus, theophylline, antidiabetics, midazolam, triazolam
Increase: atorvastatin, pravastatin
Increase: myopathy, rhabdomyolysis risk—lovastatin, simvastatin; do not use concurrently
Increase: action, risk for toxicity—all products metabolized by CYP3A enzyme system
Increase: levels of sildenafil, tadalafil, vardenafil
Increase: effect of calcium channel blockers
Increase: QT prolongation—class IA, III antidysrhythmics, quinidines, procainamide, dofetilide, sotalol, amiodarone, or other products that prolong QT
Increase or decrease action: zidovudine

Drug/Food

- Do not use with grapefruit juice

Drug/Herb
Decrease: clarithromycin effect—St. John's wort

Drug/Lab Test
Increase: AST, ALT, BUN, creatinine, LDH, total bilirubin, INR, PT

NURSING CONSIDERATIONS

Assess:

- **Infection:** wound characteristics, urine, stool, sputum, WBC, temperature; C&S prior to product therapy; product may be given as soon as culture is taken; C&S may be repeated after treatment
- **Bleeding:** check INR if anticoagulants are taken
- **Hypersensitivity:** allergies before treatment, reaction to each medication
- **Heart failure:** increased risk of heart-related disease and death in some patients; use caution in those with increased CV risk, and weigh benefits and risk
- **QT prolongation, ventricular dysrhythmias:** monitor ECG, cardiac status in those with underlying cardiac abnormalities
- ***Clostridium difficile*–associated diarrhea (CDAD):** monitor for diarrhea, cramping, blood in stools, fever; report immediately to prescriber; may start up to several weeks after conclusion of treatment
- **Serious skin reaction:** Stevens-Johnson syndrome, toxic epidermal necrolysis; product should be discontinued immediately; may occur after therapy is concluded
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk, use caution in breastfeeding

Evaluate:

- Therapeutic response: C&S negative for infection, prevention of endocarditis

Teach patient/family:

- To take with full glass of water; may give with food to decrease GI symptoms; to take extended release with food
- To report sore throat, fever, fatigue; may indicate superinfection
- To notify prescriber of diarrhea, dark urine, pale stools, yellow discoloration of eyes or skin, severe abdominal pain
- To take at evenly spaced intervals; to complete dosage regimen; to notify prescribers of all products used
- To notify prescriber if pregnancy is suspected or planned or if breastfeeding

TREATMENT OF HYPERSENSITIVITY: Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

clevidipine (Rx)

(klev-id′i-peen)

Cleviprex

Func. class.: Calcium channel blocker (L-type)

Chem. class.: Dihydropyridine

ACTION: L-type calcium channels mediate the influx of calcium during depolarization in arterial smooth muscle; reduces mean arterial B/P by decreasing systemic vascular resistance

USES: Reduction of B/P when oral therapy is not feasible

CONTRAINDICATIONS: Hypersensitivity to this product, eggs, soya lecithin; defective lipid metabolism; severe aortic stenosis, pancreatitis

Precautions: Pregnancy, labor, breastfeeding, children <18 yr, heart failure, hyperlipidemia, chronic hypertension, pheochromocytoma

DOSAGE AND ROUTES

• **Adult: CONTINUOUS IV** 1-2 mg/hr; dose may be doubled q90sec initially; as B/P reaches goal, adjust dose less frequently (q5-10min) with smaller increases in dose; most patients require 4-6 mg/hr, max 32 mg/hr; no more than 1000 mL should be infused per 24-hr period due to lipid load restrictions

Available forms: Single-dose vial 50, 100 mL (0.5 mg/mL)

Administer:

Intermittent IV INFUSION route

• Do not give through same line as other medications; do not dilute, do not filter

• Gently invert several times before use; do not use if discolored or if particulate matter is present

• Give through central or peripheral line at 1-2 mg/hr; use infusion device

• Store vials in refrigerator; do not freeze; leave vials in carton until use; product is photosensitive, but protection from light during administration is not required

Solution compatibilities: water for injection, 0.9% NaCl, D_5W/0.9% NaCl, D_5/LR, LR, 10% amino acid

SIDE EFFECTS

CNS: Headache

CV: Reflex tachycardia, hypotension, rebound hypertension, atrial fibrillation

GI: Nausea, vomiting

MS: Arthralgia

GU: Acute renal failure

PHARMACOKINETICS

Onset 2-4 min; half-life initially 1 min, terminal 15 min; metabolized via esterases in blood, extravascular tissues; excreted in urine 63%-74%, feces 7%-22%; protein binding >99%

NURSING CONSIDERATIONS

Assess:

• **Cardiac status:** Monitor B/P, pulse, respiration, ECG; some patients have developed severe angina, acute MI if obstructive CAD is severe; if not transitioned to other antihypertensive therapies after clevidipine infusion, patients should be monitored ≥8 hr for rebound hypertension; monitor for rebound hypertension after product stoppage

• **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excretion is unknown, use cautiously in breastfeeding

Evaluate:

• Therapeutic response: decreased B/P

Teach patient/family:

• To notify prescriber immediately if neurologic symptoms, visual changes, or symptoms of HF occur

• To inform the patient of reason for product, expected result
• To continue follow-up for hypertension in patients with hypertension
• To notify prescriber if pregnancy is planned or suspected, or if breastfeeding

clindamycin (Rx)

(klin-da-my'sin)

Cleocin, Cleocin T, Clinda-Derm, Clindagel, Clindesse, Clindets, Dalacin T, Evolin, Dalacin C

Func. class.: Antiinfective—miscellaneous

Chem. class.: Lincomycin derivative

ACTION: Binds to 50S subunit of bacterial ribosomes, suppresses protein synthesis

USES: Skin, skin structure, respiratory tract infections; septicemia; intra-abdominal infections; endocarditis prophylaxis; infections caused by staphylococci, streptococci, *Rickettsia, Fusobacterium, Actinomyces, Peptococcus, Bacteroides, Pneumocystis jiroveci*

CONTRAINDICATIONS: Hypersensitivity to this product or lincomycin, tartrazine dye; ulcerative colitis/enteritis

Black Box Warning: Pseudomembranous colitis

Precautions: Pregnancy, breastfeeding, GI/hepatic disease, asthma, allergy, diarrhea

DOSAGE AND ROUTES

Most infections

• **Adult: PO** 150-450 mg q6hr, max 2700 mg/day; **IM/IV** 1.2-2.7 g/day in 2-4 divided doses, max 4800 mg/day severe infections
• **Child >1 mo: PO** 8-25 mg/kg/day in divided doses q6-8hr; **IM/IV** 20-40 mg/kg/day in 3-4 equal divided doses q6-8hr
• **Neonate: IM/IV** 15-20 mg/kg/day divided doses q6-8hr

PID

• **Adult: IV** 900 mg q8hr plus gentamicin

Bacterial endocarditis prophylaxis

• **Adult: PO/IV** 600 mg 1 hr (PO), 30 min (IV) prior to procedure

Bacterial vaginosis

• **Adult/adolescent: Vaginal:** (Clindamax) 1 applicator (5 g) at bedtime × 3-7 day; (Clindesse) 1 applicator (5 g) single dose or 1 suppository (100 mg) at bedtime × 3 nights

Available forms: Capsules 75, 150, 300 mg; granules for oral solution 75 mg/5 mL; injection infusion in D_5W 300 mg, 600 mg, 900 mg/16 mL; injection 150 mg/mL, 300 mg/2 mL, 600 mg/4 mL, 900 mg/6 mL; topical: foam/gel, lotion, solution 1%, cream 2%; **vaginal:** cream 2%; **vaginal suppositories** 100 mg

Administer:

• In equal intervals around the clock to maintain blood levels
• Obtain C&S prior to use, may start product before results are received

PO route

• Do not break, crush, chew capsules
• Orally with at least 8 oz of water

Oral solution

• Do not refrigerate reconstituted product; store at room temperature ≤2 wk
• Reconstitute granules with most of 75 mL of water, shake well, add remaining water, shake well (75 mg/5 mL)

Vaginal route

• Use applicator supplied
• Partner is not treated

Topical route

• Do not get in eyes, mouth cuts

IM route

• IM deep injection; rotate sites; do not give >600 mg in single IM injection

IV route

• Visually inspect parenteral products for particulate matter and discoloration prior to use
• **Vials:** dilute 300- and 600-mg doses with 50 mL of a compatible diluent; dilute 900-mg doses with 50-100 mL of a compatible diluent; dilute 1200-mg doses

with 100 mL of a compatible diluent, final concentration max 18 mg/mL

- **ADD-vantage vials:** dilute 600- and 900-mg ADD-vantage containers with 50 or 100 mL, respectively, of NS or D_5W
- **Storage:** when diluted in D_5W, NS, or LR, solutions with concentrations of 6, 9, or 12 mg/mL are stable for 16 days at room temperature or 32 days under refrigeration when stored in glass bottles or minibags; when diluted in D_5W, solutions with a concentration of 18 mg/mL are stable for 16 days at room temperature

Intermittent IV infusion route

- Infuse over at least 10-60 min, infusion rates max 30 mg/min and ≤1.2 g should be infused in a 1-hr period
- Infuse 300-mg doses over 10 min; 600-mg doses over 20 min, 900-mg doses over 30 min, and 1200-mg doses over 40 min

Continuous IV infusion route

- Give first dose rapidly, then follow with continuous infusion
- Rate is based on desired serum clindamycin levels
- To maintain serum concentrations above 4 mcg/mL, use a rapid infusion rate of 10 mg/min for 30 min and a maintenance rate of 0.75 mg/min; to maintain serum concentrations above 5 mcg/mL, use a rapid infusion rate of 15 mg/min for 30 min and a maintenance rate of 1 mg/min; to maintain serum concentrations above 5 mcg/mL, use a rapid infusion rate of 20 mg/min for 30 min and a maintenance rate of 1.25 mg/min

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amsacrine, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, ceftobiprole, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, DOXORUBicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, levoFLOXacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, raNITIdine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan,

urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

GI: *Nausea, vomiting, abdominal pain, diarrhea,* CDAD, anorexia
CV: Dysrrthmias, hypotension
INTEG: Rash, urticaria, pruritus, abscess at inj site
SYST: Stevens-Johnson syndrome, exfoliative dermatitis
MISC: Candidiasis

PHARMACOKINETICS

PO: Peak 45 min, duration 6-8 hr
IM: Peak 3 hr (adult), 1 hr (child); duration 8-12 hr; half-life 2½ hr; metabolized in liver by CYP3A4; excreted in urine, bile, feces as inactive metabolites; crosses placenta; excreted in breast milk, protein binding 94%

INTERACTIONS

• May block clindamycin effect: erythromycin; avoid using together
Increase: neuromuscular blockade—neuromuscular blockers
Decrease: absorption—kaolin/pectin
Drug/Lab Test
Increase: alkaline phosphatase, bilirubin, CPK, AST, ALT

NURSING CONSIDERATIONS

Assess:
• **Infection:** C&S prior to product therapy; product may be given as soon as culture is taken; monitor appearances of wounds, sputum, stools, urine baseline and periodically

Black Box Warning: CDAD: bowel pattern prior to, during treatment; if severe diarrhea occurs, product should be discontinued; may occur several weeks after therapy is terminated; use this product in serious infections only

• **Monitor blood studies:** CBC
• **Serious skin reactions:** Stevens-Johnson syndrome, exfoliative dermatitis (monitor for rash); discontinue at first appearance of rash, may occur after conclusion of therapy
• **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk, not recommended if breastfeeding
Evaluate:
• Therapeutic response: negative C&S
Teach patient/family:
• To take oral product with full glass of water; that antiperistaltic products may worsen diarrhea
• About all aspects of product therapy; to complete entire course of medication to ensure organism death (10-14 days); culture may be taken after medication course completed
• To report sore throat, fever, fatigue; may indicate **superinfection**
• To take with food to reduce GI symptoms

Black Box Warning: To notify nurse or prescriber of diarrhea with pus, mucus, rash

TREATMENT OF HYPERSENSITIVITY:

• Withdraw product; maintain airway; administer EPINEPHrine, O_2, IV corticosteroids

clindamycin (topical, vaginal) (Rx)

(klin-da-mye'sin)

Cleocin, Cleocin-T, Clindacin-P, Clindagel, ClindaMax, Clindasol 🍁, Clinda-T 🍁, Clindesse, Clindets, Dalacin 🍁, Evoclin

Func. class.: Topical antiinfective
Chem. class.: Lincosamide derivative

ACTION: Antibacterial activity results from inhibition of protein synthesis; bacteriostatic

USES: For the treatment of acne vulgaris; treatment of bacterial vaginosis and anaerobic bacteria

CONTRAINDICATIONS:

Hypersensitivity to this product or lincomycin, history of antibiotic-associated colitis or ulcerative colitis

Precautions: Breastfeeding, children <12 yr

DOSAGE AND ROUTES

Acne vulgaris

• **Adult/adolescent: TOPICAL** (gel, lotion, solution) Apply a thin film of 1% to affected areas bid; **TOPICAL (foam)** Apply 1% topical foam to affected areas once daily; if there is no improvement after 6-8 wk or if the condition worsens, discontinue treatment; **TOPICAL** (medicated pledgets) Use a pledget to apply a thin film to the affected area bid

Bacterial vaginosis and anaerobic bacteria

Nonpregnant adult/adolescent/postmenarchal females: Intravaginal cream: one applicatorful (100 mg clindamycin/5 g cream) intravaginally, preferably at bedtime, for 3 or 7 consecutive days in nonpregnant women and for 7 consecutive days in pregnant women; Clindesse is administered as a single dose at any time of the day

• **Intravaginal ovules/suppositories:** 1 ovule (100 mg clindamycin) inserted intravaginally at bedtime for 3 days

Available forms: Topical gel, foam, lotion, pledget, solution 1%; vaginal cream 2%, vaginal suppositories 100 mg

Administer:

Topical route

• Improvement occurs after 6 wk but can require 8-12 wk

• Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth

• Wash hands prior to and after use; wash affected area and gently pat dry

Cream/ointment/lotion: Shake well before use (lotion); apply a thin film to the cleansed affected area; massage gently into affected areas

Foam formulations: Do not dispense foam directly onto hands or face; the warmth of the skin will cause the foam to melt; apply directly into the cap or onto a cool surface; gently massage into the affected areas

Solution formulations: Shake well prior to use; apply a thin film to the cleansed affected area; massage gently into affected areas; if using a solution-soaked pledget, may use more than 1 pledget per application as needed; use only once and then discard

Intravaginal route: Only use dosage formulations specified for intravaginal use

Suppository: Unwrap vaginal ovule (suppository) before insertion; use applicator(s) supplied by the manufacturer

Cream: Use applicator(s) supplied by the manufacturer

SIDE EFFECTS

GU: Colitis, diarrhea, overgrowth, vaginitis, vaginal moniliasis, UTI

INTEG: Redness, burning, dermatitis, rash, pruritus

NURSING CONSIDERATIONS

Assess:

• Contact prescriber immediately if severe diarrhea, stomach cramps/pain, or bloody stools occur

Infection: Assess for number of lesions, severity in acne, itching in vaginosis

Evaluate:

• Decreased lesions in acne, infection in vaginosis

Teach patient/family:

Topical route

• That improvement occurs after 6 wk but can require 8-12 wk

• That topical products are not for intravaginal therapy and are for external use only; not to use skin products near the eyes, nose, or mouth

• To wash hands prior to and after use; to wash affected area and gently pat dry

• **Cream/ointment/lotion:** to shake well prior to use; **lotion:** to apply a thin film to the cleansed affected area and massage gently into affected area

• **Foam formulations:** not to dispense foam directly onto hands or face; use fingertips and gently massage into the affected areas

• **Solution formulations:** to shake well; to apply a thin film to the cleansed affected area and massage gently into affected areas; if using a solution-soaked pledget, may use more than one pledget per application as needed; each pledget should be used only once and then discarded

Intravaginal route

• To use only dosage formulations specified for intravaginal use; not to ingest

• **Suppository:** to unwrap vaginal ovule (suppository) before insertion; to use applicator(s) supplied by the manufacturer

• **Cream:** to use applicator(s) supplied by the manufacturer

clobazam (Rx)

Kloe'ba-zam

Onfi, Sympazam

Func. class.: Anticoagulant

Chem. class.: Benzodiazepine

Controlled Substance Schedule IV

ACTION: Potentates the GABA system by binding at the benzodiazepine site

USES: Adjunctive treatment of seizures associated with Lennox-Gastaut syndrome

CONTRAINDICATIONS: Hypersensitivity, breastfeeding

Precautions: Abrupt discontinuation, dependency, drug abuse, depression, suicidal thoughts/behaviors, CNS depressants, opiates

DOSAGE AND ROUTES

• **Adult and child ≥2 yr and >30 kg: PO** 5 mg bid × 6 days; on day 7, increase to 10 bid; on day 14, increase to 20 mg bid as needed, max 40 mg/day

• **Adult and child ≥2 yr and <30 kg: PO** 5 mg daily × 6 days, then day 7 increase to 5 mg bid, then day 14 increase to 10 mg bid as tolerated, max 40 mg/day

Hepatic dose, poor CYP2C19 metabolizers, elderly

• **Adult: PO** 5 mg daily × 7 days, then titrate to half the recommended dose

Available forms: Tablets 10, 20 mg; oral suspension 2.5 mg/mL; oral film 5 mg, 10 mg, 20 mg

Administer:

• May crush, break and give with soft food, may give without regard to food

• Shake oral suspension prior to use

• Apply oral film to tongue immediately after opening, do not use with liquids

• Not to discontinue abruptly, taper on weekly basis by 10 mg

SIDE EFFECTS

CNS: *Fatigue, sedation, hyperactivity, insomnia, lethargy*

GI: *Vomiting, nausea, constipation*

GU: *UTI*

META: *Increased/decreased appetite*

RESP: *URI, pneumonia, cough*

PHARMACOKINETICS

Onset rapid, peak 1-4 hr, duration unknown, half-life 36-82 hr

INTERACTIONS

Increase: sedation: CNS depressants, avoid using together

Increase: sedation, respiratory depression: opioids

Increase: clobazam effect: CYP2C19 inhibitors, alcohol

Decrease: effect of hormonal contraceptives, use alternative contraception

NURSING CONSIDERATIONS

Assess:

• **Hypersensitive reactions, and Stevens-Johnson syndrome, toxic epidermal necrolysis:** rashes, blistering/swelling of mouth, may occur anytime, but more common during the first 2 mo of use

• **Suicidal thoughts/behaviors:** monitor for depression, change in behaviors, thoughts, mood

• **Opioids, CNS depression use:** monitor for severe respiratory depression, avoid using together; monitor for abuse, dependence

• **Pregnancy/breastfeeding:** to avoid use in pregnancy, if pregnant, enroll in North American AED Pregnancy Registry (888-238-2334), not to breastfeed

Evaluate:

• Therapeutic response: decreasing seizures without serious reactions

Patient/family teaching:

• To use caution in driving, other hazardous activities until response is known

• To discuss with providers the use of this product and all others taken

• **Pregnancy/breastfeeding:** to report if pregnancy is planned or suspected, or if breastfeeding or if using hormonal contraceptives, use alternative contraceptive

• How to use suspension and film

• Not to use suspension after 90 days, discard

• **Suicidal thoughts/behaviors:** to have patient or family members, caregivers to report suicidal thought/behaviors, depression, change in mood

• Not to discontinue abruptly

clobetasol (Rx)

(kloe-bay′ta-sol)

Clobex, Clodan, Dermovate, Impoyz, Olux, Olux-E, Temovate, Temovate-E

Func. class.: Corticosteroid, topical

ACTION: Crosses cell membrane to attach to receptors to decrease inflammation, itching

USES: Inflammation/itching in corticosteroid-responsive dermatoses on the skin/scalp

CONTRAINDICATIONS: Hypersensitivity, use of some preparations on face, axilla, groin; monotherapy for primary bacterial infections

Precautions: Pregnancy, breastfeeding, children <12 yr

DOSAGE AND ROUTES

• **Adult: TOPICAL** Apply to affected areas bid (shampoo: daily up to 4×/wk)

Available forms: Gel, lotion, ointment, cream, shampoo, solution, spray, foam 0.05%

Administer:

Topical route

• Do not use with occlusive dressings

• Treatment should be limited to 2 wk

• **Cream/ointment/lotion:** using gloves, apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area

• **Gel:** using gloves, apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area

• **Scalp foam:** invert can and dispense foam onto a saucer or other cool surface; do not dispense directly onto hands; pick up small amounts of foam with fingers and gently massage into affected area until foam disappears; repeat until entire affected scalp area is treated

• **Shampoo:** apply onto dry scalp in thin film, leave lather on scalp for 15 min, rinse off

SIDE EFFECTS

GU: Glycosuria

INTEG: Burning, folliculitis, pruritus, dermatitis, irritation, erythema, hypertrichosis, acne

MISC: Hyperglycemia, HPA axis suppression

NURSING CONSIDERATIONS

Assess:

• Skin reactions: burning, pruritus, folliculitis, dermatitis

• **Beers:** avoid in older adults with delirium or with high risk for delirium; may induce or worsen delirium

Evaluate:

• Therapeutic response: decrease in itching, inflammation on the skin, scalp

Teach patient/family:

Topical route

• Not to use with occlusive dressings

• That treatment should be limited to 2 wk

• **Cream/ointment/lotion:** to apply sparingly in a thin film and rub gently into the cleansed affected area

• **Gel:** to apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area

• **Scalp foam:** to invert can and dispense a small amount of foam onto a saucer or other cool surface; not to dispense onto hands; to pick up small amounts and gently massage into affected area until foam disappears; repeat until affected scalp area is treated

clomiPHENE (Rx)

(kloe′mi-feen)

Func. class.: Ovulation stimulant

Do not confuse:
clomiPHENE/clomiPRAMINE

USES: Female infertility (ovulatory failure)

CONTRAINDICATIONS: Pregnancy, hypersensitivity, hepatic disease, undiagnosed uterine bleeding, uncontrolled thyroid or adrenal dysfunction, intracranial lesion, ovarian cysts, endometrial carcinoma
Precautions: Hypertension, depression, seizures, diabetes mellitus, abnormal ovarian enlargement, ovarian hyperstimulation

DOSAGE AND ROUTES

• **Adult: PO** 50 mg/day × 5 days or 50 mg/day beginning on day 5 of menstrual cycle, may increase to 100 mg daily × 5 days with next cycle; may be repeated until conception occurs or max 6 cycles of therapy
Available forms: Tablets 50 mg

clomiPRAMINE (Rx)

(kloe-mip′ra-meen)

Anafranil

Func. class.: Antidepressant, tricyclic
Chem. class.: Tertiary amine

Do not confuse:
clomiPRAMINE/clomiPHENE

USES: Obsessive-compulsive disorder

CONTRAINDICATIONS: Hypersensitivity to this product, carBAMazepine, tricyclics, immediate post-MI, MAOI therapy
Precautions: Pregnancy, breastfeeding, geriatric patients, seizures, cardiac disease, glaucoma, prostatic hypertrophy, urinary retention

Black Box Warning: Children, suicidal ideation

DOSAGE AND ROUTES

Obsessive-compulsive disorder

• **Adult: PO** 25 mg at bedtime, increase gradually over 4 wk to 75-250 mg/day in divided doses

• **Child 10-18 yr: PO** 25 mg/day, gradually increase over 2 wk; max 3 mg/kg/day or 200 mg/day, whichever is smaller
Available forms: Capsules 25, 50, 75 mg

⚠ HIGH ALERT

clonazePAM (Rx)

(kloe-na′zi-pam)

KlonoPIN, Rivotril

Func. class.: Anticonvulsant
Chem. class.: Benzodiazepine derivative

Controlled Substance Schedule IV

Do not confuse:
clonazePAM/LORazepam/cloNIDine
KlonoPIN/cloNIDine

ACTION: Inhibits spike, wave formation during absence seizures (petit mal); decreases amplitude, frequency, duration, spread of discharge during minor motor seizures

USES: Absence, atypical absence, akinetic, myoclonic seizures; Lennox-Gastaut syndrome, panic disorder

CONTRAINDICATIONS: Pregnancy, hypersensitivity to benzodiazepines, acute closed-angle glaucoma, psychosis, severe hepatic disease
Precautions: Breastfeeding, geriatric patients, open-angle glaucoma, chronic

respiratory disease, renal/hepatic disease

Black Box Warning: Coadministration with other CNS depressants, especially opiates

DOSAGE AND ROUTES

Lennox-Gastaut syndrome/atypical absence seizures/akinetic and myclonic seizures

- **Adult: PO** up to 1.5 mg/day in 3 divided doses; may be increased 0.5-1 mg q3days until desired response, max 20 mg/day
- **Geriatric: PO** 0.25 daily-bid initially, increase by 0.25/day q7-14days as needed
- **Child ≤10 yr or ≤30 kg: PO** initial 0.01-0.03 mg/kg/day in divided doses q8hr, max 0.05 mg/kg/day; may be increased 0.25-0.5 mg q3days until desired response, max 0.1-0.2 mg/kg/day

Panic disorder

- **Adult: PO** 0.25 mg bid, increase to 1 mg daily after 3 days, max 4 mg/day

Available forms: Tablets 0.5, 1, 2 mg; orally disintegrating tablets 0.125, 0.25, 0.5, 1, 2 mg

Administer:

PO route

- With food, milk for GI symptoms
- **Orally disintegrating tablets:** open pouch by peeling back foil on blister pack (do not push tablet through foil), place on tongue, allow to dissolve; may be swallowed with/without water
- Store at room temperature

SIDE EFFECTS

CNS: *Drowsiness,* dizziness, confusion, behavioral changes, tremors, insomnia, headache, suicidal tendencies, slurred speech, fatigue

CV: Palpitations, bradycardia

EENT: *Nystagmus, diplopia*

GI: *Nausea, constipation,* anorexia, diarrhea

GU: Dysuria, enuresis, nocturia, retention, libido changes

HEMA: Anemia, thrombocytopenia, leukopenia

INTEG: Rash

RESP: Congestion, respiratory depression

PHARMACOKINETICS

PO: Peak 1-2 hr, metabolized by liver, excreted in urine, half-life 18-50 hr, duration 6-12 hr, protein binding 85%

INTERACTIONS

Increase: clonazePAM effects—CYP3A4 inhibitors (azoles, cimetidine, clarithromycin, diltiazem, erythromycin, FLUoxetine), oral contraceptives; adjust dosage

Black Box Warning: Increase: CNS depression—alcohol, barbiturates, opiates, antidepressants, other anticonvulsants, general anesthetics, hypnotics, sedatives

Decrease: clonazePAM effect—CYP3A4 inducers (carBAMazepine, PHENobarbital, phenytoin); monitor effect

Drug/Herb

Black Box Warning: Increase: CNS depression—kava, chamomile, valerian

Increase: clonazePAM effect—ginkgo, melatonin

Decrease: clonazePAM effect—ginseng, St. John's wort

Drug/Lab Test

Increase: AST, alkaline phosphatase, bilirubin

Decrease: platelets, WBC

NURSING CONSIDERATIONS

Assess:

- **Seizures:** monitor duration, type, intensity, with/without aura
- Blood studies: RBC, Hct, HB, reticulocyte counts periodically
- Hepatic studies: ALT, AST, bilirubin, creatinine
- **Abrupt discontinuation:** do not discontinue abruptly; seizures may increase
- Signs of physical withdrawal if medication suddenly discontinued
- **Mental status:** mood, sensorium, affect, oversedation, behavioral changes, **suicidal thoughts/behaviors;** if mental status changes, notify prescriber

- **Allergic reaction:** red, raised rash; product should be discontinued
- **Blood dyscrasias:** fever, sore throat, bruising, rash, jaundice
- **Toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse; drug levels during initial treatment (therapeutic 20-80 ng/mL)

Black Box Warning: Coadministration with other CNS depressants, especially opioids: increased risk of sedation causing death with benzodiazepines and opioids

- **Beers:** may be appropriate in older adults for seizure disorders, rapid eye movement sleep disorder, benzodiazepine/ethanol withdrawal; avoid in those with delirium or at high risk of delirium

Evaluate:
- Therapeutic response: decreased seizure activity

Teach patient/family:
- To carry emergency ID bracelet stating name, products taken, condition, prescriber's name, phone number
- About potential drug tolerance, withdrawal symptoms
- To continue with follow-up exams, lab work

Black Box Warning: Coadministration with other CNS depressants, especially opioids: to avoid driving, other activities that require alertness

- To take as prescribed, not to skip or take double doses, provide "Medication Guide"
- To avoid driving and other hazardous activities until response is known
- **ODT:** open when ready to use, peel foil back with dry hands, place on tongue to dissolve
- To avoid alcohol, other CNS depressants; increased sedation may occur
- Not to discontinue medication quickly after long-term use; to taper off over several weeks
- To notify prescriber of yellowing of skin/eyes, clay-colored stools, bleeding, fever, extreme fatigue, sore throat, suicidal thoughts/behaviors
- **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected or if breastfeeding, to register with North American Antiepileptic Drug Pregnancy Registry (888-233-2334) if pregnant, not to use during pregnancy/breastfeeding

TREATMENT OF OVERDOSE:
Lavage, flumazenil, monitor electrolytes, VS, administer vasopressors, sodium bicarbonate

cloNIDine (Rx)
(klon'i-deen)

Catapres, Catapres-TTS, Duraclon, Kapvay

Func. class.: Antihypertensive

Chem. class.: Central alpha-adrenergic agonist

Do not confuse:
cloNIDine/KlonoPIN/clonazePAM

ACTION: Inhibits sympathetic vasomotor center in CNS, which reduces impulses in sympathetic nervous system; B/P, pulse rate, cardiac output are decreased; prevents pain signal transmission in CNS by alpha-adrenergic receptor stimulation of the spinal cord

USES: Mild to moderate hypertension, used alone or in combination; severe pain in cancer patients (epidural), attention-deficit/hyperactivity disorder (ADHD)

CONTRAINDICATIONS: Hypersensitivity; (epidural) bleeding disorders, anticoagulants

Precautions: Pregnancy, breastfeeding, children <12 yr (transdermal), geriatric patients, noncompliant patients, MI (recent), diabetes mellitus, chronic renal failure, Raynaud's disease, thyroid

disease, depression, COPD, asthma, pheochromocytoma

Black Box Warning: Labor (epidermal cloNIDine)

DOSAGE AND ROUTES

Hypertension

- **Adult: PO** 0.1 mg bid then increase by 0.1-0.2 mg/day at weekly intervals until desired response; max 2.4 mg; range 0.2-0.6 mg/day in divided doses or **TRANSDERMAL** q7days, start 0.1 mg and adjust q1-2wk
- **Geriatric: PO** 0.1 mg at bedtime; may increase gradually
- **Child: PO** 5-10 mcg/kg/day in divided doses q8-12hr, max 0.9 mg/day

Severe pain

- **Adult: CONTINUOUS EPIDURAL INFUSION** 30 mcg/hr
- **Child: CONTINUOUS EPIDURAL INFUSION** 0.5 mcg/kg/hr, then titrate to response

ADHD

- **Adolescent/child ≥6 yr: PO** 0.05 mg/kg/day in 3-4 divided doses, may increase by 0.1 mg/day weekly up to 0.4 mg/day; extended release 0.1 mg at bedtime, increase dose by 0.1 mg/day up to 0.4 mg/day

Available forms: Tablets 0.1, 0.2, 0.3 mg; transdermal 2.5, 5, 7.5 mg delivering 0.1, 0.2, 0.3 mg/24 hr, respectively; injection 100, 500 mcg/mL; extended-release tablet 0.1 mg

Administer:

- Store patches in cool environment, tablets in tight container

PO route

- Give last dose at bedtime
- Do not crush, cut, chew, or break extended-release tablets; Kapvay is not interchangeable with other products

Transdermal route

- Once weekly; apply to site without hair; best absorption over chest or upper arm; rotate sites; clean site before application; apply firmly, especially around edges; may secure with adhesive tape if loose; fold sticky sides together and discard
- Should be removed before MRI

Epidural route

- Used for severe cancer pain
- May be used with opiates
- Use only if familiar with epidural infusion devices

Black Box Warning: Dilute 500 mcg/mL with 0.9% NaCl (100 mcg/mL)

Black Box Warning: Do not use for labor

SIDE EFFECTS

CNS: *Drowsiness,* nightmares, anxiety, depression, hallucinations, syncope, dizziness
CV: *Orthostatic hypotension,* HF, ECG abnormalities, sinus tachycardia
EENT: Taste change, dry eyes
ENDO: Hyperglycemia
GI: *Nausea, vomiting,* constipation, *dry mouth*
GU: Impotence, urinary retention, decreased libido
INTEG: *Rash,* pruritus, excoriation (transdermal patches)
MISC: Withdrawal symptoms

PHARMACOKINETICS

PO: Onset ½ to 1 hr, peak 2-4 hr, duration 8-12 hr, half-life 6-12 hr
TRANSDERMAL: Onset 3 days; duration 1 wk; metabolized by liver (metabolites); excreted in urine (45% unchanged, inactive metabolites), feces; crosses blood-brain barrier; excreted in breast milk

INTERACTIONS

- **Increase:** bradycardia, verapamil, dilTIAZem
- **Life-threatening elevations of B/P:** tricyclics, beta-blockers

Increase: CNS depression—opiates, sedatives, hypnotics, anesthetics, alcohol
Increase: hypotensive effects—diuretics, other antihypertensive nitrates
Increase: bradycardia—amphetamines, beta-blockers, digoxin, dilTIAZem, MAO inhibitors, verapamil
Decrease: hypotensive effects—tricyclics, MAOIs, appetite suppressants, amphetamines, prazosin, antipsychotics

Decrease: effect of levodopa
Drug/Herb
Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—ephedra, ginseng
Drug/Lab Test
Increase: blood glucose
Decrease: VMA, urinary catecholamines, aldosterone
Positive: Coombs' test

NURSING CONSIDERATIONS

Assess:
- **Hypertension:** B/P, pulse; report significant changes
- **Allergic reaction:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- **HF:** edema, dyspnea, wet crackles, B/P, more common in geriatric patients
- **ADHD:** B/P, pulse, palpitations, syncope
- **Beers:** avoid as first-line in older adults; high risk of CNS effects, bradycardia, orthostatic hypotension

Black Box Warning: Pregnancy/breastfeeding: do not use for labor/epidural; excreted in breast milk, discontinue breastfeeding or product

Evaluate:
- Therapeutic response: decrease in B/P with hypertension, decrease in withdrawal symptoms (opioid), decrease in pain

Teach patient/family:
- To avoid hazardous activities and driving until response is known, product may cause drowsiness
- To notify all health care providers of medication use
- Not to discontinue product abruptly or **withdrawal symptoms** may occur: anxiety, increased B/P, headache, insomnia, increased pulse, tremors, nausea, sweating; to comply with dosage schedule even if feeling better
- Not to use OTC (cough, cold, or allergy), alcohol, or CNS depressant products unless directed by prescriber
- To rise slowly to sitting or standing position to minimize orthostatic hypotension, especially among geriatric patients
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of **angioedema**
- About excessive perspiration, dehydration, vomiting; diarrhea may lead to fall in B/P; consult prescriber if these occur; that product may cause dizziness, fainting; that light headedness may occur during first few days of therapy
- That product may cause dry mouth; to use hard candy, saliva product, sugarless gum, or frequent rinsing of mouth
- Not to skip or stop product unless directed by prescriber; tolerance may develop with long-term use
- **Transdermal:** how to use patch; that patch comes in 2 parts: product patch and overlay to keep patch in place; not to trim or cut; that response may take 2-3 days, if switching from tablets to patch, to taper tablets to avoid withdrawal; to remove for MRI; can use during bathing, swimming

TREATMENT OF OVERDOSE:

Supportive treatment; administer tolazoline, atropine, DOPamine prn

⚠ HIGH ALERT

clopidogrel (Rx)

(klo-pid'oh-grel)

Plavix

Func. class.: Platelet aggregation inhibitor
Chem. class.: Thienopyridine derivative

Do not confuse:
Plavix/Paxil

ACTION: Inhibits ADP-induced platelet aggregation

USES: Reducing the risk of stroke, MI, vascular death, peripheral arterial disease in high-risk patients, acute coronary

syndrome, transient ischemic attack (TIA), unstable angina

CONTRAINDICATIONS:
Hypersensitivity, active bleeding

Precautions: Pregnancy, breastfeeding, children, previous hepatic disease, increased bleeding risk, neutropenia, agranulocytosis, renal disease, Asian/Black/Caucasian patients

Black Box Warning: CYP2C19 allele (poor metabolizers)

DOSAGE AND ROUTES

Recent MI, stroke, peripheral arterial disease, TIA

- **Adult: PO** 75 mg/day with/without aspirin

Acute MI (ST-segment elevation, MI)

- **Adult: PO** 75 mg/day with aspirin 75-325 mg/day; with or without loading dose or thrombolytics; those >75 yr no loading dose should be given; continue this product for 2 wk to <1 yr with aspirin 81 mg indefinitely

Acute coronary syndrome

- **Adult: PO** loading dose 300 mg, then 75 mg/day with aspirin

Available forms: Tablets 75, 300 mg

Administer:

- Without regard to food
- Should be discontinued 5 days prior to elective surgery if an antiplatelet action is not desired

SIDE EFFECTS

CNS: Headache, dizziness, depression
CV: Edema, hypertension, chest pain
GI: Diarrhea, constipation, GI discomfort
HEMA: Bleeding (major/minor from any site), neutropenia, aplastic anemia, agranulocytosis, thrombotic thrombocytopenic purpura
INTEG: Rash, pruritus, anaphylaxis
MISC: Fatigue, intracranial hemorrhage, toxic epidermal necrolysis, Stevens-Johnson syndrome, flulike syndrome
MS: Arthralgia
RESP: Bronchospasm

PHARMACOKINETICS

Rapidly absorbed; metabolized by liver (CYP3A4, CYP2B6, CYP1A2, CYP2C8); excreted in urine, feces; half-life 6 hr; protein binding 95%; effect on platelets after 3-7 days

INTERACTIONS

Black Box Warning: Avoid use with CYP2C19 inhibitors (omeprazole, esomeprazole)

Increase: bleeding risk—anticoagulants, aspirin, NSAIDs, abciximab, eptifibatide, tirofiban, thrombolytics, ticlopidine, SSRIs, treprostinil, rifampin, SNRIs, prasugrel, monitor closely
Increase: action of some NSAIDs, phenytoin, TOLBUTamide, tamoxifen, torsemide, fluvastatin, warfarin, monitor closely
Decrease: clopidogrel effect—proton pump inhibitors (PPIs)
Decrease: CYP3A4 inhibitors/substrates—atorvastatin, simvastatin, cerivastatin

Drug/Herb

Increase: clopidogrel effect—feverfew, fish oil, omega-3 fatty acid, garlic, ginger, ginkgo biloba, green tea, horse chestnut
Decrease: clopidogrel effect—bilberry, saw palmetto

Drug/Lab Test

Increase: AST, ALT, bilirubin, uric acid, total cholesterol, nonprotein nitrogen (NPN)

NURSING CONSIDERATIONS

Assess:

- **Thrombotic/thrombocytic purpura:** fever, thrombocytopenia, hemolytic anemia, neurologic changes, treat immediately

Black Box Warning: CYP2C19 allele (poor metabolizers): consider using another antiplatelet product; higher CV reaction occurs after acute coronary syndrome or PCI; tests are available to determine CYP2C19 allele

- Hepatic studies: AST, ALT, bilirubin, creatinine (long-term therapy)

• Blood studies: CBC, differential, Hct, HB, PT, cholesterol (long-term therapy); thrombocytopenia, neutropenia are rare
• **Hypersensitivity:** rash, angioedema may occur

Evaluate:
• Therapeutic response: absence of stroke, MI

Teach patient/family:
• That blood work will be necessary during treatment (CBC, LFTs)
• To report any unusual bruising, bleeding to prescriber; that it may take longer to stop bleeding
• To take without regard to food
• To tell all health care providers that clopidogrel is being used; may be held for 5 days before surgery, restart as soon as possible
• **Hypersensitivity:** To report immediately rash, pruritus
• **Pregnancy/breastfeeding:** to notify provider if pregnancy is planned or suspected or if breastfeeding; do not breastfeed, use cautiously in pregnancy

clotrimazole (topical, vaginal, oral) (OTC)

(kloe-trim′a-zole)

Canesten, Clotrimaderm, Cruex, Desenex Gyne-Lotrimin, Lotrimin, Lotrimin AF, Trivagizole 3

Func. class.: Topical antifungal
Chem. class.: Imidazole derivative

Do not confuse:
clotrimazole/miconazole/clobetasol

ACTION: Antifungal activity results from altering cell wall permeability

USES: Vulvovaginal, oropharyngeal candidiasis; topical fungal infections, prevention of oropharyngeal candidiasis in immunocompromised

CONTRAINDICATIONS: Hypersensitivity, ophthalmic use
Precautions: Hepatic impairment (oral)

DOSAGE AND ROUTES

Tinea corporis, cruris, pedis, versicolor; candidiasis
• **Adult/child ≥2 yr: TOPICAL** apply to affected area and rub into area AM/PM × 2-4 wk

Vulvovaginal candidiasis
• **Adult/child ≥12 yr: VAG CREAM** 1 applicator at bedtime × 3 days (2%) or 7 days (1%)

Oropharyngeal candidiasis
• **Adult/child ≥3 yr: LOZENGE 1 PO** dissolved 5×/day × 2 wk or adults 1 lozenge dissolved tid (prevention)

Oropharyngeal candidiasis prevention in immunocompromised
• **Adult: PO:** Lozenge dissolve tid

Available forms: Topical cream, solution, 1%; vaginal cream 1%, 2%; lozenges, troches 10 mg

Administer:

Topical route
• Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth
• Wash hands prior to and after use; wash affected area and gently pat dry
• **Cream/solution:** apply to the cleansed affected area; massage gently into affected areas

PO route
• **Troches:** allow to dissolve; do not chew or swallow whole

Intravaginal route
• Only use dosage formulations specified for intravaginal use; intravaginal dosage forms are not for topical therapy; do not ingest
• **Cream:** use applicator(s) supplied by the manufacturer

SIDE EFFECTS

GI: Nausea, vomiting
GU: Vaginal burning, irritation
INTEG: Burning, peeling, rash, pruritus

PHARMACOKINETICS

PO duration 3 hr

INTERACTIONS

Drug/Lab Test
Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** assess for hypersensitivity; product might need to be discontinued
- **Infection:** assess for severity of infection, itching
- Hepatic function studies periodically if using oral troches

Evaluate:

- Decreased infection, itching

Teach patient/family:

Topical route:

- That topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth; do not use occlusive dressings
- To wash hands prior to and after use; wash affected area and gently pat dry
- **Cream:** to shake well before use; apply a thin film to the cleansed affected area; massage gently into affected areas

PO route:

- **Troches:** allow to dissolve; do not chew or swallow whole
- **Cream:** to use applicator(s) supplied by the manufacturer

cloZAPine (Rx)

(kloz´a-peen)

Clozaril, FazaClo ODT, Versacloz

Func. class.: Antipsychotic

Chem. class.: Tricyclic dibenzodiazepine derivative

Do not confuse:

Clozaril/Colazal

cloZAPine/cloNIDine/clofazimine/clonazePAM/KlonoPIN

ACTION: Interferes with DOPamine receptor binding with lack of EPS; also acts as an adrenergic, cholinergic, histaminergic, serotonergic antagonist

USES: Management of psychotic symptoms for schizophrenic patients for whom other antipsychotics have failed; recurrent suicidal behavior

CONTRAINDICATIONS: Hypersensitivity, severe granulocytopenia (WBC <3500 before therapy), coma, ileus

Precautions: Pregnancy, breastfeeding, children <16 yr, geriatric patients; CV, pulmonary, cardiac, renal, hepatic disease; seizures, prostatic enlargement, closed-angle glaucoma, stroke

Black Box Warning: Bone marrow suppression, hypotension, myocarditis, orthostatic hypotension, geriatric patients with dementia-related psychosis, seizures, syncope

DOSAGE AND ROUTES

- **Adult: PO** 12.5 mg daily or bid; may increase by 25-50 mg/day; over 2 wk; dose >500 mg requires 3 divided doses; do not increase dose more than 2×/wk; max 900 mg/day; if dose is to be discontinued, taper over 1-2 wk

Available forms: Tablets 25, 50, 100, 200 mg; orally disintegrating tablets 12.5, 25, 100, 150, 200 mg; oral suspension 50 mg/mL

Administer:

- May be taken with or without food
- Patient-specific registration required before administration (cloZAPine REMS program); if WBC <3500 cells/mm^3 or ANC <2000 cells/mm^3, therapy should not be started; may only dispense the 7-, 14-, 28-day supply upon receipt of lab report that is appropriate
- Check to confirm PO medication swallowed; monitor for hoarding or giving of medication to other patients, if hospitalized; avoid giving patient >7 days' worth of medication if outpatient
- Store in tight, light-resistant container
- **Orally disintegrating tablet:** do not push through foil; leave in foil blister until ready to take, peel back foil, place tablet in mouth; allow to dissolve, swallow; water is not needed
- **Oral suspension:** shake before using; use oral syringe and syringe adapter

SIDE EFFECTS

CNS: Neuroleptic malignant syndrome, *sedation, dizziness, headache,* seizures, *insomnia,* dystonia

CV: *Tachycardia, hypo/hypertension,* orthostatic hypotension
EENT: *Blurred vision*
GI: *Drooling or excessive salivation, constipation, nausea, abdominal discomfort, vomiting,* anorexia, *dry mouth, dyspepsia,* hepatotoxicity
GU: *Urinary abnormalities,* incontinence
HEMA: Leukopenia, agranulocytosis
RESP: Dyspnea, pulmonary embolism
SYST: Death among geriatric patients with dementia, aggravation of diabetes mellitus

PHARMACOKINETICS

Bioavailability 27%-47%; 97% protein bound; completely metabolized by liver enzymes involved in metabolism Genetic warning CYP1A2, 2D6, 3A4; excreted in urine (50%), feces (30%) (metabolites); half-life 8-12 hr

INTERACTIONS

Increase: CNS depression—CNS depressants, psychoactives, alcohol, antihistamines, opioids, sedative/hypnotics
Increase: cloZAPine level—caffeine, citalopram, FLUoxetine, sertraline, ritonavir, risperiDONE, CYP1A2 inhibitors (fluvoxaMINE), CYP3A4 inhibitors (ketoconazole, erythromycin), CYP2D6 inhibitors
Increase: plasma concentration—warfarin, digoxin, other highly protein-bound products
Increase: QT prolongation—beta-blockers, class IA/III antidysrhythmias, and other drugs that increase QT
Increase: hypotension, respiratory, cardiac arrest, collapse—benzodiazepines
Increase: bone marrow suppression—antineoplastics, radiation therapy
Increase: seizures—lithium
Decrease: cloZAPine level—CYP1A2 inducers (carBAMazepine, omeprazole, rifAMPin); PHENobarbital; CYP3A4 inducers

Drug/Herb

Decrease: cloZAPine action—St. John's wort

Drug/Lab Test

Increase: cholesterol, blood glucose, triglycerides
Decrease: WBC, ANC

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Myocarditis: if suspected, discontinue use; myocarditis usually occurs during first month of treatment; dyspnea, fever, palpitations, ECG changes

Black Box Warning: Seizures: usually occur with higher doses >600 mg/day or dosage change >100 mg/day; do not use in uncontrolled seizure disorder; use cautiously in those with a predisposition to seizures

- AIMS assessment, blood glucose, CBC differential, glycosylated hemoglobin A1c, LFTs, neurologic function, pregnancy test, serum creatinine, electrolytes, lipid profile, prolactin, thyroid function tests, weight

Black Box Warning: Bone marrow depression: bilirubin, CBC, LFTs monthly; discontinue treatment if WBC <3000-3500/mm^3 or ANC <1500/mm^3; test weekly; may resume when normal; if WBC <2000/mm^3 or ANC <1000/mm^3, discontinue; if agranulocytosis develops, never restart product

- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

Black Box Warning: Hypotension, bradycardia, syncope: B/P standing and lying; take pulse, respirations q4hr during initial treatment; establish baseline prior to starting treatment; report drops of 30 mm Hg; dizziness, faintness, palpitations, tachycardia on rising

- **Extrapyramidal symptoms:** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
- **Neuroleptic malignant syndrome:** tachycardia, seizures, fever, dyspnea, diaphoresis, increased/decreased B/P; notify prescriber immediately

• **Beers:** avoid in older adults except for schizophrenia, bipolar disorder; increased risk of stroke and cognitive decline
• **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; excreted in breast milk; discontinue breastfeeding or discontinue product; EPS may be present in neonates exposed to this product during third trimester

Evaluate:
• Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech

Teach patient/family:
• About symptoms of agranulocytosis and need for blood tests weekly for 6 mo, then q2wk; to report flulike symptoms
• That orthostatic hypotension often occurs; to rise gradually from sitting or lying position; to avoid hot tubs, hot showers, tub baths; hypotension may occur
• To avoid abrupt withdrawal of this product because EPS may result; that product should be withdrawn over 1-2 wk
• To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use with alcohol or CNS depressants, increased drowsiness may occur
• About compliance with product regimen

Black Box Warning: To report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn and product discontinued

• That heat stroke may occur in hot weather; to take extra precautions to stay cool
• To avoid driving, other hazardous activities; seizures may occur
• To notify prescriber if pregnant or if pregnancy is intended; not to breastfeed

TREATMENT OF OVERDOSE:
Lavage; provide an airway; do not induce vomiting

⚠ HIGH ALERT

cobimetinib (Rx)
(koe-bi-me′ti-nib)
Cotellic
Func. class.: Antineoplastic

C

USES:
Orphan drug. For the treatment of unresectable or metastatic melanoma in patients with a BRAF V600E or V600K mutation, in combination with vemurafenib

CONTRAINDICATIONS:
Hypersensitivity

DOSAGE AND ROUTES
• **Adult: PO** 60 mg (three 20-mg tablets) daily × 21 days, in combination with vemurafenib 960 mg bid × 28 days; repeat cycle q28days until disease progression or unacceptable toxicity

Available forms: Tablets 20 mg

codeine (Rx)
(koe′deen)
Func. class.: Opiate analgesic, antitussive
Chem. class.: Opiate, phenathrene derivative
Controlled Substance Schedule II, III, IV, V (depends on content)

Do not confuse:
codeine/Lodine/iodine

ACTION:
Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors; decreases cough reflex, GI motility

USES:
Mild to moderate pain

CONTRAINDICATIONS:
Breastfeeding, hypersensitivity to opiates, respiratory depression, increased intracranial pressure, seizure disorders, severe respiratory disorders

Black Box Warning: Children recovering from tonsillectomy/adenoidectomy who are ultrarapid metabolizers; respiratory depression

Precautions: Pregnancy, geriatric patients, cardiac dysrhythmias, prostatic hypertrophy, bowel impaction

Black Box Warning: Accidental exposure, coadministration with other CNS depressants, including opioids

DOSAGE AND ROUTES

Pain

- **Adult: PO** 15-60 mg q4hr prn
- **Child 6-17 yr (unlabeled): PO** 0.5 to 1 mg/kg/dose, max: 60 mg/dose every 4 hours as needed

Renal disease

- **Adult: PO** CCr 10-50 mL/min, 75% of dose; CCr <10 mL/min, 50% of dose

Available forms: Tablets 15, 30 mg; injection 15, 30, 60 mg/mL; oral solution 10 mg/5 mL, 25 mg/5 mL

Administer:

- Discontinue gradually after long-term use, use stool softener, laxative for constipation
- Store in light-resistant container at room temperature

SIDE EFFECTS

CNS: *Drowsiness, sedation,* dizziness, dependency, headache, confusion
CV: Bradycardia, palpitations, orthostatic hypotension
GI: *Nausea, vomiting, anorexia, constipation,* dry mouth
GU: Urinary retention
INTEG: Flushing, rash, sweating
RESP: Respiratory depression

PHARMACOKINETICS

Bioavailability 60%-90%; peak ½-1 hr; duration 4-6 hr; metabolized by liver (CYP3A4 to morphine); excreted by kidneys, in breast milk; crosses placenta; half-life 3 hr; protein binding 7%; altered codeine metabolism occurs in different ethnic groups

PO: Onset 30-60 min

INTERACTIONS

Black Box Warning: Increase: CNS depression—alcohol, antihistamines, antidepressants, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants; monitor response

Increase: toxicity—MAOIs; use cautiously

Drug/Herb

Increase: CNS depression—chamomile, kava, valerian

Drug/Lab Test

Increase: lipase, amylase
Decrease: opioid effect—opioid antagonists

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, type, location, aggravating, alleviating factors; need for pain medication, tolerance; use pain scoring
- I&O ratio; check for decreasing output; may indicate urinary retention, especially among geriatric patients
- GI function: nausea, vomiting, constipation
- **Cough:** type, duration, ability to raise secretion for productive cough; do not use to suppress productive cough
- CNS changes, dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Allergic reactions: rash, urticaria
- B/P, pulse respirations baseline and periodically

Black Box Warning: Monitor for tolerance, addiction, abuse

Black Box Warning: Children (tonsillectomy/adenoidectomy and are ultrarapid metabolizers): deaths have occurred; use is contraindicated

Black Box Warning: Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min, shallow; obstructive sleep apnea (children) (tonsillectomy/adenoidectomy)

• **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function

Evaluate:

• Therapeutic response: decrease in pain, absence of grimacing, decreased cough, decreased diarrhea

Teach patient/family:

• To report any symptoms of CNS changes, allergic reactions

• That physical dependency may result after extended periods, product should be used short term

• To change position slowly; orthostatic hypotension may occur

• To avoid hazardous activities if drowsiness or dizziness occurs

Black Box Warning: To avoid alcohol, other CNS depressants unless directed by prescriber

• To increase fiber, water in diet to help avoid constipation

• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected; infants born to those using opioids are at risk of neonatal opiate withdrawal; not to breastfeed

TREATMENT OF OVERDOSE:

Naloxone 0.4-mg ampule diluted in 10 mL 0.9% NaCl and given by direct IV push, 0.02 mg q2min (adult)

colchicine (Rx)

(kol'chih-seen)

ColciGel, Colcrys, Gloperba, Mitagere

Func. class.: Antigout agent

Chem. class.: Alkaloid

Do not confuse:

colchicine/Cortrosyn

ACTION:

Inhibits microtubule formation of lactic acid in leukocytes, which decreases phagocytosis and inflammation in joints

USES:

Gout, gouty arthritis (prevention, treatment); to arrest the progression of neurologic disability in those with MS, Mediterranean fever

Unlabeled uses: Bechet syndrome with arthritis, cutaneous lesions or mucocutaneous ulcers, acute and recurrent pericarditis with NSAIDs, or aspirin

CONTRAINDICATIONS:

Serious GI, severe cardiac/renal/hepatic disorders, hypersensitivity

Precautions: Pregnancy (PO), breastfeeding, children, geriatric patients, blood dyscrasias, hepatic disease

DOSAGE AND ROUTES

Gout prevention

• **Adult: PO** 0.6-1.2 mg/day in 1-2 divided doses, depending on severity

Gout treatment

• **Adult: PO** 1.2 mg initially, then 0.6 mg 1 hr later (1.8 mg); *for those on strong CYP3A4 inhibitor* (during past 14 days), 0.6 mg initially, then 0.3 mg 1 hr later

Mediterranean fever

• **Adult on no interacting products: PO** 1.2-2.4 mg/day in 1-2 divided doses; **strong CYP3A4 inhibitors; P-glycoprotein inhibitors within 14 days:** max 0.6 mg/day in 1-2 divided doses; **moderate CYP3A4 inhibitors within 14 days:** max 1.2 mg/day in 1-2 divided doses

• **Adolescent: PO** 1.2-2.4 mg/day in 1-2 divided doses, titrate by 0.3 mg/day

• **Child >6-12 yr: PO** 0.9-1.8 mg/day in 1-2 divided doses

• **Child 4-6 yr: PO** 0.3-1.8 mg/day in 1-2 divided doses

Bechet syndrome (unlabeled)

• **Adult PO:** 1.2-1.8 mg/day in divided doses

Pericarditis (unlabeled)

• **Adult PO:** ≥70 kg 0.5-0.6 mg bid; <70 kg 0.5-0.6 mg daily

Renal dose

• **Adult: PO** CCr <30 mL/min, for acute gout, do not repeat course for 2 wk; for familial Mediterranean fever, 0.3 mg daily, increase cautiously

Available forms: Tablets 0.6 mg; oral solution 0.6 mg/5 mL; capsules 0.6 mg; topical gel 4×

Administer:

PO route

- Without regard to food
- Cumulative doses ≤4 mg, renal patients ≤2 mg

SIDE EFFECTS

GI: *Nausea, vomiting, anorexia,* cramps

HEMA: Agranulocytosis, thrombocytopenia, aplastic anemia, pancytopenia

MISC: Alopecia, peripheral neuritis

PHARMACOKINETICS

PO: Peak ½-2 hr, half-life 30 hr, deacetylates in liver, excreted in feces (metabolites/active product)

INTERACTIONS

Increase: colchicine level/toxicity—moderate/strong CYP3A4 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, ritonavir, nefazodone, nelfinavir, saquinavir, telithromycin), P-glycoprotein inhibitors; reduce dose

Increase: GI effects—NSAIDs, ethanol

Increase: bone marrow depression—radiation, bone marrow depressants, cycloSPORINE

Increase: rhabdomyolysis HMG-CoA reductase inhibitors—digoxin

Decrease: action of vitamin B_{12}; may cause reversible malabsorption

Drug/Food

Increase: colchicine level—grapefruit juice, avoid using together

Drug/Lab Test

Increase: alkaline phosphatase, AST

Decrease: platelets, WBC, granulocytes

False positive: urine HB

Interference: urinary 17-hydroxycorticosteroids

NURSING CONSIDERATIONS

Assess:

- **Gout:** relief of pain, uric acid levels decreasing; monitor response to treatment q1hr
- **Familial Mediterranean fever:** chest pain, fever, joint pain, red lesions baseline and during treatment
- I&O ratio; observe for decrease in urinary output
- CBC, platelets, reticulocytes before, during therapy (q3mo); may cause aplastic anemia, agranulocytosis, decreased platelets in those on long-term therapy
- **Toxicity:** weakness, abdominal pain, nausea, vomiting, diarrhea; product should be discontinued, report symptoms immediately
- **Beers:** reduce dose in older adults; monitor for adverse reactions
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk; neonatal codeine withdrawal may occur; don't use in labor (premature infant); excreted in breast milk, avoid breastfeeding

Evaluate:

- Therapeutic response: decreased stone formation, decreased pain in kidney region, absence of hematuria, decreased pain in joints, reduced familial Mediterranean fever episodes

Teach patient/family:

- To avoid alcohol, OTC preparations that contain alcohol
- To report any pain, redness, hard areas, usually in legs; rash, sore throat, fever, bleeding, bruising, weakness, numbness, tingling, nausea, vomiting, abdominal pain, muscle pain, weakness
- To avoid grapefruit and juice, may increase colchicine level
- About the importance of complying with medical regimen (diet, weight loss, product therapy); about the possibility of bone marrow depression occurring; not to double or skip doses; during acute attacks other products may be needed
- To advise all providers of product use; that surgery may increase the possibility of acute gout symptoms

TREATMENT OF OVERDOSE:

D/C medication; may need opioids to treat diarrhea

colesevelam (Rx)

(koe-leh-seve′eh-lam)

WelChol

Func. class.: Antilipemic

Chem. class.: Bile acid sequestrant

ACTION: Adsorbs, combines with bile acids to form insoluble complex excreted through feces; loss of bile acids lowers cholesterol levels

USES: Elevated LDL cholesterol, alone or in combination with HMG-COA reductase inhibitor; type 2 diabetes (adjunct)

CONTRAINDICATIONS: Hypersensitivity, bowel disease, primary biliary cirrhosis, triglycerides >500 mg/dL, bowel obstruction, pancreatitis, biliary obstruction, dysphagia, fat-soluble vitamin deficiency

Precautions: Pregnancy, breastfeeding, children

DOSAGE AND ROUTES

Hyperlipidemia

- **Adult: PO** three 625-mg tablets bid with meals or 6 tablets daily with meal; may increase to 7 tablets if needed (monotherapy); 3 tablets bid with meals or 6 tablets daily with meal given with an HMG-CoA reductase inhibitor (combination)

Type 2 diabetes

- **Adult and geriatric: PO** approx 3.8 g (6 tablets)/day or approx 1.9 g (3 tablets) bid

Available forms: Tablets 625 mg; granules for oral suspension 3.75 g/packet

Administer:

- Swallow tablets whole; do not break, crush, or chew
- Give product daily or bid with meals; give all other medications 4 hr before colesevelam; with liquid to avoid poor absorption
- **Granules for oral suspension:** empty contents of packet into a cup/glass, add ½-1 cup (4-8 oz) of water, fruit juice, diet soda; stir well before drinking

SIDE EFFECTS

CNS: Headache, fatigue

ENDO: Hypoglycemia

CV: Hypertension

GI: *Constipation, nausea,* flatulence, hypertriglyceridemia

PHARMACOKINETICS

Excreted in feces, peak response 2 wk

INTERACTIONS

Decrease: absorption of—diltiaZEM, gemfibrozil, mycophenolate, phenytoin, propranolol, warfarin, thiazides, digoxin, penicillin G, tetracyclines, corticosteroids, iron, thyroid, fat-soluble vitamins, glyBURIDE, fluoroquinolones

Decrease: action of—oral contraceptives, give ≥4 hr prior to colesevelam

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Cardiac glycoside level if used with an HMG-CoA
- **Hypercholesterolemia:** fasting LDL, HDL, total cholesterol, triglyceride levels baseline and q4-6wk after initiation of treatment and periodically, electrolytes if on extended therapy; monitor BUN/creatinine, take diet history
- Bowel pattern daily; increase bulk, water in diet for constipation
- **Diabetes:** hypoglycemia (weakness, hunger, dizziness, diaphoresis) can result from use of this product, monitor blood glucose, A1c

Evaluate:

- Therapeutic response: decreased total cholesterol level, LDL cholesterol, apolipoproteins

Teach patient/family:

- About the importance of compliance; timing of dose 4 hr after other meds
- **Hypercholesterolemia:** That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- To take with meal and fluids
- To discuss with health care professional all OTC, herbals, supplements, to use oral contraceptive at least 4 hr prior to this product

- Diabetes: to monitor glucose
- **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected or if breastfeeding; that insulin may be used in diabetes during pregnancy; to use another form of contraception other than oral contraceptives

collagenase clostridium histolyticum-aaes (Rx)

(kol'la-je-nase)

Xiaflex

Func. class.: Enzyme

USES: Treatment of adults with Dupuytren's contracture with a palpable cord; treatment of adult men with Peyronie's disease with a palpable plaque/curvature deformity of at least 30 degrees

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

DOSAGE AND ROUTES

Dupuytren's contracture

Adult: Intralesional: Inject 0.58 mg per cord affecting a metacarpophalangeal (MP) joint or a proximal interphalangeal (PIP) joint. If contracture persists, finger extension procedure should be performed 24 to 72 hr following injection

Peyronie's disease

Adult male: Intralesional Inject 0.58 mg into a Peyronie's plaque; repeat 1 to 3 days later. Perform a penile modeling procedure 1-3 days after second injection. Use a second treatment cycle (two 0.58-mg injections and a penile modeling procedure) in 6 wk if needed (max 4 cycles)

Available forms: Capsules 25, 50, 75 mg

conivaptan (Rx)

(kon-ih-vap'tan)

Vaprisol

Func. class.: Vasopressin receptor antagonist

ACTION: Dual arginine vasopressin (AVP) antagonist with affinity for V_{1A}, V_2 receptors; level of AVP in circulating blood is critical for regulation of water, electrolyte balance and is usually elevated in euvolemic/hypervolemic hyponatremia

USES: Euvolemia hyponatremia in hospitalized patients; not indicated for HF, hypervolemic hyponatremia

Unlabeled uses: Increased intracranial pressure

CONTRAINDICATIONS: Hypersensitivity, hypovolemia

Precautions: Pregnancy, breastfeeding, orthostatic disease, renal disease, heart failure, rapid correction of serum sodium

DOSAGE AND ROUTES

- **Adult: IV INFUSION** loading dose 20 mg given over 30 min then CONT INFUSION of 20 mg over 24 hr; after day 1, give 20 mg/24 hours for an additional 1-3 days; can be titrated up to 40 mg/day if serum sodium is not rising at desired rate; max time 4 days

Hepatic/renal dose

- **Adult: IV** Child-Pugh A-C or CCr 30-60 mL/min: give IV loading dose over 10 min then **CONTINUOUS IV INFUSION** 10 mg over 24 hr × 2-4 days

Available forms: Injection (premixed) 0.2 mg/mL in 100 mL D_5W

Administer:

Intermittent IV Infusion

- Premixed, do not need dilution (0.2 mg/mL)

Continuous IV INFUSION route

- Give over 24 hrs or 40 mg/24 hr

SIDE EFFECTS

CNS: Headache, confusion, insomnia

CV: Hypo/hypertension, *orthostatic hypotension*

GI: Nausea, vomiting, constipation, dry mouth

GU: Hematuria, infertility (women), polyuria

INTEG: Erythema, injection site reaction

META: Dehydration, hypokalemia, hypomagnesemia, hyponatremia

MISC: Oral candidiasis

PHARMACOKINETICS

Protein binding 99%, metabolized by CYP3A4, half-life 5 hr

INTERACTIONS

Increase: effect of—CYP3A4 substrates (alfuzosin, ARIPiprazole, bexarotene, bortezomib, bosentan, bupivacaine, buprenorphine, carBAMazepine, cevimeline, cilostazol, cinacalcet, clopidogrel, colchicine, cyclobenzaprine, dapsone, darifenacin, disopyramide, DOCEtaxel, donepezil, DOXOrubicin, dutasteride, eletriptan, eplerenone, ergots, erlotinib, eszopiclone, ethinyl estradiol, ethosuximide, etoposide, fentaNYL, galantamine, gefitinib, ifosfamide, irinotecan, lidocaine, loperamide, loratadine, mefloquine, methadone, modafinil, PACLitaxel, paricalcitrol, pimozide, praziquantel, quiNIDine, quiNINE, ramelteon, repaglinide, rifabutin, sibutramine, sildenafil, sirolimus, SUFentanil, SUNItinib, tacrolimus, tamoxifen, teniposide, testosterone, tiaGABine, tinidazole, trimetrexate, vardenafil, vinca alkaloids, ziprasidone, zolpidem, zonisamide); do not use concurrently

NURSING CONSIDERATIONS

Assess:

- Renal, hepatic function
- **Sodium levels/volume status:** monitor serum sodium levels q2-3hr until stable; overly rapid correction of sodium concentration (>12 mEq/L per 24 hr) may result in osmotic demyelination syndrome
- Neurologic status: confusion, headache
- **Injection site reactions:** redness, inflammation, pain; if these occur, product needs to be discontinued
- CV status: atrial fibrillation, hypo/hypertension, orthostatic hypotension; monitor B/P, pulse baseline and periodically
- Monitor other electrolytes (magnesium and potassium)
- **Pregnancy/breastfeeding:** no well-controlled studies; use in pregnancy only if benefits outweigh fetal risk, may cause fetal harm; discontinue breastfeeding or discontinue product; excretion is unknown

Evaluate:

- Therapeutic response: correction of serum sodium levels

Teach patient/family:

- To report neurologic changes: headache, insomnia, confusion
- About administration procedure and expected results
- To report injection site pain, redness, swelling

Vaginal Ring

ethinyl estradiol/ etonogestrel (Rx)
NuvaRing

Transdermal

ethinyl estradiol/ norelgestromin (Rx)
Xulane

ACTION: Prevents ovulation by suppressing FSH and LH; *monophasic:* estrogen/progestin (fixed dose) used during a 21-day cycle; ovulation is inhibited by suppression of FSH and LH;

thickness of cervical mucus and endometrial lining prevents pregnancy; *biphasic:* ovulation is inhibited by suppression of FSH and LH; alteration of cervical mucus, endometrial lining prevents pregnancy; *triphasic:* ovulation is inhibited by suppression of FSH and LH; change of cervical mucus, endometrial lining prevents pregnancy; variable doses of estrogen/progestin combinations may be similar to natural hormonal fluctuations; *extended cycle:* estrogen/progestin continuous for 84 days, off for 7 days, results in 4 menstrual periods/yr; *progressive estrogen:* constant progestin with 3 progressive doses of estrogen; *progestin-only pill, implant, intrauterine:* change of cervical mucus and endometrial lining prevents pregnancy; ovulation may be suppressed

USES: To prevent pregnancy, regulation of menstrual cycle, treatment of acne in women >14 yr for whom other treatment has failed, emergency contraception; *injection:* inhibits gonadotropin secretion, ovulation, follicular maturation; *emergency:* inhibits ovulation and fertilization, decreases transport of sperm and egg from fallopian tube to uterus; *vaginal ring, transdermal:* inhibits ovulation, prevents sperm entry into uterus; *antiacne:* may decrease sex hormone binding globulin, results in decreased testosterone

CONTRAINDICATIONS: Pregnancy, breastfeeding, women ≥40 yr, reproductive cancer, thrombophlebitis, MI, hepatic tumors, hepatic disease, CAD, CVA, breast cancer, jaundice, stroke, vaginal bleeding

Precautions: Depression, hypertension, renal disease, seizure disorders, lupus erythematosus, rheumatic disease, migraine headache, amenorrhea, irregular menses, gallbladder disease, diabetes mellitus, heavy smoking, acute mononucleosis, sickle cell disease

Black Box Warning: Tobacco smoking

DOSAGE AND ROUTES

Monophasic

- **Adult: PO** Take first tablet on Sunday after start of menses × 21 days; skip 7 days, then repeat cycle; may contain 7 placebo tablets when 1 tablet is taken daily

Biphasic

- **Adult: PO** Take 10 days of small progestin, then large progestin; estrogen is the same during cycle; skip 7 days, then repeat cycle; may contain 7 placebo tablets when 1 tablet is taken daily

Triphasic

- **Adult: PO** Estrogen dose remains constant; progestin changes throughout 21-day cycle; some products contain 28 tablets per month

Extended cycle

- **Adult: PO** Start taking on first day of menses; continue for 84 days of active tablets, then 7 days of placebo; repeat cycle

Progestin

- **Adult: PO** Start on first day of menses, then daily and continuously

Progressive estrogen

- **Adult: PO** Progestin dose remains constant; estrogen increases q7days throughout 21-day cycle; may include 7 placebo tablets for 28-day cycle

Emergency

- **Adult/adolescent: PO** Give within 72 hr of intercourse, repeat 12 hr later; **Plan B** 1 tablet, then 1 tablet 12 hr later; **Preven** 2 tablets, then 2 tablets 12 hr later; **Ovral** 2 white tablets; **Lo/Ovral (unlabeled)** 4 white tablets; **Levlen, Nordette** 4 orange tablets; **Triphasil, Tri-Levlen** 4 yellow tablets

Injectable

- **Adult: IM (Depo-Provera)** 150 mg within 5 days of start of menses or within 5 days postpartum (must not be breastfeeding); if breastfeeding, give 6 wk postpartum, repeat q3mo

Intrauterine

- **Adult: INTRAUTERINE** To be inserted using the levonorgestrel-releasing intrauterine system (LRIS) by those trained in procedure; inserted into uterine cavity

within 7 days of the onset of menstruation; use should not exceed 5 yr per implant

Vaginal ring

- **Adult: VAG** Insert 1 ring on or prior to day 5 of cycle; leave in place 3 wk; remove for 1 wk, then repeat

Transdermal

- **Adult: TD** Apply patch within 7 days of menses; change weekly × 3 wk; no patch wk 4; repeat cycle

Implant

- **Adult: SUBDERMAL** In inner side of upper arm on days 1-5 of menses, replace q3yr

Acne

- **Adult: PO (Ortho Tri-Cyclen)** Take daily × 21 days, off 7 days

Administer:

- PO with food for GI symptoms; give at same time each day
- Subdermal implant of 6 capsules effective for 5 yr, then should be removed
- IM injection deep in large muscle mass after shaking suspension; ensure patient not pregnant if injections are 2 wk or more apart

SIDE EFFECTS

CNS: Depression, fatigue, dizziness, nervousness, anxiety, headache

CV: Increased B/P, cerebral hemorrhage, thrombosis, pulmonary embolism, fluid retention, edema, MI

EENT: Optic neuritis, retinal thrombosis, cataracts

ENDO: Decreased glucose tolerance, increased TBG, PBI, T_4, T_3, temporary infertility

GI: *Nausea,* vomiting, cramps, diarrhea, bloating, constipation, change in appetite, cholestatic jaundice, weight change

GU: Breakthrough bleeding, amenorrhea, spotting, dysmenorrhea, galactorrhea, endocervical hyperplasia, vaginitis, cystitis-like syndrome, breast changes

HEMA: Increased fibrinogen, clotting factor

INTEG: *Chloasma, melasma,* acne, rash, urticaria, erythema, pruritus, hirsutism, alopecia, photosensitivity

PHARMACOKINETICS

Excreted in breast milk

INTERACTIONS

Decrease: oral contraceptives' effectiveness—anticonvulsants, rifAMPin, analgesics, antibiotics, antihistamines, griseofulvin

Decrease: oral anticoagulants' action

Drug/Herb

- Altered action: black cohosh

Decrease: oral contraceptives' effect—saw palmetto, St. John's wort

Drug/Food

Increase: peak level—grapefruit juice

Drug/Lab Test

Increase: PT; clotting factors VII, VIII, IX, X; TBG, PBI, T_4, platelet aggregability, BSP, triglycerides, bilirubin, AST, ALT

Decrease: T_3, antithrombin III, folate, metyrapone test, GTT, 17-OHCS

NURSING CONSIDERATIONS

Assess:

- Glucose, thyroid function, LFTs, B/P
- Reproductive changes: changes in breasts, tumors; positive Pap smear; product should be discontinued

Evaluate:

- Therapeutic response: absence of pregnancy, endometriosis, hypermenorrhea

Teach patient/family:

- To use sunscreen or avoid sunlight; photosensitivity can occur
- To take at same time each day to ensure equal product level
- To report GI symptoms that occur after 4 mo
- **Pregnancy/breastfeeding:** to use another birth control method during first 3 wk of oral contraceptive use; to avoid use in breastfeeding; many antibiotics interfere with oral contraceptives
- To take another tablet as soon as possible if one is missed
- That, after product is discontinued, pregnancy may not occur for several months
- To report abdominal pain, change in vision, shortness of breath, change in menstrual flow, spotting, breakthrough bleeding, breast lumps, swelling, headache, severe leg pain

• That continuing medical care is needed: Pap smear and gynecologic examinations q12mo
• To notify health care providers and dentists of oral contraceptive use; many antibiotics interfere with oral contraceptive effect

Black Box Warning: Do not smoke; increased risk of CV side effects

copanlisib (Rx)

(koh-pan′-lih-sib)

Aliqopa

Func. class.: Antineoplastic biologic response modifiers

USES:

For the treatment of non-Hodgkin's lymphoma

CONTRAINDICATIONS:

Pregnancy, hypersensitivity

Precautions: Breastfeeding, contraception requirements, children, diabetes mellitus, diarrhea, geriatric patients, hepatic/pulmonary disease, hyperglycemia, hypertension, infertility, male-mediated teratogenicity, neutropenia, pneumonitis, bone marrow suppression, infection, reproductive risk, serious rash, thrombocytopenia

DOSAGE AND ROUTES

Relapsed follicular lymphoma

• **Adult: IV** 60 mg over 1 hr on days 1, 8, and 15 repeated q28days until disease progression; reduce dose to 45 mg if using with strong CYP3A4 inhibitor

Available forms: Injection, lyophilized 60-mg single-dose vials

crisaborole (Rx)

(kris′a-bor-ole)

Eucrisa

Func. class.: Dermatologic agent

Chem. class.: Phosphodiesterase 4 enzyme inhibitor

ACTION:

Increases intracellular cyclic adenosine monophosphate (cAMP) levels in the skin

USES:

Mild to moderate atopic dermatitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Children, pregnancy, breastfeeding

DOSAGE AND ROUTES

• **Adult/child ≥2 yr: TOPICAL;** Apply ointment bid in a thin film to cover area

Available forms: Topical ointment 2%

Administer:

Topical route:

• For external use only; store at room temperature
• Tube should be tightly closed
• Apply only to affected areas

SIDE EFFECTS

INTEG: Burning, stinging, application site pain

PHARMACOKINETICS

97% protein bound, excreted renally

INTERACTIONS

• None known

NURSING CONSIDERATIONS

Assess:

• **Contact dermatitis:** for redness, itching, inflammation; assess if these symptoms are relieved after application
• **Hypersensitivity:** for pruritus, inflammation, rash; if present, product should be discontinued
• **Pregnancy/breastfeeding:** no adverse reactions in animal studies, no human studies available; consider benefits to mother and infant if breastfeeding; product is systemically absorbed

Evaluate:

• Therapeutic response: decreasing redness, itching, inflammation

Teach patient/family:

• **Contact dermatitis:** to identify whether symptoms are relieved after application;

to apply a thin film and wash hands after use; to use externally only
- **Hypersensitivity:** to report immediately itching, inflammation, rash; if present, product should be discontinued
- **Pregnancy/breastfeeding:** to advise prescriber if pregnant or planning to get pregnant, or if breastfeeding; effects are unknown

crizotinib (Rx)
(kriz-oh′ti-nib)
Xalkori
Func. class.: Antineoplastic

USES: Locally advanced or metastatic non–small-cell lung cancer (NSCLC) that is anaplastic lymphoma kinase (ALK)-positive as detected by an FDA-approved test

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, concurrent use of strong CYP3A4 inducers/inhibitors
Precautions: Neonates, infants, children, adolescents, pneumonitis, severe hepatic disease, congenital long QT syndrome, severe renal impairment, end-stage renal disease, vision disorders

DOSAGE AND ROUTES
- **Adult: PO** 250 mg bid; continue as long as beneficial; if CCr <30 mL/min use 250 mg daily

Available forms: Capsules 200, 300 mg

crofelemer (Rx)
(kroe-fel′e-mer)
Mytesi
Func. class.: Antidiarrheal
Chem. class.: Red sap of *Croton lechleri* plant

ACTION: Blocks chloride channel and high-volume water loss in diarrhea

USES: Noninfectious diarrhea in those with HIV/AIDS using antiretrovirals

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, Black patients, children/adolescents, GI disease, infection, malabsorption syndrome, pancreatitis

DOSAGE AND ROUTES
- **Adult: PO** 125 mg bid

Available forms: Delayed-release tablets 125 mg
Administer:
- Do not break, crush, or chew
- Without regard to meals

SIDE EFFECTS
CNS: Dizziness, depression
GI: Nausea, constipation, abdominal pain, anorexia, flatulence, hemorrhoids
INTEG: Acne vulgaris, contact dermatitis
MISC: Arthralgia, cough, increased urinary frequency

INTERACTIONS
Increase: serious constipation, bowel obstruction—alosetron (IBS)
Increase: constipation—may occur with antimuscarinics, opiate agonists

NURSING CONSIDERATIONS
Assess:
- Stools: volume, color, characteristic, frequency; bowel pattern before protein rebound constipation
- Electrolytes (K, Na, Cl), hydration status
- Monitor effect in Black patients; may be less effective

Evaluate: Therapeutic response: decreased diarrhea
Teach patient/family:
- To avoid OTC products unless directed by prescriber
- If drowsiness occurs, not to operate machinery

crotamiton

(kroe-tam′-ih-tuhn)

Crotan, Eurax (Rx)

Func. class.: Scabicide/pediculicide

USES: Scabies, lice

CONTRAINDICATIONS: Hypersensitivity; raw, inflamed skin

DOSAGE AND ROUTES

- **Adult: TOPICAL** After routine bath, apply over the entire body from the chin to the soles; do not apply to the face or head; repeat in 24 hr; patient may take a cleansing bath 48 hr after the second dose

Treatment of pruritus

- **Adult: TOPICAL** Apply topically by massaging gently into affected area until medication is completely absorbed; repeat if needed

Available forms: Lotion, cream 10%

cyanocobalamin (vitamin B_{12}) (OTC, Rx)

(sye-an-oh-koe-bal′a-min)

Nascobal, Rubramin PC

hydroxocobalamin (OTC, Rx)

CytoKit

Func. class.: Vitamin B_{12}, water-soluble vitamin

ACTION: Needed for adequate nerve functioning, protein and carbohydrate metabolism, normal growth, RBC development, cell reproduction

USES: Vitamin B_{12} deficiency, pernicious anemia, Vitamin B_{12} malabsorption syndrome, Schilling test, increased requirements with pregnancy, thyrotoxicosis, hemolytic anemia, hemorrhage, renal/hepatic disease, nutritional supplementation

CONTRAINDICATIONS: Hypersensitivity to this product, cobalt, benzyl alcohol, optic nerve atrophy

Precautions: Pregnancy, breastfeeding, children, renal/hepatic disease, folic acid/iron deficiency anemia, infection

DOSAGE AND ROUTES

cyanocobalamin

- **Adult: PO** Up to 1000 mcg/day **SUBCUT/IM** 30-100 mcg/day × 1 wk, then 100-200 mcg/mo

Schilling test

- **Adult/child: IM** 1000 mcg in 1 dose
- **Child: PO** up to 1000 mcg/day **SUBCUT/IM** 30-50 mcg/day × 2 wk, then 100 mcg/mo; **NASAL** 500 mcg weekly

hydroxocobalamin

- **Adult: SUBCUT/IM** 30-50 mcg/day × 5-10 days, then 100-200 mcg/mo
- **Child: SUBCUT/IM** 30-50 mcg/day × 5-10 days, then 30-50 mcg/mo

Available forms: *Cyanocobalamin:* tablets 50, 100, 250, 500, 1000, 5000 mcg; extended-release tablets 1000 mcg; lozenges 100, 250, 500 mcg; nasal 500 mcg/spray; injection 100, 1000 mcg/mL; *hydroxocobalamin:* injection 1000 mcg/mL, powder for injection 5 g/vial

Administer:

PO route

- With fruit juice to disguise taste; immediately after mixing
- With meals if possible for better absorption; large doses should not be used because most is excreted
- Protect from light, heat

IM route

- By IM injection for pernicious anemia for life unless contraindicated

Intranasal route

- Avoid use within 1 hr of hot fluids, food, no priming needed

IV route

- IV route not recommended but may be admixed in TPN solution

Additive compatibilities: Ascorbic acid, chloramphenicol, hydrocortisone, vitamin B/C

Solution compatibilities: Dextrose/Ringer's or LR combinations, dextrose/saline combinations, D_5W, $D_{10}W$, 0.45% NaCl, Ringer's or LR solution

Y-site compatibilities: Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium,

atropine, azaTHIOprine, aztreonam, benztropine, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, clindamycin, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, hydrOXYzine, imipenem-cilastatin, indomethacin, insulin (regular), isoproterenol hydrochloride, ketorolac, labetalol, lidocaine, magnesium, mannitol, meperidine, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, miconazole, midazolam, minocycline, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, raNITIdine, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil, vitamin B complex with C

SIDE EFFECTS

CNS: Flushing, optic nerve atrophy
CV: HF, peripheral vascular thrombosis, pulmonary edema
GI: *Diarrhea*
INTEG: Itching, rash, pain at injection site
META: Hypokalemia
SYST: Anaphylactic shock

PHARMACOKINETICS

Gastric intrinsic factor must be present for absorption to occur; stored in liver, kidneys, stomach; 50%-90% excreted in urine; crosses placenta; excreted in breast milk

INTERACTIONS

Increase: absorption—predniSONE
Decrease: absorption—aminoglycosides, anticonvulsants, colchicine, chloramphenicol, aminosalicylic acid, potassium preparations, cimetidine

Drug/Herb

Decrease: vitamin B_{12} absorption—goldenseal

Drug/Lab Test

False positive: intrinsic factor

NURSING CONSIDERATIONS

Assess:

- For vitamin B_{12} deficiency: red, beefy tongue; psychosis; pallor; neuropathy, ataxia, positive Romberg
- GI function: diarrhea, constipation
- Potassium levels during beginning treatment in megaloblastic anemia; q6mo in pernicious anemia; folic acid, plasma vitamin B_{12} (after 1 wk), reticulocyte counts
- Nutritional status: egg yolks, fish, organ meats, dairy products, clams, oysters: good sources of vitamin B_{12}
- For pulmonary edema, worsening of HF in cardiac patients

Evaluate:

- Therapeutic response: decreased anorexia, dyspnea on exertion, palpitations, paresthesias, psychosis, visual disturbances

Teach patient/family:

- That treatment must continue for life for pernicious anemia
- To eat a well-balanced diet
- To avoid contact with persons with infection; that infections are common

TREATMENT OF OVERDOSE:

Discontinue product

cyclobenzaprine (Rx)

(sye-kloe-ben'za-preen)

Amrix

Func. class.: Skeletal muscle relaxant, central acting
Chem. class.: Tricyclic amine salt

ACTION: Reduces tonic muscle activity at the brainstem; may be related to antidepressant effects

USES: Adjunct for relief of muscle spasm and pain in musculoskeletal conditions

CONTRAINDICATIONS: Acute recovery phase of MI, dysrhythmias, heart block, HF, hypersensitivity, intermittent porphyria, thyroid disease, QT prolongation, within 14 days of MAOIs

Precautions: Pregnancy, breastfeeding, geriatric patients, renal/hepatic disease, addictive personality, CV disease, child <15 yr

DOSAGE AND ROUTES

Musculoskeletal disorders

- **Adult/adolescent ≥15 yr: PO** 5 mg tid × 1 wk, max 30 mg/day × 3 wk
- **Adult: EXTENDED RELEASE** 15 mg/day, max 30 mg/day × 3 wk
- **Geriatric: PO** 5 mg tid

Hepatic dose

- **Adult (mild hepatic disease): PO** 5 mg, titrate slowly

Available forms: Tablets 5, 7.5, 10 mg; extended-release tablets 15, 30 mg

Administer:

- Without regard to meals, give with food for GI symptoms
- Do not crush, break, chew extended-release tablets
- Store in tight container at room temperature

SIDE EFFECTS

CNS: *Dizziness, weakness, drowsiness,* headache, insomnia, confusion, nervousness, fatigue

CV: Postural hypotension, dysrhythmias

EENT: Diplopia, temporary loss of vision, blurred vision, dry mouth

GI: *Nausea,* dry mouth, constipation

GU: Urinary retention

INTEG: Rash

PHARMACOKINETICS

PO: Onset 1 hr, peak 3-8 hr, duration 12-24 hr, half-life 1-3 days, 32 hr extended release, metabolized by liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

- Do not use within 14 days of MAOIs, traMADol

Increase: QT interval—Class IA/III antidysrhythmics and other products that increase QT interval

Increase: serotonin syndrome—SSRIs, SNRIs, tricyclics, triptans, fentaNYL, busPIRone, traMADol, traZODone

Increase: CNS depression—alcohol, tricyclics, opiates, barbiturates, sedatives, hypnotics

Drug/Herb

Increase: CNS depression—kava, chamomile, hops, valerian

NURSING CONSIDERATIONS

Assess:

- **Serotonin syndrome:** If using with SSRIs, SNRIs, monitor closely; if syndrome occurs, discontinue both products immediately, hallucinations, nausea, vomiting, diarrhea, tachycardia, hyperthermia
- **Pain:** location, duration, mobility, stiffness at baseline, periodically
- **Allergic reactions**: rash, fever, respiratory distress
- Severe weakness, numbness in extremities
- Assistance with ambulation if dizziness, drowsiness occurs, especially for geriatric patients
- **Beers:** avoid use in older adults; anticholinergic effects
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed; use cautiously in breastfeeding

Evaluate:

- Therapeutic response: decreased pain, spasticity; relief of muscle spasms of acute, painful musculoskeletal conditions generally short-term; long-term therapy seldom warranted

Teach patient/family:

- Not to discontinue medication abruptly; that insomnia, nausea, headache, spasticity, tachycardia will occur; that product should be tapered off over 1-2 wk
- Not to take with alcohol, other CNS depressants or MAOIs
- To avoid hazardous activities if drowsiness, dizziness occurs

- To avoid using OTC medication (cough preparations, antihistamines) unless directed by prescriber
- To use gum, frequent sips of water for dry mouth
- To notify prescriber of serotonin syndrome
- To report feeling of fullness of bladder, inability to void adequate amounts
- To use fluids, bulk in diet to prevent constipation

TREATMENT OF OVERDOSE: Use anticonvulsants if indicated; monitor cardiac function

cyclopentolate ophthalmic

See Appendix B

⚠ HIGH ALERT

cyclophosphamide (Rx)

(sye-kloe-foss′fa-mide)

Procytox ✱

Func. class.: Antineoplastic alkylating agent

Chem. class.: Nitrogen mustard

Do not confuse:
cyclophosphamide/cycloSPORINE

ACTION: Alkylates DNA; is responsible for cross-linking DNA strands; activity is not cell-cycle–phase specific

USES: Hodgkin's disease, lymphomas, leukemia; cancer of female reproductive tract, breast, multiple myeloma; neuroblastoma; retinoblastoma; Ewing's sarcoma; nephrotic syndrome

CONTRAINDICATIONS: Pregnancy, hypersensitivity, prostatic hypertrophy, bladder neck obstruction

Precautions: Radiation therapy, cardiac disease, anemia, dysrhythmias, child, dental disease/work, dialysis, geriatric patients, heart failure, hematuria, infections, leukopenia QT prolongation, secondary malignancy surgery, tumor lysis syndrome, vaccinations, breastfeeding, severely depressed bone marrow function

DOSAGE AND ROUTES

Acute lymphocytic leukemia (ALL)

- **Adult/adolescent/child: IV** Total doses of IV 300-1500 mg/m^2 have been incorporated into induction, intensification, consolidation regimens, possibly using vinCRIStine, predniSONE, or others; **PO** 1-5 mg/kg/day depending on response

Neuroblastoma

- **Adult/child: IV** For induction, 40-50 mg/kg in divided doses over 2-5 days or 10-15 mg/kg q7-10days, 3-5 mg/kg 2×/wk or 1-5 mg/kg daily
- **Child and infant: PO** 150 mg/m^2/day, days 1-7 with DOXOrubicin (**IV** 35 mg/m^2 on day 8) q21days × 5 cycles
- **Child: IV** 70 mg/kg/day with hydration on days 1, 2 with DOXOrubicin and vinCRIStine q21days for courses 1, 2, 4, 6 alternating with CISplatin and etoposide q21days for courses 3, 5, 7

Breast cancer

- **Adult: PO** 100-200 mg/m^2/day or 2 mg/kg/day × 4-14 days; **IV** 500-1000 mg/m^2 on day 1 in combination with fluorouracil and methotrexate or DOXOrubicin or DOXOrubicin alone, also cyclophosphamide 600 mg/m^2; may be given dose-dense on day 1 of q14days with DOXOrubicin (60 mg/m^2) with growth-factor support

Operable node-positive breast cancer IV (TAC regimen)

- **Adult: IV** 500 mg/m^2 with DOXOrubicin (50 mg/m^2 **IV**), then DOCEtaxel (75 mg/m^2) **IV** given 1 hr later q3wk × 6 cycles

Nephrotic syndrome

- **Child: PO** 2 mg/kg daily × 60-90 days, cumulative dose 168 mg/kg

Available forms: Powder for injection ✱ 200, 500 mg, 1, 2 g/vials; capsules 25, 50 mg

Administer:

- Use cytotoxic handling procedures

- In AM so product can be eliminated before bedtime
- Fluids IV or PO prior to chemotherapy to hydrate patient
- Antacid prior to oral agent; give after evening meal, before bedtime
- Antiemetic 30-60 min before product and prn
- Allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine

PO route

- Take on empty stomach; do not crush, break, chew capsules; wash hands immediately if in contact with capsules
- May be taken as a single dose or divided doses
- Take in AM or afternoon, avoid evening
- Store in tight container at room temperature

Direct IV route

- Reconstitute with NS only 100 mg/5 mL, swirl, inject slowly

Intermittent IV INFUSION route

- Use cytotoxic handling procedures
- IV after diluting 100 mg/5 mL, 0.9% NaCl of sterile water or bacteriostatic water; shake; let stand until clear; may be further diluted in ≤250 mL D_5/NS, 0.45% NaCl; give 100 mg or less/min (2 mg/mL)
- Use 21, 23, 25G needle; check site for irritation, phlebitis

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azlocillin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, kanamycin, ketorolac, labetalol, leucovorin, levoFLOXacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANTRONE, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin-dalfopristin, raNITIdine, rapacuronium, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, TPN, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine,

voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Cardiotoxicity (high doses), myocardial fibrosis, hypotension
ENDO: SIADH, gonadal suppression
GI: *Nausea, vomiting, weight loss,* anorexia
GU: Hemorrhagic cystitis, *hematuria*
HEMA: Thrombocytopenia, leukopenia, myelosuppression
INTEG: *Alopecia*
META: Hyperuricemia
MISC: Secondary neoplasms
RESP: Pulmonary fibrosis, interstitial pneumonia

PHARMACOKINETICS

Metabolized by liver, excreted in urine, half-life 4-6½ hr, 50% bound to plasma proteins

INTERACTIONS

Increase: neuromuscular blockade—succinylcholine
Increase: action of warfarin
Increase: bone marrow depression—other antineoplastics, radiation, allopurinol, thiazides
Decrease: digoxin levels—digoxin
Decrease: cyclophosphamide effect
Decrease: antibody response—live virus vaccines

Drug/Herb

Increase: toxicity—St. John's wort

Drug/Lab Test

Increase: uric acid
False positive: Pap smear
False negative: PPD, mumps, *Candida, Trichophyton,* Pap smear

NURSING CONSIDERATIONS

Assess:

- **Hemorrhagic cystitis; renal studies:** BUN, serum uric acid, urine CCr prior to, during therapy; I&O ratio; report fall in urine output <30 mL/hr; provide increased fluid intake to 3 L/day (adults)
- **Bone marrow depression:** CBC, differential, platelet count baseline, weekly; withhold product if WBC is <2500 or platelet count is <75,000; notify prescriber. Assess for hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
- **Pulmonary fibrosis/interstitial pneumonia:** pulmonary function tests, chest x-ray films prior to, during therapy; chest film should be obtained q2wk during treatment; monitor for dyspnea, rales/crackles, edema
- **Hepatotoxicity:** hepatic studies prior to, during therapy (bilirubin, AST, ALT, LDH), as needed; jaundice of skin, sclera; dark urine, clay-colored stools; itchy skin; abdominal pain; fever; diarrhea
- Unproductive cough, chest pain, tachypnea
- Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine); provide rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation, reduce incidence of hemorrhagic cystitis
- Warm compresses at injection site for inflammation
- **Beers:** avoid in older adults; delirium, dementia may occur; avoid in men due to decrease in urine flow, retention

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy; nephrotic syndrome

Teach patient/family:

- To take adequate fluids (3 L/day, adults) to eliminate product
- That amenorrhea can occur and may last up to 1 yr after therapy but is reversible after stopping treatment
- To report any changes in breathing or coughing
- To avoid foods with citric acid, hot temperature, or rough texture; that skin, fingernails may become darker
- **To report signs of infection:** increased temperature, sore throat, flulike symptoms
- **To report signs of anemia:** fatigue, headache, faintness, SOB, irritability

- To report bleeding (bruising, hematuria, petechiae); to avoid the use of razors, commercial mouthwash
- To avoid the use of aspirin products, ibuprofen
- To avoid vaccinations during therapy
- About proper handling and disposal of chemotherapy drugs
- **Pregnancy/breastfeeding:** to use reliable contraception during treatment and for 1 yr after treatment (women); men should use condoms during and for 4 mo following treatment; not to breastfeed

cycloSPORINE (Rx)

(sye'kloe-spor-een)

Gengraf, Neoral, SandIMMUNE

Func. class.: Immunosuppressant, antirheumatic (DMARD)

Chem. class.: Fungus-derived peptide

Do not confuse:
cycloSPORINE/cycloSERINE/cyclophosphamide

ACTION: Produces immunosuppression by inhibiting T lymphocytes

USES: Organ transplants (liver, kidney, heart) to prevent rejection (GVHD), rheumatoid arthritis, psoriasis

CONTRAINDICATIONS: Breastfeeding, hypersensitivity to polyoxyethylated castor oil (injection only); psoriasis or RA in renal disease (Neoral/Gengraf); Gengraf/Neoral used with PUVA/UVB, methotrexate, coal tar; ocular infections

Black Box Warning: Uncontrolled malignant hypertension

Precautions: Pregnancy, geriatric patients, severe hepatic disease

Black Box Warning: Immunosuppression, nephrotoxicity, skin cancer; requires a specialized care setting and experienced clinician; infections; new primary malignancy (lymphoma, skin cancer)

DOSAGE AND ROUTES—NTI

Prevention of transplant rejection (nonmodified) (Sandimmune)

- **Adult/child: PO** 15 mg/kg 4-12 hr prior to surgery, daily for 2 wk, reduce dosage by 2.5 mg/kg/wk to 5-10 mg/kg/day; **IV** 5-6 mg/kg 4-12 hr prior to surgery, daily, switch to **PO** form as soon as possible

Prevention of transplant rejection (modified) (Neoral)

- **Adult/child: PO** 4-12 mg/kg/day divided q12hr, depends on organ transplanted

Rheumatoid arthritis (Neoral/Gengraf)

- **Adult: PO** 2.5 mg/kg/day divided bid, may increase 0.5-0.75 mg/kg/day after 8-12 wk, max 4 mg/kg/day; decrease dose by 25% in HTN

Psoriasis (Neoral/Gengraf)

- **Adult: PO** 2.5 mg/kg/day divided bid, × 4 wk, then increase by 0.5 mg/kg/day q2wk, max 4 mg/kg/day; decrease dose by 25% in HTN

Autoimmune diseases (Sandimmune)

- **Adult/child: PO** 1-3 mg/kg/day

Available forms: Oral solution 100 mg/mL; soft gel capsule 25, 50, 100 mg; injection 50 mg/mL

Administer:

PO route

- Some brands are not interchangeable
- Do not break, crush, or chew capsules
- Use pipette provided to draw up oral solution; may mix with milk or juice; wipe pipette, do not wash (Neoral)
- For several days prior to transplant surgery; give at same time of day
- With corticosteroids
- With meals for GI upset or in chocolate milk, milk, or orange juice (SandIMMUNE)

Rheumatoid arthritis

- Give Neoral or Gengraf 2.5 mg/kg/day divided bid; may use with salicylates, NSAIDs, PO corticosteroids
- Always give the daily dose of Neoral/Gengraf in 2 divided doses on consistent schedule

Rejection prevention

- Give initial SandIMMUNE PO dose 4-12 hr prior to transplantation as a single dose of 15 mg/kg, continue the single daily dose for 1-2 wk, then taper 5%/wk to a maintenance dose of 5-10 mg/kg/day

Intermittent IV INFUSION route

- After diluting each 50 mg/20-100 mL of 0.9% NaCl or D_5W (2.5 mg/mL), run over 2-6 hr, use an infusion pump

Continuous IV INFUSION route

- May run over 24 hr
- **For SandIMMUNE parenteral,** give ⅓ of PO dose, initial dose 4-12 hr before transplantation as a single IV dose 5-6 mg/kg/day, continue the single daily dose until PO can be used

Y-site compatibilities: Abciximab, alatrofloxacin, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epiRUBicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levoFLOXacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, meropenem, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANTRONE, morphine, multiple vitamins injection, nafcillin, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, raNITIdine, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, zoledronic acid

SIDE EFFECTS

CNS: *Tremors, headache,* seizures, progressive multifocal leukoencephalopathy, confusion, migraine, paresthesia

GI: Nausea, vomiting, diarrhea, *oral candida, gum hyperplasia,* hepatotoxicity, pancreatitis

GU: Nephrotoxicity

INTEG: Rash, acne, *hirsutism*

META: Hyperkalemia, hypomagnesemia, hyperlipidemia, hyperuricemia

MISC: *Infection,* gingival hyperplasia, hypersensitivity, malignancy

PHARMACOKINETICS

Peak 4 hr; highly protein bound; half-life (biphasic) 1.2 hr, 25 hr; metabolized in

liver; excreted in feces, 6% in urine; crosses placenta; excreted in breast milk

INTERACTIONS

Increase: action, toxicity of cycloSPORINE—allopurinol, amiodarone, amphotericin B, androgens, azole antifungals, beta-blockers, bromocriptine, calcium channel blockers, carvedilol, cimetidine, colchicine, corticosteroids, fluoroquinolones, foscarnet, imipenem-cilastatin, macrolides, metoclopramide, oral contraceptives, NSAIDs, melphalan, SSRIs

Increase: effects of aliskiren, digoxin, etoposide, HMG-CoA reductase inhibitors, methotrexate, potassium-sparing diuretics, sirolimus, tacrolimus

Increase: action, toxicity of—digoxin, colchicine

Increase: hyperkalemia—potassium-sparing diuretics, potassium supplements, ACE inhibitors

Increase: renal dysfunction—aminoglycosides, ciprofloxacin, NSAIDs, fibric acid derivatives, vancomycin, melphalan, ketoconazole

Decrease: cycloSPORINE action—anticonvulsants, nafcillin, orlistat, PHENobarbital, phenytoin, rifamycins, sulfamethoxazole-trimethoprim, terbinafine, ticlopidine

Decrease: antibody reaction—live virus vaccines

Drug/Herb

Decrease: immunosuppression—echinacea, melatonin; do not use together

Decrease: cycloSPORINE levels—St. John's wort; do not use together

Drug/Food

- Slowed metabolism of product—grapefruit juice, food

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Nephrotoxicity: BUN, creatinine at least monthly during treatment, 3 mo after treatment; nephrotoxicity increases with increasing doses and duration of treatment

- Product blood level during treatment 12 hr after dose, toxic >400 ng/mL
- Hepatic studies: alkaline phosphatase, AST, ALT, bilirubin; **hepatotoxicity:** dark urine, jaundice, itching, light-colored stools; product should be discontinued
- Serum lipids, magnesium, potassium, cycloSPORINE blood concentrations, therapeutic cycloSPORINE range: 100-400 mg/mL
- **Posterior reversible encephalopathy:** impaired cognition, seizures, visual changes including blindness, loss of motor function, movement disorders, and psychiatric changes; dosage reduction or discontinuation may be needed
- **Progressive multifocal leukoencephalopathy (PML):** apathy, confusion, cognitive changes; may be fatal, withhold dose, notify prescriber immediately
- **Immunosuppression/infection:** bacterial, viral, protozoal, and fungal infections are common; assess for signs of infection often
- **Nephrotoxicity:** Increased with increased doses and duration
- **Psoriasis:** Lesions baseline and during treatment
- **RA:** Pain, ROM, ADLs baseline and during treatment

Black Box Warning: Requires a specialized care setting and experienced clinician: product must be given in a facility equipped with adequate laboratory and supportive medical services

Black Box Warning: New primary malignancy: lymphoma, skin cancer; increased risk in psoriasis with use of PUVA or UVB therapy, methotrexate, other immunosuppressives, coal tar or radiation; these patients may be at increased risk of skin cancer also

Evaluate:

- Therapeutic response: absence of rejection; decreased pain in rheumatoid arthritis, decreased lesions in psoriasis

Teach patient/family:

- To report fever, chills, sore throat, fatigue since serious infections may occur; tremors, bleeding gums, increased B/P

- To take at same time of day, every day; not to skip doses or double dose; not to use with grapefruit juice or receive vaccines; that there are many drug interactions; not to add new products without approval of prescriber

Black Box Warning: To limit UV exposure

- That treatment is lifelong to prevent rejection; to identify signs of rejection
- To report severe diarrhea because drug loss and rejection may result
- **About the signs of nephrotoxicity:** increased B/P, tremors of the hands, changes in gums, increased hair on body, face
- To continue with all lab work and follow-up appointments
- That types of products are not interchangeable
- Not to wash syringe/container with water; variation in dose may result
- To notify prescriber of all medications, herbal products, supplements that are taken
- **Pregnancy/breastfeeding:** to use contraceptive measures during treatment, for 12 wk after ending therapy; to notify prescriber if pregnancy is planned or suspected; no well-controlled studies; use only if benefits outweigh risks; discontinue breastfeeding or product

⚠ HIGH ALERT

cytarabine (Rx)

(sye-tare′a-been)

Cytosur

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Pyrimidine nucleoside analog

Do not confuse:
Cytosar/Cytoxan/Cytovene

ACTION: Competes with physiologic substrate of DNA synthesis, thus interfering with cell replication in the S phase of the cell cycle (before mitosis)

USES: Acute myelocytic leukemia, acute nonlymphocytic leukemia, chronic myelocytic leukemia; lymphomatous meningitis (intrathecal/intraventricular)
Unlabeled uses: Hodgkin's/non-Hodgkin's lymphoma, malignant meningitis, mantle cell lymphoma

CONTRAINDICATIONS: Pregnancy, hypersensitivity
Precautions: Breastfeeding, children, renal/hepatic disease, tumor lysis syndrome, infection, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia

Black Box Warning: Bone marrow suppression, arachnoiditis, abdominal pain, nausea/vomiting of chemotherapy, diarrhea, hepatotoxicity; requires a specialized care setting and experienced clinician, oral ulceration

DOSAGE AND ROUTES

Regimens will vary

Acute myelogenous leukemia (AML)

- **Adult: CONTINUOUS IV INFUSION** 100 mg/m^2/day × 7 days q2wk as single agent or 2-6 mg/kg/day (100-200 mg/m^2/day) as a single dose or 2-3 divided doses for 5-10 days until remission, used in combination; maintenance 70-200 mg/m^2/day for 2-5 days monthly; **SUBCUT/IM** maintenance 100 mg/m^2/day × 5 days q28days

Meningeal leukemia

- **Adult/child: INTRATHECAL** 5-75 mg/m^2, frequency varies

Acute promyelocytic leukemia (unlabeled)

Adult: CONTINUOUS IV 200 mg/m^2 by continuous infusion × 7 days starting on day 3 of therapy with daunorubicin and tretinoin

Renal dose

- **Adult: IV** CCr ≤60 mL/min, serum creatinine 1.5-1.9 mg/dL or increase of 0.5-1.2 mg/dL from baseline: reduce to 1 g/m^2/dose; serum creatinine ≥2 mg/dL or change from baseline serum creatinine was 1.2 mg/dL: reduce to 100 mg/m^2/day

Available forms: Solution for injection 20 mg/mL, 100 mg/mL

Administer:
- Antiemetic 30-60 min prior to product and prn
- Allopurinol to maintain uric acid levels and alkalinization of the urine

IV route
- Use cytotoxic handling precautions

Direct IV route
- Give undiluted, give by direct IV over 1-3 min through free-flowing tubing (IV)

Intermittent IV INFUSION route
- Dilute in 50-100 mL NS or D_5W, given over 30 min to 24 hr, depending on dose

Continuous IV INFUSION route
- May also be given by continuous infusion

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, amsacrine, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiaZEM, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levoFLOXacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANTRONE, mivacurium, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin-dalfopristin, raNITIdine, rapacuronium, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, headache, confusion, drowsiness, chemical arachnoiditis (IT)
CV: Edema
EENT: Conjunctivitis, visual changes
GI: *Nausea, vomiting, anorexia, diarrhea, stomatitis,* hepatotoxicity, abdominal pain, GI ulceration (high dose)
GU: Urinary retention, renal dysfunction
HEMA: Thrombophlebitis, bleeding, thrombocytopenia, leukopenia, myelosuppression, anemia
INTEG: *Rash*
META: Hyperuricemia
RESP: Dyspnea, pulmonary edema (high doses)
SYST: Anaphylaxis, tumor lysis syndrome
Cytarabine syndrome: *Fever,* myalgia, bone pain, chest pain, *rash,* conjunctivitis, malaise (6-12 hr after administration)

PHARMACOKINETICS

INTRATHECAL: Half-life 100-236 hr; metabolized in liver; excreted in urine

(primarily inactive metabolite); crosses blood-brain barrier, placenta
IV/SUBCUT: Distribution half-life 10 min, elimination half-life 1-3 hr

INTERACTIONS

- Do not use with live virus vaccines
- Do not use within 24 hr of chemotherapy—sargramostim, GM-CSF, filgrastim, G-CSF

Increase: toxicity—immunosuppressants, methotrexate, flucytosine, radiation, or other antineoplastics
Increase: bleeding risk—anticoagulants, platelet inhibitors, salicylates, thrombolytics, NSAIDs
Decrease: effects of oral digoxin, gentamicin

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow suppression: CBC (RBC, Hct, HB), differential, platelet count weekly; withhold product if WBC is <1000/mm^3, platelet count is <50,000/mm^3, or RBC, Hct, HB are low; notify prescriber of these results; assess for bleeding: hematuria, heme-positive stools, bruising or petechiae, mucosa, or orifices q8hr

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes prior to and during therapy
- I&O ratio; report fall in urine output to <30 mL/hr
- Monitor temperature; fever may indicate beginning infection; no rectal temperatures

Black Box Warning: Hepatotoxicity: hepatic studies prior to and during therapy: bilirubin, ALT, AST, alkaline phosphatase, as needed or monthly; check for jaundice of skin, sclera; dark urine; clay-colored stools; pruritus; abdominal pain; fever; diarrhea

- Serum uric acid during therapy
- **For anaphylaxis:** rash, pruritus, facial swelling, dyspnea; resuscitation equipment should be nearby

Black Box Warning: Chemical arachnoiditis (IT): headache, nausea, vomiting, fever; neck rigidity/pain, meningism, CSF pleocytosis; may be decreased by dexamethasone

- **Cytarabine syndrome** 6-12 hr after infusion: fever, myalgia, bone pain, chest pain, rash, conjunctivitis, malaise; corticosteroids may be ordered
- Dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy; personality changes, with high doses; pulmonary edema may be fatal (rare)
- Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- Local irritation, pain, burning, discoloration at injection site
- GI symptoms: frequency of stools, cramping; antispasmodic may be used
- Increased fluid intake to 2-3 L/day to prevent urate deposits and calculi formation unless contraindicated
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: improvement of hematologic parameters, decrease in size, spread of tumor

Teach patient/family:

- To report any coughing, chest pain, changes in breathing; may indicate beginning pneumonia, pulmonary edema
- **Stomatitis:** To avoid foods with citric acid, hot temperature, or rough texture if stomatitis is present; use sponge brush and rinse with water after each meal; to report stomatitis: any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report any symptoms
- To report signs of infection: increased temperature, sore throat, flulike symptoms; to avoid crowds, persons with infections
- To report signs of **anemia:** fatigue, headache, faintness, SOB, irritability

- To report bleeding; to avoid use of razors, commercial mouthwash, salicylates, NSAIDs, anticoagulants
- To use thrombocytopenia precautions
- To take fluids to 3 L/day to prevent renal damage
- To avoid receiving vaccines during treatment
- That fever, headache, nausea, vomiting are likely to occur
- **Pregnancy/breastfeeding:** to use reliable contraception during treatment and for 4 mo thereafter; not to breastfeed

dabigatran (Rx)

(da-bye-gat'ran)

Pradaxa

Func. class.: Anticoagulant

Chem. class.: Direct thrombin inhibitor

ACTION: Direct thrombin inhibitor that inhibits both free and clot-bound thrombin; prevents thrombin-induced platelet aggregation and thrombus formation by preventing conversion of fibrinogen to fibrin

USES: Stroke/systemic embolism prophylaxis with nonvalvular atrial fibrillation, DVT, pulmonary embolism in hip replacement

CONTRAINDICATIONS: Hypersensitivity, active bleeding, prosthetic heart valves, use with P-gp inducers

Precautions: Pregnancy, labor, obstetric delivery, breastfeeding, children, geriatric patients, abrupt discontinuation, anticoagulant therapy, renal disease, surgery

Black Box Warning: Abrupt discontinuation, epidural/spinal anesthesia, lumbar puncture

DOSAGE AND ROUTES

Stroke prophylaxis, atrial fibrillation, and DVT/PE prophylaxis

- **Adult: PO** 150 mg bid

For conversion from an alternative anticoagulant to dabigatran

- When converting from warfarin to dabigatran, discontinue warfarin and initiate dabigatran when the INR is <2.0; when converting from a parenteral anticoagulant to dabigatran, initiate dabigatran 0-2 hr prior to the time of the next scheduled anticoagulant dose or at the time of discontinuation of a continuously administered anticoagulant (IV unfractionated heparin)

For conversion from dabigatran to warfarin

- **Adult:** CCr >50 mL/min, start warfarin 3 days prior to discontinuing dabigatran; CCr 31-50 mL/min, start warfarin 2 days prior to discontinuing dabigatran; CCr 15-30 mL/min, start warfarin 1 day prior to discontinuing dabigatran

For conversion from dabigatran to parenteral anticoagulants

- **Adult: PO** discontinue dabigatran; start parenteral anticoagulant 12 hr (CCr ≥30 mL/min) or 24 hr (CCr <30 mL/min) after the last dabigatran dose

Deep venous thrombus (DVT)/pulmonary embolism (PE) prophylaxis

- **Adult: PO** 220 mg or 150 mg/day × 28-35 days, starting with ½ dose 1-4 hr after surgery (knee replacement); 110 mg on first day 1-4 hr after surgery, hemostasis achieved, then 220 mg daily × 28-35 days; those previously treated 150 mg bid (hip replacement)

DVT/PE/treated with a parenteral anticoagulant × 5-10 days

- **Adult: PO** 150 mg bid

Renal dose

- **Adult: PO** CCr 15-30 mL/min, 75 mg bid (for reduction in stroke risk and systemic embolism in nonvalvular atrial fibrillation)

Available forms: Capsules 75, 110, 150 mg

Administer:

- Prior to surgery, discontinue product; restart after surgery is completed
- Do not crush, break, chew, or empty contents of capsule
- Without regard to food
- Store in original package at room temperature until time of use; discard after 30 days; protect from moisture

SIDE EFFECTS

GI: Abdominal pain, dyspepsia, esophagitis, gastritis, diarrhea

HEMA: Bleeding (any site)

SYST: Anaphylaxis (rare), angioedema

PHARMACOKINETICS

Protein binding 35%, half-life 12-17 hr (extended in renal disease), onset unknown, peak 1-2 hr, duration unknown, high-fat meal delays peak

INTERACTIONS

Increase: bleeding risk—amiodarone, other anticoagulants, clopidogrel, ketoconazole, quiNIDine, thrombolytics, verapamil

P-gp inhibitors: dose should be reduced to 150 mg/day (75 mg bid) in those with CCr 30-50 mL/min

Decrease: dabigatran effect—rifAMPin; avoid concurrent use

Decrease: dabigatran effect—P-glycoprotein inducers (carBAMazepine, rifAMPin, tipranavir)

Drug/Herb

Decrease: dabigatran—St. John's wort

Drug/Lab Test

Increase: thrombin time, aPTT

NURSING CONSIDERATIONS

Assess:

- **Stroke:** facial palsy, weakness, headache, blurred vision, speaking difficulty
- **DVT/PE:** Pain in calf, swelling, or behind knee, trouble breathing, chest pain, lightheadedness
- **Bleeding:** blood in urine or emesis, dark tarry stools, lower back pain; caution with arterial/venous punctures, catheters, NG tubes; monitor vital signs frequently; elderly patients more prone to serious bleeding, monitor aPTT, ecarin clotting time baseline and during treatment

Black Box Warning: Premature discontinuation: risk of thrombosis/MI/emboli: swelling, pain, redness, difficulty breathing, chest pain, tachypnea, cough, coughing up blood, cyanosis

- **Postthrombotic syndrome:** pain, heaviness, itching/tingling, swelling, varicose veins, brownish/reddish skin discoloration, ulcers; use of ambulation, compression stockings, adequate anticoagulation can prevent this syndrome
- **Surgery:** discontinue 24-48 hr prior to surgery in those with CCr ≥50 mL/min, 72-96 hr in those with CCr <50 mL/min; longer times may be needed in major surgery; restart after surgery, spinal epidural catheter

Black Box Warning: Epidural/spinal anesthesia, lumbar puncture: risk of hematoma that may cause permanent paralysis; indwelling epidural catheters and products that cause coagulation changes (NSAIDs, anticoagulants) may increase the risk of paralysis

Black Box Warning: Do not discontinue abruptly

- **Pregnancy/breastfeeding:** no well-controlled studies; bleeding may occur if used during pregnancy; discontinue breastfeeding or product, unknown if excreted in breast milk

Evaluate:

- Therapeutic response: decreased thrombus formation/extension, absence of emboli, postthrombotic effects

Teach patient/family:

- About the purpose and expected results; to take at same time of day; not to skip or double doses; if dose is missed, to take as soon as remembered if on the same day; do not administer if <6 hr before next dose; to store in original container, protect from moisture
- To take without regard to food; to swallow capsule whole, not to open; to take with a full glass of water
- To notify all providers that this product is being used; to check with prescriber about when to discontinue
- **Bleeding:** to report any bleeding or bruising, including blood in stool, emesis, urine; nosebleeds

Black Box Warning: Neurologic changes: to notify prescriber immediately of bowel or bladder changes, numbness in lower extremities, midline back pain

- Not to use any other OTC products, herbs without prescriber approval
- That lab tests may be required during treatment

dabrafenib (Rx)

(da-braf'e-nib)

Tafinlar

Func. class.: Antineoplastic

Chem. class.: Signal transduction inhibitor, kinase inhibitor

ACTION: Inhibits kinase, inhibitor against mutated forms of BRAF kinases in melanoma cells

USES: Unresectable or metastatic BRAF V600E-mutated malignant melanoma or V600K-mutated melanoma in combination with tramatinib

CONTRAINDICATIONS: Pregnancy, hypersensitivity

Precautions: Breastfeeding, children, infection, dehydration, diabetes mellitus, fever, G6PD deficiency, hemolytic anemia, hyperglycemia, hypotension, infertility, iritis, renal failure, secondary malignancy

DOSAGE AND ROUTES

• **Adult: PO** 150 mg q12hr until disease progression; avoid strong CYP3A4/CYP2C8 inhibitors or inducers

Available forms: Capsules 50, 75 mg

Administer:

PO route

• Obtain testing for genetic evidence of BRAF V60E or K

• Swallow whole; do not open, crush, chew capsules

• If dose is missed, take within 6 hr of missed dose; if >6 hr have passed, skip dose

• Space doses q12hr

• Take at least 1 hr prior to or 2 hr after a meal

SIDE EFFECTS

CNS: Headache, fever, fatigue

GI: Pancreatitis

INTEG: Rash, alopecia

MISC: Myalgia

OTHER: Hyperglycemia, hypophosphatemia, hyponatremia, secondary malignancy, hand/foot syndrome

CV: Cardiomyopathy, HF, thromboembolism

EENT: Uveitis, retinal detachment

PHARMACOKINETICS

Protein binding 99.7%, half-life 8 hr (dabrafenib), 10 hr, 21-22 hr metabolites, excreted 71% (feces), 23% (urine)

INTERACTIONS

Altered: dabrafenib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Decrease: dabrafenib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifAMPin, PHENobarbital), antacids, proton pump inhibitors

Decrease: effect of CYP3A4, CYP2C9 substrates

Drug/Herb

Decrease: dabrafenib concentrations—St. John's wort

Drug/Food Test

Increase: dabrafenib effect—grapefruit juice; avoid use while taking product

NURSING CONSIDERATIONS

Assess:

• **Secondary malignancy:** perform a dermatologic evaluation before therapy, q2mo while on therapy, and for up to 6 mo after discontinuing

• **Serious fever and febrile reaction:** hypotension, rigors/chills, dehydration, renal failure; fever occurs when given with trametinib. Interruption of therapy, a dose reduction, or permanent therapy discontinuation may be needed. Monitor for signs and symptoms of infection. If severe, monitor renal function (BUN/serum creatinine) during and after and give antipyretics when therapy is resumed. In a febrile reaction that does not resolve within 3 days, give corticosteroids (predniSONE 10 mg/day PO) for at least 5 days; ensure that there is no evidence of active infection prior to starting corticosteroids

• **Hyperglycemia:** Monitor serum glucose levels at baseline and as clinically indicated

• **Uveitis, iritis, and iridocyclitis:** steroid and mydriatic ophthalmic drops may provide relief for these conditions. Monitor for visual signs and symptoms of uveitis (blurred vision, photophobia, and eye pain). Continue at the same dose in iritis. Hold for mild or moderate uveitis that does not respond to ocular therapy, severe uveitis, or

iridocyclitis; initiate treatment as indicated. Permanently discontinue in those who develop persistent grade 2 or higher uveitis that lasts longer than 6 wk

• **Bleeding:** major intracranial bleeding/GI bleeding can occur when used with trametinib. Monitor for signs of bleeding (frank blood; blood in stools, urine, vomit); evaluate any fall in hematocrit, hypotension, grade 3 bleeding, hold product; grade 4, discontinue

• **Cardiomyopathy:** a decrease in left ventricular ejection fraction (LVEF) ≥10% from baseline and below the lower limit of normal (LLN) was higher when given in combination with trametinib. Obtain an ECG or MUGA prior to starting combination therapy, 1 mo after starting dabrafenib, and then q2-3mo during treatment. Hold dabrafenib for symptomatic CHF or LVEF below the LLN with an absolute decrease of >20% from baseline. Resume at the same dose if LVEF improves to the institutional LLN and an absolute decrease of 10% or less from baseline

• **Palmar-plantar erythrodysesthesia syndrome (hand and foot syndrome):** may occur when given with trametinib, usually within 37 days; hospitalization may be required due to a secondary infection of the skin. Interruption of therapy, a dose reduction, or permanent therapy discontinuation may be needed in those who develop severe skin toxicity

Evaluate:

• Therapeutic response: decrease in melanoma progression

Teach patient/family:

• To notify prescriber of new lesions

• To notify providers of all OTC, Rx, herbal products taken

• To take as prescribed 1 hr prior to or 2 hr after meals, to take a missed dose at least 6 hr before next dose

• To report adverse reactions immediately

• About reason for treatment, expected results

• Advise patients to report symptoms of severe hyperglycemia (excessive thirst, increased urinary frequency)

• Advise that other malignancies are possible

• **Pregnancy:** to use effective nonhormonal contraception during treatment and for at least 30 days after discontinuing treatment; not to breastfeed

⚠ HIGH ALERT

dacarbazine (Rx)

(da-kar′ba-zeen)

Func. class.: Antineoplastic alkylating agent

Chem. class.: Cytotoxic triazine

Do not confuse:

dacarbazine/procarbazine

ACTION: Alkylates DNA, RNA; inhibits DNA, RNA synthesis; also responsible for breakage, cross-linking of DNA strands; activity is not cell-cycle–phase specific

USES: Hodgkin's disease, malignant melanoma

Unlabeled uses: Metastatic soft tissue sarcoma in combination with other agents

CONTRAINDICATIONS: Breastfeeding, hypersensitivity

Precautions: Renal disease, infection

Black Box Warning: Pregnancy first trimester, radiation therapy, hepatic disease, bone marrow suppression, secondary malignancy, requires an experienced clinician

DOSAGE AND ROUTES

Metastatic malignant melanoma

• **Adult: IV** 2-4.5 mg/kg/day × 10 days or 100-250 mg/m^2/day × 5 days; repeat q3-4wk depending on response

Hodgkin's lymphoma

• **Adult: IV** 150 mg/m^2/day × 5 days with other agents, repeat q4wk; or 375 mg/m^2 on days 1 and 15 when given in combination, repeat q15days

Soft tissue sarcoma (unlabeled)

• **Adult/child: IV** 250 mg/m^2/day as continuous infusion × 4 days q21days

Available forms: Powder for injection 100-, 200-, 500-mg vials

Administer:

• Antiemetic 30-60 min prior to giving product to prevent vomiting, nausea; vomiting may subside after several doses, nausea/vomiting may be severe and last several hours

• Antibiotics for prophylaxis of infection

IV route

• Use cytotoxic handling precautions

• Clarify all orders, double-check original order; may be fatal if wrong dose is given

Direct IV route

• After diluting 100 mg/9.9 or 200 mg/19.7 mL of sterile water for injection (10 mg/mL), give by slow direct IV over 2-3 min

Intermittent IV INFUSION route

• May be further diluted in 50-250 mL D_5W or NS for injection, given as an infusion over ½-1 hr

• Watch for extravasation; stop infusion, notify prescriber, provide treatment as to protocol

• Store in light-resistant container in a dry area (vials); reconstituted solutions can be stored at ≤8 hr at room temperature or 3 days refrigerated

Y-site compatibilities: Amifostine, anidulafungin, atenolol, aztreonam, bivalirudin, bleomycin, caspofungin, DAPTOmycin, dexmedetomidine, DOCEtaxel, DOXOrubicin, ertapenem, etoposide, fenoldopam, filgrastim, fludarabine, gemtuzumab, granisetron, levofloxacin, mechlorethamine, melphalan, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, quinupristin-dalfopristin, sargramostim, teniposide, thiotepa, tigecycline, tirofiban, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

GI: *Nausea, anorexia, vomiting,* hepatotoxicity, diarrhea

HEMA: Thrombocytopenia, leukopenia, anemia

INTEG: *Alopecia,* dermatitis, pain at injection site, photosensitivity; severe sun reactions (high doses)

MISC: Flulike symptoms, malaise, fever, myalgia, hypotension

SYST: Anaphylaxis, new primary malignancy

PHARMACOKINETICS

Metabolized by liver; excreted in urine; half-life 5 hr; onset, peak, duration unknown

INTERACTIONS

Black Box Warning: Increased: toxicity, bone marrow suppression: bone marrow suppressants, radiation, other antineoplastics

Increase: adverse reaction, decrease antibody reaction—live virus vaccines, do not use together, complete all needed vaccines ≥2 wk prior to first dose

Drug/Lab Test

Increase: BUN, AST, ALT

Decrease: platelets, WBC, RBC

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow suppression: monitor CBC, differential, platelet count weekly; notify prescriber of results, allow blood counts to rise to normal prior to use

• Monitor temperature, may indicate beginning infection, I&O, for nausea, appetite

Black Box Warning: New primary malignancy: assess for new malignancy that may occur with this product

• **Bleeding:** hematuria, guaiac, bruising, petechiae of mucosa or orifices q8hr

• Effects of alopecia on body image; discuss feelings about body changes

Black Box Warning: Hepatotoxicity: assess for jaundice of skin, sclera; dark urine; clay-colored stools; itchy skin; abdominal pain; fever; diarrhea; monitor hepatic studies prior to, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

- Inflammation of mucosa, breaks in skin
- IV site for irritation, redness, pain; if infiltration occurs, use hot packs at site
- **Hypersensitivity reactions, anaphylaxis:** discontinue product, administer meds for anaphylaxis
- Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation

Black Box Warning: Product must be administered by those experienced in the use of cancer chemotherapy

Evaluate:
- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:
- That patient should avoid prolonged exposure to sun, wear sunscreen
- That hair may be lost during treatment; that a wig or hairpiece may make the patient feel better; that new hair may be different in color, texture
- To report signs of **infection:** fever, sore throat, flulike symptoms
- To report signs of **anemia:** fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid aspirin products or ibuprofen

Black Box Warning: Pregnancy/breastfeeding: to notify prescriber if pregnancy is planned or suspected; to use reliable contraceptives during and for several months after therapy; not to breastfeed, contraindicated in first trimester

dalbavancin (Rx)

(dal-ba-van′sin)

Dalvance

Func. class.: Antiinfective

Chem. class.: Glycopeptide

ACTION: Binds to the bacterial cell walls, inhibiting their synthesis

USES: Treatment of acute bacterial skin and skin structure infections due to gram-positive organisms (cellulitis, major abscess, wound infections); *Enterococcus faecalis, Enterococcus faecium, Staphylococcus aureus* (MRSA), *Staphylococcus aureus* (MSSA), *Streptococcus agalactiae* (group B streptococci), *Streptococcus anginosus, Streptococcus constellatus, Streptococcus dysgalactiae, Streptococcus intermedius, Streptococcus pyogenes* (group A beta-hemolytic streptococci)

CONTRAINDICATIONS: Hypersensitivity

Precautions: Antimicrobial resistance, breastfeeding, infusion-related reactions, pregnancy, CDAD, ulcerative colitis, vancomycin or glycopeptide hypersensitivity, viral infection, elderly, children, hepatic disease

DOSAGE AND ROUTES

- **Adult: IV** 1500 mg once; or 1000 mg once, then 500 mg **IV** 1 wk later

Renal dose
- **Adult: IV** CCr <30 mL/min 1125 mg as a single dose or 750 mg once then 375 mg 1 wk later

Available forms: Injection 500 mg/vial (single use)

Administer:

IV INFUSION route
- Visually inspect parenteral products for particulate matter and discoloration
- **Reconstitution:** Reconstitute each 500 mg/25 mL (20 mg/mL) sterile water for injection or D_5W; to avoid foaming, alternate between gentle swirling and inversion until completely dissolved, do not shake; further dilution is required
- **Storage:** Refrigerate or store at room temperature. Do not freeze. The total time from reconstitution to dilution to use max 48 hr
- **Dilution:** Transfer the dose of reconstituted solution from the vial(s) to an IV bag or bottle containing D_5W (1-5 mg/mL), discard unused product

Intermittent IV INFUSION

• Give over 30 min, do not infuse with other medications or electrolytes, saline-based infusion solutions may cause precipitation and should not be used; if a common IV line is being used to administer other drugs, the line should be flushed prior to and after each dose

SIDE EFFECTS

CNS: Dizziness, headache, flushing
GI: Nausea, CDAD, abdominal pain, diarrhea, vomiting
RESP: Bronchospasm
SYST: Red man syndrome, hypersensitivity reactions
GU: Mycotic vulvovaginal infections
ENDO: Hypoglycemia
INTEG: Rash, urticaria, infusion-related reactions, pruritus, petechiae, phlebitis

PHARMACOKINETICS

Protein binding 93%, primarily to albumin, excreted in feces and urine, metabolism decreased in renal disease, half-life 8 days, peak infusion's end, duration 1 wk

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:

• Monitor CBC with differential, LFTs
• BUN/creatinine; lower dose may be required in severe renal disease
• **CDAD:** monitor for bowel pattern daily; if severe diarrhea occurs, product should be discontinued, may occur ≥8 wk after last dose
• **Infection:** B/P, pulse, temperature, characteristics of urine, stools, sputum baseline and during treatment, make sure use is for a bacterial infection
• **Anaphylaxis:** rash, urticaria, pruritus, wheezing; may occur a few days after administration
• **Infusion site reactions:** monitor for reactions, discontinue if present
• **Red man–like syndrome:** assess for flushing, rash over upper torso and neck; may occur after a few minutes of infusion; may be treated with antihistamines and a slower infusion, usually caused by too rapid an infusion

Evaluate:

• Therapeutic response: decreased symptoms of infection, negative C&S

Teach patient/family:

• To report allergic reactions to this product, vancomycin, or other glycopeptides
• That product is used for bacterial infections only
• To report sore throat, bruising, bleeding, joint pain **(blood dyscrasias)**; diarrhea with mucus, blood **(CDAD)**; rash, pruritus, wheezing **(hypersensitivity reactions)**
• **Pregnancy/breastfeeding:** to notify health care professional if pregnancy is planned or suspected or if breastfeeding
• To notify prescriber of all OTC, prescription medications, and herbals used

dalfampridine (Rx)

(dal-fam′pri-deen)

Ampyra, Fampyra

Func. class.: Neurologic agent—multiple sclerosis

Chem. class.: Broad-spectrum potassium channel blocker

USES: For improved walking in patients with multiple sclerosis

CONTRAINDICATIONS: Renal failure (CCr <50 mL/min), seizures
Precautions: Pregnancy, breastfeeding, geriatric patients, renal disease

DOSAGE AND ROUTES

• **Adult: PO** 10 mg q12hr

Renal dose

• **Adult: PO** CCr 51-80 mL/min, no dosage adjustment needed but seizure risk unknown; CCr ≤50 mL/min, do not use

Available forms: Extended-release tablets 10 mg

⚠ HIGH ALERT

dalteparin (Rx)

(dahl'ta-pear-in)

Fragmin

Func. class.: Anticoagulant

Chem. class.: Low-molecular-weight heparin

ACTION: Inhibits factor Xa/IIa (thrombin), resulting in anticoagulation

USES: Unstable angina/non–Q-wave MI; prevention/treatment of deep venous thrombosis in abdominal surgery, hip replacement, or in those with restricted mobility during acute illness, pulmonary embolism, reduced recurrence of VTE in pediatrics

Unlabeled uses: VTE prophylaxis in gynecologic surgery

CONTRAINDICATIONS: Hypersensitivity to this product, heparin, or pork products; active major bleeding, hemophilia, leukemia with bleeding, thrombocytopenic purpura, cerebrovascular hemorrhage, cerebral aneurysm; those undergoing regional anesthesia for unstable angina, non–Q-wave MI, dalteparin-induced thrombocytopenia

Precautions: Hypersensitivity to benzyl alcohol, pregnancy, breastfeeding, children, recent childbirth, geriatric patients; hepatic disease; severe renal disease; blood dyscrasias; bacterial endocarditis; acute nephritis; uncontrolled hypertension; recent brain, spine, eye surgery; congenital or acquired disorders; severe cardiac disease; peptic ulcer disease; hemorrhagic stroke; history of HIT; pericarditis; pericardial effusion; recent lumbar puncture; vasculitis; other diseases in which bleeding is possible

Black Box Warning: Epidural/spinal anesthesia, lumbar puncture

DOSAGE AND ROUTES

DVT/pulmonary embolism (cancer-associated venous thrombosis)

• **Adult: SUBCUT** 200 IU/kg daily during first mo (max single dose 18,000 IU), then 150 IU/kg daily for mo 2-6 (max single dose 18,000 IU), use prefilled syringe that is closest to calculated dose; if platelets are 50,000-100,000/mm^3, reduce dose by 2500 units until platelets ≥100,000 mm^3; if platelets <50,000/mm^3, discontinue until >50,000/mm^3

Hip replacement surgery/DVT prophylaxis

• **Adult: SUBCUT** 2500 IU 2 hr prior to surgery and second dose in the evening on the day of surgery (4-8 hr postop), then 5000 IU **SUBCUT** first postop day and daily × 5-10 days

Unstable angina/non–Q-wave MI

• **Adult: SUBCUT** 120 IU/kg q12hr × 5-8 days, max 10,000 IU q12hr × 5-8 days with concurrent aspirin; continue until stable

DVT, prophylaxis for abdominal surgery

• **Adult: SUBCUT** 2500 IU 1-2 hr prior to surgery; repeat daily × 5-10 days; for high-risk patients, >3400 IU should be used

DVT prophylaxis in patients with severely restricted mobility due to acute illness

Adult: SUBCUT 5000 IU daily × 12-14 days

VTE in pediatrics. See manufacturer's information

Renal dose

• **Adult: SUBCUT** cancer patient with CCr <30 mL/min, monitor and adjust based on anti–factor Xa during extended treatment

VTE prophylaxis in gynecologic surgery (unlabeled)

• **Adults: SUBCUT** 2500 IU daily starting 1-2 hr prior to surgery then daily

Available forms: Prefilled syringes, 2500, 5000 IU/0.2 mL; 7500 IU/0.3 mL; 10,000 IU/mL, 12,500 IU/0.5 mL, 15,000 IU/0.6 mL, 18,000 IU/0.72 mL, 95,000 IU/3.8 mL

Administer:

• Cannot be used interchangeably (unit for unit) with unfractionated heparin or other LMWHs

• Do not give IM or IV product route; approved is SUBCUT only; do not mix with other injections or solutions

• Have patient sit or lie down; SUBCUT injection may be 2 inches from umbilicus

in a U-shape, upper outer side of thigh, or upper outer quadrangle of the buttocks; rotate injection sites
• Change injection site daily; use at same time of day

SIDE EFFECTS

CNS: Intracranial bleeding, fever
HEMA: Thrombocytopenia, DIC
GU: Hematuria
INTEG: Skin necrosis, injection site reaction
SYST: Hypersensitivity, hemorrhage, anaphylaxis

PHARMACOKINETICS

87% absorbed, excreted by kidneys, elimination half-life 2-2.3 hr, peak 2-4 hr, onset 1-2 hr, duration up to 24 hr

INTERACTIONS

Increase: bleeding risk—aspirin, oral anticoagulants, platelet inhibitors, NSAIDs, salicylates, thrombolytics, some cephalosporins, SSRIs; cautious use

Drug/Herb

Increase: bleeding risk— angelica, capsicum, chamomile, dandelion, dan shen, feverfew, garlic, ginger, ginkgo, horse chestnut, avoid using together

Drug/Lab Test

Increase: AST, ALT
Decrease: platelets

NURSING CONSIDERATIONS

Assess:

• **Blood studies** (Hct/HB, CBC, platelets, anti-Xa,) during treatment because bleeding can occur
• **Bleeding:** bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis; decrease in Hct, B/P may indicate bleeding, possible hemorrhage; notify prescriber immediately; product should be discontinued

Black Box Warning: Epidural/spinal anesthesia: neurologic impairment may occur frequently when neuraxial anesthesia has been used; spinal/epidural hematomas may occur with paralysis; numbness in lower extremities; bowel, bladder changes; back pain; notify prescriber immediately; those at greatest risk are taking products that cause increased bleeding risk

• **Hypersensitivity:** fever, skin rash, urticaria; notify prescriber immediately
• Needed dosage change q1-2wk; dose may need to be decreased if bleeding occurs
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed; LMWH does not cross placenta; benefits and risk must be weighed with provider; if used, discontinue 24 hr prior to induction or cesarean delivery; use of multidose vials containing benzyl alcohol is contraindicated; use caution in breastfeeding

Evaluate:

• Therapeutic response: absence of DVT/PE, prevention of complication (unstable angina, non-Q-wave MI)

Teach patient/family:

• To avoid OTC preparations that contain aspirin, other anticoagulants unless approved by prescriber; serious product interactions may occur
• To use soft-bristle toothbrush to avoid bleeding gums; to avoid contact sports; to use electric razor; to avoid IM injections
• **Bleeding:** to report any signs of bleeding (gums, under skin, urine, stools), unusual bruising

TREATMENT OF OVERDOSE:

Protamine sulfate 1% given IV; 1 mg protamine/100 anti-Xa international units of dalteparin given

⚠ HIGH ALERT

dantrolene (Rx)

(dan′troe-leen)

Dantrium, Revonto, Ryanodex

Func. class.: Skeletal muscle relaxant, direct acting
Chem. class.: Hydantoin

USES: Spasticity in multiple sclerosis, stroke, spinal cord injury, cerebral palsy, malignant hyperthermia

CONTRAINDICATIONS: Hypersensitivity, hepatic disease, hepatitis

Precautions: Pregnancy, breastfeeding, geriatric patients, peptic ulcer disease, cardiac/renal/hepatic disease, stroke, seizure disorder, diabetes mellitus, ALS, COPD, MS, mannitol/gelatin hypersensitivity, labor, lactase deficiency, extravasation

Black Box Warning: Hepatotoxicity

DOSAGE AND ROUTES

Spasticity

- **Adult: PO** 25 mg daily × 7 days, then 25 mg tid × 7 days, then 50 mg tid × 7 days, then 100 mg tid (max 100 mg qid); if no further benefit is observed at the next higher dose, decrease dosage to the previous dose; stop if no benefit seen within 45 days
- **Child: PO** 0.5 mg/kg daily × 7 days, then 0.5 mg/kg tid × 7 days, then 1 mg/kg tid × 7 days, then 2 mg/kg tid; max 100 mg qid, if no further benefit is observed at the next higher dose, decrease dosage to the previous dose; stop if no benefit is seen in 45 days

Prevention of malignant hyperthermia

- **Adult/child: PO** 4-8 mg/kg/day in 3-4 divided doses × 1-3 days prior to procedure, give last dose 4 hr preop; **IV** 2.5 mg/kg prior to anesthesia

Malignant hyperthermia

- **Adult/child: IV** 1-2.5 mg/kg, may repeat to total dose of 10 mg/kg; **PO** 4-8 mg/kg/day in 4 divided doses × 1-3 days

Neuroleptic malignant syndrome (unlabeled)

- **Adult: PO** 100-300 mg/day in divided doses; **IV** 1.25-1.5 mg/kg

Available forms: Capsules 25, 50, 100 mg; injection 20 mg/vial, 250 mg/vial

⚠ HIGH ALERT

dapagliflozin (Rx)

(dap′a-gli-floe′zin)

Farxiga

Func. class.: Oral antidiabetic

Chem. class.: Sodium-glucose cotransporter 2 (SGLT 2) inhibitor

Do not confuse:
Farxiga/Fetzima

ACTION:

Blocks reabsorption of glucose by the kidney, increases glucose excretion, lowers blood glucose concentrations

D

USES:

Type 2 diabetes mellitus, with diet and exercise

CONTRAINDICATIONS:

Dialysis, renal failure (eGFR <30 mL/min/1.73 m^2) or ESRD (dialysis), hypersensitivity, breastfeeding, diabetic ketoacidosis, active bladder cancer

Precautions: Pregnancy, children, renal/hepatic disease, hypothyroidism, hyperglycemia, hypotension, bladder cancer, hypercholesterolemia, pituitary insufficiency, type 1 diabetes mellitus, malnutrition, fever, dehydration, adrenal insufficiency, geriatrics, genital fungal infections, hypoglycemia

DOSAGE AND ROUTES

Type 2 diabetes mellitus in combination with diet and exercise

- **Adult: PO** 5 mg daily, increase dose to 10 mg daily in those who require additional glycemic control

Reduction of HF hospitalizations in type 2 diabetes mellitus and established cardiovascular (CV) disease or multiple CV risk factors

- **Adult: PO** 10 mg once daily.

