**Frequent:** Anorexia, nausea, swelling of breasts, peripheral edema marked by swollen ankles and feet. **Transdermal:** Skin irritation, redness.

**Occasional:** Vomiting (esp. with high doses), headache (may be severe), intolerance to contact lenses, hypertension, glucose intolerance, brown spots on exposed skin. **Vaginal:** Local irritation, vaginal discharge, changes in vaginal bleeding (spotting, breakthrough, prolonged bleeding). **Rare:** Chorea (involuntary movements), hirsutism (abnormal hairiness), loss of scalp hair, depression.

### ADVERSE EFFECTS/TOXIC REACTIONS

Prolonged administration increases risk of gallbladder disease, thromboembolic disease, breast/cervical/vaginal/endo-metrial/hepatic carcinoma. Cholestatic jaundice occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess frequency/severity of vasomotor symptoms. Question medical history as listed in Precautions. Question for possibility of pregnancy (contraindicated).

#### INTERVENTION/EVALUATION

Monitor B/P, weight, serum calcium, glucose, LFT. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine, thromboembolic disorders.

#### PATIENT/FAMILY TEACHING

- Limit alcohol, caffeine.
- Avoid grapefruit products.
- Immediately report sudden headache, vomiting, disturbance of vision/speech, numbness/weakness of extremities, chest pain, calf pain, shortness of breath, severe abdominal pain, mental depression, unusual bleeding.
- Avoid smoking.
- Report abnormal vaginal bleeding.
- Never place patch on breast or waistline.

## estrogen (esterified)

es-troe-jen, es-ter-i-fied  
(Menest)

**BLACK BOX ALERT** Risk of dementia may be increased in postmenopausal women. Do not use to prevent cardiovascular disease. May increase risk of endometrial carcinoma or invasive breast cancer in postmenopausal women.

#### FIXED-COMBINATION(S)

**Duavee:** estrogen/bazedoxifene (estrogen agonist/antagonist): 0.45 mg/20 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Estrogen.  
**CLINICAL:** Hormone.

## USES

Management of moderate to severe vasomotor symptoms associated with menopause. Treatment of hypoestrogenism due to hypogonadism, castration, or primary ovarian failure. Prevention of osteoporosis in postmenopausal women. Palliative treatment of inoperable, progressive cancer of the prostate and breast in men, and of the breast in postmenopausal women. Abnormal uterine bleeding (injection only). Treatment of moderate to severe vulvar and vaginal atrophy due to menopause. **OFF-LABEL:** Prevention of estrogen deficiency–induced premenopausal osteoporosis. **Cream:** Prevention of nosebleeds.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to estrogens. Breast cancer (except in pts being treated for metastatic disease), hepatic disease, history of or current thrombophlebitis, undiagnosed abnormal vaginal bleeding, pregnancy, DVT or PE (current or history of), angioedema or anaphylactic reaction to estrogens, estrogen-dependent tumors. Known protein C, protein S, antithrombin deficiency or other thrombophilic disorder. **Cautions:** Asthma, epilepsy, migraine headaches, diabetes, cardiac/renal dysfunction, history of severe hypocalcemia, lupus erythematosus, porphyria, endometriosis, gallbladder disease, familial defects of lipoprotein metabolism. Hypoparathyroidism, history of cholestatic jaundice.

## ACTION

Responsible for development and maintenance of female reproductive system and secondary sexual characteristics; modulates release of gonadotropin-releasing hormone, reduces follicle-stimulating hormone (FSH), luteinizing hormone (LH). **Therapeutic Effect:** Reduces elevated levels of gonadotropins, LH, and FSH.

## PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed. Protein binding: 50%–80%. Metabolized in liver. Primarily excreted in urine. **Half-life (total estrone):** 27 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **anticoagulants** (e.g., warfarin), **anastrozole**, **exemestane**. **HERBAL:** **Herbals with estrogenic properties** (e.g., fennel, red clover, ginseng) may increase adverse effects. **FOOD:** None significant. **LAB VALUES:** May increase serum glucose, HDL, calcium, triglycerides. May decrease serum cholesterol, LDH. May affect serum metapyrone testing, thyroid function tests.

## AVAILABILITY (Rx)

**Vaginal Cream:** 0.625 mg/g. **Injection Powder for Reconstitution:** 25 mg. **Tablets:** 0.3 mg, 0.625 mg, 1.25 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute with Sterile Water for Injection. • Slowly add diluent, shaking gently. • Avoid vigorous shaking.

**Rate of administration** • Give slowly to prevent flushing reaction.

**Storage** • Refrigerate vials for IV use. • Use immediately following reconstitution.

## PO

• Administer at same time each day. • Give with milk, food if nausea occurs.

**IV INCOMPATIBILITIES**

No information available on Y-site administration.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Cyclic administration is either 3 wks on, 1 wk off or 25 days on, 5 days off.

**Vasomotor Symptoms Associated With Menopause**

**PO: ADULTS, ELDERLY:** 0.3-1.25 mg/day given cyclically (3 wks on and 1 wk off).

**Vulvar and Vaginal Atrophy**

**PO: ADULTS, ELDERLY:** 0.3-1.25mg/day; initiate at the lowest dose and adjust based on pt response. Give cyclically (3 wks on and 1 wk off).

**Intravaginal: ADULTS, ELDERLY:** 0.5–2 g/day cyclically.

**Hypoestrogenism due to Hypogonadism**

**PO: ADULTS:** 2.5–7.5 mg/day in divided doses for 20 days, followed by a 10-day rest period. Dose may be titrated in 6- to 12-mo intervals. Progestin treatment should be added to maintain bone mineral density once skeletal maturity is achieved.

**Hypoestrogenism due to Castration, Primary Ovarian Failure**

**PO: ADULTS:** Initially, 1.25 mg/day cyclically. Adjust dosage, upward or downward, according to severity of symptoms and pt response. For maintenance, adjust dosage to lowest level that will provide effective control.

**Breast Cancer (Metastatic)**

**PO: ADULTS, ELDERLY:** 10 mg 3 times/day for at least 3 mos.

**Prostate Cancer (Advanced)**

**PO: ADULTS, ELDERLY:** 1.25–2.5 mg 3 times/day.

**Dyspareunia**

**Intravaginal: ADULTS, ELDERLY:** 0.5 g cyclically (21 days on, 7 days off) or 0.5 g twice weekly.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Contraindicated.

**SIDE EFFECTS**

**Frequent:** Vaginal bleeding (spotting, breakthrough bleeding), breast pain/tenderness, gynecomastia. **Occasional:** Headache, hypertension, intolerance to contact lenses. **High doses:** Anorexia, nausea. **Rare:** Loss of scalp hair, depression.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Prolonged administration may increase risk of breast, cervical, endometrial, hepatic, vaginal carcinoma; cerebrovascular disease, coronary heart disease, gallbladder disease, hypercalcemia.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for hypersensitivity to estrogen, hepatic impairment, thromboembolic disorders associated with pregnancy, estrogen therapy. Assess frequency/severity of vasomotor symptoms. Review results of baseline mammogram in pts with breast cancer.

**INTERVENTION/EVALUATION**

Assess B/P periodically. Assess for edema; weigh daily. Monitor for loss of vision, diplopia, migraine, thromboembolic disorder, sudden onset of proptosis.

**PATIENT/FAMILY TEACHING**

- Avoid smoking due to increased risk of heart attack, blood clots.
- Avoid grapefruit products.
- Diet, exercise important part of therapy when used to retard osteoporosis.
- Promptly report signs/symptoms of thromboembolic, thrombotic disorders: sudden severe headache, shortness of breath, vision/speech disturbance, weakness/numbness of an extremity, loss of coordination; pain in chest, groin, leg; abnormal vaginal bleeding, depression.
- Teach female pts to perform breast self-exam.
- Report weight gain of more than 5 lbs a wk.
- Stop taking medication, contact physician if pregnancy is suspected.

## eszopiclone

TOP  
100e-zop-i-clone  
(Lunesta)

**BLACK BOX ALERT** ■ Complex sleep behaviors (e.g., sleepwalking, sleep-driving, or engaging in activities while not fully awake) may occur. May result in serious injuries, including death.

**Do not confuse Lunesta with Neulasta.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Non-benzodiazepine (Schedule IV). **CLINICAL:** Hypnotic.

## USES

Treatment of insomnia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to eszopiclone. Pts who have experienced complex sleep behaviors after taking eszopiclone. **Cautions:** Hepatic impairment, compromised respiratory function, COPD, sleep apnea, clinical depression, suicidal ideation, history of drug dependence; concomitant CNS depressants, strong CYP3A4 inhibitors (e.g., ketoconazole); elderly.

## ACTION

May interact with GABA-receptor complexes at binding domains located close to or allosterically coupled to benzodiazepine receptors. **Therapeutic Effect:** Prevents insomnia, difficulty maintaining normal sleep.

## PHARMACOKINETICS

Rapidly absorbed following PO administration. Protein binding: 52%–59%. Metabolized in liver. Excreted in urine. **Half-life:** 5–6 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and

efficacy not established. **Elderly:** Pts with impaired motor or cognitive performance may require dosage adjustment.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/toxicity. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **CNS depressants** (e.g., alcohol, morphine, oxycodone, zolpidem) may increase CNS depression. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease concentration/effect. **FOOD:** Onset of action may be reduced if taken with or immediately after a high-fat meal. **LAB VALUES:** None known.

## AVAILABILITY (Rx)

 **Tablets, Film-Coated:** 1 mg, 2 mg, 3 mg.

## ADMINISTRATION/HANDLING

## PO

• Should be administered immediately before bedtime. • Do not give with or immediately following a high-fat or heavy meal. • Do not break, crush, dissolve, or divide tablet.

## INDICATIONS/ROUTES/DOSAGE

## Insomnia

**PO: ADULTS:** 1 mg before bedtime. **Maximum:** 3 mg. **Concurrent use with CYP3A4 inhibitors** (e.g., clarithromycin, erythromycin, azole antifungals): 1 mg before bedtime; if needed, dose may be increased to 2 mg. **ELDERLY, DEBILITATED PTS:** Initially, 1 mg before bedtime. **Maximum:** 2 mg.

## Sleep Maintenance Difficulty

**PO: ADULTS:** 2 mg before bedtime.

## Dosage in Renal Impairment

No dose adjustment.

## Dosage in Hepatic Impairment

Use caution. Initially, 1 mg immediately before bedtime. **Maximum:** 2 mg.

## SIDE EFFECTS

**Frequent (34%–21%):** Unpleasant taste, headache. **Occasional (10%–4%):** Drowsiness, dry mouth, dyspepsia, dizziness, nervousness, nausea, rash, pruritus, depression, diarrhea. **Rare (3%–2%):** Hallucinations, anxiety, confusion, abnormal dreams, decreased libido, neuralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Chest pain, peripheral edema occur occasionally.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, pulse, respirations. Raise bed rails, provide call light. Provide environment conducive to sleep (quiet environment, low or no lighting). Question usual sleep patterns. Initiate fall precautions. Screen for other conditions affecting sleep (e.g., stress, depression, hyperactivity, drug abuse).

### INTERVENTION/EVALUATION

Assess sleep pattern of pt. Evaluate for therapeutic response (decrease in number of nocturnal awakenings, increase in length of sleep).

### PATIENT/FAMILY TEACHING

- Take only when experiencing insomnia. Do not take when insomnia is not present.
- Do not break, chew, crush, dissolve, or divide tablet. Take whole.
- Avoid alcohol.
- At least 8 hrs must be devoted for sleep time before daily activity begins.
- Take immediately before bedtime.
- Report insomnia that worsens or persists longer than 7–10 days, abnormal thoughts or behavior, memory loss, anxiety.

malignancies may occur (reported in children/adolescents).

**Do not confuse Enbrel with Levid.**

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Protein, TNF inhibitor. **CLINICAL:** Antiarthritic.

## USES

Treatment of moderate to severely active rheumatoid arthritis (RA). Treatment of moderately to severely active polyarticular juvenile idiopathic arthritis (JIA), ankylosing spondylitis (AS), psoriatic arthritis. Treatment of chronic, moderate to severe plaque psoriasis. **OFF-LABEL:** Treatment of acute graft-versus-host disease.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to etanercept. Serious active infection or sepsis. **Cautions:** History of recurrent infections, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). History of HE, decreased left ventricular function, significant hematologic abnormalities; moderate to severe alcoholic hepatitis, elderly, preexisting or recent-onset CNS demyelinating disorder.

## ACTION

Binds to tumor necrosis factor (TNF), blocking its interaction with cell surface receptors. Elevated levels of TNF, involved in inflammatory processes and the resulting joint pathology of rheumatoid arthritis, JIA, AS, and plaque psoriasis. **Therapeutic Effect:** Relieves symptoms of arthritis, psoriasis, spondylitis.

## PHARMACOKINETICS

Well absorbed after SQ administration.

**Half-life:** 72–132 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** No age-related precautions noted in pts 4 yrs

## etanercept

TOP  
100

e-tan-er-sept

(Enbrel, Enbrel SureClick, Enbrel Mini)

**BLACK BOX ALERT** ■ Serious, potentially fatal infections, including bacterial sepsis, tuberculosis, have occurred. Lymphomas, other

and older. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Anakinra, anti-TNF agents, baricitinib, pimecrolimus, tacrolimus (topical), tocilizumab may increase adverse/toxic effects. May increase concentration, adverse/toxic effects of belimumab, cyclophosphamide, natalizumab. Use of live virus vaccines may potentiate virus replication, increase vaccine side effect, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

## AVAILABILITY (Rx)

**Injection Solution (Cartridge):** 50 mg/mL. **Injection, Solution (Prefilled Syringe):** 25 mg/0.5 mL, 50 mg/mL. **Injection, Solution (Autoinjector):** 50 mg/mL. **Solution, Reconstituted:** 25 mg.

## ADMINISTRATION/HANDLING

**◀ ALERT ▶** Do not add other medications to solution. Do not use filter during reconstitution or administration.

### SQ

- Refrigerate prefilled syringes.
- Inject into thigh, abdomen, upper arm. Rotate injection sites.
- Give new injection at least 1 inch from an old site and never into area where skin is tender, bruised, red, hard.
- Once reconstituted, may be stored in vial for up to 14 days refrigerated.

## INDICATIONS/ROUTES/DOSAGE

**Rheumatoid Arthritis (RA), Psoriatic Arthritis, Ankylosing Spondylitis**

**SQ: ADULTS, ELDERLY:** 25 mg twice wkly given 72–96 hrs apart or 50 mg once wkly. **Maximum:** 50 mg/wk.

**Juvenile Rheumatoid Arthritis (JIA)**

**SQ: CHILDREN 2–17 YRS:** (63 kg or greater): 50 mg once wkly. (Less than 63 kg): 0.8 mg/kg once wkly. **Maximum:** 50 mg/dose.

## Plaque Psoriasis

**SQ: ADULTS, ELDERLY:** 50 mg twice wkly (give 3–4 days apart) for 3 mos. (25 mg or 50 mg once wkly have also been used.) **Maintenance:** 50 mg once wkly. **CHILDREN 4–17 YRS:** 0.8 mg/kg once wkly. **Maximum:** 50 mg/wk.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (37%):** Injection site erythema, pruritus, pain, swelling; abdominal pain, vomiting (more common in children than adults). **Occasional (16%–4%):** Headache, rhinitis, dizziness, pharyngitis, cough, asthenia, abdominal pain, dyspepsia. **Rare (less than 3%):** Sinusitis, allergic reaction.

## ADVERSE EFFECTS/TOXIC REACTIONS

Infection (pyelonephritis, cellulitis, osteomyelitis, wound infection, leg ulcer, septic arthritis, diarrhea, bronchitis, pneumonia) occurs in 29%–38% of pts. Rare adverse effects include heart failure, hypertension, hypotension, pancreatitis, GI hemorrhage.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess onset, type, location, duration of pain, inflammation. If significant exposure to varicella virus has occurred during treatment, therapy should be temporarily discontinued and treatment with varicella-zoster immune globulin should be considered. Screen for active infection. Question history as listed in Precautions. Question travel history. Screen for active infection.

### INTERVENTION/EVALUATION

Assess for improvement of joint swelling, pain, tenderness. Monitor erythrocyte sedimentation rate (ESR), C-reactive protein level, CBC with differential, platelet count. Observe for signs of infection.

### PATIENT/FAMILY TEACHING

- A healthcare provider will show you how to properly prepare and inject medication.

You must demonstrate correct preparation and injection techniques before using medication at home. • Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report travel plans to endemic areas. • Injection site reaction generally occurs in first mo of treatment and decreases in frequency during continued therapy. • Do not receive live vaccines during treatment. • Report persistent fever, bruising, bleeding, pallor.

## etoposide, VP-16 HIGH ALERT

e-toe-poe-side  
(Etopophos, Toposar, VePesid )

**BLACK BOX ALERT** Severe myelosuppression with resulting infection, bleeding may occur. Must be administered by personnel trained in administration/handling of chemotherapeutic agents.

**Do not confuse etoposide with etidronate, or VePesid with Pepcid or Versed.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Topoisomerase II inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of refractory testicular tumors, small-cell lung carcinoma. **OFF-LABEL:** Acute lymphocytic, acute nonlymphocytic leukemias; Ewing's and Kaposi's sarcoma; Hodgkin's and non-Hodgkin's lymphomas; endometrial, gastric, non-small-cell lung carcinomas; multiple myeloma; myelodysplastic syndromes; neuroblastoma; osteosarcoma; ovarian germ cell tumors; primary brain, gestational trophoblastic tumors; soft tissue sarcomas; Wilms tumor.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to etoposide. **Cautions:** Hepatic/renal impairment, myelosuppression, elderly, pts with low serum albumin.

### ACTION

Induces single- and double-stranded breaks in DNA. Cell cycle-dependent and phase-specific; most effective in S and G<sub>2</sub> phases of cell division. **Therapeutic Effect:** Inhibits, alters DNA synthesis.

### PHARMACOKINETICS

Variably absorbed from GI tract. Rapidly distributed, low concentrations in CSF. Protein binding: 97%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–12 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression. **Live-virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease therapeutic effect of BCG (Intravesical), vaccines (live). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected decrease of leukocytes, platelets, RBC, Hgb, Hct.

### AVAILABILITY (Rx)

**Capsules:** 50 mg. **Injection, Powder for Reconstitution:** (Etopophos): 100 mg. **Injection Solution:** (Toposar): 20 mg/mL (5 mL, 25 mL, 50 mL).

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Administer by slow IV infusion. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately and thoroughly with soap, water. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation, administration.

**Reconstitution** • (*Toposar*) Dilute to a concentration of 0.2–0.4 mg/mL in D<sub>5</sub>W or 0.9% NaCl. • (*Etopophos*) Reconstitute each 100 mg with 5–10 mL Sterile Water for Injection, D<sub>5</sub>W, or 0.9% NaCl to provide concentration of 20 mg/mL or 10 mg/mL, respectively. • May give without further dilution or further dilute to concentration as low as 0.1 mg/mL with 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • (*Toposar*) Infuse slowly, at least 30–60 min (rapid IV may produce marked hypotension) at a rate not to exceed 100 mg/m<sup>2</sup>/hr. • Monitor for anaphylactic reaction during infusion (chills, fever, dyspnea, diaphoresis, lacrimation, sneezing, throat, back, chest pain). • (*Etopophos*) May give over as little as 5 min up to 210 min.

**Storage** • (*Toposar*) Store injection at room temperature before dilution. • Concentrate for injection is clear, yellow. • Diluted solution is stable at room temperature for 96 hrs at 0.2 mg/mL, 24 hrs at 0.4 mg/mL. • Discard if crystallization occurs. • (*Etopophos*) Refrigerate vials. • Stable at room temperature for 24 hrs or for 7 days if refrigerated after reconstitution.

**PO**

**Storage** • Refrigerate gelatin capsules.

**IV INCOMPATIBILITIES**

**VePesid:** Cefepime (Maxipime), filgrastim (Neupogen). **Etopophos:** Amphoteri-

cin B (Fungizone), cefepime (Maxipime), chlorproMAZINE (Thorazine), methyl-PREDNISolone (Solu-Medrol), prochlorperazine (Compazine).

**IV COMPATIBILITIES**

**VePesid:** CARBOplatin (Paraplatin), CISplatin (Platinol), cytarabine (Cytosar), DAUNOrubicin (Cerubidine), DOXOrubicin (Adriamycin), granisetron (Kytril), mitoXANTRONE (Novantrone), ondansetron (Zofran). **Etopophos:** CARBOplatin (Paraplatin), CISplatin (Platinol), cytarabine (Cytosar), dacarbazine (DTIC-Dome), DAUNOrubicin (Cerubidine), dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOXOrubicin (Adriamycin), granisetron (Kytril), magnesium sulfate, mannitol, mitoXANTRONE (Novantrone), ondansetron (Zofran), potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Dosage individualized based on clinical response, tolerance to adverse effects. Treatment repeated at 3- to 4-wk intervals. Refer to individual protocols.

**Refractory Testicular Tumors**

**IV: ADULTS:** 100 mg/m<sup>2</sup> on days 1–5 q3wks (in combination with cisplatin) for 4 cycles or (in combination with bleomycin and cisplatin) for 4 cycles.

**Small-Cell Lung Carcinoma**

Platinum-based therapy (cisplatin or carboplatin) in combination with either etoposide or irinotecan for 4 cycles for limited-stage disease or for 4–6 cycles for extensive-stage disease.

**Dosage in Renal Impairment****Creatinine**

Clearance	Dosage
15–50 mL/min	75% of normal dose
Less than 15 mL/min	Consider further dose reduction

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (66%–43%):** Mild to moderate nausea/vomiting, alopecia. **Occasional (13%–6%):** Diarrhea, anorexia, stomatitis. **Rare (2% or less):** Hypotension, peripheral neuropathy.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression manifested as hematologic toxicity, principally anemia, leukopenia (occurring 7–14 days after drug administration), thrombocytopenia (occurring 9–16 days after administration), and, to lesser extent, pancytopenia. Bone marrow recovery occurs by day 20. Hepatotoxicity occurs occasionally. Amenorrhea, angioedema, cortical blindness (transient), cyanosis, dysphagia, erythema, esophagitis, extravasation (induration/necrosis), hyperpigmentation, hypersensitivity reaction, pneumonitis, heart disease (ischemic), laryngospasm, maculopapular rash, malaise, metabolic acidosis, mucositis, MI, optic neuritis, ovarian failure, pruritic erythematous rash, pruritus, pulmonary fibrosis, radiation-recall phenomenon (dermatitis), reversible posterior leukoencephalopathy syndrome (RPLS), seizure, Stevens-Johnson syndrome, tongue edema, toxic epidermal necrolysis, toxic megacolon reported in less than 1 % of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC before and at frequent intervals during therapy. Antiemetics readily control nausea, vomiting. Screen for active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, B/P, hepatic/renal function tests. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore

throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess for paresthesia (peripheral neuropathy). Monitor for infection (cough, fatigue, fever).

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy.
- Promptly report fever, sore throat, signs of local infection, unusual bruising or bleeding from any site, burning or pain with urination, numbness in extremities, yellowing of skin or eyes.

**everolimus**TOP  
100

e-veer-oh-li-mus

(Afinitor, Afinitor Disperz, Zortress)

**BLACK BOX ALERT** ■ Immunosuppressant (may result in infection, malignancy including lymphoma or skin cancer); increased risk of nephrotoxicity in renal transplants (avoid standard doses of cycloSPORINE); increased risk of renal arterial or venous thrombosis in renal transplants.