HF with reduced ejection fraction (NYHA class II to IV) to reduce the risk of cardiovascular death and hospitalization for HF

- **Adult: PO** 10 mg once daily

Chronic kidney disease to reduce the risk of sustained eGFR decline, end-stage kidney disease, CV death, and hospitalization for HF in those at risk of disease progression

- **Adult: PO** 10 mg once daily

Renal dose

• **Adult: PO** eGFR ≥45 mL/min/1.73 m^2 no change, eGFR <45 mL/min, do not use

Available forms: Tablets 5, 10 mg

Administer:

PO route

• Once daily in AM without regard to food

• Store at room temperature

SIDE EFFECTS

GI: Pancreatitis, constipation, nausea

GU: Cystitis, candidiasis, urinary frequency, polydipsia, polyuria, increased serum creatinine; renal impairment/failure; infections

INTEG: Photosensitivity, rash, pruritus

META: Hypercholesterolemia, lipidemia, hypoglycemia, hyperkalemia, hypomagnesemia, hypo/hyperphosphatemia

MISC: Bone fractures, hypotension; dehydration; orthostatic hypotension; hypersensitivity; new bladder cancer

PHARMACOKINETICS

91% protein binding, primary excretion in urine, half-life 12.9 hr; primarily metabolized by O-glucuronidation by UGT1A9; minor CYP3A4; Cmax is less than 2 hr

INTERACTIONS

Increase: hypoglycemia—sulfonylureas, insulin, MAOIs, salicylates, fibric acid derivatives, bile acid sequestrates, ACE inhibitors, angiotensin II receptor antagonists, beta-blockers; adjust antidiabetics

Increase or decrease: glycemic control—androgens, lithium, bortezomib, quinolones

Decrease: effect, hyperglycemia—digestive enzymes, intestinal absorbents, thiazide diuretics, loop diuretics, corticosteroids, estrogen, progestins, oral contraceptives, sympathomimetics, isoniazid, phenothiazines, protease inhibitors, atypical antipsychotics, carbonic anhydrase inhibitors, cycloSPORINE, tacrolimus, baclofen

Drug/Lab Test

Increase: Hct, LDL

Decrease: eGFR

NURSING CONSIDERATIONS

Assess:

• **Hypoglycemia** (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating) when used with other agents even though product does not cause hypoglycemia; if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose or, if severe, with IV glucagon; monitor HbA1c, lipid panel, blood glucose, BUN, creatinine; if renal function is reduced, discontinue; monitor volume status, B/P, usually in those with eGFR <60 mL/min/1.73m^2; more frequent in those with poor renal function

• **Necrotizing fasciitis of the perineum:** may occur in both females and males and require surgical intervention; assess perineum for swelling, pain, fever; if present, discontinue and start antibiotics

• **Bone fracture risk:** avoid use in those at increased risk of fractures; renal impairment increases fracture risk

• **Mycotic infections:** increased risk of mycotic infections, especially genital; caution in those with previous infections or in uncircumcised males

• **Hypersensitivity:** discontinue immediately

• **Ketoacidosis:** increased urine/serum ketone levels, may occur without increased glucose levels; may occur more frequently in those with reduced intake of food, fluids, or in serious conditions

• **Renal function:** baseline and periodically; discontinue if renal function is reduced; assess for signs of UTIs (serious)

• **Pregnancy/breastfeeding:** avoid use in pregnancy; do not breastfeed

Evaluate:

• Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait; HbA1c WNL

Teach patient/family:

• The symptoms of hypo/hyperglycemia, what to do about each

• That medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery
• To avoid OTC medications and herbal supplements unless approved by health care provider
• That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
• To carry emergency ID and glucose source
• That blood glucose monitoring and periodic lab tests are required to assess product effect
• That GI side effects may occur
• That there is a risk of renal impairment, dehydration, and bladder cancer
• To report immediately fever, itching, change in urine output, light headedness or feeling faint, other signs of UTI
• To ensure adequate fluid intake to avoid dehydration and/or hypotension; to report symptoms to provider
• **Necrotizing fasciitis of the perineum:** Teach patient to report immediately pain, swelling of perineum, fever
• **Candidiasis (yeast infection):** Have patient report itching, discharge, inflammation, redness, burning; discuss dietary ways of preventing
• **Ketoacidosis:** to report immediately confusion, abdominal pain, fatigue, trouble breathing, nausea, vomiting, food intolerance

⚠ HIGH ALERT

dapagliflozin/saxagliptin (Rx)

(dap′a-gli-floe′zin/sax-a-glip′tin)

Qtern

Func. class.: Oral antidiabetic
Chem. class.: Sodium-glucose cotransporter 2 (SGLT-2) inhibitor/dipeptidyl peptidase-4 (DPP-4) inhibitor antidiabetics

USES: Type 2 diabetes mellitus, with diet and exercise

CONTRAINDICATIONS: Dialysis, renal failure, hypersensitivity, breastfeeding, diabetic ketoacidosis
Precautions: Pregnancy, children, renal/hepatic disease, hypothyroidism, hyperglycemia, hypotension, bladder cancer, hypercholesterolemia, pituitary insufficiency, type 1 diabetes mellitus, malnutrition, fever, dehydration, adrenal insufficiency, geriatrics, genital fungal infections, hypoglycemia

DOSAGE AND ROUTES

Type 2 diabetes mellitus

• **Adult: PO** 10 mg dapagliflozin and 5 mg saxagliptin once daily, taken in the morning, with or without food

Renal dose

• **Adult: PO** eGFR 45 mL/min/1.73 m^2 or more: no change; eGFR <45 mL/min/1.73 m^2: do not start in these patients. In patients currently taking the product, discontinue when eGFR is persistently <60 mL/min/1.73 m^2; eGFR <45 mL/min/1.73 m^2: do not use

Available forms: Tablets 10 mg, 5 mg

DAPTOmycin (Rx)

(dap′toe-mye-sin)

Cubicin Cubicin RF

Func. class.: Antiinfective—miscellaneous
Chem. class.: Lipopeptide

ACTION: Binds to the bacterial membrane and results in a rapid depolarization of the membrane potential, leading to inhibition of DNA, RNA, and protein synthesis

USES: Bacteremia, endocarditis, UTI, complicated skin, skin structure infections caused by *Staphylococcus aureus* (MRSA, MSSA) including methicillin-resistant strains, *Streptococcus agalactiae, Streptococcus dysgalactiae, Enterococcus faecalis* (vancomycin-susceptible strains), *Streptococcus pyogenes* (group A beta-hemolytic), *Staphylococcus aureus, Staphylococcus epidermidis, Corynebacterium jeikeium, Staphylococcus haemolyticus*

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, GI/renal disease, myopathy, ulcerative/CDAD, rhabdomyolysis, eosinophilic pneumonia

DOSAGE AND ROUTES

Complicated skin and skin structure infections

- **Adult: IV INFUSION** 4 mg/kg over ½ hr diluted in 0.9% NaCl, give q24hr × 7-14 days; some indications may use up to 6 mg/kg
- **Child/Adolescent 12 to 17 yrs: IV** 5 mg/kg/dose q 24 hr for up to 14 days
- **Child 7-11 yr: IV** 7 mg/kg/dose q 24 hr for up to 14 days
- **Child 2-6 yr: IV** 9 mg/kg/dose q 24 hr for up to 14 days
- **Child 1 year: IV** 10 mg/kg/dose q 24 hr for up to 14 days

Staphylococcus aureus bacteremia, right-sided infective endocarditis

- **Adult: IV INFUSION** 6 mg/kg daily × 2-6 wk, up to 8-10 mg/kg daily; treatment failures should use another agent

Renal dose

- **Adult: IV INFUSION** CCr <30 mL/min, hemodialysis, CAPD 4 mg/kg q48hr, 6 mg/kg q48hr (bacteremia)

Bacteremia caused by *S. aureus* in children with normal renal function

- **Child 12-17 yr: IV INFUSION** 7 mg/kg q24hr for up to 42 days
- **Child 7-11 yr: IV INFUSION** 9 mg/kg q24hr up to 42 days
- **Child 1-6 yr: IV INFUSION** 12 mg/kg q24hr up to 42 days

Available forms: Lyophilized powder for injection 500 mg/vial; powder for IV infusion 350 mg/vial

Administer:

IV route

- Cubicin RF and Cubicin have different reconstitution and storage methods
- For IV use only; use a 21-gauge or smaller needle for all transfers
- Do not admix
- Cubicin RF is compatible with 0.9% NaCl injection, sterile water for injection, and bacteriostatic water for injection; Cubicin is compatible with 0.9% NaCl injection and LR injection
- Do not use with ReadyMED elastomeric infusion pumps
- Visually inspect for particulate matter and discoloration prior to use

Cubicin RF preparation

Reconstitution

- Reconstitute a 500-mg vial/10 mL of sterile water for injection or bacteriostatic water for injection (50 mg/mL)
- Do NOT reconstitute with saline products
- Transfer the 10 mL of sterile water for injection or bacteriostatic water for injection through the center of the rubber stopper. Point the transfer needle against the inside wall of the vial
- Prior to use, rotate or swirl the vial for a few minutes
- Vials are not preserved and are for single-use only
- *Storage (Vials):* Vials reconstituted with sterile water for injection can be stored for 1 day at room temperature, and vials reconstituted with bacteriostatic water for injection can be stored for 2 days at room temperature. Vials reconstituted with either solution can be stored for 3 days under refrigeration at 36°F to 46°F (2°C to 8°C)
- *Storage (Syringes):* Solutions reconstituted with sterile water for injection are stable in polypropylene syringes with an elastomeric plunger stopper for 1 day at room temperature, and solutions reconstituted with bacteriostatic water for injection are stable in this type of syringe for 2 days at room temperature. Solutions reconstituted with sterile water for injection and bacteriostatic water for injection are stable in this syringe for 3 days and 5 days, respectively, under refrigeration

Dilution:

- **Adults/child 7-17 yr:** Further dilute in 50 mL of 0.9% sodium chloride injection

• **Child 1 to 6 yr:** Further dilute in 25 mL of 0.9% sodium chloride injection

Cubicin preparation

Reconstitution

• To minimize foaming, avoid vigorous agitation or shaking of the vial during or after reconstitution

• Reconstitute the vial with 0.9% NaCl for injection according to the manufacturer's instructions (50 mg/mL)

• Transfer the appropriate volume of 0.9% sodium chloride for injection through the center of the rubber stopper. Point the transfer needle against the inside wall of the vial

• Ensure that all the powder is wetted by gently rotating the vial. Allow the wetted product to stand undisturbed for 10 min. Gently rotate or swirl the vial contents for a few minutes, as needed, to obtain a completely reconstituted solution

• Vials are not preserved and are for single-use only

• **Storage:** The reconstituted solution is stable in the vial for 12 hr at room temperature and up to 48 hr if stored under refrigeration at 35°F to 46°F (2°C to 8°C)

Dilution:

• **Adults/child 7-17 yr:** Further dilute in 50 mL of 0.9% NaCl

• **Child 1-6 yr:** Further dilute in 25 mL of 0.9% NaCl

• **Storage:** Diluted solutions are stable for 12 hr at room temperature or 48 hr under refrigeration

Cubicin RF and Cubicin administration:

• Do not use IV push in children

IV push:

• Give via slow IV push over 2 min

Intermittent IV Infusion:

• **Adult/child 7-17 yr:** Give over 30 min

• **Child 1-6 yr:** Give over 60 min

• If the same IV line is used for sequential infusion of different drugs, flush the line with a compatible IV solution prior to and after daptomycin administration

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin-sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, milrinone, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, niCARdipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PHENobarbital, phenylephrine, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine,

rocuronium, sodium acetate/bicarbonate/citrate/phosphates, succinylcholine, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, insomnia, dizziness
CV: Hypo/hypertension
GI: Nausea, constipation, diarrhea, vomiting, dyspepsia, CDAD, abdominal pain
GU: Nephrotoxicity
HEMA: Anemia
INTEG: Rash, pruritus, injection site reactions
MS: Rhabdomyolysis
RESP: Cough, eosinophilic pneumonia, dyspnea
SYST: Anaphylaxis, DRESS, Stevens-Johnson syndrome, angioedema

PHARMACOKINETICS

Site of metabolism unknown, protein binding 92%, half-life 8.1 hr, 78% excreted unchanged (urine), excreted in breast milk, peak infusion's end, duration 24 hr

INTERACTIONS

• May alter anticoagulant levels—warfarin; monitor PT, INR
Increase: myopathy—HMG-CoA reductase inhibitors
Drug/Lab Test
Increase: CK, AST, ALT, BUN, creatinine, albumin, LDH
Increase/Decrease: glucose
Decrease: alkaline phosphatase, magnesium, phosphate, bicarbonate, Hb/Hct

NURSING CONSIDERATIONS

Assess:
• **Eosinophilic pneumonia:** assess for dyspnea, fever, cough, shortness of breath; if left untreated, can lead to respiratory failure and death
• **DRESS:** Assess for swelling, rash, fever, may lead to organ involvement, discontinue product
• **Nephrotoxicity:** any patient with compromised renal system; toxicity may occur; BUN, creatinine
• **Rhabdomyolysis:** check for myopathy, CPK >1000 U/L (>5 × ULN), discontinue product, muscle pain, weakness; caution if concomitant HMG-CoA reductase inhibitor therapy, consider discontinuation of therapy
• **Bowel function:** assess for diarrhea, fever, abdominal pain; report to prescriber; CDAD may occur
• Monitor I&O ratio: report hematuria, oliguria; nephrotoxicity may occur
• B/P during administration; hypotension/hypertension may occur
• Signs of infection
• **Pregnancy/breastfeeding:** Identify whether pregnancy is planned or suspected; avoid use in pregnancy or breastfeeding, lack of controlled studies
Evaluate:
• Therapeutic response: negative culture, resolution of infection
Teach patient/family:
• About allergies prior to treatment, reaction to each medication
• To report sore throat, fever, fatigue; could indicate superinfection; diarrhea; muscle weakness, pain, shortness of breath
• To avoid driving, hazardous activities until response is known; may cause dizziness
• To avoid breastfeeding, use in pregnancy

daratumumab (Rx)

(dar'a-toom-ue-mab)
Darzalex Faspro
Func. class.: Antineoplastic
Chem. class.: Monoclonal antibody

ACTION: Binds to CD38, thereby inducing apoptosis in tumor cells

USES: For the treatment of multiple myeloma in patients who have received at least 3 prior therapies including a

proteasome inhibitor (PI) and an immunomodulatory agent or who are double refractory to a PI and an immunomodulatory agent

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

• **Adult: IV** 16 mg/kg (actual body weight) weekly on wk 1 to 8 (8 doses), 16 mg/kg every other week on wk 9 to 24 (8 doses), and then 16 mg/kg q4wk starting on wk 25 until disease progression; premedicate 1-3 hr prior to infusion with corticosteroid, oral antipyretic, oral or IV antihistamine

Available forms: Injection 100 mg/5 mL, 400 mg/mL in single-dose vials

Administer

• Visually inspect for particulate matter and discoloration prior to use, solution in single-dose vials is colorless to pale yellow

• Premedication 1-3 hr prior to each infusion with acetaminophen 650-1000 mg PO, diphenhydramine 25-50 mg IV/PO, dexamethasone 20 mg

• If a dose is missed, give as soon as possible and adjust the dosing schedule to maintain the treatment interval

• Initial dilution volume and/or infusion rate differ for first, second, and subsequent infusions; the maximum infusion rate is 200 mL/hr

• Withdraw the needed amount (mL) from the 20-mg/mL vials for the calculated dose (use actual body weight); discard any unused portion left in the vial

• For the first infusion (week 1), dilute the calculated amount in 0.9% NaCl injection to a total infusion bag volume of 1000 mL for a single-dose infusion (16 mg/kg) or 500 mL for split-dose infusions (8 mg/kg). For subsequent infusions, dilute the calculated amount in 0.9% NaCl injection to a total infusion bag volume of 500 mL. Following a single-dose infusion (16 mg/kg), reduce the total infusion bag volume to 500 mL only if there were no grade 1 or higher infusion reactions during the previous week

• Gently invert the bag to mix, do not shake

• Infusion bags/containers must be made of polyvinylchloride (PVC), polypropylene (PP), polyethylene (PE), or polyolefin blend

• *Storage of admixture:* Store at room temperature 59°F to 77°F (15°C to 25°C) for up to 15 hr (includes infusion time) or for up to 24 hr refrigerated 36°F to 46°F (2°C to 8°C), protect from light; allow refrigerated admixtures to warm to room temperature prior to use

• Administer using an infusion-set fitted with a flow regulator and with an inline, sterile, nonpyrogenic, low-protein-binding polyethersulfone filter (pore size of 0.2 or 0.22 micrometer); polyurethane, polybutadiene (PBD), PVC, PP, or PE administration sets must be used

• Do not infuse other drugs concomitantly in the same IV line

• Administer the diluted infusion intravenously at the appropriate infusion rate as follows: ***Week 1 infusion(s):*** start at 50 mL/hr, increase by 50 mL/hr hourly to a max 200 mL/hr; ***Week 2 infusion (following a single 16-mg/kg dose infusion only):*** start at 50 mL/hr, increase by 50 mL/hr hourly to max 200 mL/hr; ***Subsequent infusions:*** start at 100 mL/hr, increase by 50 mL/hr hourly to max 200 mL/hr if there were no grade 1 or higher infusion reactions during the previous week

• Discard unused product

SIDE EFFECTS

CNS: Fever, headache, fatigue, chills
GI: Nausea, vomiting, diarrhea, constipation, anorexia
CV: Hypertension
RESP: Cough, dyspnea, URI, pneumonia
HEMA: Thrombocytopenia, neutropenia, lymphopenia, anemia
EENT: Nasal congestion
MS: Arthralgia, back pain
MISC: Infusion site reactions, herpes zoster reactivation

PHARMACOKINETICS
Onset, peak, duration unknown, half-life 9-27 days

INTERACTIONS
None known

Drug/Lab Test

Decrease: platelets, RBCs, neutrophils, lymphocytes

NURSING CONSIDERATIONS
Assess:

• **Hypersensitivity/bronchospasm:** premedicate prior to infusion to prevent hypersensitivity and bronchospasm, have emergency equipment nearby, reactions may occur for up to 4 hr after conclusion of infusion

• **Thrombocytopenia, neutropenia, lymphopenia:** monitor CBC, platelets periodically; type and cross for blood transfusions prior to infusion, type and cross-match may not be accurate after using product

• **Pregnancy/breastfeeding:** not to use during pregnancy, response is unknown, use contraception during and for 3 mo after last dose; secretion in breast milk is unknown

• **Herpes zoster reactivation:** use antivirals 1 wk prior to infusion and continue for 3 mo after conclusion of therapy

Evaluate:

• Therapeutic response: Slowly, prevention of growth in multiple myeloma

Teach patient/family:

• That bloodwork and continuing labs will be needed

• To report immediately change in breathing, tight chest, wheezing, itching, chills, nausea, vomiting

• To report to all providers the use of this product

• Pregnancy/breastfeeding: To report if pregnancy is planned or suspected or if breastfeeding

daratumumab/hyaluronidase-fihj (Rx)
(dar′a-toom′ue-mab/hye′al-ureon′i-dase)

Darzalex

Func. class.: Antineoplastic

USES:
Multiple myeloma

CONTRAINDICATIONS:
Hypersensitivity, pregnancy, breastfeeding

DOSAGE AND ROUTES
Multiple myeloma (newly diagnosed)

Adult: SUBCUT with lenalidomide and dexamethasone in those ineligible for autologous stem cell transplant: Wk 1-8: daratumumab 1800 mg/hyaluronidase 30,000 units weekly × 8 doses; wk 9-24: daratumumab 1800 mg/hyaluronidase 30,000 units q2wk × 8 doses; wk 25 and thereafter: daratumumab 1800 mg/hyaluronidase 30,000 units q4wk until disease progression or unacceptable toxicity

Adult: SUBCUT with bortezomib, melphalan, predniSONE; in those ineligible for autologous stem cell transplant: wk 1-6: daratumumab 1800 mg/hyaluronidase 30,000 units weekly × 6 doses; wk 7-54: daratumumab 1800 mg/hyaluronidase 30,000 units q3wk × 16 doses; wk 55 and thereafter: daratumumab 1800 mg/hyaluronidase 30,000 units q4wk until disease progression or unacceptable toxicity

Available forms: solution for injection 1800 units-30000 units/15 mL

⚠ HIGH ALERT

darbepoetin alfa (Rx)
(dar′bee-poh′eh-tin)

Aranesp

Func. class.: Colony-stimulating factor

Chem. class.: Recombinant human erythropoietin

ACTION: Stimulates erythropoiesis by the same mechanism as endogenous erythropoietin; in response to hypoxia, erythropoietin is produced in the kidney and released into the bloodstream, where it interacts with progenitor stem cells to increase red cell production

USES: Anemia associated with chronic renal failure in patients on and not on dialysis and anemia in nonmyeloid malignancies for patients receiving coadministered chemotherapy

CONTRAINDICATIONS: Hypersensitivity to hamster protein products, human albumin, polysorbate 80; uncontrolled hypertension; red cell aplasia

Precautions: Pregnancy, breastfeeding, children, seizure disorder, porphyria, hypertension, sickle cell disease; vitamin B_{12}, folate deficiency; chronic renal failure, dialysis; latex hypersensitivity, CABG, angina, anemia

Black Box Warning: HB >11 g/dL, neoplastic disease, MI, stroke, thromboembolic disease

DOSAGE AND ROUTES

Correction of anemia in chronic renal failure

• **Adult: SUBCUT/IV For those on dialysis** 0.45 mcg/kg as a single injection; every week, or 0.75 mcg/kg q2wk; **for those not on dialysis** 0.45 mcg/kg q4wk titrate, max target Hb of 11 g/dL

Anemia due to chemotherapy

• **Adult: SUBCUT** 2.25 mcg/kg/wk or 500 mcg q3wk, start only if Hb <10 g/dL and 2 more months of chemotherapy

Epoetin alfa to darbepoetin conversion

• **Adult: SUBCUT/IV** (epoetin alfa <2500 units/wk) 6.25 mcg/wk; (epoetin alfa 2500-4999 units/wk) 12.5 mcg/wk; (epoetin alfa 5000-10,999 units/wk) 25 mcg/wk; (epoetin alfa 11,000-17,999 units/wk) 40 mcg/wk; (epoetin alfa 18,000-33,999 units/wk) 60 mcg/wk; (epoetin alfa 34,000-89,999 units/wk) 100 mcg/wk; (epoetin alfa >90,000 units/wk) 200 mcg/wk

Available forms: Sol for injection 25, 40, 60, 100, 150, 200, 300, 500 mcg/mL

Administer:

• Transfusions may still be required for anemia, use iron supplements with this product

SUBCUT route

- Do not give intradermally
- Identify latex allergy
- Don't shake, protect from light

IV route

- Without shaking; check for discoloration, particulate matter, do not use if present; do not dilute, do not mix with other products or solutions, discard unused portion
- IV given direct undiluted or bolus into IV tubing or venous line after completion of dialysis; watch for clotting of line
- Adjust dosage every month or more
- Store refrigerated, do not freeze; protect from light

SIDE EFFECTS

CNS: Seizures, headache, dizziness, stroke
CV: *Hypo/hypertension,* cardiac arrest, *angina pectoris,* HF, acute MI, dysrhythmias, chest pain, edema
GI: *Diarrhea, vomiting, nausea, abdominal pain, constipation*
HEMA: Red cell aplasia
MISC: *Infection, fatigue, fever*
MS: *Bone pain, myalgia, limb pain, back pain, arthralgia*
RESP: *Dyspnea, cough, bronchitis*
SYST: Allergic reactions, anaphylaxis

PHARMACOKINETICS

IV: Onset of increased reticulocyte count 2-6 wk; distributed to vascular space; absorption slow and rate limiting; terminal half-life 49 hr (SUBCUT), 21 hr (IV); peak 34 hr; increased Hb levels not observed until 2-6 wk

INTERACTIONS

Increase: darbepoetin alfa effect—androgens

Drug/Lab Test

Increase: WBC, platelets, Hb
Decrease: bleeding time

NURSING CONSIDERATIONS

Assess:

• Symptoms of **anemia:** fatigue, dyspnea, pallor

• **Serious allergic reactions:** rash, urticaria; if anaphylaxis occurs, stop product, administer emergency treatment (rare)

Black Box Warning: Increased risk of death if hemoglobin >11 g/dL: monitor Hb prior to and weekly × 4 wk or after

change in dose and then often after target range has been reached; a rise >1g/dL over 2 wk may increase risks; reduce dose, keep Hb <10 g/dL in chronic kidney disease

Black Box Warning: Renal studies: urinalysis, protein, blood, BUN, creatinine, electrolytes; monitor dialysis shunts; during dialysis, heparin may need to be increased; those with renal dysfunction may be at greater risk of death. Keep Hb <10 g/dL in chronic kidney disease

Black Box Warning: **Blood studies:** ferritin, transferrin monthly; transferrin saturation ≥20%, ferritin ≥100 ng/mL; Hb 2×/wk until stabilized in target range (30%-33%), then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to this agent; iron stores should be corrected prior to beginning therapy; if there is lack of response, obtain folic acid, iron, vitamin B_{12} levels

Black Box Warning: **Neoplastic disease:** breast, non–small-cell lung, head and neck, lymphoid, or cervical cancers, increased tumor progression; use lowest dose to avoid RBC transfusion

- B/P: check for rising B/P as Hb rises; antihypertensives may be needed

Black Box Warning: **CV status:** hypertension may occur rapidly, leading to **hypertensive encephalopathy;** Hb >11 g/dL may lead to stroke, MI, death; do not administer

- I&O; report drop in output to <50 mL/hr
- **Seizures: if Hb is increased by 1 g/dL within 2 wk, institute seizure precautions, decrease dose**
- CNS symptoms: sweating, pain in long bones
- **Dialysis patients:** thrill, bruit of shunts; monitor for circulation impairment
- **Pregnancy/breastfeeding:** Those who become pregnant should register with Amgen's Pregnancy Surveillance Program (800-772-6436), may cause fetal harm

Evaluate:
- Therapeutic response: increase in reticulocyte count, Hb/Hct; increased appetite, enhanced sense of well-being

Teach patient/family:
- To avoid driving or hazardous activity during beginning of treatment
- To monitor B/P, Hb, max Hb 11 g/dL
- To take iron supplements, vitamin B_{12}, folic acid as directed

Black Box Warning: To report to prescriber any chest pain, SOB, swelling/pain in legs, confusion, inability to speak; to comply with treatment regimen

- That menses and fertility may return; to use contraception
- About home administration procedures, if appropriate
- **Seizures:** discuss injury prevention in those who are prone to seizures, may occur if Hb is increased too rapidly, to report immediately if seizures occur
- **Chronic renal failure:** that product does not cure condition, that other treatment regimens should be followed

darifenacin (Rx)

(da-ree-fen′ah-sin)

Enablex

Func. class.: Antispasmodic/GU anticholinergic

Chem. class.: M3 selective receptor antagonist

Do not confuse:
Enablex/Effexor XR

ACTION: Bladder smooth muscle relaxation by decreasing the action of muscarinic receptors, thereby relieving overactive bladder

USES: Urge incontinence, frequency, urgency in overactive bladder

CONTRAINDICATIONS: Hypersensitivity, urinary retention, narrow-angle glaucoma (uncontrolled)

Precautions: Severe hepatic disease (Child-Pugh C), GI/GU obstruction, controlled narrow-angle glaucoma, ulcerative

colitis, myasthenia gravis, moderate hepatic disease (Child-Pugh B), elderly

DOSAGE AND ROUTES

• **Adult: PO** 7.5 mg/day, initially; may increase to 15 mg/day after 14 days if needed

With CYP3A4 inhibitor

• **Adult: PO** max 7.5 mg/day

Hepatic dosage

• **Adult: PO** (Child-Pugh B) max 7.5 mg/day; do not use in severe hepatic disease

Available forms: Tablets, extended release 7.5, 15 mg

Administer:

• Without regard to meals; do not crush, break, chew extended-release tablets

• Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache, confusion, hallucinations, drowsiness

EENT: Blurred vision, dry eyes

GI: Constipation, dry mouth, nausea, dyspepsia

INTEG: Rash, pruritus, skin drying

MISC: Angioedema, flulike symptoms

PHARMACOKINETICS

Peak 7 hr, half-life 12-19 hr, extensively metabolized by CYP2D6, less metabolism in poor metabolizers; some metabolism by CYP3A4, protein binding 98%, duration 24 hr

INTERACTIONS

Increase: level of—digoxin

Increase: anticholinergic effect—anticholinergics

Increase: darifenacin level—CYP3A4 and CYP2D6 inhibitors (ketoconazole, itraconazole, ritonavir)

Increase: levels of—drugs metabolized by CYP2D6 (flecainide, tricyclics)

NURSING CONSIDERATIONS

Assess:

• **Urinary function:** urgency, frequency, retention, incontinence in bladder outflow obstruction

• **Bowel pattern:** constipation, abdominal pain, increase fluids, bulk in diet if constipation occurs

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; cautious use in breastfeeding, excretion is unknown

Evaluate:

• Therapeutic response: decreasing urgency, frequency of urination

Teach patient/family:

• To take without regard to meals; not to crush, break, chew extended-release tablets; not to use other products unless approved by prescriber

• Not to double or skip doses, provide "Patient Information" and ask to read

• To discuss with provider all OTC, Rx, herbals, supplements used

• To store at room temperature

• To avoid breastfeeding; to notify prescriber if pregnancy is planned or suspected

• About anticholinergic symptoms (dry mouth, constipation, dry eyes, heat prostration); not to become overheated

• To avoid hazardous activities until reaction is known; dizziness, blurred vision can occur

• **Angioedema:** to report facial swelling, difficulty swallowing, or large tongue

darolutamide (Rx)

(dar′-oh-loo′-tuh-mide)

Nubeqa

Func. class.: Antineoplastic-hormone

ACTION: Competitively inhibits androgen binding, AR nuclear translocation, and androgen receptor-mediated transcription

USES: Nonmetastatic castration-resistant prostate cancer

DOSAGE AND ROUTES

• **Adults: PO**

600 mg bid until disease progression or unacceptable toxicity

Administer:

• Patient should be receiving a gonadotropin-releasing hormone (GnRH) analog or has had a bilateral orchiectomy

• Give with food

• Have the patient swallow the tablet whole; do not crush or chew

• If a dose is missed, it should be taken as soon as the patient remembers before the next scheduled dose; do not take 2 doses at the same time if a dose is missed

SIDE EFFECTS

CNS: Fatigue
GI: Elevated LFTs, hyperbilirubinemia, diarrhea, nausea
GU: Hot flashes
HEMA: Neutropenia, anemia
MS: MS pain
CV: Hyper/hypotension, heart failure
INTEG: Rash

PHARMACOKINETICS

Use with food, increases bioavailability by 2- to 2.5-fold; protein binding (albumin) 92% for darolutamide, 99.8% active metabolite, keto-darolutamide; half-life 20 hr, 63.4% excreted urine, 32.4% feces (30% unchanged); metabolized by CYP3A4, UGT1A9, and UGT1A1, a BCRP inhibitor, inhibits OATP1B1 and OATP1B3l

INTERACTIONS

Avoid use with CYP3A4, UGT1A9, UGT1A1

NURSING CONSIDERATIONS

Assess:
• **Prostate cancer:** decreasing signs/symptoms of prostate cancer
• **Hepatic/renal disease:** monitor for hepatic and renal involvement
• **Pregnancy:** males with female partners of reproductive potential should avoid pregnancy and use effective contraception during and ≥1 wk after treatment
Evaluate:
Therapeutic response: decreased progression of prostate cancer
Teach patient/family:
• **Pregnancy:** patients with female partners of reproductive potential should avoid pregnancy and use effective contraception during and ≥1 wk after treatment; there is a possibility of infertility

dasatinib (Rx)

(da-si′ti-nib)
Sprycel
Func. class.: Antineoplastic—miscellaneous
Chem. class.: Protein-tyrosine kinase inhibitor

USES: Treatment of accelerated, chronic blast phase CML or acute lymphoblastic leukemia (ALL); chronic phase CML with resistance or intolerance to prior therapy; Philadelphia chromosome–positive CML in chronic phase

CONTRAINDICATIONS: Pregnancy, hypersensitivity

DOSAGE AND ROUTES

Accelerated or myeloid/lymphoid blast phase CML with resistance/intolerance to prior therapy
• **Adult: PO** 140 mg daily titrated up to 180 mg daily in those resistant to therapy
Chronic phase CML with resistance/intolerance to prior therapy
• **Adult: PO** 100 mg daily either AM or PM
Dosage reduction for those taking a strong CYP3A4 inhibitor
• **Adult: PO** 20-40 mg daily
Available forms: Tablets 20, 50, 70, 80, 100, 140 mg

⚠ HIGH ALERT

DAUNOrubicin (Rx)

(daw-noe-roo′bi-sin)
Cerubidine
Func. class.: Antineoplastic, antibiotic
Chem. class.: Anthracycline glycoside

USES: Acute lymphocytic leukemia (ALL), acute myelogenous leukemia (AML)

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, systemic infections, cardiac disease, bone marrow depression

Black Box Warning: IM/SUBCUT use

Precautions: Tumor lysis syndrome, MI, infection, thrombocytopenia, renal/hepatic disease; gout

Black Box Warning: Bone marrow suppression, cardiac disease, extravasation, renal failure, hepatic disease; requires a specialized care setting and an experienced clinician

DOSAGE AND ROUTES

- **Adult <60 yr: IV** 45 mg/m²/day × 3 days, first cycle, then 2 days second cycle
- **Adult ≥60 yr: IV** 30 mg/m²/day × 3 days, then 2 days of subsequent courses in combination, max 400-600 mg/m² total cumulative dose
- **Child ≥2 yr: IV** 25 mg/m²/day depending on cycle weekly in combination; **<2 yr or BSA <0.5** determine on mg/m²/kg basis

Available forms: Injection 5 mg/mL

⚠ HIGH ALERT

daunorubicin/cytarabine (Rx)

(daw-noe-roo′bi-sin/sye-tare′a-been)

Vyxeos

Func. class.: Antineoplastic

USES: For the treatment of newly diagnosed therapy-related AML or AML with myelodysplasia-related changes

DOSAGE AND ROUTES

- **Adult: IV First induction,** 44 mg/m² daunorubicin liposomal and 100 mg/m² cytarabine liposomal over 90 min on days 1, 3, and 5; patients who do not achieve a response may receive a second induction. **Second induction** (given 2-5 wk after first induction cycle), 44 mg/m² daunorubicin liposomal and 100 mg/m² cytarabine liposomal on days 1 and 3. **Consolidation therapy** (given 5-8 wk after start of the last induction), 29 mg/m² daunorubicin liposomal and 65 mg/m² cytarabine liposomal on days 1 and 3. Patients without disease progression or unacceptable toxicity should receive a second cycle of consolidation therapy given 5-8 wk after the start of the previous consolidation

Available forms: Injection (lyophilized cake) 44 mg daunorubicin/100 mg cytarbine (single-dose vial)

D

decitabine/cedazuridine (Rx)

(de-sye′ta-been/sed′az-ure′i-deen)

Inqovi

Func. class.: Antineoplastic, antimetabolite

USES: Treatment of myelodysplastic syndromes (MDSs)

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

- **Adult: PO** 35 mg decitabine/100 mg cedazuridine daily × 5 days of each 28-day cycle, complete at least 4 cycles

Available forms: Tablets 35-100 mg

deferasirox (Rx)

(def-a′sir-ox)

Exjade, Jadence, Jadenu, Jadenu Sprinkle

Func. class.: Heavy-metal chelating agent

USES: Chronic iron overload, transfusion hemosiderosis

CONTRAINDICATIONS: Breastfeeding, children, hypersensitivity, severe renal/hepatic disease, GI hemorrhage

Black Box Warning: Renal failure, GI bleeding/perforation, hepatotoxicity, nephrotoxicity

DOSAGE AND ROUTES

• **Adult and child >2 yr: PO** (Jadenu) Estimated GFR >60 mL/min/1.73 m^2: Initial, 14 mg/kg orally once daily; adjust in increments of 3.5 or 7 mg/kg every 3-6 mo based on clinical response and goals; use lowest effective dose to provide a trend in decreasing ferritin; if not adequately controlled with 21 mg/kg/day (e.g., serum ferritin levels persistently >2500 mcg/L and not decreasing over time), may increase to a max of 28 mg/kg/day; consider dose reduction if serum ferritin falls below 1000 mcg/L at 2 consecutive visits (especially if dose is >17.5 mg/kg/day); if serum ferritin falls below 500 mcg/L, interrupt therapy and monitor monthly
(Exjade) Estimated GFR >60 mL/min/1.73 m^2: Initial, 20 mg/kg orally once daily; adjust in increments of 5 or 10 mg/kg every 3-6 mo based on clinical response and goals; use lowest effective dose to provide a trend in decreasing ferritin; max 40 mg/kg
Available forms: Tablets 90, 180, 360 mg; oral suspension tablets 125, 250, 500 mg; sprinkles 90, 180, 360 mg

⚠ HIGH ALERT

degarelix (Rx)

(day-gah-rel′iks)

Firmagon

Func. class.: Antineoplastic
Chem. class.: GnRH-receptor antagonist

ACTION: Reduces release of gonadotropins and testicular steroidogenesis by reversibly binding to GnRH receptors

USES: Advanced prostate cancer

CONTRAINDICATIONS: Hypersensitivity, QT prolongation, osteoporosis, severe hepatic/renal disease, pregnancy, breastfeeding
Precautions: CV disease, electrolyte abnormalities, geriatric patients

DOSAGE AND ROUTES

• **Adult (male): SUBCUT** 240 mg given as two 120-mg injections (40 mg/mL concentrations); maintenance 80 mg (20 mg/mL concentration) every 28 days, starting 28 days after first dose
Available forms: Injection 80, 120 mg vial
Administer:
• Do not give IV, SUBCUT only
• Use double gloves, gown, aseptic technique during preparation and administration, all safe handling procedures
• Keep vials vertical; do not shake the vials; give reconstituted drug within 1 hr after addition of sterile water for injection
Reconstitution of 120-mg vial (240-mg dose *only*):
• Use two 120-mg vials; repeat for each 120-mg vial: draw up 3 mL of sterile water for injection with a 2-inch, 21-G needle; do not use bacteriostatic water for injection; inject the sterile water slowly, swirl gently; reconstitution can take up to 15 min; avoid turning the vial upside down; repeat with a new vial, needle, and syringe for the second 120-mg dose (total dose = 240 mg)
Reconstitution of 80-mg vial:
• Use 4.2 mL of sterile water for injection with a 2-inch, 21-G needle; do not use bacteriostatic water for injection; inject the sterile water slowly into vial containing 80 mg; swirl gently; reconstitution can take up to 15 min; withdraw 4 mL (20 mg/mL); avoid turning upside down during withdrawal
SUBCUT injection:
• Exchange the reconstitution needle with a 1.25-inch, 27-G needle; remove air bubbles; give in the abdominal region; rotate injection site periodically; use area not exposed to pressure; grasp aspirate before injection; inject the dose SUBCUT; when giving the loading dose of two 120-mg doses, the second dose should be injected at a different site

SIDE EFFECTS

CNS: Chills, dizziness, fatigue, fever, headache, insomnia
CV: Increased QT prolongation, hypotension, hot flashes, hypertension
GI: Diarrhea, constipation, nausea
GU: ED, UTI, gynecomastia, testicular atrophy
INTEG: Injection site reactions, pain at site, redness, swelling
MS: Back pain, decreased bone density

SYST: Hypersensitivity, anaphylaxis, angioedema

PHARMACOKINETICS

Peak 2 days, duration 50 days, half-life 53 days

INTERACTIONS

Increase: QT prolongation—class IA/III antidysrhythmics, methyldopa, metoclopramide, reserpine, avoid using together

Drug/Lab Test

Increase: PSA, LFTs, GGT

Decrease: bone density test

NURSING CONSIDERATIONS

Assess:

- Monitor HbA1c, lipids, B/P prior to initiation and 3-6 mo after
- **QT prolongation:** more common in those taking class IA/III antidysrhythmics, heart failure, congenital long QT syndrome; monitor cardiac status at baseline and often thereafter, include ECG periodically
- **Anaphylaxis, angioedema (rash, trouble breathing):** discontinue treatment and do not restart in serious reactions; assess for rash, dyspnea, wheezing, facial swelling
- Liver function studies, PSA, GGT that may be elevated; bone density that may be decreased; electrolytes; if PSA is elevated, monitor testosterone levels

Evaluate:

- Therapeutic response: decreasing spread, size of tumor

Teach patient/family:

- To notify all prescribers of cardiac disease or use of all cardiac products, irregular pulse, heartbeat
- Side effects and adverse reactions that may occur
- Injection technique if patient/family will be giving product (provide patient information)

delafloxacin (Rx)

(dela-flox′-a-sin)

Baxdela

Func. class.: Antiinfective

Chem. class.: Fluoroquinolone

ACTION: Inhibits bacterial DNA gyrase

USES: For the treatment of acute bacterial skin and skin structure infections

DOSAGE AND ROUTES

- **Adult: PO** 450 mg q12hr × 5-14 days
- **Adult: IV** 300 mg q12hr × 5-14 days

Renal dose: Adult (eGFR 15-29 mL/min/1.73 m²) no change: PO 200 mg q12hr IV then switch to 450 mg PO

Available forms: Injection 300 mg in single-dose vials; tablets 450 mg

CONTRAINDICATIONS

Hypersensitivity to this product or fluoroquinolones, tendon rupture, aortic aneurysm, renal failure, myasthenia gravis, children

Precautions: Pregnancy, breastfeeding, renal disease, CDAD, elderly, transplants, RA, psychiatric disorders

Administer

PO route

- Take without regard to meals, give ≥2 hr prior to or 6 hr after any antacid, multivitamin, or other medication that contains divalent or trivalent cations
- If a dose is missed, take it as soon as possible up to 8 hr prior to the next scheduled dose. If less than 8 hr before next dose, wait until the next scheduled dose

IV route

- Reconstitute the 300-mg vial/10.5 mL of 5% dextrose for injection or 0.9% sodium chloride for injection 300 mg/12 mL (25 mg/mL)
- Shake vigorously until dissolved
- The reconstituted vial must be further diluted
- *Storage:* Reconstituted vials refrigerated at 36°F to 46°F (2°C to 8°C) or at room temperature of 68°F to 77°F (20°C to 25°C) for up to 24 hr. Do not freeze
- Withdraw the needed volume of reconstituted solution per dose, 12 mL for a 300-mg dose and 8 mL for a 200-mg dose
- Dilute the reconstituted solution to a total volume of 250 mL using either 5% dextrose for injection or 0.9% sodium chloride for injection to achieve a concentration of 1.2 mg/mL
- *Storage:* Diluted solutions may be kept refrigerated at 36°F to 46°F (2°C to 8°C) or at room temperature of 68°F to 77°F (20°C to 25°C) for up to 24 hr. Do not freeze

Intermittent IV infusion
- Infuse over 60 min
- Do not administer with any solution containing multivalent cations through the same IV line
- Do not admix with other medications. Flush lines with 5% dextrose for injection or 0.9% sodium chloride for injection prior to and after each infusion if using common IV line

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, anxiety, paresthesia, unusual dreams
CV: Palpitations, sinus tachycardia, hyper/hypotension, flushing, bradycardia
GI: Nausea, vomiting, anorexia, abdominal pain, CDAD
GU: Vaginal candidiasis, renal dysfunction, renal failure
EENT: Blurred vision, tinnitus, oral candidiasis
META: Hypo/hyperglycemia
MS: Myalgia
INTEG: Infusion site reactions
MISC: Hypersensitivity, fungal infections

PHARMACOKINETICS

PO: Onset unknown, peak 1 hr, duration unknown
IV: Onset unknown, peak 1 hr, duration unknown
Half-life PO 4-8½ hr, IV 3.7 hr

INTERACTIONS

Increase: Infection risk—corticosteroids
Decrease: Delafloxacin level—antacids, didanosine
Drug/Lab: Increase: LFTs, CK, alkaline phosphatase, blood glucose
Decrease: Blood glucose

NURSING CONSIDERATIONS

Assess:
- C&S prior to starting treatment, may begin treatment before results are received
- **Infection:** monitor WBC, temperature, vital signs, baseline and periodically

Black Box Warning: Myasthenia gravis: avoid use in these patients, muscle weakness

Black Box Warning: Tendonitis, rupture: monitor for tenderness, weakness, inflammation of tendons, muscles, discontinue at first signs, increased in those >60 yr or taking corticosteroids

Black Box Warning: Peripheral neuropathy: monitor for tingling, burning, pain of extremities

- **CDAD:** Monitor for diarrhea with blood, mucus, abdominal pain, stop product immediately
- **Hypersensitivity:** Assess for rash, pruritus, discontinue immediately
- **Psychiatric disorders:** Assess for hallucinations, psychosis, paranoia, delusions, suicidal thought/behaviors
- **CNS symptoms:** Headache, dizziness, fatigue, insomnia
- Monitor renal, hepatic studies: LFTs, BUN, creatinine

Evaluate:
- Therapeutic response
- C&S negative, decreasing signs or symptoms of infection

Teach patient/family:
- Teach the patient continuing follow-ups and lab work will be needed
- To report diarrhea with blood or mucous, abdominal pain, fever, stop product immediately
- To report if pregnancy is planned or suspected or if breastfeeding
- To report rash, itching, headache, dizziness, fatigue, insomnia
- To report injection site pain, redness, burning

Black Box Warning: To report muscle tenderness, weakness, inflammation to stop immediately

⚠ HIGH ALERT

denosumab (Rx)

(den-oh´sue-mab)

Prolia, Xgeva

Func. class.: Bone resorption inhibitor
Chem. class.: Monoclonal antibody, bone resorption

ACTION: Neutralizes activity of receptor activator nuclear factor kappa-B ligand (RANKL) by binding and blocking its interaction with cell-surface receptors; use of a RANKL inhibitor may reduce bone turnover and decrease tumor burden

USES: **Prolia:** Osteoporosis in postmenopausal women or men at high risk for fractures; increase bone mass in men who are receiving androgen deprivation therapy for prostate cancer and women receiving aromatase inhibitor therapy for breast cancer at high risk for fractures; **Xgeva:** prevention of skeletal-related events in bone metastases from solid tumors

CONTRAINDICATIONS: Hypersensitivity, hypocalcemia, pregnancy
Precautions: Breastfeeding, child/infant/neonate, anemia, coagulopathy, diabetes mellitus, dialysis, eczema, hypoparathyroidism, immunosuppression, latex hypersensitivity, malabsorption syndrome, neoplastic disease, pancreatitis, parathyroid disease, dental/renal/thyroid disease, TB, vitamin D deficiency

DOSAGE AND ROUTES

Osteoporosis in men and postmenopausal osteoporosis (Prolia)
• **Adult female: SUBCUT** 60 mg q6mo
Bone metastases from solid tumors (Xgeva)
• **Adult: SUBCUT** 120 mg q4wk, max 120 mg q4wk
Giant cell tumor (bone) (Xgeva)
• **Adult: SUBCUT** (Xgeva) 120 mg on days 1, 8, and 15, then 120 mg q4wk beginning on day 29
Available forms: Solution for injection 60 mg/mL (Prolia); 120 mg/1.7 mL (Xgeva)
Osteoporosis prophylaxis in men at high risk for bone fractures after receiving androgen deprivation therapy for nonmetastatic prostate cancer and in women at high risk for bone fractures after receiving adjuvant aromatase inhibitor therapy for breast cancer:
• **Adults: SUBCUT** (Prolia) 60 mg q6mo with 1000 mg of calcium and ≥400 units of vitamin D daily
Hypercalcemia of malignancy that is refractory to bisphosphonate therapy:
• **Adults: SUBCUT** (Xgeva) 120 mg on days 1, 8, and 15, then 120 mg q4wk beginning on day 29
Administer:
SUBCUT route
• Give acetaminophen prior to and for 72 hr after to decrease pain
• Do not use if particulate matter or discoloration is present; solution is clear and colorless to slightly yellow with small white/opalescent particles; remove from refrigerator and allow to warm to room temperature (15-30 min)
• **Use of prefilled syringe with needle safety guard:** leave green guard in original position until after use; remove and discard needle cap immediately before injection; give by SUBCUT injection in upper arm/thigh or abdomen; after injection, point needle away from people and slide green guard over needle
• **Use of single-use vials:** use 27-G needle; give in upper arm/thigh or abdomen; do not reinsert needle in vial; discard supplies as appropriate
• Store and use out of direct sunlight/heat; do not freeze; use within 14 days after removal from refrigerator; store unopened containers in refrigerator

SIDE EFFECTS

CNS: Headache, vertigo, fatigue, insomnia
CV: Angina, atrial fibrillation
GI: Abdominal pain, constipation, *diarrhea,* flatulence, GERD, *vomiting, nausea,* pancreatitis
GU: Cystitis
HEMA: Anemia
INTEG: Dermatitis, pruritus
META: Hypercholesterolemia, hypocalcemia, hypophosphatemia
MS: Back, bone pain; MS pain, myalgia, osteonecrosis of the jaw
RESP: Cough, *dyspnea*
SYST: Infection, secondary malignancy, anaphylaxis

PHARMACOKINETICS

Half-life 25.4 days, bioavailability 62%, max serum concentration 3-21 days

INTERACTIONS

Increase: infection, possible—immunosuppressives (except cytarabine liposomal), corticosteroids

Drug/Lab Test

Increase: cholesterol

Decrease: calcium, phosphate

NURSING CONSIDERATIONS

Assess:

- **Acute phase reaction:** fever, myalgia, headache, flulike symptoms for 72 hr after injection; usually resolves after 72 hr
- **Blood tests:** serum calcium, creatinine, BUN, magnesium, phosphate; provide adequate calcium, vitamin D, magnesium
- **Hypocalcemia (may be fatal):** paresthesia, twitching, laryngospasm, Chvostek's and Trouseau's signs; preexisting hypocalcemia should be corrected before treatment; patient with vitamin D deficiency may require higher doses of vitamin D
- **Hypercalcemia:** nausea, vomiting, anorexia, weakness, thirst, constipation, dysrhythmias
- **Dental status:** correct dental complications prior to product use; good oral hygiene should be maintained; if dental work is to be performed, antiinfectives should be given to prevent osteonecrosis of the jaw
- **Infection:** do not start treatment in patients with active infections; infections should be resolved first
- **Pregnancy:** identify whether pregnancy is planned or suspected; women who become pregnant should enroll in Amgen's Pregnancy Surveillance Program (800-772-6436); do not use in pregnancy, breastfeeding

Evaluate:

- Therapeutic response: increased/maintained bone density, decreased calcium levels

Teach patient/family:

- To report hypercalcemic relapse: nausea, vomiting, bone pain, thirst
- To notify prescriber immediately if rash, infection, cramps, twitching occur
- To continue with dietary recommendations, including additional Ca 1000 mg/day and vitamin D ≥400 units (Prolia product labeling)
- That product must be continued or fractures may occur
- To use acetaminophen prior to and for 72 hr after injection to lessen bone pain
- About the purpose of this product and its expected results
- To avoid OTC, Rx medications, and herbs and supplements unless approved by prescriber
- To exercise regularly, stop smoking, and avoid alcohol to maintain bone health
- To inform all health care providers of product use; to avoid dental procedures/surgery if possible; to practice good oral hygiene
- That lab tests and follow-up exams will be required
- **Pregnancy/breastfeeding:** not to use during pregnancy and breastfeeding; to notify prescriber if pregnancy is planned, suspected; to use contraception during and for (Xgeva) 5 mo after completion of therapy; that males should use contraception if partner is pregnant

deoxycholic acid (Rx)

(dee-ox′-i-koe′-lik as′-id)

Belkyra, Kybella

Func. class.: Cytolytic agent

USES: For improvement in the appearance of moderate to severe convexity or fullness associated with submental fat

CONTRAINDICATIONS: Infection

DOSAGE AND ROUTES

- **Adult: SUBCUT** 0.2 mL per injection site. A single treatment consists of up to a max of 50 injections (10 mL total dose), with each injection spaced 1 cm apart. Up to 6 single treatments may be given at intervals of no less than 1 mo. Injections are made into the subcutaneous fat of the submental region, between the dermis and the platysma.

Available forms: Injection 10 mg/mL (2-mL single-use vials)

desipramine (Rx)

(dess-ip′ra-meen)
Func. class.: Antidepressant, tricyclic
Chem. class.: Dibenzazepine, secondary amine

Do not confuse:
desipramine/disopyramide

ACTION: Blocks reuptake of norepinephrine, serotonin into nerve endings, thereby increasing action of norepinephrine, serotonin in nerve cells

USES: Depression

CONTRAINDICATIONS: Hypersensitivity to tricyclics, carBAMazepine, closed-angle glaucoma, acute MI, MAOIs
Precautions: Pregnancy, breastfeeding, geriatric patients, severe depression, increased intraocular pressure, seizure disorder, CV disease, urinary retention, cardiac dysrhythmias, cardiac conduction disturbances, family history of sudden death, prostatic hypertrophy, thyroid disease

Black Box Warning: Children <18 yr, suicidal patients

DOSAGE AND ROUTES

- **Adult: PO** 50-75 mg/day in 1-4 divided doses; titrate by 25-50 mg weekly up to 300 mg/day in single or divided doses (inpatient), 200 mg/day (outpatient)
- **Geriatric: PO** 25 mg/day at bedtime, titrate weekly; may increase to 150 mg/day
- **Adolescent: PO** 25-50 mg/day in divided doses; max 150 mg/day
- **Child 6-12 yr: PO** 1-3 mg/kg/day in divided doses; max 5 mg/kg/day

Available forms: Tablets 10, 25, 50, 75, 100, 150 mg
Administer:

- Increased fluids, bulk in diet for constipation, especially in geriatric patients; with food or milk for GI symptoms; crushed if patient is unable to swallow medication whole; without regard for food
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once-daily dosing

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, fatigue, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, paresthenia, suicidal ideation, impaired memory, seizures, serotonin syndrome
CV: *Orthostatic hypotension,* ECG changes, *tachycardia, hypertension,* palpitations
EENT: *Blurred vision,* tinnitus, mydriasis, ophthalmoplegia
ENDO: SIADH
GI: *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, weight gain
GU: *Retention,* dereased libido
HEMA: Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
INTEG: Rash, urticaria, sweating, pruritus, photosensitivity

PHARMACOKINETICS

Well absorbed, widely distributed, protein binding 92%, extensively metabolized in the liver (CYP2D6) to active metabolite of imipramine; some patients are poor metabolizers; half-life 15-60 hr

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists, other tricyclic antidepressants
Increase: CNS depression—alcohol, barbiturates, opioids, CNS depressants, skeletal muscle relaxants
Increase: desipramine level—cimetidine, dilTIAZem, fluvoxaMINE, FLUoxetine, PARoxetine, sertraline, verapamil
Increase: life-threatening B/P elevations—cloNIDine; do not use concurrently

Increase: hypertension—EPINEPHrine, norepinephrine
Increase: hyperpyrexia, seizures, excitation; do not use within 14 days of MAOIs
Increase: QT interval—tricyclics, SUNItinib, vorinostat, ziprasidone, gatifloxacin, levoFLOXacin, moxifloxacin, sparfloxacin, class IA/III antidysrhythmics, linezolid, methylene blue

Drug/Herb
Increase: serotonin syndrome—St. John's wort, SAM-e, yohimbe; avoid concurrent use
Increase: CNS depression—kava, valerian

Drug/Lab Test
Increase: serum bilirubin, blood glucose, alkaline phosphatase, LFTs

NURSING CONSIDERATIONS

Assess:
- **Pain:** characteristics, including locations, intensity, alleviating factors, prior to and periodically
- **CV:** B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS, ECG in cardiac patients
- **Hepatic studies:** AST, ALT, bilirubin; thyroid function studies; monitor blood glucose and cholesterol in those who are overweight
- Weight weekly, BMI initially and periodically; appetite may increase with product
- **EPS** primarily in geriatric patients: rigidity, dystonia, akathisia
- **Seizure activity** in those with a history of seizures; may be prior to cardiac events

Black Box Warning: Depression: monitor mental status: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms (depression, panic); this product is not indicated for children; monitor mental status baseline and during first few months of treatment

- Urinary retention, constipation; constipation most likely in children
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly
- **Beers:** avoid in older adults with delirium or at high risk for delirium; assess for confusion; highly anticholinergic
- **Pregnancy/breastfeeding:** no well-controlled studies, use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: decreased depression

Teach patient/family:
- That therapeutic effects may take 2-3 wk

Black Box Warning: That suicidal thoughts/behaviors may occur; to notify prescriber immediately

- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol, other CNS depressants
- Not to discontinue medication abruptly after long-term use because this may cause nausea, headache, malaise
- To wear sunscreen or large hat because photosensitivity occurs

TREATMENT OF OVERDOSE:

ECG monitoring; lavage; administer anticonvulsant

desloratadine (Rx)

(des'lor-at'ah-deen)

Aerius ✱, Aerius Kids ✱, Allergy Control ✱ Clarinex, Clarinex RediTabs

Func. class.: Antihistamine, second generation

Chem. class.: Selective histamine (H_1)-receptor antagonist

ACTION: Binds to peripheral histamine receptors, thus providing antihistamine action without sedation

USES: Seasonal/perennial allergic rhinitis, chronic idiopathic urticaria, pruritus

CONTRAINDICATIONS: Hypersensitivity, infants/neonates

Precautions: Pregnancy, breastfeeding, child, asthma, renal/hepatic impairment, phenylketonuria

DOSAGE AND ROUTES

- **Adult and child ≥12 yr: PO** 5 mg/day
- **Child 6-11 yr: PO** 2.5 mg/day
- **Child 2-5 yr: PO** 1.25 mg/day
- **Child 6-11 mo: PO** 1 mg/day (urticaria only)

Hepatic/renal dose

- **Adult: PO** 5 mg every other day

Available forms: Tablets 5 mg; orally disintegrating tablets 2.5, 5 mg (RediTabs); oral solution 0.5 mg/mL

Administer:

- Without regard to meals
- Do not remove RediTabs from blister until ready to use
- RediTabs directly on tongue; may take with or without water
- Use calibrated device for syrup

SIDE EFFECTS

CNS: Sedation (more common with increased doses), headache, psychomotor hyperactivity, seizures, fatigue, dizziness

GI: Hepatitis, nausea, dry mouth

MISC: Flulike symptoms, pharyngitis, myalgias

PHARMACOKINETICS

Onset antihistamine effect 1 hr, peak 1½ hr, elimination half-life 8½-28 hr, metabolized in liver to active metabolites, excreted in urine

INTERACTIONS

Increase: CNS depression (rare)—alcohol, opiates, sedative/hypnotics, H_1 blockers, antipsychotics, tricyclic antidepressants, anxiolytics

Increase: desloratadine—nilotinib, etravirine

NURSING CONSIDERATIONS

Assess:

- **Allergy:** hives, rash, rhinitis; monitor respiratory status; stop product 4 days prior to antigen skin test
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected; use only if benefits outweigh fetal risk; avoid breastfeeding, excretion unknown

Evaluate:

- Therapeutic response: absence of running or congested nose, other allergy symptoms

Teach patient/family:

- To avoid driving, other hazardous activities if drowsiness occurs; to use caution until product's effects are known
- That product may cause photosensitivity; to use sunscreen or stay out of the sun to prevent burns
- Not to exceed max dose, to take without regard to meals
- To use RediTab by removing from pack and allowing to dissolve on tongue, without regard to water

D

desmopressin (Rx)

(des-moe-press′in)

DDAVP, Nocdurna, Octostim, Stimate

Func. class.: Pituitary hormone

Chem. class.: Synthetic antidiuretic hormone

ACTION: Promotes reabsorption of water by action on renal tubular epithelium; causes smooth muscle constriction, increase in plasma factor VIII levels, which increases platelet aggregation, thereby resulting in vasopressor effect; similar to vasopressin

USES: Hemophilia A, von Willebrand's disease type 1, nonnephrogenic diabetes insipidus, symptoms of polyuria/polydipsia caused by pituitary dysfunction, nocturnal enuresis, nocturia

Unlabeled uses: Uremic bleeding

CONTRAINDICATIONS: Hypersensitivity, nephrogenic diabetes insipidus, severe renal disease, loop diuretics or systemic/inhaled glucocorticosteroids (nocturia)

Black Box Warning: Hyponatremia

Precautions: Pregnancy, breastfeeding, coronary artery disease, hypertension, cystic fibrosis, thrombus, electrolyte imbalances, male infertility

DOSAGE AND ROUTES

- **PO** is 10-20× greater effect than nasal
- **Child:** Evening dose is 2× higher than daytime to provide sufficient antidiuresis during the night

Primary nocturnal enuresis

- **Adult/child ≥6 yr: PO** 20 mcg at bedtime, max 0.6 mg at bedtime; **INTRANASAL** 0.2 mL at bedtime, half in each nostril

Diabetes insipidus

- **Adult: INTRANASAL** 10-40 mcg in divided doses (1-4 sprays with pump); **PO** Initially 0.05 mg bid, adjust based on diurnal pattern of response; usual range (0.1-1.2 mg)/day in 2-3 divided doses **IV/SUBCUT** 2-4 mcg/day or **SUBCUT** in 2 divided doses
- **Child 3 mo to 12 yr: INTRANASAL** 5-30 mcg/day in divided doses

Hemophilia/von Willebrand's disease

- **Adult/child >3 mo: IV** 0.3 mcg/kg in 0.9% NaCl over 15-30 min; may repeat if needed
- **Adult/child >11 mo: NASAL SPRAY** 300 mcg (1 spray in each nostril); give 2 hr prior to surgery

Antihemorrhagic

- **Adult/child >3 mo: IV/SUBCUT** 0.2-0.4 mcg/kg/dose
- **Adult/child <50 kg: INTRANASAL** 1 spray in 1 nostril
- **Adult/child >50 kg: INTRANASAL** 1 spray in each nostril

Nocturia

- **Adult 50-64 yr: INTRANASAL** 1 spray in 1 nostril 30 min before going to bed (not at increased risk for hyponatremia); **women SL** 27.7 mcg 1 hr prior to bedtime with no water; **men** 55.3 mcg 1 hr prior to bedtime with no water

Uremic bleeding (unlabeled)

- **Adult: SUBCUT/IV** 0.3-0.4 mcg/kg as a single injection

Available forms: Injection 4 mcg/mL, tablets 0.1, 0.2 mg; nasal spray pump (DDAVP) 10 mcg/spray (0.1 mg/mL); nasal spray (Stimate) 1.5 mg/mL (150 mcg/dose); tablets (SL) 27.7, 55.3 mcg

Administer:

PO route

- Store at room temperature

SL: Keep under tongue to dissolve; limit fluids at night 1 hr prior to 8 hr after use, avoid caffeine/alcohol before bed

SUBCUT route

- Rotate sites

Nasal route

- DDAVP and Stimate are not interchangeable
- Prime before first dose (press down 4 times), pump stays primed for 1 wk; to reprime, press down 1 time
- **Nocturia:** do not shake bottle, prime by pumping 5 times into the air away from the face; if not used for >3 days, reprime with 2 actuations, have patient blow nose, tilt head back slightly, close nostril, inhale while pumping 1 time, wipe applicator and replace cap

Direct IV route

- Undiluted over 1 min for diabetes insipidus

Intermittent IV INFUSION route

- Diluted single dose/50 mL of 0.9% NaCl **(adult and child >10 kg),** single dose/10 mL in child <10 kg; give as IV infusion over 15-30 min; monitor B/P and pulse during infusion
- Store in refrigerator

SIDE EFFECTS

CNS: Drowsiness, headache, lethargy, flushing, seizures

CV: Increased B/P, palpitations, tachycardia

EENT: Nasal irritation, congestion, rhinitis

GI: Nausea, heartburn, cramps

GU: Vulval pain

META: Hyponatremia, hyponatremia-induced seizures

SYST: Anaphylaxis (IV)

PHARMACOKINETICS

PO: Onset 1 hr, peak 4-7 hr

INTRANASAL: Onset 1 hr; peak 1-4 hr; duration 8-20 hr

IV: Onset 1 min, peak ½ hr, duration >3 hr Half-life 1.4-3.8 hr (eGFR >50 mL/min/1.73m^2) (PO)

INTERACTIONS

Increase: adverse reactions—carBAMazepine, chlorproPAMIDE, clofibrate, SSRIs, lamotrigine

Black Box Warning: Increase: hyponatremia—loop diuretics, inhaled glucocorticosteroids, do not use together in nocturia

Increase: pressor effect—pressor products, monitor
Decrease: antidiuretic action—lithium, alcohol, demeclocycline, heparin, large doses of EPINEPHrine

NURSING CONSIDERATIONS

Assess:
- Pulse, B/P when giving IV or SUBCUT
- Renal studies: BUN/creatinine, serum sodium, urine osmolality, I&O ratio, weight daily; check for edema in extremities; if water retention severe, diuretic may be prescribed
- **Water intoxication:** lethargy, behavioral changes, disorientation, neuromuscular excitability
- **Intranasal use:** nausea, congestion, cramps, headache; usually decreased with decreased dose; for nasal mucosa changes: congestion, edema, discharge, scarring (nasal route)
- For severe allergic reaction, including anaphylaxis (IV route); notify prescriber, discontinue use
- **Nocturnal enuresis:** identify how often enuresis is occurring; avoid use in those prone to water intoxication or sodium depletion

Black Box Warning: Hyponatremia: assess for conditions that can cause hyponatremia (fluid/electrolyte imbalances, loop diuretics/inhaled glucocorticosteroids, severe diarrhea, infections); monitor sodium levels baseline, 7 days, 30 days after start of treatment (nocturia)

- **Diabetes insipidus:** urine volume/osmolality and plasma osmolality; monitor for dry skin, poor turgor, thirst (dehydration)
- **Hemophilia/von Willebrand's disease:** factor VIII coagulant activity, bleeding time prior to using for hemostasis; assess for bleeding, frank and occult
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; use caution in breastfeeding, excretion is unknown
- **Beers:** avoid for treatment of nocturia or nocturnal polyuria; high risk of hyponatremia

Evaluate:
- Therapeutic response: absence of severe thirst, decreased urine output, decreased osmolality

Teach patient/family:
- About the proper technique for nasal instillation: to insert tube into nostril to instill product, clear nasal passage before use
- To avoid OTC products (cough, hay fever) because these preparations may contain EPINEPHrine, decrease product response; not to use with alcohol because adverse reactions may occur
- To wear emergency ID specifying therapy
- That if dose is missed, to take when remembered up to 1 hr prior to next dose; not to double dose; to avoid fluids from 1 hr to up to 8 hr after PO dose
- To report upper respiratory infection, nasal congestion to prescriber
- How to use SUBCUT, rotate sites

desonide topical

See Appendix B

desoximetasone (Rx)

(dess-ox'ee-met'ah-sone)

Topicort, Topicort Spray

Func. class.: Corticosteroid, topical

ACTION: Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES: Inflammation/itching of corticosteroid-responsive dermatoses on the skin; spray—plaque psoriasis

CONTRAINDICATIONS: Hypersensitivity, use of some preparations on face, axilla, groin, intertriginous areas; monotherapy in primary bacterial infection, TB

Precautions: Pregnancy, breastfeeding, children, skin infections, Cushing's syndrome

DOSAGE AND ROUTES

Dermatosis (except spray)

- **Adult/child >10 yr:** Apply to affected areas 2 times/day

Plaque psoriasis (spray)

Adult: Spray, apply to affected areas, rub gently bid for ≤4 wk

Available forms: Cream 0.05%, 0.25%; ointment 0.05%, 0.25%; gel 0.05%; spray 0.25%

Administer:

Topical route

- Do not use with occlusive dressings
- **Cream/ointment/lotion:** apply sparingly in a thin film and rub gently into the cleansed affected area
- **Gel:** apply sparingly in a thin film and rub gently into the cleansed affected area
- **Spray:** discard after 30 days; keep away from heat/flame; store at room temperature

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration

MISC: Hyperglycemia, glycosuria, systemic absorption, hypothalamic-pituitary-adrenal (HPA) axis suppression, Cushing's syndrome

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning, pruritus, folliculitis, dermatitis
- **Systemic absorption:** HPA suppression and possible adrenocortical insufficiency after stopping treatment
- **Pregnancy/breastfeeding:** if pregnancy is planned or suspected; no well-controlled studies; use only if benefit outweighs fetal risk; caution use in breastfeeding; do not apply to breast

Evaluate:

- Decrease in itching, inflammation on the skin

Teach patient/family:

Topical route

- Not to use with occlusive dressings
- **Cream/ointment/lotion:** apply sparingly in a thin film and rub gently into the cleansed affected area
- **Gel:** apply sparingly in a thin film and rub gently into the cleansed affected area
- **Spray:** discard after 30 days; keep away from heat/flame; store at room temperature

desvenlafaxine (Rx)

Khedezla, Pristiq

Func. class.: Antidepressant

Chem. class.: Serotonin-receptor norepinephrine reuptake inhibitor (SNRI)

Do not confuse:

Pristiq/Prilosec

ACTION: May work by blocking the central presynaptic reuptake of 5-HT and NE, resulting in an increased sustained level of these neurotransmitters

USES: Major depressive disorder

Unlabeled uses: Vasomotor symptoms (hot flashes) associated with menopause

CONTRAINDICATIONS: Hypersensitivity to this product or venlafaxine, MAOI therapy

Precautions: CNS depression, abrupt discontinuation, hypertension, hepatic/renal disease, hyponatremia, geriatric patients, pregnancy, labor and delivery, breastfeeding, angina, bleeding, cardiac dysrhythmias, MI, stroke, mania, hypovolemia, dehydration, increased intraocular pressure, anticoagulant therapy, bipolar disorder

Black Box Warning: Children, suicidal ideation

DOSAGE AND ROUTES

Major depressive disorder

• **Adult: PO** Initially, 50 mg/day; max 400 mg/day with adjustments as needed

Reduction of hot flash frequency/ severity in women with natural or medically induced menopause (unlabeled)

• **Adult: PO** 25-150 mg/day, max 200 mg/day

Renal/hepatic dose

• **Adult: PO** CCr 30-50 mL/min 50 mg daily; CCr <30 mL/min or end-stage renal disease 50 mg every other day; moderate to severe hepatic disease, max 100 mg/day

Available forms: Extended-release tablets 25, 50, 100 mg

Administer:

• Without regard to food; food may minimize GI symptoms

• Extended-release tablet: do not crush, break, or chew

• Store at room temperature

SIDE EFFECTS

CNS: *Dizziness,* drowsiness, *headache*, tremor, paresthesias, asthenia, suicidal thoughts/behaviors, seizures, fatigue, chills, yawning, hot flashes, flushing, *irritability*, *insomnia*, *anxiety, abnormal dreams, fatigue*

CV: Palpitations, sinus tachycardia, increased B/P, orthostatic hypotension

EENT: Blurred vision, mydriasis, tinnitus, bruxism

GI: *Nausea,* xerostomia, *diarrhea*, constipation, vomiting, anorexia, weight loss, dysgeusia, hypercholesterolemia, hypertriglyceridemia

GU: Urinary retention/hesitancy, orgasm dysfunction, decreased libido, impotence, proteinuria

HEMA: Impaired platelet aggregation

INTEG: Photosensitivity, hyperhidrosis, diaphoresis, rash

SYST: Serotonin syndrome, neuroleptic malignant syndrome–like symptoms, toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, angioedema; neonatal abstinence syndrome (fetal exposure)

PHARMACOKINETICS

Protein binding 30%, elimination half-life 11 hr; elimination half-life is increased (hepatic/renal disease)

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome–like reactions—SSRIs, other SNRIs, serotonin receptor agonists (almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, SUMAtriptan, ZOLMitriptan), tricyclics, traZODone, sibutramine, ergots, lithium, nefazodone, meperidine, phentermine, MAOIs, dextromethorphan, linezolid, promethazine, methylphenidate, dexmethylphenidate, mirtazapine, pentazocine, tryptophan, methylene blue IV; do not administer concurrently

Increase: bleeding risk—salicylates, thrombolytics, NSAIDs, platelet inhibitors, anticoagulants

Increase: CNS depression—alcohol, opioids, antihistamines, sedatives/hypnotics

Increase: hallucinations, delusions, disorientation—zolpidem

Drug/Herb

Increase: desvenlafaxine action—kava, valerian

Drug/Lab Test

Increase: cholesterol, triglycerides

False positive: amphetamine, phencyclidine

Decrease: sodium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Suicidal thoughts/behaviors: mental status and mood; identify suicidal ideation

• **Serious skin reactions:** assess during and after treatment; discontinue product immediately if rash develops

• **Serotonin syndrome, neuroleptic malignant syndrome–like symptoms:** assess for nausea/vomiting, sedation, dizziness, diaphoresis (sweating), facial flush, hallucinations, mental status changes, myoclonia, restlessness, shivering, elevated B/P, hyper-

thermia, muscle rigidity, autonomic instability, mental status changes; if serotonin syndrome occurs, discontinue desvenlafaxine and any other serotonergic agents

- Monitor B/P baseline and periodically during treatment, lipid levels, signs of glaucoma
- Appetite and nutritional intake; weight loss is common, change diet as needed to support weight
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; discontinue breastfeeding or product, excreted in breast milk

Evaluate:

- Decreased depression, increased sense of well-being, renewed interest in activities

Teach patient/family:

- To take as directed, not to double or skip doses; if a dose is missed, take as soon as remembered unless close to next dose; do not discontinue abruptly, decrease gradually

Black Box Warning: To report immediately suicidal thoughts/behaviors; have family members look for symptoms of suicidal ideation

- Not to operate machinery or engage in hazardous activities until reaction is known, may cause dizziness, drowsiness
- To avoid all other products unless approved by prescriber
- To report if pregnancy is planned or suspected or if breastfeeding
- **Serious skin reactions:** to report immediately allergic reactions, including rash, hives, difficulty breathing, or swelling of face, lips
- **Serotonin syndrome, neuroleptic malignant syndrome:** to report immediately nausea/vomiting, sedation, dizziness, sweating, facial flush
- That continuing follow-up exams will be needed; that low sodium levels may occur, to watch for headache, confusion, weakness

deutetrabenazine (Rx)

(du-tet-ra-BEN-a-zeen)

Austedo

Func. class.: Central monoamine-depleting agent

USES: For the treatment of chorea associated with Huntington's disease and tardive dyskinesia

CONTRAINDICATIONS

Hypersensitivity, hepatic disease, MAOIs

Black Box Warning: Suicidal ideation

DOSAGE AND ROUTES

- **Adult (treatment naïve; not switching from tetrabenazine): PO** Initially, 6 mg/day; increase at weekly intervals by increments of 6 mg/day to a max of 48 mg/day; doses >12 mg should be divided throughout the day
- **Adult (switching from tetrabenazine): PO** Discontinue tetrabenazine and start deutetrabenazine the next day. Use 6 mg/day for patients taking tetrabenazine 12.5 mg/day

Available forms: Tablets 6, 9, 12 mg

dexamethasone (Rx)

(dex-ah-meth'a-sone)

Decadron, Hemady

dexamethasone sodium phosphate (Rx)

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid, long acting

ACTION: Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability and lysosomal stabilization, suppresses normal immune response, no mineralocorticoid effects

USES: Inflammation, allergies, neoplasms, cerebral edema, septic shock, collagen disorders, dexamethasone

suppression test for Cushing syndrome, adrenocortical insufficiency, TB, meningitis, acute exacerbations of MS

CONTRAINDICATIONS: Hypersensitivity to corticosteroids, sulfites, or benzyl alcohol; fungal infections, abrupt discontinuation, coagulopathy, ulcerative colitis, seizure disorders

Precautions: Pregnancy, breastfeeding, diabetes mellitus, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, peptic ulcer, esophagitis, recent MI, hypertension, TB, active hepatitis, psychosis, sulfite hypersensitivity, thromboembolic disorders

DOSAGE AND ROUTES

Inflammatory condition/neoplasias

- **Adult: PO** 0.75-9 mg/day in divided doses q6-12hr or phosphate **IM** 0.5-9 mg/day divided q6-12hr
- **Child: PO** 0.024-0.34 mg/kg/day in divided doses q6-12hr

Anaphylactic shock

- **Adult: IV** (phosphate) single dose 1-6 mg/kg or **IV** 40 mg q2-6hr as needed up to 72 hr

Airway edema/extubation

- **Adult: PO/IM/IV** 0.5-2 mg/kg/day divided q6hr; use 24 hr before extubation and use for 24 hr after extubation

Chemotherapy-induced vomiting

- **Adult: PO/IV** 10-20 mg 15-30 min prior to chemotherapy or 10 mg q12hr on each treatment day
- **Child: IV** 5-20 mg 15-30 min prior to chemotherapy

Cerebral edema

- **Adult: IV** (phosphate) 10 mg, then 4-6 mg **IM** q6hr × 2-4 days, then taper over 1 wk
- **Child:** loading dose 1-2 mg/kg **(PO/IM/IV)**, then 1-1.5 mg/kg/day, max 16 mg/day divided q4-6hr for 2-4 days, then taper down weekly

Cushing syndrome (suppression test)

Adult: PO 0.5 mg q6hr × 48 hr (after determining 24-hr 17 hydroxycorticosteroids urine level); repeat urine collection to determine levels during 24 hr or 1 mg at 11 PM and draw plasma cortisol at 8 AM next morning

Palliative management of recurrent or inoperable brain tumors

- **Adult: IM/IV** 2 mg bid-tid (maintenance)

Adrenocortical insufficiency

- **Adult: PO** 0.75-9 mg/day in divided doses
- **Child: PO** 0.03-0.3 mg/kg/day in 2-4 divided doses

Intraarticular/intralesional

Adult: PO 0.2-6 mg daily to q3days, depends on condition

Available forms: Tablets 0.5, 0.75, 1, 1.5, 2, 4, 6 mg; oral solution 0.5 mg/5 mL; elixir 0.5 mg/5 mL, oral concentrate 1 mg/mL; injection 4 mg/mL, 10 mg/mL

Administer:

PO route

- Titrated dose; use lowest effective dose
- With food or milk to decrease GI symptoms, give once daily in AM for less toxicity, fewer adverse reactions

IM route

- IM injection deeply in large muscle mass; rotate sites; avoid deltoid; use 21-G needle
- In 1 dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue

Intra-articular/intralesional route

- Use rarely, as injections may damage joints

Direct IV route (sodium phosphate)

- Undiluted direct over ≥1 min

Intermittent IV INFUSION route

- Diluted with 0.9% NaCl or D_5W, give as IV infusion at prescribed rate

Continuous IV infusion

- Change IV solution q24hr

Y-site compatibilities: Acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, caffeine, CARBOplatin, carmustine, ceFAZolin, cefepime, cefmetazole, cefonicid,

cefotaxime, cefoTEtan, cefOXitin, cefpirome, ceftaroline, cefTAZidime, ceftizoxime, cefTRIAXone, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexmedetomidine, digoxin, diltiazem, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, foscarnet, furosemide, ganciclovir, gatifloxacin, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, liposome, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methicillin, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, morphine, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxyCODONE, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, penicillin G potassium/sodium, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, topotecan, trastuzumab, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Depression,* headache, mood changes, euphoria, pseudotumor cerebi, seizures
CV: *Hypertension*
EENT: Increased intraocular pressure, cataracts
ENDO: HPA suppression, hyperglycemia, sodium, fluid retention, pheochromocytoma
GI: *Nausea,* peptic ulceration, vomiting, weight gain
INTEG: Acne, poor wound healing, ecchymosis, petechiae, hirsutism
META: Hypokalemia, fluid retention, hypokalemic alkalosis
MS: Fractures, osteoporosis, weakness, arthralgia, myopathy

PHARMACOKINETICS

Half-life 1-2 days
PO: Onset 1 hr, peak 1-2 hr, duration 2½ days
IM: Onset 1 hr, peak 1 hr, duration 2 days-3 wk
IV: Onset 1 hr, peak 1 hr, duration varies

INTERACTIONS

Increase: toxicity—cycloSPORINE, monitor closely
Increase: side effects—alcohol, salicylates, amphotericin B, digoxin, cycloSPORINE, diuretics, NSAIDs, monitor closely
Increase: dexamethasone action—salicylates, estrogens, hormonal contraceptives, ketoconazole, macrolide antiinfectives, NSAIDs
Increase: tendinitis, tendon rupture risk—quinolones
Decrease: effect of—antidiabetics, insulin dose may need to be increased
Decrease: dexamethasone action—cholestyramine, colestipol, barbiturates, rifAMPin, phenytoin, theophylline, antacids, bosentan, carBAMazepine
Decrease: anticoagulant effect—anticonvulsants, antidiabetics, isoniazid, toxoids, anticholinesterases, salicylates
Decrease: potassium levels—thiazide/loop diuretics, amphotericin B

Decrease: antibody response—vaccines, avoid using concurrently

Drug/Herb

Decrease: dexamethasone action—echinacea, avoid using together

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose

Decrease: calcium, potassium, T_4, T_3, thyroid ^{131}I uptake test

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood, urine glucose while receiving long-term therapy; hypo/hyperglycemia, weight daily; notify prescriber of weekly gain >5 lb, B/P, pulse; notify prescriber of chest pain
- I&O ratio; be alert for decreasing urinary output, increasing edema
- **Cerebral edema:** LOC and headache, baseline and periodically
- **Adrenal insufficiency:** weight loss, nausea, vomiting, anorexia, confusion, decreased B/P, baseline and periodically
- **Epidural injections (unlabeled):** may cause rare events (vision loss, paralysis, stroke, death)
- **Cushingoid symptoms:** assess for buffalo hump, moon face, increased B/P; monitor plasma cortisol levels during long-term therapy (normal: 138-635 nmol/L SI units when drawn at 8 AM); prolonged use can cause cushingoid symptoms
- **Infection:** fever, WBC even after withdrawal of medication; product masks infection
- **Potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Edema, hypertension, cardiac symptoms
- **Mental status:** affect, mood, behavioral changes, aggression
- **Abrupt withdrawal:** acute adrenal insufficiency and death may occur following abrupt discontinuation of systemic therapy; withdraw gradually
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; discontinue breastfeeding or product

Evaluate:

- Therapeutic response: decreased inflammation

Teach patient/family:

- To carry medical alert ID as corticosteroid user at all times
- To contact prescriber if surgery, trauma, stress occurs because dose may need to be adjusted
- To notify prescriber if therapeutic response decreases because dosage adjustment may be needed
- To take with food or milk
- That bruising may occur easily
- That if on long-term therapy, a high-protein diet may be needed
- Not to discontinue abruptly because **adrenal crisis** can result
- **About symptoms of adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, hypertension
- To avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
- About all aspects of product usage, including cushingoid symptoms; to notify health care provider of infection
- To avoid exposure to chickenpox or measles, persons with infection

dexamethasone (ophthalmic) (Rx)

(dex-a-meth′a-sone)

Dextenza, Dexycu, Maxidex, Ozurdex

Func. class.: Ophthalmic antiinflammatory

Chem. class.: Corticosteroid

Do not confuse:

dexamethasone/desoximetasone

ACTION: Exact mechanism of antiinflammatory action unknown; inhibits multiple inflammatory cytokines;

decreases inflammation, collagen deposits, capillary dilation, edema

USES: Treatment of corticosteroid-responsive ophthalmic disorders

CONTRAINDICATIONS: Hypersensitivity to this product or sulfites, ocular TB, acute herpes simplex (superficial), fungal/viral infections of the eye, posterior lens capsule rupture

Precautions: Corneal infected abrasions, glaucoma, pregnancy, breastfeeding, migration of intravitreal implant risk, children

DOSAGE AND ROUTES

Corticosteroid-responsive ophthalmic disorders

- **Adult:** Instill 1 or 2 drops of 0.1% ophthalmic solution or suspension every hour during the day and every 2 hr at night; reduce application to every 4 hr after response occurs

Available forms: Ophthalmic solution, suspension 0.1%; implant, intravitreal (0.7 mg); insert, opthalmic 0.4 mg; intraocular suspension 9%

Administer:

- For ophthalmic use only
- Instruct patient on proper instillation of eye ointment or solution; do not touch the tip of the dropper to the eye, fingertips, or other surface; wait ≥15 min before inserting soft contact lens

SIDE EFFECTS

EENT: Burning, stinging, poor vision, corneal ulcerations, increased IOP, optic nerve damage

NURSING CONSIDERATIONS

Assess:

- **Corneal effects:** ulcerations, infections can worsen with this product

Evaluate:

- Decreased corneal inflammation

Teach patient/family:

- How to use products
- Not to share with others or use for other conditions
- To notify prescriber immediately if vision changes or if condition worsens
- To take as prescribed

dexlansoprazole (Rx)

(dex-lan-so-prey′zole)

Dexilant

Func. class.: Antiulcer, proton pump inhibitor

Chem. class.: Benzimidazole

ACTION: Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks final step of acid production

USES: Gastroesophageal reflux disease (GERD), severe erosive esophagitis, heartburn

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, proton-pump hypersensitivity, gastric cancer, hepatic disease, vitamin B_{12} deficiency, colitis

DOSAGE AND ROUTES

Erosive esophagitis

- **Adult: PO** 60 mg daily for up to 8 wk; maintenance: **PO** 30 mg daily for up to 6 mo

GERD

- **Adult: PO** 30 mg daily × 4 wk

Hepatic disease

- **Adult: PO** (Child-Pugh B): max 30 mg/day; Child-Pugh C

Available forms: Delayed-release capsules 30, 60 mg

Administer:

- Swallow capsules whole; do not crush, chew capsules; capsules may be opened, contents sprinkled on food, use immediately; do not chew contents of capsule; give without regard to food

SIDE EFFECTS

CNS: Headache, dizziness, confusion, agitation, amnesia, depression, anxiety, seizures, insomnia, migraine

CV: Chest pain, angina, bradycardia, palpitations, CVA, hypertension, MI
EENT: Tinnitus
GI: Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, colitis, dysgeusia, CDAD
HEMA: Anemia, neutropenia, thrombocytopenia, pernicious anemia, thrombosis
INTEG: Rash, urticaria, pruritus
META: Gout
MS: Arthralgia, mylagia
RESP: Upper respiratory infections, cough, epistaxis, dyspnea, pneumonia
SYST: Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

PHARMACOKINETICS

Absorption 57%-64%; half-life 1-2 hr; protein binding 96.1%-98.8%; extensively metabolized in liver by CYP2C19/CYP3A4; excreted in urine, feces; clearance decreased in geriatric patients, renal/hepatic impairment; peak 4 hr

INTERACTIONS

Increase: dexlansoprazole effect—CYP2C19, 3A4 inhibitors (fluvoxaMINE, voriconazole)
Decrease: dexlansoprazole absorption—sucralfate
Decrease: absorption of ketoconazole, itraconazole, iron, delavirdine, ampicillin, calcium carbonate
Drug/Herb
Decrease: dexlansoprazole effect—St. John's wort
Drug/Lab Test
Increase: LFTs, bilirubin, creatinine, glucose, lipids
Decrease: platelets, magnesium

NURSING CONSIDERATIONS

Assess:
- **CDAD (rare):** diarrhea, abdominal cramps, fever; report to prescriber promptly
- **Hepatotoxicity (rare):** hepatitis, jaundice; monitor hepatic studies (AST, ALT, alkaline phosphatate) if hepatic adverse reactions occur
- **Hypomagnesemia:** usually 3 mo to 1 yr after beginning therapy; monitor magnesium level, assess for irregular heartbeats, muscle spasms; in children, fatigue, upset stomach, dizziness; magnesium supplement may be used
- **Anaphylaxis (rare), serious skin disorders:** require emergency intervention
- **Beers:** avoid scheduled use >8 wk in older adults who are at high risk for erosive esophagitis, pathologic hypersecretory conditions
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: absence of epigastric pain, swelling, fullness; healing of erosive esophagitis

Teach patient/family:
- **CDAD:** to report to prescriber at once abdominal cramps, bloody diarrhea, fever
- That diabetic patient should know that hypoglycemia may occur
- To avoid hazardous activities; dizziness may occur
- To avoid alcohol, salicylates, ibuprofen; may cause GI irritation
- To report allergic reactions, symptoms of low magnesium levels
- To notify prescriber if pregnancy is planned or suspected; not to breastfeed
- To swallow capsule whole, not to chew, crush; to report all products being used to prescriber

dexmethylphenidate (Rx)

(dex′meth-ul-fen′ih-dayt)

Focalin, Focalin XR

Func. class.: Central nervous system (CNS) stimulant, psychostimulant

Controlled Substance Schedule II

Do not confuse:
dexmethylphenidate/methylphenidate

ACTION: Increases release of norepinephrine and DOPamine into the

extraneuronal space; also blocks the reuptake of norepinephrine and DOPamine into the presynaptic neuron; mode of action for treating attention-deficit/hyperactivity disorder (ADHD) is unknown

USES: ADHD

CONTRAINDICATIONS: Hypersensitivity to methylphenidate, anxiety, history of Gilles de la Tourette's syndrome, tics, glaucoma, concurrent treatment with MAOIs or within 14 days of discontinuing treatment with MAOIs

Precautions: Pregnancy, hypertension, depression, seizures, CV disorders, breastfeeding, child <6 yr, geriatric patients, psychosis, thyrotoxicosis

Black Box Warning: Substance abuse, alcoholism

DOSAGE AND ROUTES

- **Adult/adolescent/child ≥6 yr: (immediate release) PO** 2.5 mg bid with doses at least 4 hr apart, gradually increase to a maximum of 20 mg/day (10 mg bid); for those taking methylphenidate, use ½ of methylphenidate dose initially, then increase as needed to a max of 20 mg/day
- **Adolescent/child ≥6 yr: EXTENDED RELEASE** 5 mg/day, (not taking methylphenidate/dexmethylphenidate) may adjust to 20 mg/day in 5-mg increments, max 30 mg/day
- **Adult: PO EXTENDED RELEASE** 10 mg/day, may adjust to 20 mg/day in 10-mg increments, max 40 mg/day

Available forms: Tablets 2.5, 5, 10 mg; extended-release capsules 5, 10, 15, 20, 25, 30, 35, 40 mg

Administer:

- Twice daily at least 4 hr apart; extended release once a day; in the morning, extended-release capsule may be opened and contents sprinkled onto applesauce and consumed without chewing
- Without regard to meals
- Do not break, crush, or chew extended-release product
- Med guide should be provided by dispenser

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, nervousness, insomnia, toxic psychosis, neuroleptic malignant syndrome (rare), Tourette's syndrome

CV: Palpitations, B/P changes, angina, dysrhythmias, tachycardia, MI, stroke

GI: *Nausea, anorexia,* abnormal hepatic function, hepatic coma, *abdominal pain*

HEMA: Leukopenia, anemia, thrombocytopenic purpura

INTEG: Exfoliative dermatitis, urticaria, rash, erythema multiforme

MISC: *Fever,* arthralgia, scalp hair loss, rhabdomyolysis

PHARMACOKINETICS

Readily absorbed, elimination half-life 2.2 hr, metabolized by liver, excreted by kidneys

PO: Peak 1½ hr, onset ½-1 hr

PO-ER: Onset unknown, peak 4 hr

INTERACTIONS

Increase: hypertensive crisis—MAOIs or within 14 days of MAOIs, vasopressors

Increase: sympathomimetic effect—decongestants, vasoconstrictors

Increase: effects of anticonvulsants, tricyclics, SSRIs, coumarin

Increase: serious adverse reactions with clonidine, other centrally acting alpha-2 agonists, avoid concurrent use

Decrease: effects of antihypertensives, monitor B/P

Decrease: metabolism of anticoagulants, phenytoins, barbiturates, TCAs, dose adjustment may be needed

Drug/Herb

- Synergistic effect—melatonin

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Assess for substance abuse, past or current; psychotic episodes may occur, especially with parenteral abuse; avoid use in a history of substance abuse or alcoholism, as dependence may occur

- **Toxicity:** rhabdomyolysis, headache, flushing, vomiting, agitation, tachycardia, tremor, euphoria, hallucinations, hyperreflexia

• VS, B/P; may reverse antihypertensives; check patients with cardiac disease more often for increased B/P
• CBC, differential platelet counts during long-term therapy, urinalysis; with diabetes: blood glucose, urine glucose; insulin changes may have to be made because eating will decrease
• Height, growth rate q3mo in children; growth rate may be decreased; weight loss, anorexia may occur
• Mental status: mood, sensorium, affect, stimulation, insomnia, aggressiveness, hostility
• **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness
• Appetite, sleep, speech patterns
• For attention span, decreased hyperactivity in persons with ADHD
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
• Therapeutic response: decreased hyperactivity or ability to stay awake

Teach patient/family:
• To decrease caffeine consumption (coffee, tea, cola, chocolate); may increase irritability, stimulation
• To take early in day to prevent insomnia; not to take more than prescribed, dependence may occur
• To avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion
• To taper off product over several weeks to avoid depression, increased sleeping, lethargy
• To report weight loss; anorexia may occur
• To avoid hazardous activities until stabilized on medication
• To get needed rest; patients will feel more tired at end of day
• To notify all health care workers, including school nurse, of medication and schedule
• About information, instructions provided in patient information section
• To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding
• **To report toxicity immediately:** vomiting, agitation, tremor, hyperreflexia, euphoria, confusion, hallucinations, flushing, headache, tachycardia, rhabdomyolysis

TREATMENT OF OVERDOSE:
Administer fluids; hemodialysis: or peritoneal dialysis; antihypertensive for increased B/P; administer short-acting barbiturate prior to lavage

dextroamphetamine (Rx)
(dex-troe-am-fet'a-meen)
Dexedrine, ProCentra, Zenzedi
Func. class.: Cerebral stimulant
Chem. class.: Amphetamine
Controlled Substance Schedule II

ACTION:
Increases release of norepinephrine, DOPamine in cerebral cortex to reticular activating system

USES:
Narcolepsy, attention-deficit/hyperactivity disorder (ADHD)

CONTRAINDICATIONS:
Hypersensitivity to sympathomimetic amines, hyperthyroidism, glaucoma, severe arteriosclerosis

Black Box Warning: Substance abuse

Precautions: Pregnancy, breastfeeding, children <3 yr, depression, Gilles de la Tourette's disorder, cardiomyopathy, bipolar disorder, abrupt discontinuation, acute MI; benzyl alcohol, salicylate hypersensitivity; hypercortisolism, obesity, psychosis, seizure disorder, hypertension, anxiety, anorexia nervosa, tartrazine dye hypersensitivity

Black Box Warning: Symptomatic cardiac disease

DOSAGE AND ROUTES
Narcolepsy
• **Adult: PO** 5 mg bid, titrate daily dose by no more than 10 mg/wk, max 60 mg/day

• **Child 6-12 yr: PO** 5 mg/day, titrate daily dose by no more than 5 mg/day at weekly intervals, max 40 mg/day

ADHD

• **Adult: PO** 5-60 mg/day daily or divided bid, max 40 mg/day

• **Child 3-5 yr: PO** 2.5 mg/day increasing by 2.5 mg/day at weekly intervals, max 40 mg/day

• **Child >6-12 yr: PO** 5 mg daily-bid increasing by 5 mg/day at weekly intervals, max 40 mg/day

Available forms: Tablets 2.5, 5, 7.5, 10, 15, 20, 30 mg; oral solution 5 mg/5 mL; extended-release capsules 5, 10, 15 mg

Administer:

• At least 6 hr prior to bedtime to avoid sleeplessness

• Use calibrated measuring device for oral solution

• Store all forms at room temperature

SIDE EFFECTS

CNS: *Hyperactivity, insomnia, restlessness, talkativeness,* dizziness, headache, chills, stimulation, dysphoria, irritability, aggressiveness, tremor, dependence, addiction

CV: *Palpitations, tachycardia,* hypertension, decrease in heart rate, dysrhythmias

GI: *Anorexia,* dry mouth, diarrhea, constipation, weight loss, metallic taste

GU: Impotence, change in libido

INTEG: Urticaria

MISC: Rhabdomyolysis

PHARMACOKINETICS

Onset 30-60 min, peak 2 hr, duration 4 hr; extended release onset 1 hr, peak 2 hr, duration 8 hr; metabolized by liver; urine excretion pH dependent; crosses placenta, breast milk; half-life 6-8 hr (child), 10-12 hr (adult)

INTERACTIONS

Increase: hypertensive crisis: MAOIs or within 14 days of MAOIs

Increase: serotonin syndrome, neuroleptic malignant syndrome: SSRIs, SNRIs, serotonin-receptor agonists; do not use concurrently

Increase: dextroamphetamine effect—acetaZOLAMIDE

Increase: CNS effect—haloperidol, tricyclics, phenothiazines

Decrease: absorption of barbiturates, phenytoin

Decrease: dextroamphetamine effect—ascorbic acid, ammonium chloride

Decrease: effect of adrenergic blockers, antidiabetics, antihypertensives, antihistamines

Drug/Herb

• Serotonin syndrome—St. John's wort

Decrease: stimulant effect—eucalyptus

Drug/Food

Increase: amine effect—caffeine (cola, coffee, tea [green/black])

Decrease: effect—fruit juice (oral solution)

Drug/Lab Test

Increase: plasma corticosteroids, urinary steroids

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Cardiac disease: VS, B/P; product may reverse antihypertensives; check patients with cardiac disease often

Black Box Warning: Substance abuse: use for prolonged periods may lead to dependence; sudden death or serious CV events can occur from misuse; chronic intoxication (insomnia, irritability, personality changes)

• CBC, urinalysis; with diabetes: blood glucose, urine glucose; insulin changes may be required because eating will decrease

• Height, growth rate in children (growth rate may be decreased), weight

• **Toxicity:** symptoms may vary in children; anxiety, headache, flushing, vomiting, rhabdomyolysis, tremor, hyperreflexia, confusion, euphoria, tachycardia

• **ADHD:** change in behavior, growth retardation in children

• Mental status: mood, sensorium, affect, stimulation, insomnia, irritability

• Tolerance or dependency: increased amount may be used to get same effect; will develop after long-term use

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; infants may show withdrawal and low birth weight, avoid breastfeeding, excreted in breast milk

Evaluate:

• Therapeutic response: increased CNS stimulation, except in ADHD, decreased drowsiness

Teach patient/family:

• To take before meals (obesity)

• To decrease caffeine consumption (coffee, tea, cola, chocolate); may increase irritability, stimulation

• To avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion; to avoid fruit juice at same time as solution, effect is decreased

• To tell parents that change in behavior may occur in beginning treatment, irritability, hostility

• **Seizures:** that those with a seizure disorder may have decreased seizure threshold

• To taper product over several weeks; depression, increased sleeping, lethargy may occur

• To avoid hazardous activities until stabilized on medication

• To get needed rest; patient will feel more tired at end of day

TREATMENT OF OVERDOSE:

Administer fluids, hemodialysis; antihypertensive for increased B/P, ammonium chloride for increased excretion

dextroamphetamine sulfate/dextroamphetamine saccharate/amphetamine aspartate/amphetamine sulfate (Rx)

Adderall XR, Mydayis

Func. class.: CNS stimulant

Chem. class.: Amphetamine

Controlled Substance Schedule II

ACTION:

Causes the release of DOPamine and norepinephrine in the brain

USES:

Narcolepsy, ADHD

CONTRAINDICATIONS

Hypersensitivity to sympathomimetic amines, hyperthyroidism, glaucoma, severe arteriosclerosis

Black Box Warning: Substance abuse

Precautions: Pregnancy, breastfeeding, children <3 yr, depression, Tourette's syndrome, cardiomyopathy, bipolar disorder, abrupt discontinuation, acute MI, benzyl alcohol, salicylate hypersensitivity, hypercortisolism, obesity, psychosis, seizure disorder, hypertension, anxiety, anorexia nervosa

DOSAGE AND ROUTES

ADHD

Adults: PO (immediate-release Adderall) Initially, 5 mg daily or bid. If divided doses are required, give first dose upon awakening and the subsequent doses (1 or 2) at 4- to 6-hr intervals. Titrate by no more than 5 mg/day at weekly intervals to the minimum effective dose; doses greater than 60 mg/day are not usually needed

Child/adolescent ≥6 yr: PO (immediate-release Adderall): 5 mg daily or bid. May titrate daily dose in 5-mg increments at weekly intervals to minimum effective dose. Daily dose may be given in 1 to 3 divided doses at 4- to 6-hr intervals, 40 mg daily

Child 3-5 yr: (immediate-release Adderall) PO: 2.5 mg daily in the morning. May titrate daily dose in 2.5-mg increments at weekly intervals to minimum effective dose. Daily dose may be given in 1 to 3 divided doses at 4- to 6-hr intervals

Adults: PO (extended-release capsules – Adderall XR) When initiating treatment for the first time or switching from another ADHD medication, the recommended dose is 20 mg daily upon awakening

Adolescents: PO (extended-release capsules – Adderall XR) 10 mg daily in

the morning for both initial therapy and when converting to extended-release amphetamine, dextroamphetamine from another stimulant medication. May titrate to 20 mg daily after 1 wk if ADHD symptoms are not adequately controlled

Child 6-12 yr: PO (extended-release capsules – Adderall XR) 5 to 10 mg daily in the morning for initial treatment. If converting to extended-release (ER) amphetamine, dextroamphetamine from a different stimulant medication, begin with 10 mg daily. May titrate daily dose in 5- to 10-mg increments at weekly intervals to the minimum effective dose. Max: 40 mg/day PO ER capsules

Adults: PO (extended-release capsules – Mydayis) Initially, 12.5 mg daily in the morning upon awakening; take consistently with or without food. Initial doses of 25 mg daily may be considered for some patients. Dose may be increased by 12.5-mg increments no sooner than weekly. Max: 50 mg/day

Adolescent ≥13 yr: PO Initially, 12.5 mg daily in the morning upon awakening; take consistently with or without food. Dose may be increased by 12.5-mg increments no sooner than weekly. Max: 25 mg/day

Narcolepsy

Adult/adolescent/child ≥12 yr: PO (immediate-release tablets – Adderall): 10 mg daily in the morning. If divided doses are required, give first dose upon awakening and the subsequent doses (1 or 2) at 4- to 6-hr intervals. Titrate by no more than 10 mg/day at weekly intervals to the minimum effective dose. Maximum: 60 mg/day

Child 6-11 yr: PO (immediate-release tablets – Adderall): 5 mg daily in the morning. Titrate daily dose in 5-mg increments at weekly intervals to minimum effective dose. Daily dose may be given in 1 to 3 divided doses at 4- to 6-hour intervals. Max: 60 mg/day

Available forms: Many products, check with manufacturer

Administer

- At least 6 hr prior to bedtime to avoid sleeplessness
- Use calibrated measuring device for oral solution
- Store all products at room temperature

SIDE EFFECTS

CNS: Hyperactivity, insomnia, restlessness, talkativeness, dizziness, headache, chills, stimulation, dysphoria, irritability, aggressiveness, tremor, dependence, addiction

CV: Palpitations, tachycardia, hypertension, decrease in heart rate, dysrhythmias

GI: Anorexia, dry mouth, diarrhea, constipation, weight loss, metallic taste

GU: Impotence, change in libido

INTEG: Urticaria

MISC: Rhabdomyolysis

PHARMACOKINETICS

Immediate release: Onset unknown, peak 3 hr, duration 4-6 hr

Extended release: Onset unknown, peak 7-8 hr, duration unknown

Half-life immediate release 9-14 hr; extended release 10-14 hr

INTERACTIONS

Increase: Hypertensive crisis risk—MAOIs or within 14 days of MAOIs

Increase: Serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists; do not use concurrently

Increase: Amphetamine effect—acetaZOLAMIDE

Increase: CNS effect—haloperidol, tricyclics, phenothiazines

Decrease: absorption of barbiturates, phenytoin

Decrease: dextroamphetamine effect—ascorbic acid, ammonium chloride

Decrease: effect of—adrenergic blockers, antidiabetics, antihypertensives, antihistamines

Drug/Herb

- Serotonin syndrome—St. John's wort
- **Decrease:** stimulant effect—eucalyptus

Drug/Food
Increase: amine effect—caffeine (cola, coffee, tea)
Drug/Lab
Increase: plasma corticosteroids, urinary steroids

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Cardiac disease: VS, B/P product may reverse antihypertensives, check patients with cardiac disease often

Black Box Warning: Substance abuse: use for prolonged periods may lead to dependence; sudden death or serious CV events can occur from misuse, chronic intoxication (insomnia, irritability, personality changes)

- CBC, urinalysis; with diabetes blood glucose, urine glucose; insulin changes may be required because eating will decrease
- Height, growth rate in children (growth rate may be decreased), weight
- Toxicity: symptoms may vary in children; anxiety, headache, flushing, vomiting, rhabdomyolysis, tremor, hyperreflexia, confusion, euphoria, tachycardia
- ADHD: change in behavior, growth retardation in children
- Mental status: mood, sensorium, affect, stimulation, insomnia, irritability
- Tolerance or dependency: increased amount may be used to get same effect; will develop after long-term use
- Pregnancy/breastfeeding: no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excreted in breast milk

Evaluate:
- Therapeutic response: decreased CNS stimulation (ADHD); decreased drowsiness (narcolepsy)

Teach patient/family:
- To decrease caffeine consumption; may increase irritability, stimulation
- To avoid OTC products unless discussed with provider
- To tell parents that change in behavior may occur at beginning treatment; irritability, hostility
- Seizures: that those with a seizure disorder may have decreased seizure threshold
- To taper product over several weeks; depression, increased sleeping, lethargy may occur
- To get needed rest; patient will feel more tired at end of day

dextromethorphan (OTC)

(dex-troe-meth-or′fan)

Balminil, Benylin DM, Bronchophan Forte DM, Delsym 12-Hour, ElixSure Cough, Koffex, Robitussin, Robitussin Cough with Honey, Robitussin Long Acting Strength, Scot-Tussin Diabetes CF, Triaminic Long Acting Cough, Vicks Formula 44

Func. class.: Antitussive, nonopioid
Chem. class.: Levorphanol derivative

ACTION: Depresses cough center in medulla by direct effect

USES: Nonproductive cough caused by colds or inhaled irritants

CONTRAINDICATIONS: Hypersensitivity, MAOIs, SSRIs
Precautions: Pregnancy, fever, hepatic disease, asthma/emphysema, chronic cough, child <4 yr, breastfeeding

DOSAGE AND ROUTES

- **Adult/child ≥12 yr: PO** 10-20 mg q4hr or 30 mg q6-8hr, max 120 mg/day; **SUS REL LIQ** 60 mg q12hr, max 120 mg/day
- **Child 6-11 yr: PO** 5-10 mg q4hr; **SUS REL LIQ** 30 mg bid, **LOZ** 5-10 mg q1-4hr; max 60 mg/day

• **Child 4-5 yr: PO** 2.5-7.5 mg q4-8hr, max 30 mg/day; **SUS REL LIQ** 15 mg bid

Available forms: Liquid, extended release, 15 mg/5 mL, 30 mg/5 mL; gel capsules 5, 15 mg; capsules 15 mg; extended-release suspension: 30 mg/5 mL; lozenges 5 mg; ✱ solution 3 mg/mL; 7.5 mg/5 mL, 10 mg/5 mL, 15 mg/5 mL; strips, orally disintegrating 7.5 mg

Administer:

• **Extended-release suspension:** shake well, use calibrated measuring device

• Decreased dose for geriatric patients; metabolism may be slowed

SIDE EFFECTS

CNS: *Dizziness,* sedation, confusion, ataxia, fatigue

GI: *Nausea*

PHARMACOKINETICS

PO: Onset 15-30 min, duration 3-6 hr

SUS: Duration 12 hr

Half-life 11 hr, metabolized by the liver, excreted via kidneys

INTERACTIONS

• Do not give with MAOIs or within 2 wk of MAOIs; avoid furazolidone, linezolid, procarbazine (MAOI activity)

Increase: CNS depression—alcohol, antidepressants, antihistamines, opioids, sedative/hypnotics

Increase: adverse reactions—amiodarone, quiNIDine, serotonin receptor agonist, sibutramine, SSRI

NURSING CONSIDERATIONS

Assess:

• **Cough:** type, frequency, character, lung sounds, sputum

• Increase fluids to liquefy secretions, unless contraindicated

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding

Evaluate:

• Therapeutic response: absence of cough

Teach patient/family:

• To avoid driving, other hazardous activities until stabilized on medication

• To avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleaners that increase cough

• To avoid alcohol, CNS depressants

• To notify prescriber if cough persists over a few days

• Not to use if breastfeeding or in child <4 yr

⚠ HIGH ALERT

diazePAM (Rx)

(dye-az′-e-pam)

Diastat, Dio-Stat Acudial, Valium, Valtoco

Func. class.: Antianxiety, anticonvulsant, skeletal muscle relaxant, central acting

Chem. class.: Benzodiazepine, long-acting

Controlled Substance Schedule IV

Do not confuse:

diazePAM/Ditropan/LORazepam

ACTION: Potentiates the actions of GABA, especially in the limbic system, reticular formation; enhances presympathetic inhibition, inhibits spinal polysynaptic afferent paths

USES: Anxiety, acute alcohol withdrawal, adjunct for seizure disorders; preoperatively as a relaxant for skeletal muscle relaxation; rectally for acute repetitive seizures

CONTRAINDICATIONS: Pregnancy, hypersensitivity to benzodiazepines, closed-angle glaucoma, coma, myasthenia gravis, ethanol intoxication, hepatic disease, sleep apnea

Precautions: Breastfeeding, children <6 mo, geriatric patients, debilitation, renal disease, asthma, bipolar disorder, COPD, CNS depression, labor, Parkinson's disease, neutropenia, psychosis, seizures, substance abuse, smoking

Black Box Warning: Coadministration with other CNS depressants, respiratory depression

DOSAGE AND ROUTES

Anxiety/seizure disorders

- **Adult: PO** 2-10 mg bid-qid; **IM/IV** 2-5 mg q3-4hr
- **Geriatric: PO** 2-2.5 mg daily-bid, increase slowly as needed
- **Child >6 mo: PO** 1-2.5 mg tid/qid; **IM/IV** 0.04-0.3 mg/kg/dose q2-4hr, max 0.6 mg/kg in an 8-hr period

Precardioversion

- **Adult: IV** 5-15 mg 5-10 min precardioversion

Preendoscopy

- **Adult: IV** 2.5-20 mg; **IM** 5-10 mg ½ hr preendoscopy

Muscle relaxation

- **Adult: PO** 2-10 mg tid-qid or **EXTENDED RELEASE** 15-30 mg/day; **IV/IM** 5-10 mg, repeat in 2-4 hr

Tetanic muscle spasms

- **Adult: IV/IM** 10 mg, then 10 mg in 3-4 hr
- **Child >5 yr: IM/IV** 5-10 mg q3-4hr prn
- **Infant >30 days: IM/IV** 1-2 mg q3-4hr prn

Status epilepticus

- **Adult: IV/IM** 5-10 mg, 2 mg/min, may repeat q10-15min, max 30 mg; may repeat in 2-4 hr if seizures reappear
- **Child >5 yr: IM** 1 mg q2-5min; **IV** 1 mg slowly
- **Child 1 mo-5 yr: IV** 0.2-0.5 mg slowly; **IM** 0.2-0.5 mg slowly q2-5min up to 5 mg, may repeat in 2-4 hr prn

Seizures other than status epilepticus

- **Adult: RECT** 0.2 mg/kg, may repeat in 4-12 hr
- **Child 6-11 yr: RECT** 0.3 mg/kg, may repeat in 4-12 hr
- **Child 2-5 yr: RECT** 0.5 mg/kg, may repeat in 4-12 hr

Alcohol withdrawal

- **Adult: IV** 10 mg initially, then 5-10 mg q3-4hr prn

Psychoneurotic reactions

- **Adult:** IM/IV 2-10 mg, may repeat in 3-4 hr

Epilepsy cluster seizures

Adult: Nasal spray 0.2 mg/kg or 0.3 mg/kg, depending on the patient's age and weight

Available forms: Tablets 2, 5, 10 mg; injection 5 mg/mL; oral solution 5 mg/5 mL, rectal 2.5 (pediatric), 10, 20 mg, twin packs; extended-release capsule 15 mg, rectal gel; nasal spray 5 mg in 0.1 mL

Administer:

PO route

- With food or milk for GI symptoms; crushed if patient is unable to swallow medication whole
- Reduce opioid dose by ⅓ if given concomitantly with diazepam
- **Concentrate:** use calibrated dropper only; mix with water, juice, pudding, applesauce; to be consumed immediately

Rectal route

- Do not use more than 5×/mo or for an episode q5days (Diastat)

Nasal route

- Do not prime
- Place patient on side or back
- Remove from blister pack
- Insert nozzle in nostril, press plunger to deliver dose, remove

IM route

- Painful, use deltoid if used this route

Direct IV route

- Have emergency equipment nearby
- Observe for several hours after IV; if used in combination with opioids, decrease opioid dose
- Into large vein; give IV 5 mg or less/1 min or total dose over 3 min or more (children, infants); continuous infusion is not recommended; inject as close to vein insertion as possible; do not dilute or mix with other products

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* headache, hangover, slurred speech, paradoxical excitation

CV: Hypotension, tachycardia

EENT: *Blurred vision*

GI: Constipation, nausea, vomiting, diarrhea, weight gain

INTEG: Rash, dermatitis, itching, phlebitis (IV), venous thrombosis

RESP: Respiratory depression
MISC: Psychological/physical dependency, tolerance, neutropenia

PHARMACOKINETICS

Metabolized by liver via CYP2C19, CYP3A4; 15%-20% of Asian patients and up to 5% of White and Black patients are poor metabolizers; excreted by kidneys; crosses placenta; excreted in breast milk; crosses the blood-brain barrier; half-life 1-12 days; more reliable by mouth; 99% protein binding
PO: Rapidly absorbed, onset ½ hr, peak 2 hr, duration up to 24 hr
IM: Onset 15-30 min, duration 1-1½ hr, absorption slow and erratic
RECT: Peak 1.5 hr
IV: Onset immediate, duration 15 min-1 hr

INTERACTIONS

Increase: diazepam effect—amiodarone, protease inhibitors, dilTIAZem, cimetidine, clarithromycin, dalfopristin-quinupristin, delavirdine, disulfiram, efavirenz, erythromycin, fluconazole, fluvoxaMINE, imatinib, itraconazole, ketoconazole, IV miconazole, nefazodone, niCARdipine, ranolazine, troleandomycin, valproic acid, verapamil, voriconazole, zafirlukast, zileuton; monitor for increased sedation
Increase: toxicity—barbiturates, SSRIs, cimetidine, CNS depressants, valproic acid, CYP3A4 inhibitors
Increase: CNS depression—CNS depressants, alcohol; monitor for increased sedation
Decrease: diazePAM metabolism—oral contraceptives, valproic acid, disulfiram, isoniazid, propranolol
Decrease: diazePAM effect—CYP3A4 inducers (rifAMPin, barbiturates, carBAMazepine, ethotoin, phenytoin, fosphenytoin), smoking
Drug/Herb
Increase: CNS depression—kava, chamomile, valerian
Drug/Lab Test
Increase: AST/ALT, alkaline phosphatase

NURSING CONSIDERATIONS

Assess:
- **CV:** B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- **Blood studies:** CBC during long-term therapy; blood dyscrasias (rare); hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase
- **IV site:** frequently, watch for phlebitis
- **Degree of anxiety:** what precipitates anxiety and whether product controls symptoms
- **Alcohol withdrawal symptoms,** including hallucinations (visual, auditory), delirium, irritability, agitation, fine to coarse tremors
- Seizure control and type, duration, intensity of seizures
- For muscle spasms; pain relief

Black Box Warning: Avoid coadministration with other CNS depressants; do not use with opioids

Black Box Warning: Respiratory depression: monitor for respiratory depression, respirations q5-15 min if given IV

- IV site for thrombosis or phlebitis, which may occur rapidly
- **Mental status:** mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, suicidal tendencies
- **Physical dependency, withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness after long-term, high-dose use
- **Beers:** avoid use in older adults; may be appropriate for seizures, sleep disorders, benzodiazepine/ethanol withdrawal, severe anxiety disorders
- **Pregnancy/breastfeeding:** use in pregnancy not recommended; do not breastfeed, excretion in breast milk

Evaluate:
- Therapeutic response: decreased anxiety, restlessness, insomnia

Teach patient/family:
- That product may be taken with food

- That product not to be used for everyday stress or for >4 mo unless directed by prescriber; to take no more than prescribed amount; that product may be habit forming, review package insert with patient
- To avoid OTC preparations unless approved by prescriber
- To avoid driving, activities that require alertness; drowsiness may occur
- To avoid alcohol, other psychotropic medications unless directed by prescriber; that smoking may decrease diazePAM effect by increasing diazePAM metabolism
- Not to discontinue medication abruptly after long-term use; to gradually taper
- To rise slowly or fainting may occur, especially in geriatric patients
- That drowsiness may worsen at beginning of treatment
- To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding

TREATMENT OF OVERDOSE: Lavage, VS, supportive care, flumazenil

dibucaine topical

See Appendix B

diclofenac (Rx)

(dye-kloe′fen-ak)

Zonvolax

diclofenac epolamine (Rx)

Flector, Licart

diclofenac potassium (Rx)

Cambia, Zipsor

diclofenac sodium (Rx)

Func. class.: Nonsteroidal antiinflammatory products (NSAIDs), nonopioid analgesic

Chem. class.: Phenylacetic acid

Do not confuse:
Cataflam/Catapres

ACTION: Inhibits COX-1, COX-2 by blocking arachidonate, resulting in analgesic, antiinflammatory, antipyretic effects

USES: Acute, chronic RA; osteoarthritis; ankylosing spondylitis; analgesia; primary dysmenorrhea; patch: mild to moderate pain

CONTRAINDICATIONS: Hypersensitivity to aspirin, iodides, other NSAIDs, bovine protein, asthma, serious CV disease; eczema, exfoliative dermatitis, skin abrasions (gel, patch); treatment of perioperative pain in CABG surgery

Precautions: Pregnancy, breastfeeding, children, bleeding disorders, GI disorders, cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <30 mL/min, accidental exposure, acute bronchospasm, hypersensitivity to benzyl alcohol

Black Box Warning: GI bleeding/perforation, MI, stroke

DOSAGE AND ROUTES

Osteoarthritis

- **Adult: PO** (diclofenac potassium/delayed-release diclofenac sodium) 50 mg bid-tid, max 150 mg/day; **DELAYED RELEASE** 50 mg bid-tid or 75 mg bid, max 150 mg/day; **EXTENDED RELEASE** (extended-release diclofenac sodium) 100 mg daily, max 150 mg/day; **TOPICAL GEL** 1% 4 g for each of lower extremities qid, max 16 g/day; 2 g for each of upper extremities qid, max 8 g/day; **TOPICAL SOL** apply 40 drops to each affected knee qid; apply 10 drops at a time, spread over entire knee

Rheumatoid arthritis

- **Adult: PO** (diclofenac potassium/delayed-release diclofenac sodium) 50 mg tid-qid, max 200 mg/day; **DELAYED RELEASE** 50 mg tid-qid or 75 mg bid, max 200 mg/day; **EXTENDED RELEASE** (extended-release diclofenac sodium) 100 mg daily, may increase to 200 mg/day, max 200 mg/day

Ankylosing spondylitis

- **Adult: PO DELAYED RELEASE** (delayed-release diclofenac sodium) 25 mg qid and 25 mg at bedtime, max 125 mg/day

Acute migraine with/without aura
- **Adult: PO** (powder for oral solution) 50 mg as a single dose, mix contents of packet in 1-2 oz water

Mild to moderate pain
- **Adult: PO** (diclofenac potassium) 25 mg qid

Dysmenorrhea or nonrheumatic inflammatory conditions
- **Adult: PO** (diclofenac potassium) 50 mg tid or 100 mg initially, then 50 mg tid, max 200 mg first day, then 150 mg/day, immediate release only

Pain of strains/sprains
- **Adult: TOPICAL PATCH** apply patch to area bid

Actinic keratosis
- **Adult: TOPICAL GEL** apply to area bid

Hepatic dose
- **Adult: PO** Moderate to severe hepatic impairment: use not recommended

Renal dose
- **Avoid:** Use of topical gel, patch, solution, potassium oral tablet for advanced renal disease

Available forms: Epolamine: topical patch 1.3%; **potassium:** tablets 50 mg; tablets, liquid filled 25 mg; oral powder for solution 50 mg; **sodium:** delayed-release tablets (enteric-coated) 25, 50, 75 mg; Pennsaid: extended-release tablets, 100 mg

Administer:

PO route
- Do not break, crush, or chew enteric products
- Take with a full glass of water to enhance absorption, remain upright for ½ hr; if dose is missed, take as soon as remembered within 2 hr if taking 1-2×/day; do not double doses
- Allow 6 hr between use with another NSAID
- Store at room temperature

Powder:
- Mix powder in 30-60 mL water only
- Mix solution; have patient drink immediately
- Powder (Cambia) and Zorvolex may be less effective if taken with food; Zorvolex capsules are not interchangeable with other formulations of oral product

Topical patch route
- Wash hands before handling patch
- Remove and release liner prior to administration
- Use only on normal, intact skin
- Remove before bath, shower, swimming; do not use heat or occlusive dressings
- Discard removed patch in trash away from children, pets
- Store at room temperature

Topical gel route
- Apply to intact skin; do not use heat or occlusive dressings
- Use only for osteoarthritis, mild to moderate pain
- Store at room temperature, avoid heat, do not freeze

Topical solution route
- Apply to clean, dry skin
- Wait until dry before applying clothing, other creams/lotions
- Wait ≥30 min after use before bathing, swimming
- Store at room temperature

SIDE EFFECTS

CNS: *Dizziness, headache*
CV: HF, MI, stroke, edema
EENT: Tinnitus
GI: Nausea, anorexia, vomiting, diarrhea, constipation, flatulence, GI bleeding, hepatotoxicity
GU: Nephrotoxicity: hematuria
HEMA: Anemia, blood dyscrasias
INTEG: Rash, pruritus, photosensitivity
SYST: Anaphylaxis, Stevens-Johnson syndrome, exfoliative dermatitis, toxic epidermal necrolysis

PHARMACOKINETICS

PO: Peak 2-3 hr; **TOPICAL Patch:** Peak 12 hr; elimination half-life 1-2 hr, patch 12 hr, 99% bound to plasma proteins, metabolized in liver to metabolite, excreted in urine

INTERACTIONS

- Need for dosage adjustment: antidiabetics

Increase: hyperkalemia—potassium-sparing diuretics

Increase: anticoagulant effect—anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics, SSRIs

Increase: toxicity—phenytoin, lithium, cycloSPORINE, methotrexate, digoxin, lithium, cidofovir
Increase: GI side effects—aspirin, other NSAIDs, bisphosphonates, corticosteroids
Decrease: antihypertensive effect—beta-blockers, diuretics, ACE inhibitors
Decrease: effect of diuretics
Drug/Herb
Increase: bleeding risk—garlic, ginger, ginkgo; monitor for bleeding

NURSING CONSIDERATIONS

Assess:
- **CABG:** do not use oral, topical, gel, patch in perioperative pain in coronary artery bypass graft surgery for 10-14 days

Black Box Warning: Stroke/MI: may increase HF and hypertension; increased CV thrombotic events, which may be fatal; those with CV disease may be at greater risk

- **Pain:** location, character, aggravating/alleviating factors, ROM prior to and 1 hr after dose
- **Actinic keratosis:** check lesions prior to use and periodically
- LFTs (may be elevated), uric acid (may be decreased—serum; increased—urine) periodically; also BUN, creatinine, electrolytes (may be elevated)
- **Serious skin disorders/anaphylaxis:** if rash develops, discontinue immediately, may be fatal; patients with asthma, aspirin hypersensitivity, nasal polyps may develop hypersensitivity
- **GI bleed:** Increased risk for peptic/duodenal ulceration, perforation, obstruction, GI bleeding
- **Blood dyscrasias (thrombocytopenia):** Bruising, fatigue, bleeding, poor healing; blood counts during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued and restarted after hematologic recovery; check stool guaiac
- **Beers:** avoid chronic use in older adults unless other alternatives are ineffective; increased risk of GI bleeding
- **Pregnancy/breastfeeding:** use only if benefit outweighs fetal risks <30 wk, do not use after 30 wk; discontinue breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: decreased inflammation in joints, after cataract surgery

Teach patient/family:
- That product must be continued for prescribed time to be effective; to contact prescriber prior to surgery regarding when to discontinue this product
- To report bleeding, bruising, fatigue, malaise; **blood dyscrasias** do occur
- To notify prescriber immediately, stop product if rash occurs
- To avoid aspirin, alcoholic beverages, NSAIDs, or other OTC medications unless approved by prescriber
- To take with food, milk, or antacids to avoid GI upset; to swallow whole
- To use caution when driving; drowsiness, dizziness may occur
- To report **hepatotoxicity:** flulike symptoms, nausea, vomiting, jaundice, pruritus, lethargy
- To use sunscreen to prevent photosensitivity
- To notify all providers of product use
- To notify prescriber if pregnancy is planned or suspected
- **Stroke/MI:** to notify prescriber immediately, seek medical attention if chest pain, slurred speech, weakness, shortness of breath occur
- **Gel:** to use dosing card to measure; not to apply where cosmetics, sunscreen have been applied
- **Transdermal:** not to use in water (swimming/bathing); to use only on intact skin; not to cover with occlusive dressing; to apply adhesive tape or mesh sleeve if patch begins to peel off

diclofenac ophthalmic
See Appendix B

dicyclomine (Rx)

(dye-sye′kloe-meen)

Bentyl

Func. class.: Gastrointestinal anticholinergic, antispasmodic

ACTION:

Inhibits acetylcholine on receptors, decreases GI motility

USES: IBS

CONTRAINDICATIONS: Hypersensitivity to anticholinergics, closed-angle glaucoma, GI obstruction, myasthenia gravis, paralytic ileus, GI atony, toxic megacolon, dementia

DOSAGE AND ROUTES

- **Adult: PO** 10-20 mg tid-qid, max 160 mg/day; **IM** 10-20 mg q6hr; max 1-2 days
- **Child >2 yr: PO** 10 mg tid-qid
- **Child 6 mo-2 yr: PO** 5 mg tid-qid

Available forms: Capsules 10 mg; 20 mg; syrup 10 mg/mL; injection 10 mg/mL

Administer:

PO route

- Protect from light/heat
- **Children:** Syrup should be diluted with equal volume of water before use

IM route

- Aspirate prior to use
- Do not give IV, SUBCUT

SIDE EFFECTS

CNS: Headache, dizziness, fever, insomnia, drowsiness, confusion, numbness, excitement, restlessness

GI: Dry mouth, thirst, constipation, nausea, vomiting, distention, paralytic ileus

GU: Urinary hesitancy/urgency, ED

EENT: Blurred vision, increased IOP, photophobia

INTEG: Rash, urticaria, allergic reaction

MISC: Heat stroke

PHARMACOKINETICS

Onset unknown, peak 1-1½, duration unknown, half-life 1.8 hr

INTERACTIONS

Increase: side effects—antihistamines, antiparkinson agents, phenothiazines, TCAs, avoid using together

Decrease: dicyclomine effect—antacids, use antacids 1 hr prior to product

Decrease: effect of anticoagulants—anticoagulants

Decrease: effect of motility agents

NURSING CONSIDERATIONS

Assess:

- **IBS symptoms:** assess for constipation/diarrhea or both, abdominal pain, bloating, gas. Identify if product is lessening symptoms
- **Pregnancy/breastfeeding:** used in pregnancy to decrease nausea/vomiting; do not breastfeed
- **Anticholinergic effects:** Monitor for dry mouth, constipation, dizziness
- **CNS changes:** Assess for dizziness, drowsiness; caution against driving or other hazardous activities until response is known
- **Pregnancy/breastfeeding:** Use in pregnancy only if clearly needed, do not breastfeed

Evaluate:

- Therapeutic response
- Decreasing abdominal pain, bloating, gas, diarrhea/constipation

Teach patient/family:

- To report anticholinergic effects
- Not to drive or perform other hazardous activities until response is known
- Pregnancy/breastfeeding: do not breastfeed

didanosine (Rx)

(dye-dan′oh-seen)

Videx EC

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION: Nucleoside analog incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES: HIV-1 infection in combination with at least 2 other antiretrovirals

CONTRAINDICATIONS: Hypersensitivity, lactic acidosis, pancreatitis, phenylketonuria

Precautions: Pregnancy, breastfeeding, children, renal disease, sodium-restricted diets, elevated amylase, preexisting peripheral neuropathy, hyperuricemia, gout, HF, noncirrhotic portal hypertension

Black Box Warning: Hepatic disease, lactic acidosis, pancreatitis

DOSAGE AND ROUTES

- **Adult/adolescent/child ≥6 yr and ≥60 kg: PO DELAYED-RELEASE CAPSULE** 400 mg/day; if used with tenofovir, reduce to 250 mg/day
- **Adult/adolescent/child ≥6 yr and 25 kg to <60 kg: PO DELAYED-RELEASE CAPSULE** 250 mg/day; if used with tenofovir, reduce to 200 mg/day
- **Adolescent 20 kg to <25 kg: PO DELAYED-RELEASE CAPSULE** 200 mg/day
- **Adult ≥60 kg: PO ORAL SOLUTION** 200 mg bid or 400 mg/day; if used with tenofovir, reduce to 250 mg/day
- **Adult <60 kg: PO ORAL SOLUTION** 125 mg bid or 250 mg/day; if used with tenofovir, reduce to 200 mg/day
- **Adolescent/child/infant >8 mo: PO ORAL SOLUTION** 120 mg/m^2 every 12 hr, max adult dosing
- **Infant <8 mo/neonate ≥2 wk: PO ORAL SOLUTION** 100 mg/m^2 every 12 hr for up to 3 mo

Renal dose

- **Adult: PO** CrCl ≥60 mL/min: No change
- **Adult/adolescent ≥60 kg: PO** CCr 30-59 mL/min: reduce oral solution to 100 mg 12 hr or 200 mg every 24 hr; reduce extended-release capsules to 200 mg/day; CCr 10-29 mL/min: reduce oral solution to 150 mg every 24 hr; reduce extended-release capsules to 125 mg/day; CCr <10 mL/min: reduce oral solution to 100 mg every 24 hr; reduce extended-release capsules to 125 mg/day
- **Adult/adolescent <60 kg: PO** CCr 30-59 mL/min: reduce oral solution to 75 mg every 12 hr or to 150 mg every 24 hr; reduce extended-release capsules to 125 mg/day; CCr 10-29 mL/min: reduce oral solution to 100 mg every 24 hr; reduce extended-release capsules to 125 mg/day; CCr <10 mL/min: reduce oral solution to 75 mg every 24 hr; extended-release capsules are not recommended

Available forms: Powder for oral solution 10 mg/mL; delayed-release capsules 125, 200, 250, 400 mg

Administer:

- Pediatric: powder for oral solution after preparation by pharmacist; dilution required using purified USP water, then antacid (10 mg/mL), refrigerate, shake before use
- On an empty stomach ≥30 min prior to or 2 hr after meals
- Adjust dose with renal impairment
- Store tablets, capsules in tightly closed bottle at room temperature; store oral solution after dissolving at room temperature ≤4 hr

SIDE EFFECTS

CNS: Peripheral neuropathy, seizures, confusion, *anxiety,* hypertonia, abnormal thinking, asthenia, *insomnia,* CNS depression, pain, dizziness, chills, fever
CV: Hypertension, vasodilation, dysrhythmia, syncope, HF, palpitation
EENT: Ear pain, otitis, photophobia, visual impairment, retinal depigmentation, optic neuritis
GI: Pancreatitis, *diarrhea, nausea,* vomiting, *abdominal pain,* constipation, stomatitis, dyspepsia, liver abnormalities, flatulence, taste perversion, dry mouth, oral thrush, melena, increased ALT/AST, alkaline phosphatase, amylase, hepatic failure, noncirrhotic portal hypertension
GU: Increased bilirubin, uric acid
HEMA: Leukopenia, granulocytopenia, thrombocytopenia, anemia
INTEG: *Rash, pruritus,* alopecia, ecchymosis, hemorrhage, petechiae, sweating
MS: Myalgia, arthritis, myopathy, muscular atrophy
RESP: Cough, pneumonia, dyspnea, asthma, epistaxis, hypoventilation, sinusitis
SYST: Lactic acidosis, anaphylaxis

PHARMACOKINETICS

PO: Peak 0.67 hr, delayed release 2 hr; half-life 1½ hr, child 1 hr; extensive metabolism; administration within 5 min of food will decrease absorption (50%); excreted in urine, feces

INTERACTIONS

Increase: didanosine level—allopurinol, tenofovir
Increase: side effects from magnesium, aluminum antacids
Increase: pancreatitis risk—stavudine

Black Box Warning: Increase: fatal acetic acidosis: Stavudine (pregnancy), do not use together

Decrease: absorption—ketoconazole, dapsone
Decrease: concentrations of fluoroquinolones, other antiretrovirals, itraconazole, tetracyclines

Black Box Warning: Increase: fatal lactic acidosis—stavudine, tenofovir, other antiretrovirals; do not use together

- **Do not use with these products PO:** gatifloxacin, gemifloxacin, levoFLOXacin, moxifloxacin, norfloxacin

Drug/Food

- Any food decreases rate of absorption 50%; do not use with food
- Do not use with acidic juices

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Pancreatitis: do not use in those with symptoms of pancreatitis; may be dose related in advanced HIV, alcoholism, history of pancreatitis

- **Peripheral neuropathy:** tingling or pain in hands and feet, distal numbness; onset usually occurs 2-6 mo after beginning treatment; may persist if product not discontinued

Black Box Warning: Lactic acidosis, severe hepatomegaly, pancreatitis: abdominal pain, nausea, vomiting, elevated hepatic enzymes; product should be discontinued because condition can be fatal

- Children by dilated retinal exam q6mo may be considered to rule out retinal depigmentation
- CBC, differential, platelet count monthly; notify prescriber of results; alkaline phosphatase, monitor amylase; viral load, CD4 count
- **Renal studies:** BUN, serum uric acid, urine CCr prior to, during therapy
- Temperature may indicate beginning infection
- **Hepatic studies** prior to, during therapy (bilirubin, AST, ALT) as needed, monthly
- Cleanup of powdered products; use wet mop or damp sponge

Black Box Warning: Pregnancy/breastfeeding: identify if pregnancy is planned or suspected; product is not recommended in initial treatment due to toxicity; do not breastfeed; enroll in the Antiretroviral Pregnancy Registry (800-258-4263); do not use with stavudine

Evaluate:

- Therapeutic response: absence of infection; symptoms of HIV

Teach patient/family:

Black Box Warning: Pancreatitis: to report immediately abdominal pain, diarrhea, nausea, vomiting

- To report numbness, tingling in extremities
- To take on an empty stomach; not to take dapsone at same time as ddI; not to mix powder with fruit juice; to chew tablets or

crush and dissolve in water; to drink powder immediately after mixing
• To report signs of **infection:** increased temperature, sore throat, flulike symptoms; other infections and complications may still occur
• To report signs of **anemia:** fatigue, headache, faintness, SOB, irritability
• To report **bleeding;** to avoid use of razors, commercial mouthwash
• That product does not cure symptoms, only controls them; that infection of others may occur via sex or blood

Black Box Warning: Pregnancy/breastfeeding: identify if pregnancy is planned or suspected, do not use with stavudine, fatal lactic acidosis may occur

difelikefalin (RX)

(dye-fel-i-KEF-a-lin)

Korsuva

Func. class.: Selective opioid receptor agonist

USES: Chronic kidney disease–associated pruritus

DOSAGE AND ROUTES

• **Adult IV** 0.5 mcg/kg at the end of each hemodialysis treatment

Available forms: Injection: 65 mcg/1.3 mL (50 mcg/mL)

difluprednate (ophthalmic) (Rx)

(die-flu′pred-nate)

Durezol

Func. class.: Ophthalmic antiinflammatory

Chem. class.: Corticosteroid

USES: For the treatment of postoperative ocular pain and postoperative ocular inflammation; for the treatment of endogenous anterior uveitis

CONTRAINDICATIONS: Hypersensitivity to this product, glycerin, polysorbate, ocular TB, acute herpes simplex (superficial), fungal/viral infections of the eye

Precautions: Pregnancy, breastfeeding, children, corneal infected abrasions, glaucoma

DOSAGE AND ROUTES

Postoperative ocular pain, inflammation

• **Adult/geriatric/adolescents/children/infants: OPHTH** Instill 1 drop into the conjunctival sac of the affected eye(s) qid beginning 24 hr after surgery; continue giving 4×/day for the first 2 wk of the postoperative period, then administer bid × 1 wk; at the end of the third week, taper dosage based on response

Endogenous anterior uveitis

• **Adult: OPHTH** Instill 1 drop into the conjunctival sac of the affected eye(s) qid × 14 days, followed by tapering based on response

⚠ HIGH ALERT

digoxin (Rx) NTI

(di-jox′in)

Digitek, Digox, Lanoxin, Lanoxin Pediatric, Toloxin

Func. class.: Cardiac glycoside, inotropic, antidysrhythmic

Chem. class.: Digoxin preparation

Do not confuse:
Lanoxin/Lasix/Lonox/Lomotil/Xanax/naloxone

ACTION: Inhibits the sodium-potassium ATPase pump, which makes more calcium available for contractile proteins, thereby resulting in increased cardiac output (positive inotropic effect); increases force of contractions; decreases heart rate (negative chronotropic effect); decreases AV conduction speed

USES: Heart failure, atrial fibrillation/flutter
Unlabeled uses: Paroxysmal supraventricular tachycardia (PSVT) treatment/prophylaxis

CONTRAINDICATIONS: Hypersensitivity to digoxin, ventricular fibrillation, ventricular tachycardia
Precautions: Pregnancy, breastfeeding, geriatric patients, renal disease, acute MI, AV block, severe respiratory disease, hypothyroidism, sinus nodal disease, hypokalemia, carotid sinus syndrome, second- or third-degree heart block, electrolyte disturbances, hypertension, cor pulmonale, Wolff-Parkinson-White syndrome

DOSAGE AND ROUTES—NTI

- Digitalization may be done either by rapid digitalization with a loading dose over days or gradual digitalization with slow titration over weeks
- Digoxin injection is often used first to achieve rapid digitalization, then switched to PO dosing for maintenance
- Total loading dose (rapid, IV) is divided and administered 50% of dose over 5 min, then 25% at 4-8 hr after initial dose, and last 25% at 8-16 hr after first dose

Heart failure

- Target serum level ≤1.3 nmol/L

Optional loading dose

- **Adult: IV/PO** 10 mcg/kg lean body weight

Maintenance dose

- **Adult: PO** 0.0625-0.125 mg daily (usual max, 0.25 daily)
- **Older adult: PO** 0.0625-0.125 mg daily (usual max, 0.125 mg daily)

Atrial fibrillation

- Target serum level 1.3-2.6 nmol/L

Optional loading dose

- **Adult: IV/PO** 10 mcg/kg lean body weight Adult dosages/body weight

Maintenance dose

- **Adult: PO** 0.125-0.25 mg daily (usual max 0.25 mg daily)

Child: 2-5 yr: 10-15 mcg/kg: 5-10 yr: 7-10 mcg/kg; >10 yr 3-5 mcg/kg

Digitalization and maintenance doses (digoxin IV and digoxin oral solution) in children

Age	Oral Digitalizing Dose (mcg/kg)	IV Digitalizing Dose (mcg/kg)	Daily maintenance dose PO/IV (mcg/kg)	Clinical Notes
Premature	20-30	15-25	20%-30% of digitalizing dose	Divided daily dosing
Full Term	25-35	20-30	25%-35% of digitalizing dose	
1-24 mo	35-60	30-50		
2-5 yr	30-40	25-35		
5-10 yr	20-35	15-30		
Over 10 yr	10-15	8-12		Adult dosages/body weight

Available forms: Elixir 0.05 mg/mL; tablets 0.0625, 0.125, 0.1875, 0.25, 0.5 mg; injection ✱, 0.25 mg/mL; pediatric injection 0.1 mg/mL

- Serum levels should be drawn just prior to the next scheduled dose or within 6-8 hr after last dose
- Apical heart rate (BPM) must be assessed prior to administering dose; follow agency protocol for minimum BPM for administering digoxin (usually 60 BPM)

Administer:

PO route

- Serum levels should be drawn just prior to the next scheduled dose or again 6-8 hr after the last dose
- Apical heart rate (BPM) must be assessed prior to administering dose; follow agency protocol for minimum BPM for administering digoxin (usually 60 BPM)

• **Bioavailability varies among different oral dosage forms and different brands; changing from one preparation to another might require dosage adjustments**

• Digitalization may be done either by rapid digitalization with a loading dose over days or gradual digitization with slow titration over weeks

• Digoxin injection is often used first to achieve rapid digitalization, then switched to PO dosing for maintenance

• Total loading dose (rapid, IV) is divided and administered: 50% of dose over 5 min, then 25% at 4-8 hr after initial dose, and last 25% at 8-16 hr after first dose

• **All dosage forms:** may be administered without regard to meals

• **Tablet:** may be crushed and administered with food or fluids

• **Pediatric elixir:** administer using a calibrated measuring device

Injectable

• When changing from PO to IM/IV, use 20%-25% less

• IV is preferred over IM because it is less painful and more rapid action

• PO should replace parenteral therapy as soon as possible

• Visually inspect parenteral products for particulate matter and discoloration prior to use

IM route

• Do not administer >2 mL at any one IM injection site

• Inject deeply into gluteal muscle, then massage area

IV route

• Monitor ECG during and for 6 hr after IV use; watch for dysrhythmias or bradycardia; notify prescriber

• May be given undiluted or each 1 mL may be diluted in 4 mL of sterile water for injection, NS, D_5W, or LR; diluent volumes <4 mL will cause precipitation; use diluted solutions immediately

• Inject over ≥5 min via Y-site or 3-way stopcock; in patients with pulmonary edema, administer over 10-15 min; to avoid inadvertent overdosage, do not flush the syringe following administration

• Check for potency and check site for redness, inflammation, infiltration; tissue sloughing can occur

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, methicillin, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, metilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/

sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache,* drowsiness, apathy, confusion, disorientation, fatigue, depression, hallucinations

CV: Dysrhythmias, *hypotension,* bradycardia, AV block

EENT: Blurred vision, yellow-green halos, photophobia, diplopia

GI: Nausea, vomiting, anorexia, abdominal pain, diarrhea

PHARMACOKINETICS

Half-life 30-40 hr, excreted in urine, protein binding 20%-30%

PO: Onset ½-2 hr, peak 2-6 hr, duration 3-4 days

IV: Onset 5-30 min, peak 1-4 hr, duration variable

INTERACTIONS

Increase: toxicity—azole antifungals, macrolides, tetracyclines, ritonavir; monitor for toxicity

Increase: hypercalcemia, hypomagnesemia, digoxin toxicity—thiazides, parenteral calcium; monitor electrolytes

Increase: hypokalemia, digoxin toxicity—diuretics, amphotericin B, carbenicillin, ticarcillin, corticosteroids

Increase: digoxin levels—propantheline, quiNIDine, verapamil, amiodarone, anticholinergics, dilTIAZem, NIFEdipine, indomethacin

Increase: bradycardia—beta-adrenergic blockers, antidysrhythmics

Increase: cardiac dysrhythmia risk—sympathomimetics

Decrease: digoxin absorption—antacids, kaolin/pectin, cholestyramine, metoclopramide

Decrease: digoxin level—thyroid agents, cholestyramine, colestipol, metoclopramide, aMILoride

Drug/Food

Decrease: digoxin effect—food, separate by ≥1 hr

Decrease: GI absorption—flaxseed, psyllium

Drug/Herb

Increase: cardiac effects—foxglove, goldenseal, hawthorn, rue

Decrease: product effect—St. John's wort

Drug/Lab Test

Increase: CPK

NURSING CONSIDERATIONS

Assess:

- Apical pulse for 1 min prior to giving product; if pulse <60 in adult or <90 in infant, take again in 1 hr; if <60 in adult, call prescriber; note rate, rhythm, character; monitor ECG continuously during parenteral loading dose; monitor I&O, daily weight; check for edema
- Electrolytes: potassium, sodium, chloride, magnesium, calcium; renal function studies: BUN, creatinine; blood studies: ALT, AST, bilirubin, Hct, Hb before initiating treatment and periodically thereafter; monitor for decrease or increase in potassium
- Monitor product levels; therapeutic level 0.5-2 ng/mL, draw ≥6-8 hr after last dose, optimally 12-24 hr after a dose
- **Beers:** avoid dosage >0.125 mg/dL in atrial fibrillation, heart failure in older adults; decreased renal clearance may lead to toxicity
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed; excreted in breast milk (small amounts), may breastfeed

Evaluate:
• Therapeutic response: decrease in heart failure, dysrhythmias; serum digoxin level (0.5-2 ng/mL)
Teach patient/family:
• Not to stop product abruptly; about all aspects of product; to take exactly as ordered; how to monitor heart rate
• To avoid OTC medications, herbal remedies because many adverse product interactions may occur; not to take antacid within 2 hr of this product
• To notify prescriber of loss of appetite, lower stomach pain, diarrhea, weakness, drowsiness, headache, blurred or yellow vision, rash, depression, toxicity
• About the toxic symptoms of this product; when to notify prescriber
• To maintain a sodium-restricted diet as ordered
• To use one brand consistently, to keep in original container
• To notify prescriber if pregnancy is planned or suspected
• To carry ID stating condition treated, products taken
• How to take pulse, when to notify prescriber

TREATMENT OF OVERDOSE: Discontinue product; give potassium; monitor ECG; give adrenergic-blocking agent, digoxin immune FAB

digoxin immune FAB (Rx)

(di-jox′in im-myoon′ FAB)

DigiFab

Func. class.: Antidote—digoxin specific

USES: Life-threatening digoxin toxicity

CONTRAINDICATIONS: Mild digoxin toxicity, hypersensitivity to this product, papain or ovine protein

DOSAGE AND ROUTES
1 (40 mg) DigiFab binds 0.5 mg digoxin

Digoxin toxicity (known amount) (tablets, oral solution, IM)
• **Adult and child: IV** dose (mg) = dose ingested (mg) × 0.8/1000 × 38- or 40-mg vial
Toxicity (known amount) (capsule, IV)
• **Adult and child: IV** dose = dose ingested (mg)/0.5 × 38- or 40-mg vial
Toxicity (known amount) by serum digoxin concentrations (SDCs)
• **Adult and child: IV** SDC (ng/mL) × kg of weight/100 × 38- or 40-mg vial
Digoxin toxicity (unknown amount)
• **Adult and child >20 kg: IV** 228 mg (6 vials)
• **Infant and child <20 kg: IV** 38 mg (1 vial)
Acute ingestion
• **Adult: IV** 380 mg (10 vials)
Life-threatening ingestion
• **Adult: IV** 760 mg (20 vials)
Skin test
• **Adult: ID** 0.1 mL of 1:100 dilution, check after 20 min

⚠ HIGH ALERT

dilTIAZem (Rx)

(dil-tye′a-zem)

Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilt-XR, Matzim LA, Taztia XT, Tiadylt ER, Tiazac

Func. class.: Calcium channel blocker, antiarrhythmic class IV, antihypertensive
Chem. class.: Benzothiazepine

ACTION: Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, dilates coronary arteries, slows SA/AV node conduction times, dilates peripheral arteries

USES: **PO** angina pectoris due to coronary artery spasm, hypertension, improvement in exercise tolerance (chronic stable angina), **IV** atrial fibrillation, flutter, paroxysmal supraventricular tachycardia

CONTRAINDICATIONS:

Sick sinus syndrome, AV heart block, hypotension <90 mm Hg systolic, acute MI, pulmonary congestion, cardiogenic shock

Precautions: Pregnancy, breastfeeding, children, geriatric patients, HF, aortic stenosis, bradycardia, GERD, hepatic disease, hiatal hernia, ventricular dysfunction

DOSAGE AND ROUTES

Prinzmetal's or variant angina, chronic stable angina

- **Adult: PO** 30 mg qid, increasing dose gradually to 180-360 mg/day in divided doses or **EXTENDED RELEASE** (LA, CD, XT, XR products) 180-360 mg, max 480-540 mg/day, depending on brand

Atrial fibrillation/flutter, paroxysmal supraventricular tachycardia

- **Adult: IV BOLUS** 0.25 mg/kg over 2 min initially, then 0.35 mg/kg may be given after 15 min; if no response, may give **CONTINUOUS INFUSION** 5-15 mg/hr for up to 24 hr

Hypertension

- **Adult: PO** 30 mg tid, increase to max 480 mg/day; **EXTENDED RELEASE** 120-240 mg daily, max 540 mg/day; **SUSTAINED RELEASE** 60 mg bid, max 360 mg/day

Rapid ventricular rate secondary to dysrhythmias (unlabeled)

- **Adolescent/child/infant >7 mo: IV BOLUS** 0.25 mg/kg over 5 min, then **CONTINUOUS IV INFUSION** 0.11 mg/kg/hr

Exercise tolerance in chronic stable angina (Cardizem LA) Adult PO extended release 180 mg daily, increase q7-14days, max 360 mg

Available forms: Tablets 30, 60, 90, 120 mg; extended-release tablets 120, 180, 240, 300, 360, 420 mg; extended-release capsules 60, 90, 120, 180, 240, 300, 360, 420 mg; injection 5 mg/mL (5, 10 mL); powder for injection 100 mg

Administer:

PO route

- Not all products are interchangeable
- CCBs should be used cautiously in those prone to excessive hypotension with acute cerebral interactions, hemorrhage, edema, severely raised intracranial pressure or cerebrovascular insufficiency, or with outflow obstruction of the left ventricle (aortic stenosis)
- Store at room temperature
- **Cardizem LA** extended-release tablet 24 hr: give daily, either AM or PM, without regard to meals
- **Tiazac, Tiztia XT:** give daily without regard to meals
- **Conventional regular-release tablet:** give before meals, at bedtime
- **Cardizem CD or equivalent (Cartia XT):** generic extended-release capsule 24 hr: give daily, without regard to meals
- May crush, sprinkle regular tablet on applesauce for administration

Direct IV route

- IV undiluted over 2 min

Continuous IV INFUSION route

- Diluted 125 mg/100 mL, 250 mg/250 mL of D_5W, 0.9% NaCl, D_5/0.45% NaCl, give 10 mg/hr, may increase by 5 mg/hr to 15 mg/hr, continue infusion up to 24 hr max

Y-site compatibilities: Albumin, amikacin, amphotericin B, aztreonam, bumetanide, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, digoxin, DOBUTamine, DOPamine, doxycycline, EPINEPHrine, erythromycin, esmolol, fentaNYL, fluconazole, gentamicin, hetastarch, HYDROmorphone, imipenem-cilastatin, labetalol, lidocaine, LORazepam, meperidine, metoclopramide, metroNIDAZOLE, midazolam, milrinone, morphine, multivitamins, niCARdipine, nitroglycerin, norepinephrine, oxacillin, penicillin G potassium, pentamidine, piperacillin, potassium chloride, potassium phosphates, ranitidine, sodium nitroprusside, theophylline, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium

SIDE EFFECTS

CNS: Tremor, paresthesia

CV: Dysrhythmia, *edema*, HF, bradycardia, hypotension, palpitations

GI: *Nausea,* vomiting, diarrhea, *constipation*
GU: Nocturia, polyuria, sexual dysfunction, dysuria
INTEG: *Rash,* flushing, photosensitivity, burning, pruritus, Stevens-Johnson syndrome, sweating
RESP: Rhinitis, dyspnea, pharyngitis, cough
EENT: Blurred vision, epistaxis, tinnitus
ENDO: Hyperglycemia, gynecomastia
HEMA: Anemia, leukopenia, thrombocytopenia
MS: Stiffness, muscle cramps
MISC: Gingival hyperplasia

PHARMACOKINETICS

Onset 30-60 min; peak 2-3 hr immediate release, 10-14 hr extended release, 11-18 hr sustained release; half-life 3½-9 hr; metabolized by liver; excreted in urine (96% as metabolites)

INTERACTIONS

Increase: effect, toxicity—theophylline, lithium
Increase: effects of beta-blockers, digoxin, lithium, carBAMazepine, cycloSPORINE, anesthetics, HMG-CoA reductase inhibitors, benzodiazepines, methylPREDNISolone; monitor for increased action of each product
Increase: AV node slowing—cimetidine, ranitidine; monitor closely
Decrease: antihypertensive effect—NSAIDs, phenobarbital, phenytoin
Drug/Food
Increase: dilTIAZem effect—grapefruit juice; avoid use

NURSING CONSIDERATIONS

Assess:

- **HF:** dyspnea, weight gain, edema, jugular venous distention, rales; monitor I&O ratios daily, weight
- **Angina:** location, duration, alleviating factors, activity when pain starts
- **Dysrhythmias:** cardiac status: B/P, pulse, respiration, ECG and intervals PR, QRS, QT; if systolic B/P <90 mm Hg or HR <50 BPM, hold dose, notify prescriber; monitor B/P, ECG continuously if using IV; report bradycardia, have emergency equipment nearby
- Monitor if refills are being purchased
- Monitor digoxin levels if taking both products, digoxin toxicity is more common
- Potassium baseline and periodically; LFTs, renal studies
- Stevens-Johnson syndrome: assess for rash, fever, fatigue, mouth blistering; discontinue product immediately if severe
- **Beers:** avoid extended-release capsule in older adults; promotes fluid retention, exacerbates heart failure
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding; no well-controlled studies; use only if benefit outweighs fetal risk; discontinue breastfeeding or product, excreted in breast milk

Evaluate:

- Therapeutic response: decreased anginal pain, decreased B/P, increased exercise tolerance

Teach patient/family:

- How to take pulse, B/P before taking product; that a record or graph should be kept
- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- To limit caffeine consumption; to avoid grapefruit juice
- To discuss OTC, Rx, herbals, supplements with provider
- About the importance of complying with all areas of medical regimen: diet, exercise, stress reduction, product therapy
- To report dizziness, SOB, palpitations, rash, nausea, headache, swelling of face, hands
- Not to discontinue abruptly
- To use sunscreen, protective clothing to prevent photosensitivity
- To rise or change positions slowly, orthostatic hypotension may occur
- **Angina:** To discuss other therapy, including nitrates, beta-blockers and when to take
- To use good oral hygiene and teeth cleaning, gingival hyperplasia occurs
- **Pregnancy:** to avoid pregnancy and breastfeeding

TREATMENT OF OVERDOSE:

Atropine for AV block, vasopressor for hypotension

dimenhyDRINATE (OTC, Rx)

(dye-men-hye′dri-nate)

Dramamine, Driminate, GoodSense Motion Sickness, Gravol ✱ TripTone, Wal-Dram

Func. class.: Antiemetic, antihistamine, anticholinergic

Chem. class.: H_1-receptor antagonist, ethanolamine derivative

Do not confuse:
dimenhydrinate/diphenhydramine

USES: Motion sickness, nausea, vomiting, vertigo

CONTRAINDICATIONS: Hypersensitivity, infants, neonates, tartrazine dye hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, cardiac dysrhythmias, asthma, prostatic hypertrophy, bladder-neck obstruction, closed-angle glaucoma, stenosing peptic ulcer, pyloroduodenal obstruction

DOSAGE AND ROUTES

- **Adult: PO** 50-100 mg q4hr; max 400 mg/24 hr; **IM/IV** 50 mg q4hr as needed (Canada only)
- **Child 6-12 yr: PO** 25-50 mg q6-8hr prn, max 150 mg/day
- **Child 2-5 yr: PO** 12.5-25 mg q6-8hr, max 75 mg/day

dimethyl fumarate (Rx)

(dye-meth′il fue′ma-rate)

Tecfidera

Func. class.: Immunomodulator

USES: Relapsing multiple sclerosis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, immunosuppression, infertility, male-mediated teratogenicity

DOSAGE AND ROUTES

- **Adult: PO** 120 mg bid × 7 days, may increase to 240 mg bid for maintenance

Available forms: Delayed-release capsule 120, 240 mg

dinoprostone (Rx)

(dye-noe-prost′one)

Cervidil, Prepidil, Prostin E2

Func. class.: Oxytocic, abortifacient

Chem. class.: Prostaglandin E_2

USES: Cervical ripening

CONTRAINDICATIONS: Hypersensitivity, C-section, surgery, fetal distress, multiparity, vaginal bleeding, cephalopelvic disproportion

Precautions: Pregnancy, cardiac disease, asthma, anemia, jaundice, diabetes mellitus, seizure disorders, hypertension, glaucoma, uterine fibrosis, cervical stenosis, pelvic surgery, pelvic inflammatory disease, respiratory disease

Black Box Warning: Requires a specialized setting and an experienced clinician

DOSAGE AND ROUTES

Cervical ripening

- **Adult: GEL** 0.5 mg vaginal gel placed in cervical canal, may repeat after 6 hr, max 1.5 mg/24 hr; vaginal insert 10 mg high in vagina, remove at onset of active labor or within 12 hr

Available forms: Vaginal gel 0.5 mg/3 g; vaginal insert 10 mg

diphenhydrAMINE (OTC, Rx)

(dye-fen-hye′dra-meen)

Aler-Dryl, Allergy Childrens, Allergy Relief Childrens, Allergy Relief, Anti-Hist Allergy, Aurodryl Allergy Childrens, Banophen, Benadryl Allergy Childrens, Benadryl Allergy, Complete Allergy Relief, Di-Phen,

Diphen, Diphenhist, Genahist, Geri-Dryl. GoodSense Allergy Relief, GoodSense Sleep Aid, M-Dryl, Naramin, Nighttime Sleep Aid, Nytol Maximum Strength, Nytol, Ormir, PediaCare Childrens Allergy, Pharbedry, Siladryl Allergy, Simply Sleep, Sleep Tabs, Tetra-Formula Nighttime Sleep, Total Allergy Medicine, Total Allergy, ZzzQuil

Func. class.: Antihistamine (first generation, nonselective)

Chem. class.: Ethanolamine derivative, H_1-receptor antagonist

Do not confuse:
diphenhydrAMINE/dicyclomine/dimenhyDRINATE

ACTION: Acts on blood vessels, GI, respiratory system by competing with histamine for H_1-receptor site; decreases allergic response by blocking histamine

USES: Allergy symptoms, rhinitis, motion sickness, antiparkinsonism, nighttime sedation, infant colic, nonproductive cough, insomnia in children

CONTRAINDICATIONS: Hypersensitivity to H_1-receptor antagonist, neonates

Precautions: Pregnancy, breastfeeding, children <6 yr, increased intraocular pressure, cardiac/renal disease, hypertension, bronchial asthma, seizure disorder, stenosed peptic ulcers, hyperthyroidism, prostatic hypertrophy, bladder neck obstruction

DOSAGE AND ROUTES

Antihistamine/antiemetic/antivertigenia

- **Adult/child >12 yr: PO** 25-50 mg q4-6hr, max 300 mg/day; **IM/IV** 10-50 mg, max 300 mg/day
- **Child 6-12 yr: PO/IM/IV** 12.5-25 mg/dose
- **Child 2-6 yr: PO** 6.25 mg/dose

Nighttime sleep aid

- **Adult and child ≥12 yr: PO** 25-50 mg at bedtime

Antitussive (syrup only)

- **Adult and child >12 yr: PO** 25 mg q4hr, max 150 mg/24 hr
- **Child 6-12 yr: PO** 12.5 mg q4hr, max 75 mg/24 hr

Motion sickness

- **Adult: IM/IV** 10-50 mg, max 25 mg/min; doses up to 100 mg/dose may be used; **PO** 25-50 mg q4-6hr

Available forms: Capsules 25, 50 mg; tablets 25, 50 mg; chewable tablets 12.5 mg; elixir 12.5 mg/5 mL; syrup 12.5 mg/5 mL; injection 50 mg/mL

Administer:

- Avoid use in children <6 yr; death has occurred; overdose has occurred with topical gel taken orally (adult/child)
- With meals for GI symptoms; absorption rate may slightly decrease
- At bedtime only if using for sleep aid

IM route

- Deep IM in large muscle; rotate site

Direct IV route

- Undiluted; give 25 mg/min or less

Intermittent IV INFUSION route

- Dilute with 0.9% NaCl, 0.45% NaCl, D_5W, 0.9% NaCl, $D_{10}W$, LR, Ringer's

Y-site compatibilities: Acetaminophen, aldesleukin, alfentanil hydrochloride, amifostine, amikacin sulfate, aminocaproic acid, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium besylate, atropine sulfate, azithromycin, benztropine mesylate, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefTAZidime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, digoxin, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole,

fludarabine, folic acid, gallium, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methicillin, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, seizures
CV: Hypotension, palpitations
EENT: Blurred vision, tinnitus, nasal stuffiness
GI: Nausea, anorexia, diarrhea
GU: *Retention,* dysuria, frequency
HEMA: Thrombocytopenia, agranulocytosis, hemolytic anemia
INTEG: Photosensitivity, rash
MISC: Anaphylaxis
RESP: Increased thick secretions, wheezing, chest tightness

PHARMACOKINETICS

Metabolized in liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-4 hr
PO: Peak 2-4 hr, duration 4-8 hr
IM: Onset ½ hr, peak 2-4 hr, duration 4-8 hr
IV: Onset immediate, duration 4-8 hr

INTERACTIONS

Increase: CNS depression—barbiturates, opiates, hypnotics, tricyclics, alcohol
Increase: diphenhydrAMINE effect—MAOIs

Drug/Herb

Increase: CNS depression—chamomile, kava, valerian

Drug/Lab Test

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Urinary retention, frequency, dysuria; product should be discontinued
- CBC during long-term therapy; blood dyscrasias may occur
- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- **EPS:** If using for dystonic reactions, assess type of involuntary movement and evaluate response to medication
- **Cough:** Characteristics (type, frequency, thickness of secretions); evaluate response to this medication, increase fluids to 2L/day unless contraindicated
- **Anaphylaxis:** used for this rash, throat tightness, have emergency equipment nearby

- Store in tight container at room temperature
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excreted in breast milk

Evaluate:

- Therapeutic response: absence of running or congested nose or rashes, improved sleep

Teach patient/family:
- About all aspects of product use; to notify prescriber of confusion, sedation, hypotension
- To avoid driving, other hazardous activity if drowsiness occurs
- That photosensitivity may occur, use sunscreen, protective clothing
- To avoid concurrent use of alcohol, other CNS depressants
- To use hard candy, gum, frequent rinsing of mouth for dryness
- Product should be discontinued 4 days before skin allergy tests
- Not to use for sedation in child <4 yr, deaths have occurred
- **Pregnancy/breastfeeding:** To report if pregnancy is planned or suspected or if breastfeeding, avoid if breastfeeding

TREATMENT OF OVERDOSE: Administer diazePAM, vasopressors, phenytoin IV

diphenoxylate/atropine (Rx)

(dye-fen-ox′ee-late/a′troe-peen)

Lomotil, Lonox

difenoxin/atropine (Rx)

(dye-fen-ox′in/a′troe-peen)

Motofen

Func. class.: Antidiarrheal

Chem. class.: Phenylpiperidine derivative opiate agonist

Controlled Substance Schedule V

diphenoxylate/atropine

Controlled Substance Schedule **IV**

difenoxin/atropine

USES: Acute nonspecific and acute exacerbations of chronic functional diarrhea

CONTRAINDICATIONS: Children <2 yr, hypersensitivity, CDAD, severe electrolyte imbalances, diarrhea associated with organisms that penetrate intestinal mucosa

DOSAGE AND ROUTES

Diphenoxylate/atropine
- **Adult: PO** 5 mg qid titrated to patient response needed, max 8 tablets/day
- **Child 2-12 yr: PO** (liquid only) 0.3-0.4 mg/kg/day in 4 divided doses

Difenoxin/atropine
- **Adult: PO** 2 tablets, then 1 tablet after each loose stool or q3-4hr prn, max 8 tablets/day

Available forms: Diphenoxylate/atropine 2.5 mg/0.025 mg/5 mL solution, tablet; difenoxin/atropine tablet 1 mg/0.025 mg

dipyridamole (Rx)

(dye-peer-id′a-mole)

Persantine

Func. class.: Coronary vasodilator, antiplatelet agent

Chem. class.: Nonnitrate

ACTION: Inhibits adenosine uptake, which produces coronary vasodilation; increases oxygen saturation in coronary tissues, coronary blood flow; acts on small resistance vessels with little effect on vascular resistance; may increase development of collateral circulation; decreases platelet aggregation by the inhibition of phosphodiesterase (an enzyme)

USES: Prevention of transient ischemic attacks, inhibition of platelet adhesion to prevent myocardial reinfarction, thromboembolism, with warfarin in prosthetic heart valves, prevention of coronary bypass graft occlusion with aspirin; IV form used to evaluate CAD; used as alternative to exercise with thallium myocardial perfusion imaging to evaluate CAD

Unlabeled uses: Cardiomyopathy, MI prophylaxis, proteinuria, TIA, valvular heart disease

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, hypotension, unstable angina, asthma, hepatic disease, labor

DOSAGE AND ROUTES

Inhibition of platelet adhesion

- **Adult: PO** 75-100 mg qid in combination with warfarin, 75 mg qid with aspirin

Thallium myocardial perfusion imaging

- **Adult: IV** 570 mcg/kg, max 60 mg/day

TIA with aspirin (unlabeled)

- **Adult: PO** 225-400 mg/day max 400 mg/day

Available forms: Tablets 25, 50, 75 mg; injection 10 mg/2 mL

Administer:

PO route

- On empty stomach: 1 hr before meals or 2 hr after; give with 8 oz water for better absorption
- Store at room temperature

IV route

- IV after diluting to at least 1:2 ratio using D_5W, 0.45% NaCl, or 0.9% NaCl to a total volume of 20-50 mL; give over 4 min; do not give undiluted
- Inject thallium 201 within 5 min after product infusion
- Do not admix

SIDE EFFECTS

CNS: *Headache, dizziness, weakness, fainting, syncope;* IV: transient cerebral ischemia, weakness

CV: *Postural hypotension;* IV: MI

GI: *Nausea, vomiting,* anorexia, diarrhea

INTEG: *Rash,* flushing

PHARMACOKINETICS

PO: Peak 75 min; **IV** peak 2 min, therapeutic response may take several months, metabolized in liver, excreted in bile, undergoes enterohepatic recirculation, protein binding 91%-99%, terminal half-life 12 hr

INTERACTIONS

- Prevention of coronary vasodilation: theophylline, other xanthines; do not use together, causes a false-negative thallium imaging result

Increase: digoxin effect—digoxin

Increase: bleeding risk—NSAIDs, cefoTEtan, valproic acid, salicylates, sulfinpyrazole, anticoagulants, thrombolytics; monitor for bleeding

Increase: adenosine effects

Increase: myasthenia gravis effects—cholinesterase inhibitors

NURSING CONSIDERATIONS

Assess:

- B/P, pulse during treatment until stable; take B/P lying, standing; orthostatic hypotension is common
- Cardiac status: chest pain; what aggravates, ameliorates condition
- **Pregnancy/breastfeeding:** no well-controlled studies, use only if clearly needed; cautious use in breastfeeding, excreted in breast milk

Evaluate:

- Therapeutic response: decreased platelet adhesion

Teach patient/family:

- That medication is not a cure; may have to be taken continuously in evenly spaced doses only as directed
- To avoid hazardous activities until stabilized on medication; dizziness may occur
- To rise slowly from sitting or lying to prevent orthostatic hypotension
- Not to use alcohol or OTC medications unless approved by prescriber
- About cardiac stress testing, expectations

diroximel (Rx)

(dye-rox'i-mel)

Vumerity

Func. class.: MS agent

USES: Relapsing multiple sclerosis

CONTRAINDICATIONS

Hypersensitivity

DOSAGE AND ROUTES

- **Adults: PO** 231 mg bid for 7 days, then increase to 462 mg bid

Available forms: Delayed-release capsule 231 mg

⚠ HIGH ALERT

DOBUTamine (Rx)

(doe-byoo'ta-meen)

Func. class.: Adrenergic direct-acting β_1-agonist, cardiac stimulant

Chem. class.: Catecholamine

Do not confuse:
DOBUTamine/DOPamine

ACTION: Causes increased contractility, increased cardiac output without marked increase in heart rate by acting on β_1-receptors in heart; minor α and β_2 effects

USES: Cardiac decompensation due to organic heart disease or cardiac surgery
Unlabeled uses: Cardiogenic shock in children; congenital heart disease in children undergoing cardiac catheterization

CONTRAINDICATIONS: Hypersensitivity, idiopathic hypertrophic subaortic stenosis
Precautions: Pregnancy, breastfeeding, children, hypertension, CAD, MI, hypovolemia, dysrhythmias, sulfite hypersensitivity, renal failure, geriatric patients

DOSAGE AND ROUTES

• **Adult and child: IV INFUSION** 0.5-1 mcg/kg/min; titrate to 2-20 mcg/kg/min, may increase to 40 mcg/kg/min if needed
Available forms: Injection 12.5 mg/mL; premixed infusion 250 mg/mL, 500 mg/500 mL, 500 mg/250 mL, 1000 mg/250 mL
Administer:
Injectable
• Visually inspect parenteral products for particulate matter and discoloration prior to administration whenever solution and container permit
• Store reconstituted solution for 24 hr if refrigerated
IV route
• Must be diluted prior to administration
• Infuse into a large vein
Dilution
• Concentrate for injection must be diluted with ≥50 mL of a compatible IV solution, dilute 500 mg (40 mL) in 210 mL D_5W or NS (withdraw 40 mL from a 250-mL bag) to produce a final concentration of 2000 mcg/mL; or 1000 mg (80 mL) in 170 mL D_5W or NS (withdraw 80 mL from a 250-mL bag) to produce a final concentration of 4000 mcg/mL; max 5000 mcg/mL and should be adjusted according to the patient's fluid requirements
Infusion
• Continuous: Use a controlled-infusion device
• Premixed bags in D_5W solutions can be a pink color that increases with time
• Do not give DOBUTamine simultaneously with solutions containing sodium bicarbonate or strong alkaline solutions (incompatible)
• Infusion should be started at a low rate and titrated frequently to reach the optimal dosage; titrate to B/P, urine flow, frequency of ectopic activity, heart rate, and measurements of cardiac output, central venous pressure, and/or pulmonary capillary wedge pressure

Y-site compatibilities: Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid,

LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, phenylephrine, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Anxiety,* headache, dizziness, fatigue
CV: Palpitations, tachycardia, hypo/hypertension, PVCs, angina
ENDO: Hypokalemia
GI: Heartburn, nausea, vomiting
MS: Muscle cramps (leg)
RESP: Dyspnea

PHARMACOKINETICS

IV: Onset 1-2 min, peak 10 min, half-life 2 min, metabolized in liver (inactive metabolites), excreted in urine

INTERACTIONS

Increase: severe hypertension—guanethidine
Increase: dysrhythmias—general anesthetics
Increase: pressor effect, dysrhythmias—atomoxetine, COMT inhibitors, tricyclics, MAOIs, oxytocics
Decrease: DOBUTamine action—other beta-blockers

NURSING CONSIDERATIONS

Assess:
- **Hypovolemia:** if present, correct first; administer any cardiac glycoside before DOBUTamine
- **Oxygenation/perfusion deficit:** check B/P, chest pain, dizziness, loss of consciousness
- **Heart failure:** S_3 gallop, dyspnea, neck venous distention, bibasilar crackles in patients with HF, cardiomyopathy; palpate peripheral pulses, report if extremities become cold or mottled or if peripheral pulses decrease
- **ECG** during administration continuously; if B/P increases, product is decreased; CVP or PCWP, cardiac output during infusion; report changes, may induce ectopic rhythms
- Serum electrolytes, urine output; correct before use
- **Sulfite sensitivity,** which may be life threatening
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; cautious use in breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: increased B/P with stabilization, increased urine output

Teach patient/family:
- About the reason for product administration
- To report shortness of breath, chest pain, numbness of extremities, headache, IV site discomfort, exercise intolerance, inability to complete ADLs

TREATMENT OF OVERDOSE:

Administer a β_1-adrenergic blocker; reduce IV or discontinue, ensure oxygenation/ventilation; for severe tachydysrhythmias (ventricular), give lidocaine or propranolol

⚠ HIGH ALERT

DOCEtaxel (Rx)

(doe-se-tax′el)

Taxotere

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Taxane

Do not confuse:
Taxotere/Taxol

ACTION: Inhibits reorganization of microtubule network needed for interphase and mitotic cellular functions; also causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

USES: Locally advanced or metastatic breast cancer, non–small-cell lung cancer, androgen-independent metastatic prostate cancer, postsurgery operable node-positive breast cancer, induction treatment of locally advanced squamous cell carcinoma of the head and neck, gastric adenocarcinoma

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity to this product, bilirubin exceeding ULN

Black Box Warning: Other products with polysorbate 80, neutropenia of <1500/mm^3

Precautions: Children, cardiovascular disease, pulmonary disorders, bone marrow depression, herpes zoster, pleural effusion

Black Box Warning: Edema, hepatic disease, lung cancer, taxane hypersensitivity

DOSAGE AND ROUTES:

- Other regimens are used
- **Adult: IV** 60-100 mg/m^2 given over 1 hr q3wk; if neutrophil count is <500 cells/mm^3 for >1 wk, reduce dose by 25%

Operable node-positive breast cancer, adjuvant

- **Adult: IV** (TAC regimen) 75 mg/m^2 1 hr after DOXOrubicin 50 mg/m^2 and cyclophosphamide 500 mg/m^2 q3wk × 6 cycles

Locally advanced or metastatic non–small-cell lung cancer after failure of CISplatin chemotherapy

- **Adult: IV** 75 mg/m^2 over 1 hr q3wk; if neutrophil count is <500 cells/mm^3 for >1 wk, reduce dose to 55 mg/m^2; if patient develops grade 3 peripheral neuropathy, stop product

Androgen-independent metastatic prostate cancer

- **Adult: IV** 75 mg/m^2 given over 1 hr q3wk with 5 mg predniSONE **PO** bid continuously; give dexamethasone 8 mg **PO** at 12 hr, 3 hr, and 1 hr prior to DOCEtaxel; if neutrophil count is <500 cells/mm^3 for more than 1 wk or other toxicities occur, reduce dose to 60 mg/m^2

Squamous cell carcinoma of head and neck

- **Adult: IV** 75 mg/m^2 over 1 hr, then CISplatin 100 mg/m^2 over 1 hr on day 1, then 5FU 1000 mg/m^2/day **CONTINUOUS INFUSION** × 5 days, repeat cycle q3wk

Available forms: Injection 10 mg/mL, 20 mg/0.5 mL, 20 mg/mL, 80 mg/2 mL, 80 mg/4 mL; 20, 80 mg powder for injection/vial

Administer:

- Premedicate with dexamethasone 8 mg **PO** bid × 3 days starting 1 day prior to treatment
- Antiemetic 30-60 min prior to product and prn
- Confirmation that dexamethasone was given 8 mg bid × 3 days starting 1 day prior to infusion; for prostate cancer give 8 mg 12 hr, 3 hr, and 1 hr prior to infusion
- Store prepared solution up to 27 hr in refrigerator

Intermittent IV INFUSION route

- Use cytotoxic handling procedures
- Use non-PVC bag and use non-DEHP tubing
- Double-check all orders and products; errors can be fatal

- Solution is yellow to brown, do not use if particulate is present
- Allow vials to warm to room temperature; withdraw all diluent, inject in vial of DOCEtaxel; rotate gently to mix; allow to stand to decrease foaming, then withdraw the required amount (10 mg/mL), inject in 250 mL of 0.9% NaCl, D_5W; mix gently; give over 1 hr

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, doripenem, doxacurium, DOXOrubicin HCl, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

EENT: Altered hearing, cystoid macular edema
CNS: Seizures, fatigue, weakness
CV: *Fluid retention, peripheral edema*
GI: *Nausea, vomiting, diarrhea,* hepatotoxicity, stomatitis
HEMA: Leukopenia, thrombocytopenia, anemia
INTEG: *Alopecia,* nail changes, rash, skin eruptions
MISC: Secondary malignancy, Stevens-Johnson syndrome
MS: *Arthralgia, myalgia,* back pain, weakness
NEURO: *Peripheral neuropathy*
RESP: Dyspnea, pulmonary edema, fibrosis, embolism, acute respiratory distress syndrome, interstitial lung disease
SYST: Hypersensitivity reactions

PHARMACOKINETICS

Metabolized in liver, excreted in feces, half-life 11.1 hr, peak 5-9 days, duration 1 wk

INTERACTIONS

Increase: Docetaxel effect—CYP3A inhibitors: anastrozole (high doses), aprepitant, fosaprepitant, clarithromycin, conivaptan, delavirdine, efavirenz (induces or inhibits), erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, itraconazole, ketoconazole, nefazodone, voriconazole, and others

Increase: modified effect of docetaxel CYP3A inducers: barbiturates, bosentan, carBAMazepine, nevirapine, phenytoin, fosphenytoin, rifabutin, rifampin, rifapentine

Increase: myelosuppression—other antineoplastics, radiation

Decrease: immune response—live virus vaccines

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Neutropenia: CBC, differential, platelet count prior to treatment and weekly; withhold product if WBC is <1500/mm^3 or platelet count is <100,000/mm^3; notify prescriber, nadir 8 days

Black Box Warning: DOCEtaxel, polysorbate 80 hypersensitivity: contraindicated; some products may contain polysorbate 80

Black Box Warning: Edema: oral corticosteroids should be given as premedication; assess for fluid retention; may be severe, is usually dose related

Black Box Warning: Lung cancer: increased mortality in those with increased LFTs and a history of platinum-based products

Black Box Warning: Hepatic disease: hepatic studies prior to each cycle (bilirubin, AST, ALT, LDH); check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea, if LFTs are >5x upper limit discontinue

- **CNS changes:** confusion, paresthesias, peripheral neuropathy, dysesthesia, pain, weakness; if severe, product should be discontinued or pyridoxine used
- VS during first hour of infusion, check IV site for signs of infiltration

Black Box Warning: Hypersensitivity reactions, anaphylaxis, including hypotension, dyspnea, angioedema, generalized urticaria; discontinue infusion immediately, usually during first or second dose; mild reactions can be treated by slowing infusion, treating symptomatically; do not re-treat in those with severe reactions

- **Bone marrow depression/bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine); avoid invasive procedures, avoid IM injections, rectal temps if platelets are low
- Effects of alopecia on body image; discuss feelings about body changes

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: fever, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid use of aspirin, ibuprofen, alcohol
- That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color and texture
- That pain in muscles and joints 2-5 days after infusion is common
- To avoid receiving vaccinations while taking product
- **Pregnancy/breastfeeding:** to use barrier contraception during and for several months after treatment; to avoid breastfeeding

docosanol topical
See Appendix B

docusate calcium (OTC)
(dok′yoo-sate cal′see-um)
docusate sodium (OTC)
Colace, Diocto, DOK, Enemeez, Selax ✱, Silace
Func. class.: Laxative, emollient; stool softener
Chem. class.: Anionic surfactant

Do not confuse:
Colace/Cozaar
Dulcolax (docusate)/Dulcolax (bisacodyl)

ACTION: Increases water, fat penetration in intestine; allows for easier passage of stool

USES: Prevention of dry, hard stools

CONTRAINDICATIONS: Hypersensitivity, obstruction, fecal impaction, nausea/vomiting
Precautions: Pregnancy, breastfeeding

DOSAGE AND ROUTES
- **Adult: PO** 50-400 mg/day in divided doses (sodium) or 240 mg daily (calcium); **Rectal ENEMA** 4 mL
- **Child >12 yr: ENEMA** 2 mL
- **Child 6-12 yr: PO** 40-150 mg/day (sodium) in divided doses
- **Child 3-6 yr: PO** 20-60 mg/day (sodium) in divided doses
- **Child <3 yr: PO** 10-40 mg/day (sodium) in divided doses
- **Infant:** PO 5 mg/kg/day in divided doses

Available forms: *Calcium:* 240 mg; *sodium:* capsules 50, 100, 250 mg; tablets 100 mg; syrup 20 mg/5 mL; liquid 50 mg/5 mL, enema 283 mg/5 mL
Administer:
- Swallow tablets whole; do not break, crush, or chew
- Oral solution: diluted in milk, fruit juice to decrease bitter taste
- In morning or evening (oral dose)
- Store in cool environment; do not freeze

SIDE EFFECTS
EENT: Bitter taste, throat irritation
GI: Nausea, anorexia, cramps, diarrhea
INTEG: Rash

PHARMACOKINETICS
Onset 12-72 hr (PO), 2-15 min (rectal)

INTERACTIONS
- **Toxicity:** mineral oil

Drug/Herb
Increase: laxative action—flax, senna

NURSING CONSIDERATIONS
Assess:
- **Cause of constipation;** identify whether fluids, bulk, or exercise is missing from lifestyle; constipating products
- Cramping, rectal bleeding, nausea, vomiting; if these occur, product should be discontinued
- **Pregnancy/breastfeeding:** low risk of fetal harm in pregnancy, breastfeeding

Evaluate:
- Therapeutic response: decrease in constipation

Teach patient/family:
- That normal bowel movements do not always occur daily
- Not to use in presence of abdominal pain, nausea, vomiting
- To notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
- That product may take up to 3 days to soften stools
- To take oral preparations with a full glass of water (unless on fluid restrictions) and to increase fluid intake

⚠ HIGH ALERT

dofetilide (Rx)
Tikosyn
Func. class.: Antidysrhythmic (Class III)

ACTION: Blocks cardiac ion channel carrying the rapid component of delayed potassium current; no effect on sodium channels

USES: Atrial fibrillation, flutter, maintenance of normal sinus rhythm

CONTRAINDICATIONS: Children, hypersensitivity, digoxin toxicity, aortic stenosis, pulmonary hypertension, severe renal disease, QT prolongation, torsades de pointes, renal failure
Precautions: Pregnancy, breastfeeding, AV block, bradycardia, electrolyte imbalance, renal disease

Black Box Warning: Arrhythmias, ventricular arrhythmias/tachycardia; requires an experienced clinician in specialized care setting

DOSAGE AND ROUTES

Adult: PO 500 mcg bid initially; maintenance 250 mcg bid, max 500 mcg bid; adjust dose based on QT and renal function
Renal dose
• **Adult: PO** CCr >60 mL/min, 500 mcg bid; CCr 40-60 mL/min, 250 mcg bid; CCr 20-39 mL/min, 125 mcg bid; CCr <20 mL/min, do not use
Available forms: Capsules 125, 250, 500 mcg
Administer:
• Physician and pharmacy must be registered to use product
• With patient hospitalized for ≥3 days

Black Box Warning: Step 1: Assess cardiac conduction: Prior to first dose, the QTc interval must be determined using an average of 5-10 beats; if the QTc interval is >440 msec (or >500 msec in ventricular conduction abnormalities), do not use; if baseline heart rate is <60 BPM, then the QT interval should be used

Black Box Warning: Step 2: Assess renal function: Prior to first dose, determine renal function using the Cockcroft-Gault equation, use actual body weight to calculate creatinine clearance

Black Box Warning: Step 3: Adjust starting dose according to renal function: Refer to the renal dose section above to determine the appropriate initial dosage

Black Box Warning: Step 4: ECG monitoring: Begin continuous ECG monitoring starting with the first dose

Black Box Warning: Step 5: Dosage adjustments: Approximately 2-3 hr after the first dose, determine the QTc interval; if the QTc interval has increased by >15% (compared to baseline), or if the QTc interval is >500 msec (>550 msec in patients with ventricular conduction abnormalities), the initial dosage should be reduced by half as follows:
• Decrease an initial dose of 500 mcg bid to 250 mcg bid
• Decrease an initial dose of 250 mcg bid to 125 mcg bid
• Decrease an initial dose of 125 mcg bid to 125 mcg/day

Black Box Warning: Step 6: Reassess QTc interval: Reassess the QTc interval 2-3 hr after each subsequent dose; if the QTc interval lengthens to >500 msec (or >550 msec in patients with ventricular conduction abnormalities), discontinue

Black Box Warning: Step 7: ECG monitoring: Monitor continuous ECG for a minimum of 3 days or for 12 hr after conversion to normal sinus rhythm, whichever is greater

SIDE EFFECTS

CNS: *Dizziness,* headache, stroke
CV: QT prolongation, torsades de pointes, ventricular dysrhythmias, chest pain
GI: *Nausea,* diarrhea

PHARMACOKINETICS

Well absorbed, max plasma concentrations 2-3 hr, steady state 2-3 days, half-life 10 hr, metabolized by liver, excreted by kidneys, peak 3 hr, duration up to 24 hr

INTERACTIONS

• Do not use with cimetidine, ketoconazole, verapamil, prochlorperazine, trimeth-

oprim-sulfamethoxazole, megestrol, hydroCHLOROthiazide
Increase: QT prolongation, torsades de pointes—class IA/III antidysrhythmics, arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, methadone, pentamidine, some phenothiazines, ziprasidone, ciprofloxacin
Increase: hypokalemia—potassium-depleting diuretics
Increase: toxicity—aMILoride metFORMIN, entecavir, lamiVUDine, memantine, triamterene, procainamide, trospium
Increase: dofetilide levels—antiretroviral protease inhibitors
Increase: dysrhythmias—CYP3A4 inhibitors (SSRIs, macrolides, azoles, protease inhibitors, amiodarone, diltiazem, quinine)
Drug/Food
- Do not use with grapefruit juice

NURSING CONSIDERATIONS

Assess:
- AF patients should receive anticoagulation prior to cardioversion

Black Box Warning: Dysrhythmias: 3 days of continuous ECG monitoring, monitoring of CCr are required when starting or restarting medication; have cardiac resuscitation equipment nearby

- Cardiac status: rate, rhythm, character, continuously; B/P
- **Severe renal impairment CCr <20 mL/min:** do not use for mild to moderate renal disease; monitor BUN/creatinine; adjust dose based on creatinine clearance
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: control of atrial fibrillation, normal sinus rhythm

Teach patient/family:
- To make position changes slowly; orthostatic hypotension may occur
- To notify prescriber if fast heartbeats with fainting or dizziness occur
- To notify all prescribers of all medications, supplements taken
- That if dose is missed, not to double; to take next dose at usual time
- To avoid breastfeeding

dolasetron (Rx)

(do-la´se-tron)

Anzemet

Func. class.: Antiemetic
Chem. class.: 5-HT3 receptor antagonist

Do not confuse:
Anzemet/Avandamet

ACTION: Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

USES: Prevention of chemotherapy-induced and postoperative nausea, vomiting

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, children, geriatric patients, hypokalemia, electrolyte imbalances; granisetron/ondansetron/palonosetron hypersensitivity, QT prolongation

DOSAGE AND ROUTES

Prevention of cancer chemotherapy nausea/vomiting
- **Adult: PO** 100 mg 1 hr prior to chemotherapy
- **Child 2-16 yr: PO** 1.8 mg/kg given 1 hr prior to chemotherapy, max 100 mg

Available forms: Tablets 50, 100 mg
Administer:
PO route
- Do not mix product for oral administration in apple or apple-grape juice until immediately prior to administration; diluted product can be kept for 2 hr at room temperature
- Store at room temperature 48 hr after dilution

SIDE EFFECTS

CNS: *Headache,* dizziness, fatigue, drowsiness, serotonin syndrome

CV: Dysrhythmias, ECG changes, hypo/hypertension, tachycardia, bradycardia; ventricular tachycardia/fibrillation, QT prolongation, torsades de pointes, cardiac arrest (IV)
GI: *Diarrhea,* constipation, increased AST/ALT, abdominal pain, anorexia
GU: Urinary retention, oliguria
MISC: Rash, bronchospasm

PHARMACOKINETICS
Well absorbed, metabolized to active metabolite, half-life of active metabolite 8 hr, max concentrations after 1 hr

INTERACTIONS
Increase: dysrhythmias—antidysrhythmics
Increase: dolasetron levels—cimetidine
Increase: QT prolongation—thiazide/loop diuretics, antidysrhythmics (class IA, III), arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, methadone, pentamidine, some phenothiazines, ziprasidone; occurs at higher dose of dolasetron
Decrease: dolasetron levels—rifAMPin

NURSING CONSIDERATIONS
Assess:
- **Hypersensitivity reaction:** rash, bronchospasm
- Nausea, vomiting, prior to and after use
- **Cardiac conduction conditions:** monitor ECG, electrolyte imbalances, dysrhythmias, heart rate
- **QT prolongation:** QRS, PR prolongation; do not use in those with congenital long QT syndrome, hypokalemia, hypomagnesemia, complete heart block (unless a pacemaker is in place), correct electrolytes prior to use, monitor ECG in elderly patients, renal cardiac disease
- **Serotonin syndrome:** usually when combined with SSRIs, SNRIs, MAOIs
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed, cautious use in breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:
- To report diarrhea, constipation, nausea, vomiting, rash; or changes in respirations, heart rate, nausea, vomiting
- May cause headache; use analgesic

D

⚠ HIGH ALERT

dolutegravir (Rx)
(doe-loo-teg´ra-vir)
Tivicay, Tivicay PD
Func. class.: Antiretroviral

ACTION: Inhibits catalytic activity of HIV integrase, which is an HIV-encoded enzyme needed for replication

USES: HIV in combination with other antiretrovirals

CONTRAINDICATIONS: Breastfeeding, hypersensitivity
Precautions: Pregnancy, children, geriatric patients, hepatic disease, immune reconstitution syndrome, hepatitis, antimicrobial resistance, lactase deficiency

DOSAGE AND ROUTES
- **Adult and child ≥12 yr and ≥40 kg (treatment naïve or treatment experienced but integrase strand transfer inhibitor naïve): PO** 50 mg daily; if given with efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, or rifAMPin, give 50 mg bid

Infant/child 3 to <14 kg: PO soluble tablets for oral suspension (Tivicay PD): 3-<6 kg: 5 mg daily; 6-<10 kg: 15 mg daily; 10-<14 kg: 20 mg daily
Infant/child/adolescent ≥14 kg: PO soluble tablets for oral suspension (Tivicay PD): 14-<20 kg: 25 mg daily; ≥20 kg: 30 mg daily; **tablets (Tivicay): 14-<20 kg:** 40 mg daily; **≥20 kg:** 50 mg daily

INSTI-experienced with any INSTI-associated resistance mutation or clinically suspected INSTI resistance Children and adolescents weighing ≥40 kg: PO tablets (Tivicay): 50 mg bid

Available forms: Tablets 10, 25, 50 mg; dispersible tab 5 mg

Administer:

- May give without regard to meals, with 8 oz of water
- Store at room temperature
- Give 2 hr prior to or 6 hr after cation-containing antacids or laxatives, sucralfate, oral iron, oral calcium, or buffered products

SIDE EFFECTS

CNS: Fatigue, headache, insomnia
GI: Nausea, vomiting, diarrhea, hepatotoxicity
INTEG: Rash, pruritus
META: Hyperglycemia
SYST: Immune reconstitution syndrome
GU: Renal dysfunction

PHARMACOKINETICS

Peak 2-3 hr, steady state 5 days, half-life 14 hr, 98% protein binding, metabolized in the liver, excreted in feces 53%, urine 31%

INTERACTIONS

Decrease: effect of dolutegravir—antacids, laxatives/sucralfate, oral iron, oral calcium, buffered products
Decrease: levels—rifAMPin efavirenz, tenofovir, tipranavir/ritonavir
Drug/Herb

- Avoid concurrent use with St. John's wort

NURSING CONSIDERATIONS

Assess:

- **HIV infection:** CD4, T-cell count, plasma HIV RNA, viral load; resistance testing prior to treatment, at treatment failure
- Drug resistance testing prior to use in treatment-naïve patients
- **Immune reconstitution syndrome,** usually during initial phase of treatment; may need antiinfective prior to starting
- **Infection:** monitor for opportunistic or other infection
- Monitor total HDL/LDL cholesterol baseline and periodically; all may be elevated
- **Pregnancy/breastfeeding:** all HIV-positive women should receive antiretroviral therapy, report pregnancy to the Antiretroviral Pregnancy Registry (800-258-4263); avoid breastfeeding, excretion unknown; glucose screening should be performed at 24-48 wk gestation, confirm gestation age in each trimester by ultrasound

Evaluate:

- Therapeutic response: improvement in cell counts, T-cell counts

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr prior to next dose; not to double dose; not to share with others
- That sexual partners need to be told that patient has HIV; that product does not cure infection, just controls symptoms, does not prevent infecting others
- To report sore throat, fever, fatigue (may indicate infection)
- That continued follow-up and lab work will be needed
- That fat accumulation/redistribution may occur
- To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding and to continue follow-up exams and lab work

dolutegravir/lamivudine

(doe-loo-teg'ra-vir/la-mi'vyoo-deen)

Dovato

Func. class.: Antiretroviral/antiviral
Chem. class.: INST/NRTI

ACTION: Dolutegravir/lamivudine is active against infections caused by human immunodeficiency virus type 1 (HIV-1). Lamivudine is a nucleoside analog that works by inhibiting HIV reverse transcriptase, while dolutegravir works by inhibiting the catalytic activity of HIV integrase

USES: HIV-1 infection in adults

CONTRAINDICATIONS: Hypersensitivity

Precautions: Alcoholism, autoimmune disease, bone fractures, breastfeeding, children, depression, females, Graves' disease, Guillain-Barré syndrome, hepatic disease, hepatitis, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, hepatomegaly, HIV resistance, hypercholesterolemia, hyperlipidemia, hypertriglyceridemia, hypophosphatemia, immune reconstitution syndrome, lactic acidosis, obesity, osteomalacia, osteoporosis, pregnancy, renal failure, renal impairment, serious rash, suicidal ideation, torsades de pointes

Black Box Warning: Hepatitis B exacerbation, hepatotoxicity

DOSAGE AND ROUTES

Adults: PO One tablet (50 mg dolutegravir; 300 mg lamivudine) daily

Available forms: Tablet 50 mg-300 mg

Administer:

- Give without regard to food
- During coadministration with carBAMazepine or rifAMPin, the dolutegravir dose needs to be increased to 50 mg bid; add 50 mg/day of dolutegravir (separated by 12 hr from dolutegravir; lamivudine) should be given
- Avoid use in treatment-experienced patients and in patients with known substitutions associated with resistance to dolutegravir or lamivudine
- Do not use within 2 hr prior to or 6 hr after iron or calcium supplement
- Do not use within 2 hr prior to or 6 hr after antacids, laxatives, or other medicines that contain aluminum, magnesium, sucralfate, or buffered medicines
- Admixtures are stable for ≥24 hr at room temperature

SIDE EFFECTS

CNS: *Headache,* abnormal dreams, *depression, dizziness, insomnia,* neuropathy, paresthesia, asthenia, fatigue, drowsiness

GI: *Nausea, vomiting, anorexia, diarrhea, abdominal pain, dyspepsia,* hepatomegaly with stenosis (may be fatal), hyperbilirubinemia, hypercholesterolemia, pancreatitis

GU: Glomerulonephritis membranous/mesangial **proliferative**

INTEG: *Rash,* skin discoloration

MS: *Arthralgia, myalgia,* rhabdomyolysis

RESP: Cough

SYST: *Change in body fat distribution,* lactic acidosis

PHARMACOKINETICS

- **Lamivudine:** 36% protein binding, half-life is 13 to 19 hr
- **Dolutegravir:** 99% protein binding, metabolism occurs via UDP-glucuronosyltransferase (UGT)1A1 (major) and by the hepatic isoenzyme CYP3A (minor), half-life 14 hr, 53% excreted unchanged in the feces, urine excretion 31%

INTERACTIONS

Increased level: CYP3A4 inhibitors (aldesleukin IL-2, amiodarone, aprepitant, atazanavir, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, danazol, dalfopristin, darunavir, dasatinib, delavirdine, diltiazem, dronedarone, efavirenz, erythromycin, ethinyl estradiol, fluconazole, fluoxetine, fluvoxamine, fosamprenavir, fosaprepitant, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lanreotide, lapatinib, miconazole, nefazodone, nelfi navir, nicardipine, octreotide, posaconazole, quinine, ranolazine, rifaximin, tamoxifen, telaprevir, telithromycin, tipranavir, troleandomycin, verapamil, voriconazole, zafirlukast)

Increased: metformin

Increased: dofetilide, coadministration is contraindicated

Decrease: dolutegravir-carbamazepine, rifAMPin, an additional dolutegravir 50-mg dose should be taken

Decrease: dolutegravir-oxcarbazepine, phenytoin, phenobarbital; avoid coadministration

Drug/Lab Test

Increased: AST/ALT, amylase, bilirubin, CK, glucose, lipase

Decrease: neutrophils

NURSING CONSIDERATIONS

Assess:

• **HIV infection:** Assess symptoms of HIV, including opportunistic infections, prior to and during treatment, some may be life threatening; monitor plasma CD4+, CD8 cell counts, serum beta-2 microglobulin, serum antigen levels, treatment failures occur more often in those with baseline HIV-1 RNA concentrations <100,000 copies/mL than in those <100,000 copies/mL; monitor blood glucose, CBC with differential, serum cholesterol, lipid panel

Black Box Warning: Hepatotoxicity/lactic acidosis: Monitor hepatitis B serology, LFTs, plasma hepatitis C RNA, lactic acidosis levels. If lab reports confirm these conditions, discontinue product. More common in females or those who are overweight. Avoid use in alcoholism

• Patients coinfected with HBV and HIV who discontinue this product should have transaminase concentrations monitored q6wk for the first 3 mo and q3-6 mo thereafter.

• Resumption of anti–hepatitis B treatment may be required. For patients who refuse a fully suppressive antiretroviral regimen but still require treatment for HBV, consider 48 wk of peginterferon alfa; do not administer HIV-active medications in the absence

• Periodically monitor serum bilirubin (total and direct), serum creatinine, urinalysis, LFTs, amylase, lipase

• Pregnancy: obtain pregnancy testing prior to use; hepatitis B exacerbation: those with coexisting HBV and HIV infections who discontinue this product may experience severe acute hepatitis B exacerbation with some cases resulting in hepatic decompensation and hepatic failure

Evaluate

• **Therapeutic response:** Improvement in CD4, HIV RNC counts, decreasing signs and symptoms of HIV

Teach patient/family

• That hepatitis and HIV coinfected patients should avoid consuming alcohol; offer vaccinations against hepatitis A/hepatitis B as appropriate

• That GI complaints resolve after 2-3 wk of treatment

• To report suspected or planned pregnancy, not to breastfeed. Instruct mothers with HIV-1 infection not to breastfeed because HIV-1 can be passed to the baby in the breast milk, inform patients that there is an antiretroviral pregnancy registry to monitor fetal outcomes

• To take at the same time of day to maintain blood level; not to crush, break, or chew

• That product controls the symptoms of HIV but does not cure, that patient is still able to infect others, that other products may be necessary to prevent other infections

• **Lactic acidosis:** to notify prescriber of fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm

Black Box Warning: Hepatotoxicity: To notify prescriber of dark urine, yellowing skin or eyes, clay-colored stools, anorexia, nausea, vomiting

• Discuss with provider all Rx, OTC, herbs and supplements taken, as there are many drug interactions

• **Immune reconstitution syndrome:** advise patients to inform their health care provider immediately of any signs and symptoms of infection, as inflammation from previous infection may occur

• Instruct patients that if they miss a dose, to take it as soon as they remember, not to double their next dose or take more than the prescribed dose

dolutegravir/rilpivirine (Rx)

(doe-loo-teg´ra-vir/ril-pi-vir´een)

Juluca

Func. class.: Antiretroviral/antiviral

Chem. class.: INST/NRTI

ACTION:

Rilpivirine is a nucleoside analog that inhibits HIV reverse transcriptase; dolutegravir inhibits the catalytic activity of HIV integrase

USES:

HIV-1 infection in adults

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Alcoholism, autoimmune disease, bone fractures, breastfeeding, children, depression, females, Graves disease, Guillain-Barré syndrome, hepatic disease, hepatitis, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, hepatomegaly, HIV resistance, hypercholesterolemia, hyperlipidemia, hypertriglyceridemia, hypophosphatemia, immune reconstitution syndrome, lactic acidosis, obesity, osteomalacia, osteoporosis, pregnancy, renal failure, renal impairment, serious rash, suicidal ideation, torsades de pointes

Black Box Warning: Hepatitis B exacerbation, hepatotoxicity

DOSAGE AND ROUTES

Adults: PO 1 tablet 50 mg dolutegravir; 25 mg rilpivirine daily

Available forms: Tablet 50 mg dolutegravir, 25 mg rilpviirine

Administer:

- Give without regard to food
- During coadministration with carBAMazepine or rifAMPin, the dolutegravir dose needs to be increased to 50 mg bid; add 50 mg/day of dolutegravir (separated by 12 hr from dolutegravir; lamivudine) should be given
- Avoid use in treatment-experienced patients and in patients with known substitutions associated with resistance to dolutegravir or lamivudine
- Do not use within 2 hr prior to or 6 hr after iron or calcium supplement
- Do not use within 2 hr prior to or 6 hr after antacids, laxatives, or other medicines that contain aluminum, magnesium, sucralfate, or buffered medicines
- Admixtures are stable for at least 24 hr at room temperature under normal room fluorescent light in Baxter Viaflex PVC infusion containers

SIDE EFFECTS

CNS: Headache, abnormal dreams, depression, dizziness, insomnia, neuropathy, paresthesia, asthenia, fatigue, drowsiness

GI: Nausea, vomiting, anorexia, diarrhea, abdominal pain, dyspepsia **hepatomegaly with stenosis (may be fatal),** hyperbilirubinemia, hypercholesterolemia, **pancreatitis**

GU: Glomerulonephritis membranous/mesangial proliferative

INTEG: Rash, skin discoloration

MS: Arthralgia, myalgia, **rhabdomyolysis**

RESP: Cough

SYST: Change in body fat distribution, lactic acidosis

PHARMACOKINETICS

- **Rilpivirine:** Onset unknown, peak 4 hr, duration unknown, half-life 50 hr
- **Dolutegravir:** 99% protein binding, metabolism occurs via UDP-glucuronosyltransferase (UGT)1A1 (major) and by the hepatic isoenzyme CYP3A (minor), half-life 14 hr, 53% excreted unchanged in the feces, urine excretion 31%

INTERACTIONS

Decreased levels, virologic resistance-CYP3A4 inhibitors (aldesleukin IL-2, amiodarone, aprepitant, atazanavir, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, danazol, dalfopristin, darunavir, dasatinib, delavirdine, dilTIAZem,

dronedarone, efavirenz, erythromycin, ethinyl estradiol, fluconazole, fluoxetine, fluvoxamine, fosamprenavir, fosaprepitant, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lanreotide, lapatinib, miconazole, nefazodone, nelfinavir, nicardipine, octreotide, posaconazole, quinine, ranolazine, rifAXIMin, tamoxifen, telaprevir, telithromycin, tipranavir, troleandomycin, verapamil, voriconazole, zafirlukast)

Increased: metFORMIN

Increased: dofetilide, coadministration is contraindicated

Decrease: dolutegravir—carBAMazepine, rifAMPin, an additional dolutegravir 50-mg dose should be taken

Decrease: dolutegravir—OXcarbazepine, phenytoin, phenobarbital, avoid coadministration

Drug/Lab Test:

Increase: AST/ALT, amylase, bilirubin, CK, glucose, lipase

Decrease: neutrophils

NURSING CONSIDERATIONS

Assess:

• **HIV infection:** Assess symptoms of HIV, including opportunistic infections, prior to and during treatment, some may be life threatening; monitor plasma CD4+, CD8 cell counts, serum beta-2 microglobulin, serum antigen levels, treatment failures occur more often in those with baseline HIV-1 RNA concentrations <100,000 copies/mL than in those <100,000 copies/mL; monitor blood glucose, CBC with differential, serum cholesterol, lipid panel

Black Box Warning: Hepatotoxicity/lactic acidosis: Monitor hepatitis B serology, LFTs, plasma hepatitis C RNA, lactic acidosis levels. If lab reports confirm these conditions, discontinue product. More common in females or those who are overweight. Avoid use in alcoholism

• Patients coinfected with HBV and HIV who discontinue this product should have transaminase concentrations monitored q6wk for the first 3 mo, and q3-6 mo thereafter.

• Resumption of anti–hepatitis B treatment may be required

• Periodically monitor serum bilirubin (total and direct), serum creatinine, urinalysis, LFTs, amylase, lipase

• **Pregnancy:** Obtain pregnancy testing prior to use; hepatitis B exacerbation: those with coexisting HBV and HIV infections who discontinue this product may experience severe acute hepatitis B exacerbation with some cases resulting in hepatic decompensation and hepatic failure

Evaluate:

• Therapeutic response: improvement in CD4, HIV RNC counts, decreasing signs and symptoms of HIV

Teach patient/family:

• That hepatitis and HIV coinfected patients should avoid consuming alcohol; offer vaccinations against hepatitis A/hepatitis B as appropriate

• That GI complaints resolve after 2-3 wk of treatment

• To report suspected or planned pregnancy, not to breastfeed. Instruct mothers with HIV-1 infection not to breastfeed because HIV-1 can be passed to the baby in the breast milk, inform patients that there is an antiretroviral pregnancy registry to monitor fetal outcomes

• To take at the same time of day to maintain blood level; not to crush, break, or chew

• That product controls the symptoms of HIV but does not cure, that patient is still able to infect others, that other products may be necessary to prevent other infections

• **Lactic acidosis:** to notify prescriber of fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm

Black Box Warning: Hepatotoxicity: to notify prescriber of dark urine, yellowing skin or eyes, clay-colored stools, anorexia, nausea, vomiting

• Discuss with provider all Rx, OTC, herbs, and supplements taken, as there are many drug interactions
• Immune reconstitution syndrome: Advise patients to inform their health care provider immediately of any signs and symptoms of infection, as inflammation from previous infection may occur
• Instruct patients that if they miss a dose, to take it as soon as they remember, not to double their next dose or take more than the prescribed dose

donepezil (Rx)

(doe-nep'i-zill)

Aricept, Aricept ODT

Func. class.: Anti-Alzheimer's agent

Chem. class.: Reversible cholinesterase inhibitor

Do not confuse:
Aricept/Aciphex/Azilect

ACTION: Elevates acetylcholine concentrations (cerebral cortex) by slowing degradation of acetylcholine released in cholinergic neurons; does not alter underlying dementia

USES: Mild to severe dementia with Alzheimer's disease

CONTRAINDICATIONS: Hypersensitivity to this product or piperidine derivatives
Precautions: Pregnancy, breastfeeding, children, sick sinus syndrome, history of ulcers, GI bleeding, hepatic disease, bladder obstruction, asthma, seizures, COPD, abrupt discontinuation, AV block, GI obstruction, Parkinson's disease, surgery

DOSAGE AND ROUTES

• **Adult: PO** 5 mg/day at bedtime; may increase to 10 mg/day after 4-6 wk, may increase to 23 mg/day after 3 mo of 10 mg/day (moderate to severe)
Available forms: Tablets 5, 10, 23, mg; tablets ODT 5, 10 mg

Administer:
• Give between meals, may give with meals for GI symptoms
• Allow ODT to dissolve on tongue, then drink water
• Do not chew, crush, break

SIDE EFFECTS

CNS: Dizziness, *insomnia, headache,* fatigue, abnormal dreams, syncope, seizures, drowsiness, agitation, depression, confusion, hallucinations
CV: Atrial fibrillation, hypo/hypertension
GI: *Nausea, vomiting,* anorexia, *diarrhea,* abdominal pain, weight gain
GU: Urinary frequency
INTEG: Rash, flushing, diaphoresis, bruising
MS: Cramps, arthritis, arthralgia, back pain

PHARMACOKINETICS

Well absorbed PO; metabolized by CYP2D6, CYP3A4; half-life 10-hr single dose, 70-hr multiple doses; protein binding 96%

INTERACTIONS

Increase: donepezil effects—CYP2D6, CYP3A4 inhibitors
Increase: synergistic effect—succinylcholine, cholinesterase inhibitors, cholinergic agonists
Increase: GI bleeding—NSAIDs
Decrease: donepezil effects—CYP2D6, CYP3A4 inducers
Decrease: action of anticholinergics
Increase: QT prolongation—dofetilide, dronedarone, grepafloxacin, mesoridazine, pimozide, probucol, sparfloxacin, ziprasidone; do not use concurrently
Decrease: donepezil effect—carBAMazepine, dexamethasone, phenytoin, PHENobarbital, rifAMPin
Drug/Herb
Decrease: donepezil—St. John's wort
Drug/Lab
Increase: CK

NURSING CONSIDERATIONS

Assess:
• **Alzheimer's disease:** ADLs, memory, language, confusion baseline and during treatment

• B/P: hypo/hypertension, heart rate, ECG, QT
• Mental status: affect, mood, behavioral changes, depression, complete neurologic status
• GI status: nausea, vomiting, anorexia, diarrhea; monitor weight, active/occult GI bleeding
• GU status: urinary frequency, incontinence, I&O
• **Beers:** avoid use in older adults; increases risk of hypotension/bradycardia
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
• Therapeutic response: decrease in confusion; improved mood, memory

Teach patient/family:
• To report side effects: twitching, nausea, vomiting, sweating, dizziness; indicates cholinergic crisis or overdose
• That continuing follow-up will be needed
• To use product exactly as prescribed, not to use with other products unless approved by prescriber
• To notify prescriber of nausea, vomiting, diarrhea (dose increase or beginning treatment), or rash
• Not to increase or abruptly decrease dose; serious side effects may result
• That product is not a cure, relieves symptoms
• To report if pregnancy is planned or suspected; to avoid breastfeeding

⚠ HIGH ALERT

DOPamine (Rx)

(dope'a-meen)
Func. class.: Adrenergic
Chem. class.: Catecholamine

Do not confuse:
DOPamine/DOBUTamine

ACTION: Causes increased cardiac output; acts on β_1- and α-receptors, causing vasoconstriction in blood vessels; low dose causes renal and mesenteric vasodilation; β_1 stimulation produces inotropic effects with increased cardiac output

USES: Shock, increased perfusion, hypotension, cardiogenic/septic shock

CONTRAINDICATIONS: Hypersensitivity, ventricular fibrillation, tachydysrhythmias, pheochromocytoma, hypovolemia

Precautions: Pregnancy, breastfeeding, geriatric patients, arterial embolism, peripheral vascular disease, sulfite hypersensitivity, acute MI

Black Box Warning: Extravasation

DOSAGE AND ROUTES

• **Adult: IV INFUSION** 2-5 mcg/kg/min, titrate upward in 5-10 mcg/kg/min increments, max 50 mcg/kg/min; titrate to patient's response
• **Child: IV** 1-5 mcg/kg/min initially; usual dosage range, 2-20 mcg/kg/min

HF
• **Adult: IV** 3-10 mcg/kg/min

Bradycardia (unlabeled)
• **Adult: IV** 2-10 mcg/kg/min, titrate as needed

Available forms: Injection 40 mg, 80 mg, 160 mg/mL; concentrations for IV infusion 0.8, 1.6, 3.2 mg/mL in 250, 500 mL D_5W

Administer:
• Correct volume depletion prior to use
• Store reconstituted solution for up to 24 hr if refrigerated
• Do not use discolored solution; protect from light

IV route
• IV after diluting 200-400 mg/250-500 mL of D_5W, $D_5$0.45%NaCl, $D_5$0.9%NaCl, D_5LR, LR; use large vein
• After reconstituting, use infusion pump; give at rate of 0.5-5 mcg/kg/min, increase by 1-4 mcg/kg/min at 10-30 min intervals until desired response, titrate as needed, decrease infusion gradually

Black Box Warning: Extravasation: if extravasation occurs, stop infusion; may inject area with phentolamine 10 mg/15 mL of NS

Y-site compatibilities: Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, methicillin, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache,* anxiety
CV: *Palpitations, angina,* wide QRS complex, peripheral vasoconstriction, hypotension
GI: *Nausea, vomiting, diarrhea*
INTEG: Necrosis, tissue sloughing with extravasation
RESP: Dyspnea

PHARMACOKINETICS

IV: Onset 5 min; duration <10 min; metabolized in liver, kidney, plasma; excreted in urine (metabolites); half-life 2 min

INTERACTIONS

- Do not use within 2 wk of MAOIs; hypertensive crisis may result

Increase: bradycardia, hypotension—phenytoin
Increase: dysrhythmias—general anesthetics
Increase: severe hypertension—ergots
Increase: B/P—oxytocics
Increase: pressor effect—tricyclics, MAOIs
Decrease: DOPamine action—beta-/alpha-blockers
Drug/Lab Test
Increase: urinary catecholamine, serum glucose

NURSING CONSIDERATIONS

Assess:

- Hypovolemia; if present, correct first
- **Oxygenation/perfusion deficit:** check B/P, chest pain, dizziness, loss of consciousness
- **Heart failure:** S_3 gallop, dyspnea, neck venous distention, bibasilar crackles in patients with HF, cardiomyopathy, palpate peripheral pulses
- I&O ratio: if urine output decreases without decrease in B/P, product may need to be reduced
- **ECG** during administration continuously; if B/P increases, product should be decreased; PCWP, CVP during infusion
- B/P, pulse q5min
- Paresthesias and coldness of extremities; peripheral blood flow may decrease
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk, may cause toxicity; avoid use in breastfeeding, excretion is unknown

Evaluate:

- Therapeutic response: increased B/P with stabilization; increased urine output

Teach patient/family:

- About the reason for product administration
- To report immediately chest pain, shortness of breath, numbness/tingling of extremities
- To report immediately pain, burning, redness at IV site

TREATMENT OF OVERDOSE:

Discontinue IV, may give a short-acting alpha-adrenergic blocker

doravirine (Rx)

(dor′a-vir′een)

Pifeltro

Func. class.: Antiviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

USES: Human immunodeficiency virus (HIV) infection in antiretroviral-naive adults in combination with other antiretrovirals

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

- **Adult: PO** 100 mg daily; when given with rifabutin 100 mg q12hr

doravirine/lamivudine/ tenofovir (Rx)

(dor′a-vir′een/lam-i-voo′deen/ ten-oh-foh′veer)

Delstrigo

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI), nucleoside reverse transcriptase inhibitor (NRTI)

USES: Human immunodeficiency virus (HIV) infection in antiretroviral-naive adults

CONTRAINDICATIONS: Hypersensitivity

Precautions: Alcoholism, autoimmune disorders, bipolar disease, breastfeeding, children, depression, driving or operating hazardous machinery, geriatric patients, Graves' disease, Guillain-Barré syndrome, hepatic disease, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, HIV resistance, immune reconstitution syndrome, pregnancy, psychosis, substance abuse

Black Box Warning: Hepatitis B exacerbation

DOSAGE AND ROUTES

- **Adult: PO** 1 tablet (doravirine 100 mg; lamivudine 300 mg; tenofovir disoproxil fumarate 300 mg) daily

Concurrent treatment with rifabutin

- **Adult: PO** 1 tablet (doravirine 100 mg; lamivudine 300 mg; tenofovir disoproxil fumarate 300 mg) daily, then 12 hr later, give

an additional 100 mg of doravirine by mouth each day of rifabutin concurrent therapy

dorzolamide (Rx) (ophthalmic)

(dor-zole'ah-mide)

Trusopt

Func. class.: Antiglaucoma

Chem. class.: Carbonic anhydrase inhibitor

USES: For the treatment of elevated intraocular pressure in patients with ocular hypertension or open-angle glaucoma

CONTRAINDICATIONS: Hypersensitivity

Precautions: Hypersensitivity to sulfonamides, hepatic/renal disease, angle-closure glaucoma, electrolyte disturbances

DOSAGE AND ROUTES

- **Adult/adolescent/child/infant/neonate ≥1 wk: Ophthalmic** Instill 1 drop of a 2% solution into the affected eye(s) tid

dostarlimab-gxly (Rx)

(dos-TAR-li-mab-gxly)

Jemperli

Func. class.: Antineoplastic, misc

Chem. class.: PD-1 blocking antibody

ACTION: Binds PD-1 ligands to the PD-1 receptor found on T cells, inhibits T-cell proliferation and cytokine production

USES: Endometrial cancer, solid tumors

CONTRAINDICATIONS: Hypersensitivity, pregnancy, breastfeeding

Precautions: Immune-mediated adverse reactions, pneumonitis, respiratory disorders

DOSAGE AND ROUTES

- **Adult: : IV INF** dose 1 through dose 4: 500 mg q3wk; then dose 5 onwards 1000 mg q6wk, give over 30 min

Available forms: Injection 500-mg/10-mL (50 mg/mL) single-dose vial

Administer:

- Visually inspect the solution for particulate matter and discoloration; the solution is clear to slightly opalescent, colorless to yellow
- Discard the vial if visible particles are observed
- Do not shake
- Discard the vial if visible particles are observed
- For the 500-mg dose, withdraw 10 mL of product and dilute in an IV infusion bag with 0.9% Sodium Chloride Injection USP or 5% Dextrose Injection USP (2-10 mg/mL; max 250 mL). Compatible infusion bags are polyolefin, ethylene vinyl acetate, or polyvinyl chloride with di(2-ethylhexyl) phthalate (DEHP)
- For the 1000-mg dose, withdraw 10 mL from each of 2 vials (withdraw 20 mL total) and dilute in an IV bag containing 0.9% Sodium Chloride Injection USP or 5% Dextrose Injection USP (4-10 mg/mL; max 250 mL)
- Mix by gentle inversion; do not shake
- Discard unused portion
- Storage: protect from light; store prepared solution at room temperature for up to 6 hr from the time of preparation until the end of infusion or refrigerated at 2°C-8°C (36°F-46°F) for up to 24 hr from time of preparation until end of infusion, allow the diluted solution to come to room temperature before use; do not freeze
- Give over 30 min through an IV line using tubing made of polyvinyl chloride or platinum-cured silicon; fittings made of polyvinyl chloride or polycarbonate; and a sterile, nonpyrogenic, low-protein-binding, 0.2-micron, in-line or add-on filter
- Do not admix or run drugs through the same infusion line

SIDE EFFECTS

CNS: Fatigue, asthenia, neurologic toxicities
GI: Diarrhea, nausea, vomiting, constipation, hepatitis, colitis
INTEG: Infusion-related reactions
CV: Myocarditis
GU: Nephritis
RESP: Pneumonitis

INTERACTIONS

None known
Lab/Drug Test
Increase: alkaline phosphatase
Decrease: lymphocytes, sodium, albumin

PHARMACOKINETICS

Half-life 23.5 days

NURSING CONSIDERATIONS

Assess:
• **Severe and fatal immune-mediated adverse reactions:** During and after last dose. Monitor for symptoms/signs that may be immune-mediated adverse reactions. Monitor LFTs, creatinine, and thyroid function tests baseline and periodically during treatment. In cases of suspected immune-mediated adverse reactions
• **Transplant-related complications:** Closely monitor for febrile syndrome, GVHD, may be fatal
• **Pregnancy/breastfeeding:** Do not use in pregnancy or breastfeeding, verify pregnancy status in those of reproductive potential before starting therapy, use effective contraception during and for 4 mo after last dose
• Infusion-related reactions: Assess for burning, redness, inflammation at the site; interrupt or slow infusion or discontinue if severe
Evaluate:
• Therapeutic response
• Decreasing spread of endometrial cancer, solid tumors. Teach patient/family:
• **Pregnancy/breastfeeding:** Not to use in pregnancy and breastfeeding, a pregnancy test will be obtained before starting treatment in those of pregnancy potential, use effective contraception during and for 4 mo after last dose

doxazosin (Rx)

(dox-ay′zoe-sin)
Cardura, Cardura XL
Func. class.: Peripheral α_1-adrenergic receptor blocker
Chem. class.: Quinazoline

Do not confuse:
Cardura/Coumadin/Cardene/Ridaura

ACTION: Dilates peripheral blood vessels, lowers peripheral resistance; reduction in B/P results from peripheral α_1-adrenergic receptors being blocked

USES: Hypertension, urinary outflow obstruction, symptoms of benign prostatic hyperplasia

CONTRAINDICATIONS: Hypersensitivity to quinazolines
Precautions: Pregnancy, breastfeeding, children, hepatic disease, geriatric patients

DOSAGE AND ROUTES

BPH
• **Adult: PO** 1 mg/day at bedtime; increase in stepwise manner to 2, 4, 8 mg/day as needed at 1-2 wk intervals, max 8 mg; extended-release tablet (Cardura XL) 4 mg daily with breakfast, adjust dose q3-4wk, up to 8 mg daily
Hypertension
• **Adult: PO** 1 mg/day at bedtime, increasing gradually up to 16 mg/day if required; usual range 4-16 mg/day
• **Geriatric: PO** 0.5 mg nightly, gradually increase
Available forms: Tablets 1, 2, 4, 8 mg; extended-release tablets 4, 8 mg
Administer:
• Store in tight container at room temperature
• **Tablets:** may be broken, crushed, or chewed; if chewed, will be bitter; do not break, crush, chew XL tablets

• **Immediate-release tablet:** without regard to meals; **extended-release tablets:** give with breakfast; when switching from immediate release to extended release, the final evening dose of immediate release should not be taken

SIDE EFFECTS

CNS: *Dizziness, headache,* drowsiness, anxiety, depression, *vertigo,* weakness, fatigue
CV: Palpitations, *orthostatic hypotension,* tachycardia, *edema,* dysrhythmias, chest pain
EENT: Epistaxis, tinnitus, dry mouth, red sclera, pharyngitis, rhinitis, blurred vision
GI: *Nausea,* vomiting, diarrhea, constipation, abdominal pain, hepatitis
GU: Priapism, impotence, decreased libido
RESP: Dyspnea

PHARMACOKINETICS

PO: Onset 2 hr, peak 2-3 hr, duration up to 24 hr, half-life 22 hr, metabolized in liver, excreted via bile/feces (<63%) and in urine (9%), extensively protein bound (98%)

INTERACTIONS

Increase: hypotensive effects—alcohol, other antihypertensives, nitrates, PDE-5 inhibitors, CYP3A4 inhibitors, monitor B/P
Decrease: hypotensive effects—NSAIDs, estrogens, sympathomimetics
Drug/Herb
Decrease: Ma huang
Drug/Lab
Decrease: WBCs, neutrophils

NURSING CONSIDERATIONS

Assess:
• **Hypertension:** B/P (lying, standing), pulse 2-6 hr after each dose, with each increase; postural effects may occur, crackles, dyspnea, orthopnea with increased B/P; increased pulse; jugular venous distention during beginning treatment
• **BPH:** urinary pattern changes (hesitancy, dribbling, incomplete bladder emptying, dysuria, urgency, nocturia, urgency incontinence, intermittency) before and during treatment
• I&O, weight daily; edema in feet, legs daily
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed; use caution in breastfeeding (immediate release), avoid use with extended release

Evaluate:
• Therapeutic response: decreased B/P; decreased symptoms of BPH

Teach patient/family:
• That fainting occasionally occurs after first dose; not to drive, operate machinery for 4 hr after first dose, after dosage increase; to take first dose at bedtime; may take 1-2 wk to respond with BPH
• To rise slowly from sitting position
• To comply with hypertension regimen: low-sodium diet, exercise, weight reduction, stress management; not to smoke
• How to take B/P, to check at least once/wk
• For male to notify prescriber of erection >4 hr or priapism
• To notify all health care providers of all Rx and OTC medications and herbal supplements; not to add any products unless approved by prescriber
• To avoid hazardous activities until response is known; dizziness or drowsiness may occur
• To continue to take product even if feeling better; to take at same time each day, not to double doses

TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors; discontinue product; place patient in supine position

⚠ HIGH ALERT

doxepin (Rx)

(dox′e-pin)
Sineguan, Silenor
Func. class.: Antidepressant, tricyclic, antihistamine (topical)
Chem. class.: Dibenzoxepine, tertiary amine

Do not confuse:
Sinequan/Seroquel/Saquinavir/Singulair/Zonegran

ACTION: Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells

USES: Major depression, anxiety; *topical:* lichen simplex, atopic dermatitis, eczema, insomnia, migraine prophylaxis
Unlabeled uses: Topical pruritus

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, urinary retention, closed-angle glaucoma, prostatic hypertrophy, acute recovery from MI
Precautions: Pregnancy, breastfeeding, geriatric patients, seizures

Black Box Warning: Children, suicidal patients

DOSAGE AND ROUTES

Depression/anxiety
- **Adult: PO** 50-75 mg/day, may increase to 300 mg/day for severely ill; give in divided doses if >150 mg/day
- **Geriatric: PO** 25-50 mg at bedtime, increase weekly by 25-50 mg to desired dose, max 150 mg/day

Pruritus
- **Adult: PO** 10 mg at bedtime, may increase to 25 mg at bedtime; **TOPICAL** apply thin film qid at least 3 hr apart

Insomnia (Silenor)
- **Adult: PO** 6 mg 30 min prior to bedtime, 3 mg may be sufficient, max 6 mg/night

Available forms: Capsules 10, 25, 50, 75, 100, 150 mg; oral concentrations 10 mg/mL; tablets (Silenor) 3, 6 mg
Administer:
- **Oral concentrations:** should be diluted with 120 mL water, milk, or orange, grapefruit, tomato, prune, or pineapple juice; do not mix with grape juice
- Increased fluids, bulk in diet for constipation
- With food, milk for GI symptoms; do not give with carbonated beverages
- Dosage at bedtime to avoid oversedation during day; may take entire dose at bedtime; geriatric patients may not tolerate daily dosing
- Gum, hard candy, or frequent sips of water for dry mouth
- Store in tight container protected from direct sunlight

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, paresthesia, suicidal ideation
CV: *Orthostatic hypotension, ECG changes, tachycardia,* hypertension, palpitations, dysrhythmias
EENT: *Blurred vision,* tinnitus, mydriasis, ophthalmoplegia, glossitis
GI: *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation
GU: *Urinary retention,* acute renal failure
HEMA: Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, pancytopenia, purpuric disorder
INTEG: Rash, urticaria, sweating, pruritus, photosensitivity

PHARMACOKINETICS

PO: Peak 2 hr, metabolized in liver by CYP2C19/CYP2D6, which exert genetic polymorphism; Asians, Black patients may be poor metabolizers; excreted by kidneys, crosses placenta, excreted in breast milk, half-life 8-24 hr

INTERACTIONS

Increase: hyperpyretic crisis, seizures, hypertensive episode—MAOIs
Increase: hypertensive action—EPINEPHrine, norepinephrine
Increase: hypertensive crisis—cloNIDine; do not use together

Increase: doxepin effect—cimetidine, FLUoxetine, fluvoxaMINE, PARoxetine, sertraline
Increase: CNS depression—barbiturates, benzodiazepines, sedative/hypnotics, alcohol, other CNS depressants
Increase: QT interval—class IC/III antiarrhythmics (propafenone, flecainide), quinolones
Increase: serotonin syndrome, toxicity—SSRIs, SNRIs, serotonin-receptor agonists, triptans
Increase: anticholinergic effects—anticholinergics

Drug/Herb

• **Serotonin syndrome:** St. John's wort; avoid using together

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alkaline phosphatase, LFTs

NURSING CONSIDERATIONS

Assess:

• B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; VS q4hr in patients with CV disease
• Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Hepatic studies: AST, ALT, bilirubin
• Weight weekly; appetite may increase with product
• **ECG** for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients; product should be discontinued gradually several days prior to surgery
• **EPS** primarily in geriatric patients: rigidity, dystonia, akathisia
• **Depression:** mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms; assess often during initial treatment; restrict the amount of the product given to the patient
• **Chronic pain:** location, severity, type prior to and during treatment, alleviating/aggravating factors
• **Sexual dysfunction:** decreased libido and erectile dysfunction may occur
• Urinary retention, constipation; constipation most likely in children, geriatric patients
• **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product is discontinued abruptly
• Alcohol consumption; if alcohol is consumed, hold dose until morning
• Assistance with ambulation during beginning therapy because drowsiness/dizziness occurs; safety measures primarily for geriatric patients
• **Serotonin syndrome:** nausea, vomiting, diarrhea, agitation, hallucinations, hyperthermia, incoordination; may occur when used with other products known to cause serotonin syndrome
• **Beers:** avoid use in older adults; highly anticholinergic, sedating; causes orthostatic hypotension, may cause delirium
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; use caution in breastfeeding, excreted in breast milk

Evaluate:

• Therapeutic response: decreased anxiety, depression

Teach patient/family:

• That therapeutic effect (depression) may take 2-3 wk, antianxiety effects sooner
• To use caution when driving, during other activities requiring alertness because of drowsiness, dizziness, blurred vision
• To avoid alcohol, other CNS depressants; may potentiate effects; not to take other products unless approved by prescriber
• Not to discontinue medication abruptly after long-term use; may cause nausea, headache, malaise
• To wear sunscreen or large hat; photosensitivity occurs
• That clinical worsening and suicide may occur, usually in children, young adults ≤24 yr
• To immediately report urinary retention

TREATMENT OF OVERDOSE: ECG monitoring; lavage, administer anticonvulsant, sodium bicarbonate

⚠ HIGH ALERT

DOXOrubicin (Rx)

(dox-oh-roo'bi-sin)

Adriamycin

Func. class.: Antineoplastic, antibiotic
Chem. class.: Anthracycline glycoside

Do not confuse:
DOXOrubicin/DOXOrubicin liposomal/DAUNOrubicin

ACTION: Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

USES: Wilms' tumor; bladder, breast, lung, ovarian, stomach, thyroid cancer; Hodgkin's/non-Hodgkin's disease; acute lymphoblastic leukemia; myeloblastic leukemia; neuroblastomas; soft tissue/bone sarcomas

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, systemic infections, cardiac disorders, severe myelosuppression, lifetime dose of 550 mg/m^2, hepatic disease
Precautions: Accidental exposure, cardiac disease, dental work, electrolyte imbalance, infection, hyperuricemia

Black Box Warning: Bone marrow suppression, extravasation, heart failure, secondary malignancy; requires an experienced clinician, IM/SUBCUT use

DOSAGE AND ROUTES

• **Adult: IV** 60-75 mg/m^2 every 3 wk, or 25-30 mg/m^2 daily × 2-3 days, repeat q3-4wk or 20 mg/m^2/wk, or may be used in combination with other antineoplastics with 40-75 mg/m^2 every 21-28 days, max cumulative dose 550 mg/m^2 or 450 mg/m^2 if prior DAUNOrubicin, cyclophosphamide, mediastinal XRT
• **Child: IV** 30 mg/m^2/day × 3 days q4wk

Hepatic dose
• **Adult: IV** Bilirubin 1.2-3 mg/dL, give 50% of dose; bilirubin 3.1-5 mg/dL, give 25% of dose

Renal dose
• **Adult: IV** CCr <10 mL/min give 75% of dose

Available forms: Powder for injection 10, 20, 50 mg/vial; solution for injection 2 mg/mL

Administer:

IV route
• Give antiemetic 30-60 min prior to product to prevent vomiting
• Give allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine
• **Use cytotoxic handling procedures:** inspect for particulate and discoloration prior to use

Black Box Warning: Do not give IM, SUBCUT

Black Box Warning: If extravasation occurs, stop infusion and complete via another vein, preferably in another limb, use dexrazoxane topically

• Aluminum needles may be used during administration; avoid aluminum during storage
• Rapid injection can cause facial flushing or erythema along the vein

Reconstitution:
• To avoid risks with reconstitution, the commercially available injection may be used; there are still risks involved in handling the injection
• Do not use diluents containing preservatives to reconstitute powder for injection
• Reconstitute 10, 20, 50, 100 mg of DOXOrubicin with 5, 10, 25, 50 mL, respectively, of nonbacteriostatic NS injection (2 mg/mL), shake until completely dissolved; use reconstituted so-

lution within 24 hr; do not expose to sunlight

- **IV injection**

Inject reconstituted solution over >3-5 min via Y-site or 3-way stopcock into a free-flowing IV infusion of NS or D_5W; a butterfly needle inserted into a large vein is preferred

- Increase fluid intake to 2-3 L/day to prevent urate, calculi formation
- Store at room temperature for 24 hr after reconstituting

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, ifosfamide, imipenem cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, sargramostim, sodium acetate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystoles, irreversible cardiomyopathy, acute left ventricular failure

GI: *Nausea, vomiting,* anorexia, *mucositis,* hepatotoxicity

GU: Impotence, sterility, amenorrhea, gynecomastia, hyperuricemia, urine discoloration

HEMA: Thrombocytopenia, leukopenia, anemia

RESP: Recall pneumonitis

INTEG: *Rash,* necrosis at injection site, dermatitis, reversible *alopecia,* cellulitis, thrombophlebitis at injection site, radiation recall

SYST: Anaphylaxis, secondary malignancy

PHARMACOKINETICS

Half-life 30 min, terminal 16.5 hr; metabolized by liver; crosses placenta; excreted in urine, bile, breast milk

INTERACTIONS

Increase: life-threatening dysrhythmias—posaconazole, fluconazole; do not use together

Increase: QT prolongation—other drugs that increase QT prolongation

Increase: neutropenia, thrombocytopenia—progesterone

Increase: cardiomyopathy—calcium-channel blockers

Increase: toxicity—other antineoplastics, cycloSPORINE, radiation, mercaptopurine

Increase: hemorrhagic cystitis risk, cardiac toxicity—cyclophosphamide

Increase: effect of phenytoin, fosphenytoin

Increase: DOXOrubicin effect—streptozocin

Decrease: DOXOrubicin effect—PHENobarbital

Decrease: antibody response—live virus vaccine

Decrease: clearance of DOXOrubicin—PACLitaxel
Drug/Lab Test
Increase: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow depression: CBC, differential, platelet count weekly; withhold or reduce dose of product if WBC is <1500/mm^3 or platelet count is <50,000/mm^3; notify prescriber of these results

- **Renal studies:** BUN, serum uric acid, urine CCr, electrolytes prior to, during therapy
- **I&O ratio:** report fall in urine output to <30 mL/hr
- **Monitor temperature:** fever might indicate beginning infection
- **Hepatotoxicity:** hepatic studies prior to, during therapy: bilirubin, AST, ALT, alkaline phosphatase as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning: Dysrhythmias: ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction prior to treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected
- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Alkalosis if severe vomiting is present

Black Box Warning: Secondary malignancy: assess for AML and MDS, which may occur

Black Box Warning: Extravasation: local irritation, pain, burning at injection site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- GI symptoms: frequency of stools, cramping
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To add 2-3 L of fluids unless contraindicated prior to and for 24-48 hr after to decrease possible hemorrhagic cystitis
- To report any complaints, side effects to nurse or prescriber
- That hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair might be different in color, texture
- That continuing follow-up and lab work will be needed
- To notify health care professional of trouble breathing; swelling of hands, feet; increase in weight; change in heart rate
- That body fluids should not be handled unless protective equipment is used
- To discuss OTC, Rx, herbals, supplements with health care professional
- To avoid foods with citric acid, hot temperature, or rough texture
- To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- That urine, other body fluids may be red-orange for 48 hr
- To avoid crowds and persons with infections when granulocyte count is low
- To avoid vaccinations
- **Pregnancy/breastfeeding:** that barrier contraceptive measures are recom-

mended during therapy and for 4 mo after ending therapy; to avoid breastfeeding

⚠ HIGH ALERT

DOXOrubicin liposomal (Rx)

(dox-oh-roo′bi-sin)

Caelyx, Doxil, Myocet

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline glycoside

Do not confuse:
DOXOrubicin/DOXOrubicin liposomal/DAUNOrubicin

ACTION: Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

USES: AIDS-related Kaposi's sarcoma, multiple myeloma, metastatic ovarian carcinoma, multiple myeloma, refractory metastatic breast cancer

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity
Precautions: Children, infection, leukopenia, stomatitis, thrombocytopenia, systemic infections, cardiac disorders

Black Box Warning: Cardiotoxicity, infusion reactions, myelosuppression, hepatic disease

DOSAGE AND ROUTES

Max lifetime cumulative dose 550 mg/m^2; 400 mg/m^2 for those who have received other cardiotoxics or mediastinal radiation

Kaposi's sarcoma

- **Adult: IV** 20 mg/m^2 every 3 wk

Multiple myeloma

- **Adult: IV** 30 mg/m^2 IV infusion on day 4 every 3 wk plus bortezomib 1.3 mg/m^2/dose IV bolus on days 1, 4, 8, 11 of each cycle; give DOXOrubicin liposomal after bortezomib receipt on day 4; administer up to 8 treatment cycles or until disease progression or unacceptable toxicity occurs

Ovarian cancer

- **Adult: IV** 50 mg/m^2 q4wk

Refractory metastatic breast cancer

- **Adult: IV** 50 mg/m^2 q4wk

Hematologic toxicity in patients with ovarian cancer or HIV-related Kaposi's sarcoma

Grade 1 (ANC of 1500-1900/mm^3, platelets ≥75,000/mm^3): No dose reduction; **grade 2 (ANC of 1000-1499/mm^3, platelets ≥50,000/mm^3 and <75,000/mm^3:** Wait until ANC ≥1500 cells/mm^3 and platelets ≥75,000 cells/mm^3; redose with no dose reduction; **grade 3 (ANC of 500-999/mm^3, platelets ≥25,000/mm^3 and <50,000/mm^3):** Wait until ANC ≥1500 cells/mm^3 and platelets ≥75,000 cells/mm^3; redose with no dose reduction; **grade 4 (ANC <500/mm^3, platelets <25,000/mm^3):** Wait until ANC ≥1500 cells/mm^3 and platelets ≥75,000 cells/mm^3; reduce dose by 25% or continue with full dose with colony-stimulating factor

Available forms: Liposomal dispersion for injection: 2 mg/mL

Administer:

- Use cytotoxic protocol according to agency policy
- Prepared liposomal DOXOrubicin is translucent, red liposomal dispersion; visually inspect for particulate matter and discoloration prior to use
- Pegylated liposomal DOXOrubicin (Doxil) is for IV INFUSION use only and should not be given IM/SUBCUT; give under the supervision of a physician who is experienced in cancer chemotherapy

Black Box Warning: Care should be taken to avoid extravasation because the drug is irritating to extravascular tissue

- Premedication with antiemetics is recommended

IV route

- **Reconstitution (Doxil):** Dilute the appropriate dose, not to exceed 90 mg/250 mL D_5W; do not mix with any other diluent, drugs, or bacteriostatic agent; use

aseptic technique; product contains no preservative or bacteriostatic agent; diluted solution must be refrigerated and used within 24 hr

- **IV INFUSION (Doxil):** Do not administer as a bolus injection or an undiluted solution; rapid injection can increase the risk of an infusion-related reaction

- An acute infusion reaction can occur during the first infusion and is usually resolved by slowing the rate of infusion; most patients can tolerate subsequent infusions

- **Rate:** Infuse at an initial rate of 1 mg/min; if no infusion-related action, the rate can be increased to complete the infusion over 1 hr; do not filter
- Give antiemetic 30-60 min prior to product to prevent vomiting
- Use allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine
- Avoid mixing with other products
- Increase fluid intake to 2-3 L/day to prevent urate, calculi formation
- Store refrigerated for 24 hr after reconstituting

SIDE EFFECTS

CNS: Paresthesias, headache, depression, insomnia, fatigue, fever
CV: Chest pain, decreased B/P, cardiomyopathy, heart failure, dysrhythmias, tachycardia
EENT: Optic neuritis, rhinitis, pharyngitis, stomatitis
GI: *Nausea, vomiting,* anorexia, *mucositis,* hepatotoxicity, abdominal pain
HEMA: Thrombocytopenia, leukopenia, anemia, secondary malignancy
INTEG: *Rash,* necrosis at injection site, dermatitis, *reversible alopecia,* exfoliative dermatitis, palmar-plantar erythrodysesthesia, thrombophlebitis at injection site
RESP: Dyspnea, cough, respiratory infections

PHARMACOKINETICS

Half-life 55 hr; metabolized by liver; crosses placenta; excreted in urine, bile, breast milk

INTERACTIONS

Increase: life-threatening dysrhythmias—posaconazole, fluconazole; do not use together
Increase: QT prolongation—other drugs that increase QT prolongation
Increase: neutropenia, thrombocytopenia—progesterone
Increase: cardiomyopathy—calcium channel blockers
Increase: toxicity—other antineoplastics, cycloSPORINE, radiation, mercaptopurine
Increase: hemorrhagic cystitis risk, cardiac toxicity—cyclophosphamide
Increase: effect of—phenytoin, fosphenytoin
Increase: DOXOrubicin effect—streptozocin
Decrease: DOXOrubicin effect—PHENobarbital
Decrease: antibody response—live virus vaccine
Decrease: antineoplastic effect—hematopoietic progenitor cells; do not use 24 hr prior to or after treatment
Decrease: clearance of DOXOrubicin—PACLitaxel
Drug/Lab Test
Increase: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is $<4000/mm^3$ or platelet count is $<75,000/mm^3$; notify prescriber of these results

- Renal studies: BUN; serum uric acid; urine CCr; electrolytes prior to, during therapy
- I&O ratio: report fall in urine output to <30 mL/hr
- **Hepatotoxicity:** Hepatic studies prior to, during therapy: bilirubin, AST, ALT, alkaline phosphatase as needed or monthly; check for jaundice of skin and sclera, dark

urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning: Dysrhythmias: ECG: watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction prior to treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected
- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- **Secondary malignancy:** assess for acute myelogenous leukemia and oral cancer

Black Box Warning: Extravasation: local irritation, pain, burning at injection site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- GI symptoms: frequency of stools, cramping
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To add 2-3 L of fluids unless contraindicated prior to and for 24-48 hr after to decrease possible **hemorrhagic cystitis**
- To report any complaints, side effects to nurse or prescriber
- That hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair may be different in color, texture
- To avoid foods with citric acid, hot temperature, or rough texture
- To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- That urine, other body fluids may be red-orange for 48 hr
- To avoid crowds and persons with infections when granulocyte count is low
- To avoid vaccinations because reactions can occur; to avoid alcohol
- **Pregnancy/breastfeeding:** that barrier contraceptive measures are recommended during therapy and for 4 mo after therapy ends; to avoid breastfeeding

doxycycline (Rx)

(dox-i-sye′kleen)

Oracea

doxycycline hyclate (Rx)

Atridox, Acticlate, Doryx, Doxy MPC, Monodox, Vibramycin

doxycycline monohydrinate (Rx)

Apprilon, Vibramycin

Func. class.: Antiinfective

Chem. class.: Tetracycline

Do not confuse:

doxycycline/doxepin/dicyclomine

ACTION: Inhibits protein synthesis, phosphorylation in microorganisms by binding to 30S ribosomal subunits; bacteriostatic

USES: *Acinetobacter* sp., *Actinomyces israelii, Bacillus anthracis, Bacteroides* sp., *Balantidium coli, Bartonella bacilliformis, Borrelia recurrentis, Brucella* sp., *Campylobacter fetus, Chlamydia psittaci, Chlamydia trachomatis, Clostridium* sp., *Entamoeba histolytica, Enterobacter aerogenes, Enterococcus* sp., *Escherichia coli, Francisella tularensis, Fusobacterium fusiforme, Haemophilus ducreyi, Haemophilus*

influenzae (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Klebsiella granulomatis, Klebsiella* sp., *Leptospira* sp., *Listeria monocytogenes, Mycoplasma pneumoniae, Neisseria gonorrhoeae, Neisseria meningitidis, Orientia tsutsugamushi, Plasmodium falciparum, Propionibacterium acnes, Rickettsia akari, Rickettsia prowazekii, Rickettsia rickettsii, Shigella* sp., *Staphylococcus aureus* (MSSA), *Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci), *Streptococcus* sp., *Treponema pallidum, Treponema pertenue, Ureaplasma urealyticum, Vibrio cholerae,* viridans streptococci, *Yersinia pestis;* syphilis, gonorrhea, lymphogranuloma venereum, uncommon gram-negative/gram-positive organisms, malaria prophylaxis

Unlabeled uses: Enterocolitis, biliary tract, intraabdominal infections; epididymitis *(Chlamydia trachomatis);* chronic prostatitis *(Ureaplasma urealyticum);* traveler's diarrhea (enterotoxigenic *Escherichia coli*); Legionnaire's disease *(Legionella pneumophila);* Lyme disease *(Borrelia burgdorferi),* Lyme disease (erythema migrans); Lyme arthritis; Lyme carditis; pleural effusion; malaria (chloroquine-resistant *Plasmodium falciparum*); pelvic inflammatory disease (PID), tubo-ovarian abscess in combination; acute dental infection, dentoalveolar infection, endodontic infection; aggressive juvenile periodontitis, plaque prophylaxis *(Yersinia pestis);* tularemia prophylaxis *(Francisella tularensis);* Bancroft's filariasis (elephantiasis) *(Wuchereria bancrofti);* melioidosis due to *Burkholderia pseudomallei;* leptospirosis (*Leptospira* sp); infection prophylaxis for gynecologic procedures/surgical infection prophylaxis hysterosalpingogram or chromotubation/induced abortion/dilation and evacuation; methicillin-resistant *Staphylococcus aureus* (MRSA)–associated bone and joint infections

CONTRAINDICATIONS: Pregnancy, children <8 yr, hypersensitivity to tetracyclines, esophageal ulceration

Precautions: Breastfeeding, hepatic disease, CDAD, ulcerative colitis, sulfite hypersensitivity, excessive sunlight

DOSAGE AND ROUTES

Most infections

- **Adult: PO/IV** 100 mg q12hr on day 1, then 100 mg/day; **IV** 200 mg in 1-2 infusions on day 1, then 100-200 mg/day
- **Child >8 yr, ≥45 kg: PO** 100 mg q12hr on day 1, then 100 mg daily; severe infections 100 mg q12hr; **IV** 200 mg on day 1, then 100-200 mg daily, give 200 mg dose as 1 or 2 infusions
- **Child >8 yr, ≤45 kg: PO** 2.2 mg/kg q12hr on day 1, then 2.2 mg/kg daily, severe infections 2.2 mg/kg q12hr; **IV** 4.4 mg/kg divided on day 1, then 2.2-4.4 mg/kg daily in 1 to 2 divided doses

Gonorrhea in patients allergic to penicillin

- **Adult: PO** 100 mg q12hr × 7 days or 300 mg followed 1 hr later by another 300 mg

Malaria prophylaxis

- **Adult: PO** 100 mg/day 1-2 days prior to travel, daily during travel, and for 4 wk after return
- **Adolescent/child ≥8 yr, <45 kg: PO** 2 mg/kg/day (up to 100 mg/day) begin 1-2 days prior to travel, continue for 4 wk after return

C. trachomatis

- **Adult: PO** 100 mg bid × 7 days

Syphilis (early)

- **Adult: PO** 100 mg bid × 14 days

Anthrax, postexposure

- **Adult and child >8 yr and ≥45 kg: IV** 100 mg q12hr; change to **PO** when able × 60 days
- **Adolescent/child ≥8 yr and <45 kg: PO** 2.2 mg/kg q12hr × 60 days; **IV** 100 mg q12hr, change to **PO** when able × 60 days

Lyme disease

- **Adult/adolescent/child ≥8 yr: PO** 100 mg bid × 10-21 days

Periodontitis

- **Adult:** 20 mg bid after scaling and root planing for ≤9 mo; give close to mealtime AM or PM

Pleural effusion (unlabeled)

- **Adult: INTRACAVITARY** 500 mg diluted with 250 mL 0.9% NaCl given by chest tube lavage and drainage

Available forms: Capsule 40 mg; suspension 50 mg/5 mL; capsule 20, 50, 100 mg; delayed-release tablets 75, 100, 150 mg; delayed-release capsule 75, 100 mg; injection 42.5, 100, 200 mg; tablets 20, 100 mg; capsules 50, 100, 150 mg; tablets 50, 75, 100 mg; oral suspension 25 mg/5 mL

Administer:

PO route

- Do not break, crush, or chew capsules; may crush tablets and mix with food
- On empty stomach or with full glass of water 2 hr prior to or after meals; avoid dairy products, antacids, laxatives, iron-containing products; if these must be taken, give 2 hr prior to or after product; avoid giving oral products within 1 hr of bedtime, esophageal ulceration may occur
- **Delayed-release capsule:** Swallow whole or open and sprinkle on applesauce
- **Suspension:** Shake well, use calibrated device, may give with food/milk for GI irritation, store at room temperature, discard after 14 days

Intermittent IV INFUSION route

- After diluting 100 mg or less/10 mL or 200 mg/20 mL of sterile water or NS for injection, each 100 mg must be further diluted with 100-1000 mL of NaCl, D_5W, Ringer's, LR, D_5LR, Normosol-M, Normosol-R in D_5W; run 100 mg or less over 1-4 hr; infusion must be completed in 6 hr when diluted in LR solution or 12 hr with other solution; protect from light, heat
- Avoid rapid use, extravasation
- Store in tight, light-resistant container at room temperature; IV stable for 12 hr at room temperature, 72 hr refrigerated; discard if precipitate forms

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefonicid, cefotaxime, cefTRIAXone, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, pancuronium, pantoprazole, papaverine, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, TPN (2 in 1), trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Fever, headache

CV: Pericarditis
EENT: Dysphagia, glossitis, decreased calcification of deciduous teeth, oral candidiasis, tooth discoloration
GI: *Nausea, abdominal pain, vomiting, diarrhea,* anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, gastric burning, stomatitis
GU: *Increased BUN*
HEMA: Eosinophilia, neutropenia, thrombocytopenia, hemolytic anemia
INTEG: *Rash, urticaria, photosensitivity, increased pigmentation,* exfoliative dermatitis, pruritus, phlebitis, injection site reaction
MS: Bone growth retardation (<8 yr old), muscle, joint pain
RESP: Cough
SYST: Stevens-Johnson syndrome, angioedema, anaphylaxis, toxic epidermal necrolysis

PHARMACOKINETICS

PO: Well absorbed, widely distributed; peak 1½-4 hr; half-life 1 day; excreted in urine, feces, bile; 90% protein bound; crosses placenta; enters breast milk

INTERACTIONS

Increase: effect of—anticoagulants, digoxin, methotrexate
Decrease: doxycycline effect—antacids, $NaHCO_3$, dairy products, alkali products, iron, kaolin/pectin, barbiturates, carBAMazepine, phenytoin, cimetidine sucralfate, cholestyramine, colestipol, rifAMPin, bismuth; iron, magnesium, zinc, calcium, aluminum salts, sevelamer
Decrease: effects—penicillins, oral contraceptives, digoxin
Drug/Lab Test
Increase: BUN, alkaline phosphatase, bilirubin, amylase, ALT, AST, eosinophils, WBC
Decrease: Hb
False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:
- I&O ratio
- Blood studies: PT, CBC, AST, ALT, BUN, creatinine
- Signs of infection
- **Allergic reactions:** rash, itching, pruritus, angioedema
- Nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered
- **Overgrowth of infection:** fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea, changes in cough or sputum
- IV site for phlebitis/thrombosis; product is highly irritating
- After C&S is obtained, do not wait for results
- **Pregnancy/breastfeeding:** no well-controlled studies; may affect skeletal development, do not use in second half of pregnancy unless benefit outweighs fetal risk; discontinue breastfeeding or product, excreted in small amounts in breast milk

Evaluate:
- Therapeutic response: decreased temperature, absence of lesions, negative C&S

Teach patient/family:
- To avoid sun because burns may occur; that sunscreen does not seem to decrease photosensitivity
- That all prescribed medication must be taken to prevent superinfection; not to use outdated products because Fanconi syndrome may occur (reversible nephrotoxicity)
- That if children ≤8 yr old are undergoing tooth development, teeth may be permanently discolored
- Not to use with antacids, iron products, H_2 blockers, sevelamer, calcium (milk), magnesium, zinc
- To take with full glass of water; if nausea occurs, take with food

doxylamine/pyridoxine (Rx)
(docks-ill′ah-meen/peer-reh-dock′seen)
Diclegis, Bonjesta, Diclectin/B6
Func. class.: Antiemetic

ACTION:
Unknown, may act by anticholinergic effect

USES:
Nausea and vomiting of pregnancy in women who do not respond to other treatment

CONTRAINDICATIONS:
Hypersensitivity

DOSAGE AND ROUTES
• **Adult pregnant females: PO** 2 tablets (on an empty stomach) at bedtime, on day 1; if dose controls symptoms the next day, continue regimen. If symptoms persist on the afternoon of day 2, continue 2 tablets at bedtime, then take 3 tablets starting on day 3 (1 tablet in AM and 2 tablets at bedtime); if symptoms are controlled, continue regimen. If symptoms persist, on day 4, take 4 tablets (1 tablet in AM, 1 tablet midafternoon, and 2 tablets at bedtime); max 4 tablets/day. Use only as needed

Available forms: Tablets extended release: doxylamine 20 mg/pyridoxine 20 mg; tablets delayed release: doxylamine 10 mg/pyridoxine 10 mg

Administer
• Give whole on empty stomach with 8 oz of water
• Take as prescribed, do not double or miss doses
• Store at room temperature, protect from light

SIDE EFFECTS
CNS: Somnolence, dizziness, drowsiness

PHARMACOKINETICS
Doxylamine: Onset unknown, peak 1.7-8 hr, duration unknown; **pyridoxine:** Onset unknown, peak ½-4.7 hr; half-life: doxylamine: 12½ hr, pyridoxine: ½ hr

INTERACTIONS
Increase: CNS depression—CNS depressants, MAOIs, alcohol, avoid using together

Drug/Food
• **Decrease:** effect by food

NURSING CONSIDERATIONS
Assess:
• **Anticholinergic effects:** monitor for dry mouth, constipation, dizziness
• **CNS changes:** Assess for dizziness, drowsiness, and somnolence; caution against driving or other hazardous activities until response is known
• **Pregnancy/breastfeeding:** Used in pregnancy to decrease nausea/vomiting; do not breastfeed

Evaluate:
• Therapeutic response
• Decreasing nausea/vomiting of pregnancy

Teach patient/family:
• To report anticholinergic effects
• Not to drive or perform other hazardous activities until response is known
• Pregnancy/breastfeeding: Do not breastfeed

⚠ HIGH ALERT

dronedarone (Rx)
(droe-ned'a-rone)

Multaq

Func. class.: Antidysrhythmic (class III)

Chem. class.: Iodinated benzofuran derivative

ACTION:
Prolongs duration of action potential and effective refractory period, noncompetitive alpha- and beta-adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

USES:
To reduce hospitalization for atrial fibrillation

CONTRAINDICATIONS:
Pregnancy, breastfeeding; second, third-degree AV block; bradycardia, severe sinus node dysfunction, hypersensitivity, heart failure,

hepatic disease, QT prolongation, aminodarone-induced lung/liver toxicity

Black Box Warning: NYHA Class IV heart failure or Class II-III with recent decompensation requiring hospitalization, permanent atrial fibrillation (cannot restore sinus rhythm)

Precautions: Children, geriatric patients, Asian patients, females, electrolyte imbalances, atrial fibrillation/flutter

DOSAGE AND ROUTES

• **Adult: PO** 400 mg bid; discontinue class I, III antidysrhythmics or strong CYP3A4 inhibitors prior to beginning treatment; max 800 mg/day; severe hepatic disease

Available forms: Tablets 400 mg

Administer:

PO route

• Give bid with morning, evening meals

• Give medication guide; should be dispensed with each prescription, refill

SIDE EFFECTS

CNS: Weakness

CV: *Bradycardia,* heart failure, QT prolongation, torsades de pointes, atrial flutter

GI: Nausea, vomiting, diarrhea, abdominal pain, severe hepatic injury, hepatic failure

INTEG: Rash, photosensitivity, anaphylaxis, angioedema

RESP: Interstitial pneumonitis, pulmonary fibrosis

PHARMACOKINETICS

Peak 3-6 hr, half-life 13-19 hr, metabolized by liver, by CYP3A excreted in feces (84%), via kidneys (6%), protein binding >98%

INTERACTIONS

Increase: dronedarone levels—CYP3A inhibitors/2D6 inhibitors

Decrease: dronedarone levels—3A/2D6 inducers

Increase: bradycardia—beta-blockers, calcium channel blockers

Increase: levels of cycloSPORINE, dextromethorphan, digoxin, disopyramide, flecainide, methotrexate, phenytoin, procainamide, quiNIDine, theophylline

Increase: anticoagulant effects—dabigatran, warfarin

Drug/Herb

Increase: anticoagulant effect—yohimbine

Decrease: dronedarone effect—St. John's wort

Drug/Food:

Increase: dronedarone effect—grapefruit; avoid use

Drug/Lab Test

Increase: T4, creatinine, LFTs, bilirubin

Decrease: potassium, magnesium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: NYHA Class IV heart failure or symptomatic heart failure with recent decomposition requiring hospitalization doubles risk of death

• **ECG** to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias, B/P continuously for hypo/hypertension; report dysrhythmias, slowing heart rate

• Serum creatinine, potassium, magnesium

• I&O ratio; electrolytes (potassium, creatinine, magnesium)

• Dehydration or hypovolemia

• Rebound hypertension after 1-2 hr

• Cardiac rate; respiration: rate, rhythm, character; chest pain; start with patient hospitalized and monitored up to 1 wk

• **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding

Evaluate:

• Therapeutic response: maintenance of normal heart rhythm following atrial fibrillation, flutter

Teach patient/family:

• To take this product as directed in AM, PM with meals; to avoid missed doses; not to use with grapefruit juice, to avoid all other products without approval of provider

• To immediately report weight gain, edema, difficulty breathing, fatigue, peripheral edema
• **Pregnancy/breastfeeding:** to use effective contraception during treatment; not to breastfeed

TREATMENT OF OVERDOSE:
O_2, artificial ventilation, ECG, administer DOPamine for circulatory depression

droxidopa (Rx)
(drox′-i-doe′-pa)
Northera
Func. class.: Cardiovascular agent, vasopressor

ACTION:
A synthetic amino acid precursor of norepinephrine. It is used to increase blood pressure with symptomatic neurogenic orthostatic hypotension caused by primary autonomic failure (Parkinson's disease, multiple system atrophy, and pure autonomic failure), dopamine beta-hydroxylase deficiency, or nondiabetic autonomic neuropathy

USES:
Symptomatic neurogenic orthostatic hypotension

CONTRAINDICATIONS:
Hypersensitivity
Precautions: Angina, breastfeeding, cardiac arrhythmias, cardiac disease, children, coronary artery disease, heart disease, hyperthermia, infants, mental status changes, myocardial infarction, neonates, pregnancy, salicylate/tartrazine dye hypersensitivity

Black Box Warning: Supine hypertension

DOSAGE AND ROUTES
• **Adult: PO** 100 mg tid: upon arising in the morning, at midday, and in the late afternoon at least 3 hr prior to bedtime; titrate to response, by 100 mg tid q24-48 hr up to a dose of 600 mg **PO** tid, max 1800 mg/day

Available forms: Capsules 100, 200, 300 mg
Administer:

Black Box Warning: Give tid at the following times: upon arising in the morning, at midday, and in the late afternoon at least 3 hr prior to bedtime (to reduce the potential for supine hypertension during sleep)

• Use without regard to food, but should be taken consistently in regard to food to ensure consistent absorption
• Swallow capsules whole

SIDE EFFECTS
CNS: Headache, dizziness, fatigue
CV: Supine hypertension, arrhythmia exacerbation, chest pain
MISC: Urinary tract infection, neuroleptic malignant syndrome

PHARMACOKINETICS
Peak 3-4 hr

INTERACTIONS
Increase: droxidopa effects—carbidopa, serotonin receptor agonists, sympathomimetics
Increase: hypertensive crisis—MAOIs

NURSING CONSIDERATIONS
Assess:

Black Box Warning: Supine hypertension: monitor supine B/P prior to and at every dosage increase; assess response periodically. Advise to elevate the head of the bed when resting or sleeping to lessen the risk for supine hypertension. B/P should be monitored in supine position and in the recommended head-elevated sleeping position. Reduce or discontinue if supine hypertension persists

• **Neuroleptic malignant syndrome:** hyperthermia, severe extrapyramidal dysfunction, alterations in consciousness, mental status changes, and autonomic instability (tachycardia, blood pressure fluctuations, diaphoresis). In those with Parkinson's disease,

this condition may occur with abrupt reduction of products with dopaminergic properties
• **Arrhythmia exacerbation:** exacerbation of existing ischemic cardiac disease (coronary artery disease, angina, myocardial infarction, HF); consider the potential risk prior to initiating therapy; if chest pain occurs during use, assess cardiac status
• **Pregnancy/breastfeeding:** no well-controlled studies in pregnancy, breastfeeding

Evaluate:
• **Therapeutic response:** increased B/P

Teach patient/family:

Black Box Warning: Instruct patients to rest and sleep in an upper-body-elevated position and to monitor B/P (to reduce the potential for supine hypertension); to take ≥3 hr prior to bedtime

• To take consistently with or without food
• Not to double doses

⚠ HIGH ALERT

dulaglutide (Rx)

(doo-la-gloo′-tide)

Trulicity

Func. class.: Antidiabetic

Chem. class.: Human glucagon–like peptide-1 (GLP-1) receptor agonist

ACTION: Binds and activates known human glucagon-like peptide-1 (GLP-1) receptor agonist, mimics natural physiology for self-regulating glycemic control

USES: Type 2 diabetes mellitus, once-weekly dosing

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2 (MEN-2), thyroid cancer

Precautions: Pregnancy, breastfeeding, children, geriatric patients, severe renal/hepatic/GI disease, pancreatitis, vitamin D deficiency, burns, colitis, diarrhea, fever, GI bleeding/perforation/obstruction, ileus, infection, CDAD, thyroid disease, trauma, surgery, type 1 diabetes mellitus, tobacco smoking, vomiting

DOSAGE AND ROUTES

• **Adult: SUBCUT** 0.75 mg weekly, may increase to 1.5 mg weekly

Available forms: Solution for SUBCUT injection 0.75 mg/0.5 mL, 1.5 mg/0.5 mL, 3 mg/0.5 mL, 4.5 mg/0.5 mL (single-use pen)

Administer:

SUBCUT route
• Do not use as first-line therapy for those who have inadequate glycemic control on diet and exercise
• Administer the dose at any time of day, with or without meals
• If a dose is missed, take as soon as remembered, as long as the next dose is due at least 3 days later; if it is more than 3 days after the missed dose, wait until the next regularly scheduled dose
• Give SUBCUT only, do not give IV or IM, inject into the thigh, abdomen, or upper arm, rotate sites with each injection to prevent lipodystrophy
• Properly dispose of the pen or syringe
• Store in refrigerator for unopened pen; may store at room temperature after opening for up to 30 days, do not freeze
• When using concomitantly with insulin, give as separate injections. Never mix them together. The two injections may be injected in the same body region, but not adjacent to each other
• Part of pen is glass; if dropped on a hard surface, do not use

SIDE EFFECTS

CNS: Fatigue
ENDO: Hypoglycemia
GI: Nausea, vomiting, diarrhea, anorexia, gastroesophageal reflux, pancreatitis, flatulence, abdominal pain, constipation
SYST: Secondary malignancy
INTEG: Injection site reactions, rash, urticaria

PHARMACOKINETICS

Peak 24-72 hr, half-life 5 days, metabolized by catabolism

INTERACTIONS

Increase: hypoglycemia—ACE inhibitors, disopyramide, sulfonylureas, androgens, fibric acid derivatives, alcohol
Increase: hyperglycemia—phenothiazines, corticosteroids, anabolic steroids
Decrease: effect of dulaglutide—niacin, dextrothyroxine, thiazide diuretics, triamterene, estrogens, progestins, oral contraceptives, MAOIs

NURSING CONSIDERATIONS

Assess:
- Fasting blood glucose, A1c levels (check twice a year or quarterly in those with therapy changes or uncontrolled disease), postprandial glucose during treatment to determine diabetes control
- **Pancreatitis:** severe abdominal pain, with or without vomiting; product should be discontinued
- Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give IV $D_{50}W$, then IV dextrose solution
- Nausea, vomiting, diarrhea, ability to tolerate product, may cause dehydration
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk; avoid breastfeeding, excretion is unknown

Evaluate:
- Therapeutic response: decrease in polyuria, polydipsia, polyphagia, clear sensorium, improving A1c, weight; absence of dizziness, stable gait

Teach patient/family:
- About the symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry a glucose source (candy, sugar cube) to treat hypoglycemia

DULoxetine (Rx)

(do-lox′e-teen)

Cymbalta, Drizalma, Irenka

Func. class.: Antidepressant
Chem. class.: Serotonin-norepinephrine reuptake inhibitor (SNRI)

D

Do not confuse:
Cymbalta/Symbyax
duloxetine/fluoxetine/paroxetine/Dexilant

ACTION: May potentiate serotonergic, noradrenergic activity in the CNS; in studies, DULoxetine is a potent inhibitor of neuronal serotonin and norepinephrine reuptake

USES: Major depressive disorder (MDD), neuropathic pain associated with diabetic neuropathy, generalized anxiety disorder, fibromyalgia, chronic low back pain, osteoarthritis pain

CONTRAINDICATIONS: Alcohol intoxication, alcoholism, closed-angle glaucoma, hepatic disease, hepatitis, jaundice, hypersensitivity
Precautions: Pregnancy, breastfeeding, geriatric patients, mania, hypertension, renal/cardiac disease, seizures, increased intraocular pressure, anorexia nervosa, bleeding, dehydration, diabetes, hyponatremia, hypotension, hypovolemia, orthostatic hypotension, abrupt product withdrawal

Black Box Warning: Children, suicidal ideation

DOSAGE AND ROUTES

Major depressive disorder
- **Adult: PO** 40-60 mg/day as single dose or 2 divided doses

Diabetic neuropathy
- **Adult: PO** 60 mg/day

Generalized anxiety disorder
- **Adult: PO** 60 mg/day, may start with 30 mg/day × 1 wk, then increase to 60 mg/day; maintenance 60-120 mg/day

Fibromyalgia

• **Adult: PO** 30 mg/day × 1 wk, then 60 mg/day

Musculoskeletal pain

• **Adult: PO** 60 mg/day or 30 mg/day × 1 wk, then 60 mg/day

Renal dose

• **Adult: PO** Start with 20 mg, gradually increase; avoid use in severe renal disease

Hepatic disease (mild, moderate, severe): Avoid use.