**Do not confuse Afinitor with Lipitor, or everolimus with sirolimus, tacrolimus, or temsirolimus.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** mTOR kinase inhibitor. **CLINICAL:** Antineoplastic, immunosuppressant.

**USES**

**Afinitor:** Treatment of advanced renal cell carcinoma after failure of treatment with SUNItinib or SORAFenib. Treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis. Treatment of progressive neuroendocrine

tumors of pancreatic origin and progressive, well-differentiated, nonfunctional neuroendocrine tumors of GI or lung origin. Treatment of advanced hormone receptor–positive, HER2-negative breast cancer in postmenopausal women. Treatment of tuberous sclerosis complex (TSC) not requiring immediate surgery. **Afinitor Disperz:** Treatment of SEGA associated with TSC requiring intervention but that cannot be curatively resected. Treatment of TSC-associated partial-onset seizures. **Zortress:** Prophylaxis of organ rejection after kidney/liver transplant at low to moderate immunologic risk. **OFF-LABEL:** Relapsed or refractory Waldenström's macroglobulinemia. Treatment of progressive advanced carcinoid tumors.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to everolimus, sirolimus, other rapamycin derivatives. **Cautions:** Conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). Hereditary galactose intolerance; renal/hepatic impairment; hyperlipidemia; concurrent use of CYP3A4 inducers and inhibitors. Medications known to cause angioedema.

## ACTION

Binds to the FK binding protein to form a complex that inhibits activation of mTOR. Inhibits vascular endothelial growth factor (VEGF). **Therapeutic Effect:** Reduces cell proliferation, produces cell death. Has antiproliferative and antiangiogenic properties.

## PHARMACOKINETICS

Peak concentration occurs in 1–2 hrs following administration, with steady-state levels achieved in 2 wks. Undergoes extensive hepatic metabolism. Protein binding: 74%. Eliminated in feces (80%), urine (5%). **Half-life:** 30 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy during treatment and for up to 8

wks after discontinuation. Breastfeeding not recommended during treatment and for up to 2 wks after discontinuation. May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), P-gp inhibitors (e.g., cyclosporine) may increase concentration/effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease therapeutic effect of BCG (Intravesical), vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **St. John's wort** may decrease concentration/effect. **FOOD:** High-fat meals may reduce plasma concentration. **Grapefruit products** may increase concentration/effect (potential for myelotoxicity, nephrotoxicity). **LAB VALUES:** May increase serum BUN, creatinine, glucose, triglycerides, lipids. May decrease neutrophils, Hgb, platelets.

## AVAILABILITY (Rx)

 **Tablets:** (Zortress): 0.25 mg, 0.5 mg, 0.75 mg, 1 mg. **Tablets:** (Afinitor): 2.5 mg, 5 mg, 7.5 mg, 10 mg. **Tablets for Oral Suspension:** (Afinitor Disperz): 2 mg, 3 mg, 5 mg.

## ADMINISTRATION/HANDLING

- Give without regard to food.
- Swallow tablets whole; do not crush/cut Afinitor or Zortress.
- If pt unable to swallow Afinitor tablets, may disperse in water with gentle stirring; give immediately.
- Administer Afinitor Disperz as suspension only. Disperse in water until dissolved.
- Avoid direct contact of dispersed tablet or oral solution with skin or mucous membranes.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** If pt requires coadministration of a strong CYP3A4 inducer (e.g.,

carbamazepine, dexamethasone, PHE-Nobarbital, phenytoin, rifabutin, rifampin), consider doubling the dose. If strong inducer is discontinued, reduce everolimus to dose used prior to initiation. If moderate CYP3A4 inhibitors are required, reduce dose by 50%.

#### Renal Carcinoma, Neuroendocrine Tumors, Breast Cancer, TSC

**PO: ADULTS, ELDERLY: (Afinitor):** 10 mg once daily. **Coadministration with CYP3A4 inhibitors or P-gp inhibitors:** 2.5 mg once daily. May increase to 5 mg/day. **Coadministration with CYP3A4 inducers:** Increase by 5-mg increments up to 20 mg/day.

#### Renal Transplant Rejection Prophylaxis

**PO: ADULTS, ELDERLY: (Zortress):** Initially, 0.75 mg 2 times/day. Adjust dose at 4- to 5-day intervals based on serum concentration, tolerability, and response. Give in combination with basiliximab and concurrently with reduced doses of cycloSPORINE and corticosteroids.

#### Liver Transplant Rejection Prophylaxis (Begin at least 30 days post-transplant)

**PO: ADULTS, ELDERLY: (Zortress):** Initially, 1 mg 2 times/day. Adjust dose at 4- to 5-day intervals based on serum concentration, tolerability, and response.

#### SEGA

**PO: ADULTS, ELDERLY:** Initially, 4.5 mg/m<sup>2</sup> once daily, titrated to attain trough concentration of 5–15 ng/mL. **If trough greater than 15 ng/mL:** reduce dose by 2.5 mg/day (tablets) or 2 mg/day (tablets for oral suspension). **If trough less than 15 ng/mL:** increase dose by 2.5 mg/day (tablets) or 2 mg/day (tablets for oral suspension).

#### TSC-Associated Partial-Onset Seizures

**PO: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER:** Initially, 5 mg/m<sup>2</sup> once daily, titrated to attain trough concentration of 5–15 ng/mL. Maximum dose increment at any titration must not exceed 5 mg.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

	Mild	Moderate	Severe
Breast Cancer	7.5 mg/day or	5 mg/day or 2.5 mg/day	2.5 mg/day
PNET, RCC, renal angiomyolipoma	5 mg/day		
Liver/ Renal transplant	Reduce dose by 33%	Reduce dose by 50%	Reduce dose by 50%
SEGA	No change	No change	Initial dose 2.5 mg/m <sup>2</sup> /day

#### SIDE EFFECTS

**Common (44%–26%):** Stomatitis, asthenia. Diarrhea, cough, rash, nausea. **Frequent (25%–20%):** Peripheral edema, anorexia, dyspnea, vomiting, pyrexia. **Occasional (19%–10%):** Mucosal inflammation, headache, epistaxis, pruritus, dry skin, epigastric distress, extremity pain. **Rare (less than 10%):** Abdominal pain, insomnia, dry mouth, dizziness, paresthesia, eyelid edema, hypertension, nail disorder, chills.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Noninfectious pneumonitis characterized as hypoxia, pleural effusion, cough, or dyspnea was reported in 14% of pts; Grade 3 noninfectious pneumonitis reported in 4%. Localized and systemic infections, including pneumonia, other bacterial infections, and invasive fungal infections, have occurred due to everolimus immunosuppressive properties. Renal failure occurs in 3% of pts.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Assess medical history, esp. renal function, use of other immunosuppressants. Obtain

CBC, BMP, LFT before treatment begins and routinely thereafter. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash, edema. Monitor CBC, particularly Hgb, platelet, neutrophil count; BUN, creatinine, LFT. Monitor for shortness of breath, fatigue, hypertension. Monitor for infection (cough, fatigue, fever).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Avoid direct contact of crushed tablets with skin or mucous membrane (wash thoroughly if contact occurs).
- Avoid grapefruit products.

## evinacumab-dgnb

e-vin-ak-ue-mab  
(Evkeeza)

**Do not confuse evinacumab with alirocumab or evolocumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-like 3 (ANGPTL3) inhibitor. Monoclonal antibody. **CLINICAL:** Antihyperlipidemic.

### USES

Adjunct to other low-density lipoprotein-cholesterol (LDL-C)-lowering therapies for treatment of adult and pediatric pts,

aged 12 yrs and older, with homozygous familial hypercholesterolemia (HoFH).

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity (including anaphylactic reactions) to evinacumab-dgnb. **Cautions:** Prior infusion-related reactions.

### ACTION

Binds to and inhibits ANGPTL3, an angiotensin-like protein expressed in the liver, regulating lipid metabolism by inhibiting lipoprotein and endothelial lipase. Promotes clearance and processing of LDL.

**Therapeutic Effect:** Reduces LDL-C, HDL-C, and triglyceride levels.

### PHARMACOKINETICS

Widely distributed. Metabolized into small peptides and amino acids via catabolic pathway. Steady-state reached after 4 doses. Excretion not specified. **Half-life:** not specified.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 5 mos after discontinuation. Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breastmilk and is known to cross the placenta. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Not specified; use caution.

### INTERACTIONS

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (RX)

**Injection Solution:** 345 mg/2.3 mL (150 mg/mL), 1,200 mg/8 mL (150 mg/mL).

### ADMINISTRATION/HANDLING

**Infusion Guidelines** • Infusion rate may be decreased, interrupted, or dis-

continued based on the severity of infusion or hypersensitivity reactions.

- May administer regardless of the timing to lipoprotein apheresis.

**Preparation** • Calculate the number of vials needed for dose based on weight in kg. • Visually inspect for particulate matter or discoloration. Solution should appear slightly opalescent, colorless to pale yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 0.9% NaCl or D5W infusion bag containing a maximum volume of 250 mL to a final concentration of 0.5-20 mg/mL. • Mix by gentle inversion. Do not shake.

**Rate of Administration** • Infuse over 60 min. • Infuse via dedicated IV line using a sterile, 0.2-5 micron, in-line or add-on filter.

**Storage** • Refrigerate unused vials in original carton. • Protect from light. • Do not shake, agitate, or freeze. • May refrigerate diluted solution for up to 24 hrs or store at room temperature up to 6 hrs (includes infusion time). • Do not freeze diluted solution. • If refrigerated, allow diluted solution to warm to room temperature.

### IV INCOMPATIBILITIES

Do not infuse with other medications.

### INDICATIONS/ROUTES/DOSAGE

#### Homozygous Familial Hypercholesterolemia

**IV: Adults, Elderly, Children 12 yrs and Older:** 15 mg/kg q4wks.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Occasional (6%):** Dizziness. **Rare (5%-3%):** Rhinorrhea, nausea, extremity pain, asthenia, constipation, nasal congestion, abdominal pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe hypersensitivity reactions, including anaphylaxis, was reported. Infusion-related reactions including muscular weakness, nausea, nasal congestion, pruritus, pyrexia reported in 7% of pts. Infections including nasopharyngitis, influenza-like illness, upper respiratory tract infection reported in 16%-3% of pts, respectively. Transient, mild to moderate increased heart rate and decreased diastolic blood pressure may occur post-infusion.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT.

Obtain LDL-C level; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Obtain weight in kilograms. Question for prior infusion or hypersensitivity reactions before each infusion.

#### INTERVENTION/EVALUATION.

Obtain LDL-C level periodically. Lipid-lowering effects can occur as early as 2 wks after initiation. Monitor for hypersensitivity reactions, anaphylaxis with each infusion. If severe hypersensitivity reactions occur, stop infusion and provide supportive care (e.g., administration of antihistamines, corticosteroids, racemic epinephrine, supplemental oxygen; monitoring of vital signs). Monitor for respiratory tract illness (congestion, cough, fever, malaise).

#### PATIENT/FAMILY TEACHING.

- Severe allergic reactions, including anaphylaxis, can occur. Seek immediate medical attention if difficulty breathing, dizziness, fast heart rate, itching, hives, rash; swelling of the face, lips or tongue occur. • Use effective contraception to avoid pregnancy. Do not breast-feed. • Report symptoms of infusion-related reactions such as extremity pain, muscle weakness, nasal congestion, nausea. • Treatment may increase risk of illness of the respiratory tract.

## exemestane

**HIGH  
ALERT**

ex-e-mes-tane  
(Aromasin)

**Do not confuse Aromasin with Arimidex, or exemestane with estramustine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aromatase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of advanced breast cancer in postmenopausal women whose disease has progressed following tamoxifen therapy. Adjuvant treatment of postmenopausal women with estrogen receptor-positive early breast cancer after 2–3 yrs of tamoxifen therapy for completion of 5 consecutive yrs of adjuvant hormonal therapy. **OFF-LABEL:** Reduces risk of invasive breast cancer in postmenopausal women; treatment of endometrial cancer, uterine sarcoma.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to exemestane. **Cautions:** Not indicated for use in premenopausal women. Concomitant use of estrogen-containing agents, strong CYP3A4 inducers.

### ACTION

Irreversibly inactivates aromatase, the principal enzyme that converts androgens to estrogens in both premenopausal and postmenopausal women, lowering circulating estrogen level. **Therapeutic Effect:** Inhibits growth of breast cancers stimulated by estrogens.

### PHARMACOKINETICS

Widely distributed. Protein binding: 90%. Metabolized in liver. Excreted in urine and feces. **Half-life:** 24 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Indicated for postmenopausal women. **Children:** Not

indicated for use in this pt population. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., PHE-Nobarbital, rifAMPin) may decrease concentration/effect. **Estrogen derivatives** may decrease therapeutic effect. **HERBAL:** St. John's wort may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

### AVAILABILITY (Rx)

**Tablets:** 25 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give after meals.

### INDICATIONS/ROUTES/DOSAGE

#### Breast Cancer (Early)

**PO: POSTMENOPAUSAL WOMEN:** 25 mg once daily after a meal (following 2–3 yrs tamoxifen therapy) for total duration of 5 yrs of endocrine therapy (in absence of recurrence or contralateral breast cancer).

#### Breast Cancer (Advanced)

**PO: POSTMENOPAUSAL WOMEN:** 25 mg once daily after a meal. 50 mg/day when used concurrently with potent CYP3A4 inducers (e.g., rifAMPin, phenytoin). Continue until tumor progression.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (22%–10%):** Fatigue, nausea, depression, hot flashes, pain, insomnia, anxiety, dyspnea. **Occasional (8%–5%):** Headache, dizziness, vomiting, peripheral edema, abdominal pain, anorexia, flu-like symptoms, diaphoresis, constipation, hypertension. **Rare (4%):** Diarrhea.

### ADVERSE EFFECTS/TOXIC REACTIONS

MI has been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of cardiac disease. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for onset of depression. Assess sleep pattern. Monitor for and assist with ambulation if dizziness occurs. Assess for headache. Offer antiemetic for nausea/vomiting.

### PATIENT/FAMILY TEACHING

- Report if nausea, hot flashes become unmanageable.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Best taken after meals and at same time each day.

## exenatide

HIGH  
ALERT

ex-en-a-tide

(Bydureon BCise, Byetta, 5 mcg Pen, 10 mcg Pen)

**BLACK BOX ALERT** (Bydureon): Risk of thyroid C-cell tumors.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Glucagon-like peptide-1 (GLP-1) receptor agonist. **CLINICAL:** Antidiabetic.

### USES

Adjunct to diet, exercise to improve glycemic control in adults (immediate-release and extended-release) and pediatric patients 10 yrs of age or older (extended-release only) with type 2 diabetes mellitus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to exenatide. Bydureon only: History of medullary thyroid carcinoma. Pts with multiple endocrine neoplasia syndrome type 2 (MEN2). History of drug-induced

immune-mediated thrombocytopenia. **Cautions:** Diabetic ketoacidosis, type 1 diabetes mellitus. Pts with renal transplantation or moderate renal impairment. Not recommended in severe renal impairment, severe GI disease, pancreatitis.

### ACTION

Stimulates release of insulin from beta cells of pancreas, mimics enhancement of glucose-dependent insulin secretion, suppresses elevated glucagon secretion, slows gastric emptying (central action increases satiety). **Therapeutic Effect:** Improves glycemic control by increasing postmeal insulin secretion, decreasing postmeal glucagon levels, delaying gastric emptying, and increasing satiety.

### PHARMACOKINETICS

Minimal systemic metabolism. Eliminated by glomerular filtration with subsequent proteolytic degradation. **Half-life:** 2.4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease concentration/effect of **oral contraceptives**. May increase hypoglycemic effect of **insulin, sulfonylureas (e.g., glyburide)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Injection, Solution (Prefilled Pen):** (Byetta): 10 mcg/0.04 mL (2.4 mL); 5 mcg/0.02 mL (1.2 mL). **Injection Prefilled Single-Dose Auto-Injector:** (Bydureon BCise): 2 mg in 0.85 mL vehicle.

### ADMINISTRATION/HANDLING

#### SQ

- May be given in thigh, abdomen, upper arm.
- Rotation of injection sites is essential; maintain careful injection site record.
- Give within 60 min before

morning and evening meals. Give suspension immediately after powder is suspended.

**Storage** • Refrigerate prefilled pens. • Discard if freezing occurs. • May be stored at room temperature after first use. • Discard pen 30 days after initial use. • (*Bydureon BCise*): Remove from refrigerator 15 min prior to mixing. To mix, shake vigorously for at least 15 sec.

## INDICATIONS/ROUTE/DOSAGE

### Diabetes Mellitus

**SQ: ADULTS, ELDERLY:** (Immediate-release): 5 mcg per dose given twice daily within the 60-min period before the morning and evening meals. Dose may be increased to 10 mcg twice daily after 1 mo of therapy. **ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER:** (Extended-release): 2 mg once q7days any time of day, with or without meals.

### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Use caution. **Severe impairment: CrCl less than 30 mL/min or ESRD:** Not recommended.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

(*Byetta*): **Frequent (44%):** Nausea. **Occasional (13%–6%):** Diarrhea, vomiting, dizziness, anxiety, dyspepsia. **Rare (less than 6%):** Weakness. (*Bydureon*): **5% or greater:** Nausea, diarrhea, headache, constipation, vomiting, dyspepsia, injection site pruritus or nodule.

## ADVERSE EFFECTS/TOXIC REACTIONS

With concurrent sulfonylurea, hypoglycemia occurs in 36% when given a 10-mcg dose of exenatide, 16% when given a 5-mcg dose. May cause acute pancreatitis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Check serum glucose before administration. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management, glucose-testing technique. At least 1 mo should elapse to assess response to drug before new dose adjustment is made.

### INTERVENTION/EVALUATION

Monitor serum glucose, food intake, renal function. Assess for hypoglycemia (cool wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, surgical procedure).

### PATIENT/FAMILY TEACHING

• Diabetes mellitus requires lifelong control. • Prescribed diet and exercise are principal parts of treatment. Do not skip, delay meals. • Continue to adhere to dietary instructions, regular exercise program, regular testing of serum glucose. • When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose). • Report any unexplained severe abdominal pain with or without nausea or vomiting.

## ezetimibe

TOP  
100

e-zet-i-mib  
(Ezetrol , Zetia)

**Do not confuse Zetia with Zebeta or Zestril.**

**FIXED-COMBINATION(S)**

**Liptruzet:** ezetimibe/atorvastatin (statin): 10 mg/10 mg, 10 mg/20 mg, 10 mg/40 mg, 10 mg/80 mg. **Vytorin:** ezetimibe/simvastatin (statin): 10 mg/10 mg, 10 mg/20 mg, 10 mg/40 mg, 10 mg/80 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antihyperlipidemic. **CLINICAL:** Anticholesterol agent.

**USES**

Adjunct to diet for treatment of primary hypercholesterolemia (monotherapy or in combination with HMG-CoA reductase inhibitors [statins]), homozygous sitosterolemia, homozygous familial hypercholesterolemia (combined with atorvastatin or simvastatin). Mixed hyperlipidemia (in combination with fenofibrate).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ezetimibe. Concurrent use of an HMG-CoA reductase inhibitor (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin) in pts with active hepatic disease or unexplained persistent elevations in serum transaminase; pregnancy and breastfeeding (when used with a statin). **Cautions:** Severe renal or mild hepatic impairment. Not recommended in those with moderate or severe hepatic impairment.

**ACTION**

Inhibits cholesterol absorption in brush border of small intestine, leading to decrease in delivery of intestinal cholesterol to liver. Reduces hepatic cholesterol stores and increases clearance of cholesterol from the blood. **Therapeutic Effect:** Reduces total serum cholesterol, LDL, triglycerides; increases HDL.

**PHARMACOKINETICS**

Well absorbed following PO administration. Protein binding: greater than 90%.

Metabolized in small intestine and liver. Excreted in feces (78%), urine (11%).

**Half-life:** 22 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts 10 yrs or younger. **Elderly:** Age-related mild hepatic impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Bile acid sequestrants (e.g., cholestyramine) may decrease absorption/effect. May increase concentration/effect of cycloSPORINE. **Fenofibrate and derivatives, gemfibrozil** may increase adverse effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

**AVAILABILITY (Rx)**

**Tablets:** 10 mg.

**ADMINISTRATION/HANDLING**

- Give without regard to food.
- May give at same time as statins. Give at least 2 hrs before or 4 hrs after bile acid sequestrants.

**INDICATIONS/ROUTES/DOSAGE****Hypercholesterolemia**

**PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER:** Initially, 10 mg once daily, given with or without food. If pt is also receiving a bile acid sequestrant, give ezetimibe at least 2 hrs before or at least 4 hrs after bile acid sequestrant.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended.

**SIDE EFFECTS**

**Occasional (4%–3%):** Back pain, diarrhea, arthralgia, sinusitis, abdominal

pain. **Rare (2%):** Cough, pharyngitis, fatigue, depression.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hepatitis, hypersensitivity reaction, myopathy, rhabdomyolysis occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain diet history, esp. fat consumption. Obtain serum cholesterol, triglycerides, hepatic function tests, blood counts during initial therapy and periodically during treatment. Treatment should be discontinued if hepatic enzyme levels persist more than 3 times normal limit. Receive full medication

history and screen for interactions. Question history of hepatic/renal impairment.

#### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Question pt for signs/symptoms of back pain, abdominal disturbances. Monitor serum cholesterol, triglycerides for therapeutic response.

#### PATIENT/FAMILY TEACHING

- Periodic laboratory tests are essential part of therapy.
- Do not stop medication without consulting physician.
- Report muscular or bone pain.
- May take at same time as statins. Take at least 2 hrs before or 4 hrs after cholestyramine, colestipol, colestevlam.

## famciclovir

fam-sye-klo-veer

(Apo-Famciclovir , Famvir )

**Do not confuse famciclovir with acyclovir, ganciclovir, or valganciclovir; or Famvir with Femara.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic nucleoside. **CLINICAL:** Antiviral.

### USES

Treatment of acute herpes zoster (shingles) in immunocompetent pts, treatment and suppression of recurrent genital herpes in immunocompetent pts, treatment of recurrent mucocutaneous herpes simplex in HIV-infected pts. Treatment of recurrent herpes labialis (cold sores) in immunocompetent pts.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to famciclovir, penciclovir. **Cautions:** Renal impairment. Avoid use in galactose intolerance, severe lactose deficiency, or glucose-galactose malabsorption syndromes.

### ACTION

Inhibits HSV-2 polymerase, inhibiting herpes viral DNA synthesis and replication. **Therapeutic Effect:** Suppresses replication of herpes simplex virus, varicella-zoster virus. Shortens healing time of herpes zoster lesions. Reduces symptom severity of genital herpes.

### PHARMACOKINETICS

Rapidly absorbed. Protein binding: 20%–25%. Rapidly metabolized to penciclovir by enzymes in GI tract, liver, plasma. Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–3 hrs (increased in severe renal failure).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, amylase, bilirubin, lipase. May decrease neutrophils, platelets.

### AVAILABILITY (Rx)

**Tablets:** 125 mg, 250 mg, 500 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • Give with food to decrease GI distress.