Available forms: Capsules delayed release 20, 30, 40, 60 mg

Administer:

• Swallow capsules whole; do not break, crush, or chew; do not sprinkle on food or mix with liquid

• Without regard to food

• Store in tight container at room temperature; do not freeze

SIDE EFFECTS

CNS: Insomnia, anxiety, dizziness, tremor, somnolence, fatigue, decreased appetite, decreased weight, agitation, diaphoresis, hallucinations, neuroleptic malignant–like syndrome reaction, aggression, seizures, *headache,* abnormal dreams, flushing, hot flashes, chills

CV: Thrombophlebitis, peripheral edema, hypertension, palpitations, supraventricular dysrhythmia, orthostatic hypotension

EENT: *Abnormal vision*

ENDO: Hypo/hyperglycemia, SIADH

GI: Constipation, diarrhea, dysphagia, *nausea,* vomiting, anorexia, dry mouth, colitis, gastritis, abdominal pain, hepatic failure

GU: Abnormal ejaculation, urinary hesitation/retention/frequency, ejaculation delayed, erectile dysfunction, gynecologic bleeding

INTEG: Photosensitivity, bruising, sweating, Stevens-Johnson syndrome

MS: Gait disturbance, muscle spasm, restless legs syndrome, myalgia

SYST: Anaphylaxis, angioedema, serotonin syndrome, Stevens-Johnson syndrome

PHARMACOKINETICS

Well absorbed; extensively metabolized (CYP2D6, CYP1A2) in the liver to an active metabolite; 70% of product recovered in urine, 20% in feces; 90% protein binding; elimination half-life 9.2-19.1 hr

INTERACTIONS

• Do not use with linezolid or methylene blue IV

• **Narrow therapeutic index:** CYP2D6 extensively metabolized products (flecainide, phenothiazines, propafenone, tricyclics, thioridazine)

• Hyperthermia, rigidity, rapid fluctuations of vital signs, mental status changes, neuroleptic malignant syndrome—MAOIs; coadministration contraindicated within 14 days of MAOI use

Increase: CNS depression—opioids, antihistamines, sedative/hypnotics

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, serotonin-receptor agonists, tricyclics, traZODone

Increase: bleeding risk—anticoagulants, antiplatelets, salicylates, NSAIDs

Increase: action of DULoxetine—CYP1A2 inhibitors (fluvoxamine, quinolone antiinfectives); CYP2D6 inhibitors (FLUoxetine, quiNIDine, PARoxetine)

Drug/Herb

Increase: serotonin syndrome—St. John's wort; avoid using together

Increase: CNS depression—kava, valerian

Drug/Lab Test

Increase: ALT, bilirubin—alcohol

Increase: blood glucose

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Depression: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms, depression, panic; monitor children weekly face to face during first 4 wk or dosage change, then every other week for next 4 wk, then at 12 wk

• B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease

- **Hypo/hyperglycemia:** assess for each during treatment and before dosing
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; weight loss or gain; appetite may increase; peripheral edema may occur
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not common unless product is discontinued abruptly
- Malignant neuroleptic–like syndrome reaction
- **Serotonin syndrome:** nausea/vomiting, dizziness, facial flush, shivering, sweating
- **Sexual dysfunction:** ejaculation dysfunction, erectile dysfunction, decreased libido, orgasm dysfunction
- Assistance with ambulation during beginning therapy; drowsiness, dizziness occur
- **Beers:** use with caution in older adults; may exacerbate or cause SIADH
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefit outweighs fetal risk, complications in late third trimester have occurred; pregnancy should be registered with the Cymbalta Pregnancy Registry (866-814-6975); excreted in breast milk

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- To use sugarless gum, hard candy, frequent sips of water for dry mouth
- To report urinary retention; about signs and symptoms of bleeding (GI bleeding, nosebleed, ecchymoses, bruising)
- To use with caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol ingestion, MAOIs, other CNS depressants
- To notify prescriber of nausea, vomiting, dizziness, facial flushing, shivering, sweating, confusion, hallucinations, incoordination; may indicate serotonin syndrome
- Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise; taper

Black Box Warning: That clinical worsening and suicide risk may occur

- To wear sunscreen or large hat; photosensitivity may occur
- To notify prescriber if pregnancy is planned or suspected, or if breastfeeding
- Improvement may occur in 4-8 wk or in up to 12 wk (geriatric patients)

D

dupilumab (Rx)

(doo-pil′-ue-mab)

Dupixent

Func. class.: Dermatologicals

USES: Moderate to severe atopic dermatitis in patients whose disease is not adequately controlled with topical therapies or when those therapies are not advised, add-on maintenance in moderate-severe asthma with eosinophils, phenotype, or oral corticosteroid–dependent asthma; add-on maintenance treatment of poorly controlled chronic rhinosinusitis with nasal polyps

DOSAGE AND ROUTES

Atopic dermatitis

- **Adult/child 6-17 yr ≥60 kg: SUBCUT** Initially, 600 mg (administered as two 300-mg injections); maintenance dosing: 300 mg every other week
- **Child 6-17 yr 30-<60 kg yr SUBCUT** Initially, 400 mg (two 200-mg injections), then 200 mg every other week

Asthma

- **Adult/ child ≥12 yr:** SUBCUT Loading, 400 mg (two 200-mg injections) followed by 200 mg every other week or an initial loading dose of 600 mg (two 300-mg

injections) followed by 300 mg every other week
Available forms: Injection: 300-mg/2-mL single-dose syringes

⚠ HIGH ALERT

durvalumab (Rx)

(dur-val′-yoo-mab)
Imfinzi
Func. class.: Antineoplastic monoclonal antibody

ACTION: A human IgG1 kappa (IgG1k) monoclonal antibody, produced in Chinese hamster ovary; inhibits programmed death ligand interactions

USES: For the treatment of locally advanced non-small cell lung cancer (NSCLC); extensive stage small cell lung cancer in combination with etoposide and either CARBOplatin or CISplatin

CONTRAINDICATIONS: Pregnancy, hypersensitivity
Precautions: Adrenal insufficiency, aseptic meningitis, autoimmune disease, breastfeeding, colitis, contraception requirements, Crohn's disease, diabetes mellitus, diarrhea, hemolytic anemia, hepatic disease, hepatitis, hypophysitis, hypopituitarism, IBS, infusion-related reactions, keratitis, myocarditis, organ transplant, pneumonitis, pulmonary disease, reproductive risk, serious rash, SLE, thyroid disease, ulcerative colitis, uveitis

DOSAGE AND ROUTES

Consolidation treatment of locally advanced or unresectable non–small-cell lung cancer (NSCLC)
• **Adult: IV INF** 10 mg/kg, beginning 1-42 days after the last radiation dose, q2wk until disease progression or unacceptable toxicity, for up to 12 mo

Extensive small cell lung cancer
• **Adult >30 kg: IV INF** 1500 mg prior to chemotherapy on same day; q3wk × 4 cycles, then 1500 mg q4wk (single agent)
Adult <30 kg: IV INF 20 mg/kg before chemotherapy on the same day q3wk × 4 cycles, then q4wk (single agent)

Renal dose
• **Mild to moderate renal impairment (CCr ≥30 mL/min):** no change
• **Severe renal impairment (CCr 15-29 mL/min):** unknown
Available forms: Powder for injection 120 mg/2.4 mL, 500 mg/10 mL
Administer:
IV route
• Follow cytotoxic handling procedures
• Visually inspect for particulate matter and discoloration, product should be clear to opalescent, colorless to slightly yellow, free from particles. Discard if solution is cloudy or discolored or if particles are observed
• Do not shake
Preparation:
• Withdraw the required volume of drug and transfer into an IV container containing 0.9% sodium chloride injection or 5% dextrose injection to prepare an infusion with a final concentration ranging from 1 mg/mL to 15 mg/mL
• Mix diluted solution by gentle inversion. Do not shake
• Discard partially used or empty vials of durvalumab
Storage of diluted solution:
• Does not contain a preservative; give immediately after preparation
• If storage of diluted solution is necessary, the total time from vial puncture to the start of administration should be <24 hr if refrigerated 36°F-46°F (2°C-8°C), or <4 hr at room temperature up to 77°F (up to 25°C). Do not freeze
IV Infusion:
• Give diluted over 60 min through an IV line using a low protein-binding 0.2- or 0.22-micron in-line filter
• Do not admix or give other products through the same line

SIDE EFFECTS

CNS: Fatigue, fever
GI: Nausea, diarrhea, constipation, anorexia, abdominal pain, colitis
HEMA: Anemia, hemolytic anemia, lymphopenia
RESP: Cough, dyspnea
META: Hyponatremia, hyperbilirubinemia, hypercalcemia, hypermagnesium, hypoalbuminemia
ENDO: Hyperglycemia, hyperthyroidism, hypothyroidism
MISC: Infection, peripheral edema, musculoskeletal pain, rash, antibody formation, aseptic meningitis, dehydration, infusion reactions, keratitis, myocarditis, uveitis

PHARMACOKINETICS

Steady state 16 wk, half-life 17 days

INTERACTIONS

- None known

Drug/Lab Test

Increase: LFTs, blood glucose, serum creatinine/BUN, thyroid function tests
Decrease: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- Monitor baseline and periodically blood glucose, LFTs, serum creatinine/BUN
- **Serious infection:** may be fatal; monitor for signs and symptoms of infection; use prophylactic anti-infectives as appropriate.
- **Pregnancy/breastfeeding:** product can cause fetal harm; females of reproductive potential should avoid becoming pregnant during and for 3 mo after final dose; obtain a pregnancy test prior to starting product; do not breastfeed during and for at least 3 mo after last dose
- **Immune-mediated pneumonitis or interstitial lung disease (ILD):** may be fatal; monitor for signs or symptoms (new or worsening chest pain or shortness of breath) of pneumonitis. If pneumonitis is suspected, obtain a chest x-ray; an interruption or discontinuation of therapy and treatment with high-dose corticosteroids (followed by a steroid taper) may be necessary. The median time to onset of immune-mediated pneumonitis was 55.5 days (range, 24 to 423 days)
- **Immune-mediated hepatitis:** may be fatal; monitor for abnormal liver tests prior to each cycle of treatment; interruption or discontinuation of therapy may be needed with high-dose corticosteroids (followed by a steroid taper). The median time to onset of immune-mediated hepatitis was 51.5 days (range, 15 to 312 days)
- **Diarrhea and immune-mediated colitis:** monitor for signs and symptoms of colitis (diarrhea or severe abdominal pain). Treatment with antidiarrheal agents and high-dose corticosteroids (followed by a steroid taper), along with an interruption or discontinuation of therapy, may be necessary. The median time to onset of immune-mediated colitis was 73 days (range, 13 to 345 days). Use with caution in those with inflammatory bowel disease such as ulcerative colitis or Crohn's disease
- **Thyroid disease/disorders (hypothyroidism/hyperthyroidism):** monitor thyroid function tests (TFTs) at baseline and periodically during treatment. Asymptomatic patients with abnormal TFTs can receive treatment; manage these patients with hormone replacement and symptomatic management as needed. The median time to onset of hypothyroidism was 42 days (range, 15 to 239 days), and the median time to first onset of hyperthyroidism was 43 days (range, 14-71 days)
- **Immune-mediated adrenal insufficiency and hypophysitis/hypopituitarism:** monitor for signs and symptoms of adrenal insufficiency (hypotension, decreased cortisol level, fatigue, weakness, and weight loss) and hypophysitis (decreased pituitary hormone levels, pituitary gland inflammation, severe intractable headache, and vision impairment) during and after treatment. An interruption of therapy, treatment with high-dose corticosteroids, and hormone replacement may be necessary
- **Immune-mediated nephritis:** monitor renal function at baseline and prior to each cycle of treatment. No initial

dose adjustment is recommended in patients with renal dysfunction; use with caution in patients with renal disease or renal impairment. If immune-mediated nephritis occurs, an interruption or discontinuation of therapy may be needed with treatment with high-dose corticosteroids

• **Immune-mediated reactions (aseptic meningitis, hemolytic anemia, immune thrombocytopenic purpura, myocarditis, myositis) and ocular inflammatory toxicity (uveitis and keratitis):** monitor for signs and symptoms of immune-mediated reactions; confirm etiology or exclude other causes. Therapy may need to be temporarily withheld or permanently discontinued; administer corticosteroids as needed

• **Severe infusion-related reactions:** monitor signs and symptoms of an infusion-related reaction. Interrupt or slow the rate of infusion in those with mild or moderate infusion reactions. Permanently discontinue in those with grade 3 or 4 infusion reactions

Evaluate:

• Therapeutic response: lack of disease progression

Teach patient/family:

• To report adverse reactions immediately; to report diarrhea, hepatic, flu-like symptoms, cough, trouble breathing, rash

• About reason for treatment, expected results

• **Pregnancy/breastfeeding:** to notify provider if pregnancy is planned or suspected; to use effective contraception during treatment and for 3 mo after discontinuing treatment; do not breastfeed during or for 3 mo after final dose

dutasteride (Rx)

(doo-tass′ter-ide)

Avodart

Func. class.: Androgen inhibitor

Chem. class.: Synthetic 5α-reductase inhibitor, 4-azasteroid compound

ACTION: Inhibits both type 1 and type 2 forms of a steroid enzyme that converts testosterone to 5α-dihydrotestosterone (DHT), which is responsible for the initial growth of prostatic tissue

USES: Treatment of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland; may be used in combination with tamsulosin

CONTRAINDICATIONS: Pregnancy, breastfeeding, women, children, hypersensitivity

Precautions: Hepatic disease

DOSAGE AND ROUTES

Benign prostatic hyperplasia (BPH)

• **Adult: PO** 0.5 mg/day; may use without tamsulosin

Available form: Capsules 0.5 mg

Administer:

• Swallow capsules whole; do not break, crush, chew

• Without regard to meals

SIDE EFFECTS

GU: Decreased libido, impotence, gynecomastia, ejaculation disorders (rare), mastalgia, teratogenesis

INTEG: Serious skin infections

PHARMACOKINETICS

Peak 2-3 hr, protein binding 99%, metabolized in liver by CYP3A4, excreted in feces, half-life 5 wk at steady state

INTERACTIONS

Increase: dutasteride concentrations—ritonavir, ketoconazole, verapamil, dilTIAZem, cimetidine, ciprofloxacin, antiretroviral protease inhibitors, or other products metabolized by CYP3A4

Drug/Lab Test

Decrease: PSA

NURSING CONSIDERATIONS

Assess:

• **For decreasing symptoms of BPH:** decreasing urinary retention, frequency, urgency, nocturia

• PSA levels baseline and at 3 mo, 3-mo level becomes new baseline; double PSA level and compared with normal levels in

those untreated; urinary obstruction; determine the absence of urinary or prostate cancer prior to starting treatment
• Blood studies: ALT, AST, bilirubin, CBC with differential, serum creatinine, serum electrolytes

Evaluate:
• Therapeutic response: decreasing symptoms of BPH; decreased urinary retention, frequency, urgency, nocturia

Teach patient/family:
• To read patient information leaflet prior to starting therapy; to reread it upon prescription renewal
• To notify prescriber if therapeutic response decreases, if edema occurs
• Not to discontinue product abruptly
• About changes in sex characteristics, gynecomastia, breast hardness; that decreased libido decreases after 6 mo
• That men taking dutasteride should not donate blood for at least 6 mo after last dose to prevent blood administration to pregnant female
• That ejaculate volume may decrease during treatment; that product rarely interferes with sexual function
• That product should not be used or handled by breastfeeding women
• To swallow whole; do not crush, chew, or open capsules
• That product may increase risk for developing high-grade prostate cancer
• To report signs/symptoms of urinary obstruction or decreased urinary flow after starting therapy; to monitor for obstructive uropathy
• That continuing exams and blood counts will be needed
• **Pregnancy/breastfeeding:** do not use in pregnancy/breastfeeding; not indicated for women; that capsules should not be handled by a woman who is pregnant or who may become pregnant because product can be absorbed through skin; that product should not be used or handled by breastfeeding women

D

dutasteride/tamulosin (Rx)

Jalyn

Func. class.: BPH agent

USES: BPH

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

• **Adult men: PO** 1 capsule daily, 30 min after a meal

Available forms: Capsules 0.5 mg dutasteride/0.4 mg tamulosin

duvelisib (Rx)

(doo′-veh-lih′-sib)

Copiktra

Func. class.: Antineoplastic, kinase inhibitor

USES: Relapsed/refractory CLL, SLL, follicular lymphoma in those who have received at least 2 prior therapies

CONTRAINDICATIONS: Hypersensitvity

Black Box Warning: Colitis, diarrhea, infection, pneumonitis

DOSAGE AND ROUTES

• **Adult: PO** 25 mg bid

Available forms: Capsules 15, 25 mg

ecallantide (Rx)

(ee-kal′an-tide)

Kalbitor

Func. class.: Hematologic agent

Chem. class.: Kallikrein inhibitor

USES: Acute attacks of hereditary angioedema (≥12 yr)

CONTRAINDICATIONS: Hypersensitivity to the drug or its components

Black Box Warning: Anaphylaxis (usually within first hour after dosing)

DOSAGE AND ROUTES

- **Adult/adolescent ≥12 yr: SUBCUT** 30 mg given as three 10-mg injections; give additional 30-mg dose within 24 hr if attack persists

Available forms: Injection 10-mg/mL vials

econazole (Rx)

(ee-koe′na-zole)

Ecoza, Ecostatin ✱, Zolpak

Func. class.: Topical antifungal

Chem. class.: Imidazole derivative

USES: Tinea corporis, cruris, pedis, versicolor; cutaneous candidiasis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy

DOSAGE AND ROUTES

Tinea corporis, cruris, pedis, versicolor

- **Adult/child: TOPICAL** rub into affected areas daily × 2 wk, or × 4 wk (pedis)

Cutaneous candidiasis

- **Adult/child:** rub into affected areas bid × 2 wk

Available forms: Cream, foam 1%

econazole topical

See Appendix B

eculizumab (Rx)

eck-u-liz′uh-mob

Solaris

Func. class.: Monoclonal antibody

USES: Hemolysis in paroxysmal nocturnal hemoglobinuria (PNH), atypical hemolytic-uremic syndrome (aHUS) to prevent complement-mediated thrombotic microangiopathy

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Life-threatening and fatal meningococcal infections

DOSAGE AND ROUTES

Hemolysis in paroxysmal nocturnal hemoglobinuria (PNH):

- **Adult: IV INF** 600 mg q7days × 4 wk, then 900 mg, and then 900 mg q14days

Atypical hemolytic-uremic syndrome (aHUS) to prevent complement-mediated thrombotic microangiopathy

- **Adult: IV INF** 900 mg q7days × 4 wk, then 1200 mg, and then 1200 mg q14days
- **Child/adolescent ≥40 kg:** 900 mg q7days × 4 wk, then 1200 mg, and then 1200 mg q14days
- **Child/adolescent 30-39 kg:** 600 mg q7days × 4 wk, then 900 mg on wk 5 and then 900 mg q14days
- **Child/adolescent 20-29 kg:** 600 mg q7days × 3 wk, then 600 mg q14days
- **Child/adolescents 10-19 kg: IV INF** 600 mg single dose, then after 7 days 300 mg, then 300 mg q14days
- **Infant/child >2 mo and 5-9 kg IV INF:** 300 mg q7days × 2 wk, then 300 mg q21days

Anti-acetylcholine antibody-positive generalized myasthenia gravis
- **Adults: IV INF** 900 mg q7days × 4 wk, then 1200 mg, and then 1200 mg q14days, usually for 12 wk

Anti-aquaporin-4 (AQP4) antibody-positive neuromyelitis optica spectrum disorder (NMOSD)
- **Adult: IV INF** 900 mg q7days for the first 4 wk, then 1200 mg, and then 1200 mg q14days

Available forms: Injection 100 mg/mL (300-mg single-use vial)

edaravone (Rx)
(e-dar′-a-vone)
Radicava
Func. class.: CNS agents

USES: Amyotrophic lateral sclerosis

DOSAGE AND ROUTES
- **Adult: IV:** 60 mg/day × 14 days then a 14-day drug-free period for an initial treatment cycle. For subsequent cycles, give × 10 days out of 14-day periods followed by 14-day drug-free periods

Available forms: Injection 30 mg/100 mL premixed bags

edetate calcium disodium (Rx)
(ee′de-tate)
Calcium Disodium Versenate
Func. class.: Heavy metal antagonist (antidote, chelating agent)

USES: Lead poisoning, acute lead encephalopathy

CONTRAINDICATIONS:
Hypersensitivity, anuria, poisoning of other metals, severe renal disease, hepatitis

Black Box Warning: Child <3 yr, increased ICP, encephalopathy

DOSAGE AND ROUTES
Lead mobilization test (lead toxicity 25-45 mcg/dL)
- **Adult/adolescent: IV INFUSION** 500 mg/m^2 over 1 hr or **IM**
- **Child: IV INFUSION** 500 mg/m^2 over 1 hr or **IM** as single dose or 2 divided doses

Acute lead encephalopathy (blood levels >70 mcg/dL)
- **Adult/adolescent/child/infant: IM/IV** 1500 mg/m^2 as **IV INFUSION** over 12-24 hr in combination with dimercaprol **IM,** give first dose ≥4 hr after initial dimercaprol, when urine flow established

Available forms: Injection 200 mg/mL

efavirenz (Rx)
(ef-ah-veer′enz)
Sustiva
Func. class.: Antiretroviral
Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

ACTION: Binds directly to reverse transcriptase and blocks RNA, DNA polymerase, thus causing a disruption of the enzyme's site

USES: HIV-1 in combination with at least 2 other antivirals
Unlabeled uses: HIV prophylaxis

CONTRAINDICATIONS:
Pregnancy, hypersensitivity, moderate/severe hepatic disease
Precautions: Breastfeeding, children <3 yr, renal/hepatic disease, myelosuppression, depression, seizures

DOSAGE AND ROUTES

- **Adult and child ≥3 mo and >40 kg: PO** 600 mg/day at bedtime
- **Child ≥3 mo, 32.5-39.9 kg: PO** 400 mg/day at bedtime
- **Child ≥3 mo, 25-32.4 kg: PO** 350 mg/day at bedtime
- **Child ≥3 mo, 20-24.9 kg: PO** 300 mg/day at bedtime
- **Child ≥3 mo, 15-19.9 kg: PO** 250 mg/day at bedtime
- **Child ≥3 mo, 7.5-14.9 kg: PO** 200 mg/day at bedtime
- **Child ≥3 mo, 5-<7.5 kg: PO** 150 mg/day at bedtime
- **Child ≥3 mo, 3.5-≤5 kg: PO** 100 mg/day at bedtime

Available forms: Capsules 50-, 200-mg; 600-mg tablets

Administer:

- Give on empty stomach; give at bedtime to decrease CNS side effects
- Capsules may be opened, added to grape jelly to disguise peppery taste or sprinkled on food, may be mixed in formula, do not cut/break tablets

SIDE EFFECTS

CNS: Fatigue, impaired cognition, insomnia, abnormal dreams, depression, headache, dizziness, anxiety, drowsiness, odd feeling, suicidal thoughts/behaviors

GI: *Diarrhea,* abdominal pain, *nausea,* vomiting, hepatotoxicity

GU: Hematuria, kidney stones

INTEG: Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

SYST: Immune reconstitution syndrome

MISC: Fat accumulation/redistribution

ENDO: Hyperlipidemia

CV: QT prolongation

PHARMACOKINETICS

Peak 3-5 hr, duration up to 24 hr, well absorbed, metabolized by liver; half-life 40-76 hr; >99% protein binding, excreted in urine, feces; concentrations higher in females and in those of African, Asian, and Hispanic descent

INTERACTIONS

- Avoid use with boceprevir, delavirdine, rilpivirine; dosage change may be needed if given with telaprevir
- Do not give together with benzodiazepines, ergots, midazolam, triazolam, pimozide

Increase: CNS depression—alcohol, antidepressants, antihistamines, opioids

Increase: levels of both products—ritonavir, estrogens, anticonvulsants

Increase: levels of warfarin, statins (except pravastatin, fluvastatin)

Decrease: levels of indinavir, amprenavir, lopinavir, oral contraceptives, ketoconazole, itraconazole, posaconazole, voriconazole, saquinavir, cyclosporine, tacrolimus, sirolimus, buPROPion, sertraline

Decrease: metabolism of CYP2B6 inhibitors, CYP2C19 substrates, CYP3A4 substrates

Decrease: efavirenz metabolism—CYP3A4 inhibitors (conivaptan, ambrisentan, SORAfenib)

Decrease: efavirenz effect—CYP3A4 inducers (carBAMazepine, rifamycins)

Drug/Herb

Decrease: efavirenz level—St. John's wort; do not use together

Drug/Food

Increase: absorption—high-fat foods

Drug/Lab Test

Increase: ALT

False positive: cannabinoids

NURSING CONSIDERATIONS

Assess:

- **HIV:** monitor CBC with differential, plasma HIV RNA, absolute CD4+/CD8+ cell counts/%, serum β_2 microglobulin, serum ICD+24 antigen levels,

cholesterol, hepatic enzymes, blood glucose, pregnancy test, bilirubin, urinalysis

- Assess for suicidal thoughts/behaviors, poor concentration, dizziness, inability to sleep, usually resolves after 4 wk, give at bedtime
- Bowel pattern prior to, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis, usually occurs during first 2 wk, mild rash may resolve within 30 days; severe skin reactions including blistering, fever, product should be discontinued immediately and corticosteroids started
- **Signs of toxicity:** severe nausea/vomiting, maculopapular rash
- **Hepatotoxicity:** LFTs in those with liver disease, hold if LFTs are moderately elevated; if severe or if LFTs increase after product is restarted, discontinue permanently, do not breastfeed
- **Pregnancy/breastfeeding:** rule out pregnancy prior to starting treatment; use contraception, oral/nonhormonal contraceptives are decreased, use barrier methods also. Avoid use in first trimester (particular caution in first 8 wk of pregnancy) and in females of childbearing potential. Register pregnant women with Antiretroviral Pregnancy Registry (800-258-4263)

Evaluate:

- Therapeutic response: increased CD4 cell counts; decreased viral load; slowing progression of HIV

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered; not to double dose; to take with water, juice; to take on empty stomach at bedtime; to take at same time of day; not to break tablets; to use with other antiretrovirals
- To make sure health care provider knows all medications, supplements, OTC products taken
- To notify health care provider if severe rash occurs; that adverse reactions (rash, dizziness, abnormal dreams, insomnia) lessen after 1 mo, not to stop taking
- To avoid hazardous activities if dizziness, drowsiness occur
- That product does not cure disease but controls symptoms; that HIV can be transmitted to others even while taking this product; to continue with safe-sex practices, that opportunistic infections can occur
- To report all adverse reactions, insomnia, poor concentration, but usually are less in 2-4 wk
- That CNS side effects of feeling "stoned" or "drunk" usually abate in several months
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding; not to breastfeed or become pregnant if taking this product; to use nonhormonal contraception because serious birth defects have occurred, to use barrier method for ≥12 wk after last dose

efavirenz/lamivudine/tenofovir (Rx)

(ef-ah-veer′enz/lam-i-voo′deen/ten-oh-foh′veer)

Symfi, Symfi Lo

Func. class.: Antiretroviral

USES: Human immunodeficiency virus (HIV) infection

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Hepatitis B exacerbation

DOSAGE AND ROUTES

- **Adult/adolescent/child ≥35 kg: PO** (Symfi Lo) 1 tablet (efavirenz 400 mg; lamivudine 300 mg; tenofovir 300 mg) on an empty stomach daily at bedtime
- **Adult/adolescent/child ≥40 kg: PO** (Symfi) 1 tablet (efavirenz 600 mg; lamivudine 300 mg; tenofovir 300 mg) on an empty stomach daily at bedtime

Available forms: Tablets 400-300-300 mg; 600-300-300 mg

efavirenz/emtricitabine/tenofovir (Rx)

Atripla

Func. class.: Antiretroviral

USES: HIV

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Hepatitis B exacerbation

DOSAGE AND ROUTES

HIV:

- **Adults ≥40 kg : PO** 1 tablet (efavirenz 600 mg, emtricitabine 200 mg, tenofovir 300 mg) daily at bedtime, may be used alone or with other antiretrovirals
- **Child/adolescent ≥40 kg: PO** 1 tablet (efavirenz 600 mg, emtricitabine 200 mg, tenofovir 300 mg) daily at bedtime, may be used alone or with other antiretrovirals

Available forms: Tablet 600-200-300 mg

efinaconazole topical

See Appendix B

elagolix (Rx)

(el′a-goe′lix)

Orilissa

Func. class.: Gonadotropin-releasing hormone (GnRH) receptor antagonist

ACTION: Suppresses the pituitary, decreases estradiol, progesterone, and other hormones

USES: Moderate to severe pain associated with endometriosis, including endometriosis-related dyspareunia

CONTRAINDICATIONS: Hypersensitivity, osteoporosis, pregnancy

DOSAGE AND ROUTES

- **Moderate-severe pain of endometriosis, not dyspareunia**

Adult female: PO Initiate at 150 mg daily; max duration 24 mo

- **Moderate-severe pain of endometriosis with dyspareunia**

Adult female: PO 200 mg bid, max duration 6 mo

Hepatic dose

Adult female: PO Child-Pugh B 150 mg daily, max 6 mo (all uses)

Available forms: Tablets 200, 300 mg

Administer

- Complete pregnancy test prior to use, or use within 7 days of start of menses
- Give without regard to food, at same time of day
- If dose is missed, give on same day and then start normal dosing
- Store at room temperature

SIDE EFFECTS

CNS: Headache, depression, anxiety, mood/behavior changes, dizziness, insomnia, excitability
GI: Nausea, constipation, diarrhea, abdominal pain, increased LFTs
GU: Decreased libido, amenorrhea
MS: Arthralgia, bone loss, myalgia
MISC: Hypersensitivity

PHARMACOKINETICS

Onset unknown, peak 1 hr, duration unknown
Half-life 4-6 hr

INTERACTIONS

Increase: elagolix effect—CYP3A4 inhibitors
Decrease: elagolix effect—CYP3A4 inducers, midazolam, hormonal contraceptives, strong OATP1B1 inhibitors
Decrease: effect of—CYP3A4 substrates
Drug/Lab
Increase: LFTs, triglycerides, cholesterol, LDL, HDL

NURSING CONSIDERATIONS

Assess:
- **Endometriosis:** assess for pain and pain associated with dyspareunia prior to starting product and after use
- **Suicidal ideation:** assess for depression, change in mood, product may need to be discontinued
- **Bone density:** monitor for fractures, osteoporosis, obtain bone density test
- Monitor LFTs baseline and periodically

Evaluate:
- Therapeutic response: decreasing pain in endometriosis

Teach patient/family:
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, do not use in pregnancy, consider risks in breastfeeding, hormonal contraceptives with estrogen will reduce the product's effectiveness
- **Suicidal thoughts/behaviors:** advise caretakers, family, patient to notify provider immediately of depression, change in mood, suicidal thoughts, behaviors
- If dose is missed, take as soon as remembered, then continue with regular dosing
- Report yellowing eyes, skin, clay-colored stool, dark urine, nausea, vomiting, which may signal liver injury
- That the product will change menses
- **Bone density:** advise patient bone loss may occur, that bone density test may be required, to supplement with calcium and vitamin D to prevent bone loss if prescribed

E

elbasvir/grazoprevir (Rx)

(el'bas-vir/graz-oh'pre-vir)
Zepatier
Func. class.: Antiviral

USES: Chronic HCV genotypes 1 or 4

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Reactivation of HBV

DOSAGE AND ROUTES

Chronic HCV genotypes 1 or 4
- **Adult:** 1 tablet daily, may give with or without ribavirin

Hepatic dose
- **Adult: PO** do not use in severe hepatic disease

Available forms: Tablets 50-100 mg

eletriptan (Rx)

(el-ee-trip'tan)
Relpax
Func. class.: Antimigraine agent, abortive
Chem. class.: 5-HT_1-1B/1D receptor agonist, triptan

ACTION: Binds selectively to the vascular 5-HT_1-receptor subtype; causes vasoconstriction in cranial arteries

USES: Acute treatment of migraine with/without aura

CONTRAINDICATIONS: Hypersensitivity, coronary artery vasospasm, peripheral vascular disease, hemiplegic/basilar migraine, uncontrolled hypertension; ischemic bowel, heart disease; severe renal/hepatic disease, acute MI, stroke, angina, postmenopausal women, men >40 yr; risk factors of CAD, MI, or other cardiac disease; hypercholesterolemia, obesity, diabetes

Precautions: Pregnancy, breastfeeding, children, geriatric patients, impaired renal/hepatic function

DOSAGE AND ROUTES

• **Adult: PO** 20 or 40 mg, may increase if needed, max 40 mg (single dose); may repeat in 2 hr if headache improves but returns, max 80 mg/24 hr

Available forms: Tablets 20, 40 mg

Administer:

• Swallow tablets whole; do not break, crush, or chew; use with 8 oz of water, without regard to food

• At beginning of headache; if headache returns, repeat dose after 2 hr if first dose is ineffective; treat no more than 3 headaches per 30 days

SIDE EFFECTS

CNS: *Dizziness,* headache, anxiety, paresthesia, asthenia, somnolence, flushing, fatigue, hot/cold sensation, chills, vertigo, hypertonia, seizures, serotonin syndrome

CV: Chest pain, palpitations, hypertension, MI, sinus tachycardia, stroke, ventricular fibrillation/tachycardia, atrial fibrillation, AV block, bradycardia, chest pressure syndrome, coronary vasospasm

GI: Nausea, dry mouth, vomiting

MS: *Weakness,* back pain

RESP: Chest tightness, pressure

PHARMACOKINETICS

Onset of pain relief ½ hr, peak 1½-2 hr, half-life 4 hr, metabolized in the liver, 70% excreted in urine and feces

INTERACTIONS

Increase: eletriptan effect—CYP3A4 inhibitors (clarithromycin, erythromycin, itraconazole, ketoconazole, nelfinavir, ritonavir), propranolol; avoid use within 72 hr of these products

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, linezolid, MAOIs, TCAs, methylene blue

Increase: vasospastic reactions—ergots, ergot-similar products; avoid use within 24 hr of these products

Do not use with other 5-HT antagonists

NURSING CONSIDERATIONS

Assess:

• **Migraine:** pain location, character, intensity, nausea, vomiting, aura; quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

• **CV:** B/P; signs, symptoms of coronary vasospasms, geriatric patients may be at higher risk

• Tingling, hot sensation, burning, feeling of pressure, numbness, flushing

• Stress level, activity, recreation, coping mechanisms

• **Neurologic status:** LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache

• Ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches

• Patients with CAD risk factors; first dose should be administered in prescriber's office or medical facility

• Determine whether CYP3A4 inhibitors or other ergot-type products have been given

Evaluate:

• Therapeutic response: decrease in frequency, severity of migraine

Teach patient/family:

• To avoid driving or hazardous activity if dizziness occurs

• To report chest pain, neck or jaw pain

• To take whole with full glass of water

• To take when migraine is starting; a second dose may be used if headache returns

• To use contraception while taking product; to inform prescriber if pregnant or intending to become pregnant

• To provide dark, quiet environment

• That product does not prevent or reduce number of migraine attacks

• To use product only short term

elexacaftor/tezacaftor/ivacaftor and ivacaftor (Rx)

(el-ex-a-kaf'tor/tez-a-kaf'tor/eye-va-kaf'tor)

Trikafta

Func. Class.: Metabolic

USES: Cystic fibrosis (CF) with at least 1 *F508del* mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

Cystic fibrosis (CF) with least 1 *F508del* mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene:

• **Adult/adolescent ≥12 yr: PO** 2 tablets (elexacaftor 100 mg/tezacaftor 50 mg/ivacaftor 75 mg) in the morning and 1 tablet ivacaftor 150 mg) in the evening 12 hr apart and given with fat-containing food

Hepatic dose:

• **Adult/adolescent ≥12 yr: PO moderate impairment (Child-Pugh class B):** 2 tablets containing elexacaftor 100 mg/tezacaftor 50 mg/ivacaftor 75 mg PO once daily; NO ivacaftor 150-mg dose. Use with caution; this drug has not been studied in patients with moderate impairment; **severe impairment (Child-Pugh class C):** Do not use

Available forms: Tablets 100-50-75 mg with ivacaftor 150 mg

⚠ HIGH ALERT

elotuzumab (Rx)

(El-oh-tooz'ue-mab)

Empliciti

Func. class.: Antineoplastic

Chem. class.: Monoclonal antibody

ACTION: A humanized IgG1 monoclonal antibody that binds to the signaling lymphocytic activation molecule family member 7 (SLAMF7), a cell surface glycoprotein receptor, and activates natural killer (NK) cell–mediated antibody-dependent cellular cytotoxicity of SLAMF7-expressing myeloma cells

USES: Multiple myeloma in patients who have received 1 to 3 prior therapies, in combination with lenalidomide and dexamethasone

CONTRAINDICATIONS

Hypersensitivity, breastfeeding, hepatotoxicity, infection, infusion-related reactions, new primary malignancy, pregnancy

Precautions: Hepatic disease

DOSAGE AND ROUTES

Multiple myeloma in patients who have received 1 to 3 prior therapies, in combination with lenalidomide and dexamethasone

• **Adults: IV** 10 mg/kg weekly on cycles 1 and 2 (on days 1, 8, 15, and 22), then q2wk (on days 1 and 15), give in combination with lenalidomide 25 mg daily on days 1 through 21 and dexamethasone 28 mg PO (taken 3 to 24 hr prior to elotuzumab) on days 1, 8, 15, and 22 on cycles 1 and 2 and on days 1 and 15 of subsequent cycles; give dexamethasone 40 mg PO on days 8 and 22 of cycles 3 and beyond. Repeat treatment cycles q28 days until disease progression

Multiple myeloma in patients who have received at least 2 prior therapies including lenalidomide and a proteasome inhibitor, in combination with pomalidomide and dexamethasone

• **Adults: IV** 10 mg/kg weekly on cycles 1 and 2 (on days 1, 8, 15, and 22), then 20 mg/kg IV q4wk (on day 1) starting on cycle 3, give in combination with pomalidomide 4 mg PO daily on days 1 through 21 and PO dexamethasone (age 75 yr or less, 28 mg; age over 75 yr, 8 mg) at 3 to 24 hr prior to elotuzumab on days 1, 8, 15, and 22 on cycles 1 and 2 and on day 1 of subsequent cycles, give PO dexamethasone (age 75 yr or less, 40 mg; age over 75 yr, 20 mg) at 3 to 24 hr prior to elotuzumab on days 8, 15, and 22 of cycles 3 and beyond. Repeat treatment cycles q28days until disease progression

Available forms: Injection 300, 400 mg in single-dose vials

Administer:

IV route

• Visually inspect parenteral products for particulate matter and discoloration prior to use

• Premedication with acetaminophen PO, an IV/PO H1-blocker (diphenhydramine), an IV/PO H2-blocker, and IV dexamethasone is required prior to each infusion; hold therapy for grade 2 or higher infusion-related reactions

• Do not mix with other drugs or infuse with other drugs through the same IV line

• Calculate the appropriate dose and reconstitute (using an 18-gauge or smaller needle) the 300-mg vial with 13 mL of sterile water for injection and the 400-mg vial with 17 mL of sterile water for injection

• Following reconstitution, each vial contains overfill to allow for a maximum withdrawal of 12 mL for the 300-mg vial and 16 mL for the 400-mg vial; the final vial concentration is 25 mg/mL

• Swirl the solution by rotating the vial; invert the vial a few times to dissolve the powder

• The lyophilized powder should dissolve within 10 min; allow the reconstituted solution to stand for 5 to 10 min after all powder is dissolved

• Withdraw the needed amount (mL) from the elotuzumab 25-mg/mL vials; do not exceed a maximum withdrawal of 12 mL for the 300-mg vial and of 16 mL for the 400-mg vial; discard any unused portion

• Add the calculated amount of elotuzumab to an infusion bag made of polyvinyl chloride or polyolefin and then add enough 0.9% NaCl for injection or 5% dextrose injection so that the final diluted admixture concentration is between 1 and 6 mg/mL

• Do NOT exceed 5 mL/kg of patient weight at any given dose

• *Storage following dilution:* The diluted admixture may be stored for up to 24 hr when refrigerated 36°F to 46°F (2°C to 8°C) and protected from light; a maximum of 8 hr (of the total 24 hr) may be at room temperature 68°F to 77°F (20°C to 25°C)

• Administer the diluted admixture using an infusion set and a sterile, nonpyrogenic, low-protein-binding filter (pore size of 0.2 to 1.2 micrometer); use an automated infusion pump

• **For the 10-mg/kg dose,** give the diluted infusion IV at the appropriate infusion rate as follows:
Cycle 1, dose 1: start at 0.5 mL/min for 30 min, increase to 1 mL/min for 30 min, then increase to a maximum rate of 2 mL/min
Cycle 1, dose 2: start at 3 mL/min for 30 min, then increase to a maximum rate of 4 mL/min
Cycle 1, doses 3 and 4, and all subsequent cycles: 5 mL/min; do not exceed this rate
• **For the 20 mg/kg dose,** administer the diluted infusion intravenously at the appropriate infusion rate as follows:
Dose 1: Start at 3 mL/min for 30 min, then increase to a maximum rate of 4 mL/min
Dose 2 and all subsequent doses: 5 mL/min; do not exceed this rate
• Up titration of the infusion rate may be considered only in the absence of infusion reactions
• Complete the infusion within 24 hr from reconstitution

PHARMACOKINETICS

Onset, peak, duration unknown; half-life unknown

INTERACTIONS

Palifermin: should not be administered within 24 hr prior to, during infusion of, or within 24 hr after administration of antineoplastic agents
Increased risk of developing severe hematologic and renal toxicity: Penicillamine: Do not use together
Decrease immunologic response to tuberculin purified protein derivative (PPD): Tuberculin Purified Protein Derivative, PPD

NURSING CONSIDERATIONS

Assess:
• **Hypersensitivity:** Assess for rash, throat tightness, dyspnea, stop infusion immediately
• **Infections:** Assess for fever, flulike symptoms, may be fatal, treat as needed
• **New primary malignancy:** Monitor for new malignancies
• **Infusion reactions:** Assess for infusion reactions: redness, inflammation, burning at site within 24 hr of infusion, chills, fever; stop infusion treat as needed, monitor VS
• **Pregnancy/breastfeeding:** Do not use in pregnancy or breastfeeding. Males and females should use contraception if of reproductive potential

Evaluate:
• **Therapeutic response:** decreasing symptoms and spread of multiple myeloma

Teach patient/family:
• **Hypersensitivity:** teach patient to report immediately rash, throat tightness, dyspnea
• **Infections:** teach patient to report fever, flulike symptoms, may be fatal
• **New primary malignancy:** teach patient to report any new malignancies
• **Infusion reactions:** teach patient to report infusion reactions: redness, inflammation, burning at site within 24 hr of infusion
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected. Do not use in pregnancy or breastfeeding. Males and females should use contraception if of reproductive potential

eltrombopag (Rx)

(ell-trom-bow′pag)

Promacta

Func. class.: Hematopoietic

USES: Thrombocytopenia in chronic immune thrombocytopenic purpura when unresponsive to other treatment, chronic hepatitis C–associated thrombocytopenia

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Hepatotoxicity

DOSAGE AND ROUTES

• **Adult: PO** 50 mg/day, adjust dosage to maintain platelets at $\geq 50 \times 10^9$, max 75 mg/day; 25 mg/day chronic hepatitis C; East Asian descent, reduce dose to 25 mg daily

Available forms: Powder for oral suspension packets 12.5, 25 mg; tablets 12.5, 25, 50, 75 mg

eluxadoline (Rx)

(el-ux-ad′oh-leen)

Viberzi

Func. class.: GI agent

ACTION: Acts locally, reducing abdominal pain of IBS, works on the μ-opioid receptor

USES: Irritable bowel syndrome with diarrhea

CONTRAINDICATIONS: Hypersensitivity, alcoholism, GI/biliary obstruction, constipation, pancreatitis

DOSAGE AND ROUTES

• **Adult: PO** 100 mg bid with food. Decrease to 75 mg bid with food in those who are receiving an OATP1B1 inhibitor; do not use in those without a gallbladder

Renal dose

Adult: PO CCr <60 mL/min: reduce to 75 mg bid with food

Hepatic dose

Adult: PO Child-Pugh Class A or B: reduce to 75 mg bid with food; Child-Pugh Class C: Do not use

Available forms: Tablets 75, 100 mg

Administer

• Give with food
• Give as prescribed, do not double, if a dose is missed, give at next regular scheduled dose
• Store at room temperature

SIDE EFFECT

CNS: Headache, dizziness, insomnia, drowsiness, drunk feeling
GI: Constipation, nausea, vomiting, distention, increased LFTs
EENT: Nasopharyngitis
INTEG: Rash
RESP: URI, asthma

PHARMACOKINETICS: Onset unknown, peak 1½ hr, duration unknown, half-life 3.7-6 hr

INTERACTIONS

Increase: CYP3A4 substrate (narrow therapeutic index) effect
Increase: constipation risk—anticholinergics
Increase: eluxadoline effect—OATP1B1 inhibitors, CYP3A4 inhibitors

NURSING CONSIDERATIONS

Assess:

• **IBS symptoms:** assess for constipation/diarrhea or both, abdominal pain, bloating, gas. Identify if product is lessening symptoms; monitor AST/ALT, serum lipase, BUN/creatinine
• **CNS changes:** assess for dizziness, drowsiness; caution against driving or other hazardous activities until response is known, usually with hepatic impairment
• **Spasm:** epigastric pain, may radiate to back, may have increased LFTs
• **Pregnancy/breastfeeding:** unknown as to fetal risk, use cautiously in breastfeeding

Evaluate:

• Therapeutic response
• Decreasing abdominal pain, bloating, gas, diarrhea/constipation

Teach patient/family:

• **Severe constipation:** avoid using with other products that cause constipation; if severe constipation occurs, stop drug, notify prescriber, avoid using
• **Pancreatitis:** usually with increased alcohol use, severe abdominal pain, nausea, vomiting, discontinue immediately
• Not to drive or perform other hazardous activities until response is known
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected
• **Spasm:** to notify provider of increasing epigastric pain that radiates to back
• To take missed dose at prescribed time, do not double or skip doses

elvitegravir/cobicistat/emtricitabine/tenofovir disoproxil fumarate (Rx)

(el-vye-teg'gra-veer/koe-bik'-i-stat/em-tra-sye'tah-ben/ten-oh-foh'veer)

Stribild

elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide

Genvoya

Func. class.: Antiretrovirals

ACTION: **Elvitegravir:** Inhibits the activity of HIV integrase, which is one of three HIV-encoded enzymes required for viral replication.
Cobicistat: An inhibitor of CYP3A enzymes
Emtricitabine: A synthetic nucleoside analog of cytidine, inhibits the activity of HIV-1 reverse transcriptase (RT) by competing with the natural substrate into viral DNA, resulting in chain termination
Tenofovir disoproxil fumarate: Inhibits viral reverse transcriptase.

USES: HIV in treatment-naive patients

CONTRAINDICATIONS: Hypersensitivity, CCr <50 mL/min, severe hepatic disease

PRECAUTIONS

Pregnancy, obesity, osteoporosis, renal disease, Hispanic patients immune reconstitution syndrome

Black Box Warning: Hepatitis B/HIV combination, hepatitis B exacerbation

DOSAGE AND ROUTES

Stribild

- **Adult/child ≥12 yr, ≥35 kg, CCr ≥70 mL/min: PO** 1 tablet daily with food

Renal dose

- **Adult: PO** do not use in CCr <50 mL/min

Genvoya

- **Adult/child >=12 yr, >=35 kg: PO** 1 tablet daily with food

Available forms: Stribid: Tablet 150 mg: elvitegravir-150 mg cobicistat-200 mg emtricitabine-300 mg tenofovir disoproxil; **Genvoya:** tablet 150 mg elvitegravir, 150 mg cobicistat, 200 mg emtricitabine, 10 mg tenofovir alafenamide

Administer

- Administer tablet with food
- Don't use with other antiretrovirals

SIDE EFFECTS

GI: Abdominal pain, diarrhea, dyspepsia, flatulence, hepatic decompensation, hepatic failure, hepatitis B exacerbation, hepatomegaly, nausea, vomiting, weight gain, pancreatitis, increased LFTs
CNS: Anxiety, depression, dizziness, fatigue, headache, insomnia, paresthesias, peripheral neuropathy, suicidal ideation, fever
INTEG: Angioedema, rash, pruritis, skin discoloration/hyperpigmentation
MS: Arthralgia, back pain, bone fractures, bone pain, myalgia, myopathy, rhabdomyolysis
RESP: Cough, dyspnea, pharyngitis, rhinitis, sinusitis
GU: Glycosuria, hematuria, proteinuria, renal failure, Fanconi syndrome
META: Hyperamylasemia, hyperbilirubinemia, hypercholesterolemia, hyperglycemia, hyperlipidemia, hypertriglyceridemia, hypoglycemia, hypokalemia, hypophosphatemia
HEMA: Neutropenia
MISC: Infection, lactic acidosis, myasthenia, steatosis

PHARMACOKINETICS

Elvitegravir: Onset unknown, peak 4 hr, duration unknown, half-life 13 hr
Cobicistat: Onset unknown, peak 3 hr, duration unknown, half-life 4 hr
Emtricitabine: Onset unknown, peak 3 hr, duration unknown, half-life 10 hr
Tenofovir disoproxil fumarate: Onset unknown, peak 2 hr, duration unknown, half-life 12-18 hr

Interactions

Decrease: elvitegravir levels—antacids
Increase: alfa1 adrenoreceptor antagonists (alfuzosin)
Decrease: elvitegravir, cobicistat levels with analeptics (modafinil)

Increase: antiarrhythmic levels (amiodarone, bepridil, digoxin, disopyramide, flecainide, systemiclidocaine, propafenone, quiNIDine)
Increase: antibacterials (clarithromycin, telithromycin), cobicistat
Increase or Decrease: anticoagulants (warfarin) levels possible
Increase: anticonvulsants (carBAMzepine, OXcarbazepine, phenobarbital, phenytoin, clomazepam, ethosuximide), cobicistat, tenofovir, alafenamide
Increase: Antidepressants (SSRI paroxetine, tricyclic antidepressants [TCAs], amatriptyline, desipramine, imipramine, nortriptyline, buPROPion; traZODone)
Increase: antifungals (itraconazole, ketoconazole, voriconazole
Increase: antigout (colchicine)
Decrease: elvitegrvir, cobicistat, tenofovir, alafenamide
Increase: rifabutim with antimicrobacterial (rifabutim, rifAMPin, rifapentine)
Increase: levels of antipsychotic (quetiapine)
Increase: levels of benzodiazepine (diazePAM, lorazePAM, midazolam, triazolam)
Increase: levels of beta-blockers (metoprolol, timolol)
Increase: levels of calcium channel blockers (amLODIPine, dilTIAZem, felodipine, nicardipine, nifedipine, verapamil)
Decrease: levels of elvitegravir, cobicistat with corticosteroids (dexamethasome)
Increase: levels of corticosteroids (betamethasone, budesonide, dexamethasone, fluticasone, mometasone, triamcinolone)
Increase: levels of endothelin receptor antagonists (bosentan)
Increase: levels of ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine)
Increase: levels of GI motility agents (cisapride)
Increase: levels of HCV antivirals (tenofovir, elbasvir, grazoprevir, alafenamide)
Increase: levels of HMG-CoA reductase inhibitors
Increase: drospirenone, norgesimate
Decrease: ethinyl estradiol
Increase: levels of immunosuppressants, tenofovir alafenamide

NURSING CONSIDERATIONS

Assess:

- **HIV:** monitor for infections and improvement in symptoms of HIV
- Renal/hepatic function tests: AST, ALT, bilirubin, amylase, lipase, triglycerides periodically during treatment
- Lactic acidosis, severe hepatomegaly with steatosis: if lab reports confirm these conditions, discontinue treatment; may be fatal; more common in females or those who are overweight; monitor lactic acid levels, LFTs

Black Box Warning: Hepatotoxicity: do not use in risk factors such as alcoholism; discontinue if hepatotoxicity occurs

- Carefully evaluate drug interactions before starting therapy
- **Hepatitis B and HIV coinfection (unlabeled);** perform HBV screening in any patient who has HIV; avoid single-drug treatments in HBV
- **Pregnancy/breastfeeding:** use if clearly needed; register pregnant women in the Antiretroviral Pregnancy Registry at 800-258-4263; to reduce the risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding

Evaluate:

- Therapeutic response: decreased signs, symptoms of HIV; decreased viral load, increased CD4 counts

Teach patient/family:

- That GI complaints resolve after 3-4 wk of treatment
- That product must be taken at same time of day to maintain blood level; solution and capsule are not interchangeable; that if dose is missed, to take as soon as remembered; not to double doses; not to share with others
- That product will control symptoms but is not a cure for HIV; patient still infectious, may pass HIV virus on to others; that other products may be necessary to prevent other infections; to practice safe sex and use a condom; not to share needles or donate blood
- That changes in body fat distribution may occur

• **Lactic acidosis:** to notify prescriber immediately if fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm occur

Black Box Warning: Hepatotoxicity: to notify prescriber of dark urine, yellowing of skin/eyes, clay-colored stools, anorexia, nausea, vomiting product

• To report planned or suspected pregnancy; not to breastfeed while taking

emapalumab-lzsg (Rx)

(em-a-pal′ue-mab)

Gamifant

Func. class.: Immunomodulator

Chem. class.: Monoclonal antibody

USES: Treatment of primary hemophagocytic lymphohistiocytosis (HLH) with refractory, recurrent, or progressive disease or intolerance with conventional HLH therapy

CONTRAINDICATIONS

Hypersensitivity

DOSAGE AND ROUTES

• **Adults/children:** IV 1 mg/kg/dose over 1 hr twice per week (every 3 to 4 days). A dose increase on day 3 (to 3 mg/kg/dose), days 6 to 8 (to 6 mg/kg/dose), and day 9 onwards (to 10 mg/kg/dose) may be needed

Available forms: Injection 10 mg/2mL, 50 mg/mL, 100 mg/mL single dose

emedastine ophthalmic

See Appendix B

emicizumab-kxwh (Rx)

(em′i-siz′ue-mab)

Hemlibra

Func. class.: Antibody IgG4

USES:

For routine bleeding prophylaxis to prevent or reduce the frequency of bleeding episodes in patients with hemophilia A (congenital factor VIII deficiency) with or without factor VIII inhibitors

CONTRAINDICATIONS

Hypersensitivity

DOSAGE AND ROUTES

• **Adult and child:** SUBCUT: 3 mg/kg/dose weekly for the first 4 wk, then a maintenance dose of 1.5 mg/kg/dose, weekly, 3 mg/kg/dose weekly every 2 wk, or 6 mg/kg/dose q4wk.

Available forms:

Injection 30 mg/mL, 60 mg/0.4 mL, 105 mg/0.7 mL, 150 mg/mL single dose

empagliflozin (Rx)

(em-pa-gli-floe′zin)

Jardiance

Func. class.: Antidiabetic

Chem. class.: Sodium-glucose cotransporter 2 (SGLT2) inhibitor

ACTION: An inhibitor of sodium-glucose cotransporter 2 (SGLT2), the transporter responsible for reabsorbing the majority of glucose filtered by the tubular lumen in the kidney

USES: Type 2 diabetes mellitus with diet and exercise to reduce CV death in diabetes mellitus

CONTRAINDICATIONS: Hypersensitivity, dialysis, renal failure

Precautions: Adrenal insufficiency, breastfeeding, children, dehydration, diabetic ketoacidosis, fever, geriatric patients, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypothyroidism, hypovolemia, malnutrition, pituitary insufficiency, pregnancy, renal impairment, type 1 diabetes mellitus, vaginitis

DOSAGE AND ROUTES

• **Adult: PO** 10 mg daily, may increase to 25 mg daily

Available forms: Tablets 10, 25 mg

Administer:

• Give every day without regard to food in the AM

• Store at room temperature, protect from moisture

SIDE EFFECTS

MS: Arthralgia

ENDO: Hypercholesterolemia, hyperlipidemia, hypoglycemia (in combination)

CV: Hypotension, orthostatic hypotension

GU: Increased urinary frequency, nocturia, polyuria, cystitis, dehydration, diuresis, UTI

GI: Nausea

CNS: Syncope

MISC: Infection, ketoacidosis, URI

PHARMACOKINETICS

Protein binding 82.6%, terminal elimination half-life 12.4 hr, peak 1.5 hr

INTERACTIONS

Increase: hypoglycemic effect—angiotensin II receptor antagonists, angiotensin-converting enzyme (ACE) inhibitors, loop diuretics, thiazide diuretics, fluoxetine, olanzapine, beta-blockers, other antidiabetics, octreotide, fibric acid derivatives, MAOIs type A

Increase/Decrease: hypoglycemic effect—clonidine, androgens, bortezomib, lithium, alcohol, sulfonamides

Decrease: hypoglycemic effect—phenothiazines, typical antipsychotics, baclofen, carbonic anhydrase inhibitors, estrogens, progestins, oral contraceptives, dextrothyroxine, glucagon, corticosteroids, fenfluramine, dexfenfluramine, phenytoin, fosphenytoin, ethotoin, salicylates, cycloSPORINE, tacrolimus, tobacco

Drug/Herb/Supplements

Increase: hypoglycemia—chromium, horse chestnut

Increase/Decrease: hypoglycemia—niacin

Decrease: hypoglycemia—green tea

Drug/Lab Test

Increase: HCT, creatinine

Decrease: GFR

NURSING CONSIDERATIONS

Assess:

• **Diabetes:** monitor blood glucose, glycosylated hemoglobin A1c (HbA1c), serum cholesterol profile, serum creatinine/BUN, assess for polydipsia, other products taken by patient; assess for hypoglycemia, headache, drowsiness, hunger, weakness, sweating; have sugar source available

• **Ketoacidosis:** if patient has volume depletion, dehydration, discontinue, give insulin, glucose source

• **Renal studies:** monitor serum creatinine eGFR baseline and periodically avoid in those with eGFR <45 mL/min/1.73 m^2

• **UTI:** treat with anti-infective

• **Pregnancy/breastfeeding:** use if benefits outweigh risk to fetus; no well-controlled studies; do not breastfeed

Evaluate:

• Therapeutic response: decreasing blood glucose, A1c

Teach patient/family:

• How to check blood glucose; to continue with diet and exercise changes; to avoid smoking, alcohol

• That frequent blood glucose, HbA1c, BUN/creatinine will be needed

• To avoid other products unless approved by prescriber

• To take in the AM, without regard to food; that if dose is missed, to take when remembered, do not double dose; to read "medication guide" provided; that product controls symptoms but does not cure diabetes

• To follow medical regimen including diet, exercise, and weight loss

• Teach how to take blood glucose, urine ketones readings and how often

• **Hypoglycemia:** to report rapid heartbeat, dizziness, weakness; that lab testing will be needed, including blood glucose monitoring, and that a dosage change may be needed; to carry a sugar source at all times; review signs and symptoms of hypoglycemia and hyperglycemia and what to do about each

• **Hypotension:** to report vision changes, dizziness, fatigue; B/P should be checked regularly, stress adequate hydration

- **Ketoacidosis:** to report nausea, vomiting, abdominal pain, confusion, sleepiness
- **Infections:** (usually UTIs) to report burning, cloudy, foul-smelling urine, fever, back pain; antibiotics will be needed; and to report symptoms of mycotic infections, including foul-smelling vaginal discharge or penile discharge and redness; UTI: burning/stinging on urination, frequency
- **Pregnancy/breastfeeding:** to report if pregnancy is planned or suspected; not to breastfeed

empagliflozin/metformin (Rx)

(em′pa-gli-floe′zin/met-for′min)

Synjardy, Synjardy XR

Func. class.: Antidiabetic

Chem. class.: Biguanide; sodium-glucose cotransporter 2 (SGLT2) inhibitor

USES: Type 2 diabetes mellitus

CONTRAINDICATIONS: Hypersensitivity, diabetic ketoacidosis, dialysis, metabolic acidosis, radiographic contrast administration, renal failure

Black Box Warning: Lactic acidosis

Precautions: Pregnancy, geriatric patients, severe renal/hepatic/GI disease, pancreatitis, vitamin D deficiency, acidemia, acute heart failure, acute myocardial infarction, alcoholism, balanitis, breastfeeding, burns, cardiac disease, children, dehydration, diarrhea, ethanol intoxication, fever, gastroparesis, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypovolemia, hypoxemia, infection, malnutrition, pernicious anemia, pituitary insufficiency, polycystic ovary syndrome, sepsis, surgery, trauma, type 1 diabetes mellitus, vaginitis, vomiting

DOSAGE AND ROUTES

- **Adult: PO** bid with meals; individualize. In geriatric patients, use lowest effective dose. Max in normal renal function is empagliflozin 25 mg/day and metformin 2000 mg/day; correct volume depletion prior to initiation of treatment
- **Patients currently treated with empagliflozin:** metformin 500 mg with a similar total daily dose of empagliflozin; increase gradually to reduce the GI side effects
- **Patients currently treated with metformin:** empagliflozin 5 mg/dose with a similar total daily dose of metformin. Patients taking an evening dose of metformin XR should check with their provider about when to take their last dose prior to starting empagliflozin/metformin
- **Patients already treated with both empagliflozin and metformin:** use the same doses of each component per day, then divide the daily doses to bid dosing with meals

Renal dose:

- **Adult: PO** eGFR ≥45 mL/min/1.73 m^2, no change; eGFR <45 mL/min/1.73 m^2, do not use

Available forms: Tablets 5 mg/1000 mg, 12.5 mg/1000 mg; extended-release tablets 5 mg/1000 mg, 12.5 mg/1000 mg

emtricitabine (Rx)

(em-tri-sit′uh-bean)

Emtriva

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION: A synthetic nucleoside analog of cytosine; inhibits replication of HIV virus by competing with the natural substrate and then becoming incorporated into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES: HIV-1 infection with other antiretrovirals

Unlabeled uses: HBV infection with HIV, HIV prophylaxis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, renal disease, lactic acidosis

Black Box Warning: Hepatic insufficiency, chronic hepatitis B virus (HBV)

DOSAGE AND ROUTES

- **Adult: PO** Capsules 200 mg/day; oral solution 240 mg (24 mL)/day
- **Adolescent/child >33 kg: PO** Capsules 200 mg/day; **child 3 mo-17 yr:** oral solution 6 mg/kg/day, max 240 mg (24 mL)
- **Infants <3 mo: PO oral solution** 3 mg/kg daily, do not use capsules

Renal dose

- **Adult: PO** Capsules CCr 30-49 mL/min, 200 mg q48hr; oral solution 120 mg q24hr; capsules CCr 15-29 mL/min, 200 mg q72hr; oral solution 80 mg q24hr; capsules CCr <15 mL/min, 200 mg q96hr; oral solution 60 mg q24hr

Available forms: Capsules 200 mg; oral solution 10 mg/mL

Administer:

- Give without regard to meals
- Refrigerate oral solution
- Oral capsules and solution not interchangeable
- Store capsules at 77°F (25°C); oral solution refrigerated, use within 3 mo

SIDE EFFECTS

CNS: *Headache,* abnormal dreams, *depression,* dizziness, *insomnia,* neuropathy, paresthesia, *asthenia*, weakness
GI: *Nausea, vomiting, diarrhea, anorexia, abdominal pain, dyspepsia,* hepatomegaly with steatosis (may be fatal)
INTEG: *Rash,* skin discolorization
MS: Arthralgia, myalgia
RESP: *Cough*
SYST: Change in body fat distribution, lactic acidosis, immune reconstitution syndrome

PHARMACOKINETICS

Rapidly, extensively absorbed; peak 1-2 hr; protein binding <4%; excreted unchanged in urine (86%), feces (14%); half-life 10 hr

INTERACTIONS

Decrease: emtricitabine level—interferons
- Complex interactions—ribavirin, cautious use

Drug/Lab Test
Increase: AST/ALT, glucose, amylase, bilirubin, CK, lipase
Decrease: neutrophils

NURSING CONSIDERATIONS

Assess:

- **HIV:** monitor for infections and improvement in symptoms of HIV
- **Renal/hepatic function tests:** AST, ALT, bilirubin, amylase, lipase, triglycerides periodically during treatment
- **Lactic acidosis, severe hepatomegaly with steatosis:** if lab reports confirm these conditions, discontinue treatment; may be fatal; more common in females or those who are overweight; monitor lactic acid levels, LFTs

Black Box Warning: Hepatotoxicity: do not use in those with risk factors such as alcoholism; discontinue if hepatotoxicity occurs

- **Hepatitis B and HIV coinfection (unlabeled);** perform HBV screening in any patient who has HIV to ensure appropriate treatment; avoid single-drug treatments in HBV
- **Pregnancy/breastfeeding:** use if clearly needed; register pregnant women in the Antiretroviral Pregnancy Registry at 800-258-4263; to reduce the risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding

Evaluate:

- Therapeutic response: decreased signs, symptoms of HIV; decreased viral load, increased CD4 counts

Teach patient/family:

- That GI complaints resolve after 3-4 wk of treatment
- That product must be taken at same time of day to maintain blood level; that solution and capsule are not interchangeable; that if dose is missed, to take as soon as remembered; not to double doses; not to share with others, refrigerate oral solution
- That product will control symptoms but is not a cure for HIV; patient still

infectious, may pass HIV virus on to others; that other products may be necessary to prevent other infections; to practice safe sex and use a condom; not to share needles or donate blood
• That changes in body fat distribution may occur
• **Lactic acidosis:** to notify prescriber immediately if fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm occur

Black Box Warning: Hepatotoxicity: to notify prescriber of dark urine, yellowing of skin/eyes, clay-colored stools, anorexia, nausea, vomiting

• To report planned or suspected pregnancy; not to breastfeed while taking product

emtricitabine/rilpivirine/tenofovir alafenamide (Rx)

Odefsey
Func. class.: Antiretrovirals

USES: HIV in antiretroviral treatment–naive patients with HIV-1 RNA concentrations 100,000 copies/mL or less at treatment initiation and certain virologically stable (HIV-1 RNA <50 copies/mL) treatment-experienced patients

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Hepatitis B exacerbation

DOSAGE AND ROUTES

HIV in antiretroviral treatment-naive patients with HIV-1 RNA concentrations 100,000 copies/mL or less at treatment initiation and certain virologically stable (HIV-1 RNA <50 copies/mL) treatment-experienced patients
• **Adults/child >12 yr; ≥35 kg: PO** 1 tablet (200 mg emtricitabine; 25 mg rilpivirine; 25 mg tenofovir alafenamide) daily
Available forms: Tablets 200-25-25 mg

emtricitabine/rilpivirine/tenofovir disoproxil fumarate (Rx)

(em-tri-sit′uh-bean/ril-pi-vir′een/ten-oh-foh′veer)
Complera
Func. class.: Antiretroviral
Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:
• **Emtricitabine:** inhibits viral reverse transcriptase and is active both on HIV-1 and HBV
• **Tenofovir:** inhibits viral reverse transcriptase and acts as a DNA chain terminator
• **Rilpivirine:** inhibits HIV-1 reverse transcriptase; it does not compete for binding, nor does it require phosphorylation to be active

USES: HIV in treatment-naive patients with HIV RNA ≤100,000 copies/mL at initiation and certain virologically stable (HIV RNA <50 copies/mL) treatment-experienced patients

CONTRAINDICATIONS: Hypersensitivity, hepatotoxicity, lactic acidosis

Black Box Warning: Hepatitis B exacerbation

Precautions: Alcoholism, autoimmune disease, bone fractures, breastfeeding, children, depression, females, Graves' disease, Guillain-Barré syndrome, hepatic disease, hepatitis, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, hepatomegaly, HIV resistance, hypercholesterolemia, hyperlipidemia, hypertriglyceridemia, hypophosphatemia, immune reconstitution

syndrome, obesity, osteomalacia, osteoporosis, pregnancy, QT prolongation, renal failure, renal impairment, serious rash, suicidal ideation, torsades de pointes

DOSAGE AND ROUTES

• **Adult/adolescent/child >12 yr and weighing ≥35 kg: PO** 1 tablet (200 mg emtricitabine; 25 mg rilpivirine; 300 mg tenofovir) daily. Coadministration with rifabutin, the rilpivirine dose needs to be increased to 50 mg/day; give an additional 25 mg/day of rilpivirine with a meal

HIV prophylaxis after occupational exposure to HIV (unlabeled)

• **Adult: PO** 1 tablet (200 mg emtricitabine; 25 mg rilpivirine; 300 mg tenofovir disoproxil fumarate) daily × 28 days

Renal dose

• **Adult: PO** CCr <50 mL/min: not recommended

Available forms: Tablet 200-25-300 mg

Administer:

• Give with a meal

• Antiretroviral drug resistance testing (preferably genotypic testing) before use in treatment-naive patients and before changing therapy for treatment failure

• For pregnant women, therapy should begin immediately after HIV diagnosis

• Prior to initiating, identify virologic failures; failures occurred more frequently in those with baseline HIV RNA concentrations >100,000 copies; CD4 counts <200 cells/mm^3

• Avoid use of tenofovir-containing regimens in those with renal disease and osteoporosis

SIDE EFFECTS

CNS: *Headache*, abnormal dreams, *depression*, dizziness, *insomnia*, neuropathy, paresthesia, suicide, fatigue, drowsiness

GI: *Nausea, vomiting, anorexia, diarrhea, abdominal pain, dyspepsia*, hepatomegaly with stenosis (may be fatal), pancreatitis

INTEG: *Rash*, skin discoloration

MS: Arthralgia, myalgia, rhabdomyolysis

GU: Glomerulonephritis membranous/mesangioproliferative

SYST: Change in body fat distribution, lactic acidosis

PHARMACOKINETICS

• **Emtricitabine:** protein binding <4%, metabolized via oxidation half-life 10 hr, excreted renally (86%) and via feces (14%); peak 1-2 hr

• **Tenofovir:** protein binding <0.7%, undergoes phosphorylation, eliminated by a combination of glomerular filtration and active renal tubular secretion, 70%-80% excreted unchanged in urine half-life 17 hr, bioavailability is increased with a high-fat meal

• **Rilpivirine:** protein binding 99.7% to albumin, metabolism via oxidation by CYP3A system, half-life 50 hr, excretion 85% feces, 6.1% urine, peak 4-5 hr

INTERACTIONS

• Do not use with efavirenz, lamiVUDine; treatment duplication

Increase: rilpivirine level—CYP3A4 inhibitors (delavirdine, efavirenz, darunavir, tipranavir, atazanavir, fosamprenavir, indinavir, nelfinavir, aldesleukin IL-2, amiodarone, aprepitant, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, danazol, dalfopristin, dasatinib, diltiazem, dronedarone, erythromycin, ethinyl estradiol, fluconazole, FLUoxetine, fluvoxamine, fosaprepitant, imatinib, isoniazid, itraconazole, ketoconazole, lantreotide, lapatinib, miconazole, nefazodone, nicardipine, octreotide, posaconazole, quinine, ranolazine, rifAXIMin, tamoxifen, telaprevir, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast)

Decrease: emtricitabine level—interferons

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, beta-agonists, local anesthetics,

tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide; CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: rilpivirine adverse reactions, fungal infections—fluconazole, voriconazole

Decrease: rilpivirine effect, treatment failure—CYP3A4 inducers (rifAMPin, rifapentine, rifabutin, primadone, phenytoin, PHENobarbital, nevirapine, nafcillin, modafinil, griseofulvin, etravirine, efavirenz, barbiturates, bexarotene, bosentan, carBAMazepine, enzalutamide, dexamethasone), proton pump inhibitors

Drug/Lab Test

Increase: AST/ALT, glucose, amylase, bilirubin, lipase, CK

Decrease: neutrophils

NURSING CONSIDERATIONS

Assess:

- **HIV infection:** assess symptoms of HIV, including opportunistic infections, prior to and during treatment, some may be life-threatening; monitor plasma CD4+, CD8 cell counts, serum beta-2 microglobulin, serum ICD+24 antigen levels, treatment failures occur more often in those with baseline HIV-1 RNA concentrations >100,000 copies/mL than in those <100,000 copies/mL; monitor blood glucose, CBC with differential, serum cholesterol, lipid panel
- **Hepatotoxicity/lactic acidosis:** monitor hepatitis B serology, LFTs, plasma hepatitis C RNA, lactic acidosis levels. If lab reports confirm these conditions, discontinue product. More common in females or those who are overweight. Avoid use in alcoholism
- **Pregnancy/breastfeeding:** obtain pregnancy testing before use

Black Box Warning: Hepatitis B exacerbation: those with coexisting HBV and HIV infections who discontinue emtricitabine or tenofovir may experience severe acute hepatitis B exacerbation and hepatic decompensation and hepatic failure. Those coinfected with HBV and HIV who discontinue this product, monitor LFTs q6wk for the first 3 mo and q3-6mo thereafter. Resumption of anti–hepatitis B treatment may be required

- Monitor serum bilirubin (total and direct), serum creatinine, urinalysis, LFTs, amylase, lipase, periodically

Evaluate:

- Improvement in CD4, HIV RNA counts, decreasing signs and symptoms of HIV

TEACH PATIENT/FAMILY:

- That hepatitis and HIV coinfected patients should avoid consuming alcohol; offer vaccinations against hepatitis A and hepatitis B as appropriate
- That GI complaints resolve after 2-3 wk of treatment
- To take at the same time of day to maintain blood level; not to crush, break, or chew
- That product controls the symptoms of HIV but does not cure; patient is still able to infect others, that other products may be necessary to prevent other infections
- **Lactic acidosis:** to notify prescriber if fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm occur
- **Hepatotoxicity:** to notify prescriber of dark urine, yellowing skin or eyes, clay-colored stools, anorexia, nausea, vomiting
- **Suicide:** to report severe depression, suicidal ideation to prescriber immediately
- To report suspected or planned pregnancy, not to breastfeed

emtricitabine/tenofovir alafenamide fumarate (Rx)

(em-tri-sit′uh-bean/ten-oh-foh′veer)

Descovy

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

- **Emtricitabine:** inhibits viral reverse transcriptase and is active both on HIV-1 and HBV
- **Tenofovir:** inhibits viral reverse transcriptase and acts as a DNA chain terminator

USES: Human immunodeficiency virus (HIV) infection used in combination with other antiretrovirals

CONTRAINDICATIONS: Hypersensitivity, CCr <30 mL/min

Precautions:

Black Box Warning: Hepatitis B exacerbation

Alcoholism, autoimmune disease, bone fractures, breastfeeding, children, depression, females, Graves' disease, Guillain-Barré syndrome, hepatic disease, hepatitis, hepatitis B and HIV coinfection, hepatitis C and HIV coinfection, hepatomegaly, HIV resistance, hypercholesterolemia, hyperlipidemia, hypertriglyceridemia, hypophosphatemia, immune reconstitution syndrome, obesity, osteomalacia, osteoporosis, pregnancy, QT prolongation, renal failure, renal impairment, serious rash, suicidal ideation, torsades de pointes, hepatotoxicity, lactic acidosis

DOSAGE AND ROUTES

- **Adult/adolescent/child ≥12 yr and weighing ≥35 kg: PO** 1 tablet (200 mg emtricitabine; 25 mg tenofovir) daily

Available forms: Tablets 200 mg emtricitabine; 25 mg tenofovir

Administer:

- Antiretroviral drug resistance testing (preferably genotypic testing) is recommended prior to use in treatment-naive patients and prior to changing therapy for treatment failure
- For adults, use in all patients to reduce the risk of disease progression and to prevent the transmission of HIV, including perinatal transmission and transmission to sexual partners
- For pregnant women, therapy should begin immediately after HIV diagnosis
- Avoid use of tenofovir-containing regimens in those with renal disease and osteoporosis

SIDE EFFECTS

CNS: Weakness

GI: *Nausea,* hepatomegaly with stenosis (may be fatal), hepatic failure/decompensation, hepatitis

MS: Myalgia, bone pain, osteopenia, osteoporosis

GU: Breast enlargement, renal failure

SYST: Change in body fat distribution, lactic acidosis, Fanconi syndrome

META: Hypercholesterolemia, hypertriglyceridemia, hypophosphatemia

PHARMACOKINETICS

- **Emtricitabine:** protein binding <4%, metabolized via oxidation, half-life 10 hr, excreted renally (86%) and via feces (14%); peak 1-2 hr
- **Tenofovir:** protein binding <0.7%, undergoes phosphorylation to its active metabolite, eliminated by glomerular filtration and active renal tubular secretion, 70%-80% excreted unchanged in urine by 72 hr; half-life 17 hr, bioavailability is increased with a high-fat meal

INTERACTIONS

- Do not use with efavirenz, lamiVUDine; treatment duplication

Decrease: emtricitabine level—interferons

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines,

beta-agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide; CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone)

NURSING CONSIDERATIONS

Assess:

- **HIV infection:** assess symptoms of HIV, including opportunistic infections, prior to and during treatment, some may be life-threatening; monitor plasma CD4+, CD8 cell counts, serum beta-2 microglobulin; treatment failures occur more often in those with baseline HIV-1 RNA concentrations >100,000 copies/mL than in those <100,000 copies/mL; monitor blood glucose, CBC with differential, serum cholesterol, lipid panel
- **Hepatotoxicity/lactic acidosis:** monitor hepatitis B serology, LFTs, plasma hepatitis C RNA, lactic acidosis levels. If lab reports confirm these conditions, discontinue product. More common in females or those who are overweight. Avoid use in alcoholism

Black Box Warning: Hepatitis B exacerbation: those with coexisting HBV and HIV infections who discontinue emtricitabine or tenofovir may experience severe acute hepatitis B exacerbation with hepatic decompensation/failure. Those coinfected with HBV and HIV who discontinue this product, monitor LFTs q6wk × the first 3 mo and q3-6mo. Resumption of anti–hepatitis B treatment may be required

- Monitor serum bilirubin (total and direct), serum creatinine, urinalysis, LFTs, amylase, lipase periodically
- **Pregnancy/breastfeeding:** obtain pregnancy testing prior to use

Evaluate:

- Improvement in CD4, HIV RNC counts, decreasing signs and symptoms of HIV

Teach patient/family:

- That hepatitis and HIV coinfected patients should avoid consuming alcohol; offer vaccinations against hepatitis A and hepatitis B as needed
- That GI complaints resolve after 2-3 wk of treatment
- To take at the same time of day to maintain blood level; not to crush, break, or chew
- That product controls the symptoms of HIV but does not cure; that patient is still able to infect others, that other products may be necessary to prevent other infections
- **Lactic acidosis:** to notify prescriber if fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm occur
- **Hepatotoxicity:** to notify prescriber of dark urine, yellowing skin or eyes, clay-colored stools, anorexia, nausea, vomiting
- To report suspected or planned pregnancy, not to breastfeed

emtricitabine/tenofovir disoproxil fumarate (Rx)

Truvada

Func. class.: Antiretroviral

USES:

HIV

CONTRAINDICATIONS

Hypersensitivity

DOSAGE AND ROUTES

- **Adults:** PO emtricitabine 200 mg; tenofovir DF 300 mg daily
- **Adults/children and adolescents ≥35 kg:** PO 1 tablet (emtricitabine 200 mg; tenofovir DF 300 mg) daily
- **Children and adolescents 28 to 34 kg:** PO 1 tablet (emtricitabine 167 mg; tenofovir DF 250 mg) daily

• **Children 22 to 27 kg:** PO 1 tablet (emtricitabine 133 mg; tenofovir DF 200 mg) daily
• **Children 17 to 21 kg:** PO 1 tablet (emtricitabine 100 mg; tenofovir DF 150 mg) daily
For HIV pre-exposure prophylaxis in high-risk patients without HIV to reduce the risk of sexually acquired HIV-1

enalapril/enalaprilat (Rx)

(e-nal′a-pril/e-nal′a-pril-at)

Vasotec

Func. class.: Antihypertensive
Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

USES: Hypertension, HF, left ventricular dysfunction

CONTRAINDICATIONS: Hypersensitivity, history of angioedema, ACE inhibitors

Black Box Warning: Pregnancy second/third trimester

Precautions: Breastfeeding, renal disease, hyperkalemia, hepatic failure, dehydration, bilateral renal artery/aortic stenosis

DOSAGE AND ROUTES

Hypertension
• **Adult: PO** 2.5-5 mg/day, may increase or decrease to desired response, range 10-40 mg/day in 1-2 divided doses; **IV** 0.625-1.25 mg q6hr over 5 min
• **Child: PO** 0.08 mg/kg/day in 1-2 divided doses, max 0.58 mg/kg/day
• **Child: IV** 5-10 mcg/kg/dose q8-24hr
Heart failure
• **Adult: PO** 2.5-20 mg/day in 2 divided doses, max 40 mg/day in divided doses
Left ventricular cardiac dysfunction, asymptomatic
• **Adult: PO** 2.5 mg bid, titrate to max 10 mg bid, as tolerated; diuretic dose may require adjustment; monitor for ≥2 hr for hypotension
Renal disease
• **Adult: PO** 2.5 mg/day (CCr <30 mL/min), increase gradually; **IV** CCr >30 mL/min, 1.25 mg q6hr; CCr <30 mL/min, 0.625 mg as one-time dose, increase as per B/P
• **Child >1 mo: PO/IV** CCr <30 mL/min contraindicated
Hypertensive emergency/urgency (unlabeled)
• **Adult: IV** 1.25-5 mg q6hr
Available forms: Enalapril: tablets 2.5, 5, 10, 20 mg; oral solution 1 mg/mL; enalaprilat: injection 1.25 mg/mL

enalapril/hydrochlorothiazide (Rx)

Vaseretic

Func. class.: Antihypertensive/diuretic

USES: Hypertension

CONTRAINDICATIONS: Hypersensitivity

Black Box Warning: Pregnancy

DOSAGE AND ROUTES

• **Adult: PO** 1 tablet (10/25 mg), may increase after 2-3 wk
Available forms: Tablets 5-12.5 mg, 10-25 mg

⚠ HIGH ALERT

enasidenib (Rx)

(en′-a-sid′-a-nib)

IDHIFA

Func. class.: Antineoplastic, isocitrate dehydrogonase-2 inhibitor

USES: Relapsed or refractory acute myeloid leukemia (AML) with IDH2 mutation

DOSAGE AND ROUTES

Black Box Warning: Differentiation syndrome

- **Adult: PO:** 100 mg/day until disease progression. Treat those without disease progression for a minimum of 6 mo to allow time for clinical response

Available forms: Tablets 50, 100 mg

enfuvirtide (Rx)

(en-fyoo′vir-tide)

Fuzeon

Func. class.: Antiretroviral

Chem. class.: Fusion inhibitor

ACTION: Inhibitor of the fusion of HIV-1 with CD4+ cells

USES: Treatment of HIV-1 infection in combination with other antiretrovirals in those who are treatment experienced only

Unlabeled uses: HIV prophylaxis after occupational exposure

CONTRAINDICATIONS: Breastfeeding, hypersensitivity

Precautions: Pregnancy, children <6 yr, liver disease, myelosuppression, infections

DOSAGE AND ROUTES

- **Adult: SUBCUT** 90 mg (1 mL) bid
- **Child ≥11 kg: SUBCUT** 2 mg/kg bid, max 90 mg bid

HIV prophylaxis (unlabeled)

- **Adult: SUBCUT** 90 mg bid added to PEP regimen

Available forms: Powder for injection, lyophilized 108 mg (90 mg/mL when reconstituted)

Administer:

SUBCUT route

- **Reconstitute** vial with 1.1 mL sterile water for injection; tap and roll to mix; allow to stand until completely dissolved, may take up to 45 min; after dissolved, immediately **inject** or refrigerate up to 24 hr
- Do not mix with other medications
- **SUBCUT:** Give bid, rotate sites; preferred sites: upper arm, anterior thigh, abdomen
- **Storage:** Use reconstituted product within 24 hr, refrigerated, let product come to room temperature prior to injecting

SIDE EFFECTS

CNS: Anxiety, peripheral neuropathy, taste disturbance, Guillain-Barré syndrome, insomnia, depression, fatigue, peripheral neuropathy

GI: Nausea, abdominal pain, anorexia, constipation, pancreatitis, dry mouth, weight loss

GU: Glomerulonephritis, renal failure

HEMA: Thrombocytopenia, neutropenia

INTEG: *Injection site reactions, skin papilloma*

MISC: Influenza, cough, conjunctivitis, lymphadenopathy, myalgia, hyperglycemia, bacterial pneumonia, rhinitis, fatigue, hypersensitivity

PHARMACOKINETICS

Peak 8 hr, terminal half-life 3.8 hr, well absorbed, undergoes catabolism, 92% protein binding

INTERACTIONS

Drug/Lab

Increase: LFTs, lipase, CK, triglycerides

Decrease: Hb

Drug/Drug

Increase: effect of either product—protease inhibitor

NURSING CONSIDERATIONS

Assess:

- **Signs of infection, injection site reactions:** use analgesics; bacterial pneumonia may occur if blood counts are low or viral load is high or low CD4 counts, IV drug user, lung disease, smoker
- **Peripheral neuropathy:** may occur and last for several months, where nerves are close to the skin those with coagulation disorders are at greater risk
- **Glomerulonephritis/renal failure:** BUN, creatinine, renal failure may occur
- Bowel pattern prior to, during treatment; if severe abdominal pain or constipation occurs, notify prescriber; monitor hydration
- **Hypersensitivity:** skin eruptions, rash, urticaria, itching; assess allergies prior to treatment, reaction to each medication; may occur quickly or later after continued use, stop product, do not restart
- **Pneumonia:** those with low CD4 count or increased viral load are more susceptible
- **Immune reconstitution syndrome:** with combination theory
- **HIV:** CBC, blood chemistry, plasma HIV RNA, absolute CD4+/CD8+ cell counts/%, serum β_2 microglobulin, serum ICD+24 antigen levels, cholesterol
- **Injection site reactions:** monitor for pain, redness, swelling at site, treat as needed
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, if breastfeeding; if pregnant, register with the Antiretroviral Pregnancy Registry (800-258-4263)

Evaluate:

- Therapeutic response: increased CD4 cell counts; decreased viral load; slowing progression of HIV-1 infection

Teach patient/family:

- That pneumonia may occur; to contact prescriber if cough, fever occur
- That hypersensitive reactions may occur; rash, pruritus; to stop product, contact prescriber
- That product is not a cure for HIV-1 infection but controls symptoms; HIV-1 can still be transmitted to others; that product is to be used in combination only with other antiretrovirals
- How to prepare and give using SUBCUT injection, watch for site reactions, rotate sites; if more information is needed, call 877-438-9366
- To notify prescriber if pregnancy is suspected; not to breastfeed, to register with the Antiretroviral Pregnancy Registry (800-258-4263)

⚠ HIGH ALERT

enoxaparin (Rx)

(ee-nox′a-par-in)

Lovenox

Func. class.: Anticoagulant, antithrombotic

Chem. class.: Low-molecular-weight heparin (LMWH)

Do not confuse:
enoxaparin/enoxacin
Lovenox/Lotronex

ACTION: Binds to antithrombin III inactivating factors Xa/IIa, thereby resulting in a higher ratio of anti–factor Xa to IIa

USES: Prevention of DVT (inpatient or outpatient), PE (inpatient) in hip and knee replacement, abdominal surgery at risk for thrombosis; unstable angina, acute MI, coronary artery thrombosis
Unlabeled uses: Antiphospholipid antibody syndrome, arterial thromboembolism prophylaxis, cerebral thromboembolism, percutaneous coronary intervention

CONTRAINDICATIONS: Hypersensitivity to this product, heparin, pork; active major bleeding, hemophilia, leukemia with bleeding, thrombocytopenic purpura, heparin-induced thrombocytopenia

Precautions: Pregnancy, breastfeeding, children, geriatric patients, low-weight men (<57 kg), women (<45 kg), severe renal/hepatic disease, severe hypertension, subacute bacterial endocarditis, acute nephritis, recent burn, spinal surgery, indwelling catheters, hypersensitivity to benzyl alcohol

Black Box Warning: Lumbar puncture, aneurysm, coagulopathy, epidural anesthesia, spinal anesthesia

DOSAGE AND ROUTES

DVT prevention prior to hip or knee surgery

• **Adult: SUBCUT** 30 mg bid given 12-24 hr postop for 7-10 days

DVT prevention prior to hip replacement

• **Adult: SUBCUT** 40 mg/day started 9-12 hr preop or 30 mg q12hr started 12-24 hr postop

DVT prophylaxis prior to abdominal surgery

• **Adult: SUBCUT** 40 mg/day starting 24 hr prior to surgery × 7-12 days

Treatment of DVT or PE

• **Adult: SUBCUT** 1 mg/kg q12hr (without PE, outpatient); 1 mg/kg q12hr or 1.5 mg/kg/day (with or without PE, inpatient); warfarin should be started within 72 hr, continued ≥5 days until INR is 2-3 (at least 3 days)

DVT prophylaxis in patients with restricted mobility due to acute illness

• **Adult: SUBCUT** 40 mg q24hr

Prevention of ischemic complications in unstable angina or non–Q-wave MI/non-ST

• **Adult: SUBCUT/IV** 1 mg/kg q12hr until stable with aspirin 100-325 mg/day

Acute MI with ST-segment elevation

• **Adult/geriatric <75 yr: IV/SUBCUT** 30 mg **IV BOLUS** plus 1 mg/kg **SUBCUT,** then 1 mg/kg **SUBCUT** q12hr, max 100 mg for first 2 doses only

• **Geriatric ≥75 yr: SUBCUT** 0.75 mg/kg q12hr, max 75 mg for first 2 doses only

Renal dose

• **Adult: SUBCUT** CCr <30 mL/min: 30 mg daily **(thrombosis prophylaxis in abdominal surgery, hip or knee replacement surgery, during acute illness);** 1 mg/kg daily **(concurrently with aspirin to treat unstable angina or non-Q-wave MI);** 1 mg/kg daily **(STEMI in those ≥75 yr),** 30 mg IV bolus plus 1 mg/kg SC, then 1 mg/kg daily **(STEMI in those <75 yr),** or 1 mg/kg daily **(concurrently with warfarin for inpatient or outpatient treatment of acute deep vein thrombosis with or without pulmonary embolism)**

Available forms: Prefilled syringes 30 mg/0.3 mL, 40 mg/0.4 mL; graduated prefilled syringes 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/1 mL, 120 mg/0.8 mL, 150 mg/mL

Administer:

• Only after screening patient for bleeding disorders

• Do not mix with other products or infusion fluids

• Only this product when ordered; not interchangeable with heparin or other LMWHs

• At same time each day to maintain steady blood levels

• Avoid all IM injections that may cause bleeding

• Prepare in a sterile environment using aseptic technique

SUBCUT route

• Do not give IM; begin 1 hr prior to surgery; do not aspirate; rotate sites; do not expel bubble from syringe before administration

• To recumbent patient, give SUBCUT; rotate injection sites (left/right anterolateral, left/right posterolateral abdominal wall)

• Insert whole length of needle into skin fold held with thumb and forefinger

• If withdrawing from multidose vial, use TB syringe for proper measurement

• Prefilled syringes (30, 40 mg) not graduated; do not use for partial doses

• Do not administer if particulate is present; do not use products with benzyl alcohol in pregnant women

Direct IV route

• Use multidose vial for IV administration; use TB syringe, other graduated syringe to measure dose; give IV BOLUS through IV line, flush prior to and after

• Dilution may be stored for up to 4 wk in glass vial at room temperature, up to 2 wk in TB syringes with rubber stoppers at room temperature or refrigerated

SIDE EFFECTS

CNS: Fever, confusion, dizziness, headache
GI: Nausea, vomiting, constipation
HEMA: Hemorrhage from any site, hypochromic anemia, thrombocytopenia, bleeding
INTEG: Ecchymosis, injection site hematoma, alopecia, pruritus, rash
META: Hyperkalemia in renal failure
MS: Osteoporosis
SYST: Edema, peripheral edema, angioedema, anaphylaxis

PHARMACOKINETICS

SUBCUT: 90% absorbed, maximum antithrombin activity (3-5 hr), duration 12 hr half-life 4½ hr, excreted in urine

INTERACTIONS

Increase: enoxaparin action—anticoagulants, salicylates, NSAIDs, antiplatelets, thrombolytics, RU-486, SSRIs; monitor INR/PT

Drug/Lab Test
Increase: AST, ALT
Decrease: platelet count

Drug/Herb
Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, green tea, horse chestnut

NURSING CONSIDERATIONS

Assess:
• Monitor anti—factor Xa activity in chronic therapy (renal disease)
• Blood studies (Hct/Hb, CBC, coagulation studies, platelets [for HIT], occult blood in stools), anti–factor Xa (should be checked 4 hr after injection); thrombocytopenia may occur; PT, PTT is not needed in those with adequate coagulation; discontinue use and notify prescriber if platelets <100,000/mm^3
• Renal studies: BUN/creatinine baseline and periodically
• **Bleeding:** gums, petechiae, ecchymosis, black tarry stools, hematuria; notify prescriber
• **Anaphylaxis, angioedema:** monitor for rash; swelling of face, lips, tongue; dyspnea; stop product, initiate emergency procedures
• **Neurologic status:** those with epidural catheters are at greater chance for impairments
• Injection site reactions: inflammation, redness, hematomas

Black Box Warning: Neurologic symptoms in patients who have received spinal anesthesia, may develop spinal hematoma; those who have had trauma, spinal surgery are at greater risk

• **Beers:** reduce dose in older adults; increased bleeding risk, or if CCr <30 mL/min
• **Pregnancy/breastfeeding:** do not use in multidose vials, benzyl alcohol is present; do not breastfeed

Evaluate:
• Therapeutic response: prevention of DVT/PE

Teach patient/family:
• **Black Box Warning: Spinal anesthesia:** to report numbness, weakness in lower extremities
• To use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
• To report any signs of bleeding: gums, under skin, urine, stools; do not rub injection site, easy bruising
• To report dizziness, rash, breathing changes
• To teach how to use SUBCUT form
• To have patient discuss all products taken with all prescribers and health care providers
• To avoid OTC products containing aspirin, NSAIDs unless approved by prescriber; not to start any Rx, OTC, supplements, or herbal products unless approved by prescriber

entacapone (Rx)

(en'ta-kah-pone)

Comtan

Func. class.: Antiparkinson agent
Chem. class.: COMT inhibitor

USES: Parkinson's disease for those experiencing end-of-dose, decreased effect as adjunct to levodopa/carbidopa

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES

• **Adult: PO** 200 mg given with carbidopa/levodopa, max 1600 mg/day; may allow for 25% dosage reduction in levodopa therapy

Available forms: Tablets 200 mg

entecavir (Rx)

(en-te´ka-veer)

Baraclude

Func. class.: Antiviral

Chem. class.: Nucleoside analog

ACTION: Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

USES: Chronic hepatitis B (HBV)

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, severe renal disease, liver transplant

Black Box Warning: Hepatic disease, hepatitis, HIV, lactic acidosis

DOSAGE AND ROUTES

Chronic hepatitis B (nucleoside treatment naive)

• **Adult and adolescent ≥16 yr: PO** tablet 0.5 mg/day

• **Adult: PO** (solution) 0.5 mg daily; **Child/adolescent ≥2 yr >30 kg:** 0.5 mg (10 mL) daily; **Child ≥2 yr, 27 to 30 kg:** 0.45 mg (9 mL) daily; **Child ≥2 yr, 24 to 26 kg:** 0.4 mg (8 mL) daily; **Child ≥2 yr, 21 to 23 kg:** 0.35 mg (7 mL) daily; **Child ≥2 yr, 18 to 20 kg:** 0.3 mg (6 mL) daily; **Child ≥2 yr, 15 to 17 kg:** 0.25 mg (5 mL) daily; **Child ≥2 yr, 12 to 14 kg:** 0.2 mg (4 mL) daily; **Child ≥2 yr,** 0.15 mg (3 mL) daily

Chronic hepatitis B with compensated liver disease

• **Adult/adolescent ≥16 yr: PO** tablet 1 mg/day

• **Adult: PO** (solution) 1 mg/day; **Child/adolescent ≥2 yr, >30 kg:** 1 mg (20 mL) daily; **Child ≥2 yr, 27 to 30 kg:** 0.9 mg (18 mL) daily; **Child ≥2 yr, 24 to 26 kg:** 0.8 mg (16 mL) daily; **Child ≥2 yr, 21 to 23 kg:** 0.7 mg (14 mL) daily; **Child ≥2 yr, 18 to 20 kg:** 0.6 mg (12 mL) daily; **Child ≥2 yr, 15 to 17 kg:** 0.5 mg (10 mL) daily; **Child ≥2 yr, 12 to 14 kg:** 0.4 mg (8 mL) daily; **Child ≥2 yr, 10 to 11 kg:** 0.3 mg (6 mL) daily

Renal dose

• **Adult/child >16 yr: PO** CCr ≥50 mL/min, 0.5 mg/day; CCr 30-49 mL/min, 0.25 mg/day, 0.5 mg/day or 1 mg q48hr for lamiVUDine-refractory patient; CCr 10-29 mL/min, 0.15/day or 1 mg q72hr for lamiVUDine-refractory patient; CCr <10 mL/min, 0.05 mg/day, 0.1 mg/day or 1 mg q7day for lamiVUDine-refractory patient

• **Child 2-<16 yr: PO** (dosage based on weight) **10-11 kg:** 0.15 mg once daily (0.3 mg once daily if history of lamiVUDine resistance) **>11-14 kg:** 0.2 mg once daily (0.4 mg once daily if history of lamiVUDine resistance) **>14-17 kg:** 0.25 mg once daily (0.5 mg once daily if history of lamiVUDine resistance) **>17-20 kg:** 0.3 mg once daily (0.6 mg once daily if history of lamiVUDine resistance) **>20-23 kg:** 0.35 mg once daily (0.7 mg once daily if history of lamiVUDine resistance) **>23-26 kg:** 0.4 mg once daily (0.8 mg once daily if history of lamiVUDine resistance) **>26-30 kg:** 0.45 mg once daily (0.9 mg once daily if history of lamiVUDine resistance) **>30 kg:** 0.5 mg once daily (1 mg once daily if history of lamiVUDine resistance)

Available forms: Tablets, film coated 0.5, 1 mg; oral solution 0.05 mg/mL

Administer:

• After hemodialysis

• By mouth on empty stomach 2 hr prior to or after food

• Store at room temperature

• **Oral solution:** use calibrated oral dosing spoon provided; may be used interchangeably with tablets, do not dilute

SIDE EFFECTS

CNS: *Headache,* fatigue, dizziness, insomnia
ENDO: Hyperglycemia
GI: *Dyspepsia,* nausea, vomiting, diarrhea, elevated liver function enzymes
INTEG: Alopecia, rash
SYST: Lactic acidosis, severe hepatomegaly with steatosis

PHARMACOKINETICS

Peak 0.5-1.5 hr, steady-state 6-10 days, 100% bioavailability, extensively distributed to tissues, protein binding 13%, terminal half-life 128-149 hr duration up to 24 hr, excreted unchanged (62%-73%) via kidneys

INTERACTIONS

Drug/Food
Decrease: absorption—high-fat meal
Drug/Lab Test
Increase: ALT, AST, total bilirubin, amylase, lipase, creatinine, blood glucose, urine glucose
Decrease: platelets, albumin

NURSING CONSIDERATIONS

Assess:
• **For nephrotoxicity:** increasing CCr, BUN

Black Box Warning: For HIV prior to beginning treatment because HIV resistance may occur in chronic hepatitis B patients; monitor HIV RNA; don't use in those with HIV and HBV unless receiving antiretroviral treatment for both

Black Box Warning: For lactic acidosis and severe hepatomegaly with stenosis; increased serum lactate, increased hepatic enzymes; discontinue if present, discontinue if signs occur; may be fatal

• Geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

Black Box Warning: For exacerbations of hepatitis (jaundice, pruritus, fatigue), anorexia after discontinuing treatment, and for several months monitor LFTs

• **Pregnancy/breastfeeding:** use if clearly needed; register pregnant women at the Antiretroviral Pregnancy Registry at 800-258-4263; to reduce risk of postnatal transmission, HIV-infected mothers are advised to avoid breastfeeding

Evaluate:
• Therapeutic response: decreased symptoms of chronic hepatitis B, improving LFTs

Teach patient/family:
• Not to take with food; to take 2 hr prior to or after meals
• To take exactly as prescribed, to read the "Patient Information," to take missed dose when remembered unless close to time of next dose; that compliance with dosage schedule is required; not to share product
• Not to stop medication without approval of prescriber
• That optimal duration of treatment is unknown
• To avoid use with other medications, supplements unless approved by prescriber
• To notify prescriber of decreased urinary output, blood in urine

Black Box Warning: Symptoms of lactic acidosis: muscle pain, severe tiredness, weakness, trouble breathing, stomach pain with nausea/vomiting, coldness in arms/legs, fast/irregular heartbeat, dizziness

Black Box Warning: Symptoms of hepatotoxicity: eyes/skin turning yellow, dark urine, light-colored bowel movements, no appetite for days, nausea, stomach pain; may be worsened after discontinuing treatment

• That product does not cure but lowers amount of HBV in body
• That product does not stop spread of HBV to others by sex, sharing needles, or being exposed to blood
• Not to breastfeed; to notify prescriber if pregnancy is planned or suspected

• Not to operate machinery until effect is known, dizziness may occur
• That regular follow-up and lab tests will be needed

⚠ HIGH ALERT

entrectinib (Rx)

(en-trex′tih-nib)

Rozlytrek

Func. class.: Antineoplastic orphan drug
Chem. class.: Tyrosine kinase ROS1 inhibitor, tropomyosin receptor kinase (TRK) inhibitor

USES: ROS1-positive non–small-cell lung cancer and NTRK gene fusion–positive solid tumors

CONTRAINDICATIONS

Hypersensitivity, pregnancy, breast-feeding

DOSAGE AND ROUTES

• **Adult: PO** 600 mg daily until disease progression or unacceptable toxicity
Available forms: Capsule 100, 200 mg

enzalutamide (Rx)

(en-zal-u′ta-mide)

Xtandi

Func. class.: Antineoplastic hormone
Chem. class.: Nonsteroidal antiandrogen

USES: Metastatic, castration-resistant prostate cancer in those who have received DOCEtaxel

CONTRAINDICATIONS: Pregnancy, women, hypersensitivity

DOSAGE AND ROUTES

• **Adult: PO** 160 mg (4 × 40-mg caps) daily. If a patient experiences a grade 3 or higher toxicity or an intolerable adverse effect, withhold dosing for 1 wk or until symptoms improve to grade 2 or less, then resume at the same or a reduced dosage (120 or 80 mg), if warranted
• The concomitant use of strong CYP2C8 give 80 mg once daily; CYP3A4 inducers 240 mg daily
Available forms: Capsules 40 mg

ephedrine (Rx)

(e-FED-rin)

Rezipres

Func. class.: Antihypertensive, alpha and beta agonist

USES: Hypotension in anesthesia

DOSAGE AND ROUTES

• **Adult: IV BOLUS** 4.7 mg-9.4 mg, give additional boluses as needed, max total doses 47 mg
Available forms: Solution for IV bolus 47 mg/mL, 47 mg/5 mL (9.4 mg/mL), 23.5 mg/5 mL (4.7 mg/mL)

epinastine (ophthalmic) (Rx)

(ep-ih-nas′teen)

Func. class.: Antihistamine (ophthalmic)
Chem. class.: Histamine 1 receptor antagonist/mast cell stabilizer

ACTION: A topically active, direct H_1-receptor antagonist and mast cell stabilizer; by reducing these inflammatory mediators, it relieves the ocular pruritus associated with allergic conjunctivitis

USES: Prevention of ocular pruritus associated with signs and symptoms of allergic conjunctivitis

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, children, contact lenses

DOSAGE AND ROUTES

• **Adult/child ≥3 yr: OPHTH** Instill 1 drop in each eye bid

Available forms: Ophthalmic solution 0.5%

Administer:

Ophthalmic route

- For topical ophthalmic use only
- The preservative benzalkonium chloride may be absorbed by soft contact lenses; wait ≥10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red
- Do not share ophthalmic drops with others
- Keep bottle tightly closed when not in use
- Treatment should be continued throughout the period of exposure (i.e., until the pollen season is over or until exposure to the offending allergen is terminated), even when symptoms are absent

SIDE EFFECTS

EENT: Ocular irritation, folliculosis, hyperemia, ocular pruritus

MISC: Infection (including cold symptoms and upper respiratory infections), headache, rhinitis, sinusitis, increased cough, pharyngitis

PHARMACOKINETICS

Onset 3-5 min, peak 2 hr, duration 8 hr

NURSING CONSIDERATIONS

Assess:

- Eyes: for itching, redness, use of soft or hard contact lenses

Evaluate:

- Therapeutic response: absence of redness, itching in the eyes

Teach patient/family:

Ophthalmic route

- Product is for topical ophthalmic use only
- Wash hands prior to and after use; tilt the head back slightly and pull the lower eyelid down with the index finger; squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1-2 min; do not blink
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Wait ≥10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red
- Keep bottle tightly closed when not in use
- Do not share ophthalmic drops with others
- Remove contact lenses prior to use because the preservative benzalkonium chloride may be absorbed by soft contact lenses; product should not be used to treat contact lens–related irritation

⚠ HIGH ALERT

ePINEPHrine (Rx)

(ep-i-nef'rin)

Adrenalin, Adrenaclick, Allerjet, Auvi-Q, Anapen, Anapen Jr., EpiPen, EpiPen Jr.

Func. class.: Bronchodilator nonselective adrenergic agonist, vasopressor

Chem. class.: Catecholamine

Do not confuse:

EPINEPHrine/ePHEDrine/norepinephrine

ACTION: β_1- and β_2-agonist causing increased levels of cAMP, thereby producing bronchodilation, cardiac, and CNS stimulation; high doses cause vasoconstriction via alpha-receptors; low doses can cause vasodilation via β_2-vascular receptors

USES: Acute asthmatic attacks, hemostasis, bronchospasm, anaphylaxis, allergic reactions, cardiac arrest, adjunct in anesthesia, shock

Unlabeled uses: Bradycardia, chloroquine overdose

CONTRAINDICATIONS: Hypersensitivity to sympathomimetics, sulfites, closed-angle glaucoma, nonanaphylactic shock during general anesthesia

Precautions: Pregnancy, breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, organic brain syndrome, local anesthesia of certain areas, labor, cardiac dilation, coronary insufficiency, cerebral arteriosclerosis, organic heart disease

DOSAGE AND ROUTES

Anaphylaxis/severe asthma exacerbation

- **Adult: IM/SUBCUT** 0.3-0.5 mg, may repeat q10-15min (anaphylaxis) or q20min-4 hr (asthma)

Severe anaphylaxis

- **Adult: IV** 0.1-0.25 mg q5-15min, then 1-4 mcg/min continuous infusion if needed
- **Child: IV** ≤0.1 mcg/kg/min, then 0.1 mcg/kg/min continuous infusion if needed

Severe allergic reactions type I

- **Adult/child ≥30 kg: IM** 0.3 mg (EpiPen/EpiPen 2-Pak)
- **Child <30 kg: IM** 0.15 mg (EpiPen Jr/EpiPen Jr 2-Pak)

CPR (ACLS)

- **Adult: IV** 1 mg q3-5min

Bradycardia (ACLS)

- **Adult: IV** 2-10 mcg/min

Bradycardia/pulseless arrest (PALS)

- **Child: IV** 0.01 mg/kg may repeat q3-5min, may increase to 0.1-0.2 mg/kg if needed

Available forms: Nasal spray (solution) 1 mg/mL; **solution for injection** 1 mg/mL (1:1000); 0.1 mg/mL (1:10,000); inhaled vapor (solution) 0.22 mg/actuation; pressurized inhalation (solution) 0.22 mg/actuation; solution for injection 0.15 mg/0.15 mL autoinjector, 0.3 mg/0.3 mL autoinjector, 0.15 mg/0.3 mL

Administer:

- Increased dose of insulin for diabetic patients if glucose is elevated
- Check for correct concentrations, route, dosage prior to administering
- Give SUBCUT, IM, intraosseously, IV; suspensions are for SUBCUT use only; do not give IV
- Visually inspect parenteral products for particulate matter and discoloration prior to use; do not use solutions that are pinkish to brownish or that contain a precipitate
- Avoid extravasation during parenteral administration; if extravasation occurs, infiltrate the affected area with phentolamine diluted in NS
- Death has occurred from drug errors; make sure the right concentration is used
- Store reconstituted solution refrigerated ≤24 hr

Inhalation route

- Place in nebulizer (10 drops of a 1% base solution)
- Dilute racepinephrine 2.25% solution

IM route

- Give in the deltoid or anterior thigh (vastus lateralis); do not administer into the gluteal muscle, may give through clothing in emergency

SUBCUT route

- Inject, taking care not to inject intradermally; massage injection site well after use to enhance absorption and to decrease local vasoconstriction; injection can cause tissue irritation

Intraosseous INFUSION route (unlabeled)

- During CPR, the same EPINEPHrine dosage may be given via the intraosseous route when IV access is not available

Intracardiac route

- Intracardiac route should be reserved for extreme emergencies; intracardiac injection should only be performed by properly trained medical personnel

Endotracheal route

- Per the ACLS or PALS guidelines, the EPINEPHrine parenteral product is administered via endotracheal (ET) route; ET administration should only be used if access to IV or intraosseous routes is not possible
- **Adult:** Dilute dose in 5-10 mL of NS or sterile distilled water; administer via ET tube; endotracheal absorption of EPINEPHrine may be improved by diluting with water instead of NS
- **Child:** After dose administration, flush the ET tube with a minimum of 5 mL NS

Direct IV INJ route

- 1:10,000 solution can be given directly without diluting: dilute 1:1000 (1 mg/0.9 mL) 0.9% NaCL (1:1000 solution)
- Inject EPINEPHrine directly into a vein over 5-10 min for adults or 1-3 min for children; may be given IV push in cardiac arrest
- In neonates, may administer via the umbilical vein

During adult cardiopulmonary resuscitation (CPR):

- Resuscitation drugs may be given IV by bolus injection into a peripheral vein, followed by an injection of 20 mL IV fluid; elevate the extremity for 10-20 sec to facilitate drug delivery to the central circulation

Continuous IV INFUSION route

- Dilute 1 mg EPINEPHrine in 250 or 500 mL of a compatible IV infusion solution to provide a concentration of 4 or 2 mcg/mL, respectively; give into a large vein, if possible; more concentrated solutions (16-32 mcg/mL) may be used in fluid-restricted patients when administered through a central line

Y-site compatibilities: Alfentanil, amikacin, amiodarone, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, doxycycline, enalaprilat, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopa, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium acetate, streptomycin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid

SIDE EFFECTS

CNS: *Tremors, anxiety,* insomnia, headache, *dizziness,* confusion, hallucinations, weakness, drowsiness
CV: *Palpitations, tachycardia,* hypertension, dysrhythmias, increased T wave
GI: *Anorexia, nausea, vomiting*
MISC: Sweating, dry eyes
RESP: *Dyspnea,* paradoxical bronchospasm (inhalation)
META: Hypoglycemia

PHARMACOKINETICS

Crosses placenta, metabolized in liver
IM: 6-10 min, duration 1-4 hr
SUBCUT: Onset 5-10 min, duration 20 min-4 hr
IV: Onset immediate, peak 20 min, duration 1-4 hr
INH: Onset 1-5 min, duration 1-3 hr

INTERACTIONS

- **Do not use with MAOIs or tricyclics; hypertensive crisis may occur**
- **Toxicity:** other sympathomimetics

Decrease: hypertensive effects—beta-adrenergic blockers, stop beta-blocker 3 days prior to starting product
Increase: hypotension—alpha-blockers
Increase: cardiac effects—antihistamines, thyroid replacement hormones
Increase: dysrhythmias—cardiac glycosides
Drug/Herb

- Increased stimulation: coffee, tea, guarana, yerba maté

NURSING CONSIDERATIONS

Assess:

- **Asthma:** auscultate lungs, pulse, B/P, respirations, sputum (color, character); monitor pulmonary function studies before and during treatment
- **Vasopressor:** ECG during administration continuously; if B/P increases, decrease dose; B/P, pulse q5min after parenteral route; CVP, ISVR, PCWP during infusion if possible; inadvertent high arterial B/P can result in angina, aortic rupture, cerebral hemorrhage
- Injection site: tissue sloughing; administer phentolamine with NS
- **Sulfite sensitivity;** may be life-threatening
- Cardiac status, I&O; blood glucose in diabetes
- **Allergic reactions, bronchospasms** (swelling of face/lips/eyelids, rash, difficulty breathing): withhold dose, notify prescriber

Evaluate:

- Therapeutic response: increased B/P with stabilization or ease of breathing, relief of bronchospasm

Teach patient/family:

- About the reason for product administration
- **Inhalation:** to rinse mouth after use to prevent dryness after inhalation, not to spray near eyes, teach correct use
- To take exactly as prescribed. If on scheduled regimen, take missed dose as soon as remembered. Space remaining doses evenly. Do not double doses. To contact prescriber immediately if shortness of breath is not relieved or diaphoresis, dizziness, or chest pain occurs
- To consult prescriber prior to taking any OTC, Rx medications, supplements or herbals
- To use bronchodilator prior to using other products
- To maintain adequate fluid intake (2000-3000 mL/day) to help liquefy secretions
- To notify prescriber if pregnancy is planned or suspected or if breastfeeding
- **Autoinjector:** how to use for anaphylaxis; remove cap, place injector end tip on thigh at 90-degree angle, hold 10 sec, remove
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected or if breastfeeding

TREATMENT OF OVERDOSE:

Administer alpha-blocker and beta-blocker

EPINEPHrine nasal agent
See Appendix B

⚠ HIGH ALERT

epirubicin (Rx)

(ep-ih-roo′bi-sin)

Ellence, Pharmorubicin

Func. class.: Antineoplastic, antibiotic
Chem. class.: Anthracycline

Do not confuse:
epirubicin/eribulin

ACTION: Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; maximum cytotoxic effects at S and for G_2 phases; a vesicant

USES: Adjuvant therapy for breast cancer with axillary node involvement after resection

Unlabeled uses: Used in combination for treatment of advanced forms of cancer: bladder, gastric, head and neck, hepatocellular, lung, ovarian, multiple myeloma, soft tissue sarcoma

CONTRAINDICATIONS:

Pregnancy, breastfeeding; hypersensitivity to product, anthracyclines, anthracenediones; baseline neutrophil count <1500 cells/mm^3, severe myocardial insufficiency, recent MI, heart failure, cardiomyopathy

Black Box Warning: Severe hepatic disease, IM/SUBCUT use

Precautions: Children, geriatric patients, cardiac/renal/hepatic disease, accidental exposure, angina, dental disease, herpes, hyperkalemia, hyperphosphatemia, hypertension, hyperuricemia, hypocalcemia, infection, infertility, tumor lysis syndrome, ventricular dysfunction, previous anthracycline use

Black Box Warning: Bone marrow depression (severe), heart failure, extravasation, secondary malignancy, requires an experienced clinician

DOSAGE AND ROUTES

• **Adult: IV** 100 mg/m^2 on day 1 with fluorouracil and cyclophosphamide (FEC regimen) every 21 days × 6 cycles or 60 mg/m^2 on days 1 and 8 with oral cyclophosphamide and fluorouracil every 28 days × 6 cycles

Dosage adjustments based on hematologic and nonhematologic toxicities

• **Nadir platelet counts <50,000/mm^3, absolute neutrophil counts (ANC) <250/mm^3, neutropenic fever, or grades 3/4 nonhematologic toxicities:** Day 1 dose in subsequent cycles should be reduced by 25% of the previous dose

• **For patients receiving divided-dose epirubicin (days 1 and 8):** Day 8 dose should be reduced by 25% of the day 1 dose if the platelet counts are 75,000-100,000/mm^3 and the ANC is 1000-1499/mm^3; if day 8 platelet counts are <75,000/mm^3, ANC <1000/mm^3, or grade 3/4 nonhematologic toxicity has occurred, omit the day 8 dose

Hepatic dose

• **Adult: IV** Bilirubin 1.2-3 mg/dL or AST 2-4 × normal upper limit, 50% of starting dose; bilirubin >3-5 mg/dL or AST >4 × normal upper limit, 25% of starting dose

Available forms: Solution for injection 2 mg/mL (250 mg/25 mL, 200 mg/100 mL)

Administer:

• Antiemetic 30-60 min prior to product to prevent vomiting

Black Box Warning: To be used by a clinician experienced in giving cytotoxic products

Black Box Warning: Do not use IM/SUBCUT, severe tissue necrosis, give IV only, a vesicant; if extravasation occurs, stop and complete via another vein, preferably in another limb; avoid infusion into veins over joints or in extremities with compromised venous or lymphatic drainage

• Rapid injection can cause facial flushing or erythema along the vein; avoid administration time of <3 min

• Product should be given to those with neutrophils ≥1500/mm^3, platelet count ≥100,000/mm^3, and nonhematologic toxicities recovered to ≤grade 1

• When refrigerated, the preservative-free, ready-to-use solution can form a gelled product and will return to solution after 2-4 hr at room temperature

• Visually inspect for particulate matter and discoloration prior to use

IV route

• Double-check dose and product; fatalities have occurred with wrong dose or product

• Give anti-infectives prior to use of this product

• Use cytotoxic handling procedures; pregnant women must not handle product

• Reconstitute 50 mg and 200 mg powder for injection vials with 25 mL and 100 mL, respectively, of sterile water for injection (2 mg/mL); shake vigorously for up to 4 min; reconstituted solutions are stable for 24 hr when stored refrigerated and protected from light or at room temperature in normal light
• Solution can be further diluted with sterile water for injection

IV INJ route

• Give doses of 100-120 mg/m^2 into tubing of a freely flowing 0.9% sodium chloride (NS) or D_5W IV infusion over 15-20 min; the infusion time may be decreased proportionally in those who require lower doses; infusion times <3 min are not recommended
• Direct injection into the vein is not recommended because of the risk of extravasation; avoid use with any solution of alkaline pH because hydrolysis will occur

IV INFUSION route

• Dilute dose in 0.9% sodium chloride (NS) or D_5W, infuse over 30-60 min, avoid use with any solution of alkaline pH because hydrolysis will occur

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, miTOMYcin, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystoles, cardiomyopathy
GI: *Nausea, vomiting, anorexia, mucositis, diarrhea*
GU: *Amenorrhea, hot flashes, hyperuricemia, red urine*
HEMA: Thrombocytopenia, leukopenia, anemia, neutropenia, secondary AML
INTEG: *Rash,* necrosis, *pain at injection site, reversible alopecia*
MISC: *Infection, febrile neutropenia, lethargy, fever, conjunctivitis,* tumor lysis syndrome

PHARMACOKINETICS

Triphasic pattern of elimination; half-life 3 min, 1 hr, 30 hr; metabolized by liver, extensively; crosses placenta; widely distributed to RBCs, excreted in urine, bile, breast milk

INTERACTIONS

• Give epiRUBicin prior to PACLitaxel if both are given

Increase: toxicity—other antineoplastics or radiation, cimetidine

Increase: ventricular dysfunction, HF—trastuzumab
Increase: heart failure—calcium channel blockers
Decrease: antibody response—live virus vaccine

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow depression (severe): CBC, differential, platelet count weekly; withhold product if baseline neutrophil ≤1500/mm^3; leukocyte nadir occurs 10-14 days after administration, recovery by day 21; notify prescriber of results; assess for bleeding: hematuria, guaiac, bruising, or petechiae, or mucosa, orifices

- **Infection:** treat prior to receiving this product if regimens >120 mg/m^2, prophylactic antibiotics should be given (trimethoprim-sulfamethoxazole or a quinolone)
- Blood, urine uric acid levels; swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
- Renal disease: BUN, serum uric acid, urine CCr, electrolytes prior to, during therapy; I&O ratio; report fall in urine output to <30 mL/hr; dosage adjustment needed if serum creatinine >5 mg/dL
- Increase fluid intake to 2-3 L/day to prevent urate, calculi formation

Black Box Warning: Hepatic studies prior to, during therapy: bilirubin, AST, ALT, alkaline phosphatase as needed or monthly

Black Box Warning: Heart failure: B/P, pulse, character, rhythm, rate, ABGs, ECG, LVEF, MUGA scan, or ECHO; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs); identify cumulative amount of anthracycline received (lifetime); reactions that follow may be delayed; assess for dyspnea, tachycardia, peripheral edema, rales/crackles, ascites

- Effects of alopecia on body image; discuss feelings about body changes

Black Box Warning: Extravasation (vesicant): local irritation, pain, burning, necrosis at injection site; discontinue and start at another site.

- **Stomatitis:** oral mucosa for ulceration, burning, bleeding; may lead to inability to eat and swallow
- GI symptoms: frequency of stools, cramping
- **Pregnancy/breastfeeding:** Women of reproductive potential should avoid becoming pregnant during therapy and should be advised to use effective contraceptive methods. If a woman becomes pregnant during therapy, she should be advised of the potential risks to the fetus. There is potential for male-mediated teratogenicity. Men with sexual partners of reproductive potential should use effective contraceptive methods during and after therapy. Men or women who receive this product may have a risk of infertility. Women treated may develop irreversible amenorrhea or premature menopause; discontinue breastfeeding or discontinue product

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture; new hair growth occurs in ≤3 mo after treatment
- To avoid crowds, persons with infections when granulocyte count is low
- To avoid vaccinations because reactions may occur; to avoid cimetidine during therapy
- That urine may appear red for 2 days
- To avoid OTC medications, supplements unless approved by prescriber

Black Box Warning: That irreversible myocardial damage, leukopenia, menopause may occur

- To report rapid heartbeat, trouble breathing, fever, nausea, vomiting, oral sores
- To report pain at site immediately

• **Pregnancy/breastfeeding:** that contraceptive measures are recommended during therapy and for 4 mo thereafter for men and women; not to breastfeed

eplerenone (Rx)

(ep-ler-ee′known)

Inspra

Func. class.: Antihypertensive

Chem. class.: Selective aldosterone receptor antagonist

Do not confuse:
Inspra/Spiriva

ACTION: Binds to mineralocorticoid receptor and blocks the binding of aldosterone, a component of the renin-angiotensin-aldosterone system (RAAS)

USES: Hypertension, alone or in combination with thiazide diuretics, HF, post-MI

CONTRAINDICATIONS: Hypersensitivity; increased serum creatinine >2 mg/dL (male), >1.8 mg/dL (female); potassium >5.5 mEq/L, type 2 diabetes with microalbuminuria, hepatic disease, CCr <30 mL/min; CCr <50 mL/min in hypertension

Precautions: Pregnancy, breastfeeding, children, geriatric patients, impaired renal/hepatic function, hyperkalemia

DOSAGE AND ROUTES

Hypertension

• **Adult: PO** 50 mg/day initially, may increase to 50 mg bid after 4 wk, max 100 mg/day; 25 mg/day max if patient is taking CYP3A4 inhibitors

HF or post-MI

• **Adult: PO** 25 mg/day initially, may increase to 50 mg/day max after 4 wk

Renal dose

• **Adult: PO** CCr <30 mL/min: contraindicated; CCr <50 mL/min for HTN: contraindicated; CCr 30-49 mL/min for HF: 25 mg every other day, max 25 mg daily

Dosage adjustments for those receiving moderate CYP3A4 inhibitors

• Potassium level <5 mEq/L, increase from 25 mg every other day to 25 mg daily, or increase dose from 25 mg daily to 50 mg daily; potassium level 5 to 5.4 mEq/L no adjustment; potassium level 5.5 to 5.9 mEq/L, decrease dose from 50 mg to 25 mg, or decrease dose from 25 mg daily to 25 mg every other day; if dose was 25 mg every other day, withhold dose; if potassium is >6 mEq/L, withhold; may restart drug at 25 mg every other day when potassium level is <5.5 mEq/L

Available forms: Tablets 25, 50 mg

Administer:

• Without regard to food
• Do not use salt substitutes containing potassium
• Store in tight container at ≤86°F (30°C)

SIDE EFFECTS

CNS: Headache, *dizziness, fatigue*

CV: Angina, MI

GI: Increased GGT, *diarrhea,* abdominal pain, increased ALT

GU: Gynecomastia, mastodynia (males), abnormal vaginal bleeding

META: *Hyperkalemia,* hyponatremia, hypercholesteremia, hypertriglyceridemia, increased uric acid

RESP: *Cough*

PHARMACOKINETICS

Peak $1^1/_2$ hr; serum protein binding 50%; half-life 4-6 hr; metabolized in liver by CYP3A4; excreted in urine <5%, feces

INTERACTIONS

Increase: hyperkalemia—ACE inhibitors, angiotensin II antagonists, NSAIDs, potassium supplements, potassium-sparing diuretics; do not use together

Increase: serum levels of lithium; monitor lithium level

Increase: eplerenone levels—erythromycin, fluconazole, verapamil; reduce dose of eplerenone

Increase: levels of eplerenone—CYP3A4 inhibitors (ketoconazole, itraconazole, saquinavir, clarithromycin, imatinib, nelfinavir,

nefazodone, ritonavir, troleandomycin); do not use concurrently or reduce dose of eplerenone

Decrease: antihypertensive effect—NSAIDs

Drug/Herb

Decrease: antihypertensive effect—ephedra, St. John's wort

Drug/Food

- Grapefruit, grapefruit juice—increase product level by 25%
- Do not use salt substitutes containing potassium

Drug/Lab Test

Increase: BUN, creatinine, potassium, cholesterol, lipids, uric acid, ALT, BUN, GGT

Decrease: sodium

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P at peak/trough level of product, orthostatic hypotension, syncope when used with diuretic; monitor lithium level in those also taking lithium; those on CYP3A4 inhibitor should monitor potassium at baseline, within first wk, at 1 mo, and more often in diabetes, renal disease
- **Renal studies:** protein, BUN, creatinine; LFTs, uric acid may be increased; contraindicated in CCr <30 mL/min
- Potassium levels; hyperkalemia may occur
- **Pregnancy/breastfeeding:** use in pregnancy only if clearly needed; may be excreted in breast milk; do not breastfeed

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- Not to discontinue product abruptly
- Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes containing potassium without consulting prescriber
- To comply with dosage schedule, even if feeling better
- That product may cause dizziness, fainting, light headedness; may occur during first few days of therapy
- How to take B/P and about normal readings for age group

⚠ HIGH ALERT

epoetin alfa (Rx)

(ee-poe′e-tin)

Epogen, Eprex, Procrit

epoetin alfa epbx (Rx)

Retacrit

Func. class.: Antianemic

Chem. class.: Amino acid polypeptide

ACTION: Erythropoietin is a factor controlling the rate of red cell production; product is developed by recombinant DNA technology

USES: Anemia caused by reduced endogenous erythropoietin production, in end-stage renal disease; to correct hemostatic defect in uremia; anemia due to AZT treatment in patients with HIV or those receiving chemotherapy; reduction of allogenic blood transfusion in surgery patients

Unlabeled uses: Anemia in premature preterm infants, anemia due to ribavirin and interferon-alfa therapy in hepatitic C

CONTRAINDICATIONS: Hypersensitivity to mammalian-cell–derived products, human albumin; uncontrolled hypertension

Precautions: Pregnancy, breastfeeding, children <1 mo, seizure disorder; multidose preserved formulation contains benzyl alcohol and should not be used in premature infants; porphyria, CV disease, hemodialysis, latex allergy, hypertension, history of CABG

Black Box Warning: HB >11 g/dL, surgery, neoplastic disease

DOSAGE AND ROUTES

Anemia due to chronic kidney disease to decrease the need for red blood cell transfusion

- **Adults: IV/SUBCUT** 50-100 units/kg/dose or 3 times weekly initially; for patients on dialysis, administer IV. For patients on dialysis, initiate treatment when hemoglobin (Hgb) is less than 10 g/dL

• **Adolescents 17 years: IV/SUBCUT** 50-100 units/kg/dose 3 times weekly initially; for patients on dialysis, administer IV. For patients on dialysis, initiate treatment when hemoglobin (Hgb) is less than 10 g/dL. If Hgb approaches or exceeds 11 g/dL, reduce or interrupt the dose

• **Infants, children, and adolescents 1 mo to 16 yr:** 50 units/kg/dose IV or SUBCUT 3 times weekly initially; for patients on dialysis, administer IV. Initiate treatment when hemoglobin (Hgb) is less than 10 g/dL. If Hgb approaches or exceeds 12 g/dL, reduce or interrupt the dose

To reduce the need for allogeneic red blood cell transfusions in patients with perioperative hemoglobin more than 10 g/dL to 13 g/dL scheduled to undergo elective, noncardiac, nonvascular surgery who are at high risk for perioperative blood loss and who are NOT willing to donate autologous blood preoperatively

• **Adults: SUBCUT** 300 units/kg/day for 10 days prior to surgery, on the day of surgery, and for 4 days after surgery (15 days total) plus deep vein thrombosis (DVT) prophylaxis

Zidovudine-induced anemia in HIV-infected patients with circulating endogenous erythropoietin concentrations of 500 mUnits/mL or less who are receiving a dose of zidovudine of 4200 mg/week or less

• **Adults: SUBCUT/IV** Initially, 100 units/kg/dose 3 times weekly. If Hgb does not increase after 8 wk, increase by 50-100 units/kg/dose at 4- to 8-wk intervals until Hgb is at a concentration to avoid RBC transfusions or a dose of 300 units/kg is reached. If the Hgb is more than 12 g/dL, withhold epoetin and once Hgb is less than 11 g/dL, resume at a dose 25% below the previous dose. Patients receiving zidovudine with endogenous serum erythropoietin levels more than 500 mUnits/mL are unlikely to respond to epoetin alfa treatment

Anemia in nonmyeloid malignancies where the anemia is due to the effect of chemotherapy and at least 2 additional mo of chemotherapy are planned

• **Adults: SUBCUT** 150 units/kg/dose 3 times weekly or 40,000 units once weekly only when the hemoglobin (Hgb) is less than 10 g/dL and only until the chemotherapy course is completed. Adjust the dose to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions

• **Children and adolescents 5-17 yr: IV** 600 units/kg/dose weekly only when the hemoglobin (Hgb) is less than 10 g/dL and only until the chemotherapy course is completed. Adjust the dose to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions

To reduce the need for allogeneic red blood cell transfusions in patients with perioperative hemoglobin more than 10 g/dL to 13 g/dL scheduled to undergo elective, noncardiac, nonvascular surgery who are at high risk for perioperative blood loss and who are NOT willing to donate autologous blood preoperatively

• **Adults: SUBCUT** 300 units/kg/day for 10 days prior to surgery, on the day of surgery, and for 4 days after surgery (15 days total) plus deep vein thrombosis (DVT) prophylaxis

Available forms: Injection 2000, 3000, 4000, 10,000, 20,000, 40,000 units/mL

Administer:

• Use 1 single-use vial/dose, once syringe has entered single-dose vial, sterility cannot be guaranteed, do not administer with other product, multidose vials can be stored in refrigerator up to 21 days once opened, do not use if discolored or particulates are present

SUBCUT route

• Before injecting, preservative-free, single-dose formulation may be admixed using 0.9% NaCl with benzyl alcohol 0.9% at a 1:1 ratio to reduce injection site discomfort, store solution in refrigerator, protect from light

Direct IV route

• Additional heparin to lower chance of clots

• By direct injection or bolus into IV tubing or venous line at end of dialysis; do not shake vial; can use undiluted or diluted in 0.9% NaCl (1000-40,000 U/mL); give over ≥1 min

• Decrease dose by 25% if Hb increases by 1 g/dL in 2 wk; increase dose if Hb does not increase by 5-6 pts after 8 wk of therapy; suggested target Hb range 30%-36%

Solution compatibilities: Do not dilute or administer with other solutions

SIDE EFFECTS

CNS: Seizures, coldness, sweating, headache, fatigue, dizziness
CV: *Hypertension,* hypertensive encephalopathy, HF, edema, DVT, MI, stroke
INTEG: Pruritus, rash, injection site reaction
MISC: Iron deficiency
MS: Bone pain, arthralgia, myalgia
RESP: Cough

PHARMACOKINETICS

IV: Metabolized in body, extent of metabolism unknown, onset of increased reticulocyte count 2-6 wk, peak immediate
Subcut: Peak 5-24 hr

INTERACTIONS

• Need for increased heparin during hemodialysis

NURSING CONSIDERATIONS

Assess:

• Renal studies: urinalysis, protein, blood, BUN, creatinine; I&O, electrolytes, report drop in output <50 mL/hr

Black Box Warning: Blood studies: ferritin, transferrin, serum iron monthly; transferrin sat ≥20%, ferritin ≥100 ng/mL; Hct 2×/wk until stabilized in target range (30%-36%) then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to product; monitor Hct 2×/wk with chronic renal failure; patients treated with zidovudine or patients with cancer should be monitored weekly, then periodically after stabilization; death may occur with Hb >12 g/dL; monitor for blood clots

• B/P; check for rising B/P as Hct rises, antihypertensives may be needed; hypertension may occur rapidly, leading to hypertensive encephalopathy, use of antihypertensive may be needed

• CNS symptoms: coldness, sweating, pain in long bones; for seizures if Hct is increased within 2 wk by 4 points

• Hypersensitivity reactions: skin rashes, urticaria (rare), antibody development does not occur

• **Pure cell aplasia (PRCA)** in absence of other causes; evaluate by testing sera for recombinant erythropoetin antibodies; any loss of response to epoetin should be evaluated

• Dialysis patients: thrill, bruit of shunts; monitor for circulation impairment

• **Seizures:** place patient on seizure precautions if increase of 1 g/dL Hct in any 2-wk period, increased B/P; more common in chronic renal failure during the first 90 days of treatment

• **Pregnancy/breastfeeding:** product should be used during pregnancy only when benefits outweigh fetal risk. Multidose vials are contraindicated due to the use of benzyl alcohol as a preservative; it is not known whether epoetin alfa is distributed into breast milk

Evaluate:

• Therapeutic response: increase in reticulocyte count in 2-6 wk, Hb/Hct; increased appetite, enhanced sense of well-being

Teach patient/family:

• How to take B/P, have patient read the "Medication Guide"; a form must be signed before each cycle

• To avoid driving or hazardous activities during beginning of treatment

• To take iron supplements, vitamin B_{12}, folic acid as directed

• To report immediately chest pain, pain in calves, confusion, inability to speak, numbness in face, arm, leg

• **Chronic renal failure (anemia):** product does not cure condition, to maintain prescribed diet, medications, dialysis follow-up appointments

• **Pregnancy/breastfeeding:** to report if pregnancy is planned or suspected or if breastfeeding

• The reason for treatment, expected results, to notify health care professional of use

⚠ HIGH ALERT

eptifibatide (Rx)

(ep-tih-fib′ah-tide)

Integrilin

Func. class.: Antiplatelet agent

Chem. class.: Glycoprotein IIb/IIIa inhibitor

ACTION: Platelet glycoprotein antagonist; this agent reversibly prevents fibrinogen, von Willebrand's factor from binding to the glycoprotein IIb/IIIa receptor, thus inhibiting platelet aggregation

USES: Acute coronary syndrome including those undergoing percutaneous coronary intervention (PCI)

CONTRAINDICATIONS: Hypersensitivity, active internal bleeding; recent history of bleeding, stroke within 30 days or any hemorrhagic stroke; major surgery with severe trauma, severe hypertension, current or planned use of another parenteral GP IIb/IIIa inhibitor, dependence on renal dialysis, coagulopathy, AV malformation, aneurysm

Precautions: Pregnancy, breastfeeding, children, geriatric patients, bleeding, impaired renal function

DOSAGE AND ROUTES

Acute coronary syndrome

- **Adult: IV BOLUS** 180 mcg/kg as soon as diagnosed, max 22.6 mg, then **IV CONTINUOUS** 2 mcg/kg/min until discharge or CABG; in CABG discontinue ≥2-4 hr prior to procedure; max infusion rate 15 mg/hr

PCI in patients without acute coronary syndrome

- **Adult: IV BOLUS** 180 mcg/kg given immediately prior to PCI, then 2 mcg/kg/min × 18 hr **CONTINUOUS IV INFUSION** and a second 180-mcg/kg bolus by 10 min after first bolus; continue infusion for up to 18-24 hr, minimum 12 hr; max infusion rate 15 mg/hr

Renal dose

- **Adult: IV** maintenance CCr <50 mL/min, 1 mcg/kg/min, max rate 7.5 mg/hr; CCr <10 mL/min, contraindicated

Available forms: Solution for injection 2 mg/mL (10 mL), 0.75 mg/mL (100 mL)

Administer:

- Aspirin may be given with this product; check for bleeding
- D/C heparin prior to removing femoral artery sheath, after PCI
- Do not give discolored solutions, those with particulates; discard unused amount, protect from light
- Discontinue product prior to CABG

Direct IV route

- After withdrawing bolus dose from 20 mg/10 mL (2 mg/mL) vial, give IV push over 1-2 min

Continuous IV INFUSION route

- Follow bolus dose with continuous infusion using pump; give product undiluted directly from 100-mL vial, spike 100-mL vial with vented infusion set, use caution when centering spike on circle of stopper top, refrigerate vials, or may store vials ≤2 mo at room temperature

Y-site compatibilities: Alfentanil, alteplase, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cycloSPORINE, DAPTOmycin, dexamethasone, D_5/NaCl 0.9%, diazepam, dilTIAZem, diphenhydrAMINE, DOBUTamine, dolasetron, DOPamine, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, fosphenytoin, ganciclovir, gatifloxacin, gentamicin, granisetron, haloperidol, heparin,

E

hydrocortisone, HYDROmorphone, hydrOXYzine, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mivacurium, morphine, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, NS, octreotide, ofloxacin, ondansetron, oxytocin, palonosetron, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, rocuronium, sodium bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vecuronium, verapamil, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Stroke, hypotension
GU: Hematuria
HEMA: Thrombocytopenia, platelet dysfunction
SYST: Major/minor bleeding from any site, anaphylaxis

PHARMACOKINETICS

Onset within 1 hr, protein binding 25%, half-life 1.5-2 hr, steady-state 4-6 hr, metabolism limited, excretion via kidneys

INTERACTIONS

- Do not give with glycoprotein inhibitors IIb, IIIa

Increase: bleeding—aspirin, heparin, NSAIDs, anticoagulants, ticlopidine, clopidogrel, dipyridamole, thrombolytics, valproate, abciximab, SSRIs, SNRIs
Drug/Herb
Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, ginseng

NURSING CONSIDERATIONS

Assess:

- **Renal disease:** reduce dose if CCr >50; contraindicated in dialysis
- **Thrombocytopenia:** platelets, Hb, Hct, creatinine, APTT baseline within 6 hr of loading dose, daily therafter, patients undergoing PCI should have ACT monitored; maintain APTT 50-70 sec unless PCI to be performed; during PCI, ACT should be 200-300 sec; if platelets drop <100,000/mm^3, obtain additional platelet counts; if thrombocytopenia is confirmed, discontinue product; draw Hct, Hb, serum creatinine
- **Bleeding:** gums, bruising, ecchymosis, petechiae; from GI, GU tract, cardiac cath sites, IM injection sites
- **Pregnancy/breastfeeding:** use in pregnancy only if clearly needed; it is not known if product is excreted in breast milk; consider risks and benefits

Teach patient/family:

- About reason for medication and expected results
- To report bruising, bleeding, chest pain immediately
- Not to use other Rx, OTC products or supplements without prescriber approval

eptinezumab-jjmr (Rx)

(ep'ti-nez'ue-mab)

Vyepti

Func. class.: Antimigraine agent
Chem. class.: Calcitonin gene–related peptide receptor antagonist

ACTION: A humanized monoclonal antibody, binds to calcitonin gene–related peptide ligand and blocks binding to the receptor

USES: Prevention of migraine

CONTRAINDICATIONS: Serious hypersensitivity
Precautions: Pregnancy, breastfeeding

DOSAGE AND ROUTES

Migraine prophylaxis

- **Adult: IV:** 100 mg q3mo; may use 300 mg q3mo

Available forms: solution, preservative free 100 mg/mL (1 mL)
Administer:
Intermittent IV infusion
- Contains polysorbate 80
- Dilute in 100 mL NS; infusion bags must be made of polyvinyl chloride, polyethylene, polyolefin; mix by gentle inverting; do not shake, discard unused portion; 100-mg dose: Withdraw 1 mL eptinezumab/100 mL NS (1 mg/mL); 300-mg dose: Withdraw 1 mL eptinezumab from 3 vials/100 mL NS (3 mg/mL)
- Run over 30 min using an infusion set with a 0.2 or 0.22 micron in-line or add-on sterile filter; do not give IV push/bolus
- Do not admix or infuse other medications in same infusion set
- After infusion, flush line with 20 mL NS
- Store intact vial at 2°C to 8°C (36°F to 46°F), protect from light, do not freeze; diluted solution may be stored at room temperature, infuse within 8 hr

SIDE EFFECTS
MISC: Antibody development
RESP: Nasopharyngitis
CNS: Fatigue
GI: Nausea
INTEG: Hypersensitivity, angioedema

PHARMACOKINETICS: Onset
1 day, peak infusion's end, duration unknown, half-life 27 days

INTERACTIONS: None known

NURSING CONSIDERATIONS
Assess:
- **Migraine:** Baseline and periodically, presence of aura, nausea/vomiting
- Assess for hypersensitivity, dyspnea; reaction may be delayed, discontinue if these occur

Evaluate:
- Therapeutic response: Prevention of migraine

Teach patient/family:
- Reason for product and expected result
- Identify if pregnancy is planned or suspected

eravacycline (Rx)
(er´a-va-sye´kleen)
Xerava
Func. class.: Antibiotic—tetracycline
Chem. class.: Synthetic fluorocycline

E

ACTION: Disrupts bacterial protein
synthesis by binding to the 30S ribosomal subunit and preventing the incorporation of amino acid residues into elongating peptide chains

USES: Complicated intraabdominal
infections caused by *Bacteroides caccae, Bacteroides fragilis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides uniformis, Bacteroides vulgatus, Citrobacter freundii, Citrobacter koseri, Clostridium perfringens, Enterobacter aerogenes, Enterobacter cloacae, Enterococcus faecalis, Enterococcus faecium, Escherichia coli, Klebsiella oxytoca, Klebsiella pneumoniae, Parabacteroides distasonis, Staphylococcus aureus* (MRSA), *Staphylococcus aureus* (MSSA), *Streptococcus anginosus, Streptococcus salivarius*

CONTRAINDICATIONS: Hypersensitivity to this product or tetracyclines
Precautions: Breastfeeding, children, colitis, diarrhea, geriatric patients, GI/hepatic disease, increased intracranial pressure, inflammatory bowel disease/ulcerative colitis, papilledema, pregnancy, CDAD, UV exposure

DOSAGE AND ROUTES
- **Adult: IV** 1 mg/kg q12hr × 4-14 days

Available forms: Powder for injection 50 mg
Administer:
Intermittent IV INFUSION route
- Visually inspect for particulate matter and discoloration prior to use; reconstituted solution is clear, pale yellow to orange
- **Reconstitution:** Reconstitute each vial with 5 mL of sterile water for injec-

tion to a concentration of 10 mg/mL; swirl until powder has dissolved; avoid shaking or rapid movement. Do not give reconstituted solution by direct injection

• **Dilution:** Withdraw the full or partial reconstituted content from each vial and add it into a 0.9% sodium chloride for injection infusion bag to a concentration of 0.3 mg/mL (within a range of 0.2-0.6 mg/mL). Do not shake

• **Storage:** Diluted solution must be infused within 6 hr if stored at room temperature 77°F (max 25°C) or within 24 hr if stored refrigerated at 36°F-46°F (2°C-8°C). Do not freeze

Intermittent IV infusion

• Infuse through a dedicated IV line or by Y-site. If the same IV line is used for sequential infusion of several drugs, flush the line prior to and after infusion with 0.9% sodium chloride for injection. Give over 60 min; assess IV site frequently

SIDE EFFECTS

CV: Hypotension
EENT: Tooth discoloration
GI: Nausea, vomiting, diarrhea, pancreatitis, *Clostridium difficile*
HEMA: Thrombosis
INTEG: Rash
RESP: Pleural effusion
SYST: Anaphylaxis, wound dehiscence

PHARMACOKINETICS

Metabolized primarily by CYP3A4- and FMO-mediated oxidation, excretion 47% feces, 34% urine, half-life 20 hr

INTERACTIONS

Increase: anticoagulation—anticoagulants; anticoagulant may need dosage reduction
Increase: eravacycline effect—strong CYP3A inducers (clarithromycin, telithromycin, nefazodone, itraconazole, ketoconazole, atazanavir, darunavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir, tipranavir)
Decrease: eravacycline effect—strong CYP3A inducers (carBAMazepine, rifAMPin)

NURSING CONSIDERATIONS

Assess:

• **Infection:** fever, condition of wound, pain, vital signs, urine, stools; monitor WBC for increased levels indicating continued infection; obtain C&S prior to starting treatment, may start product prior to receiving results

• **Bowel function:** diarrhea with mucus, blood; may indicate CDAD (*Clostridium difficile*–associated disease); report to health care provider immediately; may occur several weeks after last dose

• **Wound dehiscence:** fever, inflammation, bleeding, pain, wound opening; report any of these signs immediately

• **Anaphylaxis:** rash, dyspnea, swelling of lips/tongue; discontinue product; if severe, EPINEPHrine is usually given; if allergic reaction is mild, discontinuing product and giving diphenhydramine may be sufficient

• **Tooth discoloration:** may occur if used in second or third trimester of pregnancy or in children <8 yr

Teach patient/family:

• To inform health care provider of all OTC, Rx, herbal and supplemental products taken; not to change medication without prescriber's approval

• **Pregnancy/breastfeeding:** to inform health care provider if pregnancy is planned or suspected, or if breastfeeding; that this product may cause permanent tooth discoloration and reversible inhibition of bone growth when used in the second and third trimesters of pregnancy; not to breastfeed during and for 4 days after last dose

• **Allergic reactions:** to identify allergies; that allergic reactions, including serious ones, could occur and that serious reactions require immediate treatment. Ask patient about any previous allergies

• **Diarrhea:** to report watery and bloody stools (with or without stomach cramps and fever), which may be a serious intestinal infection, even 2 or more mo after last dose

• That this product is used only to treat bacterial infections; to take all of the medication even if feeling better; not to skip doses or fail to complete the full course of therapy

erdafitinib (Rx)

(er′-duh-fih′-tih-nib)

Balversa

Func. class.: Antineoplastic-kinase inhibitor

Chem. class.: Fibroblast growth factor receptor (FGFR) inhibitors

ACTION: Inhibits the enzymatic activity of FGFR1, FGFR2, FGFR3, and FGFR4

USES: Locally advanced or metastatic urothelial carcinoma

DOSAGE AND ROUTES

• **Adult: PO** 8 mg daily; after 14 to 21 days of treatment, increase to 9 mg daily if serum phosphate level is <5.5 mg/dL and there are no ocular disorders or grade 2 or higher adverse reactions; continue treatment until disease progression or unacceptable toxicity

Available forms: Tablets 3, 4, 5 mg

Administer:

• Swallow tablets whole, with or without food

• If vomiting occurs, do not replace the dose; the next dose should be taken the next day

• If a dose is missed, it can be taken as soon as possible on the same day; do not take extra tablets to make up for the missed dose; resume the regular daily schedule on the next day

SIDE EFFECTS

GI: Abdominal pain, nausea, vomiting, anorexia, constipation, diarrhea

CNS: Fatigue, fever

EENT: Stomatitis, blurred vision, retinal detachment

INTEG: Rash, nail discoloration

META: Hyperglycemia, hyper-hypophosphatemia, hypomagnesemia, hyponatremia, hypoalbuminemia

HEMA: Leukopenia, anemia, thrombocytopenia

SYST: Infection

PHARMACOKINETICS

99.8% protein bound to alpha-1-acid glycoprotein; half-life 59 hr; 69% excreted in feces (19% unchanged) and 19% in urine (13% unchanged), metabolized by CYP2C9 (39%) and CYP3A4 (20%); an inhibitor of OCT2; peak 2.5 hr

INTERACTIONS

Avoid use with CYP3A4 inducers, inhibitors

NURSING CONSIDERATIONS

Assess:

• **Ocular disease:** Provide dry eye prophylaxis with ocular demulcents as needed; perform monthly ophthalmologic examinations during the first 4 months of treatment and every 3 months thereafter, and urgently at any time for visual disturbance; examinations should include an assessment of visual acuity, slit-lamp examination, fundoscopy, and optical coherence tomography; an interruption of therapy, discontinuation of therapy, or dose reduction may be necessary for ocular adverse reactions

• **Infection:** Assess for infection (fever, flulike symptoms)

• Avoid coadministration with agents that alter serum phosphate levels prior to the initial dose increase period (days 14 to 21); monitor phosphate levels monthly for hyperphosphatemia and follow dose modification guidelines when required; in patients with hyperphosphatemia, restrict phosphate intake to 600 to 800 mg daily; if serum phosphate is >7 mg/dL, consider adding an oral phosphate binder until the serum phosphate level returns to less than 5.5 mg/dL

• **Pregnancy/breastfeeding:** Pregnancy should be avoided during and for at least 1 mo after the last dose; obtain pregnancy testing before use

Evaluate:
• Therapeutic response: decreased progression of cancer
Teach patient/family:
• About the reproductive risk and contraception requirements during treatment; men with female partners of reproductive potential should also use effective contraception during treatment and for 1 mo after the last dose; not to breastfeed during and for 1 mo after last dose
• Ophthalmic examinations will be needed periodically

erenumab-aooe (Rx)

(e-ren'ue-mab)

Aimovig

Func. class.: CNS analgesic; antimigraine agent
Chem. class.: IgG2 monoclonal antibody

ACTION: A human immunoglobulin G2 (IgG2) monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor. CGRP is involved in migraine pathophysiology

USES: For the preventive treatment of migraine in adults

CONTRAINDICATIONS: Hypersensitivity
Precautions: Breastfeeding, latex hypersensitivity, pregnancy

DOSAGE AND ROUTES

• **Adult: SUBCUT** 70 mg monthly, may use 140 mg monthly if needed
Available forms: SureClick 70 mg/mL autoinjector solution for injection; solution for injection single-use 70 mg/mL prefilled syringe
Administer:
Injectable administration
• Visually inspect for particulate matter and discoloration prior to use; do not use if solution is cloudy or discolored or contains flakes or particles; product should be a clear to opalescent, colorless to light yellow solution
Subcutaneous route
• Product is intended for patient self-administration
• Prior to use allow to warm to room temperature for at least 30 min, protected from direct sunlight
• Do not shake
• Clean injection site on the abdomen, thigh, or upper arm with an alcohol wipe; allow skin to dry
• Do not leave cap off the autoinjector or prefilled syringe for more than 5 min; product will dry out
• Do not inject into areas where skin is tender, bruised, red, or hard
• If using the same body area for the 2 separate injections needed for the 140-mg dose, ensure that the second injection is not at same location
• **Storage:** After removing the product from the refrigerator, it can be stored at room temperature between 68°F and 77°F (20°C and 25°C) for up to 7 days. Do not return to the refrigerator after room temperature
Single-dose, prefilled SureClick autoinjector
• When ready to inject, press the purple start button; a click will be heard, and the window will turn yellow
Single-dose prefilled syringe
• Using slow, constant pressure, push the plunger rod all the way down with thumb until the prefilled syringe stops moving
• When finished, release thumb, and gently lift syringe off skin

SIDE EFFECTS

MISC: Antibody formation, injection site reaction, erythema

PHARMACOKINETICS

SUBCUT route: Peak 6 days, bioavailability 82%, half-life 28 days

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess

• **Migraines:** time of day, aggravating and ameliorating effects, auras or halos, sensitivity to light, noise, diet
• **Pregnancy/breastfeeding:** data are lacking

Evaluate:
• Therapeutic response: decrease in severity and number of migraines

Teach patient/family
• To read the FDA-approved patient labeling (Patient Information and Instructions for Use)
• Proper SUBCUT administration technique, including aseptic technique, and how to use the single-dose prefilled autoinjector or single-dose prefilled syringe
• To read and follow the Instructions for Use with each use of Aimovig
• That if the 140-mg once-monthly dosage is prescribed, to administer it as 2 separate SUBCUT injections of 70 mg each
• **Latex sensitivity:** that the needle shield within the white cap of the Aimovig prefilled autoinjector and the gray needle cap of the Aimovig prefilled syringe contain dry natural rubber (a derivative of latex), which may cause allergic reactions in individuals sensitive to latex

ergotamine/caffeine (Rx)

Cafergot, Migergot

Func. class.: Ergot

USES: Prevention/treatment of vascular headache

DOSAGE AND ROUTES

• **Adult: PO** 2 tablets at beginning of headache, then 1 tablet q30 min, max 6 tablets per headache, max 10 tablets per wk; **suppository** 1 at beginning of headache, then another dose in 1 hr, max 2 suppositories/headache, max 5 suppositories/wk

Available forms: Tablets 1 mg-100 mg

⚠ HIGH ALERT

eriBULin (Rx)

(er′i-bu′lin)

Halaven

Func. class.: Antineoplastics—nontaxane

Chem. class.: Microtubule inhibitor

ACTION: Potent antimitotic agent, different from taxanes, vinca alkaloids, epothilones; blocks cell progression during G2-M phase; inhibits the growth phase of microtubules and sequesters tubules, leading to the disruption of mitotic spindles and apoptotic cell death

USES: Metastatic breast cancer in patients who have received at least 2 chemotherapy regimens

CONTRAINDICATIONS: Hypersensitivity, pregnancy

Precautions: Breastfeeding, neonates, infants, children, bradycardia, electrolyte imbalances, heart failure, hypokalemia, hypomagnesemia, infertility, neutropenia, peripheral neuropathy, QT prolongation, hepatic/renal disease

DOSAGE AND ROUTES

• **Adult: IV** 1.4 mg/m^2 over 2-5 min on days 1 and 8, repeat q21days
• **Recommendations for dose delay:** for ANC <1000/mm^3, platelets <75,000/mm^3, or grade 3 or 4 nonhematologic toxicities: do not administer; the day 8 dose may be delayed a maximum of 1 wk; for the day 8 dose, if toxicities do not resolve to ≤ grade 2 by day 15: omit the dose; for the day 8 dose, if toxicities resolve or improve to ≤ grade 2 by day 15: administer eriBULin at reduced dose (see later), initiate the next cycle no sooner than 2 wk later
• **Dose adjustments for hematologic toxicity:** ANC <500/mm^3 for >7 days or ANC <1000/mm^3 with fever or infection: permanently reduce dose to 1.1 mg/m^2; platelets <25,000/mm^3 or <50,000/mm^3

requiring transfusion: permanently reduce dose to 1.1 mg/m^2; if day 8 of previous cycle omitted or delayed: permanently reduce dose to 1.1 mg/m^2; while receiving 1.1 mg/m^2, if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed: permanently reduce dose to 0.7 mg/m^2; while receiving 0.7 mg/m^2, if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed: discontinue

Available forms: Solution for injection 1 mg/2 mL

Administer:

IV direct, intermittent route

- Visually inspect for particulate matter, discoloration; withdraw amount (0.5 mg/mL) from single-use vial, give undiluted over 2-5 min or diluted in 100 mL 0.9% NaCl and give as intermittent infusion; do not give through line with dextrose or any other product
- Store at room temperature for 4 hr or 24 hr refrigerated

SIDE EFFECTS

CNS: Depression, dizziness, *fatigue,* fever, headache, insomnia, *peripheral neuropathy*

CV: QT prolongation, peripheral edema

GI: Abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting, weight loss

HEMA: Anemia, neutropenia, thrombocytopenia

INTEG: *Alopecia,* rash, stomatitis, infusion-related reactions

META: Hypokalemia

MS: Arthralgia, myalgia, bone/back pain

RESP: Cough, dyspnea

SYST: Infection

PHARMACOKINETICS

Protein binding 49%-65%; inhibits CYP3A4; excreted in feces 82%; urine 9%; elimination half-life 40 hr; increased levels in hepatic/renal disease

INTERACTIONS

Increase: QT prolongation—arsenic trioxide, bepridil, chloroquine, certain phenothiazines (chlorproMAZINE, mesoridazine, thioridazine), clarithromycin, class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), class III antiarrhythmics (amiodarone, bretylium, dofetilide, ibutilide, sotalol), dextromethorphan; quiNIDine, dronedarone, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, pimozide, posaconazole, probucol, propafenone, saquinavir, sparfloxacin, troleandomycin, and ziprasidone; also to a lesser degree abarelix, alfuzosin, amoxapine, apomorphine, artemether; lumefantrine, asenapine, beta-agonists, ofloxacin, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, flecainide, gatifloxacin, gemifloxacin, halogenated anesthetics, iloperidone, lapatinib, levoFLOXacin, local anesthetics, lopinavir; ritonavir, magnesium sulfate; potassium sulfate; sodium sulfate, maprotiline, mefloquine, moxifloxacin, nilotinib, norfloxacin, octreotide, ciprofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, some phenothiazines (fluPHENAZine, perphenazine, prochlorperazine, trifluoperazine), QUEtiapine, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telavancin, telithromycin, tetrabenazine, tricyclic antidepressants, venlafaxine, vardenafil, vorinostat

Increase: adverse reactions—live virus vaccines; do not use together

NURSING CONSIDERATIONS

Assess:

- **Peripheral neuropathy:** pain, numbness in extremities
- **Infection:** increased temperature, sore throat, flulike symptoms
- **Electrolyte imbalances:** correct prior to administration; monitor during therapy
- **QT prolongation:** assess for drug interactions that may occur; monitor ECG, heart rate
- **Bone marrow depression:** CBC, differential, serum creatinine, BUN, electrolytes, LFTs at baseline, periodically; increased AST/ALT >3 × ULN or total bilirubin >1.5 × ULN involves greater chance of grade 4 or febrile neutropenia

• **Pregnancy/breastfeeding:** may cause fetal harm; do not use in pregnancy or breastfeeding

Teach patient/family:

• **Infection:** to notify prescriber of increased temperature, sore throat, fatigue, flulike symptoms

• **QT prolongation:** to report extra heartbeats

Peripheral neuropathy:

• To report tingling, pain in extremities

• About reason for product and expected results

• To avoid other medications, supplements unless approved by provider; serious drug interactions may occur

• About hair loss, use of wig or hairpiece

• To notify prescriber if pregnancy is planned or suspected; to use contraception during treatment; to avoid breastfeeding

⚠ HIGH ALERT

erlotinib (Rx)

(er-loe′tye-nib)

Tarceva

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Epidermal growth factor receptor inhibitor

ACTION: Not fully understood; inhibits intracellular phosphorylation of cell-surface receptors associated with epidermal growth factor receptors

USES: Non–small-cell lung cancer (NSCLC) including EGFR exon 19 deletions or exon 21 substitution mutations, pancreatic cancer

CONTRAINDICATIONS: Pregnancy, breastfeeding

Precautions: Children, geriatric patients, ocular/pulmonary/renal/hepatic disorders, diverticulitis

DOSAGE AND ROUTES

Non–small-cell lung cancer (NSCLC), maintenance, after failure of at least one chemotherapy regimen

• **Adult: PO** 150 mg/day

Pancreatic cancer

• **Adult: PO** 100 mg/day in combination with gemcitabine 1000 mg/m^2 cycle 1, days 1, 8, 15, 22, 29, 36, 43 of 8-wk cycle; cycle 2 and subsequent cycles, days 1, 8, 15 of 4-wk cycle, used with gemcitabine

CYP3A4 inducers concurrently (rifAMPin, phenytoin)

• Increase dose by 50 mg q2wk (max 450 mg/day)

CYP3A4 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, telithromycin, ritonavir, saquinavir, troleandomycin, nelfinavir) or CYP3A4 and CYP1A2 inhibitors concurrently (ciprofloxacin)

• Decrease dose by 50 mg as needed

Available forms: Tablets 25, 100, 150 mg

Administer:

• 1 hr prior to or 2 hr after food; at same time of day

SIDE EFFECTS

CNS: CVA, anxiety, depression, headache, rigors, insomnia

CV: MI/ischemia

EENT: Ocular changes, *conjunctivitis, eye pain,* hypertrichosis

GI: *Nausea, diarrhea, vomiting, anorexia, mouth ulceration,* hepatic failure, GI perforation

GU: Renal impairment/failure

HEMA: Deep vein thrombosis, bleeding

INTEG: *Rash,* Stevens-Johnson–like skin reaction, toxic epidermal necrolysis

MISC: *Fatigue, infection*

RESP: Interstitial lung disease, *cough, dyspnea*

SYST: Hepatorenal syndrome

PHARMACOKINETICS

Slowly absorbed (60%); peak 3-7 hr; duration up to 24 hr; excreted in feces (86%), urine (<4%); metabolized by CYP3A4; half-life 36 hr; protein binding 93%; inhibits tyrosine kinase, which is a factor in epidermal growth factor receptor (EGFR)

INTERACTIONS

Increase: GI bleeding, may be fatal—warfarin, NSAIDs

Increase: erlotinib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin, telithromycin)

Increase: plasma concentrations of warfarin, metoprolol

Increase: myopathy—HMG-CoA reductase inhibitors

Decrease: erlotinib levels—CYP3A4 inducers (phenytoin, rifAMPin, carBAMazepine, PHENobarbital), proton pump inhibitors

Drug/Herb

Decrease: erlotinib levels—St. John's wort

Drug/Smoking

Decrease: erlotinib level; dose may need to be increased

Drug/Food

Increase: effect of erlotinib—grapefruit juice

Drug/Lab Test

Increase: INR, PT, AST, ALT, bilirubin

NURSING CONSIDERATIONS

Assess:

- **Serious skin toxicities:** toxic epidermal necrolysis, Stevens-Johnson syndrome; check for rash, blistering; discontinue treatment, may need corticosteroids, antiinfectives
- **MI/ischemia, CVA** in patients with pancreatic cancer
- **Pulmonary changes:** lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed
- **Ocular changes:** eye irritation, corneal erosion/ulcer, aberrant eyelash growth, discontinue if ulcers are present in the cornea, hold for keratitis (grade 3 or 4)
- GI symptoms: frequency of stools; if diarrhea is poorly tolerated, therapy may be discontinued for ≤14 days, monitor for dehydration, fluid status during period of vomiting and diarrhea, may use antidiarrheal
- Blood studies: INR, LFTs, PT; elevated INR and hemorrhage are increased when used with warfarin
- **Hepatic failure:** interrupt if severe changes to liver function occur (total bilirubin >3× ULN and/or transaminases >5× ULN when normal pretreatment LFTs)
- **GI perforation/bleeding:** some cases have been fatal; usually occurs in those using NSAIDs, taxanes, or in those with diverticulitis or peptic ulcer disease; discontinue if these occur
- **Pregnancy/breastfeeding:** do not use in pregnancy or for 1 mo after last dose; do not breastfeed during or for 2 wk after final dose

Evaluate:

- Therapeutic response: decrease in NSCLC cells, pancreatic cancer cells

Teach patient/family:

- **To report adverse reactions immediately:** SOB, severe abdominal pain, persistent diarrhea or vomiting, ocular changes, skin eruptions (face, upper chest/back)
- About reason for treatment, expected results; to take on empty stomach 1 hr prior to or 2 hr after meals
- To use sunscreen, protective clothing to prevent sunburn
- To avoid use with other products, herbs, supplements unless approved by provider, not to use with grapefruit or grapefruit juice
- To avoid smoking; decreases effect of this product
- **Pregnancy/breastfeeding:** To use reliable contraception during treatment; to avoid breastfeeding

ertapenem (Rx)

(er-tah-pen′em)

INVanz

Func. class.: Antiinfective—miscellaneous

Chem. class.: Carbapenem

Do not confuse:

INVanz/AVINza

ACTION: Interferes with cell-wall replication of susceptible organisms; bactericidal

USES: *Bacteroides distasonis, Bacteroides fragilis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides uniformis, Bacteroides vulgatus, Citrobacter freundii, Citrobacter koseri, Clostridium clostridioforme, Clostridium perfringens, Enterobacter aerogenes, Enterobacter cloacae, Escherichia coli, Eubacterium lentum, Fusobacterium* sp., *Haemophilus influenzae* (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Haemophilus parainfluenzae, Klebsiella oxytoca, Klebsiella pneumoniae, Moraxella catarrhalis, Morganella morganii, Peptostreptococcus* sp., *Porphyromonas asaccharolytica, Prevotella bivia, Proteus mirabilis, Proteus vulgaris, Providencia rettgeri, Providencia stuartii, Serratia marcescens, Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Streptococcus agalactiae* (group B streptococci), *Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci); bacteremia, community-acquired pneumonia, diabetic foot ulcer, endometritis, GYN/intraabdominal skin/skin structure/urinary tract infections, surgical infection prophylaxis

CONTRAINDICATIONS: Hypersensitivity to this product, its components, amide-type local anesthetics (IM only); anaphylactic reactions to beta-lactams, other carbapenems

Precautions: Pregnancy, breastfeeding, children, geriatric patients, GI/renal/hepatic disease, seizures

DOSAGE AND ROUTES

- **Adult/child ≥13 yr: IM/IV** 1 g/day × 14 days (IV), 7 days (IM)
- **Infant/child 3 mo-12 yr: IM/IV** 15 mg/kg q12hr (max 1 g/day) × 5-14 days

Renal dose

- **Adult: IM/IV** CCr ≤30 mL/min 500 mg daily

Available form: Powder, lyophilized, 1 g/vial

Administer:

IM route

- Reconstitute 1-g vial of ertapenem with 3.2 mL of 1% lidocaine HCl injection (without EPINEPHrine) (280 mg/mL), agitate; the IM reconstituted formulation is not for IV use
- IM may be used as an alternative to IV administration in the treatment of infections where IM therapy is appropriate; only give via IM injection × 7 days
- **For a 1-g dose:** immediately withdraw the contents of the vial and inject deeply into a large muscle, aspirate prior to injection to avoid injection into a blood vessel
- **For a dose <1 g (for pediatric patients 3 mo-12 yr):** immediately withdraw a volume equal to 15 mg/kg (max 1 g/day) and inject deeply into a large muscle, aspirate prior to injection to avoid injecting into a blood vessel; use the reconstituted IM solution within 1 hr after preparation

IV route

- Visually inspect for particulate matter and discoloration prior to use, may be colorless to pale yellow; do not mix with other products; dextrose solutions are not compatible
- **1-g vial:** For each gram reconstitute with 10 mL of either NS injection, sterile water for injection, or bacteriostatic water for injection to 100 mg/mL, shake
- **1 g dose:** Immediately transfer contents of the reconstituted vial to 50 mL of NS injection; for a dose <1 g (pediatric patients 3 mo-12 yr): from the reconstituted vial, immediately withdraw a volume equal to 15 mg/kg of body weight (max 1 g/day) and dilute in NS injection to a concentration of 20 mg/mL or less

Intermittent IV INFUSION route

- Complete the infusion within 6 hr of reconstitution, infuse over 30 min; do not co-infuse with other medications
- The reconstituted IV solution may be stored at room temperature if used within 6 hr, or store under refrigeration

for 24 hr and use within 4 hours after removal from refrigeration; do not freeze

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, milrinone, mitoMYcin, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymyxin B, potassium acetate/chloride/phosphates, procainamide, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Insomnia, seizures, dizziness, *headache,* agitation, confusion, somnolence, disorientation, edema, hypotension
CV: Tachycardia, seizures
GI: *Diarrhea, nausea, vomiting,* CDAD, abdominal pain
GU: *Vaginitis,* dysuria
INTEG: *Rash,* pain at injection site, *phlebitis/thrombophlebitis,* erythema at injection site, dermatitis
RESP: Dyspnea, cough, pharyngitis, crackles, respiratory distress
SYST: Anaphylaxis, angioedema

PHARMACOKINETICS

IV: Onset immediate; peak dose dependent; **IM:** Peak 2.3 hr half-life 4 hr; metabolized by liver; excreted in urine, feces, breast milk

INTERACTIONS

Increase: ertapenem levels—probenecid; do not coadminister
Decrease: effect of valproic acid; monitor valproic acid level, seizure control
Drug/Lab Test
Increase: hepatic enzymes, albumin, alkaline phosphatase, bilirubin, creatinine, PT
Decrease: Hct, WBC

NURSING CONSIDERATIONS

Assess:
- Renal disease: lower dose may be required
- **CNS symptoms:** for confusion, seizures; may increase seizure risk
- **CDAD:** bowel pattern, abdominal pain, mucus or blood in stools daily; if severe diarrhea occurs, product should be discontinued
- For infection: temperature, sputum, characteristics of wound, monitor WBC prior to, during, after treatment
- **Allergic reactions, anaphylaxis;** rash, urticaria, pruritus; may occur a few days after therapy begins; sensitivity to carbape-

nem antibiotics, other beta-lactam antibiotics, penicillins; have emergency equipment, epinephrine close by

- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough or sputum
- **Pregnancy/breastfeeding:** use only when clearly needed; use caution in breastfeeding

Evaluate:

- Therapeutic response: negative C&S; absence of signs, symptoms of infection

Teach patient/family:

- **CDAD:** to report severe diarrhea, CNS side effects
- **To report overgrowth of infection:** black, furry tongue; vaginal itching; foul-smelling stools
- **Pregancy/breastfeeding:** identify if pregnancy is planned or suspected or if breastfeeding to avoid breastfeeding; product is excreted in breast milk

TREATMENT OF OVERDOSE:

EPINEPHrine, antihistamines; resuscitate if needed (anaphylaxis)

ertugliflozin (Rx)

(er-too-gli-floe′-zin)

Steglatro

Func. class.: Antidiabetic

Chem. class.: Sodium-glucose cotransporter 2 inhibitors

ACTION:

An inhibitor of sodium-glucose cotransporter 2 (SGLT2), the transporter responsible for reabsorbing most of the glucose filtered by the tubular lumen in the kidney

USES: For the treatment of type 2 diabetes mellitus

DOSAGE AND ROUTES

For type 2 diabetes mellitus in combination with diet and exercise

- **Adult: PO** 5 mg/day in the morning, with or without food; max 15 mg/day

Renal dose

- **Adult: PO** CCr 30-60 mL/min/ 1.73 m^2, avoid use

Available forms: Tablets 5 mg, 15 mg

Administer:

- Administer daily in the morning, with or without food

E

CONTRAINDICATIONS

Hypersensitivity, severe renal disease

Precautions: Adrenal insufficiency, balanitis, breastfeeding, burns, children, dehydration, diabetic ketoacidosis, dialysis, fever, geriatric, hepatic disease, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypothyroidism, hypovolemia, infants, infection, lower limb amputation, malnutrition, pituitary insufficiency, pregnancy, pyelonephritis, renal disease, surgery, tissue necrosis, trauma, type 1 diabetes mellitus, UTI, vaginitis

SIDE EFFECTS

MS: Back pain

GU: Diuresis, dysuria, increased urinary frequency/urgency, nocturia, polyuria, renal failure, vaginitis, cystitis, dehydration

CNS: Headache, syncope

META: Hypercholesterolemia, hyperlipidemia, hyperphosphatemia, hypoglycemia, diabetic ketoacidosis

CV: Hypotension, hypovolemia, orthostatic hypotension

MISC: Infection, lower limb amputation, necrotizing fasciitis, orthostatic hypotension, pharyngitis, polydipsia, tissue necrosis, weight loss, candidiasis

PHARMACOKINETICS

Onset unknown, peak 1-2 hr, duration unknown, half-life 18.5 hr

INTERACTIONS

Increase: hypoglycemia—insulin, antidiabetes

Increase: urinary injury—ACE inhibitors, diuretics, NSAIDs, ARBs

Drug/Lab Test

Increase: LDL, cholesterol, Hb, serum creatinine, phosphate

Interference: Urine glucose, 1,5-AG assay

NURSING CONSIDERATIONS

Assess:

- Hypoglycemia (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucagon
- **Ketoacidosis:** monitor for increased ketone levels; may occur with any glucose level, more common in those with severe illnesses
- **Volume depletion:** monitor for orthostatic hypotension, weakness, dizziness; may occur after beginning treatment; correct volume depletion prior to starting treatment
- For stress, surgery, or other trauma that may require a change in dose
- **Diabetes:** A1c q3mo; monitor serum glucose 1 hr PP throughout treatment; serum cholesterol, serum creatinine/BUN, serum electrolytes
- **Bone fractures:** monitor bone density, other conditions that may lead to bone fractures; fractures may occur within 3 mo of starting therapy
- **Renal impairment:** monitor more frequently in those with renal disease; increased creatinine, eGFR may be decreased, BUN may occur

Black Box Warning: Lower limb amputation: increased risk of amputation; monitor wound and feet closely for complications

- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding

Evaluate:

- Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait

Teach patient/family:

- The symptoms of hypo/hyperglycemia, what to do about each
- That medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery; to take as soon as remembered if dose is missed unless close to next dose, then skip and take at next scheduled dose, do not double doses
- To avoid OTC medications and herbal supplements unless discussed with health care professional
- That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
- To carry emergency ID and glucose source
- That blood glucose monitoring is required to assess product effect
- **Hypersensitivity:** to notify prescriber immediately of itching, hives, rash, swelling of face/lips

Black Box Warning: Lower limb amputation risk: inspect feet; monitor for new ulcerations, wounds; educate about foot care

- **Ketoacidosis:** to notify prescriber immediately of nausea, vomiting, lack of appetite, sleepiness, difficulty breathing
- **Yeast infections (women/men):** that yeast infections can occur with this product (women, vaginal; men, penile); to report discharge, itching, swelling
- **Pregnancy/breastfeeding:** not to breastfeed; to advise prescriber if pregnancy is planned or suspected

ertugliflozin/ metformin (Rx)

(er-too-gli-floe′zin/met-for′min)

Segluromet

Func. class.: Antidiabetics

Chem. class.: Sodium-glucose cotransporter 2 (SGLT2) inhibitor

ACTION:

An inhibitor of sodium-glucose cotransporter 2 (SGLT2), the transporter responsible for reabsorbing most of the glucose filtered by the tubular lumen in the kidney

Uses: Treatment of type 2 diabetes mellitus in combination with diet and exercise

Contraindications: Hypersensitivity, severe renal disease

Black Box Warning: Lactic acidosis

Precautions: Adrenal insufficiency, balanitis, breast feeding, burns, children, dehydration, diabetic ketoacidosis, dialysis, fever, geriatric, hepatic disease, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypothyroidism, hypovolemia, infants, infection, lower limb amputation, malnutrition, pituitary insufficiency, pregnancy, pyelonephritis, renal disease, surgery, tissue necrosis, trauma, type 1 diabetes mellitus, UTI, vaginitis

DOSAGE AND ROUTES

Adults: PO Individualize the starting dose. Take ertugliflozin/metformin bid with meals. **Max:** ertugliflozin 7.5 mg/metformin 1000 mg bid with meals. **Those taking ertuglifloxacin:** Initiate at current dose of ertugliflozin in combination with metformin 500 mg given bid with meals; increase gradually to reduce the GI side effects due to metformin. **Those taking metformin:** Initiate at ertugliflozin 2.5 mg/metformin (either 500 mg or 1000 mg) given bid with meals, using whichever metformin dose is the same or closest to the current metformin dose. **Those taking both:** Switch to the combination product using the same daily doses of each component, divided and given bid with meals

Available forms: Tablets ertugliflozin 2.5 mg and metformin hydrochloride 500 mg, ertugliflozin 7.5 mg and metformin hydrochloride 500 mg, ertugliflozin 2.5 mg and metformin hydrochloride 1000 mg, ertugliflozin 7.5 mg and metformin hydrochloride 1000 mg

Administer:

- Administer daily in the morning, with or without food

SIDE EFFECTS

MS: Back pain

GU: Diuresis, dysuria, increased urinary frequency/urgency, nocturia, polyuria, renal failure, vaginitis, cystitis, dehydration

CNS: Headache syncope

META: Hypercholesterolemia, hyperlipidemia, hyperphosphatemia, hypoglycemia, diabetic ketoacidosis

CV: Hypotension, hypovolemia

MISC: Infection, lower limb amputation, necrotizing fasciitis, orthostatic hypotension, pharyngitis, polydipsia, tissue necrosis, weight loss, candidiasis, lactic acidosis

PHARMACOKINETICS

Ertugliflozin: Onset unknown, peak 1-2 hr, duration unknown, half-life 18.5 hr

Metformin: Onset unknown, peak 2-3 hr, duration unknown

INTERACTIONS

Increase: hypoglycemia—insulin, antidiabetes

Increase: urinary injury—ACE inhibitors, diuretics, NSAIDs

NURSING CONSIDERATIONS

Assess:

- Hypoglycemia (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with

dextrose, or, if severe, with IV glucagon
• **Ketoacidosis:** monitor for increased ketone levels; may occur with any glucose level, more common in those with severe illnesses
• **Volume depletion:** monitor for orthostatic hypotension, weakness, dizziness; may occur after beginning treatment; correct volume depletion before starting treatment
• For stress, surgery, or other trauma that may require a change in dose
• A1c q3mo; monitor serum glucose 1 hr PP throughout treatment; serum cholesterol, serum creatinine/BUN, serum electrolytes
• **Bone fractures:** monitor bone density, other conditions that may lead to bone fractures; fractures may occur within 3 mo of starting therapy
• **Renal impairment:** monitor more frequently in those with renal disease; increased creatinine, eGFR may be decreased, BUN may occur

Black Box Warning: Lactic acidosis: hypothermia, dysrrhythmias, death

Lower limb amputation: Increased risk of amputation; monitor wound and feet closely for complications
• **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding

Evaluate:
• Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait

Teach patient/family:
• The symptoms of hypo/hyperglycemia, what to do about each
• That medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery; to take as soon as remembered if dose is missed unless close to next dose, then skip and take at next scheduled dose, do not double
• To avoid OTC medications and herbal supplements unless discussed with health care professional
• That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
• To carry emergency ID and glucose source
• That blood glucose monitoring is required to assess product effect
• **Hypersensitivity:** to notify prescriber immediately of itching, hives, rash, swelling of face/lips
Lower limb amputation risk: Inspect feet; monitor for new ulcerations, wounds; educate about foot care
• **Ketoacidosis:** to notify prescriber immediately of nausea, vomiting, lack of appetite, sleepiness, difficulty breathing
• **Yeast infections (women/men):** That yeast infections can occur with this product (women, vaginal; men, penile); to report discharge, itching, swelling
• **Pregnancy/breastfeeding:** Not to breastfeed; to advise prescriber if pregnancy is planned or suspected

Black Box Warning: Lactic acidosis: to discontinue immediately if symptoms of lactic acidosis occur: myalgia, change in heart rhythm, feeling cold, hyperventilation, report immediately

ertugliflozin/ sitagliptin (Rx)

(er too gli floe'zin/sit a glip'tin)

Steglujan

Func. class.: Antidiabetics

Chem. class.: Sodium-glucose cotransporter 2 (SGLT 2) inhibitor

ACTION:

An inhibitor of sodium-glucose co-transporter 2 (SGLT2), the transporter responsible for reabsorbing most of the glucose filtered by the tubular lumen in the kidney

USES:

Treatment of type 2 diabetes mellitus in combination with diet and exercise

CONTRAINDICATIONS

Hypersensitivity, severe renal disease

Precautions: Adrenal insufficiency, balanitis, breastfeeding, burns, children, dehydration, diabetic ketoacidosis, dialysis, fever, geriatric, hepatic disease, hypercholesterolemia, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, hypotension, hypothyroidism, hypovolemia, infants, infection, lower limb amputation, malnutrition, pituitary insufficiency, pregnancy, pyelonephritis, renal disease, surgery, tissue necrosis, trauma, type 1 diabetes mellitus, UTI, vaginitis

DOSAGE AND ROUTES

• **Adult: PO** Initial: ertugliflozin 5 mg/sitagliptin 100 mg daily; if further glycemic control is needed, dose may be increased to ertugliflozin 15 mg/sitagliptin 100 mg daily (max: ertugliflozin 15 mg/sitagliptin 100 mg/day)

Available forms: Tablets: Ertugliflozin 5 mg and sitagliptin 100 mg, ertugliflozin 15 mg and sitagliptin 100 mg

Administer:

• Administer daily in the morning, with or without food
• If dose is missed, give as soon as remembered; if close to next dose, skip
• Store at room temperature

SIDE EFFECTS

MS: Back pain
GU: Diuresis, dysuria, increased urinary frequency/urgency, nocturia, polyuria, renal failure, vaginitis, cystitis, dehydration
CNS: Headache, syncope
META: Hypercholesterolemia, hyperlipidemia, hyperphosphatemia, hypoglycemia, diabetic ketoacidosis
CV: Hypotension, hypovolemia
MISC: Infection, lower limb amputation, necrotizing fasciitis, orthostatic hypotension, pharyngitis, polydipsia, tissue necrosis, weight loss, candidiasis

E

PHARMACOKINETICS

Ertugliflozin: Onset unknown, peak 1-2 hr, duration unknown, half-life 18.5 hr
Sitagliptin: Onset rapid, peak 1-4 hr, duration unknown, half-life 12.4 hr

INTERACTIONS

Increase: hypoglycemia: insulin, antidiabetes
Increase: urinary injury: ACE inhibitors, diuretics, NSAIDs, ARBs
Increase: levels of digoxin

Drug/Lab Test

Increase: LDL, cholesterol, phosphate, Hb, serum creatinine
Interference: Urine glucose, 1,5-AG assay

NURSING CONSIDERATIONS

Assess:

• **Hypoglycemia** (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucagon
• **Ketoacidosis:** Monitor for increased ketone levels; may occur with any glucose level, more common in those with severe illnesses
• **Volume depletion:** Monitor for orthostatic hypotension, weakness, dizziness; may occur after beginning treatment; correct volume depletion prior to starting treatment
• For stress, surgery, or other trauma that may require a change in dose
• **Diabetes:** A1c q3mo; monitor serum glucose 1 hr PP throughout treatment;

serum cholesterol, serum creatinine/BUN, serum electrolytes
• **Bone fractures:** Monitor bone density, other conditions that may lead to bone fractures; fractures may occur within 3 mo of starting therapy
• **Renal impairment:** Monitor more frequently in those with renal disease; increased creatinine, eGFR may be decreased, BUN may occur
Lower limb amputation: Increased risk of amputation; monitor wound and feet closely for complications
• **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding
Evaluate: Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia); clear sensorium, absence of dizziness, stable gait
Teach patient/family:
• The symptoms of hypo/hyperglycemia, what to do about each
• That medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, fever, surgery, to take as soon as remembered if dose is missed unless close to next dose, then skip and take at next scheduled dose, do not double dose
• To avoid OTC medications and herbal supplements unless discussed with health care professional
• That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
• To carry emergency ID and glucose source
• That blood glucose monitoring is required to assess product effect
• **Hypersensitivity:** to notify prescriber immediately of itching, hives, rash, swelling of face/lips
Lower limb amputation risk: Inspect feet; monitor for new ulcerations, wounds; educate about foot care
• **Ketoacidosis:** to notify prescriber immediately of nausea, vomiting, lack of appetite, sleepiness, difficulty breathing
• **Yeast infections (women/men):** that yeast infections can occur with this product (women, vaginal; men, penile); to report discharge, itching, swelling
• **Pregnancy/breastfeeding:** Not to breastfeed; to advise prescriber if pregnancy is planned or suspected

erythromycin (ophthalmic) (Rx)

(e-rith′roe-mye′sin)
Func. class.: Ophthalmic antiinfective
Chem. class.: Macrolide

ACTION: Inhibits protein synthesis, thereby decreasing bacterial replication

USES: Conjunctivitis, eye infections, prevention of ophthalmic neonatorum

CONTRAINDICATIONS: Hypersensitivity to this product or macrolides
Precautions: Pregnancy, breastfeeding

DOSAGE AND ROUTES

Bacterial conjunctivitis
• **Adult/adolescent/child: TOPICAL** apply 1 cm of ointment directly to the eye up to 6 times a day × 7-10 days depending on severity of infection
Prevention of ophthalmic neonatorum
• **Neonate: TOPICAL** apply 1-cm ribbon of ointment to lower conjunctival sac of each eye once after birth
Administer:
Ophthalmic route
• Apply ribbon of ointment directly to the eye; for ophthalmic use only
Available forms: ointment/ophthalmic 0.5%

SIDE EFFECTS

EENT: Hypersensitivity, irritation, redness

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** assess for hypersensitivity; discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route:

- Apply ribbon of ointment directly to the eye; for ophthalmic use only

erythromycin base (Rx)
(eh-rith-roh-my′sin)
Ery-Tab, PCE
erythromycin ethylsuccinate (Rx)
E.E.S., Ery Ped
erythromycin lactobionate (Rx)
Erythrocin
erythromycin stearate (Rx)
Erythrocin Stearate
erythromycin (topical) (Rx)
AKne-Mycin, Erygel
Func. class.: Antiinfective
Chem. class.: Macrolide

Do not confuse:
erythromycin/azithromycin

ACTION: Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

USES: Mild to moderate respiratory tract, skin, soft tissue infections caused by *Bordetella pertussis, Borrelia burgdorferi, Chlamydia trachomatis; Corynebacterium diphtheriae, Haemophilus influenzae* (when used with sulfonamides); *Legionella pneumophila,* Legionnaire's disease, *Listeria monocytogenes; Mycoplasma pneumoniae, Streptococcus pneumoniae,* syphilis: *Treponema pallidum; Staphylococcus* sp.

Unlabeled uses: Bartonellosis, burn wound infection, chancroid, cholera, diabetic gastroparesis, endocarditis prophylaxis, gastroenteritis, granuloma inguinale, Lyme disease, tetanus

CONTRAINDICATIONS: Hypersensitivity, preexisting hepatic disease (estolate)

Precautions: Pregnancy, breastfeeding, geriatric patients, hepatic disease, GI disease, QT prolongation, seizure disorder, myasthenia gravis

DOSAGE AND ROUTES

Most infections

- **Adults PO (base, stearate):** 250 mg q6hr or 333 mg q8hr or 500 mg q12hr; (ethylsuccinate) 400 mg q6hr or 800 mg q12hr: IV 250 mg-500 mg q6hr
- **Child >1 mo: PO (base, ethylsuccinate)** 30-50 mg/kg/day divided q6-8hr, max 2 g/day **(base)**, max 3.2 g/day **(ethylsuccinate)**; 30-50 mg/kg/day divided q6hr, max 2 g/day (stearate); IV 15-50 mg/kg/day divided q6hr, max 4 g/day
- **Neonates: PO (ethylsuccinate)** 20-50 mg/kg/day divided q6-8hr

Available forms: *Base:* enteric-coated tablets 250, 333, 500 mg; film-coated tablets 250, 500 mg; enteric-coated capsules 250, 333 mg; *stearate:* film-coated tablets 250 mg; *ethylsuccinate:* granules for oral suspension 200, 400 mg/5 mL; powder for injection 500 mg, 1 g (lactobionate), 1 g (as gluceptate)

Administer:

- Do not break, crush, or chew time-released capsule or tablet; chew only chewable tablets; enteric-coated tablets may be given with food
- Do not give by IM or IV push
- Oral product with full glass of water; do not give with fruit juice
- Give 1 hr prior to or 2 hr after meals
- Store at room temperature; store suspension in refrigerator

• Adequate intake of fluids (2 L) during diarrhea episodes

IV route

• After **reconstituting** 500 mg or less/10 mL sterile water without preservatives, dilute further in 100-250 mL of 0.9% NaCl, LR, Normosol-R; may be **further diluted** to 1 mg/mL and **given** as continuous infusion; run 1 g or less/100 mL over $^1/_2$-1 hr; continuous infusion over 6 hr, may require buffers to neutralize pH if dilution is <250 mL, use infusion pump

Lactobionate

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, atenolol, atosiban, atracurium, atropine, azaTHIOprine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefotaxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, doxapram, DOXOrubicin, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, LORazepam, LR, mannitol, mechlorethamine, meperidine, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, perphenazine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, Ringer's, ritodrine, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Seizures

CV: Dysrhythmias, QT prolongation

GI: *Nausea, vomiting, diarrhea,* hepatotoxicity, abdominal pain, stomatitis, heartburn, anorexia, CDAD, esophagitis

GU: *Vaginitis, moniliasis*

INTEG: Rash, urticaria, pruritus, thrombophlebitis, injection site reactions (IV site)

SYST: Anaphylaxis

PHARMACOKINETICS

Peak 1-4 hr (base); $^1/_2$-2$^1/_2$ hr (ethylsuccinate); half-life 1-2 hr, neonates 2 hr; metabolized in liver; excreted in bile, feces; protein binding 75%-90%; inhibitor of CYP3A4 and P-glycoprotein

INTERACTIONS

• Serious dysrhythmias—diltiaZEM, itraconazole, ketoconazole, nefazodone, pimozide, protease inhibitors, verapamil; do not use together

Increase: QT prolongation—products that increase QT prolongation

Increase: action, toxicity of alfentanil, ALPRAZolam, bromocriptine, busPIRone, carBAMazepine, cilostazol, clindamycin, cloZAPine, cycloSPORINE, diazePAM, digoxin, disopyramide, ergots, felodipine,

HMG-CoA reductase inhibitors, ibrutinib methylPREDNISolone, midazolam, quiNIDine, rifabutin, sildenafil, tacrolimus, tadalafil, theophylline, triazolam, vardenafil, vinBLAStine, warfarin
Decrease: erythromycin effect—rifabutin, rifAMPin, rifapentine

Drug/Lab Test
Increase: AST/ALT
Decrease: folate assay
False increase: 17-OHCS/17-KS

Drug/Food
Decrease: erythromycin metabolism—grapefruit juice; avoid using together

NURSING CONSIDERATIONS

Assess:
- **Infection:** temperature, characteristics of wounds, urine, stools, sputum, WBCs at baseline and periodically
- I&O ratio; report hematuria, oliguria in renal disease
- Hepatic studies: AST, ALT if patient is receiving long-term therapy
- Hearing at baseline and after treatment
- Renal studies: urinalysis, protein, blood
- C&S prior to product therapy; product may be given as soon as culture is taken; C&S may be repeated after treatment
- **CDAD:** diarrhea with blood, mucus; abdominal pain, fever; product should be discontinued immediately, notify prescriber
- **Anaphylaxis:** generalized hives, itching, flushing, swelling of lips, tongue, throat, wheezing; have emergency equipment nearby
- **QT prolongation:** may occur (IV >15 mg/min); those with electrolyte imbalances, congenital QT prolongation, elderly at greater risk; correct electrolyte imbalances prior to treatment, ECG
- **Pregnancy/breastfeeding:** use only if clearly needed; use other form of erythromycin, avoid estolate salt; use caution in breastfeeding, product appears in breast milk

Evaluate:
- Therapeutic response: decreased symptoms of infection

Teach patient/family:
- To notify nurse of diarrhea stools, dark urine, pale stools, jaundice of eyes or skin, severe abdominal pain
- To take at evenly spaced intervals; to complete dosage regimen; to take without food
- To avoid use with other products unless approved by prescriber

TREATMENT OF HYPERSENSITIVITY: Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, O_2, IV corticosteroids

erythromycin (topical) (Rx)

(e-rith-roe-mye′sin)
Akne-mycin, Ery-sol
Func. class.: Topical antiinfective, anti-acne
Chem. class.: Macrolide

ACTION: Antibacterial activity results from inhibition of protein synthesis; bacteriostatic

USES: Treatment of acne vulgaris

CONTRAINDICATIONS: Hypersensitivity, children

DOSAGE AND ROUTES

Acne vulgaris
- **Adult/adolescent: TOPICAL** Apply to affected areas bid, AM, PM

Available forms: Topical gel, ointment, pledget, solution 2%
Administer:
Topical route
- For external use only; do not use skin products near the eyes, nose, or mouth

• Wash hands prior to and after use. Wash affected area and gently pat dry before using
• **Gel/ointment/pledget/solution:** Apply to the cleansed affected area. Massage gently into affected areas
• Each pledget should be used once and discarded

SIDE EFFECTS

INTEG: Burning, rash, pruritus, peeling, irritation

NURSING CONSIDERATIONS

Assess:
• **Allergic reaction:** assess for hypersensitivity; may need to discontinue product
• **Infection:** assess for number of lesions, severity in acne
Evaluate:
• Decreased lesions in acne
Teach patient/family:
Topical route:
• That product is for external use only; do not use skin products near the eyes, nose, or mouth
• To wash hands prior to and after use; wash affected area and gently pat dry before using
• **Gel/pledget/solution/ointment/lotion:**
• To apply to the cleansed affected area; to massage gently into affected areas
• That each pledget should be used once and discarded

escitalopram (Rx)

(es-sit-tal′oh-pram)

Cipralex ✱, Lexapro

Func. class.: Antidepressant, SSRI (selective serotonin reuptake inhibitor)

Do not confuse:
Lexapro/Loxitane

ACTION: Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES: General anxiety disorder; major depressive disorder in adults/adolescents
Unlabeled uses: Panic disorder, social phobia, hot flashes related to menopause

CONTRAINDICATIONS: Hypersensitivity to this product, citalopram, MAOIs
Precautions: Pregnancy, breastfeeding, geriatric patients, renal/hepatic disease, history of seizures, abrupt discontinuation, bleeding, anticoagulants

Black Box Warning: Children/adolescents ≤12 yr, suicidal ideation

DOSAGE AND ROUTES

• **Adult/adolescent: PO** 10 mg/day; after 1 wk, dose may be increased to 20 mg/day PM
Hepatic dose/geriatric
• **Adult/child ≤12 yr: PO** 10 mg/day
Hot flashes related to menopause (unlabeled)
• **Adult: PO** 10-20 mg/day × 8 wk
Available forms: Tablets 5, 10, 20 mg; oral solution 5 mg (as base)/5 mL (contains sorbitol)
Administer:
• With food or milk for GI symptoms, give with full glass of water once a day in the AM
• Crushed if patient is unable to swallow medication whole; scored tablets can be cut
• Dosage at bedtime if oversedation occurs during the day
• Gum, hard candy, frequent sips of water for dry mouth
• **Oral solution:** measure with calibrated device
• Store at room temperature; do not freeze

SIDE EFFECTS

CNS: *Insomnia,* suicidal ideation, *drowsiness, anxiety, tremor, dizziness, fatigue, sedation, abnormal dreams,* neuroleptic malignant–like syndrome
CV: Postural hypotension
GI: *Nausea, diarrhea, dry mouth, anorexia, constipation, taste changes,* hepatitis

GU: *Decreased libido,* impotence, ejaculation disorder
INTEG: *Sweating, rash, pruritus*
SYST: Serotonin syndrome, Stevens-Johnson syndrome

PHARMACOKINETICS

PO: Metabolized in liver; excreted in urine; 56% protein binding; metabolized by CYP2C19, CYP 3A4, half-life 27-32 hr; half-life increased by 50% in geriatric patients

INTERACTIONS

- Paradoxical worsening of OCD: busPIRone

Increase: serotonin syndrome—tryptophan, amphetamines, busPIRone, lithium, amantadine, bromocriptine, SSRIs, SNRIs, serotonin-receptor agonists, traMADol, trazodone, tricyclic antidepressants, linezolid, methylene blue

- Do not use pimozide, MAOIs with or 14 days prior to escitalopram

Increase: CNS depression—alcohol, antidepressants, opioids, sedatives
Increase: side effects of escitalopram—highly protein-bound products
Increase: levels or toxicity of carBAMazepine, lithium, warfarin, phenytoin, antipsychotics, antidysrhythmics
Increase: levels of tricyclics, phenothiazines, haloperidol, diazePAM
Increase: bleeding risk—NSAIDs, salicylates, anticoagulants, SSRIs, platelet inhibitors

Drug/Herb

- **SAMe, St. John's wort:** do not use together; serotonin syndrome may occur

Increase: CNS effect—kava, valerian

Drug/Food

- Grapefruit juice—increased escitalopram effect

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alkaline phosphatase
Decrease: VMA, 5-HIAA, sodium
False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Mental status: mood, sensorium, affect, **suicidal tendencies,** increase in psychiatric symptoms, depression, panic; not approved for use in children <12 yr, provide a limited amount of product, continuing follow-ups should be weekly × 4 wk, q3wk × next 4 wk

- Appetite with bulimia nervosa, weight daily; increase nutritious foods in diet, watch for bingeing and vomiting
- **Allergic reactions:** itching, rash, urticaria; product should be discontinued, may need to give antihistamine
- B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- **Serotonin syndrome:** nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental changes, shivering, increased B/P; discontinue product, notify prescriber
- Weight weekly; appetite may decrease with product
- Alcohol consumption; if alcohol is consumed, hold dose until AM
- **Sexual dysfunction:** ejaculation dysfunction, erectile dysfunction, decreased libido, orgasm dysfunction, priapism
- Assistance with ambulation during therapy, since drowsiness, dizziness occur; safety measures primarily for geriatric patients
- **Pregnancy/breastfeeding:** use only if benefit outweighs risk to fetus; if used during pregnancy, taper in third trimester; use cautiously in breastfeeding, excreted in breast milk

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effect may take 1-4 wk, may have increased anxiety for first 5-7 days, do not abruptly discontinue

- **Serotonin syndrome:** to report immediately nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental changes, shivering
- To use caution when driving, performing other activities requiring alertness because drowsiness, dizziness, blurred vision may occur
- To avoid alcohol, other CNS depressants; to avoid all OTC, herbals, supplement products unless approved by prescriber, to take without regard to meals
- To change positions slowly; orthostatic hypotension may occur

Black Box Warning: That clinical worsening of depression and suicide risk may occur, especially in adolescents and young adults, increased depression, thoughts of dying

- To use medication guide provided
- To notify prescriber if pregnant or planning to become pregnant or if breastfeeding, discuss sexual dysfunction

esketamine (Rx)

(es-ket′-a-meen)

Spravato nasal spray

Func. class.: Antidepressant

Chem. class.: Augmentation agent

Controlled Substance: Schedule III

ACTION: Noncompetitively blocks the NMDA receptor, which is an ionotropic glutamate receptor; mechanism of action for antidepressant effect is unknown; however, the activity on NMDA receptors may be responsible for both the therapeutic and the adverse psychiatric effects

USES: Treatment-resistant depression in adults with an oral antidepressant

CONTRAINDICATIONS

Aneurysm, arteriovenous malformation, intracranial bleeding, ketamine hypersensitivity

Precautions:

Alcoholism, breastfeeding, cardiac disease, cerebrovascular disease, coadministration with other CNS depressants, driving or operating machinery, encephalopathy, geriatrics, hepatic disease, hypertension, hypertensive crisis, loss of consciousness, pregnancy, psychosis, schizophrenia

Black Box Warning: Children, CNS depression, dissociation, requires a specialized care setting, substance abuse, suicidal ideation

DOSAGE AND ROUTES

Adults: NASAL INDUCTION PHASE: On day 1, give 56 mg; for subsequent doses during wk 1 through 4, give 56 mg or 84 mg twice weekly; use 2 devices for the 56-mg dose and 3 devices for the 84-mg dose with a 5-min rest between use of each device; **MAINTENANCE PHASE:** During wk 5 through 8, give 56 mg or 84 mg weekly; during wk 9 and thereafter, give 56 mg or 84 mg q2wk or weekly

Available forms: Nasal spray 56, 84 dose kit

Administer:

Nasal route

- Must be given under the direct supervision of a health care provider and including a supervised postadministration observation
- Each device contains 28 mg; use 2 devices for a 56-mg dose and 3 devices for an 84-mg dose with a 5-min rest between use of each device
- To prevent loss of medication, do not prime the device before use
- During and after use at each treatment session, observe the patient for at least 2 hr until the patient is safe to leave
- Assess B/P prior to use; if baseline B/P >140 mm Hg systolic or >90 mm Hg diastolic, do not use if an increase in B/P or intracranial pressure poses a serious risk
- Reassess B/P about 40 min after dosing and subsequently as clinically indicated; if B/P is decreasing and the patient appears clinically stable for at least 2 hr, the patient may be discharged at the end

of the post-dose monitoring period; if not, continue to monitor
• Because of the potential for drug-induced nausea and vomiting, advise patients to avoid food for at least 2 hr prior to use and avoid liquids at least 30 min prior to administration
• Patients requiring a nasal corticosteroid or nasal decongestant on dosing day should use these at least 1 hr before receiving this product
• If treatment sessions are missed and there is a worsening of depression symptoms, consider returning to the previous dosing schedule

SIDE EFFECTS

CNS: Anxiety, dissociation, drowsiness, dizziness, headache, vertigo, dependence, impaired cognition, hallucinations, confusion, lethargy, suicidal ideation
CV: Hypertension, hypertensive crisis
GI: Nausea

PHARMACOKINETICS

Primarily metabolized to noresketamine, the active metabolite, by CYP2B6 and CYP3A4 and to a lesser extent by CYP2C9 and CYP2C19; noresketamine is metabolized by CYP-dependent pathways and metabolism occurs through glucuronidation; elimination is biphasic, with a rapid decline for the initial 2-4 hr and a mean terminal half-life 7-12 hr; elimination of the metabolite is also biphasic, 4 hr and a terminal half-life of 8 hr; metabolites are excreted in urine (78%) and feces (2%); bioavailability 48%; peak 20-40 min

INTERACTIONS

Black Box Warning: Increased: CNS depression, other CNS depressants—do not use together

Black Box Warning: Increased: sedation, B/P, MAOIs, psychostimulants—do not use together

NURSING CONSIDERATIONS

Assess

Black Box Warning: Dissociation: monitor B/P baseline and 40 min after use, then periodically for at least 2 hr after each treatment session, then provide an assessment to determine when the patient is stable and ready to leave the health care setting; special care is needed with those with schizophrenia

Black Box Warning: Substance abuse: monitor for signs of abuse or dependence; physical dependence has been reported with prolonged use of ketamine; withdrawal symptoms of ketamine include craving, fatigue, poor appetite, anxiety

Black Box Warning: Suicidal ideation: behaviors should be closely monitored during treatment, more frequently during first few months; consider changing the therapeutic regimen, including the discontinuation of esketamine and/or the concurrent oral antidepressant, in patients with worsening of depression or emergent suicidality

Evaluate

• Therapeutic response: decreasing depression

Teach patient/family:

Black Box Warning: Suicidal ideation: teach family members or caregivers to monitor for changes in behavior and to alert the health care provider if such behaviors occur

Black Box Warning: CNS depression: tell health care provider about all the Rx, OTC, vitamins, and herbal supplements used, not to use with other CNS depressants unless discussed with health care provider

• Prior to use instruct patients not to engage in potentially hazardous activities (driving, operating heavy machinery), until the next day after a restful sleep

HOW TO USE:

- **Step 1:** Instruct patient to blow nose before the first device use only; confirm the required number of devices (56 mg = 2 devices; 84 mg = 3 devices)
- **Step 2:** Check expiration date; peel blister and remove device; do not prime the device—this will cause loss of medication; ensure that the indicator on the device shows 2 green dots; give device to patient
- **Step 3:** Instruct patient to hold device with thumb gently supporting but not pressing the plunger as shown in the product labeling; patient should recline head at about 45 degrees during administration to keep medication in nose
- **Step 4:** Instruct patient to insert tip straight into the first nostril; the nose rest should touch the skin between the nostrils; close the opposite nostril; breathe in through nose while pushing plunger all the way up until it stops; sniff gently after spraying to keep medication inside nose; switch hands to insert tip into the second nostril; repeat steps to deliver second spray
- **Step 5:** After administration is complete, take the device from the patient; check that indicator on device shows no green dots; if green dot remains, have patient spray again into the second nostril. Instruct patient to rest comfortably (preferably semi-reclined) for 5 min after each device; if liquid drips out, dab nose with a tissue; DO NOT blow nose
- If a second device is required, ensure a 5-min waiting period prior to use to allow medication from first device to be absorbed
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected or if breastfeeding; if patient is pregnant, she should register with the National Pregnancy Registry for Antidepressants online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/ or by calling 844-405-6185

⚠ HIGH ALERT

eslicarbazepine (Rx)

(es'lye-kar-bay'ze-peen)

Aptiom

Func. class.: Anticonvulsant

Chem. class.: Carboxamide derivative

ACTION: Exact mechanism unknown; a voltage-gated sodium-channel blocker inhibits repetitive neuronal firing

USES: Partial seizures, adjunctive treatment

CONTRAINDICATIONS: Hypersensitivity to this product or OXcarbazepine

Precautions: Breastfeeding, abrupt discontinuation, depression, driving/operating machinery, ethanol intoxication, hepatic disease, renal disease, hyponatremia, suicidal ideation, pregnancy

DOSAGE AND ROUTES

- **Adult: PO** 400 mg daily; after 1 wk, increase to 800 mg daily, max 1600 mg daily

Renal dose

- **Adult: PO** CCr <50 mL/min 200 mg daily; after 2 wk, increase to 400 mg daily, max 800 mg daily

Available forms: Tablets 200, 400, 600, 800 mg

Administer:

- May be taken without regard to food
- May be crushed or whole
- Store at room temperature

SIDE EFFECTS

CNS: Drowsiness, dizziness, amnesia, depression, insomnia, lethargy, memory impairment, confusion, fatigue, headache, speech disturbance, suicidal thoughts/behaviors, tremors

CV: Hypertension, peripheral edema

EENT: Blurred vision, nystagmus, diplopia

GI: Nausea, constipation, diarrhea, hypercholesterolemia/hypertriglyceridemia, vomiting, hepatotoxicity

GU: Cystitis

INTEG: Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, angioedema
META: Hyponatremia
RESP: Cough

PHARMACOKINETICS

Peak 1-4 hr; metabolized by liver; moderate CYP2C19 inhibitor; weak/moderate CYP3A4 inducer; steady-state 4-5 days; excreted in urine, feces; half-life 13-20 hr; protein binding <40%

INTERACTIONS

Decrease: effects of bedaquiline, boceprevir, bosutinib, cabozantinib, cobicistat, elvitegravir, emtricitabine, crizotinib, cycloSPORINE, dronedarone, erlotinib, fosamprenavir, galantamine, gefitinib, HYDROcodone, maraviroc, oxyCODONE, paliperidone, perampanel, pimozide, praziquantel, QUEtiapine, ranolazine, rilpivirine
Decrease: eslicarbazepine effect—CYP1A2, CYP2C19 substrates
Decrease: effect of CYP3A inducers

NURSING CONSIDERATIONS

Assess:

- **Hyponatremia:** nausea, vomiting, increased seizures, headache, weakness, confusion, irritability
- **Seizures:** character, location, duration, intensity, frequency, presence of aura
- **Hepatic studies:** ALT, AST, bilirubin; sodium

Black Box Warning: Mental status: mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber

- Eye problems: need for ophthalmic examinations prior to, during, after treatment (slit lamp, fundoscopy, tonometry)
- **Allergic reaction:** purpura, red, raised rash; if these occur, product should be discontinued
- **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function
- **Pregnancy/breastfeeding:** use in pregnancy only if benefits outweigh risks to fetus. Patient should enroll in North American Antiepileptic Drug (NAAED) Pregnancy Registry (888-233-2334; www.aedpregnancyregistry.org). Product is present in breast milk; consider benefits of breastfeeding, risk of potential infant drug exposure, and risk of an untreated or inadequately treated condition

Evaluate:

- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name, and phone number
- To avoid driving, other activities that require alertness, usually for the first 3 days of treatment
- Not to discontinue medication quickly after long-term use
- **Pregnancy:** to notify prescriber if pregnancy is planned or suspected; to use additional contraceptives if using hormonal contraceptives; to avoid breastfeeding
- Not to abruptly discontinue drug
- To report signs of decreased renal function, dizziness, increased cholesterol, ocular toxicity, suicide risk, skin rashes
- To take with or without food; that tablet can be crushed
- To report increased seizures, headache, nausea, vomiting, weakness, confusion, irritability (hyponatremia)

⚠ HIGH ALERT

esmolol (Rx)

(ez'moe-lole)

Brevibloc

Func. class.: Beta-adrenergic blocker (antidysrhythmic II)

Do not confuse:
Brevibloc/Brevital

ACTION: Competitively blocks stimulation of β_1-adrenergic receptors in

the myocardium; produces negative chronotropic, inotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, decreases O_2 consumption in myocardium; also decreases renin-aldosterone-angiotensin system at high doses; inhibits β_2-receptors in bronchial system at higher doses

USES: Supraventricular tachycardia, noncompensatory sinus tachycardia, intraoperative and postoperative tachycardia and hypertension, atrial fibrillation/flutter

CONTRAINDICATIONS: Second- or third-degree heart block; cardiogenic shock, HF, cardiac failure, hypersensitivity, severe bradycardia

Precautions: Pregnancy, breastfeeding, geriatric patients, hypotension, peripheral vascular disease, diabetes, hypoglycemia, thyrotoxicosis, renal disease, atrial fibrillation, bronchospasms, hyperthyroidism, myasthenia gravis, asthma, COPD, CV disease, pheochromocytoma, abrupt discontinuation

DOSAGE AND ROUTES

Atrial fibrillation/flutter

- **Adult: IV** loading dose 500 mcg/kg/min over 1 min; maintenance 50 mcg/kg/min for 4 min; if no response after 5 min, give second loading dose, then increase infusion to 100 mcg/kg/min for 4 min; if no response, repeat loading dose, then increase maintenance infusion by 50 mcg/kg/min (max of 200 mcg/kg/min); titrate to patient response
- **Child: IV** total loading dose of 600 mcg/kg over 2 min, maintenance **IV INFUSION** 200 mcg/kg/min, titrate upward by 50-100 mcg/kg/min q5-10min until B/P, heart rate reduced by >10%

Perioperative hypertension/ tachycardia

- **Adult: IV** immediate control 80 mg (bolus) over 30 seconds, then 150 mcg/kg/min, adjust to response, max 300 mcg/kg/min, perioperative hypertension, 200 mcg/kg/min (tachycardia)

Available forms: Injection 10 mg/mL, 10 mg/mL in 250-mL bag, 20 mg/mL in 100-mL bag

Administer:

- Do not discontinue product suddenly
- Store protected from light, moisture, in cool environment

IV route

- Check that correct concentration is being given

IV direct route

- 10 mg/mL injection solution needs no dilution, may be used as an IV loading dose using a handheld syringe

Continuous IV INFUSION route

- Ready-to-use bags of premixed isotonic solution of 10 mg/mL and 20 mg/mL available in 100-, 250-mL bags; use controlled infusion device, central line preferred; rate is based on patient's weight

Y-site compatibilities: Amikacin, aminophylline, amiodarone, atracurium, butorphanol, calcium chloride, ceFAZolin, cefTAZidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, diltiazem, DOPamine, enalaprilat, erythromycin, famotidine, fentaNYL, gentamicin, insulin (regular), labetalol, magnesium sulfate, methyldopate, metroNIDAZOLE, midazolam, morphine, nitroglycerin, nitroprusside, norepinephrine, pancuronium, penicillin G potassium, piperacillin, polymyxin B, potassium chloride, potassium phosphate, propofol, ranitidine, remifentanil, streptomycin, tacrolimus, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Confusion, drowsiness, weakness, dizziness, fatigue, headache
CV: Hypotension, peripheral ischemia
GI: *Nausea,* vomiting, anorexia
INTEG: *Inflammation at site*, sweating

PHARMACOKINETICS

Onset very rapid, duration short, half-life 9 min, metabolized by hydrolysis of ester linkage, excreted via kidneys

INTERACTIONS

- Avoid use with MAOIs, Sotalol

Increase: effect of antidiabetics
Increase: possible fatal B/P increase—clonidine
Increase: potentiate suppressive effects of dilTIAZem, verapamil
Increase: antihypertensive effect—general anesthetics
Increase: digoxin levels—digoxin
Increase: alpha-adrenergic stimulation—ePHEDrine, EPINEPHrine, amphetamine, norepinephrine, phenylephrine, pseudoePHEDrine
Decrease: action of thyroid hormones
Decrease: action of esmolol—thyroid hormone, salicylates

Drug/Herb
Increase: beta-blocking effect—hawthorn
Decrease: antihypertensive effect—ephedra

Drug/Lab Test
Interference: glucose/insulin tolerance test

NURSING CONSIDERATIONS

Assess:

- **Heart failure**: I&O ratio, weight daily, jugular venous distention, weight gain, crackles, edema
- **Dysrhythmias:** B/P, pulse; note rate, rhythm, quality; rapid changes can cause shock; if systolic <100 or diastolic <60, notify prescriber before giving product; ECG continuously during infusion, hypotension common, if severe, slow or stop infusion
- **Infusion site:** monitor infusion site during infusion; do not use butterfly if irritation occurs; stop and start at another site
- **Bronchospasm:** breath sounds, respiratory pattern
- **Pregnancy/breastfeeding:** use only if benefit outweighs risk to fetus; use in the last trimester or labor or obstetric delivery has resulted in fetal bradycardia; not known if excreted in breast milk

Evaluate:

- Therapeutic response: lower B/P immediately, lower heart rate

Teach patient/family:

- Not to drive or perform other hazardous activities if drowsiness occurs
- To change positions slowly to prevent orthostatic hypotension
- About reason for use; expected results
- To notify prescriber if chest pain, SOB, wheezing, hypotension, bradycardia, pain, swelling at IV site occurs
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected

TREATMENT OF OVERDOSE:

Discontinue product; IV glucagon if needed

E

esomeprazole (Rx)

(es'oh-mep'rah-zohl)

NexIUM, NexIUM 24HR, NexIUM I.V.

Func. class.: Antiulcer
Chem. class.: Proton pump inhibitor, benzimidazole

Do not confuse:
esomeprazole/omeprazole

ACTION: Suppresses gastric secretions by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks the final step of acid production

USES: Gastroesophageal reflux disease (GERD), adult/child/infant; severe erosive esophagitis, adult/child; treatment of active duodenal ulcers in combination with anti-infectives for *Helicobacter pylori* infection; long-term use for hypersecretory conditions

CONTRAINDICATIONS: Hypersensitivity to proton pump inhibitors (PPIs)
Precautions: Pregnancy, breastfeeding, children, geriatric patients, hypomagnesemia, osteoporosis

DOSAGE AND ROUTES

Active duodenal ulcers associated with *H. pylori*

- **Adult: PO** 40 mg/day × 10-14 days in combination with clarithromycin 500 mg bid × 10 days and amoxicillin 1000 mg bid × 10 days

GERD/erosive esophagitis

- **Adult: PO** 20 or 40 mg/day × 4-8 wk; no adjustment needed in renal/liver failure, geriatric patients; **IV** 20 or 40 mg/day up to 10 days
- **Adolescent and child 12-17 yr: PO** 20 or 40 mg/day 1 hr prior to meals for ≤8 wk
- **Child 1-11 yr and ≥20 kg: PO** 10 mg/day 1 hr prior to meals for ≤8 wk
- **Infant ≥1 mo: IV** 0.5 mg/kg over 10-30 min
- **Infant 1-11 mo (>7.5-12 kg): PO** 10 mg daily × up to 6 wk
- **Infant 1-11 mo (>5-7.5 kg): PO** 5 mg daily × up to 6 wk
- **Infant 1-11 mo (3-5 kg): PO** 2.5 mg daily × up to 6 wk

Gastric ulcer prophylaxis, NSAID-associated gastropathy

- **Adult: PO** 20-40 mg/day up to 6 mo

Zollinger-Ellison syndrome

- **Adult: PO** 40 mg bid, up to 240 mg/day

Dyspepsia (unlabeled)

Adult: PO 40 mg daily × 8 wk

Hepatic dose

- **Adult: PO/IV** max 20 mg/day (severe hepatic disease)

Available forms: Delayed-release capsules 20, 40 mg; powder for IV injection 20, 40 mg/vial; delayed-release powder for oral suspension 2.5, 5, 10, 20, 40 mg

Administer:

PO route

- Swallow capsules whole; do not crush or chew; capsule may be opened and sprinkled over Tbsp of applesauce
- Same time daily, 1 hr before meal
- **Oral suspension (delayed release):** empty contents of packet into container with 1 Tbsp of water, let stand 2-3 min to thicken, restir, give within 30 min of mixing; any residual product should be flushed with more water, taken immediately
- **NG tube (delayed-release oral suspension):** add 50 mL water to contents of packet in syringe, shake, leave 2-3 min to thicken, shake, inject through NG tube within 30 min, make sure granules are dissolved

IV, direct route

- Reconstitute each vial with 5 mL 0.9% NaCl, D_5W, LR; give over 3 min

Intermittent IV INFUSION route

- Dilute reconstituted solution to 50 mL, give over 30 min, do not admix, flush line with D_5W, 0.9% NaCl, LR after infusion

Continuous IV route

- Use 2 (40-mg vials) with 5 mL of 0.9% NaCL for 80-mg loading dose, further dilute in 100 mL 0.9% NaCL give over 30 min, then infusion at 8 mg/hr

Y-site compatibility: Ceftaroline, fentanyl, furosemide, regular insulin, nitroglycerin

SIDE EFFECTS

CNS: *Headache, dizziness*

GI: *Diarrhea, flatulence,* abdominal pain, constipation, dry mouth, hepatic failure, hepatitis, microscopic colitis, *Clostridium difficile*–associated diarrhea (CDAD)

INTEG: *Rash,* dry skin

GU: Nephritis

MISC: Fractures, SLE, vitamin B_{12} deficiency

SYST: Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

PHARMACOKINETICS

Well absorbed 90%; protein binding 97%; extensively metabolized in liver (CYP2C19); terminal half-life 1-1.5 hr; eliminated in urine as metabolites and in feces; in geriatric patients, elimination rate decreased, bioavailability increased

INTERACTIONS

Increase: effect, toxicity of diazePAM, digoxin, penicillins, saquinavir, cilostazol, cloZAPine, those drugs metabolized by CYP2C19

Increase: effect of methotrexate, tacrolimus, warfarin

Decrease: effect—atazanavir, nelfinavir, dapsone, iron, itraconazole, ketoconazole, indinavir, calcium carbonate, vitamin B_{12}, clopidogrel, iron salts, mycophenolate

Drug/Lab Test

Interference: sodium, HB, WBC, platelets, magnesium

False-positive: CgA

NURSING CONSIDERATIONS

Assess:

- **GI system:** bowel sounds, abdomen for pain, swelling, anorexia, bloody stools; CDAD may occur
- **Hepatic failure, hepatitis:** AST, ALT, alkaline phosphatase at baseline and periodically during treatment
- **Serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis
- **Pregnancy/breastfeeding:** use only if benefits clearly outweigh risks to fetus; do not breastfeed

Evaluate:

- Therapeutic response: absence of epigastric pain, swelling, fullness, decreased GERD

Teach patient/family:

- To report severe diarrhea, abdominal pain, black tarry stools, rash; product may have to be discontinued
- That hypoglycemia may occur if diabetic
- To avoid hazardous activities; dizziness may occur
- To notify provider if pregnancy is planned or suspected or if breastfeeding
- To avoid alcohol, salicylates, NSAIDs; may cause GI irritation
- To take ≥1 hr prior to meal; not to crush, chew delayed-release product; if missed, to take as soon as remembered if not almost time for next dose; to take full course prescribed; to read "Patient Information"
- That if capsule is unable to be swallowed whole, contents may be mixed with a Tbsp of applesauce
- To notify provider of all OTC, Rx, or herbal products taken
- **Hypomagnesemia:** to notify prescriber of dizziness, fast heartbeat, tremors, weakness, spasm, cramps

estradiol (Rx)
(es-tra-dye´ole)
Estrace
estradiol cypionate (Rx)
Depo-Estradiol
estradiol gel (Rx)
Divigel, Elestrin, Estrogel
estradiol spray (Rx)
Evamist
estradiol topical emulsion (Rx)
Estrasorb
estradiol transdermal system (Rx)
Alora, Climara, Minivelle, Vivelle-Dot
estradiol vaginal ring (Rx)
Estring, Femring
estradiol vaginal tablet (Rx)
Vagifem
estradiol valerate (Rx)
Delestrogen
Func. class.: Estrogen, progestins

ACTION: Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins; inhibits ovulation; adequate calcium use in bone

USES: Vasomotor symptoms (menopause), inoperable breast cancer (selected cases), prostatic cancer, atrophic vaginitis, kraurosis vulvae, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration

CONTRAINDICATIONS: Pregnancy, breastfeeding, reproductive cancer, genital bleeding (abnormal, undiagnosed), protein S or C deficiency, antithrombin deficiency, angioedema, MI, stroke

Black Box Warning: Breast/endometrial cancer, thromboembolic disorders, MI, stroke

Precautions: Hypertension, asthma, blood dyscrasias, gallbladder/bone/renal/hepatic disease, HF, diabetes mellitus,

depression, migraine headache, seizure disorders, family history of cancer of breast or reproductive tract, smoking, uterine fibroids, vaginal irritation/infection, history of angioedema, cardiac disease

Black Box Warning: dementia, accidental exposure pets/children (topical)

DOSAGE AND ROUTES

Hormone replacement/menopause symptoms

• **Adult: TRANSDERMAL** 1 patch delivering 0.025, 0.0375, 0.05, 0.075, or 0.1 mg/day 2×/wk (Alora, Estraderm, Vivelle-Dot); 1 patch delivering 0.025, 0.0375, 0.05, 0.06, 0.075, or 0.1 mg/day replace q7days (Climara); **GEL** apply entire unit-dose packet to 5 × 7-inch area of upper thigh/day, alternate thighs; **SPRAY** (Evamist) 1 spray to inner surface of forearm/day in AM

Menopause/hypogonadism/castration/ovarian failure

• **Adult: PO** 0.5-2 mg/day, 3 wk on, 1 wk off or continuously; **IM** (cypionate) 1-5 mg q3-4wk; (valerate) 10-20 mg q4wk

• **Adult: TOPICAL** (Estraderm) 0.05 mg/24 hr applied 2×/wk; (Climara) 0.05 mg/hr applied 1×/wk in cyclic regimen; women with hysterectomy may use continuously

Postmenopausal osteoporosis, prophylaxis

• **Adult female: PO** 0.5 mg/day × 23 days of a 28-day cycle; **TRANSDERMAL** (Alora, Minivelle, Vivelle-Dot) 0.025 mg/day applied to skin 2×/wk; adjust as needed based on clinical response, bone mineral density; **TRANSDERMAL** (Climara) 0.025 mg/day applied to skin weekly

Prostatic cancer (inoperable)

• **Adult: IM** (valerate) 30 mg q1-2wk; **PO** (oral estradiol) 1-2 mg bid-tid

Breast cancer (palliative treatment)

• **Adult: PO** 10 mg tid × 3 mo or longer

Atrophic vaginitis/kraurosis vulvae

• **Adult: VAG CREAM** 2-4 g/day × 1-2 wk, then 1 g 1-3×/wk cycled; **VAG TABLET** 1/day × 2 wk, maintenance 1 tab 2×/wk; **VAG RING** inserted, left in place continuously for 3 mo

Vasomotor symptoms

• **Adult: TOPICAL** after cleaning and drying skin on left thigh, calf, rub in contents of pouch using both hands until completely absorbed; wash hands

Available forms: *Estradiol:* tablets 0.5, 1, 2 mg; *valerate:* injection 10, 20, 40 mg/mL; *transdermal:* 0.014, 0.025, 0.0375, 0.05, 0.075, 0.1 mg/24 hr release rate; *vag cream:* 100 mcg/g; *vag tablet:* 10 mcg; *vag ring:* 2 mg/90 days; *topical emulsion:* 2.5 mg; *gel* (Divigel) 0.06%, 0.1%; *spray* (Evamist) 1.53 mg/actuation

Administer:

• Titrated dose; use lowest effective dose

• IM inject deeply in large muscle mass

PO route

• With food or milk to decrease GI symptoms

Transdermal route

• May contain aluminum or other metals in backing of patch, can overheat in MRI scan and burn patients

• Apply to trunk of body 2×/wk; press firmly, hold in place for 10 sec to ensure good contact; do not apply to breasts

• On intermittent cycle schedule: 3 wk on, then 1 wk off; if patch falls off, reapply

Topical route

• Use Evamist daily; spray to inner upper arm; may increase to 2-3×/day based on response; allow to dry for 2 min, avoid secondary exposure to children, pets, caregivers

Vaginal route

• Use a new applicator daily, provided

SIDE EFFECTS

CNS: Dizziness, headache, migraines, depression, seizures

CV: Hypertension, thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI, chest pain

EENT: Contact lens intolerance, increased myopia, astigmatism, throat swelling, eyelid edema

GI: *Nausea,* vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, increased weight, cholestatic jaundice, hepatic adenoma

GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal

candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence,* increased risk of breast cancer, endometrial cancer, changes in libido; toxic shock, vaginal wall ulceration/erosion (vag ring)

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, erythema, pruritus, melasma; site irritation (transdermal)

META: Folic acid deficiency, hypercalcemia, hyperglycemia

PHARMACOKINETICS

PO/INJECTION/TRANSDERMAL: Degraded in liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: action of corticosteroids, tricyclics

Increase: toxicity—cycloSPORINE, dantrolene

Decrease: action of anticoagulants, oral hypoglycemics, tamoxifen

Decrease: estradiol action—anticonvulsants, barbiturates, phenylbutazone, rifAMPin, calcium

Drug/Herb

- Altered estrogen effect: black cohosh, DHEA

Decrease: estrogen effect—saw palmetto, St. John's wort

Drug/Food

Increase: estrogen level—grapefruit juice

Drug/Lab Test

Increase: BSP retention test, PBI, T_4, serum sodium, platelet aggregation, thyroxine-binding globulin (TBG), prothrombin; factors VII, VIII, IX, X; triglycerides

Decrease: serum folate, serum triglyceride, T_3 resin uptake test, glucose tolerance test, antithrombin III, pregnanediol, metyrapone test

False positive: LE prep, ANA

NURSING CONSIDERATIONS

Assess:

Black Box Warning: For previous breast/endometrial cancer, thromboembolic disorders, MI, stroke, dementia; use adequate screening for these conditions, estrogen increases the risk

- Blood glucose of diabetic patient; hyperglycemia may occur
- Weight daily; notify prescriber of weekly weight gain >5 lb; if increase, diuretic may be ordered
- B/P q4hr; watch for increase caused by water and sodium retention
- I&O ratio; decreasing urinary output, increasing edema, report changes
- Hepatic studies, including AST, ALT, bilirubin, alkaline phosphatase at baseline, periodically; periodic folic acid level
- Hypertension, cardiac symptoms, jaundice, hypercalcemia
- Mental status: affect, mood, behavioral changes, aggression
- Female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer
- **Beers:** avoid oral and topical patch in older adults; evidence of carcinogenic potential (breast, endometrial)
- **Pregnancy/breastfeeding:** do not use in pregnancy; estrogens decrease milk production; use only if needed

Evaluate:

- Therapeutic response: reversal of menopause symptoms; decrease in tumor size in prostatic, breast cancer

Teach patient/family:

- To weigh weekly; to report gain >5 lb
- To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, numbness or stiffness in legs, chest pain; tenderness, redness, and swelling in extremities; males to report impotence, gynecomastia; to report dermal rash with transdermal patch
- To avoid grapefruit or grapefruit juice (PO)
- That smoking increases CV conditions; encourage to stop
- To notify prescriber if pregnancy is planned or suspected; not to become pregnant when using estrogen
- To report changes in blood glucose if diabetic

⚠ HIGH ALERT

estrogens, conjugated (Rx)

Cenestin, Premarin, C.E.S. 🍁

estrogens, conjugated synthetic B (Rx)

Enjuvia

Func. class.: Estrogen, hormone

Do not confuse:
Premarin/Provera
Enjuvia/Januvia

ACTION: Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins, inhibits ovulation; adequate calcium use in bone

USES: Vasomotor symptoms (menopause), inoperable breast cancer, prostatic cancer, abnormal uterine bleeding, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration, atrophic vaginitis
Unlabeled uses: Hyperparathyroidism, infertility

CONTRAINDICATIONS: Pregnancy, breastfeeding, thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), hypersensitivity, MI, stroke, thrombophlebitis

Black Box Warning: Endometrial, breast cancer, thromboembolic diseases

Precautions: Hypertension, asthma, blood dyscrasias, HF, diabetes mellitus, depression, migraine headache, seizure disorders, gallbladder/bone/hepatic/renal disease, family history of cancer of breast or reproductive tract, smoking, hypothyroidism, obesity, SLE

Black Box Warning: Dementia

DOSAGE AND ROUTES

Estrogens conjugated

Vasomotor symptoms (menopause)
- **Adult: PO** 0.3-1.25 mg/day 3 wk on, 1 wk off

Prevention of osteoporosis
- **Adult: PO** 0.3 mg/day or in cycle

Atrophic vaginitis
- **Adult: VAG CREAM** 0.5 g/day × 21 days, off 7 days, repeat

Prostatic cancer
- **Adult: PO** 1.25-2.5 mg tid

Advanced inoperable breast cancer
- **Adult: PO** 10 mg tid × ≥3 mo

Abnormal uterine bleeding
- **Adult: IV/IM** 25 mg q6-12hr

Castration/primary ovarian failure
- **Adult: PO** 1.25 mg/day 3 wk on, 1 wk off

Hypogonadism
- **Adult: PO** 0.3 or 0.625 mg daily (3 wk on, 1 wk off), adjust to response

Estrogens conjugated synthetic B

Vasomotor symptoms (menopause)
- **Adult: PO** 0.625 mg/day initially; may increase based on response

Dyspareunia (moderate to severe); menopausal-cyclic regimen:
- **Adult: INTRAVAGINALLY** 0.5 g daily × 21 days, then off 7 days; continuous regimen **INTRAVAGINALLY** 0.5 g bid

Available forms: Tablets 0.3, 0.45, 0.625, 0.9, 1.25, 2.5 mg; injection 25 mg/vial; vag cream 0.625 mg/g; *synthetic B:* tablets 0.625, 1.25 mg

Administer:
Titrated dose; use lowest effective dose

PO route
- Give with or immediately after food to reduce nausea

IM route
- Reconstitute after withdrawing 5 mL of air from container, inject sterile diluent on vial side, rotate to dissolve; give injection deep in large muscle mass, aspirate before injection

Vaginal route
- Use applicator provided, wash after use

Direct IV route
- IV, after reconstituting as for IM, inject into distal port of running IV line of D_5W, 0.9% NaCl at ≤5 mg/min

Y-site compatibilities: Heparin, hydrocortisone, potassium chloride, vitamin B/C

SIDE EFFECTS

CNS: Dizziness, headache, migraine, depression, seizures, mood disturbances
CV: Hypertension, thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI, chest pain
EENT: Contact lens intolerance, increased myopia, astigmatism
GI: *Nausea,* vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, cholestatic jaundice, hepatic adenoma, weight gain/loss
GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence,* increased risk of breast cancer, endometrial cancer, libido changes
INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma
META: Folic acid deficiency, hypercalcemia, hyperglycemia

PHARMACOKINETICS

PO/IM/IV: Degraded in liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: toxicity—cycloSPORINE, dantrolene
Increase: action of corticosteroids
Decrease: action of estrogens—anticonvulsants, barbiturates, phenylbutazone, rifAMPin, bosentan
Decrease: action of anticoagulants, oral hypoglycemics, tamoxifen, thyroid, tricyclics
Drug/Food
Increase: estrogen level—grapefruit juice
Drug/Lab Test
Increase: T_4, serum sodium, platelet aggregation, thyroxine-binding globulin (TBG), prothrombin; factors VII, VIII, IX, X; triglycerides
Decrease: serum folate, serum triglyceride, T_3 resin uptake test, glucose tolerance test, antithrombin III, metyrapone test
False positive: LE prep, antinuclear antibodies

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Breast, endometrial cancer: estrogens should not be used in known, suspected, or history of these disorders

Black Box Warning: Stroke, thromboembolic disease of MI: should not be used in these conditions or known protein C deficiency, protein S deficiency, or antithrombin deficiency

- Blood glucose if diabetic patient; hyperglycemia may occur
- Weight daily; notify prescriber of weekly weight gain >5 lb; if increase, diuretic may be ordered; check for edema; B/P baseline and periodically
- Hepatic studies: AST, ALT, bilirubin, alkaline phosphatase
- Hypertension, cardiac symptoms, jaundice, hypercalcemia
- Mental status: affect, mood, behavioral changes, aggression
- Female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer; abnormal uterine bleeding, breast exam; Pap smear
- **Use lowest dose/shortest time period:** estrogen therapy should be limited to the shortest duration of therapy and lowest effective dose; individualize risks and benefits with each patient
- **Beers:** avoid oral and topical patch in older adults; evidence of carcinogenic potential (breast, endometrial)
- **Pregnancy/breastfeeding:** do not use in pregnancy; estrogens decrease milk production; use only if clearly needed

Evaluate:

- Therapeutic response: absence of breast engorgement, reversal of menopause symptoms, decrease in tumor size with prostatic cancer

Teach patient/family:

- To avoid breastfeeding; product is excreted in breast milk
- To weigh weekly; to report gain >5 lb

Black Box Warning: To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain; leg pain and redness, numbness or stiffness; chest pain; males to report impotence or gynecomastia

- To avoid sunlight or wear sunscreen; burns may occur
- To notify prescriber if pregnancy is suspected
- That vasomotor symptoms improve in 2 wk, max relief in 8 wk

⚠ HIGH ALERT

eszopiclone (Rx)

(es-zop'i-klone)

Lunesta

Func. class.: Sedative/hypnotic, nonbenzodiazepine

Chem. class.: Cyclopyrrolone

Controlled Substance Schedule IV

Do not confuse:
Lunesta/Neulasta

ACTION:

Interacts with GABA receptors

USES:

Insomnia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, geriatric patients, severe hepatic disease, abrupt discontinuation, COPD, depression, labor, sleep apnea, substance abuse, suicidal ideation, ethanol intoxication

DOSAGE AND ROUTES

- **Adult: PO** 1 mg immediately before bed, may increase to 2-3 mg if needed, max 3 mg nightly

Hepatic dose/CYP3A4 inhibitors

- **Adult: PO** 1 mg immediately before bed with severe hepatic disease, max 2 mg/day

Available forms: Tablets 1, 2, 3 mg

Administer:

- Do not break, crush, or chew tablet
- Immediately prior to bedtime; avoid use with food; for short-term use only
- If dose is missed, wait to take until next scheduled time prior to bed the next day

SIDE EFFECTS

CNS: Worsening depression, hallucinations, headache, daytime drowsiness, suicidal thoughts/actions, migraine, restlessness, anxiety, sleep driving, sleepwalking

CV: Peripheral edema, chest pain

GI: Dry mouth, bitter taste (dysgeusia)

GU: Gynecomastia, dysmenorrhea

INTEG: Rash, angioedema

PHARMACOKINETICS

Onset rapid; peak 1 hr; duration 6 hr; extensively metabolized in the liver by CYP3A4, CYP2E1; excreted via kidneys; half-life 6 hr, geriatric patients 9 hr, protein binding 52%-59%

INTERACTIONS

Increase: CNS depression—CNS depressants

Increase: toxicity due to decreased eszopiclone elimination—CYP3A4 inhibitors (clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin, SSRIs)

Decrease: eszopiclone effect—CYP3A4 inducers (dexamethasone, barbiturates, carBAMazepine, OXcarbazepine, phenytoin, fosphenytoin, ethotoin)

Drug/Food

Decrease: product action—food

Drug/Herb

Decrease: eszopiclone effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Sleep pattern:** ability to go to sleep, stay asleep, early morning awakenings, conservative methods used
- For abuse of this product, other products
- **Anaphylaxis, angioedema:** monitor during first dose

• **CNS depression/suicidal thoughts, behaviors:** assess for these symptoms
• Alternative methods to improve sleep: reading, quiet environment, warm bath, milk
• Assistance with ambulation; night light, call bell within reach
• **Beers:** avoid in older adults with delirium or at high risk for delirium
• **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected; avoid breastfeeding

Evaluate:
• Therapeutic response: ability to fall asleep and stay asleep throughout the night

Teach patient/family:
• That daytime drowsiness may occur; not to engage in hazardous activities until effect is known; that memory problems may occur
• That all other medications and supplements should be avoided unless approved by prescriber; to avoid alcohol
• To notify prescriber if pregnancy is suspected or planned
• To avoid use after a high-fat meal
• To swallow tablet whole
• To notify prescriber of facial swelling, rash, complex sleep disorders (sleep driving, sleep eating), change in thinking or behavior
• That tolerance and dependence may occur after extended use
• To take immediately prior to going to bed
• To be aware of CNS depression and suicidal thoughts/behaviors, report at once

etanercept (Rx)

(eh-tan′er-sept)

Enbrel, Enbrel SureClick, Erelzi, Eticovo

Func. class.: Antirheumatic agent (disease modifying) (DMARD)

Chem. class.: Anti-TNF agent

ACTION: Binds tumor necrosis factor (TNF), which is involved in immune and inflammatory reactions

USES: Acute, chronic rheumatoid arthritis that has not responded to other disease-modifying agents, polyarticular course of juvenile rheumatoid arthritis (JRA), ankylosing spondylitis, plaque psoriasis, psoriatic arthritis

Unlabeled uses: Crohn's disease; plaque psoriasis (child ≥4 yr)

CONTRAINDICATIONS: Sepsis

Precautions: Pregnancy, breastfeeding, children <4 yr, geriatric patients, malignancies, HF, seizures, multiple sclerosis, latex hypersensitivity

Black Box Warning: Infection, lymphoma, neoplastic disease, TB

DOSAGE AND ROUTES

RA/ankylosing spondylitis
• **Adult: SUBCUT** 50 mg/wk or 25 mg 2×/wk, 3-4 days apart
• **Child 2-17 yr: SUBCUT** 0.8 mg/kg/wk, max 50 mg/wk

Plaque psoriasis
• **Adult: SUBCUT** 50 mg (Enbrel) 2×/wk × 3 mo, then 50 mg weekly maintenance or 50 mg (Erelzi) 2×/wk × 3 mo, then weekly
• **Adolescent/child 4-17 yr (unlabeled): SUBCUT** 0.8 mg/kg/wk, max 50 mg/wk

Juvenile rheumatoid arthritis (JRA)
• **Adolescent/child 2-17 yr: SUBCUT** 0.8 mg/kg/wk, max 50 mg/wk

Psoriatic arthritis (Enbrel only)
• **Adult: SUBCUT** 50 mg weekly

Available forms: Powder for injection 25 mg; injection 50 mg/mL; autoinjector, single use

Administer:
• May be administered by the patient or a caregiver
• The needle caps on the prefilled syringe and on the SureClick autoinjector contain dry natural rubber (latex) and should not be handled by persons sensitive to this product

Injectable route

• Inspect for particulate matter and discoloration prior to use, solution should be clear and colorless, small white particles may be seen in the autoinjector or prefilled syringe

Subcut route

• Injection sites include front of the thigh, abdomen except the 2 inches around the navel, or outer area of the upper arm; rotate injection sites; do not administer where skin is tender, bruised, red, or hard

• Do not mix or transfer the contents of one vial into another vial; do not filter reconstituted product during preparation or administration; do not add other medications to solutions containing etanercept; ONLY use the supplied diluent

• A vial adapter is supplied when reconstituting the powder; the adapter should not be used if multiple doses are to be withdrawn

• If the vial will be used for multiple doses, use a 25-gauge needle for reconstituting and withdrawing

• Use as soon as possible after reconstitution; place reconstituted vials for multiple doses in the refrigerator at 36°F-46°F (2°C-8°C) within 4 hr of reconstitution; may be stored up to 14 days; do not freeze

Use of the SureClick autoinjector

• Warm to room temperature, do not shake; immediately prior to use, remove the needle shield by pulling it straight off

Use of the prefilled syringe

• **Single-use:** warm to room temperature, do not shake; remove the needle shield

SIDE EFFECTS

CNS: *Headache,* asthenia, dizziness, seizures

CV: Heart failure

GI: Abdominal pain, dyspepsia, vomiting, hepatitis, diarrhea

HEMA: Pancytopenia, anemia, thrombocytopenia, leukopenia, neutropenia

INTEG: Rash, *injection site reaction,* keratoderma blenorrhagicum

RESP: *Pharyngitis, cough, URI, non-URI,* sinusitis, *rhinitis*

SYST: Serious infections, sepsis, death, malignancies, Stevens-Johnson syndrome, reactivation of hepatitis B virus, lupus-like syndrome

PHARMACOKINETICS

Elimination half-life 102 hr, 60% absorbed (SUBCUT)

INTERACTIONS

Increase: neutropenia—sulfaSALAzine

• Do not give concurrently with live virus vaccines; immunizations should be brought up to date before treatment

• Avoid use with anakinra, cyclophosphamide, rilonacept

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

• **RA:** pain, stiffness, ROM, swelling of joints prior to, during, after treatment

Black Box Warning: Secondary malignancy: assess for lymphoma and other neoplastic diseases in children and adolescents; avoid use in those with a history of malignancy

• For injection site pain, swelling; usually occurs after 2 injections (4-5 days)

Black Box Warning: Infection: patients using immunosuppressives, corticosteroids, methotrexate at greater risk; assess for fever, discontinue in serious infection; do not use in active infection; obtain TB testing prior to use; TB must be treated prior to use

• **Hypersensitivity:** to this product, latex needle cap, benzyl alcohol; usual reactions to product last 3-5 days

• **Pregnancy/breastfeeding:** use only if clearly needed; use cautiously in breastfeeding; enroll in pregnancy surveillance program, Amgen (800-772-6436)

Evaluate:

• Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:
- That product must be continued for prescribed time to be effective
- To use caution when driving; dizziness may occur
- Not to receive live vaccinations during treatment
- About self-administration if appropriate: injection should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from previous site, check for injection reactions that last 3-5 days
- To notify prescriber of possible infection (upper respiratory, other)

etelcalcetide (Rx)

(e-tel-kal′-se-tide)

Parsabiv

Func. class.: Parathyroid analog

USES: For the treatment of secondary hyperparathyroidism in adults with chronic kidney disease on hemodialysis

DOSAGE AND ROUTES

Secondary hyperparathyroidism in patients with chronic kidney disease on hemodialysis
- **Adult: IV** 5 mg 3×/wk at the end of hemodialysis treatment, max 15 mg 3×/wk

For patients switching from cinacalcet to etelcalcetide
- **Adult: IV:** 5 mg 3×/wk at the end of hemodialysis treatment after discontinuing cinacalcet for at least 7 days

Available forms: Injection 2.5 mg/0.5 mL, 5 mg/mL, 10 mg/2 mL single dose

ethacrynate (Rx)

(eth-uh-KRIH′nayt)

Edecrin

Func. class.: Diuretic

Chem. class.: Loop diuretic

ACTIONS:

Primarily acts to inhibit the reabsorption of sodium and chloride in the ascending limb of the loop of Henle

USES:

Treatment of peripheral edema (idiopathic edema, lymphedema, or edema secondary to ascites, heart failure, or nephrotic syndrome)

CONTRAINDICATIONS

Hypersensitivity, acute myocardial infarction, anuria, breastfeeding, heart failure, pregnancy, renal failure

Precautions: Acid/base imbalance, breastfeeding, children, dehydration, diabetes mellitus, diarrhea, electrolyte imbalance, geriatric, gout, hearing impairment, hepatic disease, hepatic encephalopathy, hyperaldosteronism, hyperglycemia, hyperglycemia, hyperuricemia, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hypotension, hypovolemia, infants, metabolic alkalosis, orthostatic hypotension, pancreatitis, pregnancy, renal disease, renal failure, sympathectomy, syncope, systemic lupus erythematosus (SLE), ventricular arrhythmias

DOSAGE AND ROUTES

- **Adults:** PO initially, 50 to 100 mg/day divided once or twice daily. May increase by 25 to 50 mg/day, max dosage is 200 mg bid; IV initially, 50 mg or 0.5 to 1 mg/kg, usually 1 dose is sufficient
- **Children and adolescents:** PO initially, 1 mg/kg daily, may increase up to 3 mg/kg/day, adjust dosage at intervals of 2 to 3 days
- **Children and adolescents (unlabeled):** IV initially, 1 mg/kg daily

Available forms: Tablets 25 mg; injection 50 mg/vial

Administer

PO route
- Administer after meals

IV route
- Do not administer SUBCUT or IM because of local pain and irritation
- Reconstitute vial containing ethacrynate sodium equivalent to 50 mg of ethacrynic acid by adding 50 mL of 5% dextrose injection or 0.9% sodium chloride injection. The resulting IV solution contains the equivalent of 1 mg/mL of ethacrynic acid. If 5% dextrose

injection with a pH ≤5 is used, a hazy or opalescent solution may develop and should not be used
• Infuse slowly IV over 20-30 min through freely running IV infusion or inject directly over several min

SIDE EFFECTS

CNS: Headache, confusion, fatigue, anxiety, vertigo, syncope
GI: Anorexia, GI bleeding, diarrhea, jaundice, nausea, pancreatitis, vomiting, increased LFTs
HEMA: Agranulocytosis, thrombocytopenia, neutropenia
GU: Azotemia, hematuria, polyuria, oliguria
EENT: Blurred vision, hearing loss
CV: Orthostatic hypotension, hypovolemia, tinnitus
META: Hyperglycemia, hyperuricemia, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia
MISC: Fever, chills, injection site reaction, muscle cramps, rash

PHARMACOKINETICS

PO: Onset 30 min, peak 2 hr, duration 6-8 hr
IV: Onset rapid, peak 15-30 min, duration 2 hr
Half-life: 2-4 hr

INTERACTIONS

Increase: ototoxic effect—aminoglycosides, antibiotics, CISplatin
Increase: hypotension—antihypertensives
Increase: digoxin toxicity—cardiac glycosides, monitor drug level of digoxin
Increase: diuresis—thiazides
Increase: toxicity—lithium
Decrease: hypoglycemic effects—antidiabetics
Decrease: diuresis—NSAIDs
Drug/Herb
Increase: effect—hawthorn, horse chestnut
Decrease: effect of bumetanide—ginseng, ephedra
Drug/Lab
Increase: glucose
Decrease: chloride, potassium, sodium, calcium, phosphorus

NURSING CONSIDERATIONS

Assess:
• For tinnitus, hearing loss, ear pain; obtain audiometric testing for long-term IV treatment

Black Box Warning: Dehydration: weight, I&O daily to determine fluid loss; if urinary output decreases or azotemia occurs, product should be discontinued; safest dosage schedule is alternate days

• B/P lying, standing; postural hypotension may occur

Black Box Warning: **Fluid and electrolyte depletion:** potassium, sodium, calcium; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, calcium, magnesium; severe electrolyte depletion should be corrected prior to starting treatment

• Blood glucose if patient is diabetic; blood uric acid levels in those with gout
• Improvement in edema of feet, legs, sacral area daily if medication is being used for HF
• Signs of metabolic alkalosis: drowsiness, restlessness
• Hypokalemia: postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness
• Rashes, temperature elevation daily
• Confusion, especially in geriatric patients; take safety precautions if needed
• Digoxin toxicity in patients taking digoxin products: anorexia, nausea, vomiting, confusion, paresthesia, muscle cramps; lithium toxicity in those taking lithium
• Beers: use cautiously in older adults; may cause or exacerbate syndrome of inappropriate antidiuretic hormone secretion
Evaluate:
• Therapeutic response: decreased edema, B/P

Teach patient/family:
- To increase fluid intake to 2-3 L/day unless contraindicated; to take potassium supplement; to rise slowly from lying or sitting position
- To recognize adverse reactions: muscle cramps, weakness, nausea, dizziness, edema, weight gain
- To take with food, milk for GI symptoms; to avoid alcohol
- To take early in day to prevent nocturia; if another dose is needed, take after noon, not to double or miss dose
- To take B/P, pulse, weight weekly
- That orthostatic hypotension may occur, to avoid rising rapidly
- To continue other medical regimens
- Pregnancy/breastfeeding: to report if pregnancy is planned or suspected or if breastfeeding
- That continuing exams and blood work will be needed
- To notify other health care professionals of condition being treated, medications taken

TREATMENT OF OVERDOSE:
Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

ethambutol (Rx)
(e-tham'byoo-tole)
Etibi, Myambutol
Func. class.: Antitubercular
Chem. class.: Diisopropylethylene diamide derivative

ACTION: Inhibits RNA synthesis, decreases tubercle bacilli replication

USES: Pulmonary TB as an adjunct, other mycobacterial infections

CONTRAINDICATIONS: Children <13 yr, hypersensitivity, optic neuritis
Precautions: Pregnancy, breastfeeding, renal disease, diabetic retinopathy, cataracts, ocular defects, hepatic and hematopoietic disorders

DOSAGE AND ROUTES
- **Adult/child >13 yr: PO** 15-25 mg/kg/day as single dose (treatment naive) or 25 mg/kg daily (treatment experienced)

Renal disease
- **Adult: PO** CCr 10-50 mL/min, dose q24-36hr; CCr <10 mL/min, dose q48hr

Retreatment
- **Adult: PO** 25 mg/kg/day as single dose × 2 mo with at least 1 other product, then decrease to 15 mg/kg/day as single dose, max 2.5 g/day
- **Child: PO** 15 mg/kg/day

Available forms: Tablets 100, 400 mg
Administer:
- With meals to decrease GI symptoms
- Antiemetic if vomiting occurs
- After C&S completed; monthly to detect resistance
- 4 hr between this product and antacids

SIDE EFFECTS
CNS: *Headache, confusion,* fever, malaise, dizziness, *disorientation,* hallucinations, peripheral neuropathy
EENT: Blurred vision, optic neuritis, photophobia, decreased visual acuity
GI: *Abdominal distress, anorexia, nausea, vomiting*
INTEG: Dermatitis, pruritus, toxic epidermal necrolysis, erythema multiforme
META: *Elevated uric acid, acute gout,* impaired hepatic function
MISC: Thrombocytopenia, joint pain, anaphylaxis

PHARMACOKINETICS
Peak 2-4 hr, half-life 3 hr, metabolized in liver, excreted in urine (unchanged product/inactive metabolites, unchanged product in feces)

INTERACTIONS
- Delayed absorption of ethambutol: aluminum salts, separate by 4 hr
- Neurotoxicity: other neurotoxics

NURSING CONSIDERATIONS
Assess:

- Hepatic studies weekly × 2 wk, then q2mo: ALT, AST, bilirubin; decreased appetite, jaundice, dark urine, fatigue
- Signs of anemia: Hct, Hb, fatigue
- Mental status often: affect, mood, behavioral changes; psychosis may occur
- C&S, including sputum, prior to treatment
- Visual status: decreased acuity, altered color perception
- **Serious skin reactions:** toxic epidermal necrolysis
- **Pregnancy/breastfeeding:** use only if benefit outweighs risk to fetus; product appears in breast milk

Evaluate:
- Therapeutic response: decreased symptoms of TB, decrease in acid-fast bacteria

Teach patient/family:
- To avoid alcohol products
- That compliance with dosage schedule, duration is necessary
- That scheduled appointments must be kept or relapse may occur
- To report to prescriber any visual changes; rash; hot, swollen, painful joints; numbness, tingling of extremities

etodolac (Rx)

(ee-toe′doe-lak)

Ultradol

Func. class.: Nonsteroidal antiinflammatory/nonopioid analgesic

ACTION: Inhibits COX-1, COX-2; analgesic, anti-inflammatory

USES: Mild to moderate pain, osteoarthritis, rheumatoid arthritis, arthralgia, myalgia, juvenile rheumatoid arthritis

CONTRAINDICATIONS: Hypersensitivity; patients in whom aspirin, iodides, or NSAIDs have produced asthma; urticaria; coronary artery bypass graft surgery (CABG)

Precautions: Edema, renal/hepatic disease, children, GI ulcers, geriatric patients, bronchospasm, nasal polyps, alcoholism, bone marrow suppression, MI, hemophilia, neutropenia, ulcerative colitis, pregnancy, breastfeeding

Black Box Warning: GI bleeding, perforation, MI, stroke

DOSAGE AND ROUTES

Osteoarthritis
- **Adult: PO** 300 mg bid-tid, or 400-500 mg bid initially, then adjust dosage to 600-1200 mg/day in divided doses; max 1200 mg/day; extended release 400-1000 mg daily

Rheumatoid arthritis
- **Adult: PO** 300 mg bid-tid or 400-500 mg bid (regular release); maintenance **PO** 400-1000 mg/day (extended release) or 600-1000 mg/day divided 2-4 times, max 1200 mg/day (regular release)

Analgesia
- **Adult: PO** 200-400 mg q6-8hr up to 1000 mg daily; max 1200 mg/day; patients <60 kg, max 20 mg/kg; extended release 400-1000 mg daily

Available forms: Capsules 200, 300 mg; tablets 400, 500 mg; extended release 400, 500, 600 mg

Administer:
Without regard to food
- Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, light headedness, vertigo

CV: Tachycardia, peripheral edema, fluid retention, palpitations, dysrhythmias, HF

EENT: Tinnitus, hearing loss, blurred vision, photophobia

GI: Nausea, anorexia, vomiting, diarrhea, jaundice, cholestatic hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, dyspepsia, GI bleeding

GU: Nephrotoxicity: dysuria, hematuria, oliguria, azotemia, cystitis, UTI
HEMA: Blood dyscrasias
INTEG: Erythema, urticaria, purpura, rash, pruritus, sweating, Stevens-Johnson syndrome
SYST: Angioedema, anaphylaxis

PHARMACOKINETICS

Peak $1^1/_2$-2 hr, serum protein binding >99%, half-life 7 hr; metabolized by liver (metabolites excreted in urine)

INTERACTIONS

Increase: toxicity—cycloSPORINE, digoxin, lithium, methotrexate, phenytoin, cidofovir, aminoglycosides

Black Box Warning: Increase: GI toxicity—aspirin, NSAIDs

Decrease: effect of etodolac—antacids
Decrease: effect of beta-blockers, diuretics
Drug/Lab Test
Increase: BUN, creatinine
Decrease: Hb/Hct, WBC

NURSING CONSIDERATIONS

Assess:
- **Pain:** location, frequency, characteristics; relief after medication
- Blood, renal, liver tests: BUN, creatinine, AST, ALT, Hb, platelets prior to treatment, periodically thereafter

Black Box Warning: For GI bleeding: black stools, hematemesis

- **Pregnancy/breastfeeding:** avoid use unless benefit outweighs risks; avoid in third trimester due to constriction of fetal ductus arteriosus; do not breastfeed

Evaluate:
- Therapeutic response: decreased pain, stiffness, swelling in joints, ability to move more easily

Teach patient/family:
- To report blurred vision or ringing, roaring in the ears; might indicate toxicity
- Not to break, crush, or chew extended-release tablets
- To report change in urine pattern, weight increase, edema, pain increase in joints, fever, blood in urine; indicates nephrotoxicity
- That therapeutic effects can take up to 1 mo

Black Box Warning: To avoid aspirin, NSAIDs, acetaminophen, alcoholic beverages while taking this medication

E

⚠ HIGH ALERT

etoposide (Rx)

(e-toe-poe′side)
VePesid

etoposide phosphate (Rx)

Etopophos
Func. class.: Antineoplastic—miscellaneous
Chem. class.: Semisynthetic podophyllotoxin

ACTION: Inhibits cells from entering mitosis, depresses DNA/RNA synthesis, cell-cycle–specific S and G_2; binds to a complex of DNA and topoisomerase II, leading to DNA strand breaks

USES: Testicular cancer, small cell lung cancer
Unlabeled uses: Leukemias (ALL, AML), desmoid tumor, gastric/ovarian cancer, bone marrow ablation, Hodgkin's/non-Hodgkin's lymphoma, malignant glioma, neuroblastoma, stem cell transplant preparation, trophoblastic disease

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity
Precautions: Children, renal/hepatic disease, gout, neutropenia, thrombocytopenia, infection, bleeding

Black Box Warning: Bone marrow depression, bleeding, infection; requires an experienced clinician

DOSAGE AND ROUTES

Testicular cancer

• **Adult: IV** 100 mg/m^2/day on days 1, 2 in combination with bleomycin and CISplatin (BEP) or 100 mg/m^2/day on days 1, 3, 5, repeat q3-4wk

Small cell lung carcinoma first-line treatment with CISplatin

• **Adult: IV** 50 mg/m^2/day over 5 min-3.5 hr 5 days of a 21-day cycle

Renal dose

• **Adult: IV** CCr 45-60 mL/min, reduce dose by 15%; CCr 30-44 mL/min, reduce dose by 20%; CCr <30 mL/min, reduce dose by 25%

Hepatic dose

• **Adult: IV/PO** total bilirubin 1.5-2.9 mg/dL: reduce dose by 50%; total bilirubin 3-5 mg/dL: reduce dose by 75%; total bilirubin >5 mg/dL: hold

Available forms: Injection 20 mg/mL; 100 mg powder for injection, capsules 50 mg

Administer:

• Antiemetic 30-60 min prior to product and prn to prevent vomiting

Urate nephropathy

• Allopurinol, aggressive alkalinization to maintain uric acid levels

• Antispasmodic, EPINEPHrine, corticosteroids, antihistamines for reactions

PO route

• Give without regard to food

• Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation

• Refrigerate oral product; do not freeze

IV route

• Do not use acrylic or ABS plastic devices; may crack, leak

Intermittent IV INFUSION route (etoposide)

• Use cytotoxic handling procedures, use Luer-Lok fittings to prevent leakage

• After **diluting** 5-mL vial with 100 mg/250 mL or more D_5W or NaCl to 0.2-0.4 mg/mL, **infuse** over 30-60 min

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, dilTIAZem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, NS, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine,

piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

Intermittent IV INFUSION route (etoposide phosphate)

- **Reconstitute** each vial with 5 or 10 mL of D_5W, 0.9% NaCl for concentrations of 20 mg/mL or 10 mg/mL, respectively; may give diluted or undiluted to concentrations of as little as 0.1 mg/mL, **give** over 5-10 min

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, HCL/liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, plicamycin, polymyxin B, potassium chloride/phosphates, procainamide, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, *fever,* peripheral neuropathy, paresthesias, confusion, chills, fever

CV: *Hypotension,* MI, dysrhythmias

GI: *Nausea, vomiting, anorexia,* hepatotoxicity, dyspepsia, diarrhea, constipation

GU: Nephrotoxicity

HEMA: Thrombocytopenia, leukopenia, myelosuppression, anemia
INTEG: *Rash, alopecia,* phlebitis at IV site, Stevens-Johnson syndrome
RESP: Bronchospasm
SYST: Anaphylaxis, secondary malignancy

PHARMACOKINETICS

Half-life ½-2 hr (initial), terminal 5¼ hr, metabolized in liver, excreted in urine, feces, crosses placental barrier, protein binding 95%

INTERACTIONS

Increase: bone marrow depression—other antineoplastics, radiation, immunosuppressives
Increase: adverse reactions—live virus vaccines, toxoids
Increase: effect of etoposide, toxicity—voriconazole, conivaptan, cycloSPORINE, imatinib, nilotinib, etravirine, telithromycin
Increase: risk of bleeding—anticoagulants, NSAIDs, platelet inhibitors, thrombolytics, salicylate
Decrease: etoposide effect—sargramostim, filgrastim, separate by ≥24 hr

Drug/Food

- Decreased oral etoposide—grapefruit juice

Drug/Lab Test

Decrease: platelets, RBC, WBC, neutrophils, Hb, calcium, phosphate
Increase: uric acid, potassium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is <500/mm^3 or platelet count is <50,000/mm^3; notify prescriber, treatment should be delayed

- **Nephrotoxicity:** BUN; serum uric acid; urine CCr; electrolytes prior to, during therapy; I&O ratio; report fall in urine output to <30 mL/hr; check B/P bid, report any significant decrease

Black Box Warning: Infection: monitor temperature, fever may indicate beginning infection; treat active infection before treatment

- **Hepatotoxicity:** hepatic studies prior to, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; monitor jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning: Bleeding: hematuria, guaiac stools, bruising or petechiae, mucosa or orifices q8hr

- Effects of alopecia on body image; discuss feelings about body changes
- B/P q15min during infusion; if systolic reading <90 mm Hg, discontinue infusion, notify prescriber
- Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Injection site reaction:** monitor site closely for infiltration
- Local irritation, pain, burning, discoloration at injection site
- **Symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing, restlessness, coughing, difficulty breathing
- **Frequency of stools, characteristics:** cramping, acidosis
- **Signs of dehydration:** rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness
- **Geriatric patients:** increased alopecia, GI effects, infection, nephrotoxicity, myelosuppression

Black Box Warning: An experienced clinician knowledgeable in the use of cytotoxic products

• **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding unless benefits to mother outweigh risk to fetus

Evaluate:

• Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

• To report any changes in breathing or coughing

• That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture

• That metallic taste may occur

• **Infection:** to report symptoms of infection (fever, sore throat); to avoid crowds, persons with known infections

• To avoid immunizations

• **Pregnancy/breastfeeding:** to notify prescriber if pregnancy is planned or suspected; to use reliable contraception during and for several mo after therapy; to avoid breastfeeding

• To take as prescribed (PO), not to double dose

• To report signs of infection (flulike symptoms, fever, fatigue, sore throat)

• To check B/P, hypotension occurs

etravirine (Rx)

(e-tra′veer-een)

Intelence

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

ACTION: Binds directly to reverse transcriptase, thus blocking the RNA- and DNA-dependent DNA polymerase action and causing a disruption of the enzyme's catalytic site

USES: In combination with other antiretroviral agents for HIV infection in treatment-experienced patients with evidence of HIV replication despite ongoing antiretroviral therapy

CONTRAINDICATIONS: Breastfeeding, hypersensitivity

Precautions: Pregnancy, children, geriatric patients, impaired hepatic function, antimicrobial resistance, hepatitis, hypercholesterolemia, hypertriglycerides, immune reconstitution syndrome

DOSAGE AND ROUTES

• **Adult/child/adolescent ≥6 yr, ≥30 kg:** **PO** 200 mg bid

• **Child/adolescent ≥6 yr, 25 to 29 kg:** **PO** 150 mg bid

• **Child/adolescent ≥6 yr, 20 to 24 kg:** **PO** 125 mg bid

• **Child/adolescent ≥6 yr, 16 to 19 kg:** **PO** 100 mg bid

Available forms: Tablets 25, 100, 200 mg

Administer:

In combination with other antiretrovirals with food or after a meal

• Tablets may be dispersed in ≥5 mL of water; once dispersed, stir well, give immediately, rinse glass, have patient drink to ensure all medication taken

• Store in cool environment; protect from light

SIDE EFFECTS

CNS: *Headache, insomnia,* amnesia, anxiety, confusion, fatigue, nightmares, peripheral neuropathy, seizures, stroke, tremor

CV: Atrial fibrillation, hypertension, MI

EENT: Blurred vision

GI: *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, increased AST/ALT, constipation, flatulence, gastritis, GERD, hematemesis, hepatitis, hepatomegaly, pancreatitis

GU: Renal failure

HEMA: Hemolytic anemia, neutropenia, thrombocytopenia, anemia

INTEG: *Rash,* erythema multiforme, angioedema, Stevens-Johnson syndrome

MS: Rhabdomyolysis

OTHER: Diabetes mellitus, gynecomastia, hyperamylasemia, hypercholesterolemia, hyperglycemia, hyperlipidemia

RESP: Dyspnea, bronchospasm

SYST: DRESS

PHARMACOKINETICS

99.9% plasma protein binding; metabolized by CYP3A4, 2C9, 2C19; half-life 21-61 hr; excreted in feces

INTERACTIONS

- Do not use concurrently with atazanavir, carBAMazepine, delavirdine, fosamprenavir, fosphenytoin, phenytoin, PHENobarbital, rifapentine, rifAMPin, tipranavir, rilpivirine
- Altered effect of cycloSPORINE, tacrolimus, sirolimus

Increase: myopathy, rhabdomyolysis—HMG-CoA reductase inhibitors

Increase: etravirine levels—CYP3A4 inhibitors (fluconazole, itraconazole, ketoconazole, lopinavir, posaconazole, ritonavir, voriconazole)

Increase: withdrawal symptoms—methadone

Increase: levels of diazePAM, rifAMPin, voriconazole, warfarin

Decrease: levels of CYP3A4 inducers (amiodarone, atazanavir, clarithromycin, flecainide, fosamprenavir, lidocaine, mexiletine, propafenone, quiNIDine, sildenafil, tadalafil, vardenafil)

Decrease: etravirine levels—darunavir, dexamethasone, disopyramide, efavirenz, nevirapine, ritonavir, saquinavir, tipranavir

Drug/Herb

Decrease: etravirine—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Symptoms of HIV, possible infections:** increased temperature
- **HIV:** monitor viral load, CD4 counts, plasma HIV RNA during treatment; watch for decreasing granulocytes, Hb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; cholesterol/lipid profile
- **Fatal hypersensitivity reactions:** fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted; incidence of rash may be worse in women
- **Blood dyscrasias (anemia, granulocytopenia):** bruising, fatigue, bleeding, poor healing
- **Renal failure:** BUN, serum uric acid, CCr prior to, during therapy; may be elevated throughout treatment
- **Hepatitis/pancreatitis:** hepatic studies prior to and during therapy: bilirubin, AST, ALT, amylase, alkaline phosphatase, creatine phosphokinase, creatinine, monthly
- **Pregnancy/breastfeeding:** use only if benefits outweigh risk; enroll pregnant patients in the Antretroviral Pregnancy Registry (800-258-4263); do not breastfeed

Evaluate:

- Therapeutic response: increased CD4 count, decreased viral load

Teach patient/family:

- That product is not a cure but will control symptoms; that patient is still infective, may pass AIDS virus to others
- To notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur; to stop product and notify prescriber immediately if skin rash, fever, cough, SOB, GI symptoms occur; to advise all health care providers that allergic reaction has occurred with etravirine
- That follow-up visits must be continued, since serious toxicity may occur; blood counts must be performed
- To use contraception during treatment; that patient is still able to transmit disease
- About information on medication guide and warning card; discuss points on guide
- That other products may be necessary to prevent other infections
- To take medication after a meal