### INDICATIONS/ROUTES/DOSAGE

#### Herpes Zoster (Shingles)

**PO: ADULTS:** 500 mg q8h for 7 days. Begin as soon as possible after diagnosis and within 72 hrs of rash onset. **(HIV pts):** 500 mg 3 times/day for 7–10 days.

#### Genital Herpes Simplex (Initial)

**PO: ADULTS:** 250 mg 3 times/day for 7–10 days. **(HIV pts):** 500 mg twice daily for 5–10 days.

#### Genital Herpes Simplex (Recurrence)

**PO: ADULTS:** 125 mg 2 times/day for 5 days; or 500 mg once, then 250 mg 2 times/day for 2 days. **(HIV pts):** 500 mg twice daily for 5–10 days.

#### Genital Herpes Simplex (Suppression)

**PO: ADULTS:** 250 mg twice daily for up to 1 yr. **(HIV pts):** 500 mg twice daily continued indefinitely.

**Herpes Labialis (Cold Sores)**

**PO: ADULTS, ELDERLY: (Immunocompetent):** 1,500 mg as a single dose. Initiate at first sign or symptoms. **(HIV pts):** 500 mg 2 times/day for 5–10 days.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance and disease process.

Creatinine Clearance	Herpes Zoster	Recurrent Genital Herpes (single-day regimen)	Recurrent Genital Herpes (suppression)	Recurrent Herpes Labialis Treatment (single-day regimen)	Recurrent Orolabial or Genital Herpes in HIV Pts
40–59 mL/min	500 mg q12h	500 mg q12h	—	750 mg	—
20–39 mL/min	500 mg q24h	500 mg	125 mg q12h	500 mg	500 mg q24h
Less than 20 mL/min	250 mg q24h	250 mg	125 mg q24h	250 mg	250 mg q24h
Hemodialysis	250 mg after each hemodialysis session	250 mg after each hemodialysis session	125 mg after each hemodialysis session	250 mg after each hemodialysis session	250 mg after each hemodialysis session

**Dosage in Hemodialysis Pts**

**Herpes zoster:** 250 mg after each dialysis treatment. **Genital herpes:** 125 mg after each dialysis treatment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (23%–12%):** Headache, nausea.

**Occasional (10%–2%):** Dizziness, drowsiness, paresthesia (esp. feet), diarrhea, vomiting, constipation, decreased appetite, fatigue, fever, pharyngitis, sinusitis, pruritus. **Rare (less than 2%):** Insomnia, abdominal pain, dyspepsia, flatulence, back pain, arthralgia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Urticaria, severe skin rash, hallucinations, confusion (delirium, disorientation occur predominantly in elderly) has been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question history of galactose intolerance, severe lactose deficiency, glucose-galac-

tose malabsorption, renal impairment. Assess herpetic lesions.

**INTERVENTION/EVALUATION**

Monitor herpetic lesions. Be alert to neurologic effects: headache, dizziness. Provide analgesics, comfort measures.

**PATIENT/FAMILY TEACHING**

- Do not touch lesions with fingers to avoid spreading infection to new site.
- **Genital herpes:** Continue therapy for full length of treatment. • Avoid contact with lesions during duration of outbreak to prevent cross-contamination. • Use condoms during sexual activity. • Report if lesions recur or do not improve.
- Avoid tasks that require alertness, motor skills until response to drug is established.

**famotidine**

fa-moe-ta-deen

(Acid Reducer Maximum Strength, Apo-Famotidine , Pepcid)

**Do not confuse famotidine with cimetidine, ranitidine, fluoxetine, or furosemide.**

**FIXED-COMBINATION(S)**

**Duexis:** famotidine/ibuprofen (an NSAID): 26.6 mg/800 mg. **Pepcid Complete:** famotidine/calcium chloride/magnesium hydroxide (antacids): 10 mg/800 mg/165 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** H<sub>2</sub> receptor antagonist. **CLINICAL:** Antiulcer, gastric acid secretion inhibitor.

**USES**

Treatment of active duodenal ulcer. Prevention, maintenance of duodenal ulcer recurrence. Treatment of active gastric ulcer. Treatment of gastroesophageal reflux disease (GERD) and esophagitis due to GERD. OTC formulation for relief of heartburn, acid indigestion, sour stomach. **OFF-LABEL:** *H. pylori* eradication, risk reduction of duodenal ulcer recurrence (part of multidrug regimen), stress ulcer prophylaxis in critically ill pts, relief of gastritis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to famotidine, other H<sub>2</sub> antagonists. **OTC:** Avoid use in pts with dysphagia, odynophagia, hematemesis, melena, hematochezia, renal impairment. **Cautions:** Renal/hepatic impairment, elderly, thrombocytopenia.

**ACTION**

Inhibits histamine action of H<sub>2</sub> receptors of parietal cells. **Therapeutic Effect:** Inhibits gastric acid secretion (fasting, nocturnal, or stimulated by food, caffeine, insulin).

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	1 hr	1–4 hrs	10–12 hrs
IV	0.5 hr	0.5–3 hrs	10–12 hrs

Rapidly, incompletely absorbed from GI tract. Protein binding: 15%–20%. Partially metabolized in liver. Primarily excreted in urine. Not removed by

hemodialysis. **Half-life:** 2.5–3.5 hrs (increased in renal impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Confusion more likely to occur, esp. in pts with renal/hepatic impairment.

**INTERACTIONS**

**DRUG:** May decrease absorption of **atazanavir**, **cefuroxime**, **itraconazole**, **ketoconazole**. May decrease concentration/effect of **bosutinib**, **dasatinib**, **erlotinib**, **gefitinib**, **neratinib**, **pazopanib**. May increase concentration/effect of **risedronate**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Interferes with skin tests using allergen extracts. May increase serum alkaline phosphatase, ALT, AST. May decrease platelet count.

**AVAILABILITY (Rx)**

**Infusion, Premix:** 20 mg in 50 mL 0.9% NaCl. **Injection, Solution:** 10 mg/mL (2-mL vial). **Powder for Oral Suspension:** 40 mg/5 mL. **Tablets:** 10 mg, 20 mg, 40 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • For IV push, dilute 20 mg with 5–10 mL 0.9% NaCl. • For intermittent IV infusion (piggyback), dilute with 50–100 mL D<sub>5</sub>W, or 0.9% NaCl.

**Rate of administration** • Give IV push over at least 2 min. • Infuse piggyback over 15–30 min.

**Storage** • Refrigerate unused vials. • IV solution appears clear, colorless. • After dilution, IV solution is stable for 48 hrs if refrigerated.

**PO**

• Store tablets, suspension at room temperature. • Following reconstitution,

oral suspension is stable for 30 days at room temperature. • Give without regard to meals. • Shake suspension well before use.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), piperacillin/tazobactam (Zosyn).

### IV COMPATIBILITIES

Calcium gluconate, dexamethasone (Decadron), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), furosemide (Lasix), heparin, HYDRomorphone (Dilaudid), insulin (regular), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), potassium chloride, potassium phosphate, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Duodenal Ulcer

**PO: ADULTS, ELDERLY: ADOLESCENTS, CHILDREN WEIGHING MORE THAN 40 KG (Tablets):** 20 mg twice daily for 6 wks. **CHILDREN 1–16 YRS:** 1 mg/kg/day in 2 divided doses. **Maximum:** 40 mg 2 times/day. **CHILDREN 3 MOS–11 MOS:** 0.5 mg/kg/dose twice daily. **CHILDREN YOUNGER THAN 3 MOS, NEONATES:** 0.5 mg/kg/dose once daily.

### Gastric Ulcer

**PO: ADULTS, ELDERLY: ADOLESCENTS, CHILDREN WEIGHING MORE THAN 40 KG (Tablets, Acute therapy):** 40 mg/day at bedtime for up to 8 wks. **CHILDREN (Suspension):** 0.5 mg/kg/day at bedtime or divided twice daily. **Maximum:** 40 mg/day.

### Gastroesophageal Reflux Disease (GERD)

**Note:** A proton pump inhibitor is recommended for more severe or more frequent initial symptoms (with or without evidence of erosive esophagitis).

**PO: ADULTS, ELDERLY (Mild/intermittent symptoms without evidence of erosive esophagitis):** Initially, 10 mg twice daily. May increase to 20 mg twice daily after 2–4

wks if symptoms persist. If symptoms still persist, may continue as needed.

### Acid Indigestion, Heartburn (OTC Use)

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 10–20 mg q12h. May take 15–60 min before eating. **Maximum:** 40 mg/day.

### Usual Parenteral Dosage

**IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 20 mg q12h. **CHILDREN 1–12 YRS:** 0.25–0.5 mg/kg q12h. **Maximum:** 40 mg/day (20 mg/dose).

### Dosage in Renal Impairment

#### Creatinine

#### Clearance Dosage

Less than 50 mL/min	50% normal dose or increase dosing interval to 48 hrs
---------------------	---

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (5%):** Headache. **Rare (2% or less):** Confusion, constipation, diarrhea, dizziness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Agranulocytosis, pancytopenia, thrombocytopenia occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess epigastric/abdominal pain. Verify platelet count in critically ill pts.

### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Monitor for headache. Assess for confusion in elderly. Consider interrupting treatment in pts who develop thrombocytopenia.

### PATIENT/FAMILY TEACHING

- Report headache.
- Avoid excessive amounts of coffee, aspirin.
- Report persistent symptoms of heartburn, acid indigestion, sour stomach.

## fam-trastuzumab deruxtecan-nxki

fam tras-tu-zoo-mab de-rux-the-can (Enhertu)

**BLACK BOX ALERT** Serious and fatal cases of interstitial lung disease (ILD), pneumonitis were reported. Monitor for symptoms of ILD, pneumonitis including cough, dyspnea, fever, worsening of respiratory symptoms. Permanently discontinue in pts with Grade 2 (or higher) ILD, pneumonitis occurs. Treatment may cause fetal harm. Recommend effective contraception.

**Do not confuse fam-trastuzumab deruxtecan-nxki with ado-trastuzumab emtansine, brentuximab vedotin, pertuzumab, trastuzumab (or biosimilars), or trastuzumab/hyaluronidase.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Human epidermal growth factor receptor 2 (HER2)-directed; Antibody drug conjugate; topoisomerase inhibitor. Humanized IgG1 monoclonal antibody.

**CLINICAL:** Antineoplastic.

### USES

Treatment of adults with unresectable or metastatic HER2-positive breast cancer who have received two or more prior anti-HER2-based regimens in the metastatic setting. Treatment of locally advanced or metastatic HER2-positive gastric or gastroesophageal junction adenocarcinoma in adults who have received a prior trastuzumab-based regimen.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fam-trastuzumab deruxtecan-nxki, trastuzumab.

**Cautions:** Baseline cytopenias, hepatic impairment, pulmonary disease, cardiovascular disease, HF; conditions predisposing to infection (e.g., diabetes, renal

failure, immunocompromised pts, open wounds). Do not substitute with trastuzumab or ado-trastuzumab.

### ACTION

Composed of a cleavable tetrapeptide-based linker (trastuzumab) and cytotoxic topoisomerase I inhibitor, DXd (an exatecan derivative). Binds to HER2 receptor and undergoes internalization and intracellular linker cleavage by lysosomal enzymes, resulting in DNA damage and apoptosis (cellular death). **Therapeutic Effect:** Inhibits tumor cell growth.

### PHARMACOKINETICS

Widely distributed. Degrades into small peptides and amino acids via catabolic pathway. DXd is metabolized in liver. Protein binding: 97%. Excretion not specified. **Half-life:** 5.7 days, (DXd): 5.8 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 mos after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and for at least 4 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease effect of BCG (intravesical). May increase cardiotoxic effects of anthracyclines (e.g., DOXOrubicin). Cladribine, dipyrrone may increase myelosuppressive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May decrease serum potassium; Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets, RBCs, WBCs.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 100 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Must be prepared by personal trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for reconstitution based on weight in kg. • Direct stream toward glass wall of vial. • Reconstitute 100 mg vial with 5 mL of Sterile Water for Injection to a final concentration of 20 mg/mL. • Swirl vial gently until powder is completely dissolved. Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless to light yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 100 mL infusion bag of D<sub>5</sub>W. Infusion bag must be made of polyvinyl chloride (PVC) or polyolefin. • Mix by gentle inversion. • Do not shake or agitate diluted solution.

**Infusion guidelines** • If diluted solution was refrigerated, allow solution to warm to room temperature before infusion. • Infuse via dedicated IV line using an infusion set made of polyolefin or polybutadiene, and a 0.2 or 0.22 micron in-line filter made of polyethersulfone or polysulfone. • Do not administer as IV push or bolus. • If a dose is missed, do not wait until next cycle; administer as soon as possible. Adjust schedule to maintain q3wk cycle.

**Rate of administration** • Give initial infusion over 90 min. Give subsequent infusions over 30 min if prior infusions were tolerated. May slow or interrupt infusion if infusion reactions occur.

**Storage** • Refrigerate unused vials in original carton. • May refrigerate reconstituted vials for up to 24 hrs. • May refrigerate diluted solution for up to 24 hrs or store at room temperature for

up to 4 hrs. • Protect from light. • Do not shake, agitate, or freeze.

**IV INCOMPATIBILITIES**

Do not mix with solutions containing NaCl or other medications.

**INDICATIONS/ROUTES/DOSAGE****Breast Cancer (HER2-Positive)**

**IV: ADULTS:** 5.4 mg/kg q3wks (21-day cycle) until disease progression or unacceptable toxicity.

**Gastric Cancer (HER2-positive)**

**IV: ADULTS:** 6.4 mg/kg q3wks. Continue until disease progression or unacceptable toxicity.

**Dose Reduction for Adverse Events**

**Note:** Do not re-escalate if a dose reduction is made.

**First dose reduction:** 4.4 mg/kg.

**Second dose reduction:** 3.2 mg/kg.

**Unable to tolerate 3.2 mg/kg:** Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Interstitial Lung Disease (ILD)**

**Grade 1 ILD/pneumonitis (asymptomatic):** Withhold treatment until resolved. If resolved within 28 days, resume at same dose. If resolved in greater than 28 days, resume at reduced dose level.

**Grade 2 ILD/pneumonitis (symptomatic):** Permanently discontinue.

**Neutropenia**

**Grade 3 neutropenia (500–999 cells/mm<sup>3</sup>):** Withhold treatment until improved to Grade 2 or less, then resume at same dose. **Grade 4 neutropenia (less than 500 cells/mm<sup>3</sup>):** Withhold treatment until improved to Grade 2 or less, then resume at reduced dose level. **Febrile neutropenia (less than 1,000 cells/mm<sup>3</sup> and temperature greater than 38.3°C or sustained temperature 38°C for more than 1 hr):** Withhold treatment

until resolved, then resume at reduced dose level.

#### Left Ventricular Dysfunction

**Left ventricular ejection fraction (LVEF) greater than 45% and an absolute decrease from baseline of 10%–20%:** Maintain the same dose.

**LVEF 40%–45% and an absolute decrease from baseline of less than 10%:** Maintain same dose and assess LVEF within 3 wks. **LVEF 4%–45% and an absolute decrease from baseline of 10%–20%:** Withhold treatment and assess LVEF within 3 wks. If LVEF improves to within 10% from baseline, resume at same dose. If LVEF does not improve to within 10% from baseline, permanently discontinue. **LVEF less than 40% or an absolute decrease from baseline of greater than 20%:** Withhold treatment and assess LVEF within 3 wks. If LVEF of less than 40% or an absolute decrease from baseline of greater than 20% is confirmed, permanently discontinue. **Symptomatic HF:** Permanently discontinue.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (79%–29%):** Nausea, fatigue, asthenia, vomiting, alopecia, constipation, decreased appetite, diarrhea. **Occasional (20%–10%):** Cough, abdominal pain, headache, stomatitis, aphthous ulcer, mouth ulceration, oral mucosa erosion/blistering, dyspnea, dyspepsia, dry eye, rash, dizziness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia)

is an expected response to therapy, but more severe reactions including severe neutropenia, febrile neutropenia may be life-threatening. Grade 3 or 4 neutropenia reported in 16% of pts. Severe, life-threatening pneumonitis, ILD, respiratory failure reported in 9% of pts. Epistaxis reported in 13% of pts. Upper respiratory tract infections reported in 15% of pts. Immunogenicity (auto-fam-trastuzumab deruxtecan-nxki antibodies) reported in less than 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Confirm HER2-positive status. Obtain weight in kilograms. Assess LVEF by echocardiogram. Question history of hepatic impairment, pulmonary disease, cardiovascular disease, HF. Screen for active infection. Assess hydration/nutritional status. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression prior to each dose. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess LVEF by echocardiogram at regular intervals. If treatment is withheld due to change in LVEF, monitor LVEF within 3 wks. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetic if nausea/vomiting occurs.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of

bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); heart failure (e.g., chest pain, difficulty breathing, palpitations, swelling of extremities). • Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms. • Use effective contraception to avoid pregnancy. Do not breast-feed. • Nausea/vomiting is a common side effect. • Maintain proper hydration and nutrition.

## febuxostat

fe-bux-oh-stat  
(Uloric)

**Do not confuse febuxostat with panobinostat or Femstat.**

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Xanthine oxidase inhibitor. **CLINICAL:** Anti-gout agent.

### USES

Chronic management of hyperuricemia in pts with gout. Not recommended for treatment of asymptomatic hyperuricemia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to febuxostat. Concomitant use with azaTHIOprine, mercaptopurine. **Cautions:** Severe renal/hepatic impairment, history of cardiac disease or stroke. Hypersensitivity to allopurinol. Pts at risk for urate formation.

### ACTION

Decreases uric acid production by selectively inhibiting the enzyme xanthine oxidase. **Therapeutic Effect:** Reduces uric acid concentrations in serum and urine.

### PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed. Protein binding: 99%.

Metabolized in liver. Excreted in urine (49%), feces (45%). Removed by hemodialysis. **Half-life:** 5–8 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase concentration, toxicity of **azaTHIOprine, didanosine, mercaptopurine.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, LDH, amylase, sodium, potassium, cholesterol, triglycerides, BUN, creatinine. May decrease platelets, Hgb, Hct, neutrophils. May prolong prothrombin time.

### AVAILABILITY (Rx)

**Tablets:** 40 mg, 80 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food or antacids.

### INDICATIONS/ROUTES/DOSAGE

**◀ ALERT ▶** Recommended concomitant NSAID or colchicine with initiation of therapy and continue for up to 6 mos to prevent exacerbations of gout.

#### Hyperuricemia

**PO: ADULTS, ELDERLY:** Initially, 40 mg once daily. If pt does not achieve serum uric acid level less than 6 mg/dL after 2 wks with 40 mg, may give 80 mg once daily. **Maximum:** 120 mg/day.

#### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

### SIDE EFFECTS

**Rare (1%):** Nausea, arthralgia, rash, dizziness.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hepatic function abnormalities occur in 6% of pts. May increase risk of thromboembolic events including CVA, MI.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess renal function, LFT; concomitant use with azaTHIOprine, mercaptopurine, theophylline (contraindicated).

**INTERVENTION/EVALUATION**

Discontinue medication immediately if rash appears. Encourage high fluid intake (3,000 mL/day). Monitor I&O (output should be at least 2,000 mL/day). Monitor CBC, serum uric acid, renal function, LFT. Assess urine for cloudiness, unusual color, odor. Assess for therapeutic response (reduced joint tenderness, swelling, redness, limitation of motion). Monitor for symptoms of CVA, MI.

**PATIENT/FAMILY TEACHING**

- Encourage drinking 8–10 (8-oz) glasses of fluid daily while taking medication.
- Report rash, chest pain, shortness of breath, symptoms suggestive of stroke.
- Gout attacks may occur for several months after starting treatment (medication is not a pain reliever).
- Continue taking even if gout attack occurs.

## fenofibrate (and derivatives)

TOP  
100

fen-o-fye-brate

(Antara, Fenoglide, Fibracor, Lipofen, Lipidil EZ , Tricor, Trilipix)

**Do not confuse Tricor with Fibracor or Tracleer.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Fibric acid derivative. **CLINICAL:** Antihyperlipidemic.

**USES**

Adjunct to diet for reduction of low-density lipoprotein cholesterol (LDL-C), total cholesterol, triglycerides (types IV and V hyperlipidemia), apo-lipoprotein B, and to increase high-density lipoprotein cholesterol (HDL-C) in pts with primary hypercholesterolemia, mixed dyslipidemia. Adjunctive therapy to diet for treatment of severe hypertriglyceridemia (Fredrickson types IV and V).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to fenofibrate. Active hepatic disease, preexisting gallbladder disease, severe renal/hepatic dysfunction (including primary biliary cirrhosis, unexplained persistent hepatic function abnormality), breastfeeding. End-stage renal disease (ESRD).

**Cautions:** Anticoagulant therapy (e.g., warfarin), history of hepatic disease, venous thromboembolism, mild to moderate renal impairment, substantial alcohol consumption, statin or colchicine therapy (increased risk of myopathy, rhabdomyolysis), elderly.

**ACTION**

Downregulates apoprotein C-III and upregulates synthesis of apoprotein A-I, fatty acid transport protein, and lipoprotein lipase, increasing VLDL catabolism. **Therapeutic Effect:** Decreases triglycerides, VLDL levels, modestly increases HDL.

**PHARMACOKINETICS**

Widely distributed. Absorption increased when given with food. Protein binding: 99%. Metabolized in liver. Excreted in urine (60%), feces (25%). Not removed by hemodialysis. **Half-life:** 10–35 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Safety in pregnancy not established. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase effects of **anticoagulants** (e.g., warfarin). **Bile acid**

sequestrants may impede absorption. CycloSPORINE may increase concentration/effect, risk of nephrotoxicity. Colchicine, HMG-CoA reductase inhibitors (statins) may increase risk of severe myopathy, rhabdomyolysis, acute renal failure. **HERBAL:** None significant. **FOOD:** All foods increase absorption. **LAB VALUES:** May increase serum creatine kinase (CK), ALT, AST. May decrease Hgb, Hct, WBC; serum uric acid.

## AVAILABILITY (Rx)

**Capsules:** 30 mg, 43 mg, 50 mg, 67 mg, 90 mg, 130 mg, 134 mg, 150 mg, 200 mg. **Capsules, Delayed-Release:** 45 mg, 135 mg. **Tablets:** 35 mg, 40 mg, 48 mg, 54 mg, 105 mg, 120 mg, 145 mg, 160 mg.

## ADMINISTRATION/HANDLING

### PO

- Give Fenoglide, Lipofen, Lofibra with meals.
- Antara, Fibracor, Tricor, Triglide, and Trilipix may be given without regard to food. Antara, Fenoglide, Lipofen: Swallow whole; do not open (capsules), crush, dissolve, or cut.

## INDICATIONS/ROUTES/DOSAGE

### Hypertriglyceridemia

**PO:** (*Antara*): ADULTS, ELDERLY: 30–90 mg/day. (*Fenofibrate*): ADULTS, ELDERLY: 43–130 mg/day. (*Fenoglide*): ADULTS, ELDERLY: 40–120 mg/day with meals. (*Fibracor*): ADULTS, ELDERLY: 35–105 mg/day. (*Lipofen*): ADULTS, ELDERLY: 50–150 mg/day with meals. (*Lofibra*): ADULTS, ELDERLY: (micronized) 67–200 mg/day with meals; (tablets): 54–160 mg/day. (*Tricor*): ADULTS, ELDERLY: 48–145 mg/day. (*generic*): ADULTS, ELDERLY: 160 mg/day. (*Trilipix*): ADULTS, ELDERLY: 45–135 mg/day.

### Hypercholesterolemia, Mixed Hyperlipidemia

**PO:** (*Antara*): ADULTS, ELDERLY: 90 mg/day. (*Fenofibrate*): ADULTS, ELDERLY: 130 mg/day. (*Fenoglide*): ADULTS, ELDERLY: 120 mg/day with meals. (*Fibracor*): ADULTS, ELDERLY: 105 mg/

day. (*Lipofen*): ADULTS, ELDERLY: 150 mg/day with meals. (*Lofibra*): ADULTS, ELDERLY: (micronized) 200 mg/day with meals; (tablets): 160 mg/day. (*Tricor*): ADULTS, ELDERLY: 145 mg/day. (*generic*): ADULTS, ELDERLY: 160 mg/day. (*Trilipix*): ADULTS, ELDERLY: 135 mg/day.

## Dose Modification

### Discontinuation of Treatment

Discontinue treatment in pts with cholelithiasis, increased CPK level, suspected or diagnosed myopathy/myositis. Permanently discontinue if HDL-C is severely depressed.

### Dosage in Renal Impairment

Monitor renal function before adjusting dose. Decrease dose or increase dosing interval for pts with renal failure.

Initial doses:	Antara: 30 mg/day	Lofibra: 67 mg/day
	Fenoglide: 40 mg/day	Tricor: 48 mg/day
	Lipofen: 50 mg/day	Triglide: 50 mg/day

### Dosage in Hepatic Impairment

Contraindicated.

## SIDE EFFECTS

**Frequent (8%–4%):** Pain, rash, headache, asthenia, fatigue, flu-like symptoms, dyspepsia, nausea/vomiting, rhinitis. **Occasional (3%–2%):** Diarrhea, abdominal pain, constipation, flatulence, arthralgia, decreased libido, dizziness, pruritus. **Rare (less than 2%):** Increased appetite, insomnia, polyuria, cough, blurred vision, eye floaters, earache.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase cholesterol excretion into bile, leading to cholelithiasis. Pancreatitis, hepatitis, thrombocytopenia, agranulocytosis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain diet history, esp. fat consumption. Obtain serum cholesterol, triglyc-

erides, LFT, CBC during initial therapy and periodically during treatment. Treatment should be discontinued if hepatic enzyme levels persist greater than 3 times normal limit. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

For pts on concurrent therapy with HMG-CoA reductase inhibitors, monitor for complaints of myopathy (muscle pain, weakness). Monitor serum creatine kinase (CK). Monitor serum cholesterol, triglyceride for therapeutic response.

#### PATIENT/FAMILY TEACHING

- Report severe diarrhea, constipation, nausea.
- Report skin rash/irritation, insomnia, muscle pain, tremors, dizziness.

## fentaNYL

TOP  
100 HIGH  
ALERT

### fen-ta-nil

(Actiq, Duragesic, Fentora, Ionsys, Lazanda, Subsys)

**BLACK BOX ALERT** Physical and psychological dependence may occur with prolonged use. Must be alert to abuse, misuse, or diversion. May cause life-threatening hypoventilation, respiratory depression, or death. Use with strong or moderate CYP3A4 inhibitors may result in potentially fatal respiratory depression. **Buccal:** Tablet and lozenge contain enough medication to potentially be fatal to children. **Transdermal patch:** Serious or life-threatening hypoventilation has occurred. Limit use to children 2 yrs of age and older. Exposure to direct heat source increases drug release, resulting in overdose/death.

**Do not confuse fentaNYL with alfentanil or SUFentanil.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid, narcotic agonist (Schedule II).

**CLINICAL:** Analgesic.

#### USES

**Injection: (FentaNYL):** Pain relief, preop medication; adjunct to general or regional anesthesia. **Transdermal patch (e.g., Duragesic):** Management of pain in opioid-tolerant pts that is severe enough to require daily, around-the-clock, long-term opioid treatment. **Transdermal device (e.g., Ionsys):** Short-term management of acute postoperative pain. **Transmucosal lozenge, buccal tablet, intranasal (Lazanda), sublingual liquid: Cancer pain, breakthrough:** Management of breakthrough cancer pain in opioid-tolerant patients.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to fentaNYL. **Transdermal device (additional):** Significant respiratory depression, acute/severe bronchial asthma, paralytic ileus, GI obstruction. **Transdermal patch (additional):** Significant respiratory depression, acute/severe bronchial asthma, paralytic ileus, short-term therapy for acute or postoperative pain, pts who are not opioid tolerant. **Transmucosal buccal, buccal films, lozenges, sublingual tablets/spray, nasal spray (additional):** Management of acute or postoperative pain, pts who are not opioid tolerant. GI obstruction, significant respiratory depression (Actiq, Fentora only), acute or severe bronchial asthma. **Cautions:** Bradycardia; renal, hepatic, respiratory disease; head injuries; altered LOC; biliary tract disease; acute pancreatitis; cor pulmonale; significant COPD; increased ICP;

use of MAOIs within 14 days; elderly; morbid obesity; history of drug abuse and misuse, drug-seeking behavior, dependency.

## ACTION

Binds to opioid receptors in CNS, reducing stimuli from sensory nerve endings; inhibits ascending pain pathways. **Therapeutic Effect:** Alters pain reception, increases pain threshold.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1–2 min	3–5 min	0.5–1 hr
IM	7–15 min	20–30 min	1–2 hrs
Transdermal	6–8 hrs	24 hrs	72 hrs
Transmucosal	5–15 min	20–30 min	1–2 hrs

Well absorbed after IM or topical administration. Transmucosal form absorbed through buccal mucosa and GI tract. Protein binding: 80%–85%. Metabolized in liver. Primarily excreted by biliary system. **Half-life:** 2–4 hrs IV; 17 hrs transdermal; 6.6 hrs transmucosal.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Unknown if distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. **Children:** Neonates more susceptible to respiratory depressant effects. Patch: Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** May be more susceptible to respiratory depressant effects. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), cimetidine may increase concentration/effect; risk for respiratory depression.

**Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Alcohol, CNS depressants** (e.g., lorazepam, haloperidol, zolpidem) may increase CNS depression. May increase serotonergic effect of MAOIs (e.g., phenelzine, selegiline). **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may enhance serotonergic effect. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

## AVAILABILITY (Rx)

**Buccal Tablet:** 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg. **Buccal Soluble Film:** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg. **Injection Solution:** 50 mcg/mL. **Nasal Spray: (Lazanda):** 100 mcg/spray, 300 mcg/spray, 400 mcg/spray. **Sublingual Spray: (Subsys):** 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, 1,600 mcg. **Transdermal Patch: (Duragesic):** 12 mcg/hr, 25 mcg/hr, 50 mcg/hr, 75 mcg/hr, 100 mcg/hr. **Transmucosal Lozenges:** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, 1,600 mcg.

## ADMINISTRATION/HANDLING

**Rate of administration** • Give by slow IV injection (over 1–2 min).

• Too-rapid injection increases risk of severe adverse reactions (skeletal/thoracic muscle rigidity resulting in apnea, laryngospasm, bronchospasm, peripheral circulatory collapse, anaphylactoid effects, cardiac arrest).

**Storage** • Store parenteral form at room temperature. • Opiate antagonist (naloxone) should be readily available.

### Transdermal

• Apply to hairless area of intact skin of upper torso. • Use flat, nonirritated site. • Firmly press evenly and hold for 30 sec, ensuring that adhesion is in full contact

with skin and that edges are completely sealed. • Use only water to cleanse site before application (soaps, oils may irritate skin). • Rotate sites of application. • Carefully fold used patches so that system adheres to itself; discard in toilet. • If patch becomes loose, cover with a transparent adhesive dressing; if patch comes off, apply new patch, rotating sites (this starts a new dosing interval). Normal exposure to water may loosen the adhesive.

#### Buccal Film

• Wet inside of cheek. • Place film inside mouth with pink side of unit against cheek. • Press film against cheek and hold for 5 sec. • Leave in place until dissolved (15–30 min). • Do not chew, swallow, cut film. • Liquids may be given after 5 min of application; food after film dissolves.

#### Buccal Tablets

• Place tablet above a rear molar between upper cheek and gum. • Dissolve over 30 min. • Swallow remaining pieces with water. • Do not split tablet.

#### Sublingual Spray

• Open blister pack with scissors immediately prior to use. • Spray contents underneath tongue.

#### Sublingual Tablets

• Place under tongue. • Dissolves rapidly. • Do not suck, chew, or swallow tablet.

#### Nasal

• Prime device before use by spraying into pouch. • Insert nozzle about 12 inch into nose, pointing toward bridge of nose, tilting bottle slightly. • Press down firmly until hearing a “click” and number on counting window advances by one. Do not blow nose for at least 30 min following administration.

#### Transmucosal

• Suck lozenge vigorously. • Allow to dissolve over 15 min. • Do not chew.

### IV INCOMPATIBILITIES

Azithromycin (Zithromax), pantoprazole (Protonix), phenytoin (Dilantin).

### IV COMPATIBILITIES

Atropine, bupivacaine (Marcaine, Sensorcaine), cloNIDine (Duraclon), dexmedetomidine (Precedex), dilTIAZem (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), droperidol (Inapsine), heparin, HYDRomorphone (Dilaudid), ketorolac (Toradol), LORazepam (Ativan), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), potassium chloride, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

**Note:** Doses titrated to desired effect dependent upon degree of analgesia, pt status.

#### Acute Pain Management (FentaNYL)

**IM/IV: ADULTS, ELDERLY:** 25–50 mcg or 0.35–0.5 mcg/kg q30–60 min as needed.

#### Continuous IV Infusion (FentaNYL)

**ADULTS, ELDERLY:** After initial loading dose (25–100 mcg), begin infusion at 25–50 mcg/hr. Titrate q30–60 min to clinical effect. Usual dose range: 50–200 mcg/hour. Weight-based dosing range: 0.7–10 mcg/kg/hr.

#### Usual Buccal Dose (Fentora)

**ADULTS, ELDERLY:** Initially, 100 mcg. Titrate dose up to 800 mcg single dose, providing adequate analgesia with tolerable side effects.

#### Usual Nasal Dose (Lazanda)

**Nasal: ADULTS, ELDERLY:** Initially, 100 mcg. Titrate from 100 mcg to 200 mcg to 300 mcg to 400 mcg to 600 mcg to 800 mcg (**maximum**). Wait at least 2 hrs between doses; no more than 4 doses in 24 hrs.

#### Usual Sublingual Spray Dose (Subsys)

**ADULTS, ELDERLY:** Initially, 100 mcg. May repeat with same dose in 30 min if pain not relieved. Must wait at least 4 hours

before treating another episode of pain. May titrate to 200 mcg to 400 mcg to 600 mcg to 800 mcg to 1200 mcg to 1600 mcg.

#### Usual Transdermal Dose (Duragesic)

**ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 12–25 mcg/hr. May increase after 3 days. Do not titrate more frequently than q3days following initial application or q6days thereafter.

#### Usual Transmucosal Dose (Actiq)

**ADULTS, CHILDREN:** 200–1200 mcg for breakthrough pain. Limit to 4 applications/day. Titrate to provide adequate analgesia while minimizing adverse effects.

#### Dosage in Renal/Hepatic Impairment

**Injection:** No dose adjustment.

**Transdermal patch: Mild to moderate impairment:** Reduce dose by 50%.  
**Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent: IV:** Postop drowsiness, nausea, vomiting. **Transdermal (10%–3%):** Headache, pruritus, nausea, vomiting, diaphoresis, dyspnea, confusion, dizziness, drowsiness, diarrhea, constipation, decreased appetite. **Occasional: IV:** Postop confusion, blurred vision, chills, orthostatic hypotension, constipation, difficulty urinating. **Transdermal (3%–1%):** Chest pain, arrhythmias, erythema, pruritus, syncope, agitation, skin irritations.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose or too-rapid IV administration may produce severe respiratory depression, skeletal/thoracic muscle rigidity (may lead to apnea, laryngospasm, bronchospasm, cold/clammy skin, cyanosis, coma). Tolerance to analgesic effect may occur with repeated use. **Antidote:** Naloxone (see Appendix J for dosage). Abrupt stoppage of prolonged high-dose, continuous infusions may induce opiate withdrawal. Concomitant use with benzodiazepines may result in profound sedation, respiratory depression, coma, and death.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Resuscitative equipment, opiate antagonist (naloxone 0.5 mcg/kg) should be available for initial use. Establish baseline B/P, respirations. Assess type, location, intensity, duration of pain. Determine daily morphine equivalency in cancer pts who are being transitioned to chronic therapy. Assess risk of drug abuse, misuse, drug-seeking behavior.

### INTERVENTION/EVALUATION

Assist with ambulation. Encourage postop pt to turn, cough, deep breathe q2h. Monitor respiratory rate, B/P, heart rate, oxygen saturation. Assess for relief of pain. In pts with prolonged high-dose, continuous infusions (critical care, ventilated pts), consider weaning drip gradually or transition to a fentanyl patch to decrease symptoms of opiate withdrawal. Screen for misuse, abuse, drug-seeking behavior.

### PATIENT/FAMILY TEACHING

- Avoid alcohol; do not take other medications without consulting physician.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Teach pt proper transdermal, buccal, lozenge administration.
- **Transdermal:** Avoid saunas (increases drug release time).
- Use as directed to avoid overdose; potential for physical dependence with prolonged use.
- Report constipation, absence of pain relief.
- Taper slowly after long-term use.

## ferric carboxymaltose

fer-ik kar-box-ee-mawl-tose  
(Injectafer)

## ferric gluconate

fer-ick gloo-koe-nate  
(Ferrolecit)

## ferrous fumarate

fer-us fue-ma-rate  
(Ferrocite, Palafer )

## ferrous gluconate

fer-us gloo-koe-nate  
(Apo-Ferrous Gluconate , Ferate)

## ferrous sulfate

fer-us sul-fate  
(Fer-In-Sol, Fer-Iron, Slow-Fe)

## ferumoxytol

fer-ue mox-i-tol  
(Feraheme)

## Iron Dextran

(Infed),

## Iron sucrose

(Venofer)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Enzymatic mineral. **CLINICAL:** Iron preparation.

### USES

**Ferric carboxymaltose, ferumoxytol:** Treatment of iron deficiency in adults. **Ferrous fumarate, gluconate, sulfate:** Prevention, treatment of iron-deficiency anemia. **Ferric gluconate:** Treatment of iron-deficiency anemia in combination with erythropoietin in HD pts. **Iron dextran:** Treatment of iron deficiency in adults and pediatric pts 4 mos of age or older. **Iron sucrose:** Treatment of iron-deficiency anemia in chronic kidney disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to iron salts. Hemochromatosis, hemolytic anemias. **Cautions:** Peptic ulcer, regional

enteritis, ulcerative colitis, pts receiving frequent blood transfusions.

### ACTION

Essential component in formation of Hgb, myoglobin, enzymes. Promotes effective erythropoiesis and transport, utilization of oxygen. **Therapeutic Effect:** Prevents iron deficiency.

### PHARMACOKINETICS

Absorbed in duodenum and upper jejunum. Ten percent absorbed in pts with normal iron stores; increased to 20%–30% in pts with inadequate iron stores. Primarily bound to serum transferrin. Excreted in urine, sweat, sloughing of intestinal mucosa, menses. **Half-life:** 6 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** **Antacids** may decrease absorption of ferrous compounds. May decrease absorption of **bisphosphonates** (e.g., risedronate), **cefdinir**, **quinolones**, **tetracyclines**. **HERBAL:** None significant. **FOOD:** Cereal, coffee, dietary fiber, eggs, milk, tea decrease absorption. **LAB VALUES:** May increase serum bilirubin, iron. May decrease serum calcium.

### AVAILABILITY

**Ferric Carboxymaltose**  
**Injection, Solution:** 750 mg/15 mL.

**Ferric Gluconate**  
**Injection, Solution:** 12.5 mg/mL.

**Ferrous Fumarate**  
**Tablets:** 90 mg (29.5 mg elemental iron), 324 mg (106 mg elemental iron).

**Ferrous Gluconate**  
**Tablets:** 240 mg (27 mg elemental iron) (Fergon), 325 mg (36 mg elemental iron).

**Ferrous Sulfate**  
**Oral Solution:** 75 mg/mL (15 mg/mL elemental iron). **Tablets:** 325 mg (65 mg

elemental iron). **Syrup:** 300 mg/5 mL (60 mg elemental iron per 5 mL). **Solution, Injection: (Infed):** 50 mg/mL. **(Venofer):** 20 mg/mL. **(Feraheme):** 510 mg/17 mL.

 **Tablets (Timed-Release):** 160 mg (50 mg elemental iron). **Ferumoxytol:** 510 mg/17 mL.

## ADMINISTRATION/HANDLING

### PO

- Store all forms (tablets, capsules, suspension, drops) at room temperature.
- Ideally, give between meals with water or juice but may give with meals if GI discomfort occurs.
- Transient staining of mucous membranes, teeth occurs with liquid iron preparation. To avoid staining, place liquid on back of tongue with dropper or straw.
- Do not give with milk or milk products.
- Do not break, crush, dissolve, or divide timed-release tablets.

## INDICATIONS/ROUTES/DOSAGE

### Iron-Deficiency Anemia

Dosage is expressed in terms of milligrams of elemental iron. Assess degree of anemia, pt weight, presence of any bleeding. Expect to use periodic hematologic determinations as guide to therapy.

**IV: (Ferric Carboxymaltose): ADULTS, ELDERLY: (50 KG OR GREATER):** 750 mg on day 1; repeat dose after at least 7 days. **(LESS THAN 50 KG):** 15 mg/kg on day 1; repeat dose after at least 7 days. **(Ferric Gluconate): ADULTS, ELDERLY:** 125 mg/dose. Usual dose: 1,000 mg given over 8 sessions. **(Ferumoxytol): ADULTS, ELDERLY:** 510 mg (as IV infusion). May repeat dose 3–8 days after initial dose.

**PO: (Ferrous Fumarate): ADULTS, ELDERLY:** 65–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses. **(Ferrous Gluconate): ADULTS, ELDERLY:** 65–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses. **(Ferrous Sulfate): ADULTS, ELDERLY:** 65–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses.

**IV: (Iron Dextran): ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 15 KG:** Dose in

mL (50 mg elemental iron/mL) =  $0.0442$  (desired Hgb less observed Hgb)  $\times$  lean body weight (in kg) + (0.26  $\times$  lean body weight). Give 2 mL or less once daily until total dose reached. **IV: ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 15 KG:** Dose in mL (50 mg elemental iron/mL) =  $0.0442$  (desired Hgb less observed Hgb)  $\times$  lean body weight (in kg) + (0.26  $\times$  lean body weight). Give 2 mL or less once daily until total dose reached. **CHILDREN WEIGHING 5–15 KG:** Dose in mL (50 mg elemental iron/mL) =  $0.0442$  (desired Hgb less observed Hgb)  $\times$  body weight (in kg) + (0.26  $\times$  body weight). Give 2 mL or less once daily until total dose reached.

**IV: (Iron Sucrose): ADULTS, ELDERLY (HEMODIALYSIS-DEPENDENT PTS):** 5 mL iron sucrose (100 mg elemental iron) delivered during dialysis; administer 1–3 times/wk to total dose of 1,000 mg in 10 doses. Give no more than 3 times/wk. **CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (maximum: 100 mg) q2wks for 6 doses. **(PERITONEAL DIALYSIS-DEPENDENT PTS):** Two infusions of 300 mg over 90 min 14 days apart, followed by a single 400-mg dose over 2.5 hrs 14 days later. **CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (maximum: 100 mg) q4wks for 3 doses. **(NON-DIALYSIS-DEPENDENT PTS):** 200 mg over 2–5 min on 5 different occasions within 14 days. **CHILDREN 2 YRS AND OLDER:** 0.5 mg/kg/dose (maximum: 100 mg) q4wks for 3 doses.

**IV: (Ferumoxytol): ADULTS, ELDERLY:** (Two-dose regimen): 510 mg over at least 15 min. After 3–8 days have elapsed, repeat dose. May readminister in pts with persistent or recurrent iron-deficiency anemia. (Single-dose regimen): 1.02 g over approx. 30 min.

### Prevention of Iron Deficiency

**PO: (Ferrous Fumarate): ADULTS, ELDERLY:** 30–60 mg/day. **CHILDREN: (5–12 yrs):** 30–60 mg/day. (2–4 yrs): 30 mg/day. (6 mos–1 yr): 10–12.5 mg/day. **(Ferrous Gluconate): ADULTS, ELDERLY:** 30–60 mg/day. **CHILDREN: (5–12 yrs):** 30–60 mg/day. (2–4 yrs): 30 mg/day. (6 mos–1 yr): 10–12.5 mg/day. **(Ferrous Sulfate): ADULTS,**

**ELDERLY:** 30–60 mg/day. **CHILDREN:** (5–12 yrs): 30–60 mg/day. (2–4 yrs): 30 mg/day. (6 mos–1 yr): 10–12.5 mg/day.

## SIDE EFFECTS

**Occasional:** Mild, transient nausea.

**Rare:** Heartburn, anorexia, constipation, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Large doses may aggravate existing GI tract disease (peptic ulcer, regional enteritis, ulcerative colitis). Severe iron poisoning occurs most often in children, manifested as vomiting, severe abdominal pain, diarrhea, dehydration, followed by hyperventilation, pallor, cyanosis, cardiovascular collapse.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess nutritional status, dietary history. Question history of hemochromatosis, hemolytic anemia, ulcerative colitis. Question use of antacids, calcium supplements.

### INTERVENTION/EVALUATION

Monitor serum iron, total iron-binding capacity, reticulocyte count, Hgb, ferritin. Monitor daily pattern of bowel activity, stool consistency. Assess for clinical improvement, record relief of iron-deficiency symptoms (fatigue, irritability, pallor, paresthesia of extremities, headache).

### PATIENT/FAMILY TEACHING

- Expect stool color to darken.
- Oral liquid may stain teeth.
- To prevent mucous membrane and teeth staining with liquid preparation, use dropper or straw and allow solution to drop on back of tongue.
- If GI discomfort occurs, take after meals or with food.
- Do not take within 2 hrs of other medication or eggs, milk, tea, coffee, cereal.
- Do not take antacids or OTC calcium supplements.

## fesoterodine

fes-oh-ter-oh-deen  
(Toviaz)

**Do not confuse fesoterodine with fexofenadine or tolterodine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Muscarinic receptor antagonist. **CLINICAL:** Anticholinergic.

## USES

Treatment of overactive bladder with symptoms including urinary incontinence, urgency, frequency. Treatment of neurogenic detrusor overactivity (NDO) in pts 6 yrs of age and older and weighing more than 25 kg.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to fesoterodine. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Severe renal impairment, severe hepatic impairment, clinically significant bladder outflow obstruction (risk of urinary retention), GI obstructive disorders (e.g., pyloric stenosis [risk of gastric retention], treated narrow-angle glaucoma, myasthenia gravis, concurrent therapy with strong CYP3A4 inhibitors, elderly, use in hot weather.

## ACTION

Exhibits antimuscarinic activity by interceding via cholinergic muscarinic receptors, thereby mediating urinary bladder contraction. **Therapeutic Effect:** Decreases urinary frequency, urgency.