⚠ HIGH ALERT

everolimus (Rx)

(e-ve-ro′li-mus)

Afinitor, Afinitor Disperz, Zortress

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Kinase inhibitor

Do not confuse:
everolimus/sirolimus/tacrolimus/temsirolimus

ACTION: Proliferation signal inhibitor that inhibits mammalian target of rapamycin (mTOR); this pathway is dysregulated in cancer

USES: Renal cell cancer in those with failed treatment with SORAfenib or SUNItinib kidney transplant rejection prophylaxis with cycloSPORINE, subependymal giant cell astrocytoma, progressive pancreatic neuroendocrine tumor (PNET) with unresectable locally advanced/metastatic disease, breast cancer hormone receptor positive/HER-2 negative, renal angiomyolipoma, tuberous sclerosis complex, liver transplant rejection prophylaxis

CONTRAINDICATIONS: Breastfeeding; hypersensitivity to this product, Rapamune, Torisel, pregnancy
Precautions: Children, renal/hepatic disease, diabetes mellitus, hyperlipidemia, pleural effusion

Black Box Warning: Immunosuppression, infection, renal artery thrombosis, renal impairment, renal vein thrombosis, neoplastic disease, heart transplant

DOSAGE AND ROUTES

Prophylaxis (Zortress)
• **Adult: PO** 0.75 mg q12hr with cycloSPORINE in combination with basiliximab, corticosteroids, reduced doses of cycloSPORINE

Liver transplant rejection prophylaxis
• **Adult: PO** 1 mg bid starting at least 30 days after transplant in combination with reduced-dose tacrolimus and corticosteroids

Advanced renal cancer (Afinitor)
• **Adult: PO** 10 mg daily as long as clinically beneficial; with strong 3A4 inducers 10 mg daily, then may increase by 5-mg increments to 20 mg daily

Progressive neuroendocrine tumor (PNET) (Afinitor only)
• **Adult: PO** 10 mg daily, reduce dose to 5 mg daily if intolerable adverse reactions occur

Subependymal giant-cell astrocytoma (SEGA) (Afinitor only)
• **Adult/adolescent/child:** 4.5 mg/m^2 daily, then titrate to a target trough of 5-15 ng/mL

Hepatic dose
• **Adult:** PO (Child-Pugh A) Afinitor: 7.5 mg/day; (Child-Pugh B) Afinitor: 5 mg/day, Zortress: 0.75 mg/day divided q12hr; (Child-Pugh C) Afinitor: 2.5 mg/day

Available forms: Tablets 0.25, 0.5, 0.75 mg (Zortress); 2.5, 5, 7.5, 10 mg (Afinitor); tablets for oral suspension 2, 3, 5 mg (Afinitor Disperg)

Administer:
Follow procedure for proper handling of antineoplastics
• Swallow tablets whole with a full glass of water; do not chew, crush, or break
• **Afinitor:** take at same time of day; if unable to swallow, consistently with or without food, disperse in 30 mL of water
• **Zortress:** must take consistently with/without food, give at same time of day q12hr with cycloSPORINE
• Store protected from light at room temperature

Afinitor adjustments for toxicity
Noninfectious pneumonitis
• **Grade 1:** asymptomatic with radiographic findings only: no dosage change
• **Grade 2:** symptomatic but no interference with activities of daily living (ADLs): consider withholding therapy, resume Afinitor at a lower dosage when symptoms improve to ≤grade 1; discontinue Afinitor if symptoms do not improve within 4 wk
• **Grade 3:** symptomatic and interfering with ADL and oxygen therapy indicated: hold therapy; consider resuming Afinitor at a lower dosage when symptoms improve to ≤grade 1; consider discontinuing Afinitor if grade 3 toxicity recurs

- **Grade 4:** life-threatening and ventilator support indicated: discontinue therapy

Stomatitis

- **Grade 1:** minimum symptoms and normal diet: no dosage adjustment required
- **Grade 2:** symptomatic but can eat and swallow modified diet: hold therapy until symptoms improve to ≤grade 1 and resume Afinitor at the same dosage; if grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dosage when symptoms improve to ≤grade 1
- **Grade 3:** symptomatic and unable to adequately eat or hydrate orally: hold therapy; resume Afinitor at a lower dosage when symptoms improve to ≤grade 1
- **Grade 4:** symptomatic and life-threatening: discontinue therapy

Other nonhematologic toxicity (excluding metabolic events)

- **Grade 1:** No dosage adjustment required if toxicity is tolerable
- **Grade 2:** No dosage adjustment required if toxicity is tolerable; if toxicity is intolerable, hold therapy until symptoms improve to ≤grade 1 and resume Afinitor at the same dosage; if grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dosage when symptoms improve to ≤grade 1
- **Grade 3:** Hold therapy; consider resuming Afinitor at a lower dosage when symptoms improve to ≤grade 1; if grade 3 toxicity recurs, consider discontinuing therapy
- **Grade 4:** Discontinue Afinitor therapy

Metabolic events (hyperglycemia, dyslipidemia)

- **Grade 1 or 2:** No dose adjustment required
- **Grade 3:** Temporarily withhold therapy; resume Afinitor at a lower dosage
- **Grade 4:** Discontinue Afinitor therapy
- **Afinitor Disperz (oral suspension):** wear gloves when preparing, use 10-mL syringe and place dose in syringe, do not crush, break, using 5-mL water and 4-mL air draw into syringe with dose, wait a few minutes until in suspension after use, use same amount of water and air, swirl, give contents

SIDE EFFECTS

CNS: *Headache, insomnia, paresthesia,* chills, fever, seizure, personality changes, insomnia, dizziness, weakness, fatigue
CV: *Hypertension, peripheral edema*
EENT: Blurred vision, photophobia, eyelid edema, epistaxis, sinusitis, cataracts, conjunctivitis
GI: Nausea, vomiting, diarrhea, constipation, stomatitis, anorexia, abdominal pain, dysgeusia, hepatic artery thrombosis
GU: Renal failure, UTI, infertility
HEMA: Anemia, leukopenia, thrombocytopenia, hemolytic uremic syndrome, thrombotic microangiopathy, thrombotic thrombocytopenia, purpura
INTEG: *Rash, acne*, leukocytoclastic vasculitis
META: Hyperglycemia, increased creatinine, *hyperlipidemia,* hypophosphatemia, weight loss, hypertriglyceridemia
RESP: Pleural effusion
SYST: Angioedema, anaphylaxis, lymphoma

PHARMACOKINETICS

Rapidly, well absorbed; peak 1-2 hr; protein binding 74%; extensively metabolized by CYP3A4 enzyme system, P-gp; half-life 30 hr; reduced by high-fat meal; excreted in feces (80%), urine (5%)

INTERACTIONS

Black Box Warning: Increase: nephrotoxicity—immunosuppressants

Increase: everolimus effect—CYP3A4 inhibitors (strong, moderate), antifungals, calcium channel blockers, cimetidine, danazol, erythromycin, cycloSPORINE, HIV-protease inhibitors
Decrease: everolimus effect—CYP3A4 inducers, carBAMazepine, PHENobarbital, phenytoin, rifamycin, rifapentine
Decrease: effect of live vaccines

Drug/Herb

- St. John's wort: may decrease effect of everolimus

Drug/Food
• Alters bioavailability; use consistently with/without food; do not use with grapefruit juice
Drug/Lab Test
Increase: bilirubin, calcium, cholesterol, glucose, potassium, lipids, phosphate, triglycerides, uric acid
Decrease: calcium, glucose, potassium, magnesium, phosphate

NURSING CONSIDERATIONS

Assess:
• **Lipid profile:** cholesterol, triglycerides, lipid-lowering agent may be needed; blood glucose

Black Box Warning: Immunosuppression: CBC with differential during treatment monthly; if leukocytes <3000/mm^3 or platelets <100,000/mm^3, product should be discontinued or reduced; decreased hemoglobin level may indicate bone marrow suppression

• **Hepatic/renal studies:** AST, ALT, amylase, bilirubin, creatinine, phosphate, and for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued
• **Pneumonitis:** continuing cough, dyspnea, pleural effusion baseline and during treatment, use corticosteroids if needed, if severe, reduce dose or discontinue

Black Box Warning: Infection: bacterial fungal infections can occur and are more common with combination immunosuppression therapy; assess for fever, cough, dyspnea, fatigue

Black Box Warning: May result in graft loss within 30 days after transplantation

• Obtain everolimus blood levels in kidney transplant, hepatic disease, CYP3A4 inducers, inhibitors

• **Pregnancy/breastfeeding:** avoid in pregnancy; use adequate contraception during and for 12 wk after final dose; report exposure to the National Transplant Pregnancy Registry (877-955-6877); do not breastfeed
Evaluate:
• Therapeutic response: decreased spread of tumor; prevention of transplant rejection
Teach patient/family:

Black Box Warning: To report fever, rash, severe diarrhea, chills, sore throat, fatigue; serious infections may occur; to report clay-colored stools, cramping (hepatotoxicity)

Black Box Warning: To avoid crowds, persons with known infections to reduce risk for infection

• Not to use with grapefruit juice
• To avoid individuals recently vaccinated with live vaccines; children may require accelerated vaccine schedule before treatment
• That frequent lab tests are required
• That product may decrease male, female fertility
• That drinking alcohol is not recommended
• To take consistently with or without food
• To report vision changes, weight gain, edema, shortness of breath, impaired wound healing
• **Pregnancy:** to notify prescriber if pregnancy is planned or suspected; to use contraception prior to, during, and 12 wk after product discontinued; to avoid breastfeeding

evolocumab (Rx)

(e′-voe-lok′-ue-mab)

Repatha

Func. class.: Antilipemic
Chem. class.: Proprotein convertase subtilisin/kexin type 9 (PCSK9) inhibitor

ACTION: Binds to low-density lipoproteins, a human monoclonal antibody (IgG1)

USES: Heterozygous, familial hypercholesterolemia, atherosclerotic disease

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, latex sensitivity

DOSAGE AND ROUTES

Primary hyperlipidemia with established clinical atherosclerosis:
- **Adult: SUBCUT** 140 mg q2wk or 420 mg monthly

Homozygous familial hypercholesterolemia:
- **Adult/adolescent: SUBCUT** 420 mg monthly

Disorder of CV system, secondary prophylaxis and primary hypercholesterolemia, alone or in combination with other lipid-lowering therapies
- **Adult: SUBCUT** 140 mg q2wk or 420 mg monthly

Available forms: Autoinjector 140 mg/mL, solutions for injection 120 mg/mL, 140 mg/mL
Administer:
- Visually inspect for particulate matter and discoloration; solution is clear, colorless to pale yellow

SUBCUT route
Prefilled Syringe or SureClick Autoinjector
- If stored in the refrigerator, warm to room temperature for ≥30 min prior to use. Do not shake
- Give into areas of the abdomen (except for a 2-inch area around the umbilicus), thigh, or upper arm that are not tender, bruised, red, or indurated
- To use the 420-mg dose, give 3 injections consecutively within 30 min
- Rotate the site with each injection
- Do not administer with other injectable drugs at the same injection site

Prefilled syringe administration
- Do not pick up or pull the prefilled syringe by the plunger rod or gray needle cap. Hold the syringe by the barrel
- Pull the gray needle cap off. It is normal to see a drop of solution at the end of the needle. Do not remove any air bubbles in the syringe
- Pinch the skin injection site to create a firm surface approximately 2 inches wide. Hold the pinch, and insert the needle into the skin using a 45- to 90-degree angle
- Push the plunger rod all the way down until the syringe is empty
- When done, release the plunger and gently lift the syringe off skin

SureClick autoinjector administration
- Do not remove the orange cap until you are ready to inject
- Pull the orange cap off
- Firmly push down onto the skin when ready to inject; press the gray button. A click should be heard. Keep pushing on the skin and then lift the thumb. The injection could take about 15 sec

SIDE EFFECTS

CV: Hypertension
MS: *Myalgia, back pain, muscle spasms*
INTEG: Pruritus, injection site reaction, erythema, rash

PHARMACOKINETICS

Absorption 40%, distribution extensive, metabolism liver (CYP3A4), excretion urine, feces; onset 4 hr, peak 3-7 days; half-life 2-3 days

INTERACTIONS

None known
Drug/Lab Test
Increase: LFTs
Decrease: cholesterol

NURSING CONSIDERATIONS

Assess:
- **Hypercholesterolemia:** diet history: fat content, lipid levels (triglycerides, LDL, HDL, cholesterol); LFTs at baseline, periodically during treatment

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; cautious use in breastfeeding, excretion is unknown

Evaluate:

• Therapeutic response: decreased cholesterol, LDL; increased HDL

Teach patient/family:

• That compliance is needed

• That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise

• To notify prescriber if pregnancy suspected, planned, or if breastfeeding

• To report confusion, injection site reactions

exemestane (Rx)

(ex-em′eh-stane)

Aromasin

Func. class.: Antineoplastic

Chem. class.: Aromatase inhibitor

USES: Advanced breast carcinoma not responsive to other therapy (postmenopausal), estrogen receptor–positive early breast cancer that has received tamoxifen

CONTRAINDICATIONS:

Pregnancy, breastfeeding, premenopausal women, hypersensitivity

DOSAGE AND ROUTES

• **Adult: PO** 25 mg/day after meals; may need 50 mg/day if taken with a potent CYP3A4 inducer

Available forms: Tablets 25 mg

⚠ HIGH ALERT

exenatide (Rx)

(ex-en′a-tide)

Bydureon, Bydureon BCise, Byetta

Func. class.: Antidiabetic

Chem. class.: Incretin mimetic

ACTION: Binds and activates known human GLP-1 receptor, mimics natural physiology for self-regulating glycemic control

USES: Type 2 diabetes mellitus given in combination with metFORMIN, a sulfonylurea, thiazolidinedione, insulin glargine

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning: Medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2 (MEN-2), thyroid cancer

Precautions: Pregnancy, geriatric patients, severe renal/hepatic/GI disease, pancreatitis, vit D deficiency

DOSAGE AND ROUTES

• **Adult: SUBCUT** 5 mcg bid 1 hr prior to morning and evening meal; may increase to 10 mcg bid after 1 mo; extended release **SUBCUT (Bydureon)** 2 mg q7days

Renal dose

• **Adult:** PO CCr 30-50 mL/min, use caution when increasing dose

Available forms: Injection 5, 10 mcg pen; extended-release powder for suspension for injection 2 mg; Injection: 2 mg/dose single-dose pen

Administer:

Store in refrigerator for unopened pen; may store at room temperature after opening for up to 30 days

SUBCUT route (regular release—Byetta)

• May be used as monotherapy or combined with other products

• SUBCUT only, do not give IV/IM

• Pen needles must be purchased separately, compatible; prime prior to use; inject into thigh, abdomen, upper arm; rotate sites

• Product 1 hr prior to meals, approximately 6 hr apart; if patient is NPO, may need to hold dose to prevent hypoglycemia

• If added to insulin glargine, insulin, or detemir, a dosage reduction in these products may be required

SUBCUT route (extended release—Bydureon)

• Give every 7 days (weekly); the dose can be given at any time of day without regard to meals

• Available as a single-dose tray containing a vial of 2 mg, a prefilled syringe delivering 0.65 mL diluent, a vial connector, and 2 custom needles (23G × 5/16′) specific to this delivery system (one is a spare needle); do not substitute needles or any other components

• Inject immediately after the white to off-white powder is suspended in the diluent and transferred to the syringe

• Inject SUBCUT into the thigh, abdomen, or upper arm, rotate sites to prevent lipodystrophy

SIDE EFFECTS

CNS: *Headache, dizziness,* feeling jittery, restlessness, weakness

ENDO: Hypoglycemia, thyroid hyperplasia

GI: Nausea, vomiting, diarrhea, dyspepsia, anorexia, gastroesophageal reflux, weight loss, pancreatitis

SYST: Angioedema, anaphylaxis

INTEG: Serious injection site reactions (cellulitis, abscess, skin necrosis)

PHARMACOKINETICS

Absorption well, immediate release: peak 2.1 hr, elimination by glomerular filtration, half-life 2.4 hr; extended release: peak 2 wk

INTERACTIONS

• May decrease effect of acetaminophen

• Do not use with erythromycin, metoclopramide

Increase: hypoglycemia—ACE inhibitors, disopyramide, sulfonylureas, androgens, fibric acid derivatives, alcohol

Increase: hyperglycemia—phenothiazines, corticosteroids, anabolic steroids

Decrease: action of digoxin, lovastatin, acetaminophen (elixir)

Decrease: efficacy—niacin, dextrothyroxine, thiazide diuretics, triamterene, estrogens, progestins, oral contraceptives, MAOIs

NURSING CONSIDERATIONS

Assess:

• Fasting blood glucose, A1c levels, postprandial glucose during treatment to determine diabetes control

• **Pancreatitis:** severe abdominal pain with or without vomiting, product should be discontinued

Black Box Warning: Increased risk of thyroid tumors (medullary C-cell tumors)

• **Anaphylaxis, angioedema:** product should be discontinued immediately

• Renal studies: urinalysis, creatinine

• Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give IV $D_{50}W$, then IV dextrose solution

• Nausea, vomiting, diarrhea, ability to tolerate product, may cause dehydration

• **Pregnancy/breastfeeding:** use only if benefits clearly outweigh risks; if pregnant, enroll in the Exenatide Pregnancy Registry (800-633-9081); do not breastfeed

Evaluate:

• Therapeutic response: decrease in polyuria, polydipsia, polyphagia, clear sensorium, improving A1c, weight; absence of dizziness, stable gait

Teach patient/family:

• About the symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry a glucose source (candy, sugar cube) to treat hypoglycemia

• That product must be continued on a daily or weekly basis (extended release); about consequences of discontinuing product abruptly

• That diabetes is a lifelong illness; that product will not cure disease; to carry emergency ID with prescriber and medication information

• To continue weight control, dietary restrictions, exercise, hygiene

• That regular blood glucose monitoring and A1c testing are needed

• To notify prescriber if pregnant or intending to become pregnant

• About the importance of reading "Information for the Patient" and "Pen User Manual"; about self-injection
• **Pancreatitis:** if severe abdominal pain with or without vomiting occurs, seek medical attention immediately
• To review injection procedure; to store product in refrigerator, room temperature after first use; discard 30 days after first use; do not freeze; to protect from light (Byetta)

ezetimibe (Rx)

(ehz-eh-tim'bee)

Ezetrol, Zetia

Func. class.: Antilipemic; cholesterol absorption inhibitor

ACTION: Inhibits absorption of cholesterol by the small intestine, causes reduced hepatic cholesterol stores

USES: Hypercholesterolemia, homozygous familial hypercholesterolemia (HoFH), homozygous sitosterolemia

CONTRAINDICATIONS: Hypersensitivity, severe hepatic disease
Precautions: Pregnancy, breastfeeding, children, hepatic disease

DOSAGE AND ROUTES

• **Adult/adolescent/child >10 yr: PO** 10 mg/day
Available forms: Tablets 10 mg
Administer:
Without regard to meals
• Separate by ≥2 hr prior to or ≥4 hr after bile acid sequestrant, may use with HMG-CoA reductase inhibitors

SIDE EFFECTS

CNS: Fatigue, dizziness, headache
GI: Diarrhea, abdominal pain
MISC: Chest pain
MS: *Myalgias, arthralgias,* back pain, myopathy, rhabdomyolysis
RESP: Pharyngitis, sinusitis, cough, *URI*
EENT: Sinusitis, nasopharyngitis
SYST: Angioedema

PHARMACOKINETICS

Absorption variable, metabolized in small intestine, liver; excreted in feces 78%, urine 11%; peak 4-12 hr; half-life 22 hr

INTERACTIONS

Increase: action of ezetimibe—fibric acid derivatives, cycloSPORINE
Decrease: action of ezetimibe—antacids, bile acid sequestrants
Drug/Lab Test
Increase: LFTs

NURSING CONSIDERATIONS

Assess:
• **Hypercholestrolemia:** diet history: fat content, lipid levels (triglycerides, LDL, HDL, cholesterol); LFTs at baseline, periodically during treatment
• **Myopathy/rhabdomyolysis:** increased CPK, myalgia, muscle cramps, musculoskeletal pain, lethargy, fatigue, fever; more common when combined with statins
• **Pregnancy/breastfeeding:** do not use in pregnancy, breastfeeding
Evaluate:
• Therapeutic response: decreased cholesterol, LDL; increased HDL
Teach patient/family:
• That compliance is needed
• That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
• To notify prescriber if pregnancy suspected, planned, or if breastfeeding
• To notify prescriber if unexplained weakness, muscle pain present
• To notify prescriber of dietary/herbal supplements

ezetimibe/simvastatin (Rx)

(ehz-eh-tim'bee/sim'va-sta-tin)

Vytorin

Func. class.: Antilipemic; cholesterol absorption inhibitor

USES: Hypercholesterolemia, homozygous familial hypercholesterolemia (HoFH), homozygous sitosterolemia

CONTRAINDICATIONS: Hypersensitivity, severe hepatic disease
Precautions: Pregnancy, breastfeeding, children, hepatic disease

DOSAGE AND ROUTES

• **Adults: PO** 1 tablet/day in the evening
Available forms: Tablets 10-10, 10-20, 10-40, 10-80

factor IX complex (Rx)
Profilnine, Profilnine SD

factor IX, human (Rx)
Alphanine SD, Mononine

factor IX, recombinant (Rx)
Alprolix, BeneFIX, Ixinity, Rixubis

Func. class.: Clotting factor

USES: Factor IX deficiency (hemophilia B [Christmas disease])

DOSAGE AND ROUTES
• **Adult: IV** Individualized, check manufacturer's guidelines

Available forms: Injection

factor Xa (Rx)
Andexxa

Func. class.: Antidote

USES: For rivaroxaban reversal and apixaban reversal in patients with life-threatening or uncontrolled bleeding

CONTRAINDICATIONS: None

DOSAGE AND ROUTES
Dose based on specific factor Xa inhibitor, dose of factor Xa inhibitor, and time since the patient's last dose of factor Xa inhibitor

• **Adult: IV** For rivaroxaban ≤10 mg or apixaban ≤5 mg within 8 hr or unknown timing of last dose or for any dose of rivaroxaban or apixaban at 8 hr or more since timing of last dose, 400 mg **IV BOL** at 30 mg/min then 4 mg/min **CONT IV INFUSION** for up to 120 min

• **Adult: IV** For rivaroxaban >10 mg, apixaban >5 mg, or unknown dose of either drug within 8 hr of timing of last dose, 800 mg **IV BOL** at 30 mg/min followed by 8 mg/min **CONT IV INFUSION** for up to 120 min. Resume anticoagulant therapy as soon as medically appropriate after factor Xa treatment

Available forms: Powder for injection 100, 200 mg

famciclovir (Rx)
(fam-cy´clo-veer)

Func. class.: Antiviral

Chem. class.: Guanosine nucleoside

F

ACTION: Inhibits DNA polymerase and viral DNA synthesis by conversion of this guanosine nucleoside to penciclovir

USES: Treatment of acute herpes zoster (shingles), genital herpes; recurrent mucocutaneous herpes simplex virus (HSV) in patients with HIV; initial episodes of herpes genitalis; herpes labialis in the immunocompromised, herpes labialis prophylaxis

Unlabeled uses: Herpes simplex virus, Varicella infection (chickenpox) in HIV

CONTRAINDICATIONS: Hypersensitivity to this product, penciclovir, acyclovir, ganciclovir, valacyclovir, valganciclovir

Precautions: Pregnancy, breastfeeding, renal disease, lactose intolerance

DOSAGE AND ROUTES
Acute herpes zoster (Shingles)

• **Adult: PO** 500 mg q8hr for 7 days

Renal dose

• **Adult: PO** CCr 40-59 mL/min, 500 mg q12hr; CCr 20-39 mL/min, 500 mg q24hr; CCr <20 mL/min, 250 mg q24hr

Suppression of recurrent herpes simplex

• **Adult: PO** 250 mg q12hr up to 1 yr

Renal dose

• **Adult: PO** CCr 20-39 mL/min, 125 mg q12hr × 5 days; CCr <20 mL/min, 125 mg q24hr × 5 days

Recurrent herpes labialis (cold sores)

• **Adult: PO** 1500 mg single dose

Renal impairment: recurrent herpes labialis

• **Adult: PO** CCr ≥60 mL/min, usual dose; CCr 40-59 mL/min, 750 mg as a single dose; CCr 20-39 mL/min, 500 mg as

single dose; CCr <20 mL/min, 250 mg as a single dose; hemodialysis, 250 mg as a single dose following dialysis

Recurrent mucocutaneous orolabial genital herpes simplex infections in HIV

• **Adult: PO** 500 mg bid × 7 days

Renal impairment: recurrent orolabial or genital herpes in HIV-infected patients

• **Adult: PO** CCr ≥40 mL/min, usual dose; CCr 20-39 mL/min, 500 mg q24hr; CCr <20 mL/min, 250 mg q24hr; hemodialysis, 250 mg following each dialysis

Recurrent genital herpes simplex

• **Adult: PO** 1000 mg bid on a single day

Renal dose

• **Adult: PO** CCr 40-59 mL/min, 500 mg q12hr × 1 day; CCr 20-39 mL/min, 500 mg as a single dose; CCr <20 mL/min, 250 mg as a single dose

Chickenpox (unlabeled)

• **Adult: PO** 500 mg q8hr × 7 days, preferably within 48 hr of onset

Available forms: Tabs 125, 250, 500 mg

Administer:

• Without regard to meals

• As soon as diagnosed; for herpes zoster within 72 hr

SIDE EFFECTS

CNS: *Headache, fatigue, dizziness,* paresthesia, somnolence, fever, seizures

GI: Nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia

GU: Decreased sperm count

INTEG: *Pruritus*, vasculitis

MS: Back pain, arthralgia

RESP: Pharyngitis, sinusitis

SYST: Anaphylaxis

PHARMACOKINETICS

Bioavailability 77%, 20% protein binding, 73% excreted via kidneys, half-life 2-3 hr, peak 1 hr, duration 12 hr

INTERACTIONS

Increase: effect of famciclovir—probenecid

Decrease: effect of zoster, varicella virus vaccine

Drug/Lab

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

• **Herpes zoster:** severity of the breakout; burning, itching, pain, which are early symptoms of herpes infection; assess daily during therapy

• Monitor CBC, LFTs test if on long-term treatment

• **Acute renal failure:** usually in high dose or in those >65 yr; urine CCr; BUN before and during treatment if decreased renal function; dose may have to be lowered; hepatic studies: LFTs

• Bowel pattern before, during treatment; diarrhea may occur

• Postherpetic neuralgia during and after treatment

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; pregnant patients should enroll in the Famvir pregnancy reporting system, 1-888-669-6682; excretion unknown in breast milk

Evaluate:

• Therapeutic response: decreased size, spread of lesions

Teach patient/family:

• How to recognize beginning infection (pain, itching, tingling), use product within 48 hr of rash/urticaria

• How to prevent spread of infection; that this medication does not prevent spread to others; that condoms should be used; that until crusting of lesions has taken place, not to be around those who have not had the chicken pox vaccine or those who are immunocompromised

• About the reason for medication, expected results; that product must be taken for whole course of treatment; if lactose intolerant, to notify prescriber before use

• That women with genital herpes should have yearly Pap smears; that cervical cancer is more likely

• To avoid driving or other hazardous activities until results are known; dizziness may occur

famotidine (otc, Rx)

(fa-moe′ti-deen)

Pepcid, Pepcid AC, Zantac

Func. class.: Antiulcer agent

Chem class.: H_2-histamine receptor antagonist

ACTION: Competitively inhibits histamine at histamine H_2-receptor site, thus decreasing gastric secretion while pepsin remains at a stable level

USES: Short-term treatment of duodenal ulcer, maintenance therapy for duodenal ulcer, Zollinger-Ellison syndrome, multiple endocrine adenomas, gastric ulcers; gastroesophageal reflux disease, heartburn

Unlabeled uses: GI disorders in those taking NSAIDs; urticaria; prevention of stress ulcers, aspiration pneumonitis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children <12 yr, geriatric patients, severe renal/hepatic disease

DOSAGE AND ROUTES

Short-term treatment of benign gastric ulcer

• **Adult/child ≥ 40 kg: PO** 40 mg/day at bedtime × 4-8 wk, then 20 mg/day at bedtime if needed (maintenance); **IV** 20 mg q12hr if unable to take **PO**

• **Child 1-16 yr: PO/IV** 0.25 mg/kg/dose q12hr, max 40 mg/day

Short-term treatment of duodenal ulcer

• **Adult/child ≥ 40 kg: PO** 40 mg at bedtime or 20 mg bid; maintenance 20 mg daily at bedtime for up to 8 wk

Pathologic hypersecretory conditions

• **Adult: PO** 20 mg q6hr; may give up to 160 mg q6hr if needed; **IV** 20 mg q6hr if unable to take **PO**

GERD

• **Adult/child ≥ 40 kg: PO** 20 mg bid for up to 6 wks; 20-40 mg bid up to 12 wk (ulcerative esophagitis)

• **Child 1-16 yr: PO** 0.5 mg/kg bid, max 40 mg bid

• **Child 3 mo-<1 yr: PO** 0.5 mg/kg/dose bid ≤8 wk

• **Child <3 mo: PO** 0.5 mg/kg/dose daily ≤8 wk

Heartburn relief/prevention (OTC)

• **Adult/child >12 yr: PO** 10 mg with water for relief or take 15 min-1 hr before eating for prevention

Renal dose

• **Adult: PO** CCr <50 mL/min give ½ dose or increase interval to q36-48h

Available forms: Tabs 10, 20, 40 mg; powder for oral susp 40 mg/5 mL; inj 0.4 mg/mL premixed in normal saline, 10 mg/mL, 20 mg/50 mL; tabs chewable 10, 20 mg

Administer:

• Store in cool environment (oral); IV sol stable for 48 hr at room temperature; do not use discolored sol; discard unused oral sol after 1 mo

PO route

• After shaking oral suspension

• Give without regard to meals

• Store suspension room temperature, discard after 30 days

• Protect tablets from light

Direct IV route

• After diluting 2 mL of product (10 mg/mL) in 0.9% NaCl to total volume of 5-10 mL; inject over 2 min to prevent hypotension

Intermittent IV INFUSION route

• After diluting 20 mg (2 mL) of product in 100 mL of LR, 0.9% NaCl, D_5W, $D_{10}W$; run over 15-30 min, stable for 48 hr after dilution refrigerated

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefonicid,

cefotaxime, cefTAZidime, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, 0.9% NaCl, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, perphenazine, PHENobarbital, phenylephrine, phytonadione, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness,* paresthesia, depression, anxiety, somnolence, insomnia, fever, seizures in renal disease
CV: Dysrhythmias, QT prolongation (impaired renal functioning)
EENT: Taste change, tinnitus, orbital edema
GI: *Constipation,* nausea, vomiting, anorexia, cramps, abnormal hepatic enzymes, diarrhea
INTEG: Rash, toxic epidermal necrolysis, Stevens-Johnson syndrome
MS: Myalgia, arthralgia
RESP: Pneumonia

PHARMACOKINETICS

Protein binding 15%-20%, metabolized in liver 30% (active metabolites), 70% excreted by kidneys, half-life 2½-3½ hr
PO: Onset 60 min, duration 12 hr, peak 1-3 hr, absorption 50%
IV: Onset 60 min, peak 1-4 hr, duration 8-12 hr

INTERACTIONS

Decrease: absorption—ketoconazole, itraconazole, cefpodoxime, cefditoren cefuroxime, delaviridine
Decrease: famotidine absorption—antacids
Drug/Lab Test Increase: LFTs, BUN, creatinine

NURSING CONSIDERATIONS

Assess:
- **Ulcers:** epigastric pain, adominal pain, frank or occult blood in emesis, stools
- Renal function: patients with decreased renal function are at risk for prolonged QT
- Intragastric pH, serum creatinine/BUN baseline and periodically
- For bleeding, hematuria, hematuresis, occult blood in stools; abdominal pain
- Increase in bulk and fluids in diet to prevent constipation
- **Beers:** avoid in older adults with delirium or at high risk for delirium; may induce or worsen the condition; assess for confusion

• **Pregnancy/breastfeeding:** cautious use in pregnancy, breastfeeding; excreted in breast milk

Evaluate:

• Therapeutic response: decreased abdominal pain, healing of duodenal ulcers, decreased gastroesophageal reflux

Teach patient/family:

• That product must be continued for prescribed time in prescribed method to be effective; not to double dose; do not take for extended periods of time, risk of B_{12} malabsorption

• About possibility of decreased libido; that this is reversible after discontinuing therapy

• To avoid irritating foods, alcohol, aspirin, NSAIDs, extreme-temperature foods that may irritate GI system

• That smoking should be avoided because it diminishes effectiveness of product

• To avoid tasks requiring alertness because dizziness, drowsiness may occur

fam-trastuzumab deruxtecan-nxki (Rx)

Enhertu

Func. class.: Antineoplastic, *HER2*-directed antibody

USES: *HER2*-positive metastatic breast cancer

CONTRAINDICATIONS

Hypersensitivity

DOSAGE AND ROUTES

Adult: Intermittent IV Infusion

5.4 mg/kg once q3wk (21-day cycle) until disease progression or unacceptable toxicity

Available forms: Solution reconstituted IV 100 mg

febuxostat (Rx)

(feb-ux´oh-stat)

Uloric

Func. class.: Antigout drug, antihyperuricemic

Chem. class.: Xanthene oxidase inhibitor

ACTION: Inhibits the enzyme xanthine oxidase, thereby reducing uric acid synthesis; more selective for xanthine oxidase than allopurinol

USES: Chronic gout, hyperuricemia

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, renal/hepatic/cardiac/neoplastic disease, stroke, MI, organ transplant, Lesch-Nyhan syndrome

DOSAGE AND ROUTES

• **Adult: PO** 40 mg daily, may increase to 80 mg daily if uric acid levels are >6 mg/dL after 2 wk of therapy

Renal dose

• **Adult: PO** CCr <30 mL/min 40 mg/day

Available forms: Tabs 40, 80 mg

Administer:

PO route

• Without regard to meals or antacids; may crush and add to foods or fluids

• Only use in patients unable to take allopurinol or if allopurinol is ineffective

SIDE EFFECTS

CNS: Dizziness, weakness, flushing

GI: *Nausea,* vomiting, diarrhea, constipation, hepatitis

EENT: Cataracts, retinopathy, epistaxis

HEMA: Thrombocytopenia, anemia, leukopenia, bone marrow suppression

INTEG: Rash, DRESS, SJS, TEN

MISC: Arthralgia, gout flare

PHARMACOKINETICS

Peak 1-1.5 hr, duration up to 24 hr; metabolized extensively in the liver, excreted in feces, urine; half-life 5-8 hr; protein binding 99.2%; max lowering of uric acid 2 wk

INTERACTIONS

Increase: toxicity—azaTHIOprine, didanosine, mercaptopurine; do not use together

Increase: xanthine nephropathy, calculi—rasburicase, antineoplastics

Drug/Lab

Increase: LFTs, alkaline phosphatase, serum cholesterol, triglycerides, amylase, BUN, creatinine, aPTT, PT, CPK, creatine

Decrease: Hct/HB, RBC, platelets, lymphocytes, neutrophils, TSH, blood glucose

NURSING CONSIDERATIONS

Assess:

• **Hyperuricemia:** uric acid levels q2wk; uric acid levels should be ≤6 mg/dL, flares may occur during first 6 wk of treatment

• **Hepatic studies** before use, then 2, 4 mo and then periodically; assess for fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice

• **CV disease:** Avoid use in those with CV disease, deaths have occurred, monitor for MI, stroke

• **Renal disease:** I&O ratio; increase fluids to 2 L/day to prevent stone formation and toxicity

• For rash, hypersensitivity reactions; discontinue

• **Gout:** joint pain/swelling, may be relieved with NSAIDs for acute gouty attacks and gout flare (first 6 wk)

Evaluate:

• Therapeutic response: decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

Teach patient/family:

• That tabs may be crushed

• To take as prescribed; if dose is missed, to take as soon as remembered; not to double dose

• To increase fluid intake to 2 L/day unless contraindicated

• To avoid alcohol, caffeine because they will increase uric acid levels

• To report cardiovascular events to prescriber immediately (chest pain, dyspnea, slurred speech, weakness)

• **Gout:** that flares may occur during first 6 wk of treatment; continue and notify prescriber; NSAIDs or colchicine may be added to reduce the risk of flares

fedratinib

See Appendix B

felodipine (Rx)

(fe-loe´-di-peen)

Plenedil ✱, Renedil ✱

Func. class.: Antihypertensive, calcium channel blocker, antianginal

Chem. class.: Dihydropyridine

ACTION: Inhibits calcium ion influx across cell membrane, resulting in the inhibition of the excitation and contraction of vascular smooth muscle

USES: Essential hypertension alone or with other antihypertensives

Unlabeled uses: Hypertension in adolescents and children, angina pectoris; Prinzmetal's angina (vasospastic)

CONTRAINDICATIONS: Hypersensitivity to this product or dihydropyridines, sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension <90 mm Hg systolic

Black Box Warning: CV death

Precautions: Pregnancy, breastfeeding, children, geriatric patients, HF, hepatic injury, renal disease, coronary artery disease

DOSAGE AND ROUTES

• **Adult: PO** 5 mg/day initially; usual range 2.5-10 mg/day; max 10 mg/day; do not adjust dosage at intervals of <2 wk

• **Geriatric: PO** 2.5 mg/day, max 10 mg/day

Hepatic disease

• **Adult: PO** 2.5-5 mg, max 10 mg/day

Hypertension in adolescent/child (unlabeled)

• **Adolescent/child: PO** 2.5 mg initially, titrate upward, max 10 mg/day

Available forms: Ext rel tabs 2.5, 5, 10 mg

Administer:

PO route

• Swallow whole; do not break, crush, or chew ext rel products

• Once daily with light meal; avoid grapefruit juice

SIDE EFFECTS

CNS: *Headache,* fatigue, drowsiness, dizziness, anxiety, depression, nervousness, insomnia, light-headedness, paresthesia, tinnitus, psychosis, somnolence, flushing
CV: Dysrhythmia, *edema,* HF, hypotension, palpitations, MI, pulmonary edema, tachycardia, syncope, AV block, angina
GI: Nausea, vomiting, diarrhea, gastric upset, constipation, dry mouth
GU: Nocturia, polyuria, sexual dysfunction, decreased libido
HEMA: Anemia
INTEG: Rash, pruritus, peripheral edema
MISC: Flushing, sexual difficulties, cough, nasal congestion, SOB, wheezing, epistaxis, respiratory infection, chest pain, angioedema, gingival hyperplasia, Stevens-Johnson syndrome

PHARMACOKINETICS

Onset 1 hr, peak 2.5-5 hr, highly protein bound >99%, metabolized in liver, 0.5% excreted unchanged in urine, elimination half-life 11-16 hr

INTERACTIONS

Increase: bradycardia, HF—β-blockers, digoxin, phenytoin, disopyramide
Increase: toxicity, hypotension—nitrates, alcohol, quiNIDine, zileuton, miconazole, diltiazem, delavirdine, quinupristin-dalfopristin, conivaptan, cycloSPORINE, cimetidine, clarithromycin, antiretroviral protease inhibitors, other antihypertensives, MAOIs, ketoconazole, erythromycin, itraconazole, propranolol
Decrease: antihypertensive effects—NSAIDs, carBAMazepine, barbiturates, phenytoin

Drug/Herb

Increase: antihypertensive effect—ginseng, ginkgo, hawthorn
Decrease: antihypertensive effect—ephedra, St. John's wort

Drug/Food

Increase: felodipine level—grapefruit juice

NURSING CONSIDERATIONS

Assess:

Black Box Warning: CV status, fluid volume status, I&O, weight daily; weight gain, crackles, dyspnea, edema, jugular venous distention, adequacy of pulses, moist mucous membranes; bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported

- Monitor ALT, AST, bilirubin often if elevated
- **Cardiac status:** B/P, pulse, respiration; ECG periodically during prolonged treatment
- **Angina pain:** location, duration, intensity; ameliorating, aggravating factors
- **Hypertension:** check for compliance, number of refills
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk, may cause fetal harm; discontinue breastfeeding or product, excretion unknown

Evaluate:

- Therapeutic response: B/P, WNL, decreased anginal attacks, increased activity tolerance

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness no longer a problem
- To avoid OTC products, alcohol unless directed by prescriber; to limit caffeine consumption
- About the importance of complying with all areas of medical regimen: diet, exercise, stress reduction, product therapy
- That tablets may appear in stools but are insignificant

Black Box Warning: To report dyspnea, palpitations, irregular heartbeat, swelling of extremities, nausea, vomiting, severe dizziness, severe headache

- To change positions slowly to prevent orthostatic hypotension
- To obtain correct pulse; to contact prescriber if pulse <50 bpm
- To use good oral hygiene to prevent gingival hyperplasia

- Not to stop abruptly
- To avoid grapefruit juice

TREATMENT OF OVERDOSE:
Atropine for AV block, vasopressor for hypotension

fenofibrate (Rx)
(fen-oh-fee′brate)
Antara, Fenoglide, Lipidil Supra 🍁, Lipofen, TriCor
fenofibric acid (Rx)
Fibricor, Trilipix
Func. class.: Antilipemic
Chem. class.: Fibric acid derivative

Do not confuse:
Tricor/Tracleer

ACTION:
Increases lipolysis and elimination of triglyceride-rich particles from plasma by activating lipoprotein lipase, resulting in changes in triglyceride size and composition of LDL, leading to rapid breakdown of LDL; mobilizes triglycerides from tissue; increases excretion of neutral sterols

USES:
Hypercholesterolemia; types IV, V hyperlipidemia that do not respond to other treatment and that increase risk for pancreatitis; Fredrickson type IV, V hypertriglyceridemia

CONTRAINDICATIONS:
Hypersensitivity, severe renal/hepatic disease, primary biliary cirrhosis, preexisting gallbladder disease, breastfeeding
Precautions: Pregnancy, geriatric patients, peptic ulcer, pancreatitis, renal/hepatic disease, diabetes mellitus

DOSAGE AND ROUTES
Hypertriglyceridemia
- **Adult: PO (Antara)** 30-90 mg/day; **(Fenoglide)** 40-120 mg/day; **(Tricor)** 48-145 mg/day; **(Lipofen)** 50 mg/day

Primary hypercholesterolemia/mixed hyperlipidemia
- **Adult: PO (Antara)** 90 mg/day; **(Fenoglide)** 120 mg/day; **(Tricor)** 145 mg/day

Renal dose (geriatric)
- **Adult: PO (Tricor)** CCr 30-80 mL/min, 48 mg/day; CCr <30 mL/min, contraindicated; Adult: PO CCr 30-80 mL/min, 50 mg/day **(Triglide, Lipofen),** 30 mg/day **(Antara),** CCr <30 mL/min, contraindicated **(Antara, Lipofen)**

Available forms: Cap: *Antara* 30, 90 mg; *Lipofen* 50, 150 mg; **Tab:** 43, 50, 67, 130, 134, 150, 200 mg; *TriCor* 48, 145 mg; *Fenoglide* 40, 120 mg; fenofibrate choline: del rel caps 45, 135 mg; **fenofibric acid:** tabs 35, 105 mg

Administer:
- Product with meals (Lipofen); Antara without regard to food; may increase q4-8wk; discontinue if there is not adequate response after 2 mo
- Caps must be swallowed whole
- Brands are not interchangeable
- Protect Lipofen, Triglide from light, moisture

SIDE EFFECTS
CNS: *Fatigue, dizziness,* headache, paresthesia, insomnia, depression
CV: Hypertension, angina, DVT, PE
GI: *Nausea, vomiting, dyspepsia,* flatulence, pancreatitis, cholelithiasis, diarrhea, constipation
GU: *Polyuria*
INTEG: *Rash, pruritus*
MS: *Myalgias, arthralgias, myopathy, rhabdomyolysis*
RESP: Bronchitis, cough

PHARMACOKINETICS
Peak 2 wk, protein binding 99%, converted to fenofibric acid, metabolized in liver to fenofibric acid, excreted in urine (60%), feces (25%), half-life 20 hr

INTERACTIONS
Increase: myopathy, rhabdomyolysis—colchicine
- Avoid use with HMG-CoA reductase inhibitors; rhabdomyolysis may occur

Increase: anticoagulant effects—oral anticoagulants
Decrease: absorption of fenofibrate—bile acid sequestrants; give 1 hr prior to or ≥4 hr after bile acid sequestrant

Drug/Food
Increase: absorption
Drug/Lab Test
Increase: ALT, AST, BUN, CK, creatinine
Decrease: WBC, uric acid, HB, paradoxical effect in HDL

NURSING CONSIDERATIONS

Assess:
- **Hypercholesterolemia/hyperlipidemia diet history:** obtain a dietary history including fat content; lipid levels (triglycerides, LDL, HDL, cholesterol); may cause a paradoxical decrease in HDL; LFTs at baseline, periodically during treatment, if >3 × ULN, discontinue; CPK if muscle pain occurs; CBC, Hct, HB, PT with anticoagulant therapy; serum bilirubin (total and direct)
- **Pancreatitis, cholelithiasis, renal failure, rhabdomyolysis** (when combined with HMG Co-A reductase inhibitors), myositis; product should be discontinued; assess often for muscle pain, weakness, fever
- **Severe skin reactions:** angioedema, anaphylaxis, monitor throughout treatment
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected; do not breastfeed

Evaluate:
- Therapeutic response: decreased triglycerides, cholesterol levels

Teach patient/family:
- That compliance is needed; not to consume chipped or broken tabs (Triglide)
- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- To notify prescriber if pregnancy is suspected or planned; not to breastfeed during or for ≥5 days of last dose
- To notify prescriber of muscle pain, weakness, fever, fatigue, epigastric pain
- To report signs/symptoms of DVT (swollen, warm extremity) or PE (shortness of breath, chest pain) to provider immediately

⚠ HIGH ALERT

fentaNYL (parenteral) (Rx) REMS
(fen´ta-nill)
fentaNYL transdermal (Rx)
Ionsys
fentaNYL nasal spray (Rx)
Lazanda
fentaNYL SL spray (Rx)
Subsys
fentaNYL buccal (Rx)
Fentora
fentaNYL lozenge (transmucosal) (Rx)
Actiq
fentanyl SL (Rx)
Abstral

Func. class.: Opioid analgesic
Chem. class.: Synthetic phenylpiperidine

Controlled Substance Schedule II

Do not confuse:
fentaNYL/sufentanil

ACTION: Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception by binding to opiate receptors

USES: Controls moderate to severe pain; preoperatively, postoperatively; adjunct to general anesthetic, adjunct to regional anesthesia; **fentaNYL:** anesthesia as premedication, conscious sedation; **Actiq:** breakthrough cancer pain

CONTRAINDICATIONS: Hypersensitivity to opiates; myasthenia gravis

Black Box Warning: Headache, migraine (Actiq, ABSTRAL, Fentora, Lazanda); emergency room use (ABSTRAL, Lazanda); outpatient surgeries (Duragesic TD); opioid-naive patients, respiratory depression

Precautions: Pregnancy, breastfeeding, geriatric patients, increased intracranial pressure, seizure disorders, severe respiratory disorders, cardiac dysrhythmias

Black Box Warning: Accidental exposure, ambient temperature increase, fever, skin abrasion (TD patch), substance abuse, surgery, requires an experienced clinician

DOSAGE AND ROUTES

FentaNYL (parenteral)

Anesthetic (adjunct to regional anesthesia)

• **Adult: IV** 50-100 mcg/kg over 1-2 min

Anesthesia supplement to general anesthesia

• **Adult/child >12 yr: IM/IV** (low dose) 1-2 mcg/kg; **IV** (moderate dose) 2-20 mcg/kg; **IM/IV** (high dose) 20-50 mcg/kg, then 25 mcg to y_2 initial loading dose as needed

Induction and maintenance

• **Child 2-12 yr: IV** 2-3 mcg/kg q1-2hr as needed

Preoperatively

• **Adult/child >12 yr: IM/IV** 50-100 mcg q30-60min before surgery

Postoperatively

• **Adult/child >12 yr: IM/IV** 50-100 mcg q1-2hr prn

Moderate/severe pain

• **Adult: IV/IM** 50-100 mcg q1-2hr; **nasal; 100 mcg spray in one nostril, titrate stepwise**

Actiq

• **Adult: TRANSMUCOSAL** 200 mcg; redose if needed 15 min after completion of 1st dose; do not give more than 2 doses during titration period, max 4 doses/day

Fentora

• **Adult: BUCCAL/SL** 100 mcg placed above rear molar between upper cheek and gum; a second 100 mcg dose, if needed, may be started 30 min after 1st dose

FentaNYL transdermal

• **Adult: Duragesic:** 25 mcg/hr; may increase until pain relief occurs; apply patch to flat surface on upper torso and wear for 72 hr; apply new patch on different site; may use 12.5 mcg/hr if <60 mg/day morphine equivalent

FentaNYL nasal spray

• **Adult:** 100 mcg (1 spray in 1 nostril), may retreat after ≥2 hr, titrate upward until adequate analgesia; treat a max of 4 episodes daily

FentaNYL SL spray

• **Adult:** 100 mcg sprayed under tongue, titrate stepwise carefully

Available forms: Inj 0.05 mg/mL; lozenges 100, 200, 300, 400, 600, 800, 1200, 1600 mcg; lozenges on a stick 200, 400, 600, 800, 1200, 1600 mcg; buccal tab 100, 200, 400, 600, 800 mcg; transdermal: patch 12, 25, 50, 75, 100 mcg/hr; SL spray 100, 200, 400, 600, 800, 1200, 1600 mcg/spray; nasal spray 100, 400 mcg/actuation

Administer:

• By inj (IM, IV); give slowly to prevent rigidity

• Overdose has been fatal when confusing products/dose; recheck both before using

• Must have emergency equipment available, opioid antagonists, O_2; to be used only by those appropriately trained; IV products to be used in OR, ER, ICU

Transmucosal route

• Remove foil just before administration; instruct patient to place product between cheek and lower gum, moving it back and forth and sucking, not chewing (Actiq); place above rear molar (Fentora); place film on the inside of the cheek; all products not used or only partially used should be flushed down the toilet; this product may be used SL

Transdermal route

• q72hr for continuous pain relief; dosage adjusted after at least 2 applications; apply to clean, dry skin and press firmly

• Give short-acting analgesics until patch takes effect (8-24 hr); when reducing dosage or switching to alternative IV treatment, withdraw gradually; serum levels drop gradually, give ½ the equian-

algesic dose of new analgesic 12-18 hr after removal as ordered

IV route

• IV undiluted by anesthesiologist or diluted with 5 mL or more sterile water or 0.9% NaCl given through Y-tube or 3-way stopcock at 0.1 mg or less/1-2 min. Muscular rigidity may occur with rapid IV administration

Y-site compatibilities: Abciximab, acyclovir, alfentanil, alemtuzumab alprostadil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephalothin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etomidate, etoposide, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methotrimeprazine, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, scopolamine, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, delirium, euphoria, sedation, confusion, weakness, dizziness, seizures

CV: Bradycardia, arrest, hypo/hypertension, DVT, PE

EENT: Blurred vision, miosis

GI: Nausea, vomiting, constipation

GU: Urinary retention

INTEG: Rash, diaphoresis

MS: Muscle rigidity

RESP: Respiratory depression, arrest, laryngospasm

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk; half-life: IV, 2-4 hr; transdermal, 13-22 hr; transmucosal, 7 hr; buccal, 4-12 hr; 80% bound to plasma proteins

F

IM: Onset 7-15 min, peak 30 min, duration 1-2 hr
IV: Onset 1 min, peak 3-5 min, duration ½-1 hr
Intranasal: Onset 15-20 min, peak 25-30 min
Transdermal: Onset 12-24 hr, peak 1-3 days
Transmucosal: Onset 5-15 min, peak 30 min

INTERACTIONS

Black Box Warning: Increase: fentaNYL effect, fetal respiratory depression: CYP3A4 inhibitors (cycloSPORINE, ketoconazole, itraconazole, cimetidine, conivaptan, fluconazole, nefazodone, ranolazine), zafirlukast, zileuton

Increase: fatal reactions—MAOIs
Increase: hypotension—droperidol
Increase: CV depression—diazepam
Increase: fentaNYL effect with other CNS depressants—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, protease inhibitors
Decrease: fentaNYL effect—CYP3A4 inducers (carBAMazepine, phenytoin, PHENobarbital, rifampin)

Drug/Herb
Increase: action of fentaNYL—St. John's wort
Decrease: effect of fentaNYL—echinacea

Drug/Lab Test
Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:
• VS after parenteral route; note muscle rigidity, drug history, hepatic/renal function tests
• CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• Allergic reactions: rash, urticaria

Black Box Warning: Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

Black Box Warning: Headache/migraine: Actiq, Fentora, Lazanda not to be used for this condition; Lazanda not to be used in ER; Duragesic TD not to be used for outpatient surgery patients

Black Box Warning: Apnea, respiratory arrest in opioid-naive patients: do not use Actiq, Duragesic, Fentora, Lazanda; opioid-tolerant patients are those using ≥60 mg/day oral morphine, ≥30 mg/day oxyCODONE PO, 8 mg/day HYDROmorphone, 25 mcg TD fentaNYL/hr

Black Box Warning: Pregnancy/breastfeeding: no well-controlled studies; use only if benefits outweigh fetal risk; if used for prolonged periods, neonatal withdrawal syndrome may occur; discontinue breastfeeding or product, excreted in breast milk

• **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function

Evaluate:
• Therapeutic response: induction of anesthesia, relief of breakthrough cancer pain, general pain relief

Teach patient/family:
• About CNS changes: physical dependence; not to use with alcohol, other CNS depressants

Black Box Warning: Accidental exposure: discuss the danger of children or pets ingesting or coming in contact with product; there are increasing numbers of fatal overdose with drugs laced with fentanyl, tests are available to identify illicit drugs for the presence of fentanyl

Transdermal route

Black Box Warning: Ambient temperature: that excessive heat may increase absorption; do not use with heating pads, electric blankets, heat/tanning lamps, saunas, hot tubs, heated waterbeds, when sunbathing, never cut patch in half

• That excessive perspiration may alter adhesiveness
• To dispose of patch by placing sticky sides together and flushing down toilet
• That patient may need to clip hair before applying to ensure adhesion
• May add first aid tape around the edges if there is a problem with adhesion, always remove old patch before applying new patch

ferric carboxymaltose (Rx)

Injectafer

ferric derisomaltose (Rx)

Monofferic

Func. class.: Hematinic
Chem. class.: Iron preparation

ACTION:

Releases iron stores needed for red blood cell development as well as energy and O_2 transport and use

USES:

Iron-deficiency anemia in those intolerant to PO iron and those with kidney disease not on dialysis

CONTRAINDICATIONS

Hemosiderosis/hemochromatosis
Precautions: Pregnancy, anemia, hepatic disease, vitamin D deficiency, hemoglobinopathy, hyperparathyroidism, hypophosphatemia

DOSAGE AND ROUTES

Ferric carboxymaltose
• **Adult ≥50 kg: IV** 750 mg on day 1, repeat after ≥7 days, may repeat if needed; **<50 kg: IV** 15 mg/kg on day 1, repeat after ≥7 days; max cumulative dose 1500 mg per course of treatment
Available forms: Injection 750 mg of elemental iron in 15-mL, single-dose vial
Ferric derisomaltose
• Adult: IV infusion ≥**50 kg**:1000 mg as a single dose. Repeat dose if iron-deficiency recurs; ≤***50 kg:*** 20 mg/kg/dose as a single dose. Repeat dose if iron-deficiency recurs
Administer:
Ferric carboxymaltose
• Visually inspect for particulate matter and discoloration prior to use
• Give as an undiluted slow IV push or by continuous IV infusion
• Each vial is for single use only. Discard any unused portions; contains no preservatives
• Avoid extravasation since brown discoloration of the extravasation site may be long lasting. If extravasation occurs, discontinue administration at that site
IV Push
• No dilution necessary. Administer at a rate of approximately 2 mL/min (100 mg/min)
Intermittent IV Infusion
• Dilute up to 750 mg of iron in a maximum of 250 mL of sterile 0.9% NaCl and infuse over at least 15 min. Do not dilute to concentrations less than 2 mg iron/mL in order to maintain stability
• Store at room temperature for 72 hr when added to an infusion bag containing 0.9% NaCl at concentrations ranging from 2 to 4 mg of iron per mL
Ferric derisomaltose
IV Infusion Route
• Visually inspect parenteral products for particulate matter and discoloration prior to use
• Withdraw appropriate volume of ferric derisomaltose and dilute in 100-500 mL of 0.9% NaCl injection. The final diluted concentration should be more than 1 mg/mL
• Each vial of ferric derisomaltose is for single dose only; discard unused portion
• Do not admix
• *Storage:* Following dilution in 0.9% NaCl injection, ferric derisomaltose may be stored at room temperature for up to 8 hr
• Give via IV infusion over 20 min

SIDE EFFECTS

GI: Nausea, constipation, vomiting

CNS: Dizziness, headache, chills, syncope
CV: Hyper/hypotension, flushing, tachycardia, chest pain
INTEG: Pruritus, injection site color change, rash

PHARMACOKINETICS

IV: Onset unknown, peak 15 min-1.2 hr, duration unknown

INTERACTIONS

Increase: nephrotoxicity—dimercaprol
Drug/Lab Test. Increase: LFTs GGT
False positive: Serum iron within 24 hr after use

NURSING CONSIDERATIONS

Assess:
- **Blood studies:** Hct, HB, serum phosphate, before treatment; iron studies (iron, transferrin, ferritin)
- **Elimination:** If constipation occurs, increase water, bulk, activity
- **Nutrition:** Amount of iron in diet (meat, dark green leafy vegetables, dried beans, dried fruits, eggs)
- **Hypersensitivity:** Assess allergic reaction to IV iron, usually within 30 min of injection, have emergency equipment available
- **Extravasation:** Check for injection site reactions during treatment
- **Pregnancy/breastfeeding:** No well-controlled studies; use only if benefits outweigh fetal risk; excreted in breast milk

Evaluate:
- Therapeutic response: improvement in Hct, HB, decreased fatigue, weakness

Teach patient/family:
- Not to take PO iron with this product
- To report signs of hypersensitivity

ferrous fumarate (Rx)
Ferretts, Ferrocite, Hemocyte
ferrous gluconate (Rx)
Fergon, Ferate
ferrous sulfate (Rx)
Fer-In-Sol, Slow Iron
ferrous sulfate, dried (Rx)
Feosol, Feratab, Slow Fe, slow-release Iron
carbonyl iron (otc)
(kar´bo-nil)
ICAR, Feosol
iron polysaccharide (Rx)
Ferrex, IFEREX, Nu-Iron, Poly Iron
Func. class.: Hematinic
Chem. class.: Iron preparation

ACTION: Replaces iron stores needed for red blood cell development as well as energy and O_2 transport and use; fumarate contains 33% elemental iron; gluconate, 12%; sulfate, 20%; iron, 30%; ferrous sulfate exsiccated

USES: Iron-deficiency anemia, prophylaxis for iron deficiency in pregnancy, nutritional supplementation

CONTRAINDICATIONS: thalassemia, hemosiderosis/hemochromatosis
Precautions: Pregnancy, anemia (long term), ulcerative colitis/regional enteritis, peptic ulcer disease, hemolytic anemia, cirrhosis, sulfite sensitivity

Black Box Warning: Accidental exposure

DOSAGE AND ROUTES

Fumarate
- **Adult: PO** 200-325 mg tid
- **Child: PO** 3 mg/kg/day (elemental iron) tid-qid
- **Infant: PO** 10-25 mg/day (elemental iron) in 3-4 divided doses, max 15 mg/day

Gluconate
- **Adult: PO** 50-100 mg elemental iron tid
- **Child: PO** 3 mg/kg/day in divided doses

Sulfate
- **Adult: PO** 0.75-1.5 g/day in divided doses

• **Child 6-12 yr: PO** 3 mg/kg/day in divided doses

Pregnancy

• **Adult: PO** 300-600 mg/day in divided doses

Iron polysaccharide

• **Adult: PO** 100-200 mg tid

• **Child: PO** 4-6 mg/kg/day in 3 divided doses (severe iron deficiency)

Available forms: Fumarate: tabs 90, 150, 200, 300, 324, 325 mg; chewable tabs 100 mg; ext rel tabs 18 mg; **gluconate:** tabs 225, 240, 324, 325 mg; **sulfate:** tabs 195, 300, 325 mg; elixir 220 mg/5 mL; **dried:** tabs 200 mg; ext rel tabs 160 mg; ext rel caps 160 mg; **iron polysaccharide:** tabs 50 mg; caps 150 mg; sol 100 mg/5 mL

Administer:

PO route

• Swallow tabs whole; do not break, crush, or chew unless labeled as chewable

• Between meals for best absorption; may give with juice; do not give with antacids or milk, delay at least 1 hr; if GI symptoms occur, give after meals even if absorption is decreased; eggs, milk products, chocolate, caffeine interfere with absorption

• Store in tight, light-resistant container

• **Liquid** through plastic straw to avoid discoloration of tooth enamel; dilute thoroughly

• At least 1 hr before bedtime; corrosion may occur in stomach; ferrous gluconate is less irritating to GI tract than ferrous sulfate

• For <6 mo for anemia

SIDE EFFECTS

GI: *Nausea, constipation, epigastric pain, black and red tarry stools,* vomiting, diarrhea

INTEG: Temporarily discolored tooth enamel and eyes

PHARMACOKINETICS

PO: Excreted in feces, urine, skin, breast milk; enters bloodstream; bound to transferrin; crosses placenta

INTERACTIONS

Increase: action of iron preparation—ascorbic acid, chloramphenicol

Decrease: absorption of penicillamine, levodopa, methyldopa, fluoroquinolones, L-thyroxine, tetracycline

Decrease: absorption of iron preparations—antacids, H_2-antagonists, proton pump inhibitors, cholestyramine, vit E

Drug/Food

Decrease: absorption—dairy products, caffeine, eggs

Drug/Lab Test

False positive: occult blood

NURSING CONSIDERATIONS

Assess:

• Blood studies: Hct, HB, reticulocytes, bilirubin before treatment, at least monthly; iron studies (iron, TIBC, ferritin); avoid use with blood transfusions, iron overload may occur

• **Toxicity:** nausea, vomiting, diarrhea (green then tarry stools), hematemesis, pallor, cyanosis, shock, coma

• Elimination: if constipation occurs, increase water, bulk, activity

• **Nutrition:** amount of iron in diet (meat, dark green leafy vegetables, dried beans, dried fruits, eggs)

• Cause of iron loss or anemia, including salicylates, sulfonamides, antimalarials, quiNIDine

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; excreted in breast milk

Evaluate:

• Therapeutic response: improvement in Hct, HB, reticulocytes; decreased fatigue, weakness

Teach patient/family:

• That iron will turn stools black or dark green, stain teeth

• **Accidental exposure:** to keep out of reach of children, pets; iron poisoning may occur if increased beyond recommended level

• Not to substitute 1 iron salt for another; that elemental iron content differs (e.g., 300 mg ferrous fumarate contains about 100 mg

elemental iron; 300 mg ferrous gluconate contains only about 30 mg elemental iron)
• To avoid reclining position for 15-30 min after taking product to avoid esophageal corrosion
• To follow a diet high in iron; to avoid taking iron, dairy products, calcium supplements, and vit C together because they compete for absorption

TREATMENT OF OVERDOSE:
Induce vomiting; give eggs, milk until lavage can be done

ferumoxytol (Rx)
(fer-u-mox-y-tole)
Feraheme
Func. class.: Iron supplements

USES:
Treatment of iron-deficiency anemia in patients with chronic kidney disease or intolerance or unsatisfactory response to oral iron

CONTRAINDICATIONS:
Hypersensitivity, hemosiderosis/hemochromatosis

Black Box Warning: Serous hypersensitivity reaction

DOSAGE AND ROUTES
• **Adults:** IV 510 mg followed by a second 510 mg IV dose 3 to 8 days later
Available forms: Solution, IV 51 mg/17 mL

fesoterodine (Rx)
(fess′oh-ter-oh-deen)
Toviaz
Func. class.: Overactive bladder product
Chem. class.: Muscarinic receptor antagonist

ACTION:
Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

USES:
Overactive bladder (urinary frequency, urgency), urinary incontinence

CONTRAINDICATIONS:
GI obstruction, ileus, pyloric stenosis, urinary retention, gastric retention, hypersensitivity, closed-angle glaucoma
Precautions: Pregnancy, breastfeeding, children, renal/hepatic disease, urinary tract obstruction, ambient temperature increase, autonomic neuropathy, constipation, contact lenses, hazardous activity, GERD, gastroparesis, myasthenia gravis, prostatic hypertrophy, toxic megacolon, ulcerative colitis, possible cross-sensitivity with tolterodine

DOSAGE AND ROUTES
• **Adult and geriatric: PO EXT REL** 4 mg/day, may increase to 8 mg/day, max 4 mg/day in those taking potent CYP3A4 inhibitors
Renal dose
• **Adult: PO EXT REL** CCr <30 mL/min, max 4 mg/day
Hepatic Dose
Adult: Child-Pugh C: Not recommended.

Available forms: EXT REL TABS 4, 8 mg
Administer:
• Do not break, crush, or chew ext rel product
• Give without regard to meals
• Store at room temperature; protect from moisture

SIDE EFFECTS
CNS: Insomnia, headache, dizziness
CV: Chest pain, angina, QT prolongation, peripheral edema
EENT: Xerophthalmia
GI: *Nausea, vomiting,* abdominal pain, constipation, dry mouth
GU: Dysuria, urinary retention, UTI
INTEG: Rash, angioedema
MISC: Peripheral edema, insomnia

MS: Back pain
RESP: Cough, URI
SYST: Infection

PHARMACOKINETICS

Peak 5 hr, duration up to 24 hr, rapidly absorbed, protein binding 50%, excreted in urine/feces, half-life 7 hr [Box], metabolized by the liver (CYP2D6, CYP344 converted to active metabolite)

INTERACTIONS

Increase: action of fesoterodine—CYP3A4 inhibitors (antiretroviral protease inhibitors, macrolide antiinfectives, azole antifungals), avoid use with doses >4 mg
Increase: anticholinergic effect—antimuscarinics, anticholinergics
Increase: urinary frequency–diuretics
Drug/Herb
Decrease: fesoterodine—caffeine, green tea, guarana
Drug/Food
Increase: fesoteradine level–grapefruit juice
Decrease: festerodine level–cola, coffee, tea
Drug/Lab
Increase: ALT, GGT

NURSING CONSIDERATIONS

Assess:
• **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence
• **Allergic reactions:** angioedema; swelling of face, tongue, throat may occur anytime during treatment; have emergency equipment nearby
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk
Evaluate:
• Therapeutic response: absence of urinary frequency, urgency, incontinence
Teach patient/family:
• To avoid increased temperature, may decrease sweating
• Not to drive or operate machinery until response is known
• To avoid alcohol; drowsiness may occur
• To report immediately allergic reactions including rash, swelling of mouth, face, lips, trouble breathing
• Not to drink liquids before bedtime
• About the importance of bladder maintenance
• Not to use new medications, herbs without prescriber approval

fexofenadine (Rx, OTC)

(fex-oh-fi´na-deen)

Allegra Allergy Childrens, Allegra Allergy, Allergy 24-HR, Allergy Relief, Allergy Relief/Indoor/Outdoor

Func. class.: Antihistamine—2nd generation
Chem. class.: Piperidine, peripherally selective

ACTION: Acts on blood vessels, GI, respiratory system by competing with histamine for H_1-receptor site; decreases allergic response by blocking pharmacologic effects of histamine, less sedating

USES: Rhinitis, allergy symptoms, chronic idiopathic urticaria

CONTRAINDICATIONS: Breastfeeding, newborn or premature infants, hypersensitivity
Precautions: Pregnancy, children, geriatric patients, respiratory disease, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma, renal failure

DOSAGE AND ROUTES

• **Adult and child >12 yr: PO** 60 mg bid or 180 mg/day
• **Child 2-11 yr: PO** 30 mg bid
• **Child 6-11 yr:** Child 6 mo-2 yr: PO 15 mg bid
Renal dose
• **Adult and child ≥12 yr: PO** CCr <80 mL/min, 60 mg/day initial
• **Child 2-11 yr: PO** CCr <80 mL/min, 30 mg daily

Available forms: Tabs 30, 60, 180 mg; oral susp 6 mg/mL, orally disintegrating tab 30 mg; gel caps 180 mg
Administer:
• Without regard to meals; caps/tabs should not be given with or right before grapefruit, orange, or apple juice
Store in tight, light-resistant container
• **Orally disintegrating tab:** allow to dissolve, swallow; do not remove from blister pack until time of administration
• **Oral susp:** shake well; use calibrated measuring device

SIDE EFFECTS
CNS: Headache, drowsiness, sedation, fatigue, blurred vision, paradoxical excitation in children or geriatric patients
GI: Dyspepsia
GU: Dysmenorrhea

PHARMACOKINETICS
Well absorbed; onset 1 hr; peak 2-3 hr; duration 12-24 hr; 80% excreted in urine; feces 11%, half-life 14.5 hr, increased in renal disease

INTERACTIONS
Increase: fexofenadine effect—erythromycin, ketoconazole
Decrease: fexofenadine effect—magnesium-aluminum–containing antacids, rifAMPin
Drug/Food
Decrease: absorption of product—apple, orange, grapefruit juice
Drug/Lab Test
False negative: skin allergy tests

NURSING CONSIDERATIONS
Assess:
• **Allergy:** itchy, runny, watery eyes; congested nose; before and during treatment
• Bronchial secretions, lung sounds; increase fluids to 2000 mL/day unless contraindicated to decrease thickness of secretions
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk
Evaluate:
• Therapeutic response: absence of running or congested nose or rashes
Teach patient/family:
• About all aspects of product use; to notify prescriber if confusion, sedation, hypotension occur
• To avoid driving, other hazardous activity if drowsiness occurs
• To avoid alcohol, other CNS depressants
• To take with water; avoid fruit juices as they may decrease effectiveness

TREATMENT OF OVERDOSE:
Lavage, diazepam, vasopressors, IV phenytoin

fidaxomicin (Rx)
(fye-dax´oh-mye´sin)
Dificid
Func. class.: Antiinfective-macrolide

ACTION: Bactericidal against *Clostridium difficile;* inhibits RNA synthesis by inhibiting transcription of bacterial RNA polymerases; may act at the early stages of transcription

USES: *Clostridium difficile*–associated diarrhea

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, breastfeeding, children

DOSAGE AND ROUTES
• **Adult: PO** 200 mg bid × 10 days
Available forms: Tab 200 mg
Administer:
• Without regard to food
• Store at room temperature

SIDE EFFECTS
GI: Nausea, vomiting, abdominal pain, GI bleeding, intestinal obstruction
HEMA: Anemia, neutropenia
INTEG: Rash, pruritus

PHARMACOKINETICS
Half-life 12 hr, onset <1 hr, peak 1-5 hr, excreted in feces 92%, minimal absorption, substrate of PGP efflux transporter

INTERACTIONS

Drug/Lab Test

Increase: glucose, LFTs, alk phos

Decrease: fexofenadine sodium bicarbonate, platelets

NURSING CONSIDERATIONS

Assess:

- **CDAD:** for diarrhea, abdominal pain, fever, fatigue, anorexia, anemia, elevated WBC and low serum albumin; product may be used in place of vancomycin (PO); monitor CBC with differential and stool culture *(Clostridium difficile)*, not to be used for systemic infection; obtain C&S before use; monitor glucose (diabetic patients); monitor fluid, electrolyte depletion
- **Hypersensitivity:** rash, pruritus; angioedema (rare)
- **Pregnancy/breastfeeding:** no well-controlled studies; use only if clearly needed; cautious use in breastfeeding, excretion unknown

Evaluate:

- Positive therapeutic response: resolution of *Clostridium difficile*, decreased diarrhea

Teach patient/family:

- To report GI bleeding, severe abdominal pain
- To notify if pregnancy is planned or suspected or if breastfeeding
- To take as directed; must take all of medication
- May take without regard to food

⚠ HIGH ALERT

filgrastim (Rx)

(fill-grass´stim)

Grastofil, Neupogen, Nivestym, Zarxio, Granix

Func. class.: Biologic modifier

Chem. class.: Granulocyte colony-stimulating factor

ACTION: Stimulates proliferation and differentiation of neutrophils

USES: To decrease infection in patients receiving antineoplastics that are myelosuppressive; to increase WBC in patients with product-induced neutropenia; bone marrow transplantation, acute radiation exposure

Unlabeled uses: Neutropenia with HIV infection, aplastic anemia, ganciclovir-induced neutropenia, zidovudine-induced neutropenia

CONTRAINDICATIONS: Hypersensitivity to proteins of *Escherichia coli*

Precautions: Pregnancy, breastfeeding, children, myeloid malignancies, radiation therapy, sepsis, sickle cell disease, chemotherapy, respiratory disease

DOSAGE AND ROUTES

After myelosuppressive chemotherapy (Neupogen, Nivestym, Zarxio)

- **Adult and child: IV/SUBCUT** 5 mcg/kg/day in a single dose × up to 14 days; may increase by 5 mcg/kg with each cycle

After myelosuppressive doses of radiation (Neupogen)

- **Adult and child >7 mo: SUBCUT** 10 mcg/kg/day, start as soon as possible after receiving ≥2 Gy

After bone marrow transplantation (Neupogen, Nivestym, Zarxio)

- **Adult: IV/SUBCUT** 10 mcg/kg/day as **INFUSION (IV)** over 4 hr or 24 hr; begin 24 hr after chemotherapy and 24 hr after bone marrow transplantation

Peripheral blood progenitor cell collection/therapy (Neupogen, Nivestym, Zarxios)

- **Adult:** 10 mcg/kg/day as bolus or **CONT INFUSION** × ≥4 days before leukapheresis, continue to last leukapheresis; may alter dose if WBC >100,000 cells/mm^3

Severe neutropenia (chronic) (Neupogen, Nivestym, Zarxios)

- **Adult: SUBCUT** 5 mcg/kg daily

Neonatal neutropenia

• **Neonate: IV/SUBCUT** 5-10 mcg/kg/day × 3-5 days

Available forms: Inj 300 mcg/mL, 480 mcg/1.6 mL; vials 300 mcg/0.5 mL, 480 mcg/0.8 mL

Administer:

• Given by subcut inj, short IV infusion, or continuous SC or IV infusion

• Avoid use within 24 hr before or after chemotherapy

• Do not shake commercial single-dose vials before withdrawing the dose; if the vial is shaken and froth or bubbles form, allow the vial to stand undisturbed for a few minutes until the froth or bubbles dissipate

• Before injection, filgrastim may be allowed to reach room temperature for a maximum of 24 hr; any vial or syringe exposed to room temperature for more than 24 hr should be discarded

• Visually inspect for particulate matter and discoloration before use

• Store in refrigerator; do not freeze; may store at room temperature up to 24 hr

SUBCUT route

• **Subcut inj:** no dilution is necessary; inject by rapid subcut inj, taking care not to inject intradermally; inject into abdomen, upper outer buttock, upper outer arms, rotate sites

• **Subcut continuous infusion:** infuse subcut at a rate not to exceed 2 mL/hr (after bone transplant)

IV route

• May be diluted with 5% dextrose; do not dilute with NS; product can precipitate

• May be diluted to concentrations 5-15 mcg/mL; should be protected from adsorption to plastic by the addition of albumin to a final albumin concentration of 2 mg/mL; do not dilute filgrastim to a concentration <5 mcg/mL

• **IV infusion:** infuse IV over 15-30 min or as a continuous infusion, chemotherapy after bone transplant over 4-24 hr

Y-site compatibilities: Acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefoTEtan, cefTAZidime, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, cytarabine, dacarbazine, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, gallium, ganciclovir, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, leucovorin, LORazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, miconazole, minocycline, mitoXANtrone, morphine, nalbuphine, netilmicin, ondansetron, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

SIDE EFFECTS

CNS: Fever, headache

GI: *Nausea,* vomiting, diarrhea, mucositis, anorexia, splenic rupture

HEMA: Thrombocytopenia, excessive leukocytosis

INTEG: Alopecia, exacerbation of skin conditions, urticaria, cutaneous vasculitis, allergic reactions

MS: Osteoporosis, skeletal pain

OTHER: Chest pain, hypotension

RESP: Acute respiratory distress syndrome, wheezing, alveolar hemorrhage

PHARMACOKINETICS

SUBCUT: Onset 5-60 min, peak 2-8 hr, duration up to 1 wk

IV: Onset 5-60 min, peak 24 hr, duration up to 1 wk

INTERACTIONS

Increase: adverse reactions—do not use this product concomitantly with antineoplastics, lithium

Drug/Lab Test

Increase: uric acid, LDH, alk phos, WBC

NURSING CONSIDERATIONS

Assess:

- Blood studies: CBC, platelet count before treatment and twice weekly; neutrophil counts drop by 50% if filgrastim is discontinued the next day
- B/P, respirations, pulse before and during therapy
- Bone pain; give mild analgesics
- **Respiratory distress syndrome:** fever, dyspnea; withhold product if these occur
- **Allergic reactions:** rash, wheezing, facial edema, dyspnea; may occur within 30 min of use; give antihistamines, bronchodilators, and EPINEPHrine if needed
- **Splenic rupture:** severe left upper abdominal pain
- **Pregnancy/breastfeeding:** may cause fetal harm; if used in pregnancy, enroll in Amgen's Surveillance Program, 1-800-772-6436

Evaluate:

- Therapeutic response: absence of infection

Teach patient/family:

- About the technique for self-administration: dose, side effects, disposal of containers and needles; provide instruction sheet
- That bone pain is common

finasteride (Rx)

(fin-ass´te-ride)

Propecia, Proscar

Func. class.: Hormone, androgen inhibitor, hair stimulant

Chem. class.: 5-α-Reductase inhibitor

Do not confuse:

finasteride/furosemide

Proscar/Prograf/Provera

ACTION: Inhibits 5-α-reductase and reduction in DHT; DHT induces androgenic effects by binding to androgen receptors in the cell nuclei of the prostate gland, liver, skin; prevents development of BHP

USES: Symptomatic benign prostatic hyperplasia (Proscar); male-pattern baldness (Propecia)

CONTRAINDICATIONS: Pregnancy, breastfeeding, children, women who are pregnant or who may become pregnant should not handle tabs, hypersensitivity

Precautions: Large residual urinary volume, severely diminished urinary flow, hepatic function abnormalities

F

DOSAGE AND ROUTES

BPH

- **Adult: PO** 5 mg/day × 6-12 mo (Proscar)

Male-pattern baldness

- **Adult: PO** 1 mg/day for 3 mo or more for results (Propecia)

Available forms: Tabs (Propecia) 1 mg, (Proscar) 5 mg

Administer:

- Without regard to meals
- For a minimum of 6 mo; not all patients will respond
- Store <86° F (30° C); protect from light; keep container tightly closed

SIDE EFFECTS

GU: Impotence, decreased libido, decreased volume of ejaculate, sexual dysfunction, gynecomastia

INTEG: Rash

MISC: Breast tenderness, secondary malignancy

PHARMACOKINETICS

Bioavailability 63%; readily absorbed from GI tract; protein binding 90%; metabolized in the liver; excreted in urine (metabolites) 39%, feces (57%); crosses blood-brain barrier; peak 1-2 hr; duration 24 hr

INTERACTIONS

Drug/Lab Test

Decrease: PSA levels

NURSING CONSIDERATIONS

Assess:

- **BPH:** urinary patterns, residual urinary volume, severely diminished urinary flow
- PSA levels and exclusion of prostate/urinary cancer before initiating therapy

and periodically thereafter; PSA levels may be altered by this product
• Hepatic studies before treatment; extensively metabolized in liver
• **Pregnancy/breastfeeding:** not to be used in females; do not use in pregnancy/breastfeeding

Evaluate:
• Therapeutic response: increased urinary flow; decreased postvoiding dribbling, frequency, nocturia; hair growth within 3-6 mo; regression of prostate size

Teach patient/family:
• That pregnant women or women who may become pregnant should not touch crushed tabs or come into contact with the semen of a patient taking this product; that product may adversely affect developing male fetus
• That volume of ejaculate may be decreased during treatment; that impotence and decreased libido may also occur and may continue after discontinuing treatment
• That Propecia results may not occur for 3 mo
• That Proscar results may not occur for 6-12 mo

finerenone (Rx)

(fin-ER-e-none)

Kerendia

Func. class.: Nonsteroidal, mineralocorticoid antagonist

USES: Chronic kidney disease associated with type 2 diabetes

DOSAGES AND ROUTES

• **Adult: PO** 10 or 20 mg daily based on eGFR

Available forms: Tabs 10, 20 mg

fingolimod (Rx)

(fin-gol′i-mod) (fin-go′li-mod)

Gilenya

Func. class.: Immunosuppressant

Chem. class.: Sphingosine 1-phosphate receptor modulator

ACTION: Binds with high affinity to sphingosine 1-phosphate receptors; blocks lymphocyte egress to lymph nodes, thereby reducing the number of peripheral blood lymphocytes; may reduce lymphocyte migration into the CNS

USES: To reduce frequency of exacerbation, to delay physical disability of relapsing forms of MS

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, neonates/infants/children, AIDS, asthma, AV block, bradycardia, cardiac disease, COPD, diabetes mellitus, dysrhythmias, heart failure, hepatic disease, HIV, hypertension, immunosuppression, leukemia, lymphoma, QT prolongation, respiratory insufficiency, sick sinus syndrome, syncope, uveitis

DOSAGE AND ROUTES

• **Adult/child ≥10 and ≥40 kg: PO** 0.5 mg/day

Child ≥10 yr and ≤40 kg: 0.25 mg daily

Hepatic dose
• **Adult: PO** Child-Pugh C, total score >10: closely monitor, fingolimod exposure is doubled

Available forms: Caps 0.5 mg

Administer:

PO route
• Watch patient for 6 hr after initial dose or if product not given for >2 wk for development of bradycardia
• Give without regard to food
• Store at room temperature, protect from moisture

SIDE EFFECTS

CNS: Asthenia, depression, fatigue, headache, dizziness, progressive multifocal leukoencephalopathy, migraine, paresthesias, stroke

CV: AV block, bradycardia, chest pain, hypertension, palpitations, QT prolongation

EENT: Blurred vision, vision impairment, ocular pain, macular edema

GI: Abdominal pain, anorexia, diarrhea, jaundice, vomiting, weight loss, hepatotoxicity

HEMA: Leukopenia, lymphopenia, neutropenia
INTEG: Alopecia, pruritus
MS: Back pain
RESP: Dyspnea, cough
SYST: Infection, influenza, secondary malignancy

PHARMACOKINETICS

Protein binding (99.7%), distributed to RBCs (86%), steady-state 1-2 mo, metabolized by CYP4F2 and CYP2D6 to a lesser extent, terminal half-life 6-9 days, excreted in urine (81% inactive metabolites), peak 12-16 hr

INTERACTIONS

Increase: risk of heart block, serious bradycardia—β-blockers, calcium channel blockers, digoxin; avoid if possible
Increase: immunosuppression—antineoplastics, immunosuppressants, immune-modulating therapies
Increase: fingolimod effect—ketoconazole
Increase: infection risk—live vaccines
Decrease: effect of—inactive vaccines, toxoids
Increase: risk of torsades de pointes—Class Ia/III antidysrhythmics

NURSING CONSIDERATIONS

Assess:

- **Multiple sclerosis:** improving paresthesia, muscle weakness, clonus, muscle spasms, difficulty with moving, difficulty with coordination of balance, speech, swallowing, vision problems, fatigue; prevention of increasing disability
- **Vision:** opthalmologic exam baseline and periodically
- **Laboratory monitoring:** baseline: CBC, LFTs, serum bilirubin, ophthalmologic exam, antibodies to VZV; if there is no history of chickenpox or no vaccination, may give VZV vaccination to antibody-negative patient before giving product, postpone for 1 mo after vaccination; obtain ECG for evidence of bradycardia, AV block; monitor pulmonary function tests periodically
- **Progressive multifocal leukoencephalopathy (PML):** confusion, apathy, dizziness, unstable gait; may be fatal, discontinue product, contact prescriber
- **Bradycardia:** monitor for ≥6 hr after beginning dose, ECG before and after 1st dose, if heart rate <45 bpm or new heart block (2nd degree) occurs, do not use until resolved
- **Infections:** fever, chills, nausea, vomiting, fatigue, sore throat; monitor during and for up to 2 mo after last dose
- Monitor for QT prolongation
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk, may cause fetal harm; contraception should be used during and for 2 mo after final dose; enroll in Gilenya Pregnancy Registry (1-877-598-7237) if pregnant; discontinue breastfeeding or product, excretion unknown

Evaluate:

- Therapeutic response: improved symptoms of multiple sclerosis and prevention of increasing disability

Teach patient/family:

- About use of product and expected results; provide med guide to patient
- That continuing follow-up exams and laboratory tests will be required on a regular basis
- Pregnancy/breastfeeding: To use contraception during and for 2 mo after conclusion of treatment
- **Vaccines:** not to receive any live attenuated vaccines during and for ≥2 mo after last dose
- **Malignancy:** Use sunscreen, protective clothing; may cause melanoma basal cell carcinoma
- **Liver dysfunction:** to report jaundice, nausea, vomiting, anorexia, abdominal pain, fatigue, dark urine
- **Cardiac changes:** to report chest pain, palpitations

fish oil triglycerides emulsion (Rx)

(fish oyl try-glyc´e-rides)

Omegaven

Func. class.: Nutritional supplement—essential fatty acid

USES: A source of calories and fatty acids in pediatric patients with parenteral nutrition–associated cholestasis (PNAC)

CONTRAINDICATIONS

Hypersensitivity to this product or fish or eggs, severe hemorrhagic disorders due to a potential effect on platelet aggregation, severe hyperlipidemia, or severe disorders of lipid metabolism characterized by hypertriglyceridemia (serum triglyceride concentrations greater than 1000 mg/dL)

DOSAGE AND ROUTES

• **Child: IV infusion** 1 g/kg/day is the recommended and maximum daily dose, do not exceed 0.05 mL/min for the first 15-30 min of the infusion, max rate 1.5 mL/kg/hr

Available forms: injection 2 g/50 mL, 10 g/100 mL single dose

⚠ HIGH ALERT

flecainide (Rx)

(flek-ay´nide)

Tambocor

Func. class.: Antidysrhythmic (Class IC)

Chem. class.: Benzamide derivative

ACTION: Decreases conduction in all parts of the heart, with greatest effect on the His-Purkinje system, which stabilizes cardiac membrane

USES: Life-threatening ventricular dysrhythmias, sustained ventricular tachycardia, supraventricular tachydysrhythmias, paroxysmal atrial fibrillation/flutter associated with disabling symptoms

CONTRAINDICATIONS:

Hypersensitivity, AV bundle branch block, cardiogenic shock

Precautions: Pregnancy, breastfeeding, children, geriatric patients, renal/hepatic disease, HF, respiratory depression, myasthenia gravis, electrolyte abnormalities, atrial fibrillation, sick sinus syndrome, torsades de pointes, MI, bundle branch block, QT prolongation

Black Box Warning: Cardiac arrhythmias, atrial fibrillation, MI

DOSAGE AND ROUTES

PSVT/PAT

• **Adult: PO** 50 mg q12hr; may increase q4days by 50 mg q12hr to desired response, max 300 mg/day

Life-threatening ventricular dysrhythmias

• **Adult: PO** 100 mg q12hr; may increase by 50 mg q12hr q4days, max 400 mg/day

Renal dose

• **Adult: PO** CCr <35 mL/min, 100 mg daily or 50 mg bid initially

Available forms: Tabs 50, 100, 150 mg

Administer:

PO route

• Reduced dosage as soon as dysrhythmia is controlled

• May give with meals for GI upset

• May adjust dose q4days

• Adjust dosage at intervals of ≥4 days (approximate plateau effects); however, longer intervals are needed in patients with renal or hepatic impairment

• Frequent serum drug concentration monitoring is required for patients with severe renal (CrCl <35 mL/min) or hepatic disease and may also be helpful in patients with HF or in patients with moderate renal disease

• Monitoring of flecainide serum concentrations is strongly recommended in patients receiving amiodarone therapy

SIDE EFFECTS

CNS: *Headache, dizziness,* involuntary movement, confusion, psychosis, restlessness, irritability, paresthesias, ataxia, flushing, somnolence, depression, anxiety, malaise, fatigue, asthenia, tremors
CV: *Hypotension, bradycardia,* angina, PVCs, heart block, cardiovascular collapse, arrest, dysrhythmias, HF, fatal ventricular tachycardia, palpitations, QT prolongation, torsades de pointes
EENT: Tinnitus, *blurred vision,* hearing loss, corneal deposits, dry eyes
GI: Nausea, vomiting, anorexia, constipation, abdominal pain, flatulence, change in taste, diarrhea
GU: Impotence, decreased libido, polyuria, urinary retention
HEMA: Leukopenia, thrombocytopenia
INTEG: Rash, urticaria, edema, swelling
RESP: Dyspnea, respiratory depression

PHARMACOKINETICS

Peak 3 hr, half-life 12-27 hr, metabolized by liver, excreted unchanged by kidneys (10%), excreted in breast milk

INTERACTIONS

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone)
Increase: of both products—propranolol
Increase: CV depressant action—β-blockers, disopyramide, verapamil
Increase: flecainide level—amiodarone, cimetidine, ritonavir
Increase: digoxin level—digoxin
Increase or decrease: effect—urinary, alkalinizing agents, acidifying agents
Drug/Herb
• Do not use with hawthorn
Drug/Lab Test
Increase: CPK

NURSING CONSIDERATIONS

Assess:

Black Box Warning: HF, cardiogenic shock, LVEF <30%: should not be used in these conditions

Black Box Warning: Atrial fibrillation: avoid use; risk of ventricular dysrhythmias; use only in life-threatening dysrhythmias

Black Box Warning: Cardiac dysrhythmias: discontinue in those with prolonged QRS >180 ms or prolonged PR >300 ms, monitor for QT prolongation, monitor ECG before and during treatment

• **Electrolyte imbalances:** hypo/hyperkalemia before administration; correct electrolytes before use
• CNS effects: dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued
• Monitor renal studies: BUN, creatinine
• **Flecainide level:** monitor level in those with HF or renal failure; peak, trough
• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; discontinue breastfeeding or product, excreted in breast milk

Evaluate:
• Therapeutic response: decreased dysrhythmias

Teach patient/family:
• To change position slowly from lying or sitting to standing to minimize orthostatic hypotension
• To take as prescribed; not to skip or double dose, to take missed dose as soon as remembered within 6 hr of next dose
• To avoid hazardous activities that require alertness until response is known
• To carry emergency ID with disorder, medications taken
• To notify all health care providers of treatment, that follow-up will be needed

• To report new or worsening cardiac symptoms (chest pain, trouble breathing, sweating)

TREATMENT OF OVERDOSE: O_2, artificial ventilation, ECG, DOPamine for circulatory depression, diazepam or thiopental for seizures, treat ventricular dysrhythmias

flibanserin (Rx)

(flib-an´ser-in)

Addyi

Func. class.: Sexual dysfunction agent

USES: For the treatment of acquired, generalized hypoactive sexual desire disorder (HSDD) (also known as female sexual interest/arousal disorder)

CONTRAINDICATIONS: Hypersensitivity, hepatic disease, pregnancy, breastfeeding

DOSAGE AND ROUTES

• **Adult premenopausal females:** PO 100 mg once daily at bedtime. Discontinue after 8 wk if no improvement

Available forms: Tabs 100 mg

fluconazole (Rx)

(floo-kon´a-zole)

Canesoral, Diflucan, Diflucan One

Func. class.: Antifungal, systemic; azole

Do not confuse:
Diflucan/Diprivan

ACTION: Inhibits fungal sterols, causes direct damage to fungal membrane phospholipids

USES: Oropharyngeal candidiasis, chronic mucocutaneous candidiasis; systemic, vaginal, urinary candidiasis; cryptococcal meningitis; prevention of candidiasis in bone marrow transplant in those who receive chemotherapy and/or radiation therapy; cystitis, fungal prophylaxis, peritonitis, pneumonia, pyelonephritis

Unlabeled uses: Prophylaxis, systemic candidiasis in very-low-birthweight premature infants, blastomycosis, chemotherapy-induced neutropenia, coccidioidomycosis cryptococcosis prophylaxis, endocarditis, endophthalmitis, histoplasmosis, infectious arthritis, myocarditis, osteomyelitis, pericarditis

CONTRAINDICATIONS: Hypersensitivity to this product or azoles, pregnancy

Precautions: Breastfeeding, renal/hepatic disease, torsades de pointes

DOSAGE AND ROUTES

Vulvovaginal candidiasis

• **Adult: PO** 150 mg as a single dose; **prevention of recurrence (unlabeled)** 150 mg/day × 3 days, then weekly × 6 mo

Serious fungal infections

• **Adult: PO/IV** Most serious infections loading dose 800 mg, then continue at 400-800 mg daily for 4-6 wk

• **Child: PO/IV** 6-12 mg/kg/day

• **Neonates <14 days, 30-36 wk gestation: PO/IV** same as child except q48hr

Oropharyngeal candidiasis

• **Adult: PO/IV** 200 mg initially, then 100 mg/day for ≥2 wk

• **Child >14 days: PO/IV** 6 mg/kg initially, then 3 mg/kg/day for ≥2 wk

• **Neonate <14 days, 30-36 wk gestation: PO/IV** 6 mg/kg/dose once, then 3 mg/kg/dose once daily

Esophageal candidiasis

• **Adult: PO/IV** 200 mg on 1st day, then 100 mg daily × ≥3 wk and for ≥2 wk after resolution of symptoms

• **Child >14 days: PO/IV** 6 mg/kg on 1st day, then 3 mg/kg × ≥3 wk and for ≥2 wk after resolution of symptoms

• **Neonate: PO/IV** 6 mg/kg q 24-48hr

Cryptococcal meningitis

• **Adult: PO/IV** 400 mg on 1st day, then 200 mg/day × 10-12 wk after CSF culture negative, suppressive therapy 200 mg/day

• **Child/infant/neonate ≥14 days: PO/IV** 12 mg/kg on 1st day, then 6-12 mg/kg daily × 10-12 wk after CSF culture negative, max 600 mg/day, suppressive therapy 6 mg/kg/day

• **Neonate 0-14 days: PO/IV** 12 mg/kg on 1st day, then 6-12 mg/kg q72hr × 10-12 wk after CSF culture negative

Prevention of candidiasis in bone marrow transplant

• **Adult: PO/IV** 400 mg/day, those anticipated to have neutrophils <500/mm^3, start several days before anticipated onset of neutropenia and continue for 7 days after rise of neutrophils >1000/mm^3

• **Child >14 days: PO/IV** 10-12 mg/kg/day, max 600 mg/day

Renal disease

• **Adult: PO/IV** CCr ≤50 mL/min, after loading dose, give 50% of usual dose; hemodialysis give 100% of usual dose after dialysis treatment, give dose as per CCr on non-dialysis days

Available forms: Tabs 50, 100, 150, 200 mg; inj 2 mg/mL; powder for oral susp 10 mg/mL, 40 mg/mL

Administer:

PO route

• Shake oral susp before each use, use within 2 wk

Intermittent IV INFUSION route

• After diluting according to package directions, run at ≤200 mg/hr; do not use plastic containers in connections; check for bag leaks

• Use infusion pump; check for extravasation and necrosis q2hr

• Do not use if cloudy or precipitated

• Do not admix; do not refrigerate

• Store protected from moisture and light; diluted sol stable 24 hr; do not freeze

Y-site compatibilities: Acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, ceftobiprole, cephalothin, cephapirin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IV immune globulin, inamrinone, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, phytonadione, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol,

F

propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache,* seizures
CV: QT prolongation, torsades de pointes
GI: *Nausea, vomiting,* diarrhea, cramping, flatus, increased AST, ALT, hepatotoxicity, abdominal pain, cholestasis
HEMA: Agranulocytosis, eosinophilia, leukopenia, neutropenia, thrombocytopenia
INTEG: Stevens-Johnson syndrome, angioedema, anaphylaxis, exfoliative dermatitis, toxic epidermal necrolysis

PHARMACOKINETICS

Peak 1-2 hr, bioavailability (PO) >90%, widely distributed (peritoneum, CSF), excreted in breast milk, excreted unchanged in urine 80%, metabolized by CYP3A enzyme system at dose >200 mg/day, half-life 30 hr (adult); child 19-25 hr (PO); premature neonates (46-74 hr)

INTERACTIONS

Increase: hypoglycemia—oral sulfonylureas (glipiZIDE)
Increase: anticoagulation—warfarin
Increase: plasma concentrations/toxicity—cycloSPORINE, phenytoin, theophylline, rifabutin, tacrolimus, sirolimus, zidovudine, zolpidem
Increase: myopathy, rhabdomyolysis risk—HMG-CoA reductase inhibitors: lovastatin, simvastatin
Increase: effect of zidovudine, methadone, SUFentanil, alfentanil, buprenorphine, saquinavir, fentaNYL, ergots
Decrease: effect of calcium channel blockers
Decrease: fluconazole effect—proton pump inhibitors
Drug/Lab Test
Increase: alk phos, LFTs
Decrease: WBC, platelets

NURSING CONSIDERATIONS

Assess:
• **Infection:** clearing of CSF and other culture during treatment, obtain C&S baseline and throughout treatment, product may be started as soon as culture is taken
• **QT prolongation:** avoid with other products that cause QT prolongation
• **Hepatotoxicity:** monitor for increasing AST, ALT, baseline and periodically alk phos, bilirubin; for renal status: BUN, creatinine
• **Skin symptoms:** color, lesions, inj-site reactions; if lesions progress, stop product; monitor rash, usually appears after 2nd wk of treatment and disappears in 2 wk if continuing product
• **Pregnancy/breastfeeding:** birth defects may occur if used in 1st trimester; do not use in pregnancy, breastfeeding
Evaluate:
• Therapeutic response: decreasing oral candidiasis, fever, malaise, rash; negative C&S for infection organism
Teach patient/family:
• That long-term therapy may be needed to clear infection, not to add new medications, herbs without prescriber approval
• That medication may be taken with food to reduce GI effects
• To notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine, skin rash, abdominal pain, fever, bruising, bleeding

⚠ HIGH ALERT

fludarabine (Rx)

(floo-dar´a-been)
Func. class.: Antineoplastic, antimetabolite
Chem. class.: Purine antagonist

ACTION: Inhibits DNA synthesis by inhibition of DNA polymerase and ribonucleotide reductase; also inhibits DNA primase and DNA ligase

USES: Chronic lymphocytic leukemia

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity

Black Box Warning: Hemolytic anemia, bone marrow suppression, coma, seizures, visual disturbances

DOSAGE AND ROUTES

Chronic lymphocytic leukemia (CLL), refractory or progressive

• **Adult:** IV 25 mg/m^2 once daily for 5 consecutive days q28days; continue for at least 3 additional cycles after maximal response is achieved; PO (Canada only) 40 mg/m^2 once daily for 5 consecutive days q28days

Acute myeloid leukemia, newly diagnosed (Unlabeled)

• **Adult:** IV 30 mg/m^2/day for 5 days (cytarabine ± G-CSF ± idarubicin (FA, FLAG, or FLAG-IDA regimens), followed by consolidation therapy

Acute myeloid leukemia, refractory or high/poor-risk patients (unlabeled)

• **Adult:** IV 30 mg/m^2/day × 5 days (with cytarabine and filgrastim [FLAG regimen]), may repeat once for partial remission **or** 30 mg/m^2/day for 5 days for 1 or 2 cycles (in combination with cytarabine, idarubicin, and filgrastim [FLAG-IDA regimen])

Hematopoietic stem cell transplant (allogeneic) myeloablative conditioning regimen (off-label use)

• **Adult:** IV 40 mg/m^2/day for 4 days (with busulfan) beginning 6 days prior to transplantation

Hematopoietic stem cell transplant (allogeneic) reduced-intensity conditioning regimen (unlabeled)

• **Adult:** IV 30 mg/m^2/day × 5 days (with melphalan and alemtuzumab) prior to transplant **or** 30 mg/m^2/day for 6 days beginning 10 days prior to transplant **or** 30 mg/m^2/day for 5 days beginning 6 days prior to transplant (with busulfan with or without antithymocyte globulin)

Hematopoietic stem cell transplant (allogeneic) nonmyeloablative conditioning regimen (unlabeled)

• **Adult:** IV 30 mg/m^2/day × 3 doses beginning 5 days prior to transplant (with cyclophosphamide and rituximab) **or** 30 mg/m^2/day for 3 doses beginning 4 days prior to transplant (with total body irradiation)

Available forms: Solution for injection 50 mg /2 mL (2 mL); powder for injection 50 mg/2 mL

Administer

IV route

• Reconstitute lyophilized powder with 2 mL SWFI to a concentration of 25 mg/mL

• Dilute in 100 to 125 mL D_5W or NS, give over 30 min (CLL)

• Store vials under refrigeration or at room temperature, as specified according to each manufacturer's labeling. Protect from light. Reconstituted solution or vials of the solution for injection that have been punctured (in use) should be used within 8 hr

PO route

• Tablet [Canadian product] give with or without food; swallow whole with water; do not chew, break, or crush

• Tablet [Canadian product]: Store at 15°C to 30°C (59°F to 86°F); keep in packaging until use

SIDE EFFECTS

CV: Edema, angina pectoris, cardiac arrhythmia, cardiac failure, CVA, MI, supraventricular tachycardia, DVT, phlebitis

CNS: Fatigue, cortical blindness, coma, paralysis, chills, paresthesia, malaise, headache, sleep disorder

INTEG: Rash, diaphoresis, alopecia, pruritus

GI: Nausea, vomiting, anorexia, diarrhea, GI hemorrhage, stomatitis, cholelithiasis, esophagitis, constipation, mucositis

GU: UTI, hematuria, dysuria

HEMA: Anemia, neutropenia, thrombocytopenia, bone marrow depression

EENT: Visual disturbance, hearing loss

RESP: Cough, pneumonia, dyspnea, URI, pharyngitis, hypersensitivity, pneumonitis, hemoptysis, sinusitis
MISC: Fever, infection, myalgia, hypersensitivity, hyperglycemia, TLS

PHARMACOKINETICS

Onset, peak, duration unknown, half-life 20 hr

INTERACTIONS

Increase: toxicity—other myelosupressives
Increase: adverse reactions—live virus vaccines, bring up to date before treatment

Black Box Warning: Increase: pulmonary toxicity—pentostatin, do not use together

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Severe bone marrow suppression (anemia, thrombocytopenia, and neutropenia): may be cumulative. Time to nadir 13 days (range: 3-25 days) for granulocytes and 16 days (range: 2-32 days) for platelets. Monitor those with bone marrow impairment closely for excess toxicity; may require dosage reductions

• **Autoimmune effects:** Instances of life-threatening and sometimes fatal autoimmune phenomena, such as hemolytic anemia, autoimmune thrombocytopenia/thrombocytopenic purpura, Evans syndrome, and acquired hemophilia, have been reported to occur after 1 or more cycles of treatment with fludarabine. Patients undergoing treatment should be evaluated and closely monitored for hemolysis

Black Box Warning: Autoimmune effects: May be life-threatening, hemolytic anemia, autoimmune thrombocytopenia/thrombocytopenic purpura, Evans syndrome, and acquired hemophilia, have been reported after 1 or more cycles, evaluate and closely monitored for hemolysis, corticosteroids may be needed

• **Tumor lysis syndrome:** Risk is increased in patients with large tumor burden prior to treatment. Hydration and prophylactic antihyperuricemic therapy may be used

Black Box Warning: Neurotoxicity: Higher-than-recommended doses (up to 96 mg/m^2/day for 5-7 days) may cause severe neurologic toxicity (delayed blindness, coma, death); similar neurotoxicity (agitation, coma, confusion, seizure) has been reported (rare) with standard CLL doses (25 mg/m^2/day for 5 days). Symptoms of neurotoxicity due to high doses appeared from 21-60 days following the last dose, neurotoxicity may occur as early as 7 days and up to 225 days

Black Box Warning: Combination with pentostatin: Do not use together, fatal pulmonary toxicity may occur

Black Box Warning: Experienced physician: Injection should be administered under the supervision of a qualified health care provider experienced in the use of antineoplastic therapy

• **PML:** PML (usually fatal) due to JC virus has been reported; most cases were in patients who had received prior and/or other concurrent chemotherapy. Onset may be a few weeks or may be delayed up to 1 yr. Evaluate any neurological change promptly
• **Transfusion-associated graft-versus-host disease:** Patient should only receive irradiated blood products due to the potential for transfusion-related GVHD
• **Pregnancy/breastfeeding:** Not to be used in pregnancy or breastfeeding; effective contraception should be used by females and males during and for ≥6 mo after last dose
• Monitor CBC with differential, platelet count, AST, ALT, serum creatinine, serum albumin, uric acid; monitor for signs of infection, neurotoxicity, and tumor lysis syndrome

Evaluate:

• Therapeutic response: Inhibiting CLL

Teach patient/family:
- To report mouth irritation, mouth sores, muscle pain
- **PML:** To report confusion, depression, trouble with memory, behavioral changes, change in strength on one side is greater than the other, trouble speaking, change in balance, or vision changes
- **Bleeding:** To report vomiting blood or vomit that looks like coffee grounds or is black; coughing up blood; blood in the urine; black, red, or tarry stools; bleeding from the gums; abnormal vaginal bleeding; bruises without a reason or that get bigger; or any severe or persistent bleeding
- **Tumor lysis syndrome:** To report fast heartbeat or abnormal heartbeat; fainting; unable to pass urine; muscle weakness or cramps; nausea, vomiting, diarrhea or lack of appetite; or feeling fatigued
- To report shortness of breath or other trouble breathing, cough that is new or worse
- **Stevens-Johnson syndrome/toxic epidermal necrolysis:** To report red, swollen, blistered, or peeling skin (with or without fever); red or irritated eyes; or sores in mouth, throat, nose, or eyes
- **Signs of an allergic reaction:** To report rash; hives; itching; red, swollen, blistered, or peeling skin with or without fever; wheezing; tightness in the chest or throat; trouble breathing, swallowing, or talking; unusual hoarseness; or swelling of the mouth, face, lips, tongue, throat
- **Pregnancy/breastfeeding:** To report if pregnancy is planned or suspected or if breastfeeding; to use contraceptives (males and females taking product) during and for ≥6 mo after last dose

fludrocortisone (Rx)

(floo-droe-kor′ti-sone)

Func. class.: Corticosteroid, synthetic

Chem. class.: Mineralocorticoid

USES: Adrenal insufficiency, salt-losing adrenogenital syndrome, Addison's disease

CONTRAINDICATIONS: Children <2 yr, hypersensitivity

DOSAGE AND ROUTES

Adrenocortical insufficiency
- **Adult: PO** 100-200 mcg/day
- **Child: PO** 50-100 mcg/day

Available forms: Tabs 100 mcg (0.1 mg)

F

flumazenil (Rx)

(flu-maz′e-nill)

Anexate

Func. class.: Antidote: benzodiazepine receptor antagonist

Chem. class.: Imidazobenzodiazepine derivative

Do not confuse:
flumazenil/influenza virus vaccine

ACTION: Antagonizes actions of benzodiazepines on CNS, competitively inhibits activity at benzodiazepine recognition site on GABA/benzodiazepine receptor complex

USES: Reversal of sedative effects of benzodiazepines

CONTRAINDICATIONS: Hypersensitivity to this product or benzodiazepines, serious cyclic antidepressant overdose, patients given benzodiazepine for control of life-threatening conditions

Precautions: Pregnancy, breastfeeding, children, geriatric patients, status epilepticus, head injury, labor/delivery, renal/hepatic disease, hypoventilation, panic disorder, drug and alcohol dependency, ambulatory patients, benzodiazepine dependence

Black Box Warning: Seizures

DOSAGE AND ROUTES

Reversal of conscious sedation or general anesthesia

• **Adult: IV** 0.2 mg over 15 sec; wait 45 sec, then 0.2 mg if consciousness does not occur; may be repeated at 60-sec intervals prn (max 3 mg/hr) or 1 mg/5 min

• **Child: IV** 10 mcg (0.01 mg)/kg; cumulative dose of 1 mg or less

Management of suspected benzodiazepine overdose

• **Adult: IV** 0.2 mg over 30 sec; wait 30 sec, then give 0.3 mg over 30 sec if consciousness does not occur; further doses of 0.5 mg can be given over 30 sec at intervals of 1 min up to cumulative dose of 3 mg

• **Child: IV** 10 mcg (0.01 mg/kg), cumulative dose of <1 mg

Available forms: Inj 0.1 mg/mL

Administer:

• Check airway and IV access before administration

• Use large vein

Direct IV route

• Give undiluted or diluted with 0.9% NaCl, D_5W, LR; give over 15-30 sec into running IV, check for extravasation

• Stable for 24 hr if drawn into a syringe or mixed with other solutions

SIDE EFFECTS

CNS: Dizziness, agitation, emotional lability, confusion, seizures, somnolence, panic attacks

CV: Hypertension, palpitations, cutaneous vasodilation, dysrhythmias, bradycardia, tachycardia, chest pain

EENT: Abnormal vision, blurred vision, tinnitus

GI: Nausea, vomiting, hiccups

SYST: Headache, inj site pain, increased sweating, fatigue, rigors

PHARMACOKINETICS

Half-life 41-79 min (adult), 20-75 min (child), metabolized in liver, onset 1-2 min 50% protein binding (albumin)

INTERACTIONS

• Toxicity: mixed product overdosage

• Antagonize action of benzodiazepines, zaleplon, zolpidem

NURSING CONSIDERATIONS

Assess:

• Cardiac and respiratory status using continuous monitoring

Black Box Warning: Seizures: protect from injury; most likely among those who are withdrawing from benzodiazepines; seizures are increased in head trauma

• GI symptoms: nausea, vomiting; place patient in side-lying position to prevent aspiration

• **Allergic reactions:** flushing, rash, urticaria, pruritus

Black Box Warning: Seizures/benzodiazepine dependence: do not use in those who have used these products for status epilepticus; use in intensive care setting cautiously, there may be unrecognized benzodiazepine dependence

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; discontinue breastfeeding or product

Teach patient/family:

• Not to use with alcohol or other medications for at least 24 hr

• That sedation may occur after treatment

• To avoid hazardous activities, driving until effects are known

• That amnesia may continue

fluocinolone (Rx)

(floo-oh-sin'oh-lone)

Capex, Derma-Smoothe/FS Body, Derma-Smoothe/FS Scalp, Synalar, Synalar (Cream), Synalar (Ointment), Synalar TS

Func. class.: Corticosteroid

USES: **Body oil:** Moderate-severe atopic dermatitis in pediatric patients ≥3 mo; treatment of atopic dermatitis in adults. **Cream, ointment, topical solution:** Relief of inflammatory/pruritic corticosteroid-responsive dermatoses. **Scalp oil:** Psoriasis of the scalp in

adults. **Shampoo:** seborrheic dermatitis of the scalp

DOSAGE AND ROUTES

Atopic dermatitis:

• Topical: Body oil: Apply thin film to affected area tid

Corticosteroid-responsive dermatoses:

• Topical: Cream, ointment, solution: Apply a thin layer to affected area bid to qid, may use occlusive dressing

Scalp psoriasis:

• Topical: Scalp oil: Massage thoroughly into wet or dampened hair/scalp; cover with shower cap. Leave on overnight (≥4 hr). Wash hair with shampoo and rinse well

Seborrheic dermatitis of the scalp:

• Topical: Shampoo: Apply no more than 1 ounce to scalp daily; work into lather and allow to remain on scalp for about 5 min; remove from hair and scalp by rinsing well with water

Available forms: Cream 0.01%, 0.025%; oil 0.01%

fluocinolone topical

See Appendix B

fluocinonide (Rx)

(floo-oh-sin'oh-nide)

Lidex, Vance

Func. class.: Corticosteroid

USES: Dermatoses

DOSAGE AND ROUTES

• Adult/child ≥12 yr: Topical apply to clean area bid-qid

Available forms: Cream 0.05%, 0.1%; gel, ointment, topical solution 0.05%

fluorometholone ophthalmic

See Appendix B

⚠ HIGH ALERT

fluorouracil (Rx)

(flure-oh-yoor´a-sil)

Carac, Efudex, Fluoroplex, Tolak

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Pyrimidine analog

ACTION: Inhibits DNA, RNA synthesis; interferes with cell replication by competitively inhibiting thymidylate production, specific for S phase of cell cycle

USES: **Systemic:** cancer of breast, colon, rectum, stomach, pancreas; **topical:** multiple actinic keratoses, superficial basal cell carcinomas

Unlabeled uses: Anal carcinoma, bladder cancer, cervical cancer, esophageal cancer, glaucoma surgery (adjunctive therapy), head and neck cancer, hepatobiliary cancers, pancreatic tumors, penile cancer, unknown primary cancer, vulvar cancer

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, poor nutritional status, serious infections, dihydropyrimidine dehydrogenase deficiency, bone marrow suppression

Precautions: Children, renal/hepatic disease, angina, stomatitis, diarrhea, sunlight exposure, vaccination, occlusive dressing, GI bleeding

Black Box Warning: Requires an experienced clinician and a specialized care setting

DOSAGE AND ROUTES

Doses vary widely, based on actual body weight unless obese, then based on lean body weight

Colorectal cancer

• **Adult:** IV Bolus 400 mg/m^2 bolus on day 1, then **continuous IV infusion** 2400-3000 mg/m^2 over 46 hr q2 wk (with leucovorin ± either oxaliplatin or irinotecan) or IV Bolus 500 mg/m^2 on days 1, 8, 15, 22, 29, and 36 (1 hr after the start of leucovorin) q8 wk (with leucovorin) for 4 cycles

Gastric cancer

• **Adult:** IV Continuous Infusion 200-1000 mg/m^2/day over 24 hr (as part of a platinum-containing regimen); the duration and frequency of each cycle vary based on the dose and regimen

Pancreatic cancer

• **Adult: IV Continuous Infusion** 2400 mg/m^2 over 46 hr q14 days (with leucovorin, irinotecan, and oxaliplatin) for 24 wk

Breast cancer

• **Adult: IV** 500 mg/m^2 on days 1 and 8 every 28 days; CMF regimen: 600 mg/m^2 on days 1 and 8 every 28 days

Anal carcinoma (unlabeled)

• **Adult: IV Continuous Infusion** 1000 mg/m^2/day days 1 to 4 and days 29 to 32 (with mitomycin and radiation therapy)

Bladder cancer, muscle invasive (unlabeled)

• **Adult: IV Continuous Infusion** 500 mg/m^2/day during radiation therapy fractions 1 to 5 and 16 to 20 (with mitomycin and radiation therapy)

Cervical cancer (unlabeled)

• **Adult: IV Continuous Infusion** 1000 mg/m^2/day days 1 to 4 (with cisplatin and radiation therapy) q3 wk for 3 cycles

Esophageal cancer (unlabeled)

• **Adult: IV Continous Infusion** 1000 mg/m^2/day days 1 to 4 and days 29 to 32 of a 35-day treatment cycle (preoperative chemoradiation; with cisplatin)

Glaucoma surgery, adjunctive therapy (unlabeled)

• **Adult: Ophthalmic:** Intraoperative topical application: Apply sponge soaked in fluorouracil 50 mg/mL for 5 min. Postoperative subconjunctival injection: 5 mg once daily for 10 days or 5 mg once daily for 1 wk, then every other day the next week for a total of 10 doses

Head and neck cancer, squamous cell (unlabeled)

• **Adult: IV Continuous Infusion** 1000 mg/m^2/day days 1 to 4 q3 wk (in combination with cisplatin) for at least 6 cycles or 1000 mg/m^2/day days 1 to 4 q4 wk (with carboplatin) or 600 mg/m^2/day days 1 to 4, 22 to 25, and 43 to 46 (with carboplatin and radiation)

Available forms: Inj 50 mg/mL; cream 0.5%, 1%, 4%, 5%; sol 2%, 5%

Administer:

Topical route

• The 1% strength is used on face; higher strengths are used on other parts of the body

• Wear gloves when applying; may use with a loose dressing; use plastic or wooden applicator, do not use occlusive dressings, may use gauze dressing

IV route

• Prepared in biologic cabinet using gloves, gown, mask; use cytotoxic handling procedures

• Double-check all dosage amounts, type of product to be used; fatalities have occurred

• Antiemetic 30-60 min before product to prevent vomiting, for several days thereafter

IV direct

• Undiluted; may inject through Y-tube or 3-way stopcock; give over 1-3 min; may be diluted in NS, D_5W and given as an **intermittent infusion;** use infusion in plastic containers; given over 2-8 hr; do not refrigerate/freeze; protect from light, discard unused portion, stable for 24 hr at room temperature, do not use discolored, cloudy solution; solution is pale yellow; for crystals, dissolve by warming slowly and shaking, let cool to body temperature before use

Y-site compatibilities: Acyclovir, alatrofloxacin, alfentanil, allopurinol, amifostine, amikacin, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, digoxin, DOCEtaxel, DOPamine, doripenem, DOXOrubicin liposomal, enalaprilat, ePHEDrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, milrinone, mitoMYcin, mitoXANtrone, morphine sulfate, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ofloxacin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, propofol, propranolol, ranitidine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinBLAStine, vinCRIStine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

Systemic use

CNS: Malaise, acute cerebellar dysfunction

EENT: Light intolerance, lacrimation

GI: *Anorexia, stomatitis,* diarrhea, nausea, vomiting, **hemorrhage,** enteritis, glossitis

HEMA: **Thrombocytopenia, leukopenia, myelosuppression, anemia, agranulocytosis**

INTEG: *Rash,* fever, photosensitivity, **anaphylaxis, alopecia, hand-foot syndrome**

PHARMACOKINETICS

Half-life 16 min (IV): metabolized in liver; excreted in lungs (60%-80%) urine; IV onset 1-9 days, peak 9-21 days (nadir), duration 30 days; top: onset 2-3 days, peak 2-6 wk, duration 1-2 mo; crosses blood-brain barrier (up to 15%)

INTERACTIONS

Increase: bleeding—anticoagulants, NSAIDs, platelet inhibitors, thrombolytics

Increase: toxicity—metroNIDAZOLE, irinotecan

Increase: toxicity, bone marrow depression—radiation or other antineoplastics, leucovorin

Decrease: antibody response—live virus vaccines

Decrease: effect of phenytoin

Drug/Lab Test

Increase: AST, ALT, LDH, serum bilirubin, Hct, HB, WBC, platelets, 5-HIAA

Decrease: albumin

NURSING CONSIDERATIONS

Assess:

• **Bone marrow suppression:** monitor daily during IV treatment: CBC, differential, platelet count daily (IV); withhold product if WBC is <3500/mm^3 or platelet count is <100,000/mm^3; notify prescriber of results; product should

be discontinued; nadir of leukopenia within 2 wk, recovery 1 mo, if pretreatment of WBC <2000/mm^3 or platelets <100,000/mm^3, delay until recovery of counts above this level; nadir usually 9-14 days, recovery 30 days

Black Box Warning: Use only with an experienced clinician in a specialized care setting, for cancer chemotherapy

- **Palmar-plantar erythrodysesthesia:** hand/foot tingling changing to pain, redness
- **Infiltration:** monitor frequently for pain, redness, inflammation at site; if present, stop infusion and start at new site, may use ice at site
- Renal studies: BUN, serum uric acid, urine CCr; electrolytes before, during therapy
- Hepatic studies before, during therapy: bilirubin, alk phos, AST, ALT, LDH before, during therapy
- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices; avoid IM injections, rectal temperatures
- Inflammation of mucosa, breaks in skin; buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Infection:** fever, chills, cough, sore throat; those with current infections should be treated before receiving 5-FU, the dose reduced or discontinued if infection occurs
- **Toxicity:** hemorrhage, severe vomiting, severe diarrhea, stomatitis, WBC <3500/mm^3, platelets <100,000/mm^3, notify prescriber
- **Acute cerebellar dysfunction:** dizziness, weakness
- **Pregnancy:** identify pregnancy before starting therapy; do not use in pregnancy or breastfeeding; drug may cause fetal harm

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To avoid crowds, persons with known infection
- To avoid foods with citric acid, hot temperature, or rough texture if stomatitis is present; to drink adequate fluids
- To report stomatitis: any bleeding, white spots, ulcerations in mouth; that patient should examine mouth daily, report symptoms; viscous lidocaine may be used; rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss, give ice chips for mucositis
- **To report signs of infection:** fever, sore throat, flulike symptoms
- To report signs of **anemia:** fatigue, headache, faintness, shortness of breath, irritability
- To report **bleeding:** to avoid razors, commercial mouthwash, IM inj if counts are low
- Not to use aspirin products or NSAIDs
- To use contraception during therapy (men and women); to avoid breastfeeding (topical use)
- Not to receive vaccinations during therapy
- To use sunscreen or stay out of the sun to prevent photosensitivity
- About hair loss; to explore use of wigs or other products until hair regrowth occurs
- **Topical:** to apply only to affected areas, being careful around mouth, nose, eyes; to avoid occlusive dressings; to wash hands after application

fLUoxetine (Rx)

(floo-ox´eh-teen)

PROzac, Sarafem

Func. class.: Antidepressant, SSRI (selective serotonin reuptake inhibitor)

Do not confuse:
PROzac/PriLOSEC/Prograf/Provera
Sarafem/Serophene
fluoxetine/duloxetine/loxitane/paroxetine

ACTION: Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES: Major depressive disorder, obsessive-compulsive disorder (OCD), bulimia nervosa, premenstrual dysphoric disorder (PMDD), panic disorder
Unlabeled uses: Binge eating disorder, body dysmorphic disorder, fibromyalgia, generalized anxiety disorder, posttraumatic stress disorder, premature ejaculation, selective mutism, social anxiety disorder

CONTRAINDICATIONS: Hypersensitivity, MAOI therapy
Precautions: Pregnancy, breastfeeding, geriatric patients, diabetes mellitus, narrow-angle glaucoma, cardiac malformations in infants (exposed to FLUoxetine in utero), osteoporosis, QT prolongation

Black Box Warning: Children, suicidal ideation

DOSAGE AND ROUTES

Depression/obsessive-compulsive disorder
• **Adult: PO** 20 mg/day in AM; after 4 wk, if no clinical improvement is noted, dose may be increased to 20 mg bid in AM, PM, max 80 mg/day
• **Geriatric: PO** 10 mg/day, increase as needed
• **Child 7-17 yr: PO** 10 mg/day, max 20 mg/day
Premenstrual dysphoric disorder (Sarafem)
• **Adult: PO** 20 mg/day, may be taken daily 14 days before menses
Anorexia nervosa (unlabeled)
• **Adult: PO** 10 mg daily, max 60 mg/day
Posttraumatic stress disorder (unlabeled)
• **Adult: PO** 10-80 mg/day
Available forms: Caps 10, 20, 40 mg; tabs 10, 20, 60 mg; oral sol 20 mg/5 mL
Administer:
• Without regard to meals
• Crushed if patient is unable to swallow medication whole (tab only)
• Immediate-release product should be given in the AM unless sedation occurs
• Gum, hard candy, frequent sips of water for dry mouth
• Sarafem is used only for premenstrual dysphoric disorder
• Store at room temperature; do not freeze
• **Oral sol:** use oral syringe or calibrated measuring device

SIDE EFFECTS

CNS: *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation,* seizures, apathy, euphoria, hallucinations, delusions, psychosis, suicidal ideation, neuroleptic malignant syndrome–like reactions
CV: *Hot flashes, palpitations,* angina pectoris, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis, generalized edema, torsades de pointes
EENT: Visual changes, ear/eye pain, photophobia, tinnitus, increased intraocular pressure
GI: *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation,* taste changes, flatulence, decreased appetite
GU: *Dysmenorrhea, decreased libido, urinary frequency, UTI,* amenorrhea, cystitis, impotence, urine retention
HEMA: Hemorrhage
INTEG: *Sweating, rash, pruritus,* acne, alopecia, urticaria, angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis
META: Hyponatremia
MS: *Pain,* arthritis, twitching
RESP: *Pharyngitis, cough, dyspnea, bronchitis,* asthma, hyperventilation, pneumonia
SYST: *Asthenia,* serotonin syndrome, flulike symptoms, neonatal abstinence syndrome

PHARMACOKINETICS

PO: Peak 6-8 hr, metabolized in liver to norfluoxetine active metabolite by CYP2D6 isoenzyme, some patients may be poor metabolizers; excreted in urine, half-life 2-3 days, half-life 4-16 days, protein binding 94%

INTERACTIONS

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, selegiline, busPIRone, tryptophan, phenothiazines, haloperidol, loxapine, thiothixene, tricyclics, linezolid, traZODone, traMADol

Increase: QT prolongation—pimozide, thioridiazine, antidysrhythmics class III

Increase: bleeding risk—platelet inhibitors, thrombolytics, NSAIDs, salicylates, anticoagulants

• Do not use MAOIs, linezolid, methylene blue with or 14 days before FLUoxetine

Increase: levels or toxicity of carBAMazepine, lithium, digoxin, warfarin, phenytoin, diazepam, vinBLAStine, donepezil, antidiabetics, dorifenacin, paricalcitrol, budesonide, bosentan, thioridazine

Increase: CNS depression—alcohol, antidepressants, opioids, sedatives

Decrease: FLUoxetine effect—cyproheptadine

Drug/Herb

• Do not use together; increased risk of serotonin syndrome: St. John's wort, SAM-e

Increase: CNS effect—hops, kava, lavender, valerian

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Mental status: mood, sensorium, affect, suicidal tendencies (child/young adult), increase in psychiatric symptoms, depression, panic; monitor for seizures, seizure potential increased, Sarafem is not approved for children

• **Serotonin syndrome:** symptoms can occur anytime after first dose; nausea/vomiting, sedation, dizziness, diaphoresis, mental changes, elevated B/P; if these occur, product should be stopped, notify prescriber

• **QT prolongation:** may be more severe in those with history of QT prolongation; if thioridazine is being used, discontinue for 5 wk prior to using this product

• **Neuroleptic malignant syndrome:** fever, seizures, diaphoresis, dyspnea, hyper/hypotension; report immediately

• **Bulimia nervosa:** appetite, weight daily, increase nutritious foods in diet, watch for bingeing and vomiting

• Allergic reactions/serious skin reactions: angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, itching, rash, urticaria; product should be discontinued, may need to give antihistamine

• B/P (lying/standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; ECG for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients

• **Blood studies:** CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy; check platelets; bleeding can occur, thyroid function, growth rate (children), weight

• **Hepatic studies:** AST, ALT, bilirubin, creatinine, weight weekly; appetite may decrease with product

• Safety measures, primarily for geriatric patients

• **Beers:** avoid use in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; not recommended in breastfeeding

Evaluate:

• Therapeutic response: decreased depression, symptoms of OCD, absence of suicidal thoughts decreased symptoms of PMDD

Teach patient/family:

• That therapeutic effect may take 1-4 wk, not to discontinue abruptly, that follow-up will be required

• To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision

• To avoid alcohol, other CNS depressants

• To notify prescriber if pregnant, planning to become pregnant, or breastfeeding
• To change positions slowly because orthostatic hypotension may occur
• To avoid all OTC products unless approved by prescriber
• To notify prescriber if allergic reactions occur (rash, trouble breathing, itching)

Black Box Warning: That suicidal thoughts/behaviors may occur in young adults, children, usually during early treatment, to report immediately

• That decreased libido, erectile dysfunction may occur
• To notify prescriber of worsening symptoms, or if insomnia, anxiety, or depression continues
• **Serotonin syndrome:** to report fever, sweating, diarrhea, poor coordination, nausea/vomiting, sedation, flushing, mental changes

fluPHENAZine decanoate (Rx)

(floo-fen´a-zeen)

fluPHENAZine hydrochloride (Rx)

Func. class.: Antipsychotic
Chem. class.: Phenothiazine, piperazine

ACTION: Depresses cerebral cortex, hypothalamus, limbic system, which control activity and aggression; blocks neurotransmission produced by DOPamine at synapse; exhibits strong α-adrenergic and anticholinergic blocking action; mechanism for antipsychotic effects is unclear

USES: Schizophrenia

CONTRAINDICATIONS: Hypersensitivity, blood dyscrasias, coma, bone marrow depression

Precautions: Pregnancy, breastfeeding, children <12 yr, geriatric patients, seizure disorders, hypertension, cardiac/hepatic disease, abrupt discontinuation, accidental exposure, agranulocytosis, ambient temperature increase, angina, hypersensitivity to benzyl alcohol/parabens/sesame oil/tartrazine dye, QT prolongation, suicidal ideation, renal failure, Parkinson's disease, hypocalcemia, head trauma, prostatic hypertrophy, pulmonary disease, infection, ileus, chemotherapy, breast cancer

Black Box Warning: Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Decanoate

• **Adult and child >12 yr: IM/SUBCUT** 12.5-25 mg q1-3wk, may increase slowly, max 100 mg/dose

HCl

• **Adult: PO** 2.5-10 mg in divided doses q6-8hr, max 40 mg/day; **IM** initially 1.25 mg, then 2.5-10 mg in divided doses q6-8hr

Available forms: *Decanoate:* inj 25, 100 ✱ mg/mL; *HCl:* tabs 1, 2.5, 5, 10 mg; inj 2.5 mg/mL; elixir 2.5 mg/5 mL; oral solution 5 mg/mL

Administer:

PO route

• Give with food, milk, or a full glass of water to minimize gastric irritation
• **Oral concentrate:** Give using a calibrated measuring device; dilute just before use with 120-240 mL of water, saline, milk, 7-Up, carbonated orange beverage, or apricot, orange, pineapple, prune, tomato, or V-8 juice; do not mix with beverages containing caffeine (coffee, cola), tannics (tea), or pectinates (apple juice) or with other liquid medications; avoid spilling the solution on the skin and clothing
• **Oral elixir:** Give using a calibrated measuring device; avoid spilling the solution on the skin and clothing

Injectable routes

• Visually inspect for particulate matter and discoloration before use, slight yellow to amber color does not alter potency, markedly discolored solutions should be discarded, protect from light

IM route (fluPHENAZine HCl only)

• No dilution necessary; if irritation occurs, subsequent IM doses may be diluted with NS for injection or 2% procaine

• Inject slowly and deeply into the upper outer quadrant of the gluteal muscle using a dry syringe and needle, aspirate before injection

• Keep patient in a recumbent position ≥30 min following injection to minimize hypotensive effects

• Rotate the site of injection to avoid irritation or sterile abscess formation with repeat use

IM injection (fluPHENAZine decanoate)

• Use syringe and needle of at least 21-G, do not dilute

• Inject slowly and deeply into the upper outer quadrant of the gluteal muscle, aspirate

• Keep patient in a recumbent position for at least 30 min following the initial injection to minimize hypotensive effects; rotate the site of injection to avoid irritation or sterile abscess formation with repeat administration

Subcut injection route (fluPHENAZine decanoate)

• Use a dry syringe and a needle of at least 21-G, do not dilute

• Inject subcut, taking care not to inject intradermally

• Keep patient in a recumbent position for at least 30 min following the initial injection to minimize hypotensive effects; rotate the injection sites

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, headache,* seizures, neuroleptic malignant syndrome

CV: *Orthostatic hypotension,* hypertension, cardiac arrest, ECG changes, tachycardia

EENT: Blurred vision, glaucoma, dry eyes, nasal congestion

GI: *Dry mouth, nausea, vomiting, anorexia, constipation,* diarrhea, jaundice, weight gain, paralytic ileus, hepatitis, cholecystic jaundice

GU: Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia

HEMA: Anemia, leukopenia, leukocytosis, agranulocytosis, aplastic anemia, thrombocytopenia

INTEG: *Rash,* photosensitivity, dermatitis, hyperpigmentation (long-term use)

RESP: Laryngospasm, dyspnea, respiratory depression

PHARMACOKINETICS

Metabolized by liver, excreted in urine (metabolites), crosses placenta, enters breast milk, protein binding >90%, not dialyzable

PO/IM (HCl): Onset 1 hr, peak 90-120 min, duration 6-8 hr, half-life 15 hr

IM/SUBCUT (decanoate): Onset 1-3 days; peak 1-2 days, duration over 4 wk, single-dose half-life 7-10 days, multiple dose 14.3 days

INTERACTIONS

Increase: QT prolongation, torsades de pointes (at higher doses)—amiodarone, arsenic trioxide, astemizole, dasatinib, disopyramide, dofetilide, droperidol, erythromycin, flecainide, gatifloxacin, ibutilide, levomethadyl, ondansetron, paliperidone, palonosetron, some antidepressants, vorinostat, ziprasidone, haloperidol, phenothiazines, ARIPiprazole, lurasidone

Increase: sedation—other CNS depressants, alcohol, barbiturate anesthetics, haloperidol, metyrosine, risperiDONE

Increase: toxicity—EPINEPHrine

Increase: anticholinergic effects—anticholinergics

Decrease: effects of levodopa, lithium

Decrease: fluPHENAZine effects—smoking, barbiturates

Drug/Lab Test

Increase: LFTs, cardiac enzymes, cholesterol, blood glucose, prolactin, bilirubin, cholinesterase

Decrease: hormones (blood and urine)

False positive: pregnancy tests, PKU urinary steroids, 17-OHCS

NURSING CONSIDERATIONS

Assess:

• **QT prolongation, torsades de pointes:** ECG for changes

• Bilirubin, CBC, LFTs monthly; ophthalmic exams periodically

• Urinalysis recommended before and during prolonged therapy

• Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

• B/P standing and lying; pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg

• Dizziness, faintness, palpitations, tachycardia on rising

• **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)

• **Anticholinergic effects:** constipation, urinary retention daily; if these occur, increase bulk, water in diet

• Supervised ambulation until stabilized on medication; do not involve patient in strenuous exercise; fainting possible; patient should not stand still for long periods

Black Box Warning: Beers: avoid in older adults except for schizophrenia, bipolar disorder, or short-term use as an antiemetic during chemotherapy; increased risk of stroke, cognitive decline, mortality

• **Pregnancy/breastfeeding:** no well-controlled studies; use only if benefits outweigh fetal risk; may cause EPS in infant if used during 3rd trimester; excreted in breast milk

Evaluate:

• Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech

Teach patient/family:

• That orthostatic hypotension occurs often; to rise from sitting or lying position gradually; to avoid hazardous activities until stabilized on medication