## PHARMACOKINETICS

Widely distributed. Protein binding: 50%. Rapidly and extensively hydrolyzed to its active metabolite. Primarily excreted in urine. **Half-life:** 7 hours.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of antimuscarinic adverse events, including dry mouth, constipation, dyspepsia; increase in residual urine, dizziness, urinary tract infections higher in pts 75 yrs of age and older.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Acidini-dium, ipratropium, tiotropium, umeclidinium** may increase anticholinergic effect. **Strong CYP3A4 inducers** (e.g., carBA-Mazepine, phenytoin, rifAMPin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VAL-UES:** May increase serum ALT, GGT.

## AVAILABILITY (Rx)

 **Tablets, Extended-Release:** 4 mg, 8 mg.

## ADMINISTRATION/HANDLING

### PO

- May be administered with or without food.
- Swallow whole; do not break, crush, dissolve, or divide tablet.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO: ADULTS, ELDERLY:** Initially, 4 mg once daily. May increase to 8 mg once daily. **Maximum dose** for pts with concurrent use of strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole) is 4 mg once daily.

### NDO

**PO: CHILDREN WEIGHING 26–35 KG:** 4 mg once daily. May increase to 8 mg once daily. **GREATER THAN 35 KG:** 4 mg once daily, then increase dose to 8 mg once daily after 7 days.

### Dosage in Renal Impairment

**PO: ADULTS, ELDERLY: Maximum:** 4 mg with CrCl less than 30 mL/min.

## Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (34%–18%):** Dry mouth. **Occasional (6%–3%):** Constipation, urinary tract infection, dry eyes. **Rare (2% or less):** Nausea, dysuria, back pain, rash, insomnia, peripheral edema.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe anticholinergic effects including abdominal cramps, facial warmth, excessive salivation/lacrimation, diaphoresis, pallor, urinary urgency, blurred vision.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess urinary pattern (e.g., urinary frequency, urgency). Question history as listed in Precautions. Receive full medication history.

### INTERVENTION/EVALUATION

Assist with ambulation if dizziness occurs. Question for visual changes. Monitor incontinence, postvoid residuals. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- May produce constipation and urinary retention.
- Blurred vision may occur; use caution until drug effects have been determined.
- Heat prostration (due to decreased sweating) can occur if used in a hot environment.
- Do not ingest grapefruit products.

## fexofenadine

fex-oh-fen-a-deen

(Allegra Allergy, Allegra Allergy Children's)

**Do not confuse Allegra with Viagra, or fexofenadine with fesoterodine.**

**FIXED-COMBINATION(S)**

**Allegra-D 12 Hour:** fexofenadine/pseudoephedrine (sympathomimetic): 60 mg/120 mg. **Allegra-D 24 Hour:** fexofenadine/pseudoephedrine (sympathomimetic): 180 mg/240 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Histamine H<sub>1</sub> antagonist (second generation).  
**CLINICAL:** CLINICAL: Antihistamine.

**USES**

Relief of symptoms associated with hayfever or other upper respiratory allergies (e.g., runny nose, sneezing, itching of nose/throat).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to fexofenadine. **Cautions:** Renal impairment, hypertension (if drug combined with pseudoephedrine). Orally disintegrating tablet not recommended in children younger than 6 yrs.

**ACTION**

Competes with histamine-1 receptor site on effector cells in GI tract, blood vessels, and respiratory tract. **Therapeutic Effect:** Relieves hayfever/upper respiratory symptoms.

**PHARMACOKINETICS**

	<b>Onset</b>	<b>Peak</b>	<b>Duration</b>
PO	60 min	—	12 hrs or greater

Rapidly absorbed and widely distributed. Protein binding: 60%–70%. Does not cross blood-brain barrier. Minimally metabolized. Excreted in feces (80%), urine (11%). Not removed by hemodialysis. **Half-life:** 14.4 hrs (increased in renal impairment).

**🕒 LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12

yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Aluminum- and magnesium-containing antacids may decrease absorption. **Aclidinium, ipratropium, tiotropium, umeclidinium** may increase anticholinergic effect. **CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem)** may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may decrease concentration/effect. **LAB VALUES:** May suppress wheal, flare reactions to antigen skin testing unless drug is discontinued at least 4 days before testing.

**AVAILABILITY (Rx)**

**Oral Suspension:** 30 mg/5 mL. **Tablets:** 60 mg, 180 mg. **Tablets (Orally Disintegrating):** 30 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Avoid giving with fruit juices (apple, grapefruit, orange).
- Administer with water only.
- Shake suspension well before use.

**PO (Orally Disintegrating Tablet)**

- Take on empty stomach.
- Remove from blister pack; immediately place on tongue.
- May take with or without liquid.
- Do not split or cut.

**INDICATIONS/ROUTES/DOSAGE****Hayfever, Upper Respiratory Symptoms**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 60 mg twice daily or 180 mg once daily. **CHILDREN 2–11 YRS:** 30 mg twice daily.

**Dosage in Renal Impairment**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 60 mg once daily. **CHILDREN 2–11 YRS:** 30 mg once daily. **CHILDREN 6 MOS–LESS THAN 2 YRS:** 15 mg once daily.

CrCl	Adults	Children
>50 mL/min	No adjustment	No adjustment
10–50 mL/min	60 mg q12–24h	60 mg q24h
<10 mL/min	30 mg q24h	30 mg q24h

### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Rare (less than 2%):** Drowsiness, headache, fatigue, nausea, vomiting, abdominal distress, dysmenorrhea.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reaction occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess severity of congestion, rhinitis, urticaria, watery eyes. Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales.

#### INTERVENTION/EVALUATION

Assess for therapeutic response; relief from allergy: itching, red, watery eyes, rhinorrhea, sneezing.

#### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol during antihistamine therapy.
- Coffee, tea may help reduce drowsiness.
- Do not take with any fruit juices.

## fidaxomicin

fye-dax-oh-mye-sin  
(Dificid)

**Do not confuse fidaxomicin with azithromycin, clindamycin, erythromycin, gentamicin, plazomicin, or tobramycin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Macrolide. **CLINICAL:** Antibiotic.

### USES

Treatment of *Clostridioides difficile*-associated diarrhea in adults and children 6 mos and older.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fidaxomicin. **Cautions:** History of anemia, neutropenia, macrolide allergy.

### ACTION

Binds to ribosomal sites of susceptible organisms, inhibiting RNA-dependent protein synthesis by RNA polymerase. **Therapeutic Effect:** Bactericidal against *C. difficile*.

### PHARMACOKINETICS

Minimal systemic absorption after PO administration. Mainly confined to GI tract. Excreted primarily in feces (92%). **Half-life:** 9 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin. May decrease serum bicarbonate; platelets.

### AVAILABILITY (Rx)

**Tablets:** 200 mg.

### ADMINISTRATION/HANDLING

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

***Clostridioides difficile*-Associated Diarrhea**  
**PO:** **ADULTS:** 200 mg twice daily for 10 days. **ADOLESCENTS, CHILDREN, INFANTS 6 MOS AND OLDER: (WEIGHING 12.5 KG OR MORE):** 200 mg twice daily for 10 days. **(9 KG TO LESS THAN 12.5 KG):** **Oral suspension:** 160 mg twice daily for 10 days. (7

**KG TO LESS THAN 9 KG):** 120 mg twice daily for 10 days. **(4 KG TO LESS THAN 7 KG):** 80 mg twice daily for 10 days.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (13%–6%):** Pyrexia, nausea, vomiting, abdominal pain. **Rare (less than 2%):** Abdominal distension, abdominal tenderness, dyspepsia, dysphagia, flatulence, hyperglycemia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including angioedema, dyspnea, pruritus, rash were reported. May increase risk of development of drug-resistant bacteria or superinfection when used in the absence of proven or strongly suspected *C. difficile* infection. GI hemorrhage reported in 4% of pts. Other reactions include drug eruption, metabolic acidosis.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Verify positive *C. difficile* toxin test before initiating treatment. Initiate contact precautions. Assess bowel sounds, stool characteristics (color, frequency, consistency). Assess hydration status.

#### INTERVENTION/EVALUATION

Monitor for volume loss, dehydration, hypotension, abdominal pain, pyrexia. Encourage nutrition/fluid intake. Monitor daily pattern of bowel activity, stool consistency. Routinely assess bowel sounds. Screen for intestinal obstruction (increased nausea, abdominal pain, hyperactive bowel sounds) and consider radiologic test if suspected. Monitor for hypersensitivity reactions, GI bleeding (melena, rectal bleeding).

#### PATIENT/FAMILY TEACHING

- It is essential to complete drug therapy despite improvement of symptoms. Early discontinuation may result in anti-

bacterial resistance and increased risk of recurrent infection. • Report GI bleeding; symptoms of bowel obstruction (e.g., abdominal pain, fever, nausea, vomiting). Report allergic reactions such as itching, rash; swelling of the face or tongue. • *C. difficile* infection is extremely contagious to others. Wash hands frequently with soap and water, esp. after bowel movements. *C. difficile* spores can live on objects for months. Use bleach products to cleanse bathroom, doorknobs, other high-touch surfaces. If possible, use a separate bathroom away from others. • Drink plenty of fluids.

## filgrastim

TOP  
100

fil-gras-tim

(Granix, Neupogen, Nivestym, Zarxio)

**Do not confuse Neupogen with Epogen, Neulasta, Neumega, or Nutramigen.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hematopoietic agent. **CLINICAL:** Granulocyte colony-stimulating factor (G-CSF).

### USES

**Granix:** Decreases duration of severe neutropenia in adults and children 1 mo and older with nonmyeloid malignancies receiving chemotherapy associated with severe neutropenia, fever. **Neupogen, Zarxio:** Reduces neutropenia duration, sequelae in pts with nonmyeloid malignancies having myeloablative therapy followed by bone marrow transplant (BMT). Mobilization of hematopoietic progenitor cells into peripheral blood for collection by apheresis. Treatment of chronic, severe neutropenia. Decreases incidence of infection in pts with malignancies receiving chemotherapy associated with increased incidence of severe neutropenia with fever. Reduces

time to neutrophil recovery/duration of fever after induction/consolidation chemotherapy in AML pts. **Neupogen:** Increases survival in pts acutely exposed to myelosuppressive doses of radiation.

**OFF-LABEL:** Treatment of AIDS-related neutropenia in pts receiving zidovudine; drug-induced neutropenia; anemia in myelodysplastic syndrome; hepatitis C virus infection treatment-associated neutropenia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to filgrastim. **Neupogen, Zarxio (additional):** History of serious allergic reaction to human granulocyte colony-stimulating factors. **Cautions:** Malignancy with myeloid characteristics (due to G-CSF's potential to act as growth factor), gout, psoriasis, neutrophil count greater than 50,000 cells/mm<sup>3</sup>, sickle cell disease, concomitant use of other drugs that may result in thrombocytopenia. Do not use 24 hrs before or after cytotoxic chemotherapy.

## ACTION

Stimulates production, maturation, activation of neutrophils. **Therapeutic Effect:** Increases migration and cytotoxicity of neutrophils.

## PHARMACOKINETICS

Widely distributed. Onset of action: 24 hrs (plateaus in 3–5 days). WBC return to normal in 4–7 days. Not removed by hemodialysis. **Half-life:** 3.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **bleomycin, cyclophosphamide, topotecan.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May

increase LDH, leukocyte alkaline phosphatase (LAP) scores, serum alkaline phosphatase, uric acid.

## AVAILABILITY (Rx)

**Injection Solution: (Neupogen):** 300 mcg/mL, 480 mcg/1.6 mL **Injection, Prefilled Syringe: (Granix, Neupogen, Zarxio):** 300 mcg/0.5 mL, 480 mcg/0.8 mL.

## ADMINISTRATION/HANDLING

**◀ALERT▶** May be given by SQ injection, short IV infusion (15–30 min), or continuous IV infusion. Do not dilute with normal saline.

**Reconstitution** • Allow vial to warm to room temperature (approx. 30 min). • Visually inspect for particulate matter or discoloration. • Dilute in D<sub>5</sub>W from concentration of 300 mcg/mL to 5 mcg/mL (do not dilute to a final concentration less than 5 mcg/mL). Diluted solutions of 5–15 mcg/mL should have addition of albumin to a final concentration of 2 mg/mL. • Do not dilute with saline.

**Rate of administration** • For intermittent infusion (piggyback), infuse over 15–30 min. • For continuous infusion, give single dose over 4–24 hrs. • In all situations, flush IV line with D<sub>5</sub>W before and after administration.

**Storage** • Refrigerate vials and syringes. • Stable for up to 24 hrs at room temperature (provided vial contents are clear and contain no particulate matter).

## SQ

• Aspirate syringe before injection (avoid intra-arterial administration).

**Storage** • Store in refrigerator, but remove before use and allow to warm to room temperature.

## IV INCOMPATIBILITIES

Amphotericin (Fungizone), cefepime (Maxipime), cefotaxime (Claforan), cefOXitin (Mefoxin), ceftizoxime (Cefizox), ceftRIAXone (Rocephin), clindamycin (Cleocin), DACTINomycin (Cosmegen), etoposide (Ve-

Pesid), fluorouracil, furosemide (Lasix), heparin, mannitol, methylPREDNISolone (Solu-Medrol), mitoMYcin (Mutamycin), prochlorperazine (Compazine).

## **IV COMPATIBILITIES**

Bumetanide (Bumex), calcium gluconate, HYDROmorphone (Dilaudid), LORazepam (Ativan), morphine, potassium chloride.

## **INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Begin therapy at least 24 hrs after last dose of chemotherapy and at least 24 hrs after bone marrow infusion. Dosing based on actual body weight.

### **Chemotherapy-Induced Neutropenia**

**IV or SQ infusion, SQ injection:** (*Neupogen and biosimilars*): **ADULTS, ELDERLY, CHILDREN:** Initially, 5 mcg/kg/day. May increase by 5 mcg/kg for each chemotherapy cycle based on duration/severity of neutropenia; continue for up to 14 days or until absolute neutrophil count (ANC) reaches 10,000 cells/mm<sup>3</sup>.

#### **Granix**

**SQ: ADULTS, ELDERLY:** 5 mcg/kg/day. Continue until nadir has passed and neutrophil count recovered to normal range.

### **Bone Marrow Transplant**

**IV or SQ infusion:** (*Neupogen and biosimilars*): **ADULTS, ELDERLY, CHILDREN:** 10 mcg/kg/day. Administer >24 hrs after chemotherapy or bone marrow transfusion. Adjust dosage daily during period of neutrophil recovery based on neutrophil response.

### **Mobilization of Progenitor Cells**

**IV or SQ infusion:** (*Neupogen and biosimilars*): **ADULTS:** 10 mcg/kg/day in donors beginning at least 4 days before first leukapheresis and continuing until last leukapheresis (usually for 6–7 days). Discontinue for WBC greater than 100,000 cells/mm<sup>3</sup>.

### **Chronic Neutropenia, Congenital Neutropenia**

**SQ:** (*Neupogen and biosimilars*): **ADULTS, CHILDREN:** Initially, 6 mcg/kg/

dose twice daily. Adjust dose based on ANC/clinical response.

### **Idiopathic or Cyclic Chronic Neutropenia**

**SQ:** (*Neupogen and biosimilars*): **ADULTS, CHILDREN:** Initially, 5 mcg/kg/dose once daily. Adjust dose based on ANC/clinical response.

### **Radiation Injury Syndrome**

**SQ:** (*Neupogen only*): **ADULTS, ELDERLY:** 10 mcg/kg once daily. Continue until ANC remains greater than 1,000 cells/mm<sup>3</sup> for 3 consecutive CBCs or ANC exceeds 10,000 cells/mm<sup>3</sup> after radiation-induced nadir.

### **Dosage in Renal/Hepatic Impairment**

No dose adjustment.

## **SIDE EFFECTS**

**Frequent (57%–11%):** Nausea/vomiting, mild to severe bone pain (more frequent with high-dose IV form, less frequent with low-dose SQ form), alopecia, diarrhea, fever, fatigue. **Occasional (9%–5%):** Anorexia, dyspnea, headache, cough, rash. **Rare (less than 5%):** Psoriasis, hematuria, proteinuria, osteoporosis.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Long-term administration occasionally produces chronic neutropenia, splenomegaly. Acute respiratory distress syndrome, alveolar hemorrhage and hemoptysis (pts undergoing peripheral blood progenitor cell collection mobilization), capillary leak syndrome, cutaneous vasculitis, glomerulonephritis, leukocytosis, MI, thrombocytopenia, sickle cell crisis, splenic rupture may occur.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain CBC prior to initiation and twice wky thereafter.

### **INTERVENTION/EVALUATION**

In septic pts, be alert for adult respiratory distress syndrome. Closely monitor those

with preexisting cardiac conditions. Monitor B/P (transient decrease in B/P may occur), temperature, CBC with differential, platelet count, serum uric acid, hepatic function tests.

#### PATIENT/FAMILY TEACHING

- Report fever, chills, severe bone pain, chest pain, palpitations, difficulty breathing; left upper abdominal pain/tightness; flank pain.

## finasteride

fin-as-ter-ide  
(Propecia, Proscar)

**Do not confuse finasteride with furosemide, or Proscar with ProSom, Provera, or PROzac.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** 5-alpha-reductase inhibitor. **CLINICAL:** Benign prostatic hyperplasia agent.

#### USES

**Proscar:** Treatment (monotherapy) of symptomatic benign prostatic hyperplasia (BPH) to improve symptoms, reduce risk of acute urinary retention, or reduce the need for surgery, including transurethral resection of the prostate (TURP) and prostatectomy. Used in combination with an alpha-blocker (e.g., doxazosin) to reduce risk of symptomatic progression. **Propecia:** Treatment of male pattern hair loss. **OFF-LABEL:** Treatment of female hirsutism.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to finasteride, pregnancy or women of child-bearing potential. **Cautions:** Hepatic impairment, urinary outflow obstruction, urinary retention. Women who are attempting to conceive should avoid exposure to crushed or broken tablets.

#### ACTION

Inhibits 5-alpha reductase, an intracellular enzyme that converts testosterone into dihydrotestosterone (DHT) in prostate gland, resulting in decreased serum DHT. **Therapeutic Effect:** Reduces size of prostate gland.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (reduction of DHT)	8 hrs	—	24 hrs

Widely distributed. Protein binding: 90%. Metabolized in liver. **Half-life:** 6–8 hrs. Onset of clinical effect: 3–6 mos of continued therapy.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Physical handling of tablet by those who are or may become pregnant may produce abnormalities of external genitalia of male fetus. **Children:** Not indicated for use in children. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Decreases serum prostate-specific antigen (PSA) level, even in presence of prostate cancer. Decreases dihydrotestosterone (DHT). Increases follicle-stimulating hormone (FSH), luteinizing hormone (LH), testosterone.

#### AVAILABILITY (Rx)

 **Tablets:** 1 mg (Propecia), 5 mg (Proscar).

#### ADMINISTRATION/HANDLING

##### PO

- Do not break, crush, dissolve, or divide film-coated tablets.
- Give without regard to food.

#### INDICATIONS/ROUTES/DOSAGE

##### Benign Prostatic Hyperplasia (BPH)

**PO: ADULTS, ELDERLY: (Proscar):** 5 mg once daily. Use as single agent or in

combination with an alpha-1 adrenergic antagonist (e.g., doxazosin) (6–12 mos of treatment usually needed to assess benefit).

#### Hair Loss

**PO: ADULTS: (*Propecia*):** 1 mg/day (continue for at least 12 mos to assess full benefit).

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Rare (4%–2%):** Gynecomastia, sexual dysfunction (impotence, decreased libido, decreased volume of ejaculate).

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reaction, circumoral swelling, testicular pain occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Digital rectal exam, serum prostate-specific antigen (PSA) determination should be performed in pts with benign prostatic hyperplasia (BPH) before initiating therapy and periodically thereafter. Assess usual urinary characteristics (frequency, ability to empty bladder, urinary flow). Assess degree of urinary retention with bladder scan.

#### INTERVENTION/EVALUATION

Diligently monitor urinary output, esp. in pts with large residual urinary volume, severely diminished urinary flow, or obstructive uropathy. Obtain periodic bladder scan to assess treatment effectiveness (or to assess for acute urinary retention).

#### PATIENT/FAMILY TEACHING

- Treatment may cause impotence, decreased volume of ejaculate.
- May not notice improved urinary flow even if prostate gland shrinks.
- Must take medication longer than 6 mos, and it is

unknown if medication decreases need for surgery. • Because of potential risk to male fetus, women who are or may become pregnant should not handle tablets or be exposed to pt's semen. • Immediately report inability to urinate or severe bladder pain.

## fingolimod

TOP  
100

fin-goe-li-mod  
(Gilenya)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sphingosine 1-phosphate (S1P) receptor modulator. **CLINICAL:** Multiple sclerosis agent.

### USES

Treatment of pts 10 yrs and older with relapsing forms of multiple sclerosis (MS) to reduce frequency of clinical exacerbations, delay accumulation of physical disability.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fingolimod. Sick sinus syndrome, second-degree or higher conduction block (unless pt has functioning pacemaker). Baseline QT interval 500 msec or greater. Concurrent use of class Ia or III antiarrhythmic. Recent (within 6 mos) MI, unstable angina, stroke, TIA, decompensated requiring hospitalization or NYHA class III/IV HF. **Cautions:** Concomitant use of antiarrhythmics, beta blockers, calcium channel blockers, immunosuppressants, immune modulators, antineoplastics, QT interval-prolonging medications (e.g., amiodarone, ciprofloxacin); bradycardia, severe hepatic impairment, ischemic heart disease, diabetes, hypokalemia, hypomagnesemia; history of syncope, uveitis; pts at risk for developing bradycardia or heart block.

## ACTION

Blocks capacity of lymphocytes to move out from lymph nodes, reducing number of lymphocytes available to the CNS. **Therapeutic Effect:** May involve reduction of lymphocyte migration into central nervous system, which reduces central inflammation.

## PHARMACOKINETICS

Metabolized by the enzyme sphingosine kinase to active metabolite. Highly distributed in red blood cells (85%). Minimally metabolized in liver. Protein binding: 99.7%. Primarily excreted in urine. **Half-life:** 6–9 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related severe hepatic impairment may increase risk of adverse reactions.

## INTERACTIONS

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil), ceritinib, esmolol may increase risk of bradycardia. May increase effects of QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol). May increase toxic effects of leflunomide, natalizumab. May decrease effect of sipuleucel-T. May increase immunosuppressive effect of tofacitinib, other immunosuppressants. May decrease therapeutic effect of vaccines, increase toxic effects of live vaccines. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** Expect decrease in neutrophil count. May increase serum alkaline phosphatase, ALT, AST, bilirubin, triglycerides. May reduce diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Capsules:** 0.25 mg, 0.5 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis

**PO: ADULTS 18 YRS AND OLDER, ELDERLY:** 0.5 mg once daily. **CHILDREN 10 YRS AND OLDER, ADOLESCENTS WEIGHING MORE THAN 40 KG:** 0.5 mg once daily. **WEIGHING 40 KG OR LESS:** 0.25 mg once daily.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Frequent (25%–10%):** Headache, diarrhea, back pain, cough. **Occasional (8%–5%):** Dyspnea, clinical depression, dizziness, hypertension, migraine, paresthesia, decreased weight. **Rare (4%–2%):** Blurred vision, alopecia, eye pain, asthenia, eczema, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Infections (influenza, herpes viral infection, bronchitis, sinusitis, gastroenteritis, ear infection) reported in 13%–4% of pts. Pts with diabetes or history of uveitis are at increased risk for developing macular edema. Cases of skin cancer, lymphoma, basal cell carcinoma have been reported. Progressive multifocal leukoencephalopathy (PML) (weakness, paralysis, vision loss, aphasia, cognition impairment) may occur. Neurotoxicity, posterior reversible encephalopathy may evolve into cerebral hemorrhage, CVA. May increase risk of hypertension.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, serum chemistries prior to initial treatment. At initial treatment (within first 4–6 hrs after dose), medication reduces heart rate, AV conduction, followed by progressive increase after

first day of treatment. Obtain baseline vitals, with particular attention to pulse rate. Perform ophthalmologic evaluation prior to treatment and 3–4 mos after initiation of treatment. Question medical history as listed in Precautions. Obtain full medication history and screen for interactions.