• To avoid hot tubs, hot showers, tub baths because hypotension may occur; that in hot weather, heat stroke may occur; to take extra precautions to stay cool

• To avoid abrupt withdrawal of this product or EPS may result; that product should be withdrawn slowly

• To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; that serious product interactions may occur; to avoid use with alcohol, CNS depressants; that increased drowsiness may occur

• To use a sunscreen to prevent burns

• About the importance of compliance with product regimen, follow-up, lab, ophthalmic exams

• About EPS; about the need for meticulous oral hygiene because oral candidiasis may occur

• To report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn, product discontinued

• That urine may turn pink to reddish brown

TREATMENT OF OVERDOSE:

Lavage; if orally ingested, provide an airway; *do not induce vomiting*

flurandrenolide topical

See Appendix B

flurbiprofen ophthalmic

See Appendix B

flutamide (Rx)

(floo´ta-mide)

Func. class.: Antineoplastic, hormone

Chem. class.: Antiandrogen

ACTION: Interferes with androgen uptake in the nucleus or androgen activity in target tissues; arrests tumor growth

in androgen-sensitive tissue (i.e., prostate gland)

USES: Metastatic prostatic carcinoma, stage D_2 in combination with LHRH agonistic analogs (leuprolide), B_2-C in combination with goserelin and radiation

CONTRAINDICATIONS: Pregnancy, hypersensitivity

Black Box Warning: Severe hepatic disease

Precautions: G6PD deficiency, hemoglobinopathy, lactase deficiency, polycystic ovary syndrome, tobacco smoking

DOSAGE AND ROUTES

• **Adult: PO** 250 mg q8hr for a daily dosage of 750 mg

Available forms: Caps 125, 250 🍁 mg

Administer:

• Do not break, crush, chew caps

• Give without regard to food with a full glass of water

• Use cytotoxic handling procedures

SIDE EFFECTS

CNS: *Hot flashes,* drowsiness, confusion, depression, anxiety, paresthesia

GI: *Diarrhea, nausea, vomiting,* increased levels in hepatic studies, hepatitis, anorexia, hepatotoxicity, abdominal pain, cholestasis, **hepatic necrosis/failure hepatic necrosis/failure**

GU: *Decreased libido, impotence, gynecomastia*

HEMA: Hemolytic anemia, leukopenia, thrombocytopenia

INTEG: Irritation at site, rash, photosensitivity

MISC: Edema, neuromuscular and pulmonary symptoms, hypertension, secondary malignancy

PHARMACOKINETICS

Rapidly and completely absorbed; excreted in urine and feces as metabolites; half-life 6 hr, geriatric half-life 8 hr; 94% protein binding, peak 2 hr

INTERACTIONS

Increase: PT—warfarin

Decrease: flutamide action—LHRH analog (leuprolide)

Drug/Lab Test

Increase: LFTs, BUN, creatinine

Decrease: WBC, platelets

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Severe hepatic disease: Monitor before start of therapy and monthly × 4 mo, AST, ALT, alk phos, which may be elevated; if LFTs elevated, product may need to be discontinued; monitor CBC, bilirubin, creatinine periodically

• CNS symptoms, including drowsiness, confusion, depression, anxiety

Evaluate:

• Therapeutic response: decrease in prostatic tumor size, decrease in spread of cancer

Teach patient/family:

• To report side effects: decreased libido, impotence, breast enlargement, hot flashes, diarrhea

Black Box Warning: Hepatotoxicity: to report nausea, vomiting, yellow eyes or skin, dark urine, clay-colored stools; hepatotoxicity may be the cause

• Notify of yellow, green urine discoloration

• Avoid sun exposure, tanning beds

• To use contraception during treatment; pregnancy category

• To use with full glass of water, without regard to food

fluticasone (Rx, OTC)

(floo-tic´a-sone)

Arnuity, Ellipta, Flonase, Flovent Diskus, Flovent HFA

Func. class.: Steroidal anti-inflammatory, antiasthmatic

Chem. class.: Corticosteroid

Do not confuse:
Flonase/Flovent

ACTION: Decreases inflammation by inhibiting mast cells, macrophages, and leukotrienes; antiinflammatory and vasoconstrictor properties

USES: Prevention of chronic asthma during maintenance treatment in those requiring oral corticosteroids; nasal symptoms of seasonal/perennial, allergic/nonallergic rhinitis

CONTRAINDICATIONS: Hypersensitivity to this product or milk protein, primary treatment in status asthmaticus, acute bronchospasm
Precautions: Pregnancy, breastfeeding, active infections, glaucoma, diabetes, immunocompromised patients, Cushing syndrome

DOSAGE AND ROUTES

Prevention of chronic asthma

Flovent HFA

- **Adult/child ≥12 yr: INH** 88-440 mcg bid (in those previously taking bronchodilators alone); **INH** 88-220 mcg bid, max 440 mcg bid (in those previously taking inhaled corticosteroids); **INH** 440 mcg bid, max 880 mcg bid (in those previously taking oral corticosteroids)
- **Child 4-11 yr: INH** 88 mcg bid

Flovent Diskus

- **Adult/child ≥12 yr: INH** 100 mcg bid, max 500 mcg bid (in those previously taking bronchodilators alone); **INH** 100-250 mcg bid, max 500 mcg bid (in those previously taking inhaled corticosteroids); **INH** 500-1000 mcg bid, max 1000 mcg bid (in those previously taking oral corticosteroids)
- **Child 4-11 yr: INH** Initially 50 mcg bid, max 100 mcg bid (in those previously taking bronchodilators alone or inhaled corticosteroids)

Arnuity Ellipta

- **Adult/child ≥12 yr: INH** 100 mcg via oral inhalation daily initially; may increase to 200 mcg/day after 2 wk; max 200 mcg/day

Seasonal, perennial allergic, nonallergic rhinitis

Flonase

- **Adult: NASAL** 2 sprays initially in each nostril daily or 1 spray bid; when controlled, lower to 1 spray in each nostril daily
- **Adolescent/child >4 yr: NASAL** 1 spray in each nostril daily, may increase to 2 sprays in each nostril daily; when controlled, lower to 1 spray in each nostril daily

Available forms: Oral inhalation aerosol 44, 110, 220 mcg; oral inhalation powder 50, 100, 250 mcg; nasal spray 27.5 mcg/actuation, (propionate) 50 mcg/actuation, 27.5 mcg/spray (furoate); inhalation powder 100, 200 mcg/actuation (Arnuity Ellipta)
Administer:

- Give at 1-min intervals; if a bronchodilator aerosol spray is used, use bronchodilator first, wait 5-15 min, then use fluticasone
- Decrease dose to lowest effective dose after desired effect; decrease dose at 2-4 wk intervals

Inhalation route (aerosol)

- Shake well, prime before 1st use, release 4 sprays into air away from face, prime using 1 spray if not used for ≥7 days; when the counter reads 000, discard; clean mouthpiece daily in warm water, dry; do not share inhaler with others
- Child <4 yr requires a face mask with spacer/VHC device for delivery; allow 3-5 INH per actuation; do not use spacer with Flovent Diskus

Inhalation route: Powder for oral inhalation (Flovent Diskus)

- Fill in the "Pouch opened" and "Use by" dates in the blank lines on the label; the "Use by" date for Flovent Diskus 50 mcg is 6 wk from the date the pouch is opened; the "Use by" date for Diskus 100 mcg and 250 mcg is 2 mo from the date the pouch is opened
- After use, patient should rinse mouth with water and spit out the water, not swallow it

• To avoid the spread of infection, do not use the inhaler for more than one person

Intranasal

• Prime before first use
• Shake bottle gently before each use
• Rinse tip after use, dry with tissue
• Blow nose before use

SIDE EFFECTS

CNS: Fatigue, fever, headache, nervousness, dizziness, migraines

EENT: *Pharyngitis*, sinusitis, rhinitis, laryngitis, hoarseness, dry eyes, cataracts, nasal discharge, epistaxis, blurred vision

GI: Diarrhea, abdominal pain, nausea, vomiting, *oral candidiasis*

INTEG: Urticaria, dermatitis

META: Hyperglycemia, growth retardation in children, cushingoid features

MISC: Influenza, eosinophilic conditions, angioedema, Churg-Strauss syndrome, anaphylaxis, adrenal insufficiency (high doses), bone mineral density reduction

MS: Osteoporosis, muscle soreness, joint pain, arthralgia

RESP: *Upper respiratory infection,* dyspnea, cough, bronchitis, bronchospasm

PHARMACOKINETICS

Absorption 30% aerosol, 13.5% powder; protein binding 91%; metabolized in liver after absorption in lung; half-life 7.8 hr; <5% excreted in urine and feces

Oral INH: Onset 24 hr, peak several days, duration 1-2 wk

Intranasal: Onset 12 hr, peak several days

INTERACTIONS

Increase: fluticasone levels—CYP3A4 inhibitors (ketoconazole, itraconazole), darunavir, nelfinavir, ritonavir, amprenavir, fosamprenavir, atazanavir, delavirdine, saquinavir

Increase: cardiac toxicity—isoproterenol (asthma patients)

NURSING CONSIDERATIONS

Assess:

• **Respiratory status:** lung sounds, pulmonary function tests during, for several mo after change from systemic to inhalation corticosteroids
• Withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue
• **Adrenal insufficiency:** nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; may occur when changing from systemic to inhalation corticosteroids; may be life-threatening; adrenal function tests periodically: hypothalamic–pituitary–adrenal axis suppression in long-term treatment
• Growth rate in children; blood glucose, serum potassium for all patients
• **Beers:** avoid use in older adults with delirium or at high risk of delirium; may worsen the condition
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; use caution in breastfeeding, excretion unknown

Evaluate:

• Therapeutic response: decreased severity of asthma, COPD, allergies

Teach patient/family:

• To use bronchodilator 1st, before using inhalation, if taking both
• Not to use for acute asthmatic attack; acute asthma may require oral corticosteroids
• To avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles
• To rinse mouth after inhaled product to decrease risk of oral candidiasis
• To report immediately cushingoid symptoms: no appetite, nausea, weakness, fatigue, decreased B/P
• How to use, and when it may be empty
• To use medical ID identifying corticosteroid use

fluticasone (topical) (Rx)

(floo-tic'a-sone)

Cutivate

Func. class.: Corticosteroid, topical

Do not confuse:

fluticasone/mometasone/fludrocortisone

ACTION: Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES: Inflammation/itching of corticosteroid-responsive dermatoses on the skin

CONTRAINDICATIONS: Hypersensitivity to this product or milk protein, status asthmaticus, monotherapy in primary infections, Cushing syndrome, rosacea, perioral dermatitis, diabetes mellitus
Precautions: Pregnancy, children, breastfeeding, skin infections, skin atrophy

DOSAGE AND ROUTES

• **Adult:** Apply to affected areas bid (cream/ointment) or daily (lotion) × 4 wk
Available forms: Lotion, cream 0.05%, ointment 0.005%
Administer:
Topical route
• Do not use with occlusive dressings
• **Cream/ointment/lotion:** Apply sparingly in a thin film and rub gently into the cleansed affected area; wash hands, use gloves; avoid use on face, groin, underarms
• Reassess treatment after 2 uses

SIDE EFFECTS

INTEG: Burning, pruritus, dermatitis, hypertrichosis, hives, rash, xerosis, irritation, hyperpigmentation, miliaria
META: Hyperglycemia, glycosuria
MISC: HPA axis suppression, Cushing syndrome

PHARMACOKINETICS

Absorption 5% but variable; half-life 7 hr

INTERACTIONS

Drug/Lab
Increase: Blood glucose

NURSING CONSIDERATIONS

Assess:
• Skin reactions: burning, pruritus, dermatitis
Evaluate:
• Decreasing itching, inflammation on the skin
Teach patient/family:
Topical route:
• Not to use with occlusive dressings
• **Cream/ointment/lotion:** to apply sparingly in a thin film and rub gently into the cleansed affected area; avoid use on face, groin, underarms; wash hands; use gloves
• To reassess treatment after each use

F

fluticasone/salmeterol (Rx)

(floo-tic´a-sone/sal-mee´ter-ol)

Advair Diskus, Advair HFA, AirDuo Digihaler, AirDuo RespiClick 113/14, AirDuo RespiClick 232/14, AirDuo RespiClick 55/14, Wixela Inhub

Func. class.: Corticosteroid, long-acting/β_2-adrenergic agonist

ACTION: Decreased inflammation in inhibiting mast cells, macrophages and leukotrienes; antiinflammatory and vasoconstrictor properties relax bronchial smooth muscles

USES: Maintenance of asthma (long term), COPD

CONTRAINDICATIONS: Hypersensitivity, acute asthma/COPD episodes, severe hypersensitivity to milk proteins
Precautions: Pregnancy, breastfeeding, active infections, diabetes mellitus, glaucoma, immunosuppression, hyperthyroidism, Cushing syndrome, hypertension, QT prolongation, pheochromocytoma, seizures, MAOIs, other long-acting B_2 agonists, inhaled corticosteroid

Black Box Warning: Asthma-related deaths

DOSAGE AND ROUTES

Asthma maintenance
• **Adult/adolescent ≥12 yr: INH** 1 inhalation of Advair Diskus q12hr, or 2 inhalations of Advair HFA q12hr

• **Child 4-11 yr: INH** 1 inhalation of fluticasone 100 mcg/salmeterol 50 mcg (Advair Diskus) q12hr, must be 12 hr apart

COPD

• **Adult: INH** 1 inhalation of Advair 250/50 Diskus q12hr, must be 12 hr apart

Available forms: Inhalation 100/50, 250/50, 500/50 mcg fluticasone/salmeterol; aerosol spray 45/21, 115/21, 230/21 mcg fluticasone/salmeterol

Administer:

Oral inhalation route

Powder for oral inhalation (Diskus):

• Most children <4 years of age do not generate sufficient inspiratory flow to activate dry powder inhalers

• Give with the Diskus device:

• Mouth should be rinsed, spit out water

• Discard device after 1 mo or when counter reads 0 (whichever comes first)

HFA aerosol:

• Shake canister; prime the inhaler before first use with 4 sprays away from face or with 2 sprays (away from the face) if it has not been used for more than 4 wk, or after dropping; use spacer if unable to coordinate inhalation/activation

• Rinse mouth with water after use, clean mouthpiece at least every day; discard inhaler after 120 sprays or when the counter reads 000

Powder for inhalation (AirDuo RespiClick)

• Do not use a spacer or volume holding chamber

• Before using for the first time, check the dose counter window to ensure that the inhaler is full and the number "60" is in the window. The dose counter will count down each time the mouthpiece cap is opened and closed

• Following use, instruct patient to rinse mouth with water without swallowing

• Do not wash inhaler. If the mouthpiece needs cleaning, gently wipe it with a dry cloth or tissue

• When there are "20" doses left, the numbers on the dose counter will change to red; refill the prescription

• When the dose counter reaches "0," the background will change to solid red

• Throw away the inhaler 30 days after removing it from the foil pouch, when the counter displays "0," or after the expiration date, whichever comes first

SIDE EFFECTS

CNS: Fever, headache, nervousness, dizziness, migraines, insomnia, tremors, agitation, anxiety, depression, hyperactivity, irritability

EENT: Pharyngitis, sinusitis, rhinitis, laryngitis, hoarseness, dry eyes, cataracts, nasal discharge, epistaxis, hypersalivation, eye edema, dysphonia, conjunctivitis

GI: Diarrhea, abdominal pain, nausea, vomiting, oral candidiasis

GU: UTI

INTEG: Urticaria, dermatitis

META: Hyperglycemia, growth retardation in children, cushingoid features

MISC: Influenza, eosinophilic conditions, angioedema, Churg-Strauss syndrome, anaphylaxis, adrenal insufficiency (high doses), reduced bone mineral density, HPA axis suppression

MS: Osteoporosis, muscle soreness, joint pain, decreased growth velocity

RESP: Upper respiratory infection, dyspnea, cough, bronchitis, bronchospasm

PHARMACOKINETICS

Fluticasone: half-life 8 hr, peak 1-2 hr; salmeterol: half-life 5.5 hr, peak 5 min

INTERACTIONS

Increase: CNS stimulation—theophylline

Increase: fluticasone levels—CYP3A4 inhibitors (ketoconazole, itraconazole), darunavir, nelfinavir, ritonavir, amprenavir, fosamprenavir, atazanavir, delavirdine, saquinavir, MAOIs, linezolid

Increase: tendinitis, tendon rupture—quinolones

Increase: hypokalemia—loop diuretics, thiazides, theophylline

Drug/Lab Test

Increase: LFTs

Decrease: Potassium

NURSING CONSIDERATIONS

Assess:

• **Respiratory status:** vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate/rhythm

• Withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue

• **Adrenal insufficiency:** nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; can occur when changing from systemic to inhalation corticosteroids; may be life threatening; adrenal function tests periodically: hypothalamic–pituitary–adrenal axis suppression in long-term treatment

• Growth rate in children; blood glucose, serum potassium for all patients

Black Box Warning: Asthma-related deaths: if wheezing worsens and cannot be relieved during an acute attack, provide emergency response

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; use caution in breastfeeding, excretion unknown

Evaluate:

• Therapeutic response: decreased severity of asthma

Teach patient/family:

• To use bronchodilator first, before using inhalation, if taking both; may use spacer or valved chamber

• Not to use for acute asthmatic attack; acute asthma might require oral corticosteroids; may use short-acting B_2 agonists for rescue

• To avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles

Black Box Warning: Asthma-related deaths: seek medical attention immediately if wheezing worsens and cannot be relieved during an acute attack

• To rinse mouth after inhaled product to reduce the risk of oral candidiasis; not to swallow

fluticasone/vilanterol (Rx)

(floo-tic′a-sone/vye-lan′ter-ol)

Breo Ellipta

Func. class.: Corticosteroid, long-acting/beta-2-Adrenergic Agonists

Do not confuse:

Flonase/Flovent

F

ACTION:

Decreases inflammation by inhibiting mast cells, macrophages, and leukotrienes; anti-inflammatory and vasoconstrictor properties; vilanterol relaxes smooth muscles in the respiratory tract, inhibits mast cells

USES:

Asthma, COPD

CONTRAINDICATIONS

Hypersensitivity to this product or milk protein, primary treatment in status asthmaticus, acute bronchospasm

Precautions: Pregnancy, breastfeeding, active infections, glaucoma, diabetes, immunocompromised patients

DOSAGE AND ROUTES

Asthma

• **Adult: INH** 1 inhalation, 100 mcg fluticasone/vilanterol 25 mcg or 200 mcg fluticasone/vilanterol 25 mcg daily

Maintenance treatment of COPD

• **Adult:** 1 inhalation, 100 mcg fluticasone/vilanterol 25 mcg

Available forms: Powder for inhalation Blister 100 mcg fluticasone/vilanterol 25 mcg, 200 mcg fluticasone/vilanterol 25 mcg

Administer:

• Give 1 inhalation in 24 hr

• Discard device 6 wk after it is removed from the foil tray or when the dose counter reads "0" (whichever comes first)

• Do not open the cover of the inhaler until ready for use; each time cover is opened, 1 dose of medicine is prepared

• Exhale fully before taking one long, steady, deep breath through the mouth-

piece (do not breathe through nose); hold breath for 3 to 4 sec and exhale slowly and gently
• Patient should rinse mouth with water after inhalation and expectorate rinse solution

SIDE EFFECTS

CNS: Fatigue, fever, headache, dizziness
EENT: *Pharyngitis*, sinusitis, rhinitis, laryngitis
GI: Diarrhea, abdominal pain
MISC: Flulike symptoms
MS: Back pain, arthralgia
RESP: *Upper respiratory infection,* dyspnea, COPD, pneumonia, cough, bronchitis

PHARMACOKINETICS

Fluticasone: Onset unknown, peak 30-60 min, duration unknown
Vilanterol: Onset unknown, peak 10 min, duration unknown

INTERACTIONS

Increase: fluticasone levels—CYP3A4 inhibitors (ketoconazole, itraconazole), darunavir, nelfinavir, ritonavir, amprenavir, fosamprenavir, atazanavir, delavirdine, saquinavir
Increase: cardiac toxicity—isoproterenol (asthma patients)
Increase: hypokalemia—thiazide and thiazide-like diuretics
Increase: adverse reactions—tricyclic antidepressants

NURSING CONSIDERATIONS

Assess:
• **Respiratory status:** lung sounds, pulmonary function tests during, for several months after change from systemic to inhalation corticosteroids
• Use a short-acting beta 2 agonist
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; use caution in breastfeeding, excretion unknown
Evaluate:
• Therapeutic response: decreased severity of asthma, COPD
Teach patient/family:
• Withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue
• **Adrenal insufficiency:** nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; may occur when changing from systemic to inhalation corticosteroids; may be life-threatening; adrenal function tests periodically: hypothalamic–pituitary–adrenal axis suppression in long-term treatment
• Blood glucose, serum potassium for all patients
• Beers: avoid use in older adults with delirium or at high risk of delirium; may worsen the condition
• Pregnancy/breastfeeding: use only if benefits outweigh fetal risk; use caution in breastfeeding, excretion unknown
Evaluate:
• Therapeutic response: decreased severity of asthma, COPD
Teach patient/family:
• To use bronchodilator first, before using inhalation, if taking both
• Not to use for acute asthmatic attack; acute asthma may require oral corticosteroids
• To avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles
• To rinse mouth after inhaled product to decrease risk of oral candidiasis
• To report immediately cushingoid symptoms: no appetite, nausea, weakness, fatigue, decreased B/P
• How to use, and when it may be empty
• To use medical ID identifying corticosteroid use

fluvastatin (Rx)

(flu′vah-stay-tin)
Lescol XL
Func. class.: Antilipemic
Chem. class.: HMG-CoA reductase inhibitor

Do not confuse:
fluvastatin/FLUoxetine

ACTION: Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES: As an adjunct for primary hypercholesterolemia (types Ia, Ib), coronary atherosclerosis in CAD; to reduce the risk for secondary prevention of coronary events in patients with CAD; as an adjunct to diet to reduce LDL, total cholesterol, apo B levels in heterozygous familial hypercholesterolemia (LDL-C ≥190 mg/dL or LDL-C ≥160 mg/dL) with history of premature CV disease

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, active hepatic disease

Precautions: Previous hepatic disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalance, myopathy, rhabdomyolysis

DOSAGE AND ROUTES

• **Adult: PO** 20-40 mg/day in PM initially, titrate up to 40 mg bid; or 80 mg/day (ext rel) dosage adjustments may be made at ≥4-wk intervals or ext rel 80 mg at bedtime

Heterozygous familial hypercholesterolemia

• **Adolescent ≥1 yr postmenarche (10-16 yr): PO** 20 mg daily at bedtime, may increase q6wk, max 40 mg bid (cap) or 80 mg (ext rel)

Renal dose

• **Adult: PO** Max 40 mg/day

Available forms: Caps 20, 40 mg; ext rel tab 80 mg

Administer:

• Do not break, crush, or chew ext rel tabs, use at any time of day (tab), in the evening (cap)

• Bile acid sequestrant should be given at least 2 hr before fluvastatin

• Give without regard to food

• Store at room temperature, protected from light

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, confusion

EENT: Lens opacities

GI: *Abdominal pain, cramps, nausea, constipation, diarrhea, dyspepsia, flatus,* hepatic dysfunction, pancreatitis

HEMA: Thrombocytopenia, hemolytic anemia, leukopenia

INTEG: Rash, pruritus

MISC: Fatigue, influenza, photosensitivity

MS: Myalgia, myositis, rhabdomyolysis, *arthritis, arthralgia*

PHARMACOKINETICS

Peak response 3-4 wk, metabolized in liver, >98% protein bound, excreted primarily in feces, enters breast milk, half-life 1.9 hr, steady-state 4-5 wk

INTERACTIONS

Increase: effects of warfarin, digoxin, phenytoin; monitor closely

Increase: myopathy—cycloSPORINE, niacin, colchicine, protease inhibitors, fibric acid derivatives, erythromycin

Increase: effects of fluvastatin—alcohol, cimetidine, ranitidine, omeprazole, phenytoin, rifampin

Increase: adverse reactions—fluconazole, itraconazole, ketoconazole

Decrease: fluvastatin effect—cholestyramine, colestipol; separate by ≥4 hr

Drug/Herb

Increase: adverse reactions—red yeast rice

Drug/Lab Test

Increase: LFTs, CK

Decrease: platelets, WBC

NURSING CONSIDERATIONS

Assess:

• **Hypercholesterolemia:** diet history: fats, protein carbohydrate; nutritional analysis should see dietitian before treatment; fasting lipid profile (cholesterol, LDL, HDL, TG) before and q4-6wk, then q3-6mo when stable

• **Hepatotoxicity/pancreatitis:** monitor hepatic studies before, q12wk after dosage change, then q6mo; AST, ALT, LFTs may be increased

• Renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine
• Myopathy, rhabdomyolysis: muscle pain, tenderness; obtain baseline CPK if elevated; if these occur, product should be discontinued
• **Pregnancy/breastfeeding:** do not use in pregnancy/breastfeeding

Evaluate:
• Therapeutic response: decrease in sLDL, VLDL, total cholesterol; increased HDL, decreased triglycerides, slowing of CAD

Teach patient/family:
• That blood work will be necessary during treatment; to take product as prescribed; that effect may take ≥4 wk
• To report severe GI symptoms, headache, muscle pain, weakness, tenderness
• That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation
• To report suspected pregnancy; not to use during pregnancy, breastfeeding
• To take without regard to meals; to take immediate-release product in the evening; separate by ≥4 hr from bile-acid product, not to cut, break, chew capsule

fluvoxaMINE (Rx)

(flu-vox´a-meen)

Luvox

Func. class.: Antidepressant SSRI (selective serotonin reuptake inhibitor)

Do not confuse:
FluvoxaMINE/FluPHENAZine/Flavoxate

ACTION: Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES: Obsessive-compulsive disorder, social phobia

CONTRAINDICATIONS: Hypersensitivity, MAOIs

Precautions: Pregnancy, breastfeeding, geriatric patients, hepatic/cardiac disease, abrupt discontinuation, dehydration, ECT, hyponatremia, hypovolemia, bipolar disorder, seizure disorder

Black Box Warning: Children <8 yr, suicidal ideation

DOSAGE AND ROUTES

Depression, OCD, social anxiety disorder
• **Adult: PO** 50 mg at bedtime, increase by 50 mg/day at 4-7 day intervals, max 300 mg/day; doses over 100 mg should be divided; **EXT REL** 100 mg at bedtime, may titrate upward by 50 mg/wk, max 300 mg/day
• **Child 8-18 yr: PO** 25 mg at bedtime, increase by 25 mg/day q4-7days, max 300 mg/day ≥12 yr; max 200 mg/day 8-12 yr (OCD), 250 mg (social anxiety disorder); doses over 50 mg should be divided

Hepatic dose/geriatric
• **Adult: PO** 25 mg at bedtime, may titrate upward slowly

Available forms: Tabs 25, 50, 100 mg

Administer:
• With food, milk for GI symptoms
• When discontinuing, taper by 50%, after 3 days taper by another 50% for 3 days, then discontinue
• Store at room temperature; do not freeze
• **Immediate release:** give at bedtime; doses >100 mg/day (or >50 mg/day in those aged 8-17 yr) in 2 divided doses; if doses are not equal, give larger dose at bedtime
• **Ext rel:** give at bedtime; do not break, crush, chew ext rel product

SIDE EFFECTS

CNS: *Headache, drowsiness, dizziness, seizures,* sleep disorders, insomnia, suicidal ideation (children/adolescents), neuroleptic malignant syndrome–like reactions, *weakness,* neuroleptic malignant syndrome, tremors

CV: Palpitation, chest pain, syncope, nervousness, agitation
GI: *Nausea, anorexia, constipation,* hepatotoxicity, *vomiting, diarrhea,* dry mouth, altered taste
GU: *Decreased libido,* anorgasmia, urinary frequency, priapism
INTEG: *Rash, sweating*
MS: Myalgia
SYST: Neonatal abstinence syndrome

PHARMACOKINETICS

Crosses blood-brain barrier, 77% protein binding, metabolism by the liver, terminal half-life 15.6 hr, peak 2-8 hr

INTERACTIONS

Increase: CNS depression—alcohol, barbiturates, benzodiazepines
Increase: effect of—ramelteon, thioridazine; do not use together
Increase: QT prolongation, death—pimozide; do not use together
Increase: fluvoxaMINE, toxicity levels—tricyclics, cloZAPine, alosetron, tiZANidine, thioridazine; do not use together
Increase: metabolism, decrease effects—smoking
Increase: serotonin syndrome, neuroleptic malignant syndrome: SSRIs, SNRIs, serotonin-receptor agonists, atypical antipsychotics, traMADol, MAOIs, methylene blue, linezolid
Increase: bleeding risk—anticoagulants, NSAIDs, salicylates, thrombolytics
Decrease: metabolism, increase action of propranolol, diazepam, lithium, theophylline, carBAMazepine, warfarin
Drug/Herb
Increase: CNS effect—kava, valerian
Increase: serotonin syndrome—tryptophan, St. John's wort; do not use together

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Suicidal thoughts/behaviors: risk increases in children, young adults; this group needs to be monitored more closely, weekly × 4 wk, then every other wk × 4 wk, then at 12 wk; only small amounts should be given on each refill

- **Pregnancy, breastfeeding:** neonatal abstinence syndrome can occur; do not breastfeed
- **Neuroleptic malignant syndrome:** high fever, confusion, rigid muscles, diaphoresis, tachypenia; notify prescriber immediately
- Hepatic studies: AST, ALT, bilirubin
- Mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic, obsessive-compulsive symptoms
- Constipation; most likely in geriatric patients
- Growth rate (children), bone density (postmenopausal females), glucose (diabetes)
- **Serotonin syndrome:** agitation, hypothermia, hallucinations, tachycardia, nausea, vomiting, diarrhea, instability, changes in B/P
- **For toxicity:** nausea, vomiting, diarrhea, syncope, increased pulse, seizures
- **Beers:** avoid in older adults unless safer alternatives are unavailable; may cause ataxia, impaired motor function

Evaluate:

- Therapeutic response: decrease in OCD, social phobia symptoms

Teach patient/family:

- That therapeutic effects may take 2-3 wk; not to discontinue abruptly
- To use caution when driving, performing other activities requiring alertness because drowsiness, dizziness may occur
- Not to use other CNS depressants, alcohol, barbiturates, benzodiazepines, St. John's wort, kava
- **Pregnancy/breastfeeding:** to avoid use in pregnancy; not to breastfeed
- To notify prescriber if pregnancy is suspected, planned
- To notify prescriber of allergic reaction
- To increase bulk in diet if constipation occurs, especially in geriatric patients

Black Box Warning: That suicidal thoughts/behaviors may occur; that family health care providers should look closely for suicidal tendencies, especially during early therapy or in young adults, children

• **Serotonin syndrome:** to report immediately nausea, vomiting, diarrhea, agitation, instability, hallucinations
• To stop taking MAOIs at least 14 days before starting product

TREATMENT OF OVERDOSE:
Gastric lavage

folic acid (vit B_9) (OTC)
(foe´lik a´sid)
FA-8, Folvite
Func. class.: Vit B complex group, water-soluble vitamin

ACTION: Needed for erythropoiesis; increases RBC, WBC, platelet formation with megaloblastic anemias

USES: Megaloblastic or macrocytic anemia caused by folic acid deficiency; hepatic disease, alcoholism, hemolysis, intestinal obstruction, pregnancy to reduce risk for neural tube defects
Unlabeled uses: Methotrexate toxicity prophylaxis, in those receiving methotrexate for RA

CONTRAINDICATIONS: Hypersensitivity
Precautions: Pregnancy, anemias other than megaloblastic/macrocytic anemia, vit B_{12} deficiency anemia, uncorrected pernicious anemia

DOSAGE AND ROUTES
RDA
• **Adult and child ≥14 yr: PO** 400 mcg
• **Adult (pregnant/lactating): PO** 600 mcg/day
• **Child 9-13 yr: PO** 300 mcg
• **Child 4-8 yr: PO** 200 mcg
• **Child 1-3 yr: PO** 150 mcg
• **Infant 6 mo-1 yr: PO** 80 mcg
• **Neonate/infant <6 mo: PO** 65 mcg
Megaloblastic/macrocytic anemia due to folic acid or nutritional deficiency
• **Pregnant/lactating: PO** 800-1000 mcg
Therapeutic dose
• **Adult and child: PO/IM/SUBCUT/IV** up to 1 mg/day
Maintenance dose
• **Adult and child >4 yr: PO/IM/SUBCUT/IV** 0.4 mg/day
• **Pregnant and lactating: PO/IM/SUBCUT/IV** 0.8-1 mg/day
• **Child <4 yr: PO/IM/SUBCUT/IV** up to 0.3 mg/day
• **Infant: PO/IM/SUBCUT/IV** up to 0.1 mg/day
Prevention of neural tube defects during pregnancy
• **Adult: PO** 0.6 mg/day
Prevention of megaloblastic anemia during pregnancy
• **Adult: PO/IM/SUBCUT** up to 1 mg/day during pregnancy
Tropical sprue
• **Adult: PO** 3-15 mg/day
Methotrexate toxicity
• **Adult: PO/IM/SUBCUT** 1 mg daily or 5 mg weekly
Available forms: Tab: 400, 800 mcg; cap 0.8, 5, 20 mg; solution, injection 5 mg/mL (10 mL)
Administer:
SUBCUT route
• Do not inject intradermally
IM route
• Inject deeply in large muscle mass, aspirate
Direct IV route
• Direct undiluted ≤5 mg/1 min or more
Continuous IV INFUSION route
• May be added to most IV sol or TPN

Y-site compatibilities: Alfentanil, aminophylline, ascorbic acid injection, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bumetanide, calcium gluconate, ceFAZolin, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, furosemide, ganciclovir,

glycopyrrolate, heparin, hydrocortisone, hydrOXYzine, imipenem-cilastatin, indomethacin, insulin (regular), ketorolac, labetalol, lidocaine, LR, magnesium sulfate, mannitol, meperidine, methicillin, methylPREDNISolone, metoclopramide, metoprolol, mezlocillin, midazolam, moxalactam, multiple vitamins injection, naloxone, nitroglycerin, nitroprusside, ondansetron, oxacillin, oxytocin, penicillin G potassium/sodium, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, potassium chloride, procainamide, propranolol, ranitidine, Ringer's, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, ticarcillin, ticarcillin-clavulanate, TPN, trimetaphan, urokinase, vancomycin, vasopressin

SIDE EFFECTS

CNS: Confusion, depression, excitability, irritability
GI: Anorexia, nausea, bitter taste
INTEG: Pruritus, rash, erythema
RESP: Bronchospasm
SYST: Anaphylaxis (rare)

PHARMACOKINETICS

PO: Peak ½-1 hr, bound to plasma proteins, excreted in breast milk, metabolized by liver, excreted in urine (small amounts)

INTERACTIONS

Increase: need for folic acid—estrogen, hydantoins, carBAMazepine, glucocorticoids
Decrease: folate levels—methotrexate, sulfonamides, sulfaSALAzine, trimethoprim
Decrease: phenytoin levels, fosphenytoin, may increase seizures

NURSING CONSIDERATIONS

Assess:
• **Megaloblastic anemia:** fatigue, dyspnea, weakness
• HB, Hct, reticulocyte count
• Nutritional status: bran, yeast, dried beans, nuts, fruits, fresh vegetables, asparagus
• Products currently taken: estrogen, carBAMazepine, methotrexate, trimethoprim, hydantoins; these products may cause increased folic acid use by the body and contribute to a deficiency if taking other neurotoxic products
• **Pregnancy/breastfeeding:** may be used in pregnancy/breastfeeding

Evaluate:
• Therapeutic response: increased weight, oriented, well-being; absence of fatigue; increase in reticulocyte count within 5 days of beginning treatment, absence of fetal neural tube defect

Teach patient/family:
• To take product exactly as prescribed; that periodic lab work is required
• To alter nutrition to include foods high in folic acid: organ meats, vegetables, fruit
• That urine will turn bright yellow
• To notify prescriber of allergic reaction
• To avoid breastfeeding

F

⚠ HIGH ALERT

fondaparinux (Rx)

(fon-dah-pair′ih-nux)

Arixtra

Func. class.: Anticoagulant, antithrombotic
Chem. class.: Synthetic, selective factor Xa inhibitor

Do not confuse:
Arixtra/Anti-Xa

ACTION: Inhibits factor Xa; neutralization of factor Xa interrupts blood coagulation and thrombin formation

USES: Prevention/treatment of deep venous thrombosis, PE in hip and knee replacement, hip fracture or abdominal surgery
Unlabeled uses: Acute symptomatic superficial vein thrombosis in the legs (≥5 cm length) HIT, prophylaxis of venous thromboembolism (major surgery for cancer)

CONTRAINDICATIONS: Hypersensitivity to this product; hemophilia, leukemia with bleeding, peptic ulcer disease, hemorrhagic stroke, surgery, thrombocytopenic purpura, weight <50 kg, severe

renal disease (CCr <30 mL/min), active major bleeding, bacterial endocarditis

Precautions: Pregnancy, breastfeeding, children, geriatric patients, alcoholism, hepatic disease (severe), blood dyscrasias, heparin-induced thrombocytopenia, uncontrolled severe hypertension, acute nephritis, mild to moderate renal disease

Black Box Warning: Spinal/epidural anesthesia, lumbar puncture

DOSAGE AND ROUTES

Deep venous thrombosis/PE

- **Adult <50 kg: SUBCUT** 5 mg/day × ≥5 days until INR 2-3; give warfarin within 72 hr of fondaparinux
- **Adult 50-100 kg: SUBCUT** 7.5 mg/day × ≥5 days until INR 2-3; give warfarin within 72 hr of fondaparinux
- **Adult >100 kg: SUBCUT** 10 mg/day × ≥5 days until INR 2-3; give warfarin within 72 hr of fondaparinux

Prevention of deep venous thrombosis

- **Adult: SUBCUT** 2.5 mg/day given 6 hr after surgery; (hemostasis established) continue for 5-9 days; for hip surgery, up to 32 days; for abdominal surgery, up to 24 days

Acute symptomatic superficial leg vein thrombosis (unlabeled)

- **Adult: SUBCUT** 2.5 mg daily × 45 days

Renal disease

- **Adult: SUBCUT** CCr 30-50 mL/min, use cautiously; CCr <30 mL/min, do not use

HIT (unlabeled)

Adult: SUBCUT <50 kg: 5 mg daily; 50-100 kg: 7.5 mg daily; >100 kg: 10 mg daily

Available forms: Inj 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL prefilled syringes

Administer:

- Alone; do not mix with other products or solutions; cannot be used interchangeably (unit to unit) with other anticoagulants
- Only after screening patient for bleeding disorders

SUBCUT route

- SUBCUT only; do not give IM; do not give <6 hr after surgery
- Check for discolored sol or sol with particulate; if present, do not give
- Administer 6-8 hr after surgery; administer to recumbent patient, rotate inj sites (left/right anterolateral, left/right posterolateral abdominal wall)
- Wipe surface of inj site with alcohol swab, twist plunger cap and remove, remove rigid needle guard by pulling straight off needle; do not aspirate, do not expel air bubble from surface
- Insert whole length of needle into skinfold held with thumb and forefinger
- When product is injected, a soft click may be felt or heard
- Give at same time each day to maintain steady blood levels; observe inj site
- Avoid all IM inj that may cause bleeding
- Store at 77° F (25° C); do not freeze

SIDE EFFECTS

CNS: Confusion, headache, dizziness, *insomnia*

HEMA: *Anemia,* hematoma, thrombocytopenia, major bleeding (intracranial, cerebral, retroperitoneal hemorrhage), postoperative hemorrhage, heparin-induced thrombocytopenia

INTEG: Increased wound drainage, bullous eruption, local reaction—*rash,* pruritus, inj-site bleeding

META: Hypokalemia

PHARMACOKINETICS

Rapidly, completely absorbed; peak 3 hr, duration up to 24 hr; distributed primarily in blood; does not bind to plasma proteins except 94% to ATIII; eliminated unchanged in urine within 72 hr with normal renal function; half-life 17-21 hr

INTERACTIONS

Increase: bleeding risk—salicylates, NSAIDs, abciximab, eptifibatide, tirofiban, clopidogrel, dipyridamole, quiNIDine, valproic acid, some cephalosporins

Drug/Herb

Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, kava

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Monitor patients who have received epidural/spinal anesthesia or lumbar puncture for neurologic impairment, including spinal hematoma; may lead to permanent disability or paralysis

- Blood studies (CBC, anti-Xa, HB/Hct, prothrombin time, platelets, occult blood in stools); thrombocytopenia may occur; if platelets <100,000/mm^3, treatment should be discontinued; renal studies: BUN, creatinine; contraindicated in CCr <30 mL/min; use caution in CCr 30-50 mL/min
- For bleeding: gums, petechiae, ecchymosis, black tarry stools, hematuria; decreased Hct, notify prescriber
- **For risk of hemorrhage if coadministering with other products that may cause bleeding**
- For hypersensitivity: rash, fever, chills; notify prescriber
- **Beers:** Avoid in older adults; increased risk of bleeding, lower creatinine clearance
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; cautious use in breastfeeding, excretion unknown

Evaluate:

- Therapeutic response: prevention of DVT

Teach patient/family:

- To use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
- To report any signs of bleeding: gums, under skin, urine, stools
- To avoid OTC products containing aspirin, NSAIDs

formoterol (Rx)

(for-moh′ter-ahl)

Duaklir Genuair, Foradil Aerolizer, Oxeze, Perforomist, Symbicort, Zenhale

Func. class.: Bronchodilator

Chem. class.: β-Adrenergic agonist

Do not confuse:

Formoterol/fluticasone

Foradil/Toradol

ACTION: Has β_1 and β_2 action; relaxes bronchial smooth muscle and dilates the trachea and main bronchi by increasing levels of cAMP, which relaxes smooth muscles; causes increased contractility and heart rate by acting on β-receptors in heart

USES: Maintenance, treatment of asthma, COPD; prevention of exercise-induced bronchospasm

CONTRAINDICATIONS: Hypersensitivity to sympathomimetics, monotherapy for asthma, COPD, status asthmaticus

Precautions: Pregnancy, geriatric patients, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, African descent, aneurysm

Black Box Warning: Asthma-related death

DOSAGE AND ROUTES

COPD

Adult: NEB Perforomist solution: 20 mcg BID, max 40 mcg/day; Canada: Foradil: Dry powder inhaler: 12 mcg or 24 mcg BID, max 48 mcg/day

Asthma

Adult: INH: Canada Foradil: Dry powder inhaler: 12 mcg q12hr; in severe cases, 24 mcg q12 hr, max 48 mcg daily; Oxeze Turbuhaler: Dry powder inhaler: 6 mcg or 12 mcg q12 hr max 48 mcg daily

Available form: INH powder in cap 12 mcg (Foradol Aerolizer); nebulizer sol for INH 20 mcg/2 mL (Perforomist); powder for oral inhalation (Oxeze Turbuhaler) 6 mcg/inh, 12 mcg/inh

Administer:

Inhalation route

- Place cap in Aerolizer inhaler; cap is punctured; do not wash Aerolizer inhaler
- Pull off cover, twist mouthpiece to open, push buttons in; make sure the 4 pins are visible; remove cap from blister pack, place cap in chamber; twist to close, press (a click will be heard), re-

lease; patient should exhale, place inhaler in mouth, inhale rapidly
• Store at room temperature; protect from heat, moisture

SIDE EFFECTS

CNS: *Tremors, anxiety,* insomnia, headache, dizziness, stimulation
CV: Palpitations, tachycardia, hypertension, chest pain
GI: Nausea, vomiting, xerostomia
RESP: Bronchial irritation, dryness of oropharynx, bronchospasms (overuse), infection, inflammatory reaction (child)

PHARMACOKINETICS

Bronchodilation: Onset 15 min; peak 1-3 hr; duration 12 hr; metabolized in liver, lungs, GI tract; half-life 10 hr

INTERACTIONS

Increase: serious dysrhythmias—MAOIs, tricyclics
Increase: hypokalemia—loop/thiazide diuretics
Increase: effects of both products—other sympathomimetics, thyroid hormones
Increase: QT prolongation—class IA/III antiarrhythmics, phenothiazines, pimozide, haloperidol, risperiDONE, sertindole, ziprasidone, amoxapine, arsenic trioxide, chloroquine, clarithromycin, dasatinib, dolasetron, droperidol, erythromycin, halofantrine, halogenated anesthetics, levomethadyl, maprotiline, methadone, some quinolones, ondansetron, paliperidone, palonosetron, pentamidine, probucol, ranolazine, SUNItinib, tricyclics, vorinostat
Decrease: action when used with β-blockers

NURSING CONSIDERATIONS

Assess:
• Respiratory function: B/P, pulse, lung sounds; note sputum color, character; respiratory function tests before, during treatment; be alert for bronchospasm, which may occur with this patient
• **Cardiac status:** hypertension, palpitations, tachycardia; if CV reactions occur, product may need to be discontinued
• For paresthesias, coldness of extremities; peripheral blood flow may decrease
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; use caution in breastfeeding, excretion unknown
Evaluate:
• Therapeutic response: ease of breathing
Teach patient/family:

Black Box Warning: Asthma-related death, severe asthma exacerbations; if wheezing worsens and cannot be relieved during an acute asthma attack, immediate medical attention should be sought

• About correct use of inhaler/nebulizer (review package insert with patient); to avoid getting aerosol in eyes
• About all aspects of product; to avoid smoking, smoke-filled rooms, persons with respiratory infections; not to swallow caps

TREATMENT OF OVERDOSE:

Administration of β-blocker

fosamprenavir (Rx)

(fos-am-pren′a-veer)
Lexiva, Telzir
Func. class.: Antiretroviral
Chem. class.: Protease inhibitor

USES: HIV-1 infection in combination with antiretrovirals, not recommended for initial treatment

CONTRAINDICATIONS: Hypersensitivity to protease inhibitors

DOSAGE AND ROUTES

Therapy-naive patients
• **Adult: PO** 1400 mg bid without ritonavir or fosamprenavir 1400 mg/day with ritonavir 200 mg/day or fosamprenavir 700 mg bid and ritonavir 100 mg bid
• **Child >2 yr/adolescent, ≥20 kg: PO** 18 mg/kg (max: 700 mg) bid plus ritonavir 3 mg/kg (max: 100 mg) bid; 15 kg to <20 kg: 23 mg/kg bid plus ritonavir 3 mg/kg bid; 11 kg to <15 kg: 30 mg/kg/dose bid plus ritonavir 3 mg/kg/dose bid; <11 kg: 45 mg/kg/dose bid plus ritonavir 7 mg/kg/dose bid

Protease-experienced patients (PI)
• **Adult: PO** 700 mg bid and ritonavir 100 mg bid
• **Child/adolescent ≥20 kg: PO** 18 mg/kg bid with ritonavir 3 mg/kg bid
• **Child/adolescent 15 kg to <20 kg: PO** 23 mg/kg bid with ritonavir 3 mg/kg bid
• **Child/adolescent 11 kg to <15 kg: PO** 30 mg/kg bid with ritonavir 3 mg/kg bid
• **Child/adolescent <11 kg: PO** 45 mg/kg bid with ritonavir 7 mg bid
• **Infant ≥6 mo, 15 kg to <20 kg: PO** susp 23 mg/kg bid with ritonavir 3 mg/kg bid
• **Infant ≥6 mo, 11 kg to <15 kg: PO** susp 30 mg/kg bid with ritonavir 3 mg/kg bid
• **Infant ≥6 mo, <11 kg: PO** susp 45 mg/kg bid with ritonavir 7 mg/kg bid

Combination with efavirenz
• **Adult: PO** add another 100 mg/day of ritonavir for a total of 300 mg/day when all 3 products given

Hepatic dose
• **Adult: PO** (Child-Pugh 5-6) 700 mg bid without ritonavir (treatment-naive patients) or 700 mg bid with ritonavir 100 mg daily (treatment-naive or experienced patients); (Child-Pugh 7-9) 700 mg bid without ritonavir (treatment-naive patients) or 450 mg bid with ritonavir 100 mg daily (treatment-naive or experienced patients); (Child-Pugh 10-15) 350 mg bid without ritonavir (treatment-naive patients) or 300 mg bid with ritonavir 100 mg daily

foscarnet (Rx)

(foss-kar′net)

Foscavir

Func. class.: Antiviral

Chem. class.: Inorganic pyrophosphate organic analog

ACTION: Antiviral activity is produced by selective inhibition at the pyrophosphate binding site on virus-specific DNA polymerases and reverse transcriptases at concentrations that do not affect cellular DNA polymerases

USES: Treatment of CMV retinitis in patients with AIDS, treatment of acyclovir-resistant HSV infections; used with ganciclovir for relapsing patients

CONTRAINDICATIONS: Hypersensitivity, CCr <0.4 mL/min/kg

Precautions: Pregnancy, breastfeeding, children, geriatric patients, seizure disorders, severe anemia

Black Box Warning: Nephrotoxicity, electrolyte/mineral imbalances, seizures

F

DOSAGE AND ROUTES

Acyclovir-resistant HSV infections
• **Adult/adolescent (unlabeled): IV** 40 mg/kg every 8-12 hr × 2-3 wk or until lesions are healed, max 120 mg/kg/day

Cytomegalovirus (CMV) retinitis (AIDS)
• **Adult/adolescent: IV** 90 mg/kg every 12 hr or 60 mg/kg every 8 hr × 3 wk (or until symptomatic improvement); maintenance IV infusion 90-120 mg/kg over 2 hr daily, max 180 mg/kg/day (initial); 120 mg/kg/day (maintenance)

Available forms: Inj 6000 mg/250 mL, 12,000 mg/500 mL (24 mg/mL)

Administer:
• Increased fluids before and during product administration to induce diuresis, minimize renal toxicity

Intermittent IV INFUSION route
• Using infusion device at no more than 1 mg/kg/min; do not give by rapid or bolus IV; give by CVL or peripheral vein; standard 24 mg/mL sol may be used without dilution if using by CVL; dilute the 24 mg/mL sol to 12 mg/mL with D_5W or NS if using peripheral vein
• Manufacturer recommends product not be given with other medications in syringe or admixed

SIDE EFFECTS

CNS: *Fever*, dizziness, *headache*, seizures, *fatigue*, neuropathy, asthenia, encephalopathy, malaise, meningitis, *paresthesia*, depression, *confusion, anxiety*

CV: ECG abnormalities, 1st-degree AV block, nonspecific ST-T segment changes, cerebrovascular disorder, cardiomyopathy, cardiac arrest, atrial fibrillation, HF, sinus tachycardia
GI: *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, pancreatitis
GU: Acute renal failure, decreased CCr, increased serum creatinine, azotemia, diabetes insipidus, renal tubular disorders
HEMA: *Anemia*, granulocytopenia, leukopenia, thrombocytopenia, thrombosis, neutropenia, lymphadenopathy
INTEG: *Rash*, sweating, pruritus, skin discoloration
RESP: *Coughing, dyspnea,* pneumonia, pulmonary infiltration, pneumothorax, hemoptysis
SYST: *Hypokalemia, hypocalcemia, hypomagnesemia;* hypophosphatemia

PHARMACOKINETICS

14%-17% protein bound, half-life 3 hr in normal renal function, 79%-92% excreted via kidneys, onset rapid, peak infusions end, duration up to 24 hr

INTERACTIONS

Black Box Warning: Increase: nephrotoxicity—acyclovir, cidofovir, CISplatin, gold compounds, tacrolimus, tenofovir, vancomycin, aminoglycosides, amphotericin B, NSAIDs, lithium, cycloSPORINE, pentamidine

Increase: hypocalcemia—pentamidine, calcium products (decreases ionized calcium)

NURSING CONSIDERATIONS

Assess:
HSV: characteristics of lesions baseline and daily during treatment

Black Box Warning: Renal tubular disorders: I&O ratio, urine pH, serum creatinine at baseline, 3×/wk during initial therapy then 2×/wk thereafter; CCr at baseline, throughout treatment; if CCr <0.4 mL/min/kg, discontinue; provide adequate hydration before and during infusion to prevent toxicity

• Blood counts q2wk; watch for decreasing granulocytes, HB; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required
• Lesions in HSV

Black Box Warning: Seizures: may be caused by alterations in minerals and electrolytes, monitor for seizures; monitor electrolytes and minerals (calcium, phosphate, magnesium, potassium); watch closely for tetany during 1st administration

• Electrolytes and minerals (calcium, phosphate, magnesium, potassium); watch closely for tetany during 1st administration
• GI symptoms: nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product
• Blood dyscrasias (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing
• **Allergic reactions:** flushing, rash, urticaria, pruritus

CMV retinitis

• Culture (blood, urine, throat) should be performed before treatment; a negative culture does not rule out CMV. Ophthalmic exam should confirm diagnosis, another exam at conclusion of induction and q4wk during treatment. Monitor closely during therapy for tingling, numbness, paresthesias; if these occur, stop infusion, obtain lab sample for electrolytes
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; do not breastfeed

Evaluate:
• Therapeutic response: improvement in CMV retinitis, healing of HSV lesions

Teach patient/family:
• To call prescriber if sore throat, swollen lymph nodes, malaise, fever occur, since other infections may occur
• To report perioral tingling, numbness in extremities, and paresthesias
• That serious product interactions may occur if OTC products are ingested; check first with prescriber
• That product is not a cure but will control symptoms

fosinopril (Rx)

(foss′in-oh-pril)
Func. class.: Antihypertensive
Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

ACTION: Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II; results in dilation of arterial, venous vessels

USES: Hypertension, alone or in combination with thiazide diuretics, systolic HF
Unlabeled uses: Proteinuria in nondiabetic nephropathy

CONTRAINDICATIONS: Breastfeeding, children, hypersensitivity to ACE inhibitors, history of ACE-inhibitor–induced angioedema

Black Box Warning: Pregnancy

Precautions: Geriatric patients, impaired hepatic function, hypovolemia, blood dyscrasias, HF, COPD, asthma, angioedema, hyperkalemia, renal artery stenosis, renal disease, aortic stenosis, autoimmune disorders, collagen vascular disease, febrile illness, black patients

DOSAGE AND ROUTES

HF
• **Adult: PO** 10 mg/day, then up to 40 mg/day increased over several wk; use lower dose for those diuresed before fosinopril, max 40 mg/day
Hypertension
• **Adult: PO** 10 mg/day initially, then 20-40 mg/day divided bid or daily, max 80 mg/day
• **Child >50 kg: PO** 5-10 mg daily, initially, max 40 mg/day
Available forms: Tabs 10, 20, 40 mg
Administer:
• May be taken without regard to meals
• Store in tight container at ≤86° F (30° C)

SIDE EFFECTS

CNS: *Headache, dizziness,* fatigue, syncope, **stroke,** insomnia, weakness
CV: MI, chest pain, angina, palpitations, flushing, *hypotension,* orthostatic hypotension, tachycardia
GI: *Nausea,* constipation, *vomiting,* diarrhea, **hepatotoxicity, pancreatitis,** red, dry mouth, abdominal pain
GU: Sexual dysfunction, urinary frequency, renal changes
HEMA: Decreased Hct, HB; **eosinophilia, leukopenia, neutropenia, agranulocytosis**
META: *Hyperkalemia*
INTEG: Rash, urticaria, photosensitivity, pruritus
RESP: *Cough*, bronchospasm
MS: Myalgia, arthralgia
SYST: **Anaphylaxis, angioedema**

PHARMACOKINETICS

Peak 3 hr, protein binding 99%, half-life 11.5-14 hr, metabolized by liver (metabolites excreted in urine, feces, 50%)

INTERACTIONS

Increase: hyperkalemia risk—potassium-sparing diuretics, potassium supplements
Increase: hypotension—diuretics, other antihypertensives, ganglionic blockers, adrenergic blockers, nitrates, acute alcohol ingestion
Increase: toxicity—vasodilators, hydrALAZINE, prazosin, potassium-sparing diuretics, sympathomimetics, digoxin, lithium, NSAIDs
Decrease: absorption—antacids
Decrease: antihypertensive effect—salicylates
Drug/Herb
Increase: antihypertensive effect—hawthorn
Decrease: antihypertensive effect—ephedra
Drug/Lab Test
Increase: AST, ALT, alk phos, glucose, bilirubin, uric acid, BUN, potassium
False positive: urine acetone
Positive: ANA titer

NURSING CONSIDERATIONS

Assess:

• **Hypertension:** B/P, orthostatic hypotension, syncope

• **Collagen vascular disease:** neutrophils, decreased platelets; obtain WBC with differential baseline and monthly × 6 mo, then q2-3mo × 1 yr; if neutrophils <1000/mm^3, discontinue

Renal studies: protein, BUN, creatinine; increased levels may indicate nephrotic syndrome

• Baselines of renal, hepatic studies before therapy begins

• Potassium levels

• **HF:** edema in feet, legs daily; weigh daily

• **Allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help; monitor for angioedema

• Supine position for severe hypotension

Black Box Warning: Pregnancy: identify pregnancy before starting therapy; do not use in pregnancy, breastfeeding

Evaluate:

• Therapeutic response: decrease in B/P, decreased signs, symptoms in HF, prevention of early death due to MI, stroke

Teach patient/family:

• Not to discontinue product abruptly; to take at same time of day

• Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes containing potassium without consulting prescriber

• About the importance of complying with dosage schedule, even if feeling better

• To rise slowly to sitting or standing position to minimize orthostatic hypotension

• To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, nonproductive cough

• To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P

• That product may cause dizziness, fainting, light-headedness during first few days of therapy

• That product may cause skin rash or impaired perspiration

• How to take B/P; normal readings for age group

Black Box Warning: To notify prescriber if pregnancy is planned or suspected; to use contraception during treatment

TREATMENT OF OVERDOSE:

0.9% NaCl IV infusion, hemodialysis

fosinopril/hydrochlorothiazide (Rx)

Func. class.: Antihypertensive

USES: Hypertension

DOSAGE:

Black Box Warning: Do not use in pregnancy

• **Adult:** 1 tablet per day in the AM

Available forms:

Tablets: 10 mg/12.5 mg, 20 mg/12.5 mg

fosphenytoin (Rx)

(foss-fen´i-toy-in)

Cerebyx, Sequient

Func. class.: Anticonvulsant

Chem. class.: Hydantoin, phosphate phenytoin ester

ACTION: Inhibits spread of seizure activity in motor cortex by altering ion transport; increases AV conduction, prodrug of phenytoin

USES: Generalized tonic-clonic seizures, status epilepticus, partial seizures

CONTRAINDICATIONS: Pregnancy, hypersensitivity, bradycardia, SA and AV block, Stokes-Adams syndrome
Precautions: Breastfeeding, allergies, renal/hepatic disease, myocardial insufficiency, hypoalbuminemia, hypothyroidism, Asian patients positive for HLA-B 1502, abrupt discontinuation, agranulocytosis, alcoholism, carBAMazepine/barbiturate hypersensitivity, bone marrow suppression, CAD, geriatric patients, hemolytic anemia, hyponatremia, methemoglobinemia, myasthenia gravis, psychosis, suicidal ideation

Black Box Warning: Dysrhythmias, hypotension (rapid IV infusion)

DOSAGE AND ROUTES

All doses in PE (phenytoin sodium equivalent)

Status epilepticus

• **Adult/child: IV** 15-20 mg PE/kg

Nonemergency/maintenance dosing

• **Adult/adolescent >16 yr: IM/IV** 10-20 mg PE/kg; 4-6 mg PE/kg/day (maintenance)

Available forms: Inj 50-mg/mL vials

Administer:

Injectable routes

• Give IM/IV; the dosage, concentration, and infusion rate of fosphenytoin should always be expressed, prescribed, and dispensed in phenytoin sodium equivalents (PE); exercise extreme caution when preparing and administering fosphenytoin; the concentration and dosage should be carefully confirmed; fatal overdoses have occurred in children when the per mL concentration of the product (50 mg PE/mL) was misinterpreted as the total amount of drug in the vial

• Visually inspect for particulate matter and discoloration before use

IV INFUSION route

• Before infusion, dilute in 5% dextrose or 0.9% saline solution to a concentration ranging from 1.5 to 25 mg PE/mL

Black Box Warning: Because of the risk of hypotension, do not exceed recommended infusion rates; continuous monitoring of ECG, B/P, and respiratory function is recommended, especially throughout the period in which phenytoin concentrations peak (about 10-20 min after the end of the infusion)

• Loading doses should always be followed by maintenance doses of oral or parenteral phenytoin or parenteral fosphenytoin

Black Box Warning: **Adult: IV** Infuse at a max rate of 150 mg PE/min; **Elderly or debilitated adults: IV** Infuse at a max 3 mg PE/kg/min or 150 mg PE/min, whichever is less; **Child: IV** Infuse at a rate of 0.5-3 mg PE/kg/min or max 150 mg PE/min, whichever is less; **Infant/neonate: IV** Infuse at a rate max 0.5-3 mg PE/kg/min

Y-site compatibilities: Aminocaproic acid, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, CISplatin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, diltiazem, DOCEtaxel, doxacurium, eptifibatide, ertapenem, etoposide, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gemtuzumab, granisetron, ifosfamide, levofloxacin, linezolid, LORazepam, mechlorethamine, meperidine, methotrexate, metroNIDAZOLE, nesiritide, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, PHENobarbital, piperacillin-tazobactam, rocuronium, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Drowsiness,* dizziness, insomnia, paresthesias, depression, suicidal tendencies, aggression, headache, confusion, paresthesia, emotional lability, syncope, cerebral edema
CV: Hypo/hypertension, HF, shock, dysrhythmias

EENT: Nystagmus, diplopia, blurred vision
GI: Nausea, vomiting, diarrhea, constipation, anorexia, weight loss, hepatitis, jaundice, gingival hyperplasia
HEMA: Agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia
INTEG: Rash, lupus erythematosus, Stevens-Johnson syndrome, hirsutism, hypersensitivity, pruritus
RESP: Bronchospasm, cough
SYST: Hyperglycemia, hypokalemia, SJS/TEN in Asian patients positive for HLA-B 1502; drug reaction with eosinophilia and systemic symptoms (DRESS), purple glove syndrome, anaphylaxis

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys (minimal), protein binding 95%-99%, rapidly converted to phenytoin, distributed to CSF, tissue, crosses placenta; half-life 15 min; IM: onset unknown, peak 30 min, duration 24 hr, IV onset 15-45 min, peak 15-60 min, duration 24 hr

INTERACTIONS

Increase: fosphenytoin level—cimetidine, amiodarone, chloramphenicol, estrogens, H_2 antagonists, phenothiazines, salicylates, sulfonamides, tricyclics, CYP1A2 inhibitors
Decrease: fosphenytoin effects—alcohol (chronic use), antihistamines, antacids, traMADol, antineoplastics, rifampin, folic acid, carBAMazepine, theophylline, CYP1A2 inducers
Decrease: virologic response, resistance—delavirdine; do not use concurrently

Drug/Herb

Increase: anticonvulsant effect—ginkgo
Decrease: anticonvulsant effect—ginseng, valerian

Drug/Lab Test

Increase: glucose, alk phos
Decrease: dexamethasone, metyrapone test serum, PBI, urinary steroids, potassium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Rapid IV infusion: risk of hypotension and dysrhythmias with rapid infusion rates

- Seizure activity, including type, location, duration, character; provide seizure precautions
- Drug level: target level 10-20 mcg/mL, toxic level 30-50 mcg/mL, wait >2 hr after dose before testing, 4 hr after IM dose; phenytoin blood levels are used for this product
- Blood studies: CBC, platelets q2wk until stabilized, then monthly × 12 mo, then q3mo; serum calcium, albumin, phosphorus, potassium
- **Mental status:** mood, sensorium, affect, memory (long, short), suicidal thoughts/behaviors
- **Serious skin reactions:** usually occurring within 28 days of treatment; if a rash develops, patient should be evaluated for DRESS
- **Pregnancy, breastfeeding:** do not use in pregnancy; birth defects have occurred; avoid breastfeeding
- Renal studies: urinalysis, BUN, urine creatinine
- Hepatic studies: ALT, AST, bilirubin, creatinine
- Allergic reaction: red, raised rash; product should be discontinued
- **Toxicity/bone marrow depression:** nausea, vomiting, ataxia, diplopia, cardiovascular collapse, slurred speech, confusion
- Respiratory depression: rate, depth, character of respirations
- Blood dyscrasias: fever, sore throat, bruising, rash, jaundice
- Continuous monitoring of ECG, B/P, respiratory function
- **Rash:** discontinue as soon as rash develops; serious adverse reactions such as Stevens-Johnson syndrome can occur

Evaluate:

- Therapeutic response: decrease in severity of seizures

Teach patient/family:
• About the reason for, expected outcomes of treatment
• Not to use machinery or engage in hazardous activity, since drowsiness, dizziness may occur
• To carry emergency ID denoting product use, name of prescriber
• To notify prescriber of rash, bleeding, bruising, slurred speech, jaundice of skin or eyes, joint pain, nausea, vomiting, severe headaches, depression, suicidal thoughts
• To keep all medical appointments, including those for lab work, physical assessment
• To notify prescriber if pregnancy is planned or suspected; not to use in pregnancy; to avoid breastfeeding
• To use contraception while using this product

fostamatinib (Rx)
(fos′-tuh-ma′-tih-nib)
Tavalisse
Func. class.: Antihemorrhagics

USES: Thrombocytopenia in chronic idiopathic thrombocytopenic purpura (ITP) in patients who have had an insufficient response to previous treatment

CONTRAINDICATIONS: Hypersensitivity

DOSAGE AND ROUTES
• **Adult: PO** 100 mg bid. If platelet count has not increased to at least 50×10^9/L after 1 mo, increase to 150 mg bid

fostemsavir (Rx)
(fos-tem′sa-vir)
Rukobia
Func. class.: Antiretroviral
Chem. class.: gp120 attachment inhibitor

ACTION: Binds to the HIV-1 protein glycoprotein 120 subunit, inhibits the interaction between the virus and cellular CD4 receptors, prevents attachment

USES: Treatment of HIV-1 infection with other antiretrovirals in multidrug-resistant HIV-1 infection

DOSAGE AND ROUTES
HIV-1 infection
Adult PO: 600 mg bid with other antiretrovirals
Available forms: Ext rel tablets 600 mg
Administer:
PO route
• Give without regard to food; swallow whole; do not chew, crush, split

CONTRAINDICATIONS:
Breastfeeding, hypersensitivity, use of strong CYP3A inducers (enzalutamide, carbamazepine, phenytoin, rifampin, St. John's wort)

Precautions:
Pregnancy, infants, liver disease, myelosuppression, infections

SIDE EFFECTS
CNS: Fatigue, headache, dizziness, drowsiness, insomnia, abnormal dreams, peripheral neuropathy
CV: QT prolongation
GI: Nausea, vomiting, abdominal pain, diarrhea, dyspepsia, increased LFTs
META: Hyperbilirubinemia, hypercholesterolemia, hyperglycemia, hypertriglyceridemia
HEMA: Anemia, neutropenia
INTEG: Rash, pruritus

PHARMACOKINETICS
Onset unknown, peak 2 hr, duration unknown, protein binding 88.4%, half-life 11 hr

INTERACTIONS
Many drug interactions, refer to manufacturer's information

NURSING CONSIDERATIONS
Assess:
• **HIV:** CBC with differential, blood chemistry, blood glucose, plasma HIV RNA, absolute CD4+/CD8+ cell counts, serum ICD+24 antigen levels, cholesterol, serum

bilirubin (total and direct), serum lipid profile, urinalysis baseline and periodically
- **Hepatotoxicity:** Monitor LFTs, signs of hepatotoxicity in HBV and/or HCV coinfection; continue with or start anti-HBV therapy in those coinfected with HBV
- Monitor for QT prolongation in those with a history of prolonged QT interval, preexisting cardiac disease, or those taking drugs known to cause torsades de pointes
- **Hepatitis B virus coinfection:** Use with caution; elevations in LFTs are more common in patients with HBV coinfection, which may be related to HBV reactivation. Monitor hepatitis B serology, plasma hepatitis C RNA
- **Peripheral neuropathy:** May occur and last for several months, where nerves are close to the skin
- Bowel pattern before, during treatment; if severe abdominal pain or constipation occurs, notify prescriber; monitor hydration
- **Hypersensitivity:** Skin eruptions, rash, urticaria, itching; assess allergies before treatment, reaction to each medication; may occur quickly or later after continued use
- **Immune reconstitution syndrome:** With combination therapy, patients may develop immune reconstitution syndrome with inflammatory response to an opportunistic infection during initial HIV treatment or activation of autoimmune disorders (Graves disease, polymyositis, Guillain-Barre syndrome, autoimmune hepatitis)
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, or if breastfeeding; if pregnant, register with the Antiretroviral Pregnancy Registry, 800-258-4263, obtain a pregnancy test

Evaluate:
- Therapeutic response: Increased CD4 cell counts; decreased viral load; slowing progression of HIV-1 infection

Teach patient/family:
- That hypersensitive reactions may occur; rash, pruritus; to stop product, contact prescriber
- That product is not a cure for HIV-1 infection but controls symptoms; HIV-1 can still be transmitted to others; that product is to be used in combination only with other antiretrovirals
- To notify prescriber if pregnancy is suspected; not to breastfeed

fremanezumab (Rx)

(free-ma-nez´ue-mab)

Ajovy

Func. class.: Antimigraine agent

Chem. class.: Calcitonin gene-related peptide (CGRP) antagonist

ACTION: Binds to and antagonizes the calcitonin gene-related peptide (CGRP) receptor and antagonizes CGRP receptor function

USES: Migraine prophylaxis

CONTRAINDICATIONS: Hypersensitivity

Precautions: Breastfeeding, pregnancy

DOSAGE AND ROUTES

- **Adult: SUBCUT** 225 mg monthly or 675 mg q3mo

Available forms: 225 mg/1.5 mL prefilled syringe sol for injection

Administer:

SUBCUT route
- When switching between monthly and quarterly dosage options, give the first dose of the new regimen on the next scheduled date of administration
- Visually inspect for particulates, discoloration before use; do not use if solution is cloudy, discolored, or contains particles; product is clear to opalescent, colorless to slightly yellow
- Allow to sit at room temperature ≥30 min, protect from direct sunlight, do not shake
- Clean injection site on the abdomen, thigh, or upper arm with an alcohol wipe, and allow skin to dry
- Do not inject into areas where skin is tender, bruised, red, or hard. Avoid injecting directly into raised, thick, red, or scaly skin patch or lesion, or into areas with scars or stretch marks
- If using the same body area for the 3 separate injections needed for the

675-mg dose, do not use the same location used for the previous injection
• Do not coadminister with other injectable drugs at the same injection site
• If a dose is missed, give the next dose as soon as possible
• **Storage:** After removing from refrigerator, may be stored at room temperature up to 77° F (25° C) for ≤24 hr; discard if not used within 24 hr after removal from refrigerator

Single-dose prefilled syringe
• Pinch injection site skin firmly between thumb and fingers
• Hold, insert syringe at a 45- to 90-degree angle for administration

SIDE EFFECTS

INTEG: Injection site reaction, rash, urticaria, pruritus, erythema
MISC: Antibody formation

PHARMACOKINETICS

Half-life 31 days, peak 5-7 days

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:
• **Migraine:** pain, location, intensity, duration, photophobia in the past; assess response to preventing migraine after use of this product
• Injection site reaction, rash, urticaria, pruritus, erythema; may indicate allergic reactions
• **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected, or if breastfeeding; no adequate studies are available

Evaluate:
• Therapeutic response: prevention of migraine

Teach patient/family:
• How to self-administer product
• Not to double, skip doses; when switching between monthly and quarterly dosage options, to give the first dose of the new regimen on the next scheduled date of administration
• To report injection site reaction, rash, itching; may indicate allergic reaction

frovatriptan (Rx)

(froh-vah-trip′tan)

Frova

Func. class.: Antimigraine agent
Chem. class.: 5-HT_1-Receptor agonist

ACTION: Binds selectively to the vascular 5-HT_{1B}, 5-HT_{1D} receptor subtypes; exerts antimigraine effect; binds to benzodiazepine receptor sites, causes vasoconstriction in cranium

USES: Acute treatment of migraine with/without aura

CONTRAINDICATIONS: Hypersensitivity, angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease; concurrent ergotamine-containing preparations; uncontrolled hypertension; basilar or hemiplegic migraine; ischemic bowel disease; peripheral vascular disease, severe hepatic disease, prophylactic migraine treatment
Precautions: Pregnancy, breastfeeding, children, geriatric patients, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired hepatic function, seizure disorder

DOSAGE AND ROUTES

• **Adult: PO** 2.5 mg; a 2nd dose may be taken after ≥2 hr; max 3 tabs (7.5 mg/day)

Available form: Tabs 2.5 mg

Administer:
• Swallow tabs whole; do not break, crush, or chew
• With fluids
• 2 days/wk or less; rebound headache may occur

SIDE EFFECTS

CNS: *Hot/cold sensation*, paresthesia, *dizziness,* headache, fatigue, insomnia, anxiety, somnolence, seizures
CV: *Flushing*, chest pain, palpitation, coronary artery vasospasm, MI, myocardial ischemia, ventricular tachycardia, ventricular fibrillation
GI: Dry mouth, dyspepsia, abdominal pain, diarrhea, vomiting, nausea
MS: Skeletal pain

PHARMACOKINETICS

Onset of pain relief 2-3 hr, terminal half-life 25-29 hr, protein binding 15%, metabolized in liver by CYP1A2

INTERACTIONS

Increase: frovatriptan levels—CYP1A2 inhibitors (cimetidine, ciprofloxacin, erythromycin), estrogen, propranolol, hormonal contraceptives
Increase: toxicity—SSRIs, other serotonin agonists (dextromethorphan, MAOIs, antidepressants)

NURSING CONSIDERATIONS

Assess:
• **Migraine symptoms:** aura, unable to view light; ingestion of tyramine-containing foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
• Serious cardiac reactions: may occur within a few hours of taking a 5-HT1 agent; dysrhythmias, ventricular tachycardia, ventricular fibrillation leading to death
• B/P; signs, symptoms of coronary vasospasms
• For stress level, activity, recreation, coping mechanisms
• Quiet, calm environment with decreased stimulation from noise, bright light, excessive talking
• **Serotonin syndrome:** agitation, confusion, diaphoresis, increased B/P, nausea, vomiting, diarrhea; product should be discontinued
• **Pregnancy/breastfeeding:** use only if benefit outweighs fetal risk; do not breastfeed, excretion unknown
Evaluate:
• Therapeutic response: decrease in frequency, severity of migraine
Teach patient/family:
• To report any side effects to prescriber
• To inform prescriber if pregnant or planning to become pregnant
• To consult prescriber if breastfeeding
• **Serious cardiac reactions:** to report immediately pain, chest tightness
• **Serotonin syndrome:** to report agitation, confusion, sweating, nausea, vomiting, diarrhea
• **Short-term use only:** That abortive migraine agents used >10 days/mo may lead to a worsening of headaches, medication overuse

⚠ HIGH ALERT

fulvestrant (Rx)

(full-vess´trant)

Faslodex

Func. class.: Antineoplastic
Chem. class.: Estrogen-receptor antagonist

ACTION: Inhibits cell division by competitive binding to cytoplasmic estrogen receptors, downregulates estrogen receptors

USES: Advanced breast carcinoma in estrogen-receptor-positive patients (usually postmenopausal)

CONTRAINDICATIONS: Pregnancy, breastfeeding, children, hypersensitivity
Precautions: Hepatic disease, jaundice, thrombocytopenia, biliary tract disease, coagulopathy

DOSAGE AND ROUTES

• **Adult: IM** 500 mg as 2-, 5-mL injections on days 1, 15, 29 and monthly thereafter

Available forms: Inj 50 mg/mL

Administer:

IM route

• IM 5 mL give one inj in each buttock slowly, over 1-2 min

• Antiemetic 30-60 min before product to prevent vomiting prn

• Store in refrigerator; protect from light

SIDE EFFECTS

CNS: *Headache,* depression, dizziness, insomnia, paresthesia, anxiety

GI: *Nausea, vomiting,* anorexia, constipation, diarrhea, abdominal pain, hepatitis, hepatic failure, hyperbilirubinemia

HEMA: Anemia

INTEG: *Rash,* sweating, *hot flashes,* inj site pain

MS: Bone pain, arthritis, back pain

RESP: Pharyngitis, dyspnea, cough

SYST: Angioedema

PHARMACOKINETICS

Half-life 40 days, metabolized by CYP3A4, excretion in feces 90%

INTERACTIONS

Increase: Bleeding—anticoagulants, do not use concurrently

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

• For anticoagulant use

• For side effects; report to prescriber

• **Pregnancy/breastfeeding:** Obtain a pregnancy test within 7 days of first dose, have patient use contraception during and for 1 yr after last dose, do not breastfeed

Evaluate:

• Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

• To report any complaints, side effects to prescriber

• To report vaginal bleeding immediately

• That tumor flare (increase in size of tumor, increased bone pain) may occur, will subside rapidly; that analgesics may be taken for pain

• That premenopausal women must use mechanical birth control because ovulation may be induced; not to breastfeed

• To use contraception during and for 1 yr after last dose to prevent pregnancy

F

furosemide (Rx)

(fur-oh′se-mide)

Lasix

Func. class.: Loop diuretic

Chem. class.: Sulfonamide derivative

Do not confuse:

furosemide/torsemide

Lasix/Luvox/Lomotil/Lanoxin/Losec

ACTION: Inhibits reabsorption of sodium and chloride at proximal and distal tubule and in the loop of Henle

USES: Pulmonary edema; edema with HF, hepatic disease, nephrotic syndrome, ascites, hypertension

CONTRAINDICATIONS: Anuria

Precautions: Pregnancy, breastfeeding, diabetes mellitus, dehydration, severe renal disease, cirrhosis, ascites, hypersensitivity to sulfonamides/thiazides, infants, hypovolemia, electrolyte depletion, hypersensitivity

DOSAGE AND ROUTES

Acute pulmonary edema

• **Adult: IV** 40 mg slowly over 2 min, then 80 mg in 60-90 min if needed, max 200 mg/dose

Edema

• **Adult: PO** 20-80 mg/day in AM; may give another dose after 6 hr up to 600 mg/day; **IM/IV** 20-40 mg; increase by 20 mg q2hr until desired response

• **Child: PO/IM/IV** 1-2 mg/kg; may increase by 1-2 mg/kg q6-8hr up to 6 mg/kg

Hypertension

• **Adult: PO** 40 mg bid, adjust based on response

Available forms: Tabs 20, 40, 80 mg; oral sol 8 mg/mL, 10 mg/mL; inj 10 mg/mL

Administer:

- In AM to avoid interference with sleep if using product as diuretic
- Potassium replacement if potassium <3 mg/dL

PO route

- PO with food if nausea occurs; absorption may be decreased slightly; tabs may be crushed

IV route

- Undiluted; may be given through Y-tube or 3-way stopcock; give ≤20 mg/min

Intermittent IV INFUSION route

- May be added to NS or D_5W; if large doses required and given as IV infusion, max 4 mg/min; use infusion pump

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl/lipid complex/liposome, anidulafungin, argatroban, ascorbic acid, atenolol, atropine, azaTHIOprine, aztreonam, bivalirudin, bleomycin, bumetanide, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, ceftobiprole, ceftRIAXone, cefuroxime, chloramphenicol, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, DOCEtaxel, doripenem, doxacurium, DOXOrubicin liposome, enalaprilat, ePHEDrine, EPINEPHrine, etoposide, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, gallium nitrate, ganciclovir, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), isosorbide, kanamycin, leucovorin, lidocaine, linezolid, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, methicillin, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, mitoMYcin, moxalactam, multiple vitamin injection, nafcillin, naloxone, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, penicillin G, PENTobarbital, PHENobarbital, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanil, Ringer's, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, temocillin, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, urokinase, vit B/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Headache, fatigue, weakness, vertigo, paresthesias

CV: Orthostatic hypotension, chest pain, ECG changes, circulatory collapse

EENT: Loss of hearing, ear pain, tinnitus, blurred vision

ELECT: *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia,* metabolic alkalosis

ENDO: *Hyperglycemia*

GI: *Nausea,* diarrhea, dry mouth, vomiting, anorexia, cramps, oral, gastric irritations, pancreatitis

GU: *Polyuria,* renal failure, glycosuria, bladder spasms

HEMA: Thrombocytopenia, agranulocytosis, leukopenia, neutropenia, anemia

INTEG: *Rash, pruritus,* purpura, sweating, photosensitivity, urticaria

MS: Cramps, stiffness

SYST: Toxic epidermal necrolysis, erythema multiforme, Stevens-Johnson syndrome

PHARMACOKINETICS

PO: Onset 1 hr, peak 1-2 hr, duration 6-8 hr, absorbed 70%

IV: Onset 5 min; peak ½ hr; duration 2 hr (metabolized by the liver 30%); excreted in urine, some as unchanged product, and feces; crosses placenta, enters breast milk; excreted in breast milk; half-life ½-1 hr, protein binding 90%-99%

INTERACTIONS

Increase: toxicity—lithium, nondepolarizing skeletal muscle relaxants, digoxin, salicylates, aminoglycosides, ClSplatin

Increase: hypotensive action of antihypertensives, nitrates

Increase: ototoxicity—aminoglycosides, ClSplatin, vancomycin

Increase: effects of anticoagulants, salicylates

Decrease: furosemide effect—probenecid

Drug/Lab Test

Interference: GTT

Increase: LDL

NURSING CONSIDERATIONS

Assess:

• **HF:** weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily

• **Hypertension:** B/P lying, standing; postural hypotension may occur; assess for full risk in older adults, and implement fall prevention strategies

• Metabolic alkalosis: drowsiness, restlessness

• **Hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness; assess those who are also taking digoxin for digoxin toxicity due to hypokalemia

• Rashes, temperature elevation daily

• Confusion, especially in geriatric patients; take safety precautions if needed

• **Hearing,** including tinnitus and hearing loss, when giving high doses for extended periods or rapid infusion

• Rate, depth, rhythm of respiration, effect of exertion, lung sounds

• Electrolytes (potassium, sodium, chloride); include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid

• Glucose in urine if patient diabetic

• Allergies to sulfonamides, thiazides

• **Serious rash:** monitor for skin rash often; Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme may occur and are life threatening

• **Beers:** use with caution in older adults; may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion or hyponatremia; monitor sodium level closely when changing doses

• **Pregnancy/breastfeeding:** use only if benefit outweighs fetal risks; do not breastfeed, excretion unknown

Evaluate:

• Therapeutic response: improvement in edema of feet, legs, sacral area (HF); increased urine output, decreased B/P; decreased calcium levels (hypercalcemia)

Teach patient/family:

• To discuss the need for a high-potassium diet or potassium replacement with prescriber

• To rise slowly from lying or sitting position because orthostatic hypotension may occur; teach fall prevention strategies

• To recognize adverse reactions that may occur: muscle cramps, weakness, nausea, dizziness; teach diabetic patients to monitor blood glucose carefully; blood glucose levels can be elevated

• About the entire treatment regimen, including exercise, diet, stress relief for hypertension

• To contact prescriber if rash, cramps, nausea, dizziness, numbness, weakness occur

• To take with food or milk for GI symptoms

• To use sunscreen or protective clothing to prevent photosensitivity

• To take early in the day to prevent sleeplessness

• To avoid OTC medications unless directed by prescriber

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

gabapentin (Rx)

(gab´a-pen-tin)

Gralise, Gralise Starter, Horizant, Neurontin

Func. class.: Anticonvulsant

Chem. class.: GABA analogue

Do not confuse:
Neurontin/Noroxin/Motrin/Neoral

ACTION: Mechanism unknown; may increase seizure threshold; structurally similar to GABA but does not bind to GABAa or GABAb; gabapentin binding sites in neocortex, hippocampus

USES: Adjunct treatment of partial seizures, with/without generalization in patients >12 yr; adjunct for partial seizures in children 3-12 yr, postherpetic neuralgia, primary restless leg syndrome in adults, ALS, neuropathic pain

CONTRAINDICATIONS: Hypersensitivity to this product

Precautions: Pregnancy, breastfeeding, children <3 yr, geriatric patients, renal disease, hemodialysis, suicidal thoughts, depression

DOSAGE AND ROUTES

Adjunctive in partial seizures with or without secondary generalized tonic-clonic seizures (Neurontin only)

• **Adult/child >12 yr: PO** 300 mg tid; may titrate to 1800 mg/day in 3 divided doses

• **Child 3-12 yr: PO** 10-15 mg/kg/day in 3 divided doses initially titrate dose upward over approximately 3 days; if >5 yr old, use 25-35 mg/kg/day; if 3-4 yr old, 40 mg/kg/day divided in 3 doses

Postherpetic neuralgia (PHN)

• **Adult: PO (Neurontin)** 300 mg on day 1, 600 mg/day divided bid on day 2, 900 mg/day on day 3 divided tid, may titrate to 1800-3600 mg divided tid if needed; **EXT REL (Gralise only)** 300 mg on day 1, 600 mg on day 2, 900 mg on days 3-6, 1200 mg on days 7-10, 1500 mg on days 11-14, 1800 mg on day 15 and thereafter; **(Horizant only)** 600 mg in AM × 3 days, day 4 give 600 mg bid

Moderate to severe restless legs syndrome (RLS) (Horizant only)

• **Adult: PO EXT REL** 600 mg daily with food at about 5 PM; if dose missed, take next day at 5 PM

Neuropathic pain (immediate release)

• **Adult: PO** 1200-3600 mg/day in 3 divided doses, maintenance 300-1200 mg tid, max 3600 mg/day

Renal dose

• **Adult: PO EXT REL tablets (Gralise tablets only): CCr 30-59 mL/min:** 600-1800 mg/day as tolerated; CCr <30 mL/min: do not use; **ext-rel tablets (Horizant tablets only) CCr 30-59 mL/min: for RLS,** 300 mg/day, increase to 600 mg/day as needed, **for PHN,** 300 mg in the AM × 3 days, then increase to 300 mg bid, increase to 600 mg bid as needed; for dose tapering, reduce the maintenance dose to daily in the AM × 1 wk before discontinuing; **CCr 15-29 mL/min: for RLS,** 300 mg/day; **for PHN,** 300 mg PO on days 1 and 3, then 300 mg daily in the AM, increase to 300 mg bid as needed, for tapering, if dose is 300 mg bid, reduce to 300 mg daily in AM × 1 wk before discontinuation; if the dose is 300 mg daily, no taper is required; **CCr <15 mL/min: for RLS and PHN,** 300 mg every other day; **for PHN,** dose can be increased to 300 mg daily in AM; no dose taper is required

Available forms: Caps 100, 300, 400 mg; tablets 100, 300, 400, 600, 800 mg; oral sol 250 mg/5 mL; ext rel tab: 300, 600 mg

Administer:

• Do not crush or chew caps, ext rel tabs; caps may be opened and contents put in applesauce or dissolved in juice; scored tabs may be cut in half

• 2 hr apart when giving antacids

• Give without regard to meals (immediate release)

• Give with food (ext rel)

• Refrigerate oral solution

• Gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures

• Beginning dose at bedtime to minimize daytime drowsiness
• **Oral sol:** measure with calibrated device, refrigerate
• **Ext rel:** give with food at about 5 PM (Gralise); bioavailability increased with food; swallow whole; do not interchange Gralise with Horizant
• Store at room temperature away from heat and light

SIDE EFFECTS

CNS: Dizziness, fatigue, somnolence, ataxia, amnesia, abnormal thinking, *depression;* **children 3-12 yr old,** emotional lability, aggression, thought disorder, hyperkinesia, hostility
CV: Vasodilation, peripheral edema
EENT: Dry mouth, blurred vision, *diplopia,* nystagmus; otitis media **(child 3-12 yr)**
GI: Constipation, weight gain, increased appetite, nausea, vomiting; diarrhea (Gralise)
GU: Impotence, *UTI*
HEMA: Leukopenia
INTEG: Pruritus, abrasion, acne vulgaris
MS: Myalgia, back pain, gout
RESP: Cough, upper respiratory infection (child 3-12 yr)
SYST: Drug reaction with eosinophilia and systemic symptoms (DRESS); dehydration (child 3-12 yr)

PHARMACOKINETICS

half-life 5-7 hr; immediate release peak 2 hr, ext rel peak 8 hr (Gralise); 5-7 hr (Horizant)

INTERACTIONS

Increase: CNS depression—alcohol, sedatives, antihistamines, all other CNS depressants; monitor for CNS depression
Increase: effect of—HYDROcodone; dosage reduction may be needed
Decrease: gabapentin levels—antacids, separate by 2 hr
Drug/Herb
Increased: CNS depression—chamomile, kava, valerian
Drug/Lab Test
Decrease: WBC
False positive: urinary protein using Ames N-Multistix SG

NURSING CONSIDERATIONS

Assess:
• **Seizures:** aura, location, duration, frequency, activity at onset; use seizure precautions if present
• **Pain:** location, duration, characteristics if using for chronic pain, migraine
• **Vision changes:** obtain testing baseline, during and after treatment
• **RLS:** restless leg syndrome characteristics baseline and periodically
• Mental status: mood, sensorium, affect, behavioral changes, **suicidal thoughts/behaviors;** if mental status changes, notify prescriber
• WBC, gabapentin level (therapeutic 5.9-21 mcg/mL, toxic >85 mcg/mL), serum creatinine/BUN, weight
• Drug reaction with eosinophilia and systemic symptoms
• Increased fluids, bulk in diet for constipation
• **Beers:** avoid in older adults unless safer alternative is unavailable; ataxia, impaired psychomotor function may occur
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk
Evaluate:
• Therapeutic response: decreased seizure activity; decrease in chronic pain
Teach patient/family:
• To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
• To avoid driving, other activities that require alertness until response is known because dizziness, drowsiness may occur
• Not to discontinue medication quickly after long-term use; to taper over ≥1 wk because withdrawal-precipitated seizures may occur; not to double doses if dose is missed; to take if 2 hr or more before next dose
• To report changes in vision, diplopia, eye irritation to provider
• Not to use with alcohol, sedative, antihistamines, or other products that cause dizziness/sleepiness
• To notify providers of use before surgery
• To take as prescribed; not to interchange formulations; that ext rel product should not be crushed or chewed, if

tablet is to be broken in half, use within 28 days or discard
• To report suicidal thoughts or feelings, increased depression, panic attacks, hostility, confusion to provider
• Not to use within 2 hr of antacid, may take regular release without regard to meals; ext rel should be taken with food; doses interval should not be ≥12 hr
• To obtain emergency treatment for seizures or dizziness, cyanosis of extremities or lips, trouble breathing, unusual sleepiness
• To keep oral solution refrigerated
• To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding

galantamine (Rx)

(gah-lan′tah-meen)

Razadyne, Razadyne ER, Reminyl

Func. class.: Anti-Alzheimer agent

Chem. class.: Centrally acting cholinesterase inhibitor

USES: Mild to moderate dementia of Alzheimer's disease, dementia with Lewy bodies

DOSAGE AND ROUTES

• **Adult: PO** 4 mg bid with morning and evening meals; after 4 wk or more, may increase to 8 mg bid; may increase to 12 mg bid after another 4 wk, usual dose 16-24 mg/day in 2 divided doses; **EXT REL** 8 mg/day in AM; may increase to 16 mg/day after 4 wk and 24 mg/day after another 4 wk

Hepatic dose

• **Adult: PO** Child-Pugh 7-9, max 16 mg/day; Child-Pugh 10-15, avoid use

Renal dose

• **Adult: PO** CCr 10-70 mL/min, max 16 mg/day; CCr <9 mL/min, avoid use

Available forms: Tabs 4, 8, 12 mg; ext rel caps 8, 16, 24 mg; oral sol 4 mg/mL
• To take with food to minimize side effects

galcanezumab-gnim (Rx)

(gal-kuh-nezz′-you-mab)

Emgality

Func. class.: Antimigraine agent

Chem. class.: Calcitonin gene-related peptide (CGRP) antagonist

USES: Migraine prophylaxis, cluster headache

DOSAGE AND ROUTES

Migraine prevention

• **Adult: SUBCUT** 240 mg once as a loading dose, then 120 mg monthly

Episodic cluster headache

Adult: SUBCUT 300 mg (3 SUBCUT injections of 100 mg each) at the onset of the cluster period, and then monthly until the end of the cluster period

Available forms: Prefilled pen or prefilled syringe 120 mg/mL sol for inj

ganciclovir (Rx)

(gan-sye′kloe-vir)

Zirgan

Func. class.: Antiviral

Chem. class.: Synthetic nucleoside analog

ACTION: Inhibits replication of herpesviruses; competitively inhibits human CMV DNA polymerase and is incorporated, resulting in termination of DNA elongation

USES: Cytomegalovirus (CMV) retinitis in immunocompromised persons, including those with AIDS, after indirect ophthalmoscopy confirms diagnosis; prophylaxis for CMV in transplantation; ophthalmic: acute herpes keratitis

CONTRAINDICATIONS: Hypersensitivity to acyclovir, ganciclovir

Black Box Warning: Absolute neutrophil count <500/mm^3, platelet count <25,000/mm^3 (intravitreal)

Precautions: breastfeeding, children <6 mo, geriatric patients, preexisting

cytopenias, renal function impairment, radiation therapy, hypersensitivity to famciclovir, penciclovir, valacyclovir, valganciclovir

Black Box Warning: Secondary malignancy, bone marrow suppression, anemia, infertility, neutropenia, pregnancy, male-mediated teratogenicity

DOSAGE AND ROUTES

Prevention of CMV

• **Adult/adolescent: IV** 5 mg/kg/dose over 1 hr q12hr × 1-2 wk, then 5 mg/kg/day 7 day/wk, or 6 mg/kg/day × 5 days/wk

Acute herpes keratitis

• **Adult/adolescent/child ≥2 yr: OPHTH** 1 drop in affected eye 5 times daily until ulcer heals, then 1 drop tid × 7 days

Renal dose

• **Adult: IV** CCr 50-69 mL/min, reduce to 2.5 mg/kg q12hr (induction), 2.5 mg/kg q24hr (maintenance); **IV** CCr 25-49 mL/min, reduce to 2.5 mg/kg (induction); 1.25 mg/kg q24hr (maintenance); **IV** CCr 10-24 mL/min, reduce to 1.25 mg/kg q24hr (induction); 0.625 mg/kg q24hr (maintenance); **IV** CCr <10 mL/min, reduce to 1.25 mg/kg 3×/wk after hemodialysis (induction); 0.625 mg/kg 3×/wk after hemodialysis (maintenance)

Available forms: Powder for inj 500 mg/vial; ophth gel 0.15% (Zirgan)

Administer:

IV route

• Mixed in biologic cabinet using gown, gloves, mask; use cytotoxic handling procedures; do not use if particulate matter is present

Intermittent IV INFUSION route

• IV after reconstituting 500 mg/10 mL sterile water for inj (50 mg/mL), don't use bacteriostatic water with parabens; shake; further dilute in 50-250 mL D_5W, 0.9% NaCl, LR, Ringer's and run over 1 hr; use infusion pump, in-line filter, flush line well before and after product

• Do not give by bolus IV, IM, SUBCUT inj

• Use reconstituted sol within 24 hr; do not refrigerate or freeze

Y-site compatibilities: Allopurinol, amphotericin B cholesteryl, CISplatin, cyclophosphamide, DOXOrubicin liposome, enalaprilat, etoposide, filgrastim, fluconazole, gatifloxacin, granisetron, linezolid, melphalan, methotrexate, PACLitaxel, propofol, remifentanil, tacrolimus, teniposide, thiotepa

SIDE EFFECTS

CNS: *Fever,* chills, coma, *confusion,* abnormal thoughts, dizziness, bizarre dreams, *headache,* psychosis, tremors, somnolence, *paresthesia, weakness,* seizures, peripheral neuropathy

CV: Dysrhythmia, hypo/hypertension

EENT: Retinal detachment in CMV retinitis, ocular hypertension, ocular pain, conjunctival scarring, cataracts

GI: *Abnormal LFTs, nausea, vomiting, anorexia, diarrhea, abdominal pain,* hemorrhage, perforation, pancreatitis

GU: Hematuria, *increased creatinine,* BUN, infertility, decreased sperm count

HEMA: Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia, pancytopenia

INTEG: *Rash,* alopecia, *pruritus,* urticaria, pain at site, phlebitis

RESP: Dyspnea, pneumonia

PHARMACOKINETICS

Half-life 3-4½ hr (IV); excreted by kidneys (unchanged); crosses blood-brain barrier, CSF, onset rapid, peak infusions end, duration up to 24 hr

INTERACTIONS

Increase: severe granulocytopenia—zidovudine, antineoplastics, radiation; do not give together

Increase: ganciclovir toxicity—adriamycin, amphotericin B, cycloSPORINE, dapsone, DOXOrubicin, flucytosine, pentamidine, probenecid, trimethoprim-sulfamethoxazole combinations, vinBLAStine, vinCRIStine, other nucleoside analogs, mycophenolate, tenofovir, tacrolimus, aminoglycosides, NSAIDs

Increase: seizures—imipenem/cilastatin

Increase: didanosine effect—didanosine

Drug/Lab Test

Increase: LFTs, creatinine, GCT

Decrease: Hb, WBC, platelets, neutrophils, granulocytes

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Secondary malignancy: avoid direct contact with powder in caps/solution; if skin contact occurs, wash thoroughly with soap and water; do not get in the eyes

- **CMV retinitis:** Culture of blood, urine, and throat may be taken, CMV is not confirmed by this method; ophthalmic exam confirms diagnosis, these exams should be done baseline, weekly (induction), q2wk (maintenance)
- **Infection:** Increased temperature, sore throat, chills, fever; report to prescriber

Black Box Warning: Leukopenia/neutropenia/thrombocytopenia: CBC, WBCs, platelets q2days during 2×/day dosing and then q1wk for leukopenia with daily WBC count in patients with prior leukopenia with other nucleoside analogs or for whom leukopenia counts are <1000 cells/mm^3 at start of treatment

- Serum creatinine or CCr ≥q2wk, BUN; LFTs; ophthalmic exam
- For seizures, dysrhythmias
- **Infection:** Assess for flulike symptoms/fever, sore throat, coughing
- **Bleeding:** Assess for bleeding, thrombocytopenia, check gums, urine, emesis, avoid rectal temperature, vein punctures
- **Pregnancy/breastfeeding:** Not to be used in pregnancy, confirm by pregnancy test

Evaluate:

- Therapeutic response: decreased symptoms or prevention of CMV retinitis in transplant patients (if needed)

Teach patient/family:

- Not to wear contact lenses while using gel
- That product does not cure condition; that regular blood tests, ophthalmologic exams are necessary
- That major toxicities may necessitate discontinuing product

Black Box Warning: Pregnancy: use contraception during treatment (males/females) and that infertility may occur; males should use barrier contraception for 90 days after treatment; may cause reversible infertility at lower doses, irreversible infertility at higher doses; not to breastfeed (IV)

- **To report infection:** fever, chills, sore throat; blood dyscrasias: bruising, bleeding, petechiae; to avoid crowds, persons with respiratory infections
- To report itching, redness or eye pain (ophthalmic treatment)

ganciclovir ophthalmic

See Appendix B

gatifloxacin (Rx)

(ga-ti-floks´a-sin)

Zymar ✱, Zymaxid

Func. class.: Ophthalmic antiinfective

Chem. class.: Fluoroquinolone

USES: Bacterial conjunctivitis

DOSAGE AND ROUTES

Bacterial conjunctivitis

- **Adult/adolescent/child ≥1 yr: OPHTH SOL** (0.5% ophthalmic solution) 1 drop in affected eye(s) q2hr while awake (up to 8 times a day) for 1 day, then 1 drop 2-4 times a day while awake on days 2 through 7

Available forms: Ophthalmic solution 0.5%

⚠ HIGH ALERT

gemcitabine (Rx)

(jem-sit´a-been)

Infugem

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Pyrimidine analog

ACTION: Exhibits antitumor activity by killing cells undergoing DNA synthesis (5 phase) and blocking G1/5-phase boundary

USES: Adenocarcinoma of the pancreas (nonresectable stage II, III, or metastatic stage IV); in combination with CISplatin for inoperable, advanced, or metastatic non–small-cell lung cancer; advanced breast cancer in combination with PACLitaxel; with CARBOplatin for ovarian cancer, pancreatic cancer, ovarin cancer, ovarian cancer relapse
Unlabeled uses: Bladder cancer, biliary tract cancer

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity
Precautions: Children, geriatric patients, myelosuppression, radiation therapy, renal/hepatic disease, accidental exposure, alcoholism, dental disease, infection

DOSAGE AND ROUTES

Breast cancer (metastatic)
• **Adult: IV:** 1250 mg/m^2 give over 30 min days 1 and 8 q21days (in combination with paclitaxel), adjust dose on platelets and AGC on days 1, 8 of cycle, obtain CBC/differential before each dose
Ovarian cancer (advanced)
• **Adult: IV:** 1000 mg/m^2 give over 30 min days 1 and 8; q21days (in combination with carboplatin); check CBC/differential platelets before each dose
Pancreatic cancer (adjuvant)
• **Adult: IV:** 1000 mg/m^2 on days 1, 8, 15 of 28-day cycle in combination with capecitabine × 6 cycles starting within 12 wk of pancreatic resection
Non-small cell lung cancer (inoperable, locally advanced, or metastatic)
• **Adult: IV:** 1000 mg/m^2 give over 30 min days 1, 8, and 15; q28days (in combination with cisplatin) or 1250 mg/m^2 give over 30 min days 1 and 8; q21 days (in combination with cisplatin)
Biliary tract cancer, advanced (unlabeled)
• **Adult: IV:** 1000 mg/m^2 over 30 min days 1 and 8; repeat cycle every 21 days (with cisplatin) or 1000 mg/m^2 over 30 min days 1 and 8; repeat cycle every 21 days (with capecitabine) or 1000 mg/m^2 infused at 10 mg/m^2/min every 2 wk (with oxaliplatin)
Bladder cancer (unlabeled)
• **Adult:** *Advanced or metastatic:* **IV:** 1000 mg/m^2 over 30 to 60 min days 1, 8, and 15; repeat cycle every 28 days (in combination with cisplatin) or 1000 mg/m^2 over 30 min days 1 and 8; repeat cycle every 21 days (with carboplatin) until disease progression or unacceptable toxicity; *transitional cell carcinoma (refractory):* Intravesicular instillation: 2000 mg (in 100 mL NS; retain for 1 hr) twice weekly for 3 wk; repeat cycle every 4 wk for at least 2 cycles
Available forms: solution for injection 200 mg (1- and 2-g vials); powder for injection 200 mg (1-g vial); injection 10 mg/mL
Administer:
Intermittent IV route
• Prepare in biologic cabinet using gown, mask, gloves; use cytotoxic handling procedures
• After reconstituting with 0.9% NaCl 5 mL/200-mg vial of product or 25 mL/1-g vial of product (38 mg/mL), shake; may be further diluted with 0.9% NaCl to concentrations as low as 0.1 mg/mL; discard unused portions, give over 30 min, do not admix
• Diluted solution stable at room temperature for 24 hr; do not refrigerate
• Infusion longer than 60 min increases toxicity; infusion-related reactions include hypotension, severe flulike symptoms, myelosuppression, asthenia
• **Bone marrow depression:** CBC, differential, platelet count before each dose; single agent: absolute granulocyte count >1000/mm^3 and platelets >100,000/mm^3, give complete dose; absolute granulocyte count 500-999/mm^3, platelets 50,000-99,999/mm^3, give 75%; absolute granulocyte count <500/mm^3 or platelets <50,000/mm^3, do not give; combination with PACLitaxel for breast cancer: absolute granulocyte count >1200/mm^3 and platelets >75,000/mm^3, give complete dose; absolute granulocyte count 1000-1199/mm^3 or platelets 50,000-75,000/mm^3, give 75%; absolute granulocyte count 700-999/mm^3 or platelets ≥50,000/mm^3,

give 50%; absolute granulocyte count <700/mm^3 or platelets <50,000/mm^3, do not give; combination with CARBOplatin for ovarian cancer: absolute granulocyte count >1500/mm^3 and platelet count >100,000/mm^3, give complete dose; absolute granulocyte count 1000-1499/mm^3 or platelets 75,000-99,000/mm^3, give 75%; absolute granulocyte count <1000/mm^3 or platelets <75,000/mm^3, do not give

Y-site compatibilities: Alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, ampicillin, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, caspofungin, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAUNOrubicin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, leucovorin, linezolid, LORazepam, mannitol, meperidine, mesna, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, morphine, nalbuphine, ondansetron, PACLitaxel, promethazine, ranitidine, streptozocin, teniposide, thiotepa, ticarcillin, tigecycline, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Posterior reversible encephalopathy syndrome (PRES)
CV: Dysrthymias, hypertension
ENDO: Hyperglycemia
GI: Diarrhea, *nausea, vomiting,* anorexia, constipation, stomatitis, diarrhea, hepatotoxicity
GU: *Proteinuria,* hematuria
HEMA: Leukopenia, anemia, neutropenia, thrombocytopenia
INTEG: Irritation at site, *rash, alopecia*
META: Hypocalcemia, hypokalemia, hypomagnesemia
RESP: Dyspnea, bronchospasm, pneumonitis
OTHER: *Fever,* hemorrhage, infection, flulike symptoms, paresthesia, *peripheral edema,* myalgia, capillary leak syndrome

PHARMACOKINETICS

Half-life 2.5-18 hr; crosses placenta; excretion: renal, 92%-98% peak 30 min

INTERACTIONS

Increase: bleeding—NSAIDs, anticoagulants
Increase: myelosuppression, diarrhea—other antineoplastics, radiation
Decrease: antibody response—live virus vaccines

Drug/Lab Test

Increase: BUN, AST, ALT, alk phos, bilirubin, creatinine
Decrease: Hb, WBC, neutrophils, platelets

NURSING CONSIDERATIONS

Assess:

- **Blood dyscrasias:** assess for bruising, bleeding, petechiae
- Renal, hepatic studies before and during treatment; may increase AST, ALT, alk phos, bilirubin, BUN, creatinine, calcium, potassium, glucose, magnesium, urine protein, monitor I&O
- Buccal cavity for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Blood studies: Monitor blood studies (neutrophils, platelets) often
- **PRES:** monitor for headache seizures, hypertension, vision changes, if confirmed with MRI, discontinue
- **Hepatotoxicity:** May be fatal, monitor LFTs, baseline and periodically, those with preexisting liver conditions are at a greater risk
- **Pulmonary toxicity:** May be fatal, may occur up to 2 wk after last dose, if dyspnea, bronchospasm occur, discontinue
- **Capillary leak syndrome:** hemoconcentration, decreased albumin, B/P; discontinue if these occur

• **Hemolytic uremic syndrome (HUS):** more frequent when given with bleomycin; assess renal function before use and periodically; anemia with microangiopathic hemolysis, elevated bilirubin or LDH, reticulocytosis, severe thrombocytopenia, or increases in BUN/creatinine (HUS); permanently discontinue if evidence of pulmonary toxicity, may occur ≤2 wk after last dose
• Radiation therapy risks: avoid radiation therapy 7 days before and 7 days after treatment; there is increased risk of life-threatening mucositis and toxicity at any time
• **Pregnancy/breastfeeding:** No controlled studies, avoid use in pregnancy, do not breastfeed

Evaluate:
• Therapeutic response: decrease in tumor size; decrease in spread of cancer; symptom relief

Teach patient/family:
• To avoid foods with citric acid, hot temperature, or rough texture if stomatitis is present; to drink adequate fluids; to avoid use with NSAIDs, alcohol, salicylates
• To report stomatitis and any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms
• To report signs of anemia: fatigue, headache, faintness, SOB, irritability; hematuria, dysuria
• Not to receive vaccinations during treatment
• About possible hair loss and what can be done
• **Infection:** to report sore throat, fever, flulike symptoms immediately
• That continuing follow-up exams and lab work will be needed
• **Pregnancy/breastfeeding:** to use contraception during and for 4 mo after; do not breastfeed

gemfibrozil (Rx)

(jem-fi'broe-zil)

Lopid

Func. class.: Antilipemic

Chem. class.: Fibric acid derivative

Do not confuse:
gemfibrozil/gabapentin

ACTION:

Inhibits biosynthesis of VLDL, decreases triglycerides, production in the liver increases HDL

USES:

For use as an adjunct to diet for the treatment of hyperlipoproteinemia and for hypertriglyceridemia including Type IV (elevated triglycerides, VLDL) and Type V (elevated triglycerides, chylomicrons, VLDL) in patients who have significant risk of coronary artery disease or pancreatitis and who have not responded to diet

CONTRAINDICATIONS:

Severe renal/hepatic disease, preexisting gallbladder disease, primary biliary cirrhosis, hypersensitivity, use with dasabuvir, repaglinide, or simvastatin

Precautions: Pregnancy, breastfeeding, renal disease, cholelithiasis, children

DOSAGE AND ROUTES

• **Adult: PO** 600 mg bid 30 min before AM, PM meal

Hepatic/renal dose
• Avoid use

Available forms: Tabs 600 mg; caps 300 mg

Administer:

PO route
• 30 min before AM, PM meals
• Discontinue product if response does not occur within 3 mo

SIDE EFFECTS

CNS: Fatigue, vertigo, headache, paresthesia, dizziness
GI: *Dyspepsia, diarrhea, abdominal pain,* nausea, vomiting
HEMA: Leukopenia, anemia, eosinophilia, thrombocytopenia
INTEG: Rash, urticaria, pruritus
MS: Myopathy, rhabdomyolysis

PHARMACOKINETICS

Peak 1-2 hr; plasma protein binding >95%; half-life 1½ hr; 70% excreted in urine mostly unchanged; metabolized in liver (minimal)

INTERACTIONS

• Do not use with dasabuvir, repaglinide, simvastatin

Increase: hypoglycemic effect—sulfonylureas, repaglinide, metformin, glyburide, pioglitazone, other antidiabetic agents
Increase: myopathy–colchicine
Increase: anticoagulant effect—warfarin; monitor coagulation tests
Increase: nephrotoxicity—cyclosporine; monitor renal function
Increase: levels of CYP2C8, CYP2C9, CYP2C19; monitor for toxicities
Increase: risk of myositis, myalgia, rhabdomyolysis—HMG-CoA reductase inhibitors; avoid concurrent use
Decrease: effect of gemfibrozil—bile acid sequestrants, colestipol, separate by >2 hr
Decrease: level of cyclosporine
Drug/Lab Test
Increase: LFTs, CK, bilirubin, alkaline phosphatase
Decrease: HB, Hct, WBC, potassium, eosinophils, platelets

NURSING CONSIDERATIONS

Assess:
• **Hyperlipidemia:** diet history; fats, triglycerides, cholesterol; if lipids increase, product should be discontinued; LDL, VLDL baseline and periodically
• **Myopathy, rhabdomyolysis:** for muscle pain, tenderness; obtain baseline CPK; if elevated or if these occur, product should be discontinued; at greater risk if combined with HMG-CoA reductase inhibitors
• Renal, hepatic studies, CBC, blood glucose if patient is receiving long-term therapy; if LFTs increase, therapy should be discontinued; monitor hematologic and hepatic functions
• Bowel pattern daily; watch for increasing diarrhea (common)
• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; do not breastfeed, excretion unknown
Evaluate:
• Therapeutic response: decreased cholesterol, triglyceride levels; HDL, cholesterol ratios improved
Teach patient/family:
• That compliance is needed for positive results; not to double or skip dose, to take missed dose as soon as remembered unless almost time for next dose
• To minimize risk factors: high-fat diet, smoking, alcohol consumption, absence of exercise
• To notify prescriber of diarrhea, nausea, vomiting, chills, fever, sore throat, muscle cramps, abdominal cramps, severe flatulence, tendon pain
• To avoid driving, hazardous activities if dizziness, blurred vision occur

gemifloxacin (Rx)

(gem-ah-flox´a-sin)
Func. class.: Antibiotic
Chem. class.: Fluoroquinolone

ACTION: Inhibits DNA gyrase, which is an enzyme involved in replication, transcription, and repair of bacterial DNA

USES: Acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae, Haemophilus influenzae, Haemophilus parainfluenzae, Moraxella catarrhalis;* community-acquired pneumonia caused by *Streptococcus pneumoniae* including multiproduct-resistant strains, *H. influenzae, M. catarrhalis, Mycoplasma pneumoniae, Chlamydia pneumoniae, Klebsiella pneumoniae*

CONTRAINDICATIONS: Hypersensitivity to quinolones
Precautions: Pregnancy, breastfeeding, children, geriatric patients, hypokalemia, hypomagnesemia, renal disease, seizure disorders, excessive exposure to sunlight, psychosis, increased intracranial pressure, history of QT interval prolongation, dysrhythmias, myasthenia gravis, torsades de pointes

Black Box Warning: Tendon pain/rupture, tendinitis, myasthenia gravis, neurotoxicity

DOSAGE AND ROUTES

Adult: PO 320 mg/day × 5-7 days

Renal dose/hemodialysis
• **Adult: PO** CCr ≤40 mL/min, 160 mg q24hr
Available forms: Tabs 320 mg
Administer:
• 2 hr before or 3 hr after aluminum/magnesium antacids, iron, zinc products, multivitamins, buffered products
• Without regard to food
• Provide adequate hydration
• Use recommended dose to prevent QTc prolongation

SIDE EFFECTS
CNS: *Dizziness, headache,* somnolence
GI: Diarrhea, *nausea,* vomiting, anorexia, flatulence, abdominal pain, CDAD
INTEG: Rash, *photosensitivity*

PHARMACOKINETICS
Rapidly absorbed; bioavailability 71%; peak ½-2 hr; half-life 4-12 hr; excreted in urine as active product, metabolites

INTERACTIONS
Increase: CNS stimulation—NSAIDs
Increase: toxicity of gemifloxacin—probenecid

Black Box Warning: Increase: tendon rupture—corticosteroids

• **Increase:** QT prolongation—class IA, III antidysrhythmics, tricyclics, amoxapine, maprotiline, phenothiazines, haloperidol, pimozide, risperiDONE, sertindole, ziprasidone, β-blockers, chloroquine, cloZAPine, dasatinib, dolasetron, droperidol, dronedarone, flecainide, halogenated/local anesthetics, local anesthetics, lapatinib, methadone, erythromycin, telithromycin, troleandomycin, octreotide, ondansetron, palonosetron, pentamidine, propafenone, ranolazine, SUNItinib, tacrolimus, vardenafil, vorinostat
Decrease: absorption antacids containing aluminum, magnesium, sucralfate, zinc, iron; give 2 hr before or 3 hr after meals
Drug/Lab Test
Increase: LFTs, bilirubin, creatinine, BUN, GGT, potassium
Decrease: sodium, albumin
Interference: calcium, Hb, Hct, neutrophils, RBCs

NURSING CONSIDERATIONS
Assess:
• Renal, hepatic studies: BUN, creatinine, AST, ALT; I&O ratio, electrolytes
• CNS symptoms: insomnia, vertigo, headache, agitation, confusion
• **Allergic reactions and anaphylaxis:** rash, flushing, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
• **CDAD:** bowel pattern daily; if severe diarrhea, fever, abdominal pain occur, product should be discontinued
• **QT prolongation:** avoid use of quinolones in patients with known QT prolongation; females and those with ongoing proarrhythmic conditions (TdP) are at a greater risk; monitor ECG and/or Holter monitoring if product is used
• **Overgrowth of infection:** Perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Black Box Warning: Tendon rupture: tendon pain, inflammation; if present, discontinue use; more common when used with corticosteroids; discontinue immediately if tendon pain, inflammation occur

• **Toxic psychosis/pseudotumor cerebri:** headache, blurred vision, neck/shoulder pain, nausea, vomiting, dizziness, tinnitus; discontinue immediately; may occur within hours to weeks after starting product
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal/infant risk
Evaluate:
• Therapeutic response: negative C&S, absence of signs, symptoms of infection
Teach patient/family:
• To take with/without food
• That fluids must be increased to 2 L/day to avoid crystallization in kidneys

• That if dizziness or light-headedness occurs, to perform activities with assistance
• To complete full course of product therapy
• To avoid iron- or mineral-containing supplements or aluminum/magnesium antacids, buffered products within 2 hr before and 3 hr after dosing, 2 hr before sucralfate
• That photosensitivity may occur and sunscreen should be used
• To avoid other medication unless approved by prescriber
• To immediately report pain, inflammation in tendons, weakness, tingling in extremities, signs of aortic aneurysm, hypersensitivity
• To report rash, and stop product if it occurs
• To monitor blood glucose more often, blood glucose levels are affected

gentamicin (Rx)

jen-ta-mye´sin

Cidomycin, Garamycin, Geratec, Gentrasul

Func. class.: Antiinfective
Chem. class.: Aminoglycoside

Do not confuse:
gentamicin/kanamycin

ACTION: Interferes with protein synthesis in bacterial cell by binding to 30S ribosomal subunit, thus causing misreading of genetic code; inaccurate peptide sequence forms in protein chain, thereby causing bacterial death

USES: Severe systemic infections of CNS, respiratory, GI, urinary tract, bone, skin, soft tissues caused by susceptible strains of *Pseudomonas aeruginosa, Proteus, Klebsiella, Serratia, Escherichia coli, Enterobacter, Citrobacter, Staphylococcus, Shigella, Salmonella, Acinetobacter, Bacillus anthracis*

CONTRAINDICATIONS: Hypersensitivity to this product, other aminoglycosides

Precautions: Breastfeeding, neonates, geriatric patients, pseudomembranous colitis, sulfite hypersensitivity

Black Box Warning: Myasthenia gravis, Parkinson's disease, infant botulism, tinnitus, nephrotoxicity, neurotoxicity, pregnancy

DOSAGE AND ROUTES

Severe systemic infections
• **Adult: IV INFUSION** 3-5 mg/kg/day in divided doses q8hr; **IM** 3-5 mg/kg/day in divided doses q8hr
• **Child: IM/IV** 2-2.5 mg/kg q8hr
• **Neonate and infant: IM/IV** 2.5 mg/kg q8-12hr
• **Neonate <1 wk: IM/IV** 2.5 mg/kg q12hr

Renal dose: regular dosing
• **Adult: IM/IV CCr 70-100 mL/min,** reduce dose by multiplying maintenance dose by 0.85, give q8-12hr; **CCr 50-69 mL/min,** reduce as above, give q12hr; **CCr 25-49 mL/min,** reduce as above, give q24hr; **CCr <25 mL/min,** reduce as above, give based on serum concentrations, give doses after dialysis

Available forms: Inj 10, 40 mg/mL; premixed inj 70, 80, 100, 120, 160, 200/100 mL NS

Administer:
• Obtain C&S before starting treatment, treatment may be started before results are received
• Draw for peak 1 hr after IM, 30 min after IV; draw trough before next dose, do not use heparin-coated tube for blood draw

IM route
• IM inj in large muscle mass; rotate inj sites
• Product in evenly spaced doses to maintain blood level

Intermittent IV INFUSION route
• After diluting in 50-200 mL NS, D_5W; decrease vol of diluent in child; maintain 0.1% sol run over ½-1 hr (adults) or up to 2 hr (children); flush IV line with NS, D_5W after administration

Y-site compatibilities: Alatrofloxacin, aldesleukin, alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, carboplatin, carmustine, caspofungin, cefamandole, ceFAZolin, cefepime, cefotaxime, cefOXitin, cefpirome, ceftaroline, cefTAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chlorothiazide, chlorpheniramine, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clarithromycin, clindamycin, cloxacillin, codeine, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, DAUNOrubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin hydrochloride, doxorubicin hydrochloride liposomal, doxycycline, edetate calcium disodium, edetate disodium, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, gallamine, gallium, gatifloxacin, gemcitabine, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's injection, lansoprazole, lepirudin, leucovorin, levofloxacin, lidocaine, lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mephentermine sulfate, meropenem, mesna, metaraminol, methyldopate, methylPREDNISolone sodium succinate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, nalorphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, papaverine, penicillin G potassium/sodium, pentazocine, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, posaconazole, potassium acetate/chloride, procainamide, prochlorperazine, promazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine gluconate, ranitidine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/citrate, streptomycin, succinylcholine, SUFentanil, tacrolimus, telavancin, temocillin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, topotecan, TPN (2-in-1), trastuzumab, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Confusion, depression, numbness, tremors, seizures, muscle twitching, neurotoxicity, dizziness, vertigo, encephalopathy, fever, headache, lethargy

CV: Hypo/hypertension, palpitations, edema

EENT: Ototoxicity, *deafness,* visual disturbances, tinnitus

GI: *Nausea, vomiting, anorexia;* increased ALT, AST, bilirubin; hepatomegaly, hepatic necrosis, splenomegaly

GU: Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity, proteinuria

HEMA: Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia
INTEG: *Rash,* burning, urticaria, dermatitis, alopecia, photosensitivity, anaphylaxis
MS: Twitching, myasthenia gravis–like symptoms
RESP: Apnea

PHARMACOKINETICS

Not metabolized, excreted unchanged in urine, crosses placental barrier
IM: Onset rapid, peak 30-60 min
IV: Onset immediate; peak 30-90 min; plasma half-life 1-2 hr, infants 6-7 hr; duration 6-8 hr

INTERACTIONS

- Do not use at the same time as or physically mix with penicillins, may inactivate gentamicin

Black Box Warning: Increase: ototoxicity, neurotoxicity, nephrotoxicity—other aminoglycosides, amphotericin B, polymyxin, vancomycin, ethacrynic acid, furosemide, mannitol, methoxyflurane, ClSplatin, cephalosporins, penicillins, cidofovir, acyclovir, foscarnet, cycloSPORINE, tacrolimus, ganciclovir, zoledronic acid, pamidronate, monitor hearing

Increase: effects—nondepolarizing neuromuscular blockers, digoxin, entecavir, reduce dose or do not use together

Drug/Lab Test

Increase: LDH, AST, ALT, bilirubin, BUN, creatinine, eosinophils
Decrease: Hb, WBC, platelets, serum calcium/sodium/potassium/magnesium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Neurotoxicity: (myasthenia gravis, Parkinson's disease, infant botulism): monitor for paresthesias, tetany, positive Chvostek's/Trousseau's signs, confusion (adults), muscle weakness (infants); correct electrolyte imbalance

- Weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight

Black Box Warning: Nephrotoxicity: Monitor I&O ratio, urinalysis daily for proteinuria, cells, casts; report sudden change in urine output; urine pH if product is used for UTI; urine should be kept alkaline; urine for CCr testing, BUN, serum creatinine; lower dosage should be given with renal impairment (CCr <80 mL/min); toxicity is increased in patients with decreased renal function if high doses are given

- VS during infusion; watch for hypotension, change in pulse
- IV site for thrombophlebitis, including pain, redness, swelling q30min, change site if needed; discontinue, apply warm compresses to site

Black Box Warning: Peak/trough levels: Serum peak drawn at 30-60 min after IV infusion or 60 min after IM inj and trough level drawn just before next dose; blood level should be 2-4 times bacteriostatic level; peak (8 mcg/mL), trough (1-2 mcg/mL), depending on type of infection (based on traditional dosing), prolonged peak levels >10 mcg/mL may lead to toxicity

Black Box Warning: Ototoxicity: Assess eighth cranial nerve dysfunction by audiometric testing; also ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

- Dehydration: Monitor for high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine
- **Superinfection:** fever, malaise, redness, pain, swelling, perineal itching, diarrhea, stomatitis, change in cough or sputum
- C&S before starting treatment to identify infecting organism
- **Vestibular dysfunction:** nausea, vomiting, dizziness, headache; product should be discontinued if severe
- Inj sites for redness, swelling, abscesses; use warm compresses at site
- Adequate fluids of 2-3 L/day unless contraindicated to prevent irritation of tubules

Black Box Warning: Pregnancy/breastfeeding: identify whether pregnancy is planned or suspected; do not use in pregnancy or breastfeeding, deafness may occur in neonates

Evaluate:
• Therapeutic response: absence of fever, draining wounds, negative C&S after treatment
Teach patient/family:
• To report headache, dizziness, symptoms of overgrowth of infection, renal impairment

Black Box Warning: Ototoxicity: to report loss of hearing; ringing, roaring in ears; feeling of fullness in head

• To drink adequate fluids
• To avoid hazardous activities until reaction is known

gentamicin (ophthalmic) (Rx)

(jen-ta-mye´sin)
Gentak, Garamycin
Func. class.: Ophthalmic antiinfective
Chem. class.: Aminoglycoside

Do not confuse:
gentamicin/clindamycin/tobramycin/erythromycin/vancomycin

ACTION: Inhibits protein synthesis by binding of 30s ribosomal subunits, thereby decreasing bacterial replication

USES: External ocular infections

CONTRAINDICATIONS: Hypersensitivity to this product or aminoglycosides
Precautions: Pregnancy, breastfeeding, corneal healing, local redness/irritation

DOSAGE AND ROUTES

Ophthalmic (solution)
• **Adult/adolescent/child ≥1 mo: SOL** 1-2 drops in affected eye(s) every 4 hr while awake × 2 days, then every 4 hr; severe infections ≤2 drops every 1 hr
• **Ointment:** apply a small amount (½ in) to lower conjunctival sac bid or tid

Available forms: Ophthalmic ointment, ophthalmic solution 0.3%
Administer:
Ophthalmic route
• Commercially available ophthalmic solutions are not for injection subconjunctivally or into the anterior chamber of the eye
• Apply topically to the eye, taking care to avoid contamination
• Do not touch the tip of the dropper to the eye, fingertips, or other surface; wash hands before use
• Apply pressure to lacrimal sac for 1 min after instillation
• To apply the ointment, pull down gently on lower eyelid and apply a thin film of the ointment

SIDE EFFECTS

EENT: Burning, hypersensitivity, stinging, blurred vision, hyperemia, corneal ulcers

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:
• **Allergic reaction:** hypersensitivity, discontinue product
Evaluate:
• Therapeutic response: decreased ophthalmic infection
Teach patient/family:
Ophthalmic route
• To apply topically to the eye, taking care to avoid contamination; for ophthalmic use only
• Not to touch the tip of the dropper to the eye, fingertips, or other surface; to wash hands before use
• To apply pressure to lacrimal sac for 1 min after instillation
• To apply the ointment by pulling down gently on lower eyelid and applying a thin film of the ointment

gentamicin (topical) (Rx)

(jen-ta-mye´sin)
Func. class.: Topical antiinfective
Chem. class.: Aminoglycoside

Do not confuse:
gentamicin/clindamycin

ACTION: Antibacterial activity results from inhibition of protein synthesis; bactericidal

USES: Superficial infections

CONTRAINDICATIONS: Hypersensitivity to this product or other aminoglycosides
Precautions: Infections, local sensitivity

DOSAGE AND ROUTES
• **Adult/child >1 yr:** apply to affected areas tid-qid
Available forms: Topical cream, ointment 0.1%
Administer:
• For external use only; do not use skin products near the eyes, nose, or mouth
• Wash hands before and after use; wash affected area and gently pat dry
• **Cream/ointment:** Apply to the cleansed affected area, massage gently into affected areas

SIDE EFFECTS
INTEG: Rash, irritation, erythema, pruritus

PHARMACOKINETICS
Unknown

NURSING CONSIDERATIONS
Assess:
• **Allergic reaction:** hypersensitivity; product may need to be discontinued
• **Infection:** skin infection
Evaluate:
• Therapeutic response: decreased skin infection
Teach patient/family:
• To use for external use only; do not use skin products near the eyes, nose, or mouth
• To wash hands before and after use; wash affected area and gently pat dry
• **Cream/ointment:** to apply to the cleansed affected area and massage gently into affected areas

gilteritinib (Rx)
(gil′teh-rih′tih-nib)
Xospata
Func. class.: Antineoplastic
Chem. class.: Kinase inhibitor

USES: Acute myeloid leukemia-relapsed or the treatment of relapsed or refractory FLT3 mutation–positive AML

DOSAGE AND ROUTES
• **Adult: PO** 120 mg daily for a minimum of 6 mo
Qtc Interval increase: Interval >500 msec, stop treatment, when Qtc decreases to 30 msec (of baseline or ≤480 msec), restart at 80 mg/day
Available form: Tablet 40 mg

glasdegib (Rx)
(glass-deg′ib)
Daurismo
Func. class.: Antineoplastic
Chem. class.: Hedgehog pathway inhibitor

USES
Acute myeloid leukemia in combination

DOSAGE AND ROUTES
Adults ≥75 yr or with comorbidities:
PO: 100 mg once daily (in combination with subcutaneous low-dose cytarabine) for a minimum of 6 (28-day) cycles
Available forms: Tabs 25, 100 mg
Toxicity: Refer to manufacturer's information for dosage changes

⚠ HIGH ALERT

glatiramer (Rx)
(glah-tear′a-meer)
Copaxone, Glatopa, Glatect
Func. class.: Multiple sclerosis agent
Chem. class.: Biologic response modifier

ACTION: Unknown; may modify the immune responses responsible for multiple sclerosis (MS) by serving as a decoy to locally generated autoantibodies

USES: Reduction of the frequency of relapses in patients with relapsing or remitting MS after first clinical episode with MRI results consistent with MS

CONTRAINDICATIONS:
Hypersensitivity to this product or mannitol, IV use

Precautions: Pregnancy, breastfeeding, children <18 yr, immune disorders, renal disease, infection, vaccinations, geriatric patients

DOSAGE AND ROUTES
• 20 mg/mL and 40 mg/mL are not interchangeable

• **Adult: SUBCUT** 20 mg/day or 40 mg 3 × per wk, give ≥48 hr apart

Available forms: Inj premixed 20 mg/mL in single-use syringe; sol for inj 40 mg/mL

Administer:

SUBCUT route

• Refrigerate, allow to warm for 20 min; visually inspect for particulate or cloudiness; if present, discard; prefilled syringe contents are for single use; administer SUBCUT into hip, thigh, arm; discard unused portion; if refrigeration is unavailable, may store ≤1 mo at room temperature

• Use SUBCUT route only; do not give IM or IV, do not expel air bubble in prefilled syringe

• Give 40-mg dose on same 3 days of the week, must be 48 hr apart

SIDE EFFECTS
CNS: *Anxiety, hypertonia, tremor, vertigo,* speech disorder, *agitation,* confusion, flushing

CV: *Migraine, palpitations, syncope, tachycardia, vasodilation,* chest pain, hypertension

EENT: *Ear pain, blurred vision*

GI: *Nausea, vomiting, diarrhea, anorexia, gastroenteritis*

GU: *Urinary urgency, dysmenorrhea, vaginal moniliasis,* vaginal hemorrhage

HEMA: *Ecchymosis, lymphadenopathy*

INTEG: *Pruritus, rash, sweating, urticaria, erythema,* inj-site reaction

META: Edema, weight gain

MS: *Arthralgia, back pain, neck pain,* increased muscle tone

RESP: *Bronchitis, dyspnea, laryngismus, rhinitis,* laryngospasm

PHARMACOKINETICS
May be hydrolyzed locally, may reach regional lymph nodes

INTERACTIONS
Increase: serious infection—denosumab, natalizumab, roflumilast; avoid using together

Increase: hematologic toxicity (paneytopenia, thrombocytopenia)—leflunomide

• Avoid use with live virus vaccines

Increase: neutropenia effect—trastuzumab

Increase: immunosuppression—tofacitinib, avoid use

Drug/Herb

Decrease: glatiramer effect—echinacea, may need dosage change

NURSING CONSIDERATIONS
Assess:

• **CNS symptoms:** anxiety, confusion, vertigo

• **GI status:** diarrhea, abdominal pain/cramps, vomiting

• **CV status:** B/P, pulse, HR; tachycardia, palpitations, vasodilation, and chest pain may occur

• **Postinjection reactions:** Assess for chest pain, dyspnea, flushing, palpitations, usually resolve on their own, may occur quickly or several months after use; usually at least one episode of chest pain occurs 1 mo after start of therapy

• **Pregnancy/breastfeeding:** use only if clearly needed; no well-controlled studies; cautious use in breastfeeding

Evaluate:

• Therapeutic response: decreased symptoms of MS

Teach patient/family:

• With written, detailed instructions about product; provide initial and return demonstrations on inj procedure; give information about use and disposal of product, inj-site reaction (hives, rash, irritation, severe pain, flushing, chest pain)

• To notify prescribers of allergic reactions including itching, trouble breathing, chest pain, dizziness, sweating

• That irregular menses, dysmenorrhea, metrorrhagia, breast pain may occur; to use contraception during treatment

• To notify prescriber if pregnancy is suspected or if nursing
• Not to change dosing or stop taking product without advice of prescriber
• About immediate postinjection reaction: flushing, chest pain, palpitations, anxiety, dyspnea, laryngeal constriction, urticaria; does not usually require treatment, may occur months after beginning treatment
• To take as directed; not to stop product or change schedule; teach on self-injection technique
• That the 20 mg/mL and 40 mg/mL are not interchangeable

glecaprevir/pibrentasvir (Rx)

(glek-a´pre vir/pi-brent´as-vir)

Mavyret

Func. class.: Antiviral

Chem. class.: HCV MS3/4A protease inhibitor/HCV NSSA inhibitor

Do not confuse:
Mavyret/Mavik

ACTION:

Glecaprevir is an inhibitor of hepatitis C virus (HCV) NS3/4A protease, necessary for the proteolytic cleavage of the HCV-encoded polyprotein and is essential for viral replication
Pibrentasvir is an inhibitor of HCV NS5A, essential for viral RNA replication

USES:

Chronic hepatitis C (HCV monoinfected or HCV/HIV co-infected patients): Without cirrhosis or with compensated cirrhosis (Child-Pugh class A)

CONTRAINDICATIONS

Moderate or severe hepatic impairment (Child-Pugh class B or C); hepatic decompensation; coadministration with atazanavir or rifampin

Black Box Warning: HBV reactivation/exacerbation

PRECAUTIONS

Pregnancy, children, breastfeeding, immunosuppressants, chemotherapy

DOSAGE AND ROUTES

• **Adult/child >45 kg: PO** 3 tablets with food
• **Child 12-17: PO** 6 packets daily with food × 8 wk
• **Child 3-11, >45 kg: PO** 6 packets daily with food × 8 wk
• **Child 3-11, 30-44 kg: PO** 5 packets daily with food × 8 wk
• **Child 3-11, 20-29 kg: PO** 4 packets daily with food × 8 wk
• **Child 3-11 <20 kg: PO** 3 packets daily with food × 8 wk