#### INTERVENTION/EVALUATION

Monitor for bradycardia for 6 hrs after first dose, then as appropriate. Periodically monitor CBC, serum chemistries, particularly lymphocyte count (expected to decrease approximately 80% from baseline with continued treatment). Monitor for signs of systemic or local infection. Diligently monitor for hypersensitivity reaction, neurological changes, symptoms of posterior reversible encephalopathy (altered mental status, seizures, visual disturbances), PML, QT interval prolongation. Assess for new skin lesions, malignancies. Conduct ophthalmologic exams q3–4 mos after initiation, during treatment, and with any changes in vision.

#### PATIENT/FAMILY TEACHING

- Obtain regular eye examinations during and for 2 mos following treatment.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Immediately report neurological changes such as confusion, severe headache, seizure activity, vision changes, trouble speaking, one-sided weakness, paralysis.
- Treatment may increase risk of certain cancers; report new skin lesions, fever, chills, night sweats, generalized weakness, weight loss, or pain or swelling of the lymph nodes.
- Report allergic reactions such as itching, rash, swelling of the face or tongue.
- Report symptoms of infection, visual changes, yellowing of skin, eyes, dark urine.
- Due to high risk for drug interactions, do not take newly prescribed medication unless approved by prescriber who originally started treatment.

## fluconazole

flu-kon-a-zole  
(Diflucan)

**Do not confuse Diflucan with diclofenac, Diprivan, or disulfiram, or fluconazole with itraconazole, ketoconazole, omeprazole, or pantoprazole.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic azole. **CLINICAL:** Antifungal agent.

#### USES

Antifungal prophylaxis in pts undergoing bone marrow transplant; candidiasis (esophageal, oropharyngeal, urinary tract, vaginal); systemic *Candida* infections (e.g., candidemia); treatment of cryptococcal meningitis. **OFF-LABEL:** Cryptococcal pneumonia, candidal intertrigo.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to fluconazole. Concomitant administration of QT-prolonging medications (e.g., erythromycin, pimozide). **Cautions:** Hepatic/renal impairment, hypokalemia, hypersensitivity to other triazoles (e.g., itraconazole, terconazole), imidazoles (e.g., butoconazole, ketoconazole). Medications or conditions known to cause arrhythmias.

#### ACTION

Interferes with fungal cytochrome P-450 activity, an enzyme necessary for ergosterol formation (principal sterol in fungal cell membrane). **Therapeutic Effect:** Directly damages fungal membrane, altering its function. Fungistatic.

#### PHARMACOKINETICS

Widely distributed, including to CSF. Protein binding: 11%. Partially metabolized

in liver. Excreted unchanged primarily in urine. Partially removed by hemodialysis. **Half-life:** 20–30 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Secreted in human breast milk. Use caution in breastfeeding females. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May increase concentration/effect of **budesonide, calcium channel blockers (e.g., amlodipine, nifedipine, verapamil), cyclosporine, ivabradine, methadone, rifabutin, sirolimus, tacrolimus, tofacitinib.** May decrease effect of **Saccharomyces boulardii.** May increase concentration/effect, risk of myopathy of **HMG-CoA reductase inhibitors (e.g., atorvastatin, simvastatin).** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

### AVAILABILITY (Rx)

**Injection, Solution, Pre-Mix:** 200 mg (100 mL), 400 mg (200 mL). **Powder for Oral Suspension:** 10 mg/mL, 40 mg/mL. **Tablets:** 50 mg, 100 mg, 150 mg, 200 mg.

### ADMINISTRATION/HANDLING

**Rate of administration** • Do not exceed maximum flow rate of 200 mg/hr. **Storage** • Store at room temperature. • Do not remove from outer wrap until ready to use. • Squeeze inner bag to check for leaks. • Do not use parenteral form if solution is cloudy, precipitate forms, seal is not intact, or it is discolored. • Do not add supplementary medication.

### PO

- Give without regard to food.

### IV INCOMPATIBILITIES

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), calcium gluconate, cefotaxime (Claforan), ceftRIAXone (Rocephin), cefuroxime (Zinacef), chloramphenicol (Chloromycetin), clindamycin (Cleocin), co-trimoxazole (Bactrim), diazepam (Valium), digoxin (Lanoxin), erythromycin (Erythrocin), furosemide (Lasix), haloperidol (Haldol), hydroXYzine (Vistaril), imipenem and cilastatin (Primaxin).

### IV COMPATIBILITIES

Dexmedetomidine (Precedex), dilTIAZem (Cardizem), DOBUtamine (Dobutrex), DOPamine (Intropin), heparin, lipids, LORazepam (Ativan), midazolam (Versed), propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** PO and IV therapy equally effective; IV therapy recommended for pts intolerant of drug or unable to take orally. Oral suspension stable for 14 days at room temperature or refrigerated.

#### Usual Dosage

**Note:** Duration and dose dependent on location/severity of infection.

**PO/IV: ADULTS, ELDERLY:** 150 mg once or **loading dose:** 200–800 mg. **Maintenance dose:** 200–800 mg once daily. **ADOLESCENTS, CHILDREN, INFANTS: Loading dose:** 6–12 mg/kg. **Maintenance dose:** 3–12 mg/kg once daily. **Maximum:** 600 mg/day. **NEONATES: (Prophylaxis):** 3–6 mg/kg/dose twice weekly. **(Treatment):** Initially, 25 mg/kg on day 1, then 12 mg/kg once daily.

#### Dosage in Renal Impairment

After a loading dose of 400 mg, daily dosage is based on creatinine clearance.

**Creatinine**

Clearance	Dosage
Greater than 50 mL/min	100%
50 mL/min or less	50%
Dialysis	50%
CCRT	400–800 mg as loading dose
CVVH	then 200–800 mg/day
CVVHDF	400–800 mg as loading dose, then 400–800 mg/day

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Occasional (4%–1%):** Hypersensitivity reaction (chills, fever, pruritus, rash), dizziness, drowsiness, headache, constipation, diarrhea, nausea, vomiting, abdominal pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Exfoliative skin disorders, serious hepatic injury, blood dyscrasias (eosinophilia, thrombocytopenia, anemia, leukopenia) have been reported rarely. May increase risk of QT prolongation, torsades de pointes. Skin disorders including Stevens-Johnson syndrome, toxic epidermal necrolysis may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; serum potassium in critically ill pts. Receive full medication history and screen for interactions. Assess areas of infection. Assess infected area.

**INTERVENTION/EVALUATION**

Monitor hepatic function in critically ill pts. Assess for hypersensitivity reaction (chills, fever). Report rash, itching promptly. Monitor daily pattern of bowel activity, stool consistency. Assess for dizziness; provide assistance as needed.

**PATIENT/FAMILY TEACHING**

- Report dark urine, pale stool, jaundiced skin or sclera of eyes, rash, pruritus.
- Pts with oropharyngeal infections

should maintain fastidious oral hygiene. • Consult physician before taking any other medication.

**fluorouracil, 5-FU** **HIGH ALERT**

**flure-oh-ue-ra-sil**

(Carac, Efudex, Fluoroplex, Tolak)

**BLACK BOX ALERT** Must be administered by personnel trained in administration/handling of chemotherapeutic agents.

**Do not confuse Efudex with Efidac.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic.

**USES**

**Parenteral:** Treatment of carcinoma of colon, rectum, breast, stomach (gastric), pancreas. **Topical:** Treatment of multiple actinic or solar keratoses, superficial basal cell carcinomas. **OFF-LABEL: Parenteral:** Treatment of carcinoma of bladder, cervical, endometrial, head/neck, anal, esophageal, renal cell, unknown primary cancer.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to fluorouracil. Myelosuppression, poor nutritional status, potentially serious infections. **Cautions:** History of high-dose pelvic irradiation, hepatic/renal impairment, palmar-plantar erythrodysesthesia syndrome (hand and foot syndrome), previous use of alkylating agents. Pts with widespread metastatic marrow involvement.

**ACTION**

Blocks formation of thymidylic acid. Cell cycle-specific for S phase of cell division. **Therapeutic Effect:** Inhibits DNA, RNA synthesis. **Topical:** Destroys rapidly proliferating cells.

## PHARMACOKINETICS

Widely distributed. Crosses blood-brain barrier. Metabolized in liver. Primarily excreted by lungs as carbon dioxide. Removed by hemodialysis. **Half-life:** 16 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase risk of myelosuppression. May decrease the therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse/toxic effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease serum albumin. **Topical:** May cause eosinophilia, leukocytosis, thrombocytopenia, toxic granulation.

## AVAILABILITY (Rx)

**Cream, Topical:** (*Carac*): 0.5%. (*Tolak*): 4%, (*Efudex*): 5%. (*Fluoroplex*): 1%. **Injection Solution:** (*Adrucil*): 50 mg/mL. **Solution, Topical:** (*Efudex*): 2%, 5%.

## ADMINISTRATION/HANDLING

**⚠️ ALERT** Give by IV injection or IV infusion. Do not add to other IV infusions. Avoid small veins, swollen/edematous extremities, areas overlying joints, tendons. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

**Reconstitution** • IV push does not need to be diluted or reconstituted. • Inject

through Y-tube or 3-way stopcock of free-flowing solution. • For IV infusion, further dilute with 50–1,000 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Give IV push slowly over 1–2 min. • IV infusion is administered over 30 min–24 hrs (refer to individual protocols). • Extravasation produces immediate pain, severe local tissue damage.

**Storage** • Store at room temperature. • Solution appears colorless to faint yellow. Slight discoloration does not adversely affect potency or safety. • If precipitate forms, redissolve by heating, shaking vigorously; allow to cool to body temperature. • Diluted solutions stable for 72 hrs at room temperature.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), filgrastim (Neupogen), ondansetron (Zofran), vinorelbine (Navelbine).

## IV COMPATIBILITIES

Granisetron (Kytrel), heparin, HYDROMORPHONE (Dilaudid), leucovorin, morphine, potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Refer to individual protocols.

### Usual Range

**IV bolus: ADULTS, ELDERLY:** 200–1000 mg/m<sup>2</sup>/day for 1–21 days or 500–600 mg/m<sup>2</sup>/dose q3–4wks.

**IV infusion: ADULTS, ELDERLY:** 15 mg/kg/day or 500 mg/m<sup>2</sup>/day over 4 hrs for 5 days or 800–1200 mg/m<sup>2</sup> over 24–120 hrs.

### Colorectal Cancer

**IV: ADULTS, ELDERLY:** 400 mg/m<sup>2</sup> bolus on day 1, then 2,400–3,000 mg/m<sup>2</sup> over 46 hrs (as a continuous infusion) q2wks (in combination with leucovorin ± either oxaliplatin or irinotecan).

### Pancreatic Cancer

**IV: ADULTS, ELDERLY:** 2,400 mg/m<sup>2</sup> as a continuous infusion over 46 hrs q14 days for 24 wks (in combination with leucovorin, irinotecan, and oxaliplatin).

**Multiple Actinic or Solar Keratoses**

**Topical: (*Carac 0.5%*): ADULTS, ELDERLY:** Apply once daily for up to 4 wks. (*Efudex 5%*): **ADULTS, ELDERLY:** Apply twice daily for 2–4 wks. (*Fluoroplex 1%*): Apply twice daily for 2–6 wks. (*Tolak 4%*): Apply once daily for 4 wks.

**Basal Cell Carcinoma**

**Topical: (*Efudex 5%*): ADULTS, ELDERLY:** Apply twice daily for 3–6 wks up to 10–12 wks.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use extreme caution.

**SIDE EFFECTS**

**Parenteral: Frequent (greater than 10%):** Alopecia, dermatitis, anorexia, diarrhea, esophagitis, dyspepsia, stomatitis. **Occasional (10%–1%):** Cardiotoxicity (angina, ECG changes), skin dryness, epithelial fissuring, nausea, vomiting, excessive lacrimation, blurred vision. **Rare (less than 1%):** Headache, photosensitivity, somnolence, allergic reaction, dyspnea, hypotension, MI, pulmonary edema. **Topical: Occasional:** Erythema, skin ulceration, pruritus, hyperpigmentation, dermatitis, insomnia, stomatitis, irritability, photosensitivity, excessive lacrimation, blurred vision.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Earliest sign of toxicity (4–8 days after beginning therapy) is stomatitis (dry mouth, burning sensation, mucosal erythema, ulceration at inner margin of lips). Most common dermatologic toxicity is pruritic rash (generally on extremities, less frequently on trunk). Leukopenia (WBC less than 3500 cells/mm<sup>3</sup>) generally occurs within 9–14 days after drug administration but may occur as late as 25th day. Thrombocytopenia (platelets less than 100,000 cells/mm<sup>3</sup>) occasionally occurs within 7–17

days after administration. Pancytopenia, agranulocytosis occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function, LFT and monitor during therapy. Question history of hypersensitivity reaction, hepatic/renal impairment. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor for rapidly falling WBC, platelet count; intractable diarrhea, GI bleeding (bright red or tarry stool). Assess oral mucosa for stomatitis. Drug should be discontinued if intractable diarrhea, stomatitis, GI bleeding occurs. Assess skin for rash.

**PATIENT/FAMILY TEACHING**

- Maintain strict oral hygiene.
- Report signs/symptoms of infection (cough, fatigue, fever), unusual bruising/bleeding, visual changes, nausea, vomiting, diarrhea, chest pain, palpitations.
- Avoid sunlight, artificial light sources; wear protective clothing, sunglasses, sunscreen.
- **Topical:** Apply only to affected area.
- Do not use occlusive coverings.
- Be careful near eyes, nose, mouth.
- Wash hands thoroughly after application.
- Treated areas may be unsightly for several weeks after therapy.

**FLUoxetine**

floo-ox-e-teen  
(PROzac)

**BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs of age with major depressive disorder, other psychiatric disorders.

**Do not confuse FLUoxetine with DULoxetine, famotidine, fluvastatin, fluvoxamine, furosemide, or PARoxetine, or PROzac with Paxil, PriLOSEC, Prograf, Proscar, or ProSom.**

**FIXED-COMBINATION(S)**

**Symbyax:** FLUoxetine/OLANzapine (an antipsychotic): 25 mg/6 mg, 25 mg/12 mg, 50 mg/6 mg, 50 mg/12 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor (SSRI).

**CLINICAL:** Antidepressant.

**USES**

Treatment of major depressive disorder (MDD), obsessive-compulsive disorder (OCD), binge-eating and vomiting in moderate to severe bulimia nervosa, premenstrual dysphoric disorder (PMDD), panic disorder with or without agoraphobia. Treatment of resistant or bipolar 1 depression (with OLANzapine). **OFF-LABEL:** Treatment of fibromyalgia, posttraumatic stress disorder (PTSD), Raynaud's phenomena, social anxiety disorder, selective mutism.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to FLUoxetine. Use of MAOIs within 5 wks of discontinuing FLUoxetine or within 14 days of discontinuing MAOIs. Initiation in pts receiving linezolid or methylene blue. Use with pimozide or thioridazine. **Note:** Do not initiate thioridazine until 5 wks after discontinuing fluoxetine. **Cautions:** Seizure disorder, cardiac dysfunction (e.g., history of MI), diabetes, pts at risk for QT interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HF, QT interval-prolonging medications, hypokalemia, hypomagnesemia), renal/hepatic impairment, pts at high risk for suicide, in pts where weight loss is undesirable, elderly. Pts at risk of acute narrow-angle glaucoma or with increased intraocular pressure.

**ACTION**

Selectively inhibits serotonin uptake in CNS, enhancing serotonergic function. **Therapeutic Effect:** Relieves depression; reduces obsessive-compulsive, bulimic behavior.

**PHARMACOKINETICS**

Well absorbed from GI tract. Crosses blood-brain barrier. Protein binding: 94%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–3 days; metabolite, 7–9 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown whether drug crosses placenta or is distributed in breast milk. **Children:** May be more sensitive to behavioral side effects (e.g., insomnia, restlessness). **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), antiplatelets (e.g., clopidogrel), anticoagulants (e.g., warfarin) may increase risk of bleeding. Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. MAOIs (e.g., phenelzine, selegiline) may produce serotonin syndrome and neuroleptic malignant syndrome. **Strong CYP2D6 inhibitors (e.g., bupropion)** may increase concentration/effect. May decrease concentration/effect of tamoxifen. **QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol)** may increase risk of QT interval prolongation. May increase adverse effects of tricyclic antidepressants (e.g., amitriptyline). **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease concentration/effect, enhance serotonergic effect. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium. May increase serum ALT, AST.

**AVAILABILITY (Rx)**

**Capsules:** 10 mg, 20 mg, 40 mg. **Oral Solution:** 20 mg/5 mL. **Tablets:** 10 mg, 20 mg, 60 mg.

 **Capsules (Delayed-Release):** 90 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food, but give with food, milk if GI distress occurs. • **Bipolar disorder:** Give once daily in evening. • **Depression, OCD:** Give once daily in morning or twice daily (morning and noon). • **Bulimia:** Give once daily in morning.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Use lower or less frequent doses in pts with renal/hepatic impairment, pts with concurrent disease or multiple medications, the elderly. Decrease gradually to minimize withdrawal symptoms and to allow for detection of re-emerging symptoms.

### Depression

**PO: ADULTS, ELDERLY:** Initially, 20 mg each morning. May increase after several wks by 20 mg/day. **Maximum:** 80 mg/day as single or 2 divided doses. **CHILDREN 8–18 YRS:** Initially, 10–20 mg/day. Lower-weight children may be started at 10 mg/day and increased to 20 mg/day after several wks if needed. **Maximum:** 20 mg/day.

### Panic Disorder

**PO: ADULTS, ELDERLY:** Initially, 5–10 mg/day. After 3–7 days, may increase dose in 5–10 mg increments at intervals of at least 1 wk to usual dose of 20–40 mg/day. **Maximum:** 60 mg/day.

### Bulimia Nervosa

**PO: ADULTS:** Initially, 20 mg/day. May increase by 20 mg increments at intervals of at least 1 wk. **Maximum:** 60 mg/day.

### Obsessive-Compulsive Disorder (OCD)

**PO: ADULTS, ELDERLY:** Initially, 10–20 mg once daily. May increase by 20 mg increments at intervals of at least 1 wk. Range: 40–80 mg/day. **Maximum:** 120 mg/day. **CHILDREN 7–18 YRS:** Initially, 10 mg/day. May increase to 20 mg/day after 2 wks. Range: 20–60 mg/day.

### Depression Associated With Bipolar Disorder

**PO: ADULTS, ELDERLY, CHILDREN 10–17 YRS: (With Olanzapine):** Initially, 20 mg/day in evening. May increase gradually in 10–20 mg increments. Range: 20–50 mg/day.

### Premenstrual Dysphoric Disorder (PMDD) (Sarafem)

**PO: ADULTS: (Continuous daily dosing):** Initially, 10 mg once daily. Increase to 20 mg/day over first month. In a subsequent menstrual cycle, a further increase to 30 mg/day may be necessary. **(Intermittent dosing):** Initially, 10 mg once daily during luteal phase of menstrual cycle only. Over first month, may increase to 20 mg once daily during luteal phase. In a subsequent menstrual cycle, a further increase to 30 mg/day during luteal phase may be necessary.

### Dosage in Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent (greater than 10%):** Headache, asthenia, insomnia, anxiety, drowsiness, nausea, diarrhea, decreased appetite. **Occasional (9%–2%):** Dizziness, tremor, fatigue, vomiting, constipation, dry mouth, abdominal pain, nasal congestion, diaphoresis, rash. **Rare (less than 2%):** Flushed skin, light-headedness, impaired concentration.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of suicide. Agitation, coma, diarrhea, delirium, hallucinations, hyperreflexia, hyperthermia, tachycardia, seizures may indicate life-threatening serotonin syndrome.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess appearance, behavior, mood, suicidal tendencies. For pts on long-term therapy, baseline renal function, LFT, blood counts should be performed at baseline and periodically thereafter.

**INTERVENTION/EVALUATION**

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor mental status, anxiety, social functioning, appetite, nutritional intake. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Monitor serum LFT, glucose, sodium; weight.

**PATIENT/FAMILY TEACHING**

- Maximum therapeutic response may require 4 or more wks of therapy.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- To avoid insomnia, take last dose of drug before 4 PM.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occur.

**fluticasone**TOP  
100

floo-tik-a-sonē

(Arnuity Ellipta, Cutivate, Flonase,  
 ❄️ Flonase Allergy Relief, Flovent Diskus, Xhance, Flonase Sensimist)

**Do not confuse Cutivate with Ultravate, or Flonase with Flovent, Beconase.**

**FIXED-COMBINATION(S)**

**Advair, Advair Diskus, Advair HFA:** fluticasone/salmeterol (bronchodilator): 100 mcg/50 mcg, 250 mcg/50 mcg, 500 mcg/50 mcg. **Breo Ellipta:** fluticasone/vilanterol (bronchodilator): 100 mcg/25 mcg. **Dymista:** fluticasone/azelastine (an antihistamine): 50 mcg/137 mcg per spray. **Trelegy Ellipta:** fluticasone/umeclidinium (anticholinergic)/vilanterol (bronchodilator): 100 mcg/62.5 mcg/25 mcg.

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Corticosteroid. **CLINICAL:** Anti-inflammatory, antipruritic.

**USES**

**Nasal:** Management of nasal symptoms of perennial nonallergic rhinitis in adults and children 4 yrs and older. Management of seasonal and perennial allergic rhinitis in adults, children 2 yrs and older. **(Xhance):** Treatment of nasal polyps in pts 18 yrs and older. **(OTC):** Relief of hayfever/other upper respiratory allergies. **Topical:** Relief of inflammation/pruritus associated with steroid-responsive disorders (e.g., contact dermatitis, eczema), atopic dermatitis. **Inhalation:** Maintenance treatment of bronchial asthma as prophylactic therapy.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to fluticasone. (Arnuity Ellipta, Flovent Diskus): Severe hypersensitivity to milk proteins or lactose. **Inhalation:** Primary treatment of status asthmaticus, acute exacerbation of asthma, other acute asthmatic conditions. **Cautions:** Untreated systemic ocular herpes simplex; untreated fungal, bacterial infection; active or quiescent tuberculosis. Thyroid disease, cardiovascular disease, diabetes, glaucoma, hepatic/renal impairment, cataracts, myasthenia gravis, seizures, GI disease, risk for osteoporosis, untreated localized infection of nasal mucosa. Following acute MI; concurrent use with strong CYP3A4 inhibitors.

**ACTION**

Direct local effect as potent vasoconstrictor, anti-inflammatory. **Therapeutic Effect:** Prevents, controls inflammation.