Duration:
Therapy-naive: HCV genotype 1, 2, 3, 4, 5, 6: No cirrhosis: 8 wk; compensated cirrhosis (Child-Pugh A): 8 wk
Therapy-experienced: HCV genotype 1 (prior therapy with regimen containing an NS5A inhibitor without prior therapy with an NS3/4A protease inhibitor): No cirrhosis: 16 wk; compensated cirrhosis (Child-Pugh A): 16 wk
HCV genotype 1 (prior therapy with an NS3/4A protease inhibitor without prior therapy with an NS5A inhibitor): No cirrhosis: 12 wk; compensated cirrhosis (Child-Pugh A): 12 wk
HCV genotype 1, 2, 4, 5, 6 (prior therapy with PRS): No cirrhosis: 8 wk; compensated cirrhosis (Child-Pugh A): 12 wk
HCV genotype 3 (prior therapy with PRS): No cirrhosis: 16 wk; compensated cirrhosis (Child-Pugh A): 16 wk
Available forms: Tablet: glecaprevir 100 mg/pibrentasvir 40 mg; oral pellets 50 mg/20 mg

Administer:
• Give with food
• If dose is missed, give as soon as remembered if within 18 hr, then normal dosing; if >18 hr, skip
• Store at room temperature

PHARMACOKINETICS

Peak 5 hr, half-life: glecaprevir 6 hr; pibrentasvir 13 hr

INTERACTIONS

Increase: effect of—afatinib, aliskiren, alpelisib, asunaprevir, atorvastatin, betrixaban, bilastine, celiprolol, cladribine, CYP1A2 inhibitors, colchicine, dabigatran, dofetilide, doxorubicin, edoxaban, elagolix, digoxin, eluxadoline, etoposide, everolimus, grazoprevir, HMG-CoA reductase inhibitors

Increase: hypoglycemic effect—antidiabetics

Increase effect of glecaprevir/pibrentasvir—atazanavir, cobicistat, cyclosporine, darunavir, P-glycoprotein inhibitors (except cyclosporine)

Decrease: effect of glecaprevir/pibrentasvir—carBAMazepine, CYP3A4 inducers, efavirenz, fosphenytoin, rifamycins

Eltrombopag: May increase the serum concentration of OATP1B1/1B3 (SLCO1B1/1B3) substrates. *Monitor therapy*

Eltrombopag: May increase the serum concentration of BCRP/ABCG2 substrates. *Monitor therapy*

Increase: adverse reactions of glecaprevir/pibrentasvir—ethinyl

Drug/Herb

Decrease: effect of glecaprevir/pibrentasvir, avoid using together—St. John's Wort

Drug/Lab Test

Increase: bilirubin

NURSING CONSIDERATIONS

Assess:

• **Baseline (within 12 wk prior to starting antiviral therapy)** CBC, INR, hepatic function panel (albumin, total and direct bilirubin, ALT, AST, and alkaline phosphatase), and calculated GFR; repeat CBC, serum creatinine, calculated GFR, and LFTs panel after 4 wk of therapy and as clinically indicated

• **Baseline (at any time prior to starting therapy)** hepatitis C virus (HCV) genotype and subtype and quantitative HCV viral load; repeat quantitative HCV viral load testing (after 4 wk of therapy and at 12 wk after completion of therapy). If quantitative HCV viral load is detectable at treatment wk 4, repeat testing after 2 additional wk of treatment (treatment week 6)

Black Box Warning: Hepatitis B surface antigen (HBsAg) and hepatitis B core antibody (anti-HBc) prior to initiation

Black Box Warning: Serologic evidence of hepatitis B virus (HBV) infection, monitor for clinical and laboratory signs of hepatitis flare or HBV reactivation during treatment and during post-treatment follow-up

• **Diabetes,** monitor blood glucose and for signs/symptoms of hypoglycemia

• Monitor for treatment failure; if decompensation occurs, discontinue treatment

• **Pregnancy/breastfeeding:** Avoid use in pregnancy and breastfeeding

Evaluate:

• Therapeutic response: hepatitis C RNA reduction

Teach patient/family:

• To report side effects to the prescriber

• To notify all providers of product use, many drug interactions; do not take with St. John's wort

• To take at the same time each day, to use for full course even if feeling better, to take missed doses when remembered on the same day; not to double doses

• That the product will not decrease transmission of infection in others

• **Pregnancy/breastfeeding:** To notify provider if pregnancy is planned or suspected, or if breastfeeding

⚠ HIGH ALERT

glimepiride (Rx)

(glye-me′pi-ride)

Amaryl

glipiZIDE (Rx)

(glip-i′zide)

Glucotrol, Glucotrol XL

Func. class.: Antidiabetic

Chem. class.: Sulfonylurea (2nd generation)

Do not confuse:
glipiZIDE/Glucotrol/glyBURIDE

ACTION: Causes functioning β cells in pancreas to release insulin, leading to drop in blood glucose levels; may improve insulin binding to insulin receptors or increase the number of insulin receptors with prolonged administration; may also reduce basal hepatic glucose secretion; not effective if patient lacks functioning β cells

USES: Type 2 diabetes mellitus

CONTRAINDICATIONS: Hypersensitivity to sulfonylureas/sulfonamides, type 1 diabetes, diabetic ketoacidosis
Precautions: Pregnancy, geriatric patients, cardiac disease, severe renal/hepatic disease, G6PD deficiency

DOSAGE AND ROUTES

Glimepiride

- **Adult: PO** 1-2 mg/day with breakfast, then increase by ≤2 mg/day q1-2wk, max 8 mg/day
- **Geriatric: PO** 1 mg/day; may increase if needed

Renal/hepatic dose

- **Adult: PO** 1 mg/day with breakfast; may titrate upward as needed

GlipiZIDE

- **Adult: PO** 5 mg initially before breakfast, then increase by 2.5-5 mg after several days to desired response; max 40 mg/day in divided doses; **PO** (XL) 5 mg/day with breakfast, may increase to 10 mg/day, max 20 mg/day
- **Geriatric: PO** 2.5 mg/day; may increase if needed

Hepatic disease

- **Adult: PO** 2.5 mg initially, then increase to desired response; max 40 mg/day in divided doses or 15 mg/dose

Available forms: *Glimepiride:* tabs 1, 2, 4 mg; *glipiZIDE:* tabs, scored 5, 10 mg; ext rel tabs (XL) 2.5, 5, 10 mg
Administer:

- Do not break, crush, or chew ext rel tabs; may crush tabs and mix with fluids if unable to swallow whole
- **GlipiZIDE:** give product 30 min before meals (regular release); with breakfast (ext rel); **Glimepiride:** with breakfast; if patient is NPO, may need to hold dose to prevent hypoglycemia
- Gradual conversion from other oral hypoglycemics to these products is not needed; insulin ≥20 units/day, convert using 25% reduction in insulin dose every day or every other day
- Store in tight, light-resistant container at room temperature

SIDE EFFECTS

CNS: *Headache, weakness, dizziness, drowsiness,* tinnitus, fatigue, vertigo
ENDO: Hypoglycemia
GI: Hepatotoxicity, cholestatic jaundice, nausea, vomiting, diarrhea, heartburn, weight gain
HEMA: Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia; increased AST, ALT, alk phos; pancytopenia, hemolytic anemia
INTEG: Rash, allergic reactions, pruritus, urticaria, eczema, photosensitivity, erythema, allergic vasculitis
SYST: Serious hypersensitivity

PHARMACOKINETICS

PO: Completely absorbed by GI route; **glipiZIDE:** onset 1-1½ hr, peak 2-3 hr, duration 12-24 hr, half-life 2-4 hr; **glimepiride:** peak 2-3 hr, half-life 5 hr; metabolized in liver, excreted in urine, 90%-95% plasma-protein bound

INTERACTIONS

- May mask symptoms of hypoglycemia: β-blockers

Increase: action of digoxin, glycosides, cyclosporine
Increase: hypoglycemic effects—insulin, MAOIs, cimetidine, chloramphenicol, guanethidine, methyldopa, NSAIDs, salicylates, probenecid, androgens, anticoagulants, clofibrate, fenfluramine, fluconazole, gemfibrozil, histamine H_2 antagonists, magnesium salts, phenylbutazone, sulfinpyrazone, sulfonamides, tricyclics, urinary acidifiers, clarithromycin, fibric acid derivatives, voriconazole; monitor blood glucose

Decrease: hypoglycemic effect—thiazide diuretics, rifampin, isoniazid, cholestyramine, diazoxide, hydantoins, urinary alkalinizers, charcoal, corticosteroids, colesevelam; monitor blood glucose

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut

Decrease: hypoglycemic effect—green tea

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, creatinine

Decrease: platelets, WBC, sodium

NURSING CONSIDERATIONS

Assess:

- **Hypo/hyperglycemic reaction** that can occur soon after meals; for severe hypoglycemia, give IV $D_{50}W$, then IV dextrose solution
- Blood glucose, A1c levels during treatment to determine diabetes control
- **Blood dyscrasias:** CBC at baseline and throughout treatment; report decreased blood count
- For allergy to sulfonamides, potential for cross-reactivity
- For renal, hepatic dysfunction: use dose reductions, or avoidance of use may be required; increased risk of hypoglycemia in hepatic failure
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected; breastfed infant may be hypoglycemic; use only if benefits outweigh fetal risk

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; improved serum glucose, A1c

Teach patient/family:

- Not to drink alcohol; about disulfiram reaction (nausea, headache, cramps, flushing, hypoglycemia)
- To report bleeding, bruising, weight gain, edema, SOB, weakness, sore throat, swelling in ankles, rash
- To check for symptoms of cholestatic jaundice: dark urine, pruritus, yellow sclera; prescriber should be notified
- About symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry sugar packets
- That product must be continued on daily basis; about consequences of discontinuing product abruptly; to take product in morning to prevent hypoglycemic reactions at night
- To use sunscreen or stay out of the sun, wear protective clothing (photosensitivity)
- To avoid OTC medications unless ordered by prescriber
- That diabetes is a lifelong illness; product will not cure disease
- That all food in diet plan must be eaten to prevent hypoglycemia; to continue weight control, dietary restrictions, exercise, hygiene
- To carry emergency ID with prescriber and medication information
- To test using blood glucose meter while taking this product
- That ext rel tab may appear in stool
- To notify prescribers of use prior to surgery
- Not to drive or engage in hazardous tasks until response is known, dizziness may occur
- That continuing follow-up exams and lab work will be needed

TREATMENT OF OVERDOSE:

Use one of the following: Glucose 25 g IV via dextrose 50% sol, 50 mL, 1 mg glucagon, oral carbohydrate depending on severity

glucagon (Rx)

(gloo´ka-gon)

Baqsimi GlucaGen Diagnostic, GlucaGen HypoKit, Glucagon Emergency, Gvoke HypoPen, Gvoke PFS

Func. class.: Antihypoglycemic

USES: Hypoglycemia, used to temporarily inhibit movement of GI tract as a diagnostic test

CONTRAINDICATIONS: Hypersensitivity, pheochromocytoma, insulinoma

Precautions: Pregnancy, breastfeeding, cardiac disease, adrenal insufficiency

DOSAGE AND ROUTES

Severe hypoglycemia

Glucagon Emergency Kit and GlucaGen HypoKit

- **Adult: IM/IV/SUBCUT:** 1 mg once, may repeat if response is delayed

GVOKE Auto-Injector/Prefilled Syringes

- **Adult: SUBCUT** 1 mg once, may repeat if response is delayed

Baqsimi

- **Adult: Nasal** 1 actuation (3 mg) into 1 nostril once, after 15 min if no response, may repeat

DIAGNOSTIC USE

GlucaGen Diaganostic

Relaxation of the stomach, duodenum, small bowel:

- **Adult: IV:** 0.2-0.5 mg before procedure; **IM:** 1 mg before procedure

Relaxation of the colon:

- **Adult IV:** 0.5-0.75 mg before procedure; **IM:** 1-2 mg before procedure

Available forms: Powder for injection 1-mg vial; nasal

⚠ HIGH ALERT

glyBURIDE (Rx)

(glye´byoor-ide)

DiaBeta ✦, Glynase PresTab

Func. class.: Antidiabetic

Chem. class.: Sulfonylurea (2nd generation)

Do not confuse:
glyBURIDE/Glucotrol/glipiZIDE

ACTION: Causes functioning β cells in pancreas to release insulin, thereby leading to a drop in blood glucose levels

USES: Type 2 diabetes mellitus

CONTRAINDICATIONS:

Hypersensitivity to sulfonylureas, type 1 diabetes, diabetic ketoacidosis, renal failure

Precautions: Pregnancy, geriatric patients, cardiac/thyroid disease, severe renal/hepatic disease, severe hypoglycemic reactions, sulfonamide/sulfonylurea hypersensitivity, G6PD deficiency

DOSAGE AND ROUTES

Nonmicronized

- **Adult: PO** 1.25-5 mg initially, then increase to desired response at weekly intervals up to 20 mg/day; may be given as a single or divided dose
- **Geriatric: PO** 1.25 mg initially, then increase to desired response; max 20 mg/day, maintenance 1.25-20 mg/day

Micronized

- **Adult: PO** 1.5-3 mg/day initially, may increase by 1.5 mg/wk, max 12 mg/day
- **Geriatric: PO** 0.75-3 mg/day, may increase by 1.5 mg/wk

To replace insulin

- **Adult: PO** if insulin was <40 U/day, switch directly; if insulin was <20 U/day, give 2.5-5 mg (or 1.5-3 mg micronized); if insulin was 20-40 U/day, give 5 mg (or 3 mg micronized); if insulin was >40 U/day, give 5 mg (3 mg micronized) initially with 50% insulin dose, gradually taper insulin and increase glyBURIDE

Available forms: Tabs 1.25, 2.5, 5 mg (nonmicronized); 1.5, 3, 6 mg (micronized)

Administer:

- With breakfast as single or divided dose; hold dose if patient NPO to avoid hypoglycemia; take at same time each day
- Twice-daily dosing may be used if conventional doses >10 mg, micronized >6 mg
- Gradual conversion from other oral hypoglycemics to product is not needed
- Micronized glyBURIDE/nonmicronized glyBURIDE are not equivalent
- Store in tight container in cool environment

SIDE EFFECTS

CNS: *Headache, weakness,* paresthesia
ENDO: Hypoglycemia
GI: Nausea, **hepatotoxicity, cholestatic jaundice,** vomiting, diarrhea, **weight gain**

HEMA: Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia (rare)
INTEG: Rash, pruritus, photosensitivity, erythema
MISC: Angioedema, serious hypersensitivity

PHARMACOKINETICS

Completely absorbed; **Nonmicronized** onset 2 hr; peak 2-4 hr; duration 24 hr; **Micronized:** Onset 1 hr, peak 2-3 hr, duration <24 hr metabolized in liver; excreted in urine, feces (metabolites); crosses placenta; 99% plasma-protein bound

INTERACTIONS

Increase: masking symptoms of hypoglycemia—β-blockers; monitor blood glucose
Increase: level—digoxin
Increase: hypoglycemic effects—insulin, MAOIs, oral anticoagulants, chloramphenicol, NSAIDs, salicylates, probenecid, androgens, fluconazole, gemfibrozil, histamine H_2 antagonists, magnesium salts, phenylbutazone, sulfinpyrazone, sulfonamides, tricyclics, urinary acidifiers, β-blockers, clarithromycin, voriconazole; monitor blood glucose, use cautiously
Increase: triglyceride levels—colesevelam
Increase: action of—cycloSPORINE
Increase: hyperglycemia—alcohol
Decrease: both products' effects—diazoxide
Decrease: glyBURIDE action—thiazide diuretics, rifampin, carbamazepine, glucagon, corticosteroids, monitor blood glucose

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut
Decrease: hypoglycemic effect—green tea

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, creatinine, alkaline phosphatase, cholesterol, ALP
Decrease: Hb, sodium, glucose, platelets, WBC

NURSING CONSIDERATIONS

Assess:

- Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give IV $D_{50}W$, then IV dextrose sol
- Blood glucose, A1c levels during treatment
- For allergy to sulfonamides, potential for cross-reactivity
- For renal, hepatic dysfunction: use dose reductions, or avoidance of use may be required; increased risk of hypoglycemia in hepatic failure
- **Blood dyscrasias:** CBC at baseline, throughout treatment; report decreased blood counts
- **Beers:** avoid in older adults; risk of severe prolonged hypoglycemia
- **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected; breastfed infant may be hypoglycemic; insulin should be used in pregnancy

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; improved serum glucose, A1c

Teach patient/family:

- To check for symptoms of cholestatic jaundice: dark urine, pruritus, jaundiced sclera; if these occur, notify prescriber
- To use a blood glucose meter for testing while taking this product
- About the symptoms of hypo/hyperglycemia, what to do about each
- That product must be continued on a daily basis; about consequences of discontinuing product abruptly; that in times of stress, infection, surgery, trauma, a higher dose may be needed, also may require administration of insulin during these times
- To take product with breakfast or first meal of the day to prevent hypoglycemic reactions at night if taking once a day; if taking twice a day, not to take after last meal of the day
- To avoid OTC medications unless ordered by prescriber
- To report bleeding, bruising, weight gain, edema, shortness of breath, weakness, sore throat
- That diabetes is a lifelong illness; that product will not cure disease
- That all food included in diet plan must be eaten to prevent hypoglycemia; to

have glucagon emergency kit, sugar packets always available
• To use sunscreen or stay out of the sun, wear protective clothing (photosensitivity)
• To carry an emergency ID with prescriber and medication information
• To notify prescribers of use prior to surgery
• To not drive or operate machinery until response is known, dizziness may occur
• That continuing follow-up exams and lab work will be needed

TREATMENT OF OVERDOSE:
Use one of the following: Glucose 25 g IV via dextrose 50% sol, 1 mg glucagon, oral carbohydrate depending on severity

glycerin (OTC)
(glis´er-in)
Fleet Liquid Glycerin Supp, Pedia-Lax
Func. class.: Laxative

USES:
Constipation

DOSAGE AND ROUTES
Adult/child ≥6: Rectal supp: 1 daily as needed or as directed; enema 5-15 mL as needed
Child 2-6: Rectal supp 1 daily; enema: 2 mL as needed
Available forms: Supp 1, 2 g; enema 5.4 g; enema (pediatric) 4 mL/applicator

golimumab (Rx)
(goal-lim´yu-mab)
Simponi, Simponi Aria, Simponi IV

Func. class.: Antirheumatic agent (disease modifying), immunomodulator
Chem. class.: tumor necrosis factor modifier

ACTION:
Monoclonal antibody specific for human tumor necrosis factor (TNF); elevated levels of TNF are found in patients with rheumatoid arthritis

USES:
Rheumatoid arthritis (RA), ankylosing spondylitis, psoriatic arthritis, ulcerative colitis

CONTRAINDICATIONS:
Hypersensitivity, active infections
Precautions: Pregnancy, breastfeeding, children, geriatric patients, CNS demyelinating disease, Guillain-Barré syndrome, HF, hepatitis B carriers, blood dyscrasias, surgery, MS, neurologic disease, diabetes, immunosuppression

Black Box Warning: TB; fungal, bacterial, viral infections, new primary malignancy

DOSAGE AND ROUTES
Rheumatoid arthritis
• **Adult: SUBCUT** 50 mg monthly; give with methotrexate; **IV (Simponi Aria only)** 2 mg/kg over 30 min, repeat 4 wk later, then q8wk give with methotrexate
Ulcerative colitis:
• **Adult: SUBCUT** 200 mg for 1 dose, then 100 mg in 2 wk, maintenance 100 mg q4wk starting at wk 6
Available forms: Inj 50 mg/0.5 mL, 100 mg/mL prefilled syringe, SmartJect Auto Injector; inj 50 mg/4 mL single-use vial
Administer:
SUBCUT route
• Refrigerate, do not freeze; allow to warm to room temperature before using
• Visually inspect sol for particulate or discoloration; sol should be clear to slightly opalescent and colorless to slightly yellow; there may be tiny white particles; do not shake; rotate injection sites
• Use multiple injection sites for multiple injections
• Rotate injection sites, discard unused portions

SmartJect Autoinjector

- Allow the single-use prefilled autoinjector to reach room temperature for at least 30 min
- Immediately prior to use, remove cap. Inject within 5 min of cap removal. Do not put the cap back on
- Place the open end of the autoinjector against the injection site at a 90-degree angle. Make sure the green safety sleeve is flat against the skin
- Push the autoinjector firmly against the skin until the green safety sleeve slides fully into the clear cover, then press the button. Listen for a loud first click; do not pull the autoinjector away from the skin. Wait for the second click. This usually takes 3-6 sec but may take up to 15 sec. If the autoinjector is pulled away from the skin before the injection is complete, the full dose may not be administered
- Do not rub the injection site
- If the viewing window is not yellow, call 800-526-7736; do not give a second dose without talking with the prescribing health care provider

Prefilled syringe

- Allow the single-use prefilled syringe to reach room temperature for at least 30 min prior to use
- Immediately before use, remove the needle cover by pulling it straight off; do not twist off or recap. Inject within 5 min of needle cover removal
- Hold the syringe in one hand like a pencil and use the other hand to gently pinch a fold of skin at the cleaned injection site. Do not touch the plunger or the area above the finger flange prior to administration, as this may cause the needle safety device to activate
- Insert the needle at a 45-degree angle to the skin. Inject by pushing the plunger all the way down until it stops. Release pressure from the plunger. The safety guard will cover the needle and lock into place, removing the needle from the skin
- Do not rub the injection site
- Properly dispose of the used prefilled syringe

IV route

(Simponi Aria)

- Calculate number of vials needed; do not shake; dilute total volume of product in NS to yield 100 mL for infusion; slowly add product, mix gently
- Infuse over 30 min, use infusion set with in-line, low–protein-binding filter (0.22 mm pore size)
- May store diluted solution for 4 hr

SIDE EFFECTS

CNS: Dizziness, paresthesia, CNS demyelinating disorder, weakness, Guillian-Barre syndrome, MS
CV: Hypertension, HF
GI: Hepatitis
HEMA: Agranulocytosis, aplastic anemia, leukopenia, polycythemia, thrombocytopenia, pancytopenia
INTEG: Psoriasis
MISC: Increased cancer risk; antibody development to this drug; risk for infection (TB, invasive fungal infections, other opportunistic infections), may be fatal; inj-site reactions, anaphylaxis

PHARMACOKINETICS

Half-life 2 wk, SUBCUT peak 2-7 days, IV peak 12 wk

INTERACTIONS

- Do not give concurrently with live vaccines or within 3 mo; immunizations should be brought up to date before treatment
- Dosage change may be needed: warfarin, cycloSPORINE, theophylline

Increase: infection—abatacept, etanercept, rilonacept, riTUXimab, adalimumab, anakinra, immunosuppressants, inFLIXimab; avoid concurrent use

Drug/Lab Test

Increase: LFTs
Decrease: platelets, WBC, neutrophils
Positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- **Pain,** stiffness, ROM, swelling of joints during treatment

• Inj-site pain, swelling; usually occur after 2 inj (4-5 days)

Black Box Warning: TB: obtain TB skin test before starting treatment; treat latent TB before starting therapy; continue to monitor for TB even if TB test is negative

• **Blood dyscrasias:** CBC, differential before and periodically during treatment

Black Box Warning: Infection: fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds; stop treatment if present; some serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product; obtain a chest x-ray, fungal serology, TB testing before starting treatment

• **HBV infection:** test for HBV before starting treatment; HBV can be fatal in HBV carriers; monitor LFTs; hepatitis B serology, may reactivate HBV

• **HF:** B/P, pulse, edema, SOB, may occur or worsen with treatment

• **Psoriasis:** may occur or worsen

Black Box Warning: Neoplastic disease: may occur in those <18 yr; avoid use in those with known malignancies; monitor for secondary malignancies during treatment

• **Anaphylaxis:** rash, dyspnea, wheezing, emergency equipment should be nearby, if present, discontinue product immediately

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; do not breastfeed, excretion unknown

Evaluate:

• Therapeutic response: decreased inflammation, pain in joints, decreased joint destruction

Teach patient/family:

• About self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard

• That, if medication not taken when due, to inject next dose as soon as remembered and then the following dose as scheduled

• Not to receive any live virus vaccines during treatment

Black Box Warning: To report signs, symptoms of infection, allergic reaction, or lupuslike syndrome

• To notify prescriber if pregnancy is planned or suspected; not to breastfeed

goserelin (Rx)

(goe´se-rel-lin)

Zoladex

Func. class.: Gonadotropin-releasing hormone, antineoplastic (hormone)

Chem. class.: Synthetic decapeptide analog of LHRH

USES: Advanced and locally confined prostate cancer stage B2-C (10.8 mg), endometriosis, advanced breast cancer, endometrial thinning (3.6 mg)

DOSAGE AND ROUTES

Breast cancer

• **Adult: SUBCUT** 3.6 mg q28days or 10.8 mg q12wk into anterior abdominal wall below the navel

Endometrial thinning

• **Adult: SUBCUT** 3.6 mg 1-2 depots, 4 wk apart into anterior abdominal wall below the navel

Endometriosis

Adult: SUBCUT 3.6 mg q28days into anterior abdominal wall below the navel, max 6 mo

Advanced Prostate Cancer

Adult: SUBCUT 3.6 mg q28days or 10.8 mg q12wk into anterior abdominal wall below the navel

B2-C Prostate Cancer

Adult: SUBCUT 3.6 mg into anterior abdominal wall below navel 8 wk before radiotherapy, then after 28 days 10.8 mg or 3.6 mg 2 doses before and 2 doses q28days after radiotherapy

Available forms: Depot inj 3.6, 10.8 mg

granisetron (Rx)

(grane-iss´e-tron)

Sancuso, Sustol

Func. class.: Antiemetic

Chem. class.: 5-HT_3 receptor antagonist

ACTION: Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

USES: Prevention of nausea, vomiting associated with cancer chemotherapy, including high-dose CISplatin, radiation
Unlabeled uses: Acute nausea, vomiting after surgery

CONTRAINDICATIONS: Hypersensitivity to this product, benzyl alcohol
Precautions: Pregnancy, breastfeeding, children, geriatric patients, ondansetron/palonosetron/dolasetron hypersensitivity, cardiac dysrhythmias, cardiac/hepatic/GI disease, electrolyte imbalances

DOSAGE AND ROUTES

Prevention of nausea, vomiting in chemotherapy

• **Adult/child ≥2 yr: IV** 10 mcg/kg over 30 sec or over 5 min diluted and infused, 30 min before the start of cancer chemotherapy; **TD** apply 1 patch (3.1 mg/24 hr) to upper outer arm 24-48 hr before chemotherapy, patch may be worn up to 7 days

• **Adult: PO** 1 mg bid, give 1st dose 1 hr before chemotherapy and next dose 12 hr after 1st or 2 mg as a single dose anytime within 1 hr before chemotherapy

Nausea, vomiting in radiation therapy

• **Adult: PO** 2 mg/day 1 hr before radiation

Available forms: Inj 0.1 mg/mL; solution for injection, extended release 10 mg/0.4 mL; tab 1 mg; patch TD 3.1 mg/24 hr

Administer:

• Chemotherapy/radiation: given on day of chemotherapy or radiation

PO route

• Give dose 1 hr before chemotherapy/radiation and another 12 hr after 1st dose

Transdermal

• Apply to clean, dry skin on upper arm q24-48hr before chemotherapy or radiation

SUBCUTE route

• **Preparation:** Extended-release injection is for **SUBCUT** use only

• Remove the extended-release kit from the refrigerator at least 60 min prior to use; all contents should warm to room temperature

• Once at room temperature, activate one of the syringe warming pouches. Wrap the syringe in the warming pouch for 5-6 min

• Do not use if particulate matter or discoloration is observed, the tip cap is missing or has been tampered with, or the Luer fitting is missing or dislodged. The injection is a sterile, clear, colorless to slightly yellow, viscous liquid

Administer: Complete administration instructions with illustrations are in the kit

• A topical anesthetic may be used at the injection site prior to administration. Do not inject anywhere the skin is burned, hardened, inflamed, swollen, or otherwise compromised

• Using aseptic technique, give as a single slow SUBCUT injection in the back of the upper arm or the skin of the abdomen (at least 1 inch away from the umbilicus) over up to 20-30 sec; due to viscosity, pressing the plunger harder will not expel the solution faster

• Do not cut in pieces

• Apply immediately after opening pouch

Direct IV route

• May give undiluted over 30 sec via Y-site

Intermittent IV INFUSION route

• Dilute in 0.9% NaCl for inj or D_5W (20-50 mL); give over 5-15 min 30 min before chemotherapy

• Store at room temperature for 24 hr after dilution; do not freeze vials

• Do not admix

Solution compatibilities: D_5W, 0.9% NaCl

Y-site compatibilities: Acetaminophen, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl, ampicillin, ampicillin/sulbactam, amsacrine, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fluorouracil, floxuridine, fludarabine, furosemide, gallium, ganciclovir, gentamicin, haloperidol, heparin hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, leucovorin, LORazepam, magnesium sulfate, melphalan, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, miconazole, minocycline, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, ofloxacin, PACLitaxel, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

Transdermal route

• Apply to dry, clean intact skin of upper outer arm 24-48 hr before chemotherapy, firmly press on skin, keep on during chemotherapy; can bathe, avoid swimming, whirlpool; remove ≥24 hr after chemotherapy completion; do not cut patch

SIDE EFFECTS

CNS: *Headache, asthenia,* anxiety, dizziness, stimulation, insomnia, drowsiness
CV: Hypertension, QT prolongation
GI: Diarrhea, *constipation,* increased AST, ALT, *nausea*
MISC: Rash, serotonin syndrome

PHARMACOKINETICS

Metabolized in liver to an active metabolite, half-life 10-12 hr, protein binding 65%, distributed to erythrocytes excreted by the kidney
PO: Peak 60 min, duration 24 hr, IV: Peak 30 min, duration up to 24 hr
TD: Peak 24 hr

INTERACTIONS

Increase: QT prolongation—amoxapine, arsenic, β-blockers, chloroquine, class IA, III antidysrhythmics, cloZAPine, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, fluconazole, halogenated/local anesthetics, haloperidol, lapatinib, maprotiline, methadone, octreotide, ondansetron, palonosetron, pentamidine, phenothiazines, pimozide, posaconazole, propafenone, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telithromycin, tricyclics, troleandomycin, vardenafil, voriconazole, vorinostat, ziprasidone
Increase: EPS- anytipsychotics
Increase: Serotonin syndrome—SSRIs, tricyclics, MAOIs, lithium, buspirone, fentanyl

NURSING CONSIDERATIONS

Assess:

• For absence of nausea, vomiting during chemotherapy
• **Hypersensitivity reaction:** rash, bronchospasm
• **Extrapyramidal symptoms:** grimacing, shuffling gait, tremors, involuntary movements, rare
• **QT prolongation:** monitor ECG in those with heart disease or renal disease or in the elderly
• **Serotonin syndrome:** hallucinations, seizures, diaphoresis, dizziness, flushing,

hyperthermia, nausea, vomiting, diarrhea, discontinue

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk

Evaluate:

• Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:

• To report diarrhea, constipation, rash, changes in respirations

• That headache requiring an analgesic is common

• To take second dose of PO 12 hr after first dose

• That allergic reactions can occur up to 7 days after use (ext rel), or later (subcut)

• **Serotonin syndrome:** to report mental changes, including agitation, hallucinations, dizziness, sweating, flushing, tremors, seizures; discontinue immediately and notify prescriber

guaiFENesin (OTC, Rx)

(gwye-fen′e-sin)

Altarussin, Bidex, Buckleys Chest Congestion, Chest Congestion Relief, Diabetic Tussin, Fenesin IR, Geri-Tussin, GoodSense Mucus Relief, Liquibid, Mucinex Fast-Max Chest Congestion MS, Mucinex For Kids, Mucinex Maximum Strength, Mucinex, Mucos, Mucus Relief ER, Mucus Relief Max St, Mucus Relief, Pharbinex, Refenesen 400, Refenesen, Robafen Mucus/Chest Congestion, Robafen, Siltussin, Siltussin SA, Tussin Mucus & Chest Conges, Tussin, Xpect

Func. class.: Expectorant

Do not confuse:

guaiFENesin/guanfacine

Mucinex/Mucomyst

ACTION: Increases the volume and reduces the viscosity of secretions in the trachea and bronchi to facilitate secretion removal

USES: Productive and nonproductive cough

CONTRAINDICATIONS: Hypersensitivity; chronic, persistent cough

Precautions: Pregnancy, breastfeeding, HF, asthma, emphysema, fever

DOSAGE AND ROUTES

• **Adult and adolescent: PO** 200-400 mg q4hr; **EXT REL** 600-1200 mg q12hr, max 2.4 g/day

• **Child 6-11 yr: PO** 100-200 mg q4hr; **EXT REL** 600 mg q12hr, max 1.2 g/day

• **Child 2-5 yr: PO** 50-100 mg q4hr; max 600 mg/day; ext rel 300 mg q12hr, max 600 mg/day

Available forms: Tabs 100, 200, 400 mg; oral sol 100 mg/5 mL; ext rel tabs 600, 1200 mg; syrup 100 mg/5 mL; oral granules 50, 100 mg/packet, caps 200 mg; liquid 100, 200 mg/5 mL

Administer:

Do not break, crush, chew ext rel tabs

• Store at room temperature

SIDE EFFECTS

CNS: Drowsiness, headache, dizziness

GI: Nausea, anorexia, vomiting, diarrhea

PHARMACOKINETICS

Half-life 1 hr, excreted in urine (metabolites)

NURSING CONSIDERATIONS

Assess:

• **Cough:** type, frequency, character, including sputum; fluids should be increased to 2 L/day

• Increased fluids, room humidification to liquefy secretions

• **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk

Evaluate:

• Therapeutic response: productive cough, thinner secretions

Teach patient/family:
• To avoid driving, other hazardous activities if drowsiness occurs (rare)
• To avoid smoking, smoke-filled room, perfumes, dust, environmental pollutants, cleansers
• To consult health provider if cough lasts >7 days
• To avoid if breastfeeding
• To avoid use in a child <2 yr
• To use as prescribed, not to double or skip doses
• Not to drive or operate machinery until response is known, drowsiness, dizziness may occur
• To notify health care professional of change in heartbeat or if feeling faint
TD: Not to use near heat such as heating pad or expose to sunlight, tanning, not to cut patch, or use in MRI

guanfacine (Rx)
(gwahn´fa-seen)
Intuniv
Func. class.: Alpha$_2$-adrenergic agonist/antihypertensive

USES: Attention-deficit/hyperactivity disorder (extended release only), hypertension (immediate release only)

DOSAGE AND ROUTES
Hypertension (alternative agent)
Adult: PO immediate release: Initial: 0.5 to 1 mg daily at bedtime; may increase as needed after 3 to 4 wk up to 2 mg daily at bedtime
ADHD
Child ≥6 years and adolescents: ≤45 kg: **PO:** Initial: 0.5 mg daily at bedtime; may titrate q 3 to 4 days in 0.5-mg/day increments to 0.5 mg BID, then 0.5 mg TID then 0.5 mg QID; max daily dose: Patient weight 27 to 40.5 kg: 2 mg/day; 40.5 to 45 kg: 3 mg/day; **>45 kg:** Initial: 1 mg daily at bedtime; may titrate q 3 to 4 days in 1-mg/day increments to 1 mg bid, then 1 mg tid, then 1 mg qid maxi daily dose: 4 mg/day
Children and adolescents 6 to 17 years:
Extended-release product (Intuniv):
PO: Initial: 1 mg daily at the same time of day (in the morning or evening); may titrate by no more than 1-mg/wk based upon response
Available forms: Tabs 1, 2 mg; tabs, ext rel 1, 2, 3, 4 mg

guselkumab (Rx)
(gus-elk´-ue-mab)
Tremfya
Func. class.: Antirheumatic agent (disease modifying), immunomodulator, anti-TNF
Chem. class.: Recombinant human IgG1 monoclonal antibody, DMARD

USES: For the treatment of moderate to severe plaque psoriasis in those who are candidates for phototherapy or systemic therapy, psoriatic arthritis

DOSAGE AND ROUTES
• **Adult: SUBCUT** 100 mg at week 0, week 4, and every 8 wk thereafter
Available forms: Prefilled syringe 100 mg/mL

halcinonide topical

See Appendix B

haloperidol (Rx)

(hal-oh-pehr'ih-dol)

Haldol Decanoate, Haldol

Func. class.: Antipsychotic, neuroleptic

Chem. class.: Butyrophenone

ACTION: Blocks neurotransmission produced by DOPamine at synapse; exhibits strong α-adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects unclear

USES: Tourette's syndrome, prolonged parenteral therapy in chronic schizophrenia, emergency sedation of severely agitated or delirious patients, ADHD, oppositional defiant disorder

Unlabeled uses: Autistic disorder, delirium, mania, hiccups, chemotherapy-induced nausea/vomiting

CONTRAINDICATIONS: Hypersensitivity, coma, Parkinson's disease

Precautions: Pregnancy, breastfeeding, geriatric patients, seizure disorders, hypertension, pulmonary/cardiac/hepatic disease, QT prolongation, torsades de pointes, prostatic hypertrophy, hyperthyroidism, thyrotoxicosis, children, blood dyscrasias, brain damage, bone marrow depression, alcohol and barbiturate withdrawal states, angina, epilepsy, urinary retention, closed-angle glaucoma, CNS depression

Black Box Warning: Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Schizophrenia

- **Adult: PO** 0.5-2 mg bid-tid depending on severity

Severe symptoms: 3-5 mg orally 2-3 times a day; **haloperidol lactate IM** 2-5 mg q4-8hr, max 20 mg/day; **Haloperidol decanoate IM** Max initial dose 100 mg; if greater than 100 mg is needed, the dose should be given in 2 separate injections (100 mg followed by the balance in 3-7 days). **Maintenance** 10-15 times the previous daily PO dose, given IM monthly, titrate to response; max 450 mg/mo

Available forms: Tabs 0.5, 1, 2, 5, 10, 20 mg; **lactate:** oral sol 2 mg/mL; inj 5 mg/mL, **decanoate:** 50 mg/mL, 100 mg/mL

Administer:

- Reduced dose to geriatric patients
- Antiparkinsonian agent if EPS occurs
- Avoid use with CNS depressants

PO route

- Store in tight, light-resistant container
- **Oral liquid:** use calibrated device; do not mix in coffee or tea
- PO with food or milk
- Avoid skin contact with oral suspension or solution—may cause contact dermatitis

IM route (long acting)

- IM inj into large muscle mass, use 21-G, 2-in needle, use Z track method; give no more than 3 mL/inj site; patient should remain recumbent for 30 min, protect from light

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, headache,* seizures, neuroleptic malignant syndrome, confusion

CV: *Orthostatic hypotension,* ECG changes, tachycardia, QT prolongation, torsades de pointes

EENT: Blurred vision, glaucoma, dry eyes

GI: *Dry mouth, nausea, vomiting, anorexia, constipation,* weight gain, ileus, hepatitis

HEMA: Agranulocytosis, anemia, neutropenia, leukopenia

GU: Urinary retention, urinary frequency, impotence

INTEG: *Rash,* photosensitivity, dermatitis

RESP: Respiratory depression

SYST: Risk for death (dementia)

PHARMACOKINETICS

Metabolized by liver; excreted in urine, bile; crosses placenta; enters breast milk; protein binding 92%; half-life 12-36 hr (metabolites)

PO: Onset erratic, peak 2-6 hr, half-life 14-37 hr

IM (Lactate): Onset 15-30 min, peak 15-20 min, half-life 21 hr

IM (Decanoate): Peak 4-11 days, half-life 3 wk

Black Box Warning: Increase: respiratory depression, death opioids

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Increase: QT prolongation—class IA, III antidysrhythmics, tricyclics, amoxapine, maprotiline, phenothiazines, pimozide, risperiDONE, sertindole, ziprasidone, β-blockers, chloroquine, cloZAPine, dasatinib, dolasetron, droperidol, dronedarone, flecainide, halogenated/local anesthetics, lapatinib, methadone, erythromycin, telithromycin, troleandomycin, octreotide, ondansetron, palonosetron, pentamidine, propafenone, ranolazine, SUNItinib, tacrolimus, vardenafil, vorinostat, usually with IV use

Black Box Warning: Increase: oversedation—opioids, other CNS depressants, alcohol, barbiturate anesthetics

Increase: toxicity—EPINEPHrine, lithium

Increase: anticholinergic effects—anticholinergics

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Mental status:** Monitor mood, behavior, orientation, affect, LOC, sleep patterns, presence of delusions, hallucinations; baseline, periodically
- Monitor prolactin, CBC, urinalysis, ophthalmic exam before and during prolonged therapy

Black Box Warning: Assess for dementia, affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances, risk for death in dementia-related psychosis

- **CV:** B/P standing, lying; take pulse, respirations during initial treatment; establish baseline before starting treatment; report drops of 20 mm Hg
- Dizziness, faintness, palpitations, tachycardia on rising
- **Fall risk assessment:** Assess for fall potential baseline and during treatment; supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program, fainting is possible; patient should not stand still for long periods
- **Extrapyramidal symptoms,** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) after long-term use
- **Neuroleptic malignant syndrome/serotonin syndrome:** hyperthermia, muscle rigidity, altered mental status, increased CPK, seizures, hypo/hypertension, tachycardia; notify prescriber immediately
- Constipation, urinary retention daily; if these occur, increase bulk, water in diet
- **Abrupt discontinuation:** do not withdraw abruptly, taper
- **QT prolongation:** more common with IV use at high doses; monitor ECG in those with CV disease
- **Esophageal aspiration risk:** Assess for aspiration risk in pneumonia, dementia

Black Box Warning Beers: avoid use in older adults except for schizophrenia, bipolar disorder; increased risk of stroke and cognitive decline, mortality

- **Pregnancy/breastfeeding:** no well-controlled studies; use in 3rd trimester results in infant extrapyramidal symptoms; avoid breastfeeding

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns

of thought, speech; improvement in specific behaviors

Teach patient/family:

- That orthostatic hypotension occurs often; to rise from sitting or lying position gradually; to remain lying down after IM inj for at least 30 min
- To avoid hazardous activities until stabilized on medication and effects are known
- To avoid abrupt withdrawal of this product because EPS may result; to withdraw slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; to avoid use with alcohol, as increased drowsiness may occur
- About EPS and the necessity of meticulous oral hygiene because oral candidiasis may occur

Black Box Warning: Opioids: Discuss with patient, family, caregivers to report immediately, dizziness, severe drowsiness, slowed breathing, to obtain emergency services

- To report impaired vision, jaundice, tremors, muscle twitching
- To use sunscreen, protective clothing to minimize photosensitivity, avoid overheating
- To take as prescribed; not to use OTC, herbal products or alcohol unless directed by prescriber
- To use good oral hygiene, frequent sips of water, sugarless gum, candy for dry mouth

TREATMENT OF OVERDOSE:

Lavage if recently ingested orally; provide an airway; do not induce vomiting; provide supportive care

⚠ HIGH ALERT

heparin (Rx)

(hep´a-rin)

Hepalean ✱, Heparin Leo ✱, Heparin Sodium Injection, Hep-Lock, Hep-Lock U/P, Monoject Prefil ✱

Func. class.: Anticoagulant, antithrombotic

Do not confuse:
heparin/Hespan

ACTION:

Prevents conversion of fibrinogen to fibrin and prothrombin to thrombin by enhancing inhibitory effects of antithrombin III

USES:

Prevention treatment of deep venous thrombosis, PE, MI, open heart surgery, disseminated intravascular clotting syndrome, atrial fibrillation with embolization, as an anticoagulant in transfusion and dialysis procedures, to maintain patency of indwelling venipuncture devices; diagnosis, treatment of DIC

CONTRAINDICATIONS:

Bleeding, hypersensitivity to this product, corn, porcine protein (pork product)

Precautions: Pregnancy, children, geriatric patients, alcoholism, hyperlipidemia, diabetes, renal disease, heparin-induced thrombocytopenia (HIT), hemophilia, leukemia with bleeding, peptic ulcer disease, severe thrombocytopenic purpura, severe renal/hepatic disease, blood dyscrasias, severe hypertension, subacute bacterial endocarditis, acute nephritis; benzyl alcohol products in neonates/infants/pregnancy/lactation

DOSAGE AND ROUTES

Anticoagulation

- **Adult: IV BOLUS (intermittent)** 10,000 units, then 5000-10,000 q4-6hr **CONTINUOUS IV INFUSION** 5000 units, then 20,000-40,000 units give over 24 hr; **SUBCUT** 5000 units, then 10,000-20,000 units, then 8000-10,000 q8hr
- **Child >1 yr: IV bolus (intermittent)** 50-100 units/kg q4hr; **continuous IV infusion** 75 units/kg then 20 units/kg/hr, adjust to aPTT by 65-85 sec
- **Neonates, infants <1 yr: Continuous IV infusion** 75 units/kg, then 28 units/kg/hr, adjust to aPTT 65-85 sec

Thromboembolism prevention

- **Adult: SUBCUT** 5000 units q8-12hr

CV surgery

- **Adult: IV** ≥150 units/kg (300 units) for procedure <60 min, 400 units/kg for procedure ≥60 min

Line flush

• **Adult/child: IV** 10-100 units/mL (10 units: infants) to fill heparin lock

TPN

• **Adult/child IV** 0.5-1 units/mL

Available forms: Sol for inj 10, 100, 1000, 2000, 5000, 7500, 10,000, 20,000 units/mL; premixed 1000 units/500 mL, 2000 units/1000 mL, 12,500 units/250 mL, 25,000 units/250 mL, 25,000 units/500 mL; lock flush preparations 10 units/mL

Administer:

• Cannot be used interchangeably (unit for unit) with LMWHs or heparinoids

• At same time each day to maintain steady blood levels; always check dose with another nurse before use or a change in dose

• Store at room temperature

Heparin lock route

• Do not mistake heparin sodium inj 10,000 units/mL and Hep-Lock U/P 10 units/mL; they have similar blue labeling; deaths in pediatric patients have occurred when heparin sodium inj vials were confused with heparin flush vials

• Inject to prevent clots in heparin lock; inject dilute heparin solution 10-100 units/0.5-1 mL after each injection or q8hr flush lock before and after each use with sterile water or 0.9% NaCl

SUBCUT route

• Give deeply with 25-G ⅜-½-in needle; do not massage area or aspirate when giving SUBCUT inj; give in abdomen between pelvic bones, inject at 45- or 90-degree angle, rotate sites; do not pull back on plunger; apply gentle pressure for 1 min

• Changing needles is not recommended

• Do not give IM

• Avoid all IM inj that may cause bleeding, hematoma

Direct IV route

• Give loading dose undiluted, over ≥1 min; use before continuous infusion

Continuous IV INFUSION route

• Obtain baseline coagulation tests before use

• Use infusion pump; make sure pressure dressings are used after drawing blood

• Draw coagulation studies 30 min before next dose; never draw from tubing or from infused vein; use other arm

• Dilute 25,000 units/250-500 mL 0.9 NaCl or D_5W; 50-100 units/mL solutions are premixed and ready for use

• When product is added to infusion sol for cont IV, invert container at least 6 times to ensure adequate mixing

Y-site compatibilities: Acetaminophen, acetylcysteine, acyclovir, alcohol 10%, dextrose 5%, alemtuzumab, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atropine, azaTHIOprine, azithromycin, aztreonam, benztropine, betamethasone, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, caffeine, calcium chloride/gluconate, cangrelor, CARBOplatin, carmustine, cefamandole, ceFAZolin, cefotaxime, cefoTEtan, cefotiam, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, chloramphenicol succinate, chlordiazePOXIDE, chlorothiazide, chlorpheniramine, cimetidine, CISplatin, cladribine, clindamycin, cloxacillin, codeine, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin liposomal, edetate calcium disodium, edrophonium, enalaprilat, ePHEDrine sulfate, EPINEPHrine, epoetin alfa, eptifibatide, ergonovine, ertapenem, esmolol, estrogens conjugated, ethacrynate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, flecainide, fluconazole, fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, gallamine, gallium, ganciclovir, gemcitabine, gemtuzumab, glycopyrrolate, granisetron, hydrocortisone,

HYDROmorphone, ibuprofen lysine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, lactated Ringer's injection, lansoprazole, leucovorin, lidocaine, lincomycin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, mephentermine, meropenem, mesna, metaraminol, methadone, methohexital, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoMYcin, mivacurium, morphine, moxifloxacin, multiple vitamins injection, nafcillin, nalbuphine, nalorphine, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, PEMEtrexed, penicillin G potassium, sodium, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin sodium, piperacillin-tazobactam, potassium acetate/chloride, procainamide, prochlorperazine, promazine, propofol, propranolol, pyridostigmine, pyridoxine, raNITIdine, remifentanil, Ringer's injection, riTUXimab, rocuronium, sargramostim, scopolamine, sodium acetate, bicarbonate/fusidate, succinylcholine, SUFentanil, tacrolimus, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tolazoline, topotecan, TPN (2-in-1), tranexamic acid, trastuzumab, trimetaphan, trimethobenzamide, tubocurarine, urokinase, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, voriconazole, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Fever,* chills, headache
GU: Hematuria
HEMA: Hemorrhage, *thrombocytopenia,* anemia, heparin-induced thrombocytopenia (HIT)
INTEG: *Rash,* dermatitis, urticaria, pruritus, alopecia, hematoma, cutaneous necrosis (SUBCUT), inj-site reactions
META: Hyperkalemia, hypoaldosteronism, rebound hyperlipidemia, vitamin D deficiency
GI: Elevated LFTs
MS: Osteoporosis (child)
SYST: Anaphylaxis

PHARMACOKINETICS

Half-life 1-2 hr (dose dependent); excreted in urine; 95% bound to plasma proteins; does not cross placenta or alter breast milk; removed from the system via the lymph and spleen; partially metabolized in kidney, liver; excreted in urine (<50% unchanged)
SUBCUT: Onset 20-60 min, peak 2-4 hr duration 8-12 hr, well absorbed >35,000 IU/24 hr
IV: Peak 5 min, duration 2-6 hr

INTERACTIONS

Increase: heparin action—oral anticoagulants, salicylates, dextran, NSAIDs, platelet inhibitors, cephalosporins, penicillins, ticlopidine, dipyridamole, antineoplastics, clopidogrel, SSRIs, SNRIs, quinidine, valproic acid
Decrease: heparin action—digoxin, tetracyclines, antihistamines, cardiac glycosides, nicotine, nitroglycerin
Drug/Herb
Increase: bleeding risk—arnica, anise, chamomile, clove, dong quai, garlic, ginger, ginkgo, feverfew, green tea, horse chestnut
Drug/Lab Test
Increase: ALT, AST, INR, PT, PTT, potassium
Decrease: platelets

NURSING CONSIDERATIONS

Assess:
• **Bleeding, hemorrhage:** gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in Hct, B/P; HIT may occur after product discontinuation; check periodically for sign of decreasing clots
• Blood studies (Hct, occult blood in stools) q3mo
• **Thrombosis:** monitor for increased thrombosis daily, in affected areas
• Partial prothrombin time, which should be 1.5-2.5× control; for continuous IV infusion, check aPTT baseline 6 hr after initiation

and 6 hr after any dose change; use aPTT for dosing adjustments; after therapeutic aPTT has been measured 2×, check aPTT daily

- **Heparin-induced thrombocytopenia (HIT):** platelet count q2-3days; thrombocytopenia may occur on 4th day of treatment and resolves even during continued treatment; HIT may occur on the 5th-10th day of treatment, with platelets to 5000 mm^3; this may lead to HITT (venous/arterial thrombosis) even after discontinued therapy
- **Hypersensitivity:** rash, chills, fever, itching; report to prescriber

Evaluate:

- Therapeutic response: prevention of DVT and pulmonary emboli; adequate anticoagulation based on aPTT, PTT 1.5-2.5× control

Teach patient/family:

- To avoid OTC preparations that may cause serious product interactions unless directed by prescriber; to notify all health care providers of heparin use
- That product may be held during active bleeding (menstruation), depending on condition
- About subcut injection technique if self-administered; to rotate sites, not to inject into irritated or broken skin
- To use soft-bristle toothbrush to avoid bleeding gums; to avoid contact sports; to use an electric razor; to avoid IM inj
- To carry emergency ID identifying product taken
- **Bleeding:** to report to prescriber any signs of bleeding: gums, under skin, urine, stools
- To report to prescriber any signs of hypersensitivity: rash, chills, fever, itching

TREATMENT OF OVERDOSE:

Withdraw product; administer 1 mg protamine/100 units heparin

hepatitis B immune globulin (HBIG) (Rx)

HepaGam B, HyperHEP B S/D, Nabi-HB

Func. class.: Immune globulin

USES: Prevention of hepatitis B virus in exposed patients, including passive immunity in neonates born to HBsAg-positive mother, prevention of hepatitis B recurrence after liver transplant in HBsAg-positive patients

DOSAGE AND ROUTES

Hepatitis B exposure in high-risk patients

- **Adult/child: IM** 0.06 mL/kg (usual 3-5 mL) within 7 days of exposure; repeat 28 days after exposure if patient wishes to not receive hepatitis B vaccine

Neonates born to hepatitis B surface-antigen–positive persons

- **Neonate: IM** 0.5 mL within 12 hr of birth

Prevention of hepatitis B infection recurrence after liver transplant

- **Adult: IV** (HepaGam B only) 20,000 international units concurrent with grafting transplanted liver, then 20,000 international units/day on days 1-7, then 20,000 international units q2wk starting on day 14, then 20,000 international units/mo starting with month 4

Available forms: Injection: 1-, 5-mL vials; 0.5-mL neonatal single-dose syringe; 1-mL single-dose syringe

homatropine ophthalmic

See Appendix B

hydrALAZINE (Rx)

(hye-dral'a-zeen)

Apresoline

Func. class.: Antihypertensive, direct-acting peripheral vasodilator

Chem. class.: Phthalazine

Do not confuse:

hydrALAZINE/hydrOXYzine

ACTION: Vasodilates arteriolar smooth muscle by direct relaxation; reduction in

blood pressure with reflex increases in heart rate, stroke volume, cardiac output

USES: Essential hypertension; hypertensive emergency/urgency
Unlabeled uses: HF

CONTRAINDICATIONS: Hypersensitivity to hydrALAZINEs, mitral valvular rheumatic heart disease, CAD
Precautions: Pregnancy, breastfeeding, geriatric patients, CVA, advanced renal disease, hepatic disease, SLE, dissecting aortic aneurysm

DOSAGE AND ROUTES

Hypertension
- **Adult: PO** 10 mg qid 2-4 days, then 25 mg for rest of 1st wk, then 50 mg qid, max 300 mg/day
- **Child ≥1 yr (unlabeled): PO** 0.75-1 mg/kg/day in 2-4 divided doses, max 25 mg/dose, increase over 3-4 wk to max 7.5 mg/kg/day or 200 mg, whichever is less

Hypertensive crisis
- **Adult: IV BOL** 10-20 mg q4-6hr, administer **PO** as soon as possible; **IM** 10-50 mg q4-6hr
- **Child: IM/IV BOL** 0.1-0.2 mg/kg/dose q4hr as needed

Preeclampsia/eclampsia
Adult female IV 5-10 mg over 2 min

HF (unlabeled)
- **Adult: PO** 10-25 mg tid, max 100 mg tid

Available forms: Inj 20 mg/mL; tabs 10, 25, 50, 100 mg

Administer:
PO route
- Give with meals (PO) to enhance absorption

IM route
- Do not admix, switch to PO as soon as possible, use only in those that cannot use PO
- No dilution needed, inject deeply in large muscle, aspirate

Direct IV route
- IV undiluted; give through Y-tube or 3-way stopcock, give each 10 mg over ≥1 min
- To recumbent patient, keep recumbent for 1 hr after administration

Y-site compatibilities: Alemtuzumab, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, DACTINomycin, DAPTOmycin, dexrazoxone, diltiazem, DOCEtaxel, etoposide, fludarabine, gatifloxacin, gemcitabine, granisetron, HYDROmorphone, IDArubicin, irinotecan, leucovorin, linezolid, mechlorethamine, metroNIDAZOLE, milrinone, mitoXANtrone, octreotide, oxaliplatin, PACLitaxel, palonosetron, pancuronium, potassium chloride, tacrolimus, teniposide, thiotepa, tirofiban, vecuronium, vinorelbine, vitamin B/C, voriconazole

SIDE EFFECTS

CNS: *Headache, dizziness,* drowsiness, peripheral neuritis
CV: *Palpitations, tachycardia, angina,* orthostatic hypotension, shock
GI: *Nausea, vomiting, anorexia, diarrhea, hepatotoxicity*
EENT: Nasal congestion
RESP: Dyspnea
HEMA: Agranulocytosis
GU: Urinary retention
INTEG: Rash, pruritus, flushing
MISC: *Lupuslike symptoms,* muscle cramps

PHARMACOKINETICS

Half-life 3-7 hr, metabolized by liver, 12%-14% excreted in urine, protein binding 89%; ↻ half of Mexicans, blacks, South Indians, and Caucasians are at risk for toxicity
PO: Onset 20-30 min, peak 1-2 hr, duration 2-4 hr
IM: Onset 10-30 min, peak 1 hr, duration 2-6 hr
IV: Onset 5-30 min, peak 10-80 min, duration up to 12 hr

INTERACTIONS

Increase: Severe hypotension risk—MAOIs
Increase: Tachycardia, angina—sympathomimetics (EPINEPHrine, norepinephrine)
Increase: Hypotension—other antihypertensives, alcohol, thiazide diuretics
Increase: Effects of beta-blockers (metoprolol, propranolol)

Decrease: HydrALAZINE effects—NSAIDs, estrogens

Drug/Lab Test

Decrease: HB, WBC, RBC, platelets, neutrophils

Positive: ANA titer

Drug/Food

Increase: drug absorption; have patient take with food

NURSING CONSIDERATIONS

Assess:

- **Cardiac status:** B/P q15min × 2 hr, then q1hr × 2 hr, then q4hr after IV dose; pulse, jugular venous distention q4hr, after IV administration
- Electrolytes, blood studies: potassium, sodium, chloride, carbon dioxide, CBC, serum glucose, LE prep, ANA titer before, during treatment; assess for fever, joint pain, rash, sore throat (lupuslike symptoms); notify prescriber
- Number of refills to determine compliance (PO)
- Weight daily, I&O, edema in feet, legs daily, skin turgor, dryness of mucous membranes for hydration status
- For renal disease: dosage and administration are altered in reduced CCr, dialysis
- Crackles, dyspnea, orthopnea
- IV site for extravasation, rate
- Mental status: affect, mood, behavior, anxiety; check for personality changes
- **Beers:** use with caution in older adults; may exacerbate syncope in those with a history of syncope
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; 3rd-trimester toxicity has occurred; use caution in breastfeeding

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To take with food to increase bioavailability (PO)
- To avoid OTC, herbals, supplements unless directed by prescriber
- To notify prescriber if chest pain, severe fatigue, fever, muscle or joint pain, rash, sore throat; tingling, pain in hands, feet, pyridoxine can be used
- To rise slowly to prevent orthostatic hypotension
- That follow-up will be needed; to comply with other requirements, such as exercise, weight loss, avoidance of smoking
- To notify providers of product use prior to surgery
- To avoid driving or other hazardous activities until response is known; drowsiness, dizziness may occur
- To weigh 2× per wk and check lower extremities for swelling
- To take as prescribed, not to skip or double doses, to take at the same time of the day, if dose is missed, take when remembered, do not discontinue abruptly
- To notify prescriber if pregnancy is suspected or planned or if breastfeeding

TREATMENT OF OVERDOSE:

Administer vasopressors, volume expanders for shock; if PO, lavage if recently ingested, digitalization

hydrochlorothiazide (Rx)

(hye-droe-klor-oh-thye'a-zide)

Urozide

Func. class.: Thiazide diuretic, antihypertensive

Chem. class.: Sulfonamide derivative

ACTION: Acts on distal tubule and ascending limb of loop of Henle by increasing excretion of water, sodium, chloride, potassium

USES: Edema, hypertension, diuresis, HF; idiopathic lower extremity edema therapy

Unlabeled uses: Diabetes insipidus, hypercalciuria, nephrolithiasis, premenstrual syndrome, renal calculus

CONTRAINDICATIONS:
Hypersensitivity to thiazides or sulfonamides, preeclampsia, anuria, renal decompensation

Precautions: Pregnancy, breastfeeding, hypokalemia, renal/hepatic disease, gout, COPD, LE, diabetes mellitus, hyperlipidemia, CCr <30 mL/min, hypomagnesemia

DOSAGE AND ROUTES
Hypertension

Adult/adolescent: PO 12.5-25 mg/day, may increase to 50 mg/day in 1-2 divided doses, max 100 mg/day

Edema

Adult: PO 25-100 mg in 1-2 divided doses

Child 6 mo-12 yr: PO 1-2 mg/kg/day in 1 or 2 divided doses, may increase to max 37.5 mg/day (child 6 mo-2 yr) 100 mg/day (child 2-12 yr)

Child <6 mo: PO 1-3 mg/kg/day in 1 or 2 divided doses, max 37.5 mg/day

Renal dose:

- **Adult: PO** CCr <30 mL/min, do not use; not effective

Available forms: Tabs 12.5, 25, 50, 100 mg; caps 12.5 mg

Administer:

PO route

- In AM to avoid interference with sleep if using product as a diuretic; tab may be crushed, mixed with food
- Potassium replacement if potassium <3 mg/dL, replace magnesium if needed
- With food; if nausea occurs, absorption may be decreased slightly

SIDE EFFECTS
CNS: Drowsiness, paresthesia, depression, headache, *dizziness, fatigue, weakness,* fever

CV: Irregular pulse, *orthostatic hypotension,* palpitations, volume depletion, allergic myocarditis

EENT: Blurred vision

ELECT: *Hypokalemia,* hypercalcemia, hyponatremia, hypochloremia, hypomagnesemia

GI: *Nausea, vomiting, anorexia,* constipation, diarrhea, cramps, pancreatitis, GI irritation, hepatitis, jaundice

GU: *Urinary frequency,* polyuria, uremia, glucosuria, hyperuricemia, renal failure, erectile dysfunction

HEMA: Aplastic anemia, hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenia, neutropenia

INTEG: *Rash,* urticaria, purpura, photosensitivity, alopecia, erythema multiforme

META: *Hyperglycemia, hyperuricemia,* increased creatinine, BUN

SYST: Stevens-Johnson syndrome

PHARMACOKINETICS
PO: Onset 2-6 hr, peak 1-5 hr, duration 6-12 hr, half-life 6-15 hr, excreted unchanged by kidneys, crosses placenta, enters breast milk

INTERACTIONS
Increase: hyperglycemia, hyperuricemia, hypotension risk—diazoxide

Increase: hypokalemia risk—corticosteroids, amphotericin B, topiramate

Increase: toxicity—lithium, non-depolarizing skeletal muscle relaxants, cardiac glycosides

Increase: hypersensitivity reaction risk with allopurinol, monitor level

Decrease: thiazide effect—NSAIDs, monitor renal function

Increase: effects—loop diuretics

Decrease: effects—antidiabetics, monitor glucose

Decrease: thiazides absorption—cholestyramine, colestipol

Drug/Herb

Increase: severe hypokalemia—licorice

Drug/Lab Test

Increase: parathyroid test, uric acid, calcium, glucose, cholesterol, triglycerides

Decrease: potassium, sodium, HB, WBC, platelets

NURSING CONSIDERATIONS
Assess:

- B/P, pulse; weight, I&O, electrolytes baseline and periodically to determine fluid loss; effect of product may be decreased if used daily
- **Hypersensitivity to sulfonamides:** if skin rash occurs, discontinue product; fatal Stevens-Johnson syndrome may occur

- **Hypertension:** B/P lying, standing; postural hypotension may occur
- Blood studies: BUN, blood glucose, CBC, serum creatinine, uric acid
- **Signs of hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness, dehydration; monitor potassium
- **Signs of metabolic alkalosis**, restlessness, drowsiness
- Confusion, especially in geriatric patients; take safety precautions if needed
- **Beers:** use with caution in older adults; may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion or hyponatremia
- **Pregnancy, breastfeeding:** may affect fetus, crosses placental barrier, if using for hypertension before pregnancy continue; do not breastfeed

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily; decreased B/P

Teach patient/family:

- To rise slowly from lying or sitting position to prevent postural hypotension
- To notify prescriber of muscle weakness, cramps, nausea, dizziness; hypokalemia is common; rash
- That product may be taken with food or milk
- To use sunscreen for photosensitivity
- That blood glucose may be increased in diabetics
- To take early in day at same time of day to avoid nocturia
- To avoid alcohol, OTC meds unless approved by prescriber
- To monitor weight and notify prescriber of changes
- To discuss dietary potassium requirements
- That follow-ups and routine lab tests will be required
- How to take B/P, to continue with other medical regimens (weight loss, exercise), that effect in hypertension may take several weeks

TREATMENT OF OVERDOSE: Lavage if recently ingested orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status; provide supportive care

⚠ HIGH ALERT

HYDROcodone (Rx)

REMS

(hye-droe-koe′done)

Hysingla ER, Zohydro ER

HYDROcodone/acetaminophen (Rx)

Lorcet Plus, Lortab, Norco, Verdrocet, Vicodin, Vicodin ES, Vicodin HP, Xodol 10/300, Xodol 5/300, Xodol 7.5/300

Func. class.: Antitussive opioid analgesic/nonopioid analgesic

Controlled Substance Schedule II

Do not confuse:
HYDROcodone/hydrocortisone/oxycodone/HYDROmorphone

ACTION: Binds to opiate receptors in CNS to reduce pain

USES: Moderate to severe pain

CONTRAINDICATIONS: Abrupt discontinuation; hypersensitivity to this product, benzyl; GI obstruction; status asthmaticus

Black Box Warning: Respiratory depression

Precautions: Pregnancy, breastfeeding, neonates, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, renal/hepatic disease, bowel impaction, urinary retention, viral infection, ulcerative colitis, seizures, sulfite hypersensitivity, psychosis, hypertension, hyperthyroidism

Black Box Warning: Accidental exposure; neonatal opioid withdrawal syndrome; potential for overdose or poisoning, substance abuse, ethanol ingestion, benzodiazepines

DOSAGE AND ROUTES

Analgesic

- **Adult: PO** 2.5-10 mg q3-6hr as needed; if using with acetaminophen max 4 g/day, total of 5 tablets with ibuprofen combination tablets; **ext rel (Zohydro ER)** 10 mg q12hr, may increase by 10 mg q12hr q3-7days as needed; **ext rel (Hysingla)** 20 mg daily, may increase by 10-20 mg q3-5day
- **Child 1-3 yr: PO** 0.1-0.2 mg/kg q3-4hr

Antitussive

- **Adult: PO** 5 mg q4-6hr as needed
- **Child: PO** 0.6 mg/kg/day divided q6-8hr, max <2 yr, 1.25 mg/dose; 2-12 yr, 5 mg/dose; >12 yr, 10 mg/dose

Renal dose

- **Adult: PO** CCr <45 mL/min-Hysingla decrease dose by 50% initially

Hepatic dose

- **Adult: PO** Hysingla decrease by 50% initially

Available forms: ***Hydrocodone:*** **Extended release (Zohydro ER)** 10, 15, 20, 30, 40, 50 mg; **(Hysingla ER)** 20, 30, 40, 60, 80, 100, 120 mg; syrup: 1 mg/mL ***Hydrocodone/acetaminophen:*** **Tablet** 2.5 mg hydrocodone/325 acetaminophen; 5 mg hydrocodone/325 acetaminophen; 7.5 mg hydrocodone/325 acetaminophen; 15 mg hydrocodone/325 acetaminophen; 10 mg hydrocodone/325 acetaminophen; **oral solution** 7.5 mg hydrocodone/325 acetaminophen/15 mL, 10 mg hydrocodone/325 acetaminophen/15 mL

Administer:

- Check product carefully before using; fatalities have occurred using wrong dose, wrong product, given only by those knowledgable in use of opioids
- Do not break, crush, or chew tabs; only scored tabs can be broken
- With antiemetic after meals if nausea or vomiting occurs

Black Box Warning: Do not exceed 4 g acetaminophen with combination product

- Give with food or milk to prevent gastric upset
- Store in light-resistant area at room temperature

Extended-release route

- May need short- or rapid-acting opioid for breakthrough pain
- Swallow caps whole, do not crush or chew

SIDE EFFECTS

CNS: *Drowsiness,* dizziness, light-headedness, confusion, headache, sedation, euphoria, dysphoria, weakness, hallucinations, mood changes, dependence, seizures
CV: Tachycardia, bradycardia, QT prolongation (Hysingla)
EENT: Blurred vision, miosis, diplopia
GI: *Nausea, vomiting, anorexia, constipation,* esophageal obstruction, choking
GU: Urinary retention
INTEG: Rash, sweating, flushing, pruritus
META: Dehydration
RESP: Respiratory depression, cough, respiratory arrest (child), pulmonary edema

PHARMACOKINETICS

Hydrocodone: Onset unknown, peak 6-30 hr (Hysingla ER), 5 hr (Zohydro ER), duration unknown, half-life 7-9 hr
Hydrocodone/acetaminophen: Onset 10 min, peak 1-1.6 hr (hydrocodone), 0.5-1 hr (acetaminophen); duration 4-8 hr, half-life 3.3-4.4 hr, metabolized in liver, excreted in urine, crosses placenta

INTERACTIONS

Black Box Warning: Increase: anticholinergic effects—anticholinergics

Black Box Warning: Increase: CNS depression—alcohol, opioids, sedative/hypnotics, phenothiazines, skeletal muscle relaxants, general anesthetics, tricyclics

Black Box Warning: Increase hydrocodone effect—CYP3A4 inhibitors

Increase: Serotonin syndrome—SNRIs, SSRIs, TCAs, traZODone, vilazodone, monitor for serotonin syndrome
Increase: Severe reactions—MAOIs, separate by ≥14 days

Black Box Warning: Decrease: hydrocodone effect—CYP3A4 inducers

Drug/Herb
Increase: CNS depression—lavender, valerian, chamomile, Kava
Decrease: hydrocodone effect—St. John's wort
Drug/Lab Test
Increase: cholesterol, GGT
Decrease: potassium

NURSING CONSIDERATIONS

Assess:
- **Pain:** intensity, type, location, other characteristics before, 1 hr after giving product; titrate upward by 25% until pain reduced by half; need for pain medication, physical dependence; opioid is more effective before pain is severe
- **CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

Black Box Warning: Respiratory depression: do not use in those with respiratory depression; monitor for decreased respiratory rate, reduced urge to breathe, sighing breathing pattern; CO_2 retention, respiratory depression may worsen, sedation; an opioid antagonist may be needed

- **Hypersensitivity:** Assess for reactions in those with hypersensitivity to other opiates

Black Box Warning: Accidental exposure: may cause fatal overdose; do not use with ethanol; check all medications for alcohol content

- **Opioid addiction:** identify opioid addiction or use before starting product; if product has been used by snorting, fatal reactions have occurred
- B/P, pulse, respirations before, periodically; if respirations <10/min, dose may need to be reduced, oversedation may occur
- May decrease sex hormone levels after long-term use
- **Bowel status:** constipation; provide fluids, fiber in diet; may need stimulant laxatives if opioid use exceeds 3 days

Black Box Warning: Neonatal opioid withdrawal syndrome: monitor neonate for withdrawal (irritability, hyperactivity, abnormal sleep patterns, high-pitched crying, tremor, vomiting, diarrhea)

- **Allergic reactions:** rash, urticaria; stop product
- Cough and respiratory dysfunction: respiratory depression, character, rate, rhythm
- **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function

Black Box Warning: Pregnancy/breastfeeding: use only if benefits outweigh fetal risk; neonatal withdrawal syndrome may occur if used for prolonged periods in pregnancy; do not use in breastfeeding, excretion in breast milk

Evaluate:
- Therapeutic response: decrease in pain or cough

Teach patient/family:
- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result when used for extended periods
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid driving, other hazardous activities because drowsiness occurs
- To avoid other CNS depressants; they will enhance sedating properties of this product
- To change positions slowly to reduce orthostatic hypotension

- To take as directed, not to double doses or exceed doses, not to discontinue abruptly, taper, there is a high abuse potential
- To notify provider if pain is not adequately controlled
- For dry mouth, use sugarless gum, frequent sips of water, use food, good oral hygiene
- To notify prescriber of relief of pain

Black Box Warning: Not to exceed 4000 mg in combination product with acetaminophen; check all other products that may contain acetaminophen

Black Box Warning: **Ethanol ingestion:** that a patient's use with ethanol can lead to serious overdose or death; not to use with other medications containing ethanol unless directed by prescriber

Black Box Warning: **Neonatal opioid withdrawal syndrome:** that this syndrome can be fatal; that it results from prolonged maternal use of long-acting opioids

- To notify prescriber if pregnancy is planned or suspected

TREATMENT OF OVERDOSE:
Naloxone HCl (Narcan) 0.2-0.8 mg IV, O_2, IV fluids, vasopressors

hydrocortisone (Rx)
(hy-dro-kor′tih-sone)
Alkindi Sprinkle, Cortef, Cortenema
hydrocortisone acetate (topical/rectal) (Rx)
Anusol HC, Cortaid, Corticaine, Cortifoam
hydrocortisone sodium succinate (Rx)
Solu-Cortef
Func. class.: Corticosteroid
Chem. class.: Short-acting glucocorticoid

Do not confuse:
hydrocortisone/HYDROcodone/hydroxychlorothiazide
Solu-Cortef/Solu-Medrol

ACTION:
Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability, and lysosomal stabilization

USES:
Severe inflammation, adrenal insufficiency, ulcerative colitis, collagen disorders, asthma, COPD, SLE, Stevens-Johnson syndrome, ulcerative colitis, TB
Unlabeled uses: Carpal tunnel syndrome, Churg-Strauss syndrome, endophthalmitis, mixed connective-tissue disease, multiple myeloma, polyarteritis nodosa, polychondritis, pulmonary edema, temporal arteritis, Wegener's granulomatosis, septic shock

CONTRAINDICATIONS:
Fungal infection, hypersensitivity
Precautions: Pregnancy, breastfeeding, children <2 yr, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, metastatic carcinoma, psychosis, idiopathic thrombocytopenia (IM), acute glomerulonephritis, amebiasis, nonasthmatic bronchial disease, AIDS, TB, recent MI (associated with left ventricular rupture), Cushing syndrome, hepatic disease, hypothyroidism, coagulopathy, thromboembolism

DOSAGE AND ROUTES
Most disorders
- **Adult: PO** 20-240 mg daily in divided doses; **IM/IV** 100-500 mg (succinate), may repeat q2-6hr
- **Child: PO** 2-8 mg/kg/day (60-240 mg/m^2/day as a single or divided dose; **IM/IV** 0.666-4 mg/kg (20-120 mg/m^2) q12-24hr

Adrenocortical insufficiency
- **Child: PO** 0.56 mg/kg/day (15-20 mg/m^2/day) as a single dose or divided

dose; **IM/IV** 0.186-0.28 mg/kg/day (10-12 mg/m^2/day) in 3 divided doses

Shock prevention

- **Adult: IM/IV** (succinate) 50 mg/kg repeated after 4 hr; repeat q24hr as needed

Colitis

- **Adult: PO** 20-240 mg (base)/day in 2-4 divided doses; **ENEMA** 100 mg nightly for 21 days; **FOAM** 1 applicatorful 1-2×/day × 2-3 wk
- **Child: PO** 2-8 mg (base)/kg/day or 60-240 mg (base)/m^2/day in 3-4 divided doses

Available forms: Hydrocortisone: enema: 100 mg/60 mL; tabs 5, 10, 20 mg; oral granules in capsule for opening; **Acetate: rectal suppository:** 25, 30 mg; tabs 5, 10, 20 mg; **Succinate:** injection 100-, 250-, 500-, 1000-mg vial

Administer:

Daily dose in AM for better results

- In one dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue
- Do not use acetate or susp for IV; salts are not interchangeable

PO route

- With food or milk for GI symptoms

IM route

- IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21-G needle

IV route

- **Succinate:** IV in mix-o-vial or reconstitute ≤250 mg/2 mL bacteriostatic water for inj (50 mg/mL); mix gently; give direct IV over ≥1 min; may be further diluted in 100, 250, 500, or 1000 mL of D_5W, D_5 0.9%, NaCl 0.9% given over ordered rate; for doses ≥500 mg give over 10 min

Sodium succinate

Y-site compatibilities: Acyclovir, acetaminophen, alemtuzumab, alfentanil, allopurinol, amifostine, amphotericin B cholesteryl, ampicillin, amrinone, amsacrine, atracurium, atropine, aztreonam, betamethasone, calcium gluconate, cefepime, cefmetazole, cephalothin, chlordiazePOXIDE, chlorproMAZINE, cisatracurium, cladribine, cyanocobalamin, cytarabine, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, DOXOrubicin liposome, droperidol, edrophonium, enalaprilat, EPINEPHrine, esmolol, estrogens conjugated, ethacrynate, famotidine, fentaNYL, fentaNYL/droperidol, filgrastim, fludarabine, fluorouracil, foscarnet, furosemide, gallium, granisetron, heparin, hydrALAZINE, insulin (regular), isoproterenol, kanamycin, lidocaine, LORazepam, magnesium sulfate, melphalan, menadiol, meperidine, methicillin, methoxamine, methylergonovine, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, prednisoLONE, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, remifentanil, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan, trimethobenzamide, vecuronium, vinorelbine, zoledronic acid

SIDE EFFECTS

CNS: *Depression, flushing, sweating,* psychosis, headache, mood changes, pseudotumor cerebri, euphoria, insomnia, seizures

CV: *Hypertension,* edema

EENT: Increased intraocular pressure, blurred vision, cataracts, glaucoma

GI: *Diarrhea, nausea,* abdominal distention, GI hemorrhage, pancreatitis, vomiting

HEMA: Thrombophlebitis, thromboembolism

INTEG: Acne, poor wound healing, ecchymosis, petechiae

MISC: Adrenal insufficiency (after stress/withdrawal), pheochromocytoma

MS: Fractures, osteoporosis, weakness

PHARMACOKINETICS

Metabolized by liver, excreted in urine (17-OHCS, 17-KS), crosses placenta

PO: Peak 1-2 hr, duration 1-1½ days

IM/IV: Onset 20 min, peak 4-8 hr, duration 1-1½ days

IV: Peak 1-2 hr

RECT: Onset 3-5 hr

INTERACTIONS

Increase: GI bleeding risk—salicylates, NSAIDs, acetaminophen
Increase: side effects—alcohol, amphotericin B, digoxin, cycloSPORINE, diuretics
Increase: neurologic reactions—live virus vaccines/toxoids
Decrease/Increase: anticoagulation—oral anticoagulants
Decrease: hydrocortisone action—bosentan, cholestyramine, colestipol, barbiturates, rifampin, phenytoin, theophylline, carBAMazepine
Decrease: anticoagulant effects, anticonvulsants, antidiabetics, calcium supplements, toxoids, vaccines

Drug/Herb

Decrease: hydrocortisone levels—ephedra

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium, glucose
Decrease: calcium, potassium, T_4, T_3, thyroid ^{131}I uptake test, urine 17-OHCS, 17-KS
False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood glucose, urine glucose while patient receiving long-term therapy; hypokalemia and hyperglycemia; potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- B/P, pulse; notify prescriber of chest pain
- I&O ratio; be alert for decreasing urinary output, increasing edema; weight daily, notify prescriber of weekly gain >5 lb
- **Cushingoid symptoms:** weight gain, purple striae, bruising skin, weakness, acne, personality changes, hypertension, unusual hair growth
- **Adrenal insufficiency:** nausea, anorexia, hypotension, weight loss, disorientation, fatigue, dizziness, weakness
- Plasma cortisol levels during long-term therapy (normal level: 138-635 nmol/L SI units when drawn at 8 AM)
- **Infection:** increased temperature, WBC even after withdrawal of medication; product masks infection
- Mental status: affect, mood, behavioral changes, aggression
- **GI effects:** nausea, vomiting, anorexia or appetite stimulation, diarrhea, constipation, abdominal pain, hiccups, gastritis, pancreatitis, GI bleeding/perforation with long-term treatment
- **Beers:** avoid in older adults with delirium or at high risk for delirium
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk, avoid use in 1st trimester, usually compatible with breastfeeding

Evaluate:

Therapeutic response: decreased inflammation, GI symptoms

Teach patient/family:

- That emergency ID as corticosteroid user should be carried
- To immediately report abdominal pain, black tarry stools because GI bleeding/perforation can occur; if received by epidural route, to report immediately a change in vision, severe headache, seizures, weakness (emergency response needed)
- To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed; about signs of infection
- Not to discontinue abruptly because adrenal crisis can result; that product should be tapered
- That supplemental calcium/vit D may be needed if patient is receiving long-term therapy
- That product can mask infection and cause hypo/hyperglycemia (diabetic)
- To avoid OTC, herbals, supplements: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
- About adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, moon face
- To avoid live-virus vaccines if using steroids long term

hydrocortisone nasal
See Appendix B

hydrocortisone (topical) (OTC)

(hye-droe-kor′ti-sone)

Ala-Cort, Ala-Scalp, Anusol HC, Cetacort, Cortizone-10 Scalpion, Procort, Texacort

hydrocortisone butyrate (Rx)

Locoid, Locoid Lipocream

hydrocortisone probutate (Rx)

Pandel

hydrocortisone valerate (Rx)

Func. class.: Corticosteroid, topical

ACTION: Crosses cell membrane to attach to receptors to decrease inflammation, itching, inhibits multiple inflammatory cytokines

USES: Inflammation/itching in corticosteroid-responsive dermatoses on the skin, rectal area

CONTRAINDICATIONS: Hypersensitivity

Precautions: Pregnancy, breastfeeding, children

DOSAGE AND ROUTES

Corticosteroid-responsive dermatoses, inflammation, pruritus

• **Adult/child: TOP** apply to affected area 1 to 4 times per day

Inflammation from proctitis

• **Adult: RECTAL** 1 applicator full of foam once or twice a day × 2-3 wk, then every other day as needed; suppository: 1 bid × 2 wk

Available forms:

Hydrocortisone: cream 0.5%, 1%, 2.5%; gel 1%, 2%; lotion 0.25%, 1%, 2%, 2.5%; ointment 0.5%, 1%, 2.5%; rectal cream 1%; rectal ointment 1%; spray 1%; solution 1%, 2.5%; **Hydrocortisone acetate:** cream 0.5%, 1%, 2%, 2.5%; lotion 0.5%; ointment 0.5%, 1%; rectal foam 90 mg/application; suppositories 25 mg, 30 mg; **Hydrocortisone butyrate:** cream 0.1%; ointment 0.1%; lotion; **Hydrocortisone probutate:** cream 0.1%; **Hydrocortisone valerate:** cream 0.2%, ointment 0.2%

Administer:

Topical route

• May be used with dressings

Cream/ointment/lotion

• Apply sparingly in a thin film and rub gently

SIDE EFFECTS

CNS: Seizures, increased intracranial pressure, headache

CV: Hypertension

EENT: Cataracts, glaucoma

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration

MISC: Hyperglycemia, glycosuria, HPA suppression

PHARMACOKINETICS

Unknown, minimally absorbed

NURSING CONSIDERATIONS

Assess:

• Skin reactions: burning, pruritus, folliculitis, dermatitis

Evaluate:

• Decreasing itching, inflammation on the skin, rectal area

Teach patient/family:

Topical route

• That product may be used with dressings

Cream/ointment/lotion

• To apply sparingly in a thin film and rub gently into the affected area

Gel

• To apply sparingly in a thin film and rub gently

Rectal

• To remove wrapper and insert suppository

⚠ HIGH ALERT

HYDROmorphone (Rx)

REMS

(hye-droe-mor'fone)

Dilaudid, Hydromorph Contin, Jurnista

Func. class.: Opiate analgesic

Chem. class.: Semisynthetic phenanthrene

Controlled Substance Schedule II

Do not confuse:
HYDROmorphone/meperidine/morphine
Dilaudid/Demerol

ACTION: Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

USES: Moderate to severe pain

CONTRAINDICATIONS: Hypersensitivity to this product/sulfite, COPD, cor pulmonale, emphysema, GI obstruction, ileus, increased intracranial pressure, obstetric delivery, status asthmaticus

Black Box Warning: Respiratory depression, opioid-naive patients

Precautions: Pregnancy, breastfeeding, children <18 yr, addictive personality, renal/hepatic disease, abrupt discontinuation, adrenal insufficiency, angina, asthma, biliary tract disease, bladder obstruction, hypothyroidism, hypovolemia, hypoxemia, IBD, IV use, lactase/paraben deficiency, labor, latex hypersensitivity, myxedema, seizure disorders, sleep apnea

Black Box Warning: Substance abuse, accidental exposure, potential for overdose/poisoning, neonatal opioid withdrawal syndrome

DOSAGE AND ROUTES

Analgesic

- **Adult: PO** (oral solution) 2.5-10 mg q3-6hr or (tabs) 2-4 mg q4-6hr; **EXT REL:** convert to **EXT REL** by giving total daily dose of immediate release/day, in 1 daily dose, if needed titrate **EXT REL** q3-4days until adequate pain relief; use 25%-50% increase for each titration step, if more than 2 doses of rescue medication needed in 24 hr consider titration; **IV** 0.2-1 mg q2-3hr given over 2-3 min; **IM/SUBCUT** 1-2 mg q4-6hr prn, may be increased (opioid-naive patients may require lower dose); **RECT** 3 mg q6-8hr prn
- **Geriatric: PO** 1-2 mg q4-6hr
- **Child >50 kg (unlabeled): PO** 2-4 mg q3-4hr in opioid-naive patients, titrate; **IV** 0.2-1 mg q2-4hr or 0.3 mg/kg infusion (opioid-naive will require lower dose)
- **Infant >6 mo/child <50 kg (unlabeled): PO** 0.04-0.08 mg/kg q3-4hr in opioid-naive patients, titrate; **IV** 0.015-0.02 mg/kg q2-4hr or 0.006 mg/kg/hr infusion (opioid-naive)

Renal dose

- **Adult: PO (moderate impairment) ext rel** decrease dose by 50%, **severe impairment** decrease dose by 75%

Hepatic disease

- **Adult: Child-Pugh B, or C (oral liquid, immediate rel tab, supp)** give reduced dose based on response, impairment **(parenteral),** give 25%-50% of dose **(moderate impairment)**

Available forms: Powder for inj 250 mg; inj 1, 2, 4, 10 mg/mL; tabs 2, 4, 8 mg; supp 3 mg; oral sol 5 mg/5 mL; ext rel tab 8, 12, 16, 32 mg

Administer:

PO route

- Give with food or milk for GI irritation
- **Ext rel (Exalgo):** discontinue all other ext rel opioids, give q24hr; do not crush, break, chew
- When pain is beginning to return; determine interval by response
- Store in light-resistant area at room temperature

Black Box Warning: Do not use ext rel products in opioid-naive patients or with other ext rel opioids; do not use with other ext rel hydromorphone products; may be fatal

Extended release

- **Converting from oral opioids:** initiate ext rel tabs at 50% of total daily equivalent dose of ext rel, give q24hr; max increase q3-4days, titrate increases of 25%-50% with each step
- **Converting from transdermal patch (fentaNYL):** initiate ext rel tabs 18 hr after removal of patch; for each 25 mcg/hr dose of transdermal fentaNYL dose is 12 mg q24hr, start dose at 50% of HYDROmorphone ext rel dose q24hr; titrate no more often than q3-4days, may increase dose of 25%-50% with each step; if more than 2 rescue doses are required in 24 hr, consider titration

SUBCUT route

- Use short 30-G needle; make sure not to inject ID
- Rotate inj sites

IM route

- Rotate sites

IV route

- **Direct,** diluted with 5 mL sterile water or NS; give through Y-connector or 3-way stopcock; give ≤2 mg over 3-5 min, very slowly
- **IV INFUSION:** Dilute each 0.1-1 mg/mL NS (0.1-1 mg/mL), deliver by opioid syringe infuser; may be diluted in D_5W, D_5/NaCl, 0.45% NaCl, NS for larger amounts, delivery through infusion pump

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amikacin, amsacrine, aztreonam, cefamandole, cefepime, cefoperazone, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, chloramphenicol, cisatracurium, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, diltiazem, DOBUTamine, DOPamine, DOXOrubicin, DOXOrubicin liposome, doxycycline, EPINEPHrine, erythromycin lactobionate, famotidine, fentaNYL, filgrastim, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, kanamycin, labetalol, LORazepam, magnesium sulfate, melphalan, methotrexate, metroNIDAZOLE, midazolam, milrinone, morphine, nafcillin, niCARdipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, PACLitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, propofol, ranitidine, remifentanil, teniposide, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium, vinorelbine

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria,* mood changes, seizures

CV: Palpitations, bradycardia, change in B/P, hypotension, tachycardia, peripheral vasodilation

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation, cramps,* dry mouth, paralytic ileus

GU: Increased urinary output, dysuria, urinary retention

INTEG: *Rash,* urticaria, bruising, flushing, diaphoresis, pruritus

RESP: Respiratory depression, dyspnea

MISC: Physical/psychologic dependence

PHARMACOKINETICS

IM: Onset 15-30 min, peak ½-1 hr, duration 4-5 hr, metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-3 hr

INTERACTIONS

Increase: effects—other CNS depressants (alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants)

Increase: CNS, respiratory depression—MAOIs, separate by ≥14 days

Decrease: HYDROmorphone effects—opiate antagonists

Drug/Herb

Increase: action—chamomile, hops, kava, lavender, St. John's wort, valerian

Drug/Lab Test

Increase: amylase

NURSING CONSIDERATIONS

Assess:

- **Pain:** control, sedation by scoring on 0-10 scale, around-the-clock dosing is best for pain control

Black Box Warning: Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations <10/min

Black Box Warning: Substance abuse/opioid addiction: assess for previous or current substance abuse; risk for abuse will be increased in these patients; assess for misuse of medication

- I&O ratio; check for decreasing output; may indicate urinary retention
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Bowel function, constipation
- Allergic reactions: rash, urticaria
- Need for pain medication, physical dependence
- Assistance with ambulation
- Safety measures: side rails, night-light, call bell within easy reach
- **Beers:** avoid in older adults unless safer alternative is unavailable; may cause ataxia, impaired psychomotor function
- **Pregnancy/breastfeeding:** use only if benefits outweigh fetal risk; neonatal withdrawal syndrome may occur if used in pregnancy for prolonged periods; do not breastfeed

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That product is contained in a hard tablet shell that may be seen in a bowel movement, which is normal
- Not to stop taking the product without discussing with provider

Black Box Warning: Substance abuse: that physical dependency may result when used for extended periods; that withdrawal symptoms—nausea, vomiting, cramps, fever, faintness, anorexia—may occur

- To avoid driving, other hazardous activities because drowsiness occurs; to take with food if nausea occurs

Black Box Warning: That extended-release products must be taken whole; not to use with alcohol, medications with alcohol content

- To notify provider if pain is not controlled adequately
- To use sugarless gum, frequent sips of water for dry mouth, use good oral hygiene

TREATMENT OF OVERDOSE: Naloxone (Narcan) 0.2-0.8 mg IV (nontolerant patients), O_2, IV fluids, vasopressors

hydroxychloroquine (Rx)

(hye-drox-ee-klor′oh-kwin)

Apo-Hydroxyguine ✱, Plaquenil

Func. class.: Antimalarial, antirheumatic (DMARDs)

Chem. class.: 4-Aminoquinoline derivative

H

ACTION: Impairs complement-dependent antigen–antibody reactions

USES: Malaria caused by susceptible strains of *Plasmodium vivax, P. malariae, P. ovale, P. falciparum* (some strains); SLE, rheumatoid arthritis

Unlabeled uses: Lupus nephritis polymorphous-light eruptions

CONTRAINDICATIONS: Hypersensitivity to this product or chloroquine; retinal field changes

Precautions: Pregnancy, breastfeeding, blood dyscrasias, severe GI disease, neurologic disease, alcoholism, hepatic disease, G6PD deficiency, psoriasis, eczema, children, ocular disease

DOSAGE AND ROUTES

Malaria

- **Adult: PO Suppression or prevention:** 400 mg/wk, begin 2 wk before travel to endemic area, continue 4 wk after returning; **treatment:** 800 mg, then 400 mg after 6-8 hr, then 400 mg/day on 2nd and 3rd day, total dose 2 g
- **Child: PO Suppression or prevention:** 6.4 mg/kg (5 mg/kg base) weekly,

begin 1-2 wk before travel to endemic area, continue 4 wk after returning; **treatment:** 10 mg/kg, 6.4 mg/kg (5 mg/kg base) at 6, 18, 24 hr after 1st dose

Lupus erythematosus

- **Adult: PO** 200-400 mg (310 mg base) daily or divided twice daily; length depends on patient response; maintenance: 200-400 mg/day
- **Child (unlabeled): PO** 5 mg/kg/day, max 400 mg/day; long-term therapy is contraindicated

Rheumatoid arthritis

- **Adult: PO** 400-600 mg daily or divided twice daily for 4-12 wk, then 200-400 mg/day after good response

Available forms: Tabs 200 mg

Administer:

PO route

- Tabs may be crushed and mixed with food, fluids
- With food or milk; at same time each day to maintain product level
- Store in tight, light-resistant container at room temperature; keep inj in cool environment

SIDE EFFECTS

CNS: Headache, fatigue, irritability, seizures, bad dreams, dizziness, confusion, psychosis, anxiety, suicidal ideation

CV: HF, Torsades de pointes, QT prolongation, asystole with syncope

EENT: *Blurred vision, corneal changes,* tinnitus, vertigo, nystagmus, corneal deposits

GI: *Nausea, vomiting, anorexia,* diarrhea, cramps

HEMA: Thrombocytopenia, agranulocytosis, leukopenia, aplastic anemia

INTEG: Pruritus, exfoliative dermatitis, alopecia, Stevens-Johnson syndrome, photosensitivity, DRESS, rash, pruritus

PHARMACOKINETICS

Peak 3 hr; half-life 32-50 days; metabolized in liver; excreted in urine, feces, breast milk; crosses placenta, protein binding 45%

INTERACTIONS

Increase: digoxin, methotrexate levels

Increase: antibody titer—rabies vaccine

Decrease: hydroxychloroquine action—magnesium or aluminum compounds

Decrease: effect of—live virus vaccines, botulinum toxoids

NURSING CONSIDERATIONS

Assess:

- **SLE, malaria symptoms:** before treatment and daily
- **Rheumatoid arthritis:** pain, swelling, ROM, temperature of joints; for decreased reflexes: knee, ankle
- Ophthalmic exam at baseline for retinal toxicity then annually after 5 yr of use, or annually in those with increased risk factors
- Hepatic studies weekly: AST, ALT, bilirubin if patient receiving long-term treatment
- **Blood dyscrasias:** blood studies: CBC, platelets; WBC, RBC, platelets may be decreased; if severe, product should be discontinued; assess for malaise, fever, bruising, bleeding (rare)
- **ECG** during therapy: watch for depression of T waves, widening of QRS complex
- **Allergic reactions:** pruritus, rash, urticaria
- **Ototoxicity** (tinnitus, vertigo, change in hearing); audiometric testing should be done before, after treatment
- **Toxicity:** blurring vision, difficulty focusing, headache, dizziness, knee, ankle reflexes; product should be discontinued immediately
- **Pregnancy/breastfeeding:** increased rate of birth defects in the literature; CDC recommends this product for pregnant women with malaria or may be used in those with lupus; cautious use in breastfeeding

Evaluate:

- Therapeutic response: decreased symptoms of malaria, SLE, rheumatoid arthritis

Teach patient/family:

- To use sunglasses in bright sunlight to decrease photophobia; to wear protective clothing (photosensitivity)
- That urine may turn rust or brown; that skin may become blue-black

• To report hearing, visual problems, fever, fatigue, bruising, bleeding, which may indicate blood dyscrasias
RA: To report to provider if there is no change in condition, may need several months for results
Malaria prevention
• Discuss how to prevent mosquitoes in the environment
• Not to use with alcohol

TREATMENT OF OVERDOSE: Induce vomiting; gastric lavage; administer barbiturate (ultrashort acting), vasopressor, ammonium chloride; tracheostomy may be necessary

hydroxyprogesterone caproate (Rx)

(hye-droks-ee-proe-jes′te-rone cap′ro-ate)

Makena

Func. class.: Hormone, progesterone

USES: To reduce the risk of preterm birth

CONTRAINDICATIONS Hypersensitivity to hydroxyprogesterone caproate or any component; current or history of thrombosis or thromboembolic disorders; breast cancer or other hormone-sensitive cancer; undiagnosed abnormal vaginal bleeding unrelated to pregnancy; cholestatic jaundice of pregnancy; liver tumors (benign or malignant) or active liver disease; missed abortion; uncontrolled hypertension; as a diagnostic test for pregnancy

DOSAGE AND ROUTES

Adult female: IM (vial): 250 mg q7days SUBCUT 275 mg q7days; treatment may begin between 16 wk, 0 days and 20 wk, 6 days of gestation. Continue weekly administration until 37 wk (through 36 wk, 6 days) gestation or until delivery, whichever comes first

⚠ HIGH ALERT

hydroxyurea (Rx)

(hye-drox′ee-yoo-ree-ah)

Droxia, Hydrea, Siklos

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Synthetic urea analog

Do not confuse:
hydroxyurea/hydrOXYzine
Hydrea/Lyrica

ACTION: Acts by inhibiting DNA synthesis without interfering with RNA or protein synthesis; incorporates thymidine into DNA, thereby causing direct damage to DNA strands; specific for S phase of cell cycle

USES: Melanoma, chronic myelogenous leukemia, recurrent or metastatic ovarian cancer, squamous cell carcinoma of the head and neck, sickle cell anemia
Unlabeled uses: Acute myeloid leukemia, essential thrombocythemia, hypereosinophilic syndrome, meningioma, polycythemia vera

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, leukopenia (<2500/mm^3), thrombocytopenia (<100,000/mm^3), anemia (severe)
Precautions: Renal disease (severe), anemia, bone marrow suppression, dental disease, geriatric patients, HIV, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, infection, infertility, IM injection, tumor lysis syndrome, vaccinations

Black Box Warning: Secondary malignancy, bone marrow suppression

DOSAGE AND ROUTES

Ovarian cancer, malignant melanoma
• **Adult: PO** 80 mg/kg as a single dose q3days or 20-30 mg/kg as a single dose daily

Ovarian cancer in combination with radiation

- **Adult: PO** 80 mg/kg as a single dose q3days

Sickle cell anemia

- **Adult: PO** 15 mg/kg/day, may increase by 5 mg/kg/day q12wk, max 35 mg/kg/day

Chronic myelogenous leukemia (CML)/acute myelogenous leukemia (unlabeled)

- **Adult: PO** WBC >100,000/mm^3, 50-75 mg/kg/day; WBC <100,000/mm^3, 10-30 mg/kg/day; adjust for WBCs
- **Child: PO** 10-20 mg/kg/day, adjust to hematologic response

Renal disease

- **Adult: PO** CCr <59 mL/min use 50% of dose

Available forms: Caps 200, 300, 400, 500 mg

Administer:

- Gloves should be worn when handling bottles or caps, including by caregivers; wash hands immediately and thoroughly
- Do not crush or chew caps; caps can be opened and contents mixed with water
- Antiemetic 30-60 min before product and prn

SIDE EFFECTS

CNS: Headache, confusion, hallucinations, dizziness, seizures

CV: Angina, ischemia

GI: Nausea, vomiting, anorexia, diarrhea, stomatitis, constipation, hepatotoxicity, pancreatitis

GU: Increased BUN, uric acid, creatinine, temporary renal function impairment

HEMA: Leukopenia, anemia, thrombocytopenia, megaloblastic erythropoiesis

INTEG: *Rash,* urticaria, pruritus, dry skin, facial erythema

META: Hyperphosphatemia, hyperuricemia, hypocalcemia

MISC: Fever, chills, malaise, secondary cancers, tumor lysis syndrome

RESP: Pulmonary fibrosis, diffuse pulmonary infiltrates

PHARMACOKINETICS

Readily absorbed; peak 1-4 hr; degraded in liver; excreted in urine; almost totally eliminated within 24 hr; crosses blood-brain barrier; eliminated as CO_2; half-life 3.5-4.5 hr

INTERACTIONS

Increase: pancreatitis/hepatotoxicity—didanosine, stavudine

Increase: toxicity—radiation or other antineoplastics

Increase: bleeding risk—NSAIDs, anticoagulants, thrombolytics, salicylates, platelet inhibitors

Increase: uric acid levels—probenecid, sulfinpyrazone

- Do not use with live virus vaccines
- Do not use hematopoietic progenitor cells (sargramostim, filgrastim) 24 hr before or after antineoplastic

Drug/Lab Test

Increase: BUN, creatinine, LFTs, uric acid

False increase: urea, uric acid, lactic acid

Decrease: HB, WBC, platelets, phosphate, calcium

NURSING CONSIDERATIONS

Assess:

Black Box Warning: Bone marrow suppression: HB, total leukocyte count, and platelet count at least once a week during entire course; if the WBC is ≤2500/mm^3 or platelets are ≤100,000/mm^3, interrupt Hydrea until values closer to normal; if severe anemia occurs, manage without interrupting Hydrea; for Droxia, monitor blood counts q2wk and interrupt if neutrophils are <2000/mm^3, platelets are <80,000/mm^3, hemoglobin is <4.5 g/dL, or reticulocytes are <80,000/mm^3 when the HB <9 g/dL; after recovery, Droxia may be resumed at lower dosage; Droxia requires an experienced clinician knowledgeable in the use of this medication for the treatment of sickle cell anemia

- **Renal studies:** BUN; serum uric acid; urine CCr; electrolytes before, during therapy
- **Tumor lysis syndrome;** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia; uric acid nephropathy, acute renal failure, metabolic acidosis can also occur; alkalinization of urine, allopurinol may help prevent this
- I&O ratio; report fall in urine output to <30 mL/hr
- Monitor temperature; fever may indicate beginning infection
- Hepatic studies before, during therapy: bilirubin, alk phos, AST, ALT, LDH; prn or monthly; pancreatitis may also occur
- **Cutaneous vasculitic toxicity and gangrene:** more common in those who are receiving interferon
- **Bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
- Buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Pulmonary reactions:** assess for pulmonary fibrosis, fever, dyspnea, diffuse pulmonary infiltrates
- **Symptoms indicating severe allergic reaction:** rash, urticaria, itching, flushing
- **Neurotoxicity:** headaches, hallucinations, seizures, dizziness
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Black Box Warning: Secondary malignancy: leukemia may occur after extended use

- **Pregnancy/breastfeeding:** do not use in pregnancy/breastfeeding

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: elevated temperature, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid use of aspirin products, ibuprofen (thrombocytopenia)
- To avoid foods with citric acid, hot or rough texture if stomatitis is present
- To report stomatitis: any bleeding, white spots, ulcerations in the mouth; to examine mouth daily, report symptoms
- To inform provider if planning to receive vaccinations
- To wear gloves, wash hands before and after handling capsules
- To notify prescriber if pregnancy is planned or suspected
- To notify prescriber of fever, chills, sore throat, nausea, vomiting, anorexia, diarrhea, bleeding, bruising; may indicate blood dyscrasias; mental status changes, pancreatitis, hepatotoxicity

hydrOXYzine (Rx)

(hye-drox′i-zeen)

Atarax, Vistaril

Func. class.: Antianxiety/antihistamine/sedative/hypnotic, antiemetic

Chem. class.: Piperazine derivative

Do not confuse:

hydrOXYzine/hydrALAZINE

ACTION: Depresses subcortical levels of CNS, including limbic system, reticular formation; competes with H_1-receptor sites

USES: Anxiety preoperatively, prevention of nausea, vomiting postoperatively; to potentiate opioid analgesics; sedation; pruritus

CONTRAINDICATIONS: Pregnancy 1st trimester, breastfeeding; hypersensitivity to this product or cetirizine; acute asthma

Precautions: Pregnancy (2nd/3rd trimester), geriatric patients, debilitated patients, renal/hepatic disease, closed-angle glaucoma, COPD, prostatic hypertrophy, asthma

DOSAGE AND ROUTES

Anxiety

- **Adult: PO** 50-100 mg qid, max 400 mg/day; **IM** 50-100 mg q4-6hr
- **Child ≥6 yr: PO** 50-100 mg/day in divided doses, max 100 mg/day or 2 mg/kg/day
- **Child <6 yr: PO** 50 mg/day in divided doses, max 50 mg/day or 2 mg/kg/day

Alcohol withdrawal

- **Adult: IM** 50-100 mg q4-6hr

Preoperatively/postoperatively (nausea/vomiting)

- **Adult: IM** 25-100 mg q4-6hr
- **Child: IM** 1.1 mg/kg as a single dose

Pruritus

- **Adult: PO** 25 mg tid-qid; **IM** 50-100 mg, then q4-6hr prn, switch to **PO** as soon as feasible
- **Child ≥6 yr: PO** 50-100 mg/day in divided doses; **IM** 0.5-1 mg/kg/dose q4-6hr prn, use **PO** when possible
- **Child <6 yr: PO** 50 mg/day in divided doses

Renal dose

- **Adult: PO** CCr <50 mL/min, give 50% of dose

Available forms: Tabs 10, 25, 50 mg; caps 25, 50, 100 mg; syrup 2 mg/mL, 10 mg/5 mL; inj 25, 50 mg/mL; oral susp 25 mg/5 mL

Administer:

PO route

- Without regard to meals
- Crushed if patient is unable to swallow medication whole
- Shake oral susp before giving

IM route

- Does not need to be diluted; give by Z-track inj in large muscle to decrease pain, chance of necrosis; never give IV/SUBCUT (HCl)

SIDE EFFECTS

CNS: *Dizziness, drowsiness,* confusion, headache, tremors, fatigue, depression, seizures

CV: Hypotension

GI: Dry mouth, increased appetite, nausea, diarrhea, weight gain

PHARMACOKINETICS

PO: Onset 15-60 min, duration 4-6 hr, half-life 3 hr, metabolized by liver, excreted by kidneys

INTERACTIONS

Increase: CNS depressant effect—barbiturates, opioids, analgesics, alcohol, sedative/hypnotics, other CNS depressants

Increase: anticholinergic effects—phenothiazines, quiNIDine, disopyramide, antihistamines, antidepressants, atropine, haloperidol, MAOIs

Drug/Lab Test

False negative: skin allergy testing

False increase: 17-hydroxycorticosteroids

NURSING CONSIDERATIONS

Assess:

- **Anticholinergic effects:** dry mouth, dizziness, confusion, hypotension, increased sedation; monitor B/P
- Assistance with ambulation during beginning therapy, since drowsiness, dizziness occurs
- **Beers:** avoid use in older adults; anticholinergic effects, toxicity may occur
- **Pregnancy/breastfeeding:** do not use in pregnancy/breastfeeding

Evaluate:

- Therapeutic response: decreased anxiety

Teach patient/family:

- To avoid OTC preparations (cold, cough, hay fever) unless approved by prescriber
- To avoid driving, activities that require alertness
- To avoid alcohol, psychotropic medications
- Not to discontinue medication quickly after long-term use
- To rise slowly because fainting may occur
- To report urinary retention, constipation, or other serious anticholinergic symptoms to provider, discontinue use

TREATMENT OF OVERDOSE:

Lavage if orally ingested; VS, supportive care; IV norepinephrine for hypotension

ibalizumab (Rx)

(eye-ba-liz'ue-mab)

Trogarzo

Func. class.: HIV antiviral

Chem. class.: HIV-1 entry inhibitor/fusion inhibitor

ACTION: Blocks HIV-1 from infecting CD4, T cells by binding to CD4 and interfering with the steps required for the entry of HIV-1 virus into host cells, preventing viral transmission

USES: Human immunodeficiency virus type 1 (HIV-1) infection in heavily treatment-experienced adults with multidrug-resistant HIV-1 infection failing their current antiretroviral regimen

CONTRAINDICATIONS: Hypersensitivity

Precautions: Autoimmune disease, breastfeeding, Graves' disease, Guillain-Barré disease, immune reconstitution syndrome, pregnancy, progressive multifocal leukoencephalopathy, immune reconstitution syndrome

DOSAGE AND ROUTES

• **Adult: IV** 2000 mg once, then 800 mg q2wk as part of combination therapy

Available forms: Sol for infusion 200 mg/1.33 mL

Administer:

IV route

• Visually inspect for particulate matter and discoloration before use

Dilution

• Select the appropriate number of vials necessary for either the loading dose (10 vials) or maintenance dose (4 vials)

• Withdraw 1.33 mL from each vial and transfer into a 250-mL IV bag of 0.9% sodium chloride for injection. Do not use other diluents

• Once diluted, solution should be given immediately

• **Storage:** diluted solution may be stored at room temperature (20°C-25°C or 68°F-77°F) for up to 4 hr or refrigerated (2°C-8°C or 36°F-46°F) for up to 24 hr. If refrigerated, allow to stand at room temperature for at least 30 min, but no more than 4 hr before use

Intermittent IV infusion route:

• Do not administer as an IV push or bolus

• Administer in the cephalic vein of the patient's arm or an appropriate vein located elsewhere

• Infuse the loading dose (2000 mg) over no less than 30 min

• If there are no infusion-associated adverse reactions, the maintenance doses (800 mg) can be decreased to no less than 15 min

• Flush with 30 mL of 0.9% NaCl for injection after the completion

• Observe for 1 hr after completion for at least the first infusion. If there are no adverse reactions, observation time can be reduced to 15 min

Missed doses

• If a maintenance dose (800 mg) is missed by 3 days or longer, a loading dose (2000 mg) should be given as early as possible

• Resume maintenance dosing (800 mg) q14days thereafter

SIDE EFFECTS

CNS: Dizziness

ENDO: Increased serum glucose and uric acid

GI: Nausea, diarrhea

INTEG: Rash

MISC: Thrombocytopenia, dizziness, rash, hyperglycemia, neutropenia

PHARMACOKINETICS

Half-life 64 hr

INTERACTIONS

None known

NURSING CONSIDERATIONS

Assess:

• HIV: monitor CD4+ T-cell count, plasma HIV RNA baseline and periodically

• **Immune reconstitution syndrome:** Monitor beginning treatment when used with combination antiretrovirals; an inflammatory response to opportunistic infections may occur

• Blood studies: blood glucose, CBC with differential, LFTs, pregnancy testing, serum bilirubin (total and direct), serum creatinine/BUN baseline and periodically

• **Pregnancy/breastfeeding:** no adequate human data available. Report cases of antiretroviral drug exposure to the Antiretroviral Pregnancy Registry, 1-800-258-4263 or http://www.apregistry.com/. Avoid breastfeeding

Evaluate:

• Therapeutic response: increased CD4+ counts, plasma HIV-1 RNA levels, decreased viral load, slowing progression of HIV-1 infection

Teach patient/family:

• That lab work will be necessary at the start of treatment and periodically thereafter

• **Pregnancy/breastfeeding:** to notify health care provider if pregnancy is planned or suspected; that pregnancy test will be required before starting treatment; to enroll in Antiretroviral Pregnancy Registry, which monitors fetal outcomes of pregnant women exposed to this product; not to breastfeed, HIV-1 can be passed to the baby in breast milk

• To report nausea, diarrhea if severe

• To read the patient information provided

• **Immune reconstitution syndrome:** to inform health care provider immediately of any symptoms of infection

• That product is given q2wk as recommended by the health care provider; not to change the dosing schedule or any antiretroviral medication without consulting the health care provider

• To notify health care provider immediately if patient stops taking this product or any other drug in his or her antiretroviral regimen

• That product is not a cure for HIV-1 but controls symptoms and that disease still can be passed to others; to use in combination with other antiretrovirals

ibandronate (Rx)

(eye-ban′dro-nate)

Boniva

Func. class.: Bone-resorption inhibitor, electrolyte modifier

Chem. class.: Bisphosphonate

ACTION: Inhibits bone resorption, without inhibiting bone formation and mineralization; absorbs calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone; more potent than other products

USES: Postmenopausal osteoporosis and prophylaxis

Unlabeled uses: Hypercalcemia of malignancy, osteolytic metastases, Paget's disease

CONTRAINDICATIONS: Achalasia, esophageal stricture, hypocalcemia, intraarterial administration, renal failure, hypersensitivity to bisphosphonates, inability to stand or sit upright

Precautions: Pregnancy, breastfeeding, children, geriatric patients, anemia, chemotherapy, coagulopathy, dental disease, diabetes mellitus, dysphagia, GI/renal disease, GERD, hypertension, infection, multiple myeloma, phosphate hypersensitivity, vit D deficiency

DOSAGE AND ROUTES

Postmenopausal osteoporosis/ prophylaxis

• **Adult: PO** 150 mg/mo; **IV BOL** 3 mg q3mo

Hypercalcemia of malignancy (unlabeled)

• **Adult: IV INFUSION** 2 mg infused over 2 hr in moderate hypercalcemia, 4 mg in

severe hypercalcemia (>3 mmol/L). The use of 6 mg should be reserved for serum calcium levels >3.5 mmol/L

Renal dose

- **Adult: PO** CCr <30 mL/min, avoid use

Available forms: Tabs 150 mg; sol for inj 1 mg/mL (3 mg/3 mL in prefilled syringes)

Administer:

PO route

- Give early AM with a glass of water; if monthly, give on same day of each month
- Patient to remain upright for ≥1 hr after taking
- Do not suck/chew; throat ulcers may occur
- Store at room temperature

Direct IV route

- Use single-dose prefilled syringe; discard unused portion; give over 15-30 sec; give q3mo; do not use if discolored or contains particulates
- Do not admix
- Store at room temperature

SIDE EFFECTS

CNS: Fever, insomnia, dizziness, headache

CV: Hypertension, atrial fibrillation

EENT: Ocular pain/inflammation, uveitis, esophageal ulceration

GI: Constipation, nausea, vomiting, diarrhea, dyspepsia, esophageal/GI cancer

INTEG: Rash, inj-site reaction

META: *Hypomagnesemia, hypophosphatemia, hypocalcemia,* hypercholesterolemia

MS: Bone pain, myalgia, osteonecrosis of the jaw

SYST: Stevens-Johnson syndrome, erythema multiforme, dermatitis bullous

PHARMACOKINETICS

Half-life tabs 1.5-6 days, IV 4.5-25.5 hr; 91%-99% protein binding; taken up mainly by bones, primarily in areas of high bone turnover; eliminated primarily by kidneys (60%); **PO:** onset unknown, peak ½–2 hr, duration unknown; IV: onset rapid, peak 3 hr

INTERACTIONS

Increase: GI irritation—NSAIDs, salicylates

Increase: QTc prolongation—drugs that prolong QTc

Decrease: ibandronate effect—PPIs

Decrease: ibandronate effect—calcium/vit D/iron/aluminum/magnesium salts; separate by 1 hr

Drug/Food

- Do not take with food, calcium products; give product on empty stomach

Drug/Lab Test

Decrease: Alk phos, magnesium, calcium, phosphate

NURSING CONSIDERATIONS

Assess:

- **Osteoporosis:** before and during treatment; DEXA scan for bone mineral density; correct electrolyte imbalances (calcium, magnesium, phosphate) before starting therapy
- **Anaphylaxis (IV):** swelling of face, lips, mouth, rash, sweating, wheezing, trouble breathing; discontinue immediately, provide supportive treatment
- **Dental health:** before dental extraction, may require drug holiday for up to 2 mo; osteonecrosis of the jaw may occur
- Blood studies: electrolytes, creatinine/BUN, calcium, vit D, alkaline phosphatase; correct deficiencies before treatment
- **For bone pain**; use analgesics; may begin within 24 hr or even years after treatment; pain usually subsides after treatment is discontinued
- **Esophageal irritation/ulceration:** heartburn, painful swallowing; avoid use in those with swallowing difficulties

Evaluate:

- Therapeutic response: increased bone mineral density

Teach patient/family:

- **To report hypercalcemic relapse:** nausea, vomiting, bone pain, thirst, unusual muscle twitching, muscle spasms, severe diarrhea, constipation
- To continue with dietary recommendations, including calcium, vit D
- To obtain an analgesic from provider for bone pain, which may occur rapidly or within months
- That if nausea, vomiting occur; small, frequent meals may help
- To report vision symptoms: blurred vision, edema, inflammation

• To exercise regularly, stop smoking, decrease alcohol intake
• To notify health care professional of osteonecrosis of the jaw, after dental procedures, pain, draining, swelling, to notify dentist before dental procedures
• To take PO first thing in AM at least 60 min before other medications, food, beverages; to take monthly dose on same day; that if IV dose is missed, to reschedule as soon as able and to reschedule subsequent doses on new time schedule; not to receive IV dose more than once in 3 mo
• To sit upright for ≥60 min after PO to prevent irritation; to swallow tab whole, not to chew or suck
• To report whether pregnancy is planned or suspected or if planning to breastfeed

⚠ HIGH ALERT

ibrutinib (Rx)

(eye-broo′ti-nib)

Imbruvica

Func. class.: Antineoplastic-biologic response modifier

Chem. class.: Signal transduction inhibitor (STIs)—kinase inhibitor

ACTION: Irreversible inhibitor of Bruton's tyrosine kinases in B cells responsible for tumor growth

USES: Recurrent mantle cell lymphoma in patients who have received at least 1 prior treatment, Waldenström macroglobulinemia, chronic lymphocytic leukemia (CLL) including those with 17 p deletion; dependent or steroid refractory chronic graft-versus-host disease (cGVD)

CONTRAINDICATIONS: Pregnancy, breastfeeding, hypersensitivity, hepatic disease

Precautions: Children, geriatric patients, active infections, anticoagulant therapy (3 × 140-mg caps once daily until disease progression), bleeding, hepatic/renal disease, neutropenia, surgery

DOSAGE AND ROUTES

CLL, WM, cGVHD

• **Adult: PO** 420 mg/day

MCL

• **Adult: PO** 560 mg (4 × 140-mg caps) daily

Dosage adjustment for ≥ grade 3 nonhematologic toxicities, ≥ grade 3 neutropenia with infection or fever, or grade 4 hematologic toxicities: Interrupt therapy; resume upon recovery to grade 1 or baseline as indicated below:

• **First occurrence:** Resume dosing at original dose (daily dose = 560 mg/day)
• **Second occurrence:** Reduce dose by 1 capsule (daily dose = 420 mg/day)
• **Third occurrence:** Reduce dose by 2 capsules (daily dose = 280 mg/day)
• **Fourth occurrence:** Discontinue

Available forms: Caps 140 mg

Administer:

• At same time of day with water; without regard to food; if dose is missed, take as soon as possible on same day, do not double
• Do not open, break, chew cap, swallow whole
• Use safe handling procedures
• Store at room temperature, avoid moisture

SIDE EFFECTS

CNS: *Fatigue, fever,* headache, insomnia
CV: Hypertension, atrial fibrillation, peripheral edema
EENT: Sinusitis
GI: *Nausea,* vomiting, dyspepsia, anorexia, *abdominal pain,* constipation, stomatitis, *diarrhea,* GI bleeding
GU: Increased serum creatinine, UTI, renal failure
HEMA: *Neutropenia, thrombocytopenia, anemia,* bleeding, epistaxis, transient lymphocytosis, *febrile neutropenia*
INTEG: *Rash,* skin infections, *bruising*
MS: *Pain,* arthralgia, muscle cramps
RESP: Cough, dyspnea
SYST: Secondary malignancy, infection

PHARMACOKINETICS

Protein binding 97.3%; metabolized by CYP3A4/CYP2D6; primarily excreted in feces, small amount in urine; peak 1-2 hr, half-life 4-8 hr

INTERACTIONS

Increase: ibrutinib effect—avoid use with moderate or strong CYP3A4 inhibitors (clarithromycin, indinavir, itraconazole, ketoconazole, nelfinavir, posaconazole, ritonavir, saquinavir, voriconazole)

Decrease: ibrutinib effect—avoid use with moderate or strong CYP3A4 inducers (carBAMazepine, phenytoin, rifAMPin)

Drug/Herb

Decrease: SUNItinib concentration—St. John's wort

Drug/Food Test

Increase: plasma concentrations—grapefruit juice; avoid use

Drug/Lab Test

Increase: lymphocytes, uric acid, creatinine

NURSING CONSIDERATIONS

Assess:

- **Bleeding:** bruising; grade 3 or higher bleeding events may occur, may be fatal; CBC
- **Hypersensitivity:** trouble breathing, fever, itching, wheezing; swelling of face, lips, tongue; stop product immediately, provide supportive treatment
- **Renal failure:** monitor (BUN, creatinine), maintain hydration, monitor for hyperuricemia
- **Infection:** fever, sore throat, malaise; infections may be fatal
- **Cardiac changes/hypertension:** monitor B/P and for cardiac changes
- **Secondary malignancies:** monitor for new malignancies
- Hepatic/renal function; signs and symptoms of infections
- **Surgery:** may interrupt treatment a few days before surgery
- **Pregnancy/breastfeeding:** identify whether pregnancy is planned or suspected or if breastfeeding

Evaluate:

- Therapeutic response: decrease in progression of disease

Teach patient/family:

- About reason for treatment, expected result
- That many adverse reactions may occur: high B/P, bleeding, mouth swelling, shortness of breath, report immediately
- To avoid persons with known upper respiratory infections; that immunosuppression is common
- To avoid grapefruit juice or medications, herbs; there are many interactions
- To report if pregnancy is planned or suspected, or if breastfeeding
- To report bleeding, severe infections, renal toxicity (maintain hydration), development of second malignancies, diarrhea (contact physician if it persists)
- To take with water at same time each day; do not open, break, or chew

I

ibuprofen (OTC, Rx)

(eye-byoo-proe'fen)

Addaprin, Advil Junior Strength, Advil Liqui-Gels minis, Advil Migraine, Advil, Childrens Advil, Childrens Ibuprofen, Childrens Motrin, Dyspel, Genpri, GoodSense Ibuprofen Childrens, GoodSense Ibuprofen, IBU, IBU-200, Ibupak, Ibuprofen Childrens, Infants Advil, KS Ibuprofen, Motrin Childrens, Motrin IB, Motrin Infants Drop

ibuprofen lysine (injection) (Rx)

Caldolor, NeoProfen

Func. class.: NSAID

Chem. class.: Propionic acid derivative

Do not confuse:

Motrin/neurontin

ibuprofen/acetaminophen

ACTION: Inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

USES: Inflammatory disorders: Rheumatoid arthritis, osteoarthritis, primary dysmenorrhea, dental pain, musculoskeletal disorders, fever,

migraine, patent ductus arteriosus, headache

Unlabeled uses: Ankylosing spondylitis, bone pain, cystic fibrosis, gouty arthritis, psoriatic arthritis

CONTRAINDICATIONS: Pregnancy 3rd trimester; hypersensitivity to this product, NSAIDs, salicylates; asthma; severe renal/hepatic disease; perioperative pain in CABG, severe HF, active GI ulcer, IBD, risk of bleeding

Precautions: Pregnancy 1st and 2nd trimesters, breastfeeding, children, geriatric patients, bleeding disorders, GI disorders, renal disorders, cardiac disorders, hypersensitivity to other antiinflammatory agents, HF, CCr <25 mL/min

Black Box Warning: GI bleeding, MI, stroke

DOSAGE AND ROUTES

Self-treatment of minor aches/pains

- **Adult/adolescent: PO** (OTC product) 200 mg q4-6hr, may increase to 400 mg q4-6hr if needed, max 1200 mg/day
- **Child 11 yr (72-95 lb): PO** 300 mg q6-8hr
- **Child 9-10 yr (60-71 lb): PO** 250 mg q6-8hr
- **Child 6-8 yr (48-59 lb): PO** 200 mg q6-8hr
- **Child 4-5 yr (36-47 lb): PO** 150 mg q6-8hr
- **Child 2-3 yr (24-35 lb): PO** 100 mg q6-8hr
- **Child 12-23 mo (18-23 lb): PO** 75 mg q6-8hr
- **Child 6-11 mo (12-17 lb): PO** 50 mg q6-8hr

Analgesic

- **Adult: PO** 200-400 mg q4-6hr, max 3.2 g/day; OTC use max 1200 mg/day
- **Child: PO** 4-10 mg/kg/dose q6-8hr

Moderate to severe pain (hospitalized patients) (Caldolor)

- **Adult: IV** 400-800 mg q6hr as an adjunct to opiate-agonist therapy

Dysmenorrhea

- **Adult: PO** 400 mg q4-6hr, max 1200 mg/day

Antipyretic

- **Child 6 mo-12 yr: PO** 5 mg/kg (temperature <102.5°F or 39.2°C), 10 mg/kg (temperature >102.5°F), may repeat q6-8hr, max 40 mg/kg/day or 2400 mg/day whichever is less

Antiinflammatory

- **Adult: PO** 400-800 mg tid-qid, max 3.2 g/day
- **Child: PO** 30-40 mg/kg/day in 3-4 divided doses, max 50 mg/kg/day or 2400 mg/day whichever is less

Juvenile arthritis

- **Child: PO** 30-50mg/kg/day divided in 3-4 doses, max 2.4 g per day

Patent ductus arteriosus (PDA) (NeoProfen)

- **Premature neonate ≤32 wk gestation who weighs 500-1500 g: IV** 10 mg/kg initially, then, if needed, 2 doses of 5 mg/kg at 24-hr intervals; if oliguria occurs, hold dose

Cystic fibrosis (unlabeled)

- **Child 6 mo-12 yr: PO** 20-30mg/kg/dose twice daily, max 1600 mg per dose

Available forms: Caps 200 mg; tabs 100, 200, 300 🍁, 400, 600, 800 mg; cap, liq gels 200 mg; oral susp 40 mg/mL, 100 mg/5 mL; liq 100 mg/5 mL; chew tabs 100 mg; oral drops 50 mg/1.25 mL; inj 10 mg/mL (NeoProfen)

Administer:

PO route

- With food, milk, or antacid to decrease GI symptoms; if nausea and vomiting occur or persist, notify prescriber
- Shake suspension well before use
- Do not break, crush, chew enteric- or film-coated products
- Do not use in pregnancy after 30 wk gestation
- Store at room temperature

IV route

- Patient must be well hydrated before administration
- Dilute to ≤4 mg/mL with 0.9% NaCl, LR, D_5W; infuse over ≥30 min; do not give IM
- Discard unused portion

• Visually inspect for particulate prior to use
• **Ibuprofen lysine:** dilute with dextrose or saline to appropriate volume (10 mg/mL of ibuprofen is recommended); give within 30 min of preparation; give via IV port nearest insertion site; give over 15 min
• Check for extravasation; do not give in same line with TPN; interrupt TPN for 15 min before and after product administration

SIDE EFFECTS

CNS: *Headache,* dizziness, drowsiness, fatigue
CV: Tachycardia, *peripheral edema,* palpitations, dysrhythmias, CV thrombotic events, MI, stroke, HF
EENT: Tinnitus, hearing loss, blurred vision
GI: Nausea, *anorexia,* vomiting, diarrhea, jaundice, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, ulceration, necrotizing enterocolitis, GI perforation
GU: Nephrotoxicity, dysuria, hematuria, oliguria, azotemia
HEMA: Blood dyscrasias, increased bleeding time
INTEG: Purpura, *rash,* pruritus, urticaria, necrotizing fasciitis, photosensitivity, photophobia
ENDO: Hyperkalemia, hyperuricemia, hypoglycemia, hyponatremia
SYST: Anaphylaxis, Stevens-Johnson syndrome

PHARMACOKINETICS

PO: Onset ½ hr, peak 1-2 hr, duration 4-6 hr; IV: duration 4-6 hr, half-life 1.8-2 hr (adult), 1-2 hr (child) metabolized in liver (inactive metabolites), excreted in urine (inactive metabolites), 90%-99% protein binding, does not enter breast milk, well absorbed

INTERACTIONS

Increase: renal dysfunction risk—ACEI/ARBs
Increase: bleeding risk—valproic acid, thrombolytics, antiplatelets, anticoagulants, salicylates, SSRIs
Increase: blood dyscrasia risk—antineoplastics, radiation
Increase: toxicity—lithium, oral anticoagulants, cycloSPORINE, methotrexate
Increase: GI reactions—aspirin, corticosteroids, NSAIDs, alcohol, tobacco
Increase: hypoglycemia—oral antidiabetics
Decrease: effect of antihypertensives, thiazides, furosemide
Decrease: ibuprofen action—aspirin
Drug/Herb
Increase: bleeding risk—feverfew, fish oil garlic, ginger, ginkgo, ginseng *(Panax),* horse chestnut, red clover
Drug/Lab Test
Increase: BUN, creatinine, LFTs, potassium
Decrease: HB/Hct, blood glucose, WBC, platelets

NURSING CONSIDERATIONS

Assess:

Black Box Warning: GI bleeding/perforation: chronic use can cause gastritis with or without bleeding; for those with a prior history of peptic ulcer disease or GI bleeding, initiate treatment at lower dose; geriatric patients are at greater risk and those who consume >3 alcoholic drinks/day

• Renal, hepatic, blood studies: BUN, creatinine, AST, ALT, HB, stool guaiac, before treatment, periodically thereafter; monitor electrolytes as needed; make sure patient is well hydrated
• **Perioperative pain in CABG:** MI and stroke can result for 10-14 days; can be fatal; those taking NSAIDs are at greater risk of MI and stroke even in first few weeks of therapy
• **Cardiac status:** edema (peripheral), tachycardia, palpitations; monitor B/P, pulse for character, quality, rhythm, especially in patients with cardiac disease, geriatric patients
• **Pain:** note type, duration, location, intensity with ROM 1 hr after administration
• **PDA closure:** monitor for bleeding, oliguria, infection; in preterm neonates use only doses needed for ductus arteriosus closure, hold dose if renal output <0.6 mL/kg/hr on 2nd/3rd dose
• **Dysmenorrhea:** give at onset of menses

• Audiometric, ophthalmic exam before, during, after long-term treatment; for eye, ear problems: blurred vision, tinnitus; may indicate toxicity
• **Infection:** may mask symptoms; fever: temperature before and 1 hr after administration
• For history of peptic ulcer disorder, asthma, aspirin use, hypersensitivity; check closely for hypersensitivity reactions
• **Serious skin disorders:** for skin rash or swelling of lips, face, tongue; if present, discontinue immediately, provide supportive care
• **Beers:** avoid chronic use in older adults unless other alternatives are ineffective; increased risk of GI bleeding
• **Pregnancy:** identify if pregnancy is planned or suspected, or if breastfeeding; do not use after 30 wk gestation; use only if benefits outweigh fetal risk before 30 wk gestation; do not breastfeed

Evaluate:
• Therapeutic response: decreased pain, stiffness in joints; decreased swelling in joints; ability to move more easily; reduction in fever or menstrual cramping

Teach patient/family:
• To use sunscreen, sunglasses, and protective clothing to prevent photosensitivity, photophobia
• To report blurred vision, ringing, roaring in ears (may indicate toxicity); that eye and hearing tests should be done during long-term therapy
• To avoid driving, other hazardous activities if dizziness or drowsiness occurs

Black Box Warning: GI Bleeding: Assess for bleeding, bruising, ulceration, perforation of stomach

• **Nephrotoxicity:** to report change in urinary pattern, increased weight, edema, increased pain in joints, fever, blood in urine
• To avoid alcohol, NSAIDs, salicylates; bleeding may occur
• To report use of this product to all health care providers
• **Pregnancy:** to notify prescriber if pregnancy is planned or suspected; avoid after 30 wk
• To avoid driving or other hazardous activities until effect is known

Black Box Warning: MI/stroke: to report signs/symptoms of MI/stroke immediately; discontinue product, seek emergency medical treatment

• To take with full glass of water; to sit upright for 30 min after use; to take with food to lessen GI effects

TREATMENT OF OVERDOSE: Lavage if recently ingested, induce diuresis

ibuprofen/famotidine (Rx)

(eye-byoo-proe′fen/fa-moe′t-deen)

Duexis

Func. class.: Nonopioid analgesic/histamine H2 antagonist/NSAID

USES: Osteoarthritis, RA

Black Box Warning: GI bleeding/perforation

DOSAGE AND ROUTES

• **Adult: PO:** One tablet (ibuprofen 800 mg/famotidine 26.6 mg) TID

Available forms: Tablet: ibuprofen 800 mg/famotidine 26.6 mg

⚠ HIGH ALERT

ibutilide (Rx)

(eye-byoo′tih-lide)

Corvert

Func. class.: Antidysrhythmic (class III)

Chem. class.: Methane sulfonamide

ACTION: Prolongs duration of action potential and effective refractory period

USES: For rapid conversion of atrial fibrillation/flutter, including within 1 wk of coronary artery bypass or valve surgery

CONTRAINDICATIONS: Hypersensitivity breastfeeding, children <18 yr

Precautions: Pregnancy, geriatric patients, sinus node dysfunction, 2nd- or 3rd-degree AV block, electrolyte imbalances, bradycardia, renal/hepatic disease, HF

Black Box Warning: Life threatening dysrrthmias: QT prolongation, torsades de pointes, ventricular arrhythmias, ventricular tachycardia, cardiac dysrhythmias, atrial fibrillation

DOSAGE AND ROUTES

Atrial fibrillation/flutter

- **Adult ≥60 kg: IV INFUSION** 1 vial (1 mg) given over 10 min, may repeat same dose after 10 min
- **Adult <60 kg: IV INFUSION** 0.01 mg/kg given over 10 min, may repeat same dose after 10 min

Available forms: Inj 0.1 mg/mL in 10-mL vials

Administer:

- Ice compress after stopping infusion for extravasation; tubing should be removed and attempt to aspirate product; elevate affected areas

IV route

- Do not use if discolored or particulate is present
- Undiluted or diluted in 50 mL 0.9% NaCl, or D_5W (0.017 mg/mL); give over 10 min
- Solution is stable for 48 hr refrigerated or 24 hr at room temperature
- Do not admix with other sol, products
- Reduce dosage slowly with ECG monitoring
- Stop infusion as soon as arrhythmia is controlled

SIDE EFFECTS

CNS: *Headache,* syncope, stroke

CV: *Hypotension, bradycardia,* sinus arrest, HF, dysrhythmias, torsades de pointes, hypertension, extrasystoles, ventricular tachycardia, bundle branch block, AV block, palpitations, supraventricular extrasystoles, syncope, prolonged QT interval

GI: Nausea

PHARMACOKINETICS

Half-life 6 hr, metabolized by liver, excreted by kidneys

INTERACTIONS

Increase: prodysrhythmia—phenothiazines, tricyclics, tetracyclics, antidepressants, H_1-receptor antagonists, antihistamines

Increase: masking of cardiotoxicity—digoxin

- Do not use within 5 hr of ibutilide: class Ia antidysrhythmics (disopyramide, quiNIDine, procainamide), class III agents (amiodarone, sotalol); QT prolongation may occur

NURSING CONSIDERATIONS

Assess:

Black Box Warning: ECG continuously for ≥4 hr to determine product effectiveness; measure PR, QRS, QT intervals, check for PVCs, other dysrhythmias; discontinue if atrial fibrillation/flutter ceases; continue until QT interval corrected for heart rate (QTc) returned to baseline; if atrial fibrillation lasts more than 2 days, anticoagulation must be adequate >2 wk before use