**PHARMACOKINETICS**

**Inhalation/intranasal:** Protein binding: 91%. Metabolized in liver. Excreted in urine. **Half-life:** 3–7.8 hrs. **Topical:** Amount absorbed depends on affected area and skin condition (absorption increased with fever, hydration, inflamed or denuded skin).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 4 yrs. Children 4 yrs and older may experience growth suppression with prolonged or high doses. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Aerosol for Oral Inhalation: (Flovent HFA):** 44 mcg/inhalation, 110 mcg/inhalation, 220 mcg/inhalation. **Cream: (Cutivate):** 0.05%. **Ointment: (Cutivate):** 0.005%. **Powder for Oral Inhalation: (Flovent Diskus):** 50 mcg/blister, 100 mcg/blister, 250 mcg/blister. **(Arnuity Ellipta):** 50 mcg/actuation, 100 mcg/actuation, 200 mcg/actuation. **Suspension Intranasal Spray: (Flonase Allergy Relief):** 50 mcg/inhalation. **(Flonase Sensimist):** 27.5 mcg/spray. **(Xhance):** 93 mcg/actuation.

## ADMINISTRATION/HANDLING

### Inhalation

#### Flovent HFA

- Shake container well. Prime before first use. Instruct pt to exhale completely. Place mouthpiece fully into mouth, inhale, and hold breath as long as possible before exhaling. • Allow 30–60 seconds between inhalations. • Rinsing mouth after each use decreases dry mouth, hoarseness.

#### Flovent Diskus

- Do not shake or prime before use. Place mouthpiece fully into mouth, inhale quickly and deeply, remove device, and hold breath up to 10 seconds.

#### Arnuity Ellipta

- Do not shake or prime before use; put mouthpiece between lips, breathe deeply and slowly through the mouth, remove inhaler, and hold breath for 3–4 seconds.

### Intranasal

- Instruct pt to clear nasal passages as much as possible before use (topical nasal decongestants may be needed 5–15 min before use). • Tilt head slightly forward. • Insert spray tip into 1 nostril, pointing toward inflamed nasal turbinates, away from nasal septum. • Pump medication into 1 nostril while pt holds other nostril closed, concurrently inspires through nose.

## INDICATIONS/ROUTES/DOSAGE

### Nonallergic Rhinitis

**Intranasal: (Flonase): ADULTS, ELDERLY:** Initially, 200 mcg (2 sprays in each nostril once daily or 1 spray in each nostril q12h). **Maintenance:** 1 spray in each nostril once daily. May increase to 100 mcg (2 sprays) in each nostril. **Maximum:** 200 mcg/day. **CHILDREN 4 YRS AND OLDER:** Initially, 100 mcg (1 spray in each nostril once daily). **Maximum:** 200 mcg/day (2 sprays each nostril). **(Flonase Sensimist): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 110 mcg (2 sprays in each nostril) once daily. **Maintenance:** 55 mcg (1 spray in each nostril) once daily. **CHILDREN 2–11 YRS:** 55 mcg (1 spray in each nostril) once daily.

### Allergic Rhinitis

**(Flonase Sensimist): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 110 mcg (2 sprays in each nostril) once daily. **Maintenance:** 55 mcg (1 spray in each nostril) once daily. **CHILDREN 2–11 YRS:** 55 mcg (1 spray in each nostril) once daily.

### Usual Topical Dosage

**Note:** Ointment for adults only.

**Topical: ADULTS, ELDERLY, CHILDREN 3 MOS AND OLDER:** Apply sparingly to affected area once or twice daily.

**Nasal Polyps**

**(Xhance):** ADULTS, ELDERLY: 93 mcg (1 spray) per nostril twice daily. May increase to 2 sprays twice daily.

**Maintenance Treatment of Asthma**

**Inhalation powder: (Arnuity Ellipta):** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 100–200 mcg once daily. **Maximum:** 200 mcg/day. **CHILDREN 5–11 YRS:** 50 mcg once daily. **(Flovent Diskus):** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 100 mcg twice daily. **Maximum:** 1000 mcg twice daily. **(Flovent HFA):** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 88 mcg twice daily. **Maximum:** 880 mcg twice daily. **USUAL PEDIATRIC DOSE (4–11 YRS):** **(Flovent Diskus):** Initially, 50 mcg twice daily. May increase to 100 mcg twice daily. **(Flovent HFA):** 88 mcg twice daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. **(Arnuity Ellipta):** Use caution in hepatic impairment.

**SIDE EFFECTS**

**Frequent:** Inhalation: Throat irritation, hoarseness, dry mouth, cough, temporary wheezing, oropharyngeal candidiasis (particularly if mouth is not rinsed with water after each administration). **Intranasal:** Mild nasopharyngeal irritation, nasal burning, stinging, dryness, rebound congestion, rhinorrhea, altered sense of taste. **Occasional:** Inhalation: Oral candidiasis. **Intranasal:** Nasal/pharyngeal candidiasis, headache. **Topical:** Stinging, burning of skin.

**ADVERSE EFFECTS/TOXIC REACTIONS**

None known.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Establish history of skin disorder, asthma, rhinitis. Question hypersensitivity, esp. milk products or lactose. Question medical history as listed in Precautions.

**INTERVENTION/EVALUATION**

Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Assess oral mucous membranes for evidence of candidiasis. Monitor growth in pediatric pts. **Topical:** Assess involved area for therapeutic response to irritation.

**PATIENT/FAMILY TEACHING**

- Pts receiving bronchodilators by inhalation concomitantly with steroid inhalation therapy should use bronchodilator several min before corticosteroid aerosol (enhances penetration of steroid into bronchial tree).
- Do not change dose/schedule or stop taking drug; must taper off gradually under medical supervision.
- Maintain strict oral hygiene.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness, oral fungal infection).
- Increase fluid intake (decreases lung secretion viscosity).
- **Intranasal:** Clear nasal passages before use.
- Report if no improvement in symptoms or if sneezing/nasal irritation occurs.
- Improvement noted in several days.
- **Topical:** Rub thin film gently into affected area.
- Use only for prescribed area and no longer than ordered.
- Avoid contact with eyes.

**folic acid**

foe-lik as-id

**Do not confuse folic acid with folinic acid.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Vitamin, water soluble. **CLINICAL:** Nutritional supplement.

**USES**

Treatment of megaloblastic and macrocytic anemias due to folate deficiency. Treatment

of anemias due to folate deficiency in pregnant women. Folate supplementation during periconceptual period decreases risk of neural tube defects.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to folic acid. **Cautions:** Anemias (aplastic, normocytic, pernicious, refractory) when anemia present with vitamin B<sub>12</sub> deficiency.

## ACTION

Stimulates production of platelets, WBCs in folate-deficiency anemia. Necessary for formation of coenzymes in many metabolic pathways. Necessary for erythropoiesis. **Therapeutic Effect:** Essential for nucleoprotein synthesis, maintenance of normal erythropoiesis.

## PHARMACOKINETICS

PO form almost completely absorbed from GI tract (upper duodenum). Protein binding: High. Metabolized in liver. Excreted in urine. Removed by hemodialysis.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** Green tea may increase concentration. **FOOD:** None known. **LAB VALUES:** May decrease vitamin B<sub>12</sub> concentration.

## AVAILABILITY (Rx)

**Capsules:** 0.8 mg, 5 mg, 20 mg. **Injection Solution:** 5 mg/mL. **Tablets:** 0.4 mg (OTC), 0.8 mg (OTC), 1 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.

### IV

May give 5 mg or less undiluted over at least 1 min, or dilute with 50 mL

0.9% NaCl or D<sub>5</sub>W and infuse over 30 min.

## INDICATIONS/ROUTES/DOSAGE

### Anemia

**IM/IV/SQ/PO: ADULTS, ELDERLY:** 1–5 mg/day. **ADOLESCENTS, CHILDREN, INFANTS:** (**Initial:**) 0.5–1 mg/day for 3–4 wks until hematologic response. (**Maintenance:**) 0.1–0.4 mg/day. **CHILDREN YOUNGER THAN 4 YRS:** 0.1–0.3 mg/day. **INFANTS:** 0.1 mg/day. **PREGNANT/LACTATING FEMALES:** 0.8 mg/day.

### Prevention of Neural Tube Defects

**PO: FEMALES OF CHILDBEARING AGE:** 400–800 mcg/day. **FEMALES AT HIGH RISK OR FAMILY HISTORY OF NEURAL TUBE DEFECTS:** 4 mg/day.

## SIDE EFFECTS

None known.

## ADVERSE EFFECTS/TOXIC REACTIONS

Allergic hypersensitivity occurs rarely with parenteral form. Oral folic acid is nontoxic.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Pernicious anemia should be ruled out with Schilling test and vitamin B<sub>12</sub> blood level before initiating therapy (may produce irreversible neurologic damage). Resistance to treatment may occur if decreased hematopoiesis, alcoholism, anti-metabolic drugs, deficiency of vitamin B<sub>6</sub>, B<sub>12</sub>, C, E is evident.

### INTERVENTION/EVALUATION

Assess for therapeutic improvement: improved sense of well-being, relief from iron deficiency symptoms (fatigue, shortness of breath, sore tongue, headache, pallor).

### PATIENT/FAMILY TEACHING

- Eat foods rich in folic acid, including fruits, vegetables, organ meats.

## fondaparinux

**HIGH  
ALERT**

fon-**dap**-a-rin-ux  
(Arixtra)

■ **BLACK BOX ALERT** ■ Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Factor Xa inhibitor. **CLINICAL:** Antithrombotic.

### USES

Prevention of venous thromboembolism in pts undergoing total hip replacement, hip fracture surgery, knee replacement surgery, abdominal surgery. Treatment of acute deep vein thrombosis (DVT), acute pulmonary embolism in conjunction with warfarin. **OFF-LABEL:** Prophylaxis of DVT in pts with history of heparin-induced thrombocytopenia (HIT), acute symptomatic superficial vein thrombosis of the legs.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fondaparinux, active major bleeding, bacterial endocarditis, prophylaxis treatment in pts with body weight less than 50 kg, severe renal impairment (CrCl less than 30 mL/min), thrombocytopenia associated with antiplatelet antibody formation in presence of fondaparinux. **Cautions:** Conditions with increased risk of bleeding, bacterial endocarditis, active ulcerative GI disease, hemorrhagic stroke; shortly after brain, spinal, or ophthalmologic surgery; concurrent platelet inhibitors, severe uncontrolled hypertension, history of CVA, history of heparin-induced thrombocytopenia, renal/hepatic impairment, elderly, indwelling epidural catheter use.

### ACTION

Factor Xa inhibitor that selectively binds to antithrombin and increases its affinity for factor Xa, inhibiting factor Xa,

stopping blood coagulation cascade. **Therapeutic Effect:** Indirectly prevents formation of thrombin and subsequently fibrin clot.

### PHARMACOKINETICS

Widely distributed. Undergoes minimal, if any, metabolism. Highly bound to antithrombin III. Distributed mainly in blood and to a minor extent in extravascular fluid. Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 17–21 hrs (increased in renal impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use with caution, particularly during third trimester; immediate postpartum period (increased risk of maternal hemorrhage). Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may increase risk of bleeding.

### INTERACTIONS

**DRUG:** Anticoagulants (e.g., heparin, warfarin), aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of bleeding. May increase effect of apixaban, dabigatran, edoxaban, rivaroxaban. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. **FOOD:** None known. **LAB VALUES:** May cause reversible increases in serum creatinine, ALT, AST. May decrease Hgb, Hct, platelet count.

### AVAILABILITY (Rx)

**Injection, Solution:** 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL.

### ADMINISTRATION/HANDLING

#### SQ

- Parenteral form appears clear, colorless. Discard if discoloration or particulate matter is noted.
- Store at room temperature.
- Do not expel air bubble from

prefilled syringe before injection. • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** For SQ administration only.

### Prevention of Venous Thromboembolism

**SQ: ADULTS WEIGHING 50 KG OR MORE:** 2.5 mg once daily for 5–9 days after surgery (up to 10 days following abdominal surgery; optimal duration in orthopedic surgery is unknown, but usually given for a minimum of 10–14 days and extended for up to 35 days. Initial dose should be given no earlier than 6–8 hrs after surgery. Initiate dose once hemostasis established. **WEIGHING LESS THAN 50 KG:** Contraindicated.

### Treatment of Venous Thromboembolism, Pulmonary Embolism

**Note:** Start warfarin on first treatment day and continue fondaparinux until INR reaches 2 to 3 for at least 24 hr. Usual duration of fondaparinux: 5–9 days.

**SQ: ADULTS, ELDERLY WEIGHING MORE THAN 100 KG:** 10 mg once daily. **ADULTS, ELDERLY WEIGHING 50–100 KG:** 7.5 mg once daily. **ADULTS, ELDERLY WEIGHING LESS THAN 50 KG:** 5 mg once daily.

### Dosage in Renal Impairment

**CrCl greater than 50 mL/min:** No dose adjustment. **CrCl 30–50 mL/min:** Use caution (50% dose reduction or use of low-dose heparin). **CrCl less than 30 mL/min:** Contraindicated.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Frequent (19%–11%):** Anemia, fever, nausea. **Occasional (10%–4%):** Edema, constipation, rash, vomiting, insomnia, increased wound drainage, hypokalemia.

**Rare (less than 4%):** Dizziness, hypotension, confusion, urinary retention, injection site hematoma, diarrhea, dyspepsia, headache.

## ADVERSE EFFECTS/TOXIC REACTIONS

Accidental overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Thrombocytopenia occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Evaluate potential risk for bleeding. Question history of recent surgery, trauma, intracranial hemorrhage, GI bleeding. Question medical history as listed in Precautions. Ensure that pt has not received spinal anesthesia, spinal procedures.

### INTERVENTION/EVALUATION

Periodically monitor CBC, esp. platelet count, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). Assess for any signs of bleeding: bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, ecchymosis, bleeding from injection sites. Monitor B/P, pulse; hypotension, tachycardia may indicate bleeding, hypovolemia.

### PATIENT/FAMILY TEACHING

• Usual length of therapy is 5–9 days. • Do not take any OTC medication (esp. aspirin, NSAIDs). • Report swelling of hands/feet, unusual back pain, unusual bleeding/bruising, weakness. Treatment may increase risk of bleeding into the brain; report confusion, one-sided weakness, trouble speaking, seizures. Treatment may increase risk of GI bleeding; report bloody stool, vomiting up blood; dark, tarry stools.

## fosphenytoin

fos-fen-i-toyn  
(Cerebix)

**■ BLACK BOX ALERT ■** The rate of fosphenytoin intravenous (IV) administration should not exceed 150 mg phenytoin sodium equivalent (PE)/min due to risk of severe hypotension and cardiac arrhythmias. Cardiac monitoring is recommended.

**Do not confuse Cerebix with CeleBREX or CeleXA, or fosphenytoin with fospropofol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hydantoin. **CLINICAL:** Anticonvulsant.

### USES

Control of generalized tonic-clonic status epilepticus convulsive status epilepticus. Prevention, treatment of seizures occurring during neurosurgery. Short-term substitution for oral phenytoin.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fosphenytoin, phenytoin, other hydantoin. Adams-Stokes syndrome; second- or third-degree AV block; sinus bradycardia; SA block; concurrent use of delavirdine. History of hepatotoxicity attributed to fosphenytoin or phenytoin. **Cautions:** Porphyruria, diabetes, hypothyroidism, hypotension, severe myocardial insufficiency, renal/hepatic disease, hypoalbuminemia.

### ACTION

Stabilizes neuronal membranes, limits spread of seizure activity by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during nerve impulse generation. **Therapeutic Effect:** Decreases seizure activity.

### PHARMACOKINETICS

Widely distributed. Protein binding: 95%–99%. Rapidly and completely

hydrolyzed to phenytoin after IM or IV administration. Time of complete conversion to phenytoin: 4 hrs after IM injection; 2 hrs after IV infusion. **Half-life:** 8–15 min (for conversion to phenytoin). (Phenytoin: 12–29 hrs.)

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May increase frequency of seizures during pregnancy. Increased risk of congenital malformations. Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Lower dosage recommended.

### INTERACTIONS

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. May decrease concentration/effect of apixaban, axitinib, dabigatran, dronedarone, itraconazole, ivabradine, nimodipine, rivaroxaban. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, GGT, alkaline phosphatase.

### AVAILABILITY (Rx)

**Injection Solution:** 100 mg PE/2 mL, 500 mg PE/10 mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • Dilute in D<sub>5</sub>W or 0.9% NaCl to a concentration ranging from 1.5–25 mg PE/mL.

**Rate of administration** • Administer at rate less than 150 mg PE/min (decreases risk of hypotension, arrhythmias). Children: 2 mg PE/kg/min. **Maximum:** 150 mg PE/min.

**Storage** • Refrigerate. • Do not store at room temperature for longer than 48 hrs. • After dilution, solution is stable for 8 hrs at room temperature or 24 hrs if refrigerated.

**IV INCOMPATIBILITIES**

Midazolam (Versed).

**IV COMPATIBILITIES**

LORazepam (Ativan), PHENobarbital, potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** 150 mg fosphenytoin yields 100 mg phenytoin. Dosage, concentration solution, infusion rate of fosphenytoin are expressed in terms of phenytoin equivalents (PE).

**Status Epilepticus**

**IV: ADULTS: Loading dose:** 20 mg PE/kg infused at rate of 100–150 mg PE/min. May give an additional 5–10 mg PE/kg 10 min after loading dose. **Maximum total loading dose:** 30 mg PE/kg. **Maintenance dose:** Initially, 4–7 mg PE/kg/day (usual daily dose: 300–400 mg PE) given in 2–4 divided doses. **ADOLESCENTS, CHILDREN: Loading dose:** 15–20 mg PE/kg. **Maximum dose:** 1,500 mg PE. **Maintenance dose:** 2–4 mg PE/kg given 12 hrs after loading dose, then q12h (4–8 mg PE/kg/day in divided doses).

**Short-Term Substitution for Oral Phenytoin**

**IV, IM: ADULTS:** May substitute for oral phenytoin at same total daily dose.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Dizziness, paresthesia, tinnitus, pruritus, headache, drowsiness.

**Occasional:** Morbilliform rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Toxic fosphenytoin serum concentration may produce ataxia (muscular incoordination), nystagmus (rhythmic oscillation of eyes), diplopia, lethargy, slurred speech, nausea, vomiting, hypotension. As drug level increases, extreme lethargy may progress to coma.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. Obtain vital signs, medication history (esp. use of phenytoin, other anticonvulsants). Observe clinically.

**INTERVENTION/EVALUATION**

Monitor ECG, cardiac function, respiratory function, B/P during and immediately following infusion (10–20 min). Discontinue if skin rash appears. Interrupt or decrease rate if hypotension, arrhythmias occur. Monitor free and total Dilantin levels (2 hrs after IV infusion or 4 hrs after IM injection).

**PATIENT/FAMILY TEACHING**

- If noncompliance is cause of acute seizures, discuss and address reasons for noncompliance.
- Avoid tasks that require alertness, motor skills until response to drug is established.

**frovatriptan**

froe-va-**trip**-tan  
(Frova)

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin 5-HT<sub>1</sub> receptor agonist. **CLINICAL:** Antimigraine.

**USES**

Acute treatment of migraine headache with or without aura in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to frovatriptan. Management of basilar or hemiplegic migraine, cerebrovascular or peripheral vascular disease, coronary artery disease, ischemic heart disease (angina pectoris, history of MI, silent ischemia, Prinzmetal's angina), severe

hepatic impairment (Child-Pugh Grade C), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist. **Cautions:** Mild to moderate hepatic impairment, history of seizures or structural brain lesions.

## ACTION

Selective agonist for serotonin in cranial arteries causing vasoconstriction and reduction of inflammation. **Therapeutic Effect:** Relieves migraine headache.

## PHARMACOKINETICS

Widely distributed. Protein binding: 15%. Metabolized in liver. Eliminated in feces (62%), urine (32%). **Half-life:** 26 hrs (increased in hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not recommended in this population.

## INTERACTIONS

**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. May increase adverse effect of SUMatriptan. Antiemetics (5-HT<sub>3</sub> antagonists), antiparkinson agents (MAOIs), linezolid, metO Lazone, opioid agonists may increase serotonergic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

 **Tablets:** 2.5 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with fluids as soon as symptoms appear.
- Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

### Acute Migraine Headache

**PO: ADULTS, ELDERLY:** Initially, 2.5 mg. If headache improves but then returns,

dose may be repeated after at least 2 hrs. **Maximum:** 7.5 mg/day.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Occasional (8%–4%):** Dizziness, paresthesia, fatigue, flushing. **Rare (3%–2%):** Hot/cold sensation, dry mouth, dyspepsia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (cerebral hemorrhage, CVA) occur rarely, particularly in pts with hypertension, obesity, smokers, diabetes, strong family history of coronary artery disease; males older than 40 yrs; postmenopausal women.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of peripheral vascular disease, renal/hepatic impairment, possibility of pregnancy, cardiac disease. Question regarding onset, location, duration of migraine, possible precipitating factors.

### INTERVENTION/EVALUATION

Assess for relief of migraine headache, potential for photophobia, phonophobia (sound sensitivity), nausea, vomiting.

### PATIENT/FAMILY TEACHING

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine headaches, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.

lished. • Immediately report palpitations, pain, tightness in chest or throat, sudden or severe abdominal pain, pain or weakness of extremities.

## furosemide

**HIGH  
ALERT**

fur-oh-se-myde  
(Apo-Furosemide , Lasix)

**BLACK BOX ALERT** Large doses can lead to profound diuresis with water and electrolyte depletion.

**Do not confuse furosemide with famotidine, finasteride, fluconazole, FLUoxetine, loperamide, or torsemide, or Lasix with Lidex, Lovenox, Luvox, or Lixiq.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Loop diuretic. **CLINICAL:** Diuretic. Antihypertensive.

### USES

Treatment of edema associated with HF and renal/hepatic disease; acute pulmonary edema.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to furosemide. Anuria. **Cautions:** Hepatic cirrhosis, hepatic coma, severe electrolyte depletion, systemic lupus erythematosus, prostatic hyperplasia/urinary stricture.

### ACTION

Inhibits reabsorption of sodium, chloride in ascending loop of Henle and proximal/distal renal tubules. **Therapeutic Effect:** Increases excretion of water, sodium, chloride, magnesium, calcium.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30–60 min	1–2 hrs	6–8 hrs
IV	5 min	20–60 min	2 hrs
IM	30 min	N/A	N/A

Moderately absorbed from GI tract. Protein binding: greater than 98%. Partially metabolized in liver. Primarily excreted in urine (nonrenal clearance increases in severe renal impairment). Not removed by hemodialysis. **Half-life:** 30–90 min (increased in renal/hepatic impairment, neonates).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Half-life increased in neonates; may require increased dosage interval. **Elderly:** May be more sensitive to hypotensive, electrolyte effects, developing circulatory collapse, thromboembolic effect. Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Bile acid sequestrants (e.g., cholestyramine), sucralfate may decrease absorption/effect. May increase hyponatremic effect of **desmopressin**. May increase QT interval–prolonging effect of **dofetilide**. **Amphotericin B, nephrotoxic ototoxic medications (e.g., lisinopril, IV contrast dye, vancomycin)** may increase risk of nephrotoxicity, ototoxicity. May increase risk of **lithium** toxicity. **Other medications causing hypokalemia (e.g., HCTZ, laxatives)** may increase risk of hypokalemia. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, BUN, uric acid. May decrease serum calcium, chloride, magnesium, potassium, sodium.

### AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL (2 mL, 4 mL, 10 mL). **Oral Solution:** 10 mg/mL, 40 mg/5 mL. **Tablets:** 20 mg, 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

**Rate of administration** • May give undiluted but is compatible with D<sub>5</sub>W or 0.9% NaCl. • May be diluted for infusion to 1–2 mg/mL (**Maximum:** 10 mg/mL). • Administer each 40 mg or fraction by IV push over 1–2 min. Do not exceed administration rate of 4 mg/min for short-term intermittent infusion.

**Storage** • Solution appears clear, colorless. • Discard yellow solutions. • Stable for 24 hrs at room temperature when mixed with 0.9% NaCl or D<sub>5</sub>W.

### IM

• Temporary pain at injection site may be noted.

### PO

• Administer on empty stomach. • Give with food to avoid GI upset, preferably with breakfast (may prevent nocturia). • Food may decrease diuretic effect.

## IV INCOMPATIBILITIES

Ciprofloxacin (Cipro), dilTIAZem (Cardizem), DOBUtamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), droperidol (Inapsine), esmolol (Brevibloc), famotidine (Pepcid), filgrastim (Neupogen), fluconazole (Diflucan), gemcitabine (Gemzar), gentamicin (Garamycin), IDArubicin (Idamycin), labetalol (Trandate), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), niCARDipine (Cardene), ondansetron (Zofran), quiNIDine, thiopental (Pentothal), vinBLAStine (Velban), vinCRIStine (Oncovin), vinorelbine (Navelbine).

## IV COMPATIBILITIES

Amiodarone (Cordarone), bumetanide (Bumex), calcium gluconate, cimetidine (Tagamet), dexmedetomidine (Precedex), heparin, HYDRomorphone (Dilaudid), lidocaine, lipids, morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Edema, HF

**PO: ADULTS, ELDERLY:** Initially, 20–40 mg once, then titrate as needed. May titrate up to 600 mg/day in severe edematous states. **CHILDREN:** Initially, 0.5–2 mg/kg/dose. May increase by 1–2 mg/kg/dose at 6–8 hr intervals. **Maximum:** 6 mg/kg/day (not to exceed maximum adult dose of 600 mg/day). **NEONATES:** 1 mg/kg/dose 1–2 times/day.

**IV: ADULTS, ELDERLY:** 20–40 mg once, then titrate as needed. **Maximum single dose:** 200 mg. **CHILDREN:** Initially, 0.5–2 mg/kg/dose. May increase by 1 mg/kg/dose no sooner than 2 hrs after previous dose. **Maximum:** 6 mg/kg/dose. (Not to exceed maximum adult dose of 200 mg/dose.) **NEONATES:** 1–2 mg/kg/dose q12–24h.

**IV infusion: ADULTS, ELDERLY:** Bolus loading dose of 40–100 mg over 1–2 min, followed by initial infusion rate of 5 mg/hr; repeat loading dose before increasing infusion rate. **Maximum:** 40 mg/hr. **CHILDREN:** Bolus loading dose of 0.1 mg/kg, then initial infusion rate of 0.05–0.4 mg/kg/hr; titrate to desired effect. **NEONATES:** Initially, 0.1–0.2 mg/kg/hr. May increase by 0.1 mg/kg/hr q12–24h. **Maximum:** 0.4 mg/kg/hr.

### Dosage in Renal Impairment

Avoid use in oliguric states.

### Dosage in Hepatic Impairment

No dose adjustment. Decreased effect, increased sensitivity to hypokalemia/volume depletion in cirrhosis.

## SIDE EFFECTS

**Expected:** Increased urinary frequency/volume. **Frequent:** Nausea, dyspepsia, abdominal cramps, diarrhea or constipation, electrolyte disturbances. **Occasional:** Dizziness, light-headedness, headache, blurred vision, paresthesia, photosensitivity, rash, fatigue, bladder spasm, restlessness, diaphoresis. **Rare:** Flank pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Vigorous diuresis may lead to profound water loss/electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Sudden volume depletion may result in increased risk of thrombosis, circulatory collapse, sudden death. Acute hypotensive episodes may occur, sometimes several days after beginning therapy. Ototoxicity (deafness, vertigo, tinnitus) may occur, esp. in pts with severe renal impairment. Can exacerbate diabetes mellitus, systemic lupus erythematosus, gout, pancreatitis. Blood dyscrasias have been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Check vital signs, esp. B/P, pulse, for hypotension before administration. Assess renal function, serum electrolytes, esp. serum sodium, potassium. Assess skin turgor, mucous membranes for hydration status; observe for edema. Obtain baseline

weight. Initiate I&O monitoring. Auscultate lung sounds. In pts with hepatic cirrhosis and ascites, consider giving initial doses in a hospital setting.

**INTERVENTION/EVALUATION**

Monitor B/P, vital signs, serum electrolytes, I&O, weight. Note extent of diuresis. Watch for symptoms of electrolyte imbalance: Hypokalemia may result in changes in muscle strength, tremor, muscle cramps, altered mental status, cardiac arrhythmias; hyponatremia may result in confusion, thirst, cold/clammy skin. Consider potassium supplementation if hypokalemia occurs.

**PATIENT/FAMILY TEACHING**

- Expect increased frequency, volume of urination.
- Report palpitations, signs of electrolyte imbalances (noted previously), hearing abnormalities (sense of fullness in ears, tinnitus).
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Avoid sunlight, sunlamps.

## gabapentin

ga-ba-pen-tin

(Gralise, Horizant, Neurontin)

**Do not confuse Neurontin with Motrin, Neoral, nitrofurantoin, Noroxin, or Zarontin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Gamma-aminobutyric acid analogue. **CLINICAL:** Anticonvulsant, antineuralgic.

### USES

**Neurontin:** Adjunct in treatment of partial seizures (with or without secondary generalized seizures) in children 3 yrs and older and adults. Management of postherpetic neuralgia (PHN). **Horizant:** Treatment of moderate to severe primary restless legs syndrome (RLS), PHN. **Gralise:** Management of PHN. **OFF-LABEL:** Treatment of neuropathic pain, diabetic peripheral neuropathy, vasomotor symptoms, fibromyalgia, postoperative pain adjunct.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to gabapentin. **Cautions:** Severe renal impairment, elderly, history of suicidal behavior; substance abuse.

### ACTION

Binds to gabapentin binding sites in brain and may modulate release of excitatory neurotransmitters, which participates in epileptogenesis and nociception. **Therapeutic Effect:** Reduces seizure activity, neuropathic pain.

### PHARMACOKINETICS

Well absorbed from GI tract (not affected by food). Protein binding: less than 5%. Widely distributed. Crosses blood-brain barrier. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 5–7 hrs (increased in renal impairment, elderly).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta, excreted in breast milk. **Children:** Safety and efficacy not established in pts 3 yrs and younger. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, tapentadol, zolpidem) may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May alter serum glucose; WBC. May increase serum alkaline phosphatase, ALT, AST, bilirubin.

### AVAILABILITY (Rx)

**Capsules:** 100 mg, 300 mg, 400 mg. **Oral Solution:** 250 mg/5 mL. **Tablets:** 600 mg, 800 mg. **Tablets (Gralise):** 300 mg, 600 mg.

**Tablets (Extended-Release [Horizant]):** 300 mg, 600 mg.

### ADMINISTRATION/HANDLING

#### PO

**Immediate-release/solution** • Give without regard to food; may give with food to avoid, reduce GI upset. • Swallow extended-release tablets whole; do not break, crush, dissolve, or divide. Take with evening meal.

### INDICATIONS/ROUTES/DOSAGE

**Note:** When given 3 times/day, maximum time between doses should not exceed 12 hrs. If treatment is discontinued or anticonvulsant therapy is added, do so gradually over at least 1 wk (reduces risk of loss of seizure control).

#### Adjunctive Therapy for Seizure Control

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** (**Immediate-Release**): Initially, 300 mg 3 times/day. May titrate dosage. Range: 900–1,800 mg/day in 3 divided doses. **Maximum:** 3,600 mg/day. **CHILDREN 3–12 YRS:** Initially, 10–15 mg/kg/day in 3 divided doses. May titrate up to 25–35 mg/kg/day (for children

5–12 yrs) and 40 mg/kg/day (for children 3–4 yrs). **Maximum:** 50 mg/kg/day.

#### Adjunctive Therapy for Neuropathic Pain

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): Initially, 100–300 mg 1–3 times/day. May increase up to 1,200 mg 3 times/day. (*Extended-Release*): Initially, 300 mg at bedtime. May increase up to target dose of 900–3,600 mg once daily.

#### Postherpetic Neuralgia

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): 300 mg once on day 1, 300 mg twice daily on day 2, and 300 mg 3 times/day on day 3 as needed. Range: 1,800–3,600 mg/day. (*Extended-Release*): 300 mg once on day 1; 600 mg once on day 2; 900 mg once daily on days 3–6; 1,200 mg once daily on days 7–10; 1,500 mg once daily on days 11–14; then 1,800 mg once daily. (*Horizant*): 600 mg once daily in AM for 3 days, then increase to 600 mg twice daily.

#### RLS

**PO: ADULTS, ELDERLY:** (*Horizant*): 600 mg once daily at about 5 PM.

#### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (19%–10%):** Fatigue, drowsiness, dizziness, ataxia. **Occasional (8%–3%):** Nystagmus, tremor, diplopia, rhinitis,

weight gain, peripheral edema. **Rare (less than 2%):** Anxiety, dysarthria, memory loss, dyspepsia, pharyngitis, myalgia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal may increase seizure frequency, increase risk of suicidal behavior/thoughts. Overdosage may result in slurred speech, drowsiness, lethargy, diarrhea. Drug reaction with eosinophilia and systemic symptoms (multiorgan hypersensitivity) was reported. Hypersensitivity reaction, including anaphylaxis and angioedema, can occur at any time.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC). Assess location, intensity of neuralgia/neuropathic pain. Question history of renal impairment.

#### INTERVENTION/EVALUATION

Provide safety measures as needed. Monitor seizure frequency/duration, renal function, weight, behavior in children. Monitor for signs/symptoms of depression, suicidal tendencies, other unusual behavior; hypersensitivity reaction.

#### PATIENT/FAMILY TEACHING

- Use only as prescribed; do not abruptly stop taking drug (may increase seizure frequency).
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report suicidal ideation, depression, unusual behavioral changes (esp. with

Creatinine Clearance	Neurontin Dosage (Immediate-Release)	Gralise Dosage (Extended-Release)	Horizant Dosage	
			RLS	PHN
30–59 mL/min	200–700 mg q12h	600–1,800 mg once/day	300–600 mg/day	Same
16–29 mL/min	200–700 mg once daily	Not recommended	300 mg/day	Same
Less than 16 mL/min	100–300 mg once daily	Not recommended	300 mg q48h	Same
Hemodialysis	125–350 mg following HD	Not recommended	Not recommended	300–600 mg following HD

changes in dosage), worsening of seizure activity or loss of seizure control. • Seek medical attention for allergic reactions including difficulty breathing, coughing, wheezing, throat tightness, swelling of face or tongue.

## galantamine

gal-an-ta-meen  
(Razadyne ER)

**Do not confuse Razadyne with Rozerem.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Acetylcholinesterase inhibitor (central).

**CLINICAL:** Antidementia.

### USES

Treatment of mild to moderate dementia of Alzheimer's type. **OFF-LABEL:** Diabetic neuropathy, neuropathic pain, postoperative pain (adjunct), hot flashes.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to galantamine. **Cautions:** Moderate renal/hepatic impairment (not recommended in severe impairment), history of ulcer disease, asthma, COPD, bladder outflow obstruction, supraventricular cardiac conduction conditions (except with pacemaker), seizure disorder, concurrent medications that slow cardiac conduction through SA or AV node. Elderly with low body weight and/or serious co-morbidities.

### ACTION

Elevates acetylcholine concentrations in cerebral cortex by slowing degeneration of acetylcholine released by still intact cholinergic neurons. May increase serotonin/glutamate levels. **Therapeutic Effect:** Slows progression of Alzheimer's disease.

### PHARMACOKINETICS

Rapidly, completely absorbed from GI tract. Protein binding: 18%. Distributed

to blood cells; binds to plasma proteins, mainly albumin. Metabolized in liver. Excreted in urine. **Half-life:** 7 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or is distributed in breast milk. **Children:** Not prescribed for this pt population. **Elderly:** No age-related precautions noted, but use is not recommended in pts with severe hepatic/renal impairment (CrCl less than 9 mL/min).

### INTERACTIONS

**DRUG:** Anticholinergic agents (e.g., hyoscyamine, glycopyrrolate) may decrease levels/effects. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May increase bradycardiac effect of **beta blockers** (e.g., carvedilol, metoprolol). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Oral Solution:** 4 mg/mL. **Tablets:** 4 mg, 8 mg, 12 mg. Do not crush. **Capsules:** (*Extended-Release*): 8 mg, 16 mg, 24 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give tablet or solution with morning and evening meals. • Mix oral solution with nonalcoholic beverage, take immediately. • Extended-release capsule should be given with breakfast. Swallow whole. Do not break, crush, cut, or divide.

### INDICATIONS/ROUTES/DOSAGE

**Note:** If therapy interrupted for 3 or more days, restart at lowest dose; then increase gradually.

#### Alzheimer's Disease

**PO: (*Immediate-Release Tablets, Oral Solution*):** **ADULTS, ELDERLY:** Initially, 4 mg twice daily (8 mg/day). After a minimum of 4 wks (if well tolerated), may increase to 8 mg twice daily (16 mg/day). After

another 4 wks, may increase to 12 mg twice daily (24 mg/day). Range: 16–24 mg/day in 2 divided doses.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 8 mg once daily for 4 wks; then increase to 16 mg once daily for 4 wks or longer. If tolerated, may increase to 24 mg once daily. Range: 16–24 mg once daily.

#### Dosage in Renal/Hepatic Impairment

**Moderate impairment:** Maximum dosage is 16 mg/day. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (17%–7%):** Nausea, vomiting, diarrhea, anorexia, weight loss. **Occasional (5%–4%):** Abdominal pain, insomnia, depression, headache, dizziness, fatigue, rhinitis. **Rare (less than 3%):** Tremors, constipation, confusion, cough, anxiety, urinary incontinence.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may cause cholinergic crisis (increased salivation, lacrimation, urination, defecation, bradycardia, hypotension, muscle weakness). Treatment aimed at generally supportive measures, use of anticholinergics (e.g., atropine). Toxic skin reactions including Stevens-Johnson syndrome, acute generalized exanthematous pustulosis, erythema multiforme were reported. Vagotonic effects may cause bradycardia, heart block.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess cognitive, behavioral, functional deficits of pt. Obtain baseline serum renal function, LFT. Question history as listed in Precautions, esp. cardiac conduction disorders.

#### INTERVENTION/EVALUATION

Monitor cognitive, behavioral, functional status of pt. Evaluate ECG, periodic rhythm strips in pts with underlying arrhythmias. Assess for evidence of GI disturbances (nausea, vomiting, diarrhea, anorexia,

weight loss). Monitor for toxic skin reactions; cardiac effects (bradycardia).

#### PATIENT/FAMILY TEACHING

- Take with meals (reduces risk of nausea).
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report persistent GI disturbances, excessive salivation, diaphoresis, excessive tearing, excessive fatigue, insomnia, depression, dizziness, increased muscle weakness, palpitations.

## ganciclovir

gan-sye-kloe-veer  
(Cytovene)

**BLACK BOX ALERT** Toxicity presents as neutropenia, thrombocytopenia, anemia. Studies suggest carcinogenic and teratogenic effects, inhibition of spermatogenesis. May cause birth defects.

**Do not confuse Cytovene with Cytosar, or ganciclovir with famciclovir or acyclovir.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic nucleoside. **CLINICAL:** Antiviral.

### USES

Treatment of cytomegalovirus (CMV) retinitis in immunocompromised pts (e.g., HIV), prophylaxis of CMV infection in transplant pts. **OFF-LABEL:** CMV retinitis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to acyclovir, ganciclovir, valganciclovir. **Cautions:** Baseline cytopenias, renal impairment, children (long-term safety not determined due to potential for long-term carcinogenic, adverse reproductive effects), pregnancy. Absolute neutrophil count less than 500 cells/mm<sup>3</sup>, platelet count less than 25,000 cells/mm<sup>3</sup>.

### ACTION

Competes with viral DNA polymerase and incorporation into growing viral DNA

chains. **Therapeutic Effect:** Interferes with DNA synthesis, viral replication.

## PHARMACOKINETICS

Widely distributed (including CSF and ocular tissue). Protein binding: 1%–2%. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 1.7–5.8 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy. Females of reproductive potential should use effective contraception during treatment and for 30 days after discontinuation; male pts should use a barrier contraceptive during and for at least 90 days after discontinuation. Do not breastfeed. May resume breastfeeding no sooner than 72 hrs after the last dose. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bone marrow depressants may increase myelosuppression. May decrease the therapeutic effect of **cladribine**. **Imipenem** may increase risk for seizures. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution (Cytovene):** 500 mg. **Solution, Intravenous:** 500 mg/250 mL, 50 mg/mL (10 mL).

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 500-mg vial with 10 mL Sterile Water for Injection to provide concentration of 50 mg/mL; do **not** use Bacteriostatic Water (contains parabens, which are incompatible with ganciclovir). • Further dilute with 100 mL D<sub>5</sub>W, 0.9% NaCl to provide a concentration of 10 mg/mL or less for infusion.

**Rate of administration** • Administer only by IV infusion over at least 1 hr. • Do not give by IV push or rapid IV infusion

(increases risk of toxicity). Flush line with 0.9% NaCl before and after administration.

**Storage** • Store vials at room temperature. Do not refrigerate. • Reconstituted solution in vial is stable for 12 hrs at room temperature. • After dilution, use within 24 hrs. • Discard if precipitate forms, discoloration occurs. • Avoid exposure to skin, eyes, mucous membranes. • Use latex gloves, safety glasses during preparation/handling of solution. • Avoid inhalation. • If solution contacts skin or mucous membranes, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

## IV INCOMPATIBILITIES

Aldesleukin (Proleukin), amifostine (Ethylol), aztreonam (Azactam), cefepime (Maxipime), cytarabine (ARA-C), DOXOrubicin (Adriamycin), fludarabine (Fludara), foscarnet (Foscavir), gemcitabine (Gemzar), ondansetron (Zofran), piperacillin and tazobactam (Zosyn), sargramostim (Leukine), vinorelbine (Navelbine).

## IV COMPATIBILITIES

Amphotericin B, enalapril (Vasotec), filgrastim (Neupogen), fluconazole (Diflucan), granisetron (Kytril), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Cytomegalovirus (CMV) Retinitis

**IV: ADULTS, CHILDREN 3 MOS AND OLDER:** 5 mg/kg/dose q12h for 14–21 days, then 5 mg/kg/day as a single daily dose or 6 mg/kg 5 days/wk as maintenance therapy.

### Prevention of CMV in Transplant Pts

**IV: ADULTS, CHILDREN:** 5 mg/kg/dose q12h for 7–14 days, then 5 mg/kg/day as a single daily dose until day 100 post-transplant.

### Congenital CMV

**IV: NEONATES:** 6 mg/kg/dose q12h. When able, transition to oral valganciclovir to complete total treatment duration of 6 mos.

### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance (see table).

Creatinine Clearance	Dosage	
	IV Induction	IV Maintenance
50–69 mL/min	2.5 mg/kg q12h	2.5 mg/kg q24h
25–49 mL/min	2.5 mg/kg q24h	1.25 mg/kg q24h
10–24 mL/min	1.25 mg/kg q24h	0.625 mg/kg q24h
Less than 10 mL/min	1.25 mg/kg 3 times/wk	0.625 mg/kg 3 times/wk
Hemodialysis (give after HD on HD days)	1.25 mg/kg q48–72h	0.625 mg/kg q48–72h
Peritoneal dialysis	1.25 mg/kg 3 times/wk	0.625 mg/kg 3 times/wk
Continuous renal replacement therapy		
Continuous venovenous hemofiltration	2.5 mg/kg q24h	1.25 mg/kg q24h
Continuous venovenous hemodialysis/continuous venovenous hemodiafiltration	2.5 mg/kg q12h	2.5 mg/kg q24h

### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (41%–13%):** Diarrhea, fever, nausea, abdominal pain, vomiting. **Occasional (11%–6%):** Diaphoresis, infection, paresthesia, flatulence, pruritus. **Rare (4%–2%):** Headache, stomatitis, dyspepsia, phlebitis.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hematologic toxicity occurs commonly: leukopenia (41%–29% of pts), anemia (25%–19% of pts). Intraocular implant occasionally results in visual acuity loss, vitreous hemorrhage, retinal detachment. GI hemorrhage occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT in critically ill pts. Perform ophthalmic exam. Obtain specimens for support of differential diagnosis (urine, feces, blood, throat) since retinal infection is usually due to hematogenous dissemination.

#### INTERVENTION/EVALUATION

Monitor I&O, ensure adequate hydration (minimum 1,500 mL/24 hrs). Diligently evaluate hematology reports for

neutropenia, thrombocytopenia, leukopenia. Obtain periodic ophthalmic examinations. Question pt regarding visual acuity, therapeutic improvement, complications. Assess for rash, pruritus.

#### PATIENT/FAMILY TEACHING

- Treatment provides suppression, not cure, of cytomegalovirus (CMV) retinitis.
- Frequent blood tests, eye exams are necessary during therapy due to toxic nature of drug.
- May temporarily or permanently inhibit sperm production in men, suppress fertility in women.
- Barrier contraception should be used during and for 90 days after therapy due to mutagenic potential.

## gefitinib

ge-fi-ti-nib  
(Iressa)

**Do not confuse gefitinib with erlotinib, dasatinib, imatinib, or lapatinib.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

## USES

First-line treatment of metastatic non-small-cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 substitution mutations.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to gefitinib. **Cautions:** Hepatic impairment, pts at risk for interstitial lung disease (e.g., COPD, sarcoidosis, connective disease); pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract or abdominal malignancies, GI ulcers). Ocular disease, concurrent administration of CYP3A4 inducers and inhibitors.

## ACTION

Reversibly inhibits epidermal growth factor receptor–tyrosine kinase (EGFR-TK), a key driver in tumor cell growth. EGFR is expressed on cell surfaces of cancer cells.

**Therapeutic Effect:** Inhibits tumor cell proliferation and growth.

## PHARMACOKINETICS

Widely distributed. Peak plasma levels in 3–7 hrs. Protein binding: 90%. Metabolized in liver. Excreted primarily in feces (86%). **Half-life:** 48 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy. Use effective contraception during treatment and for at least 2 wks after discontinuation. Unknown if crosses placenta or distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration. H<sub>2</sub> antagonists (e.g., famotidine), proton pump inhibitors (e.g., pantoprazole) may decrease

concentration. May increase bleeding risk with warfarin. **Antacids** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** Avoid grapefruit products. **LAB VALUES:** May increase serum AST, ALT, bilirubin, urine protein.

## AVAILABILITY (Rx)

**Tablets:** 250 mg.

## ADMINISTRATION/HANDLING

• May give without regard to food. • Avoid grapefruit products. • Do not crush or cut. • Administer whole or dispersed in water. Gently swirl glass for up to 20 min and immediately ingest once dispersed.

## INDICATIONS/ROUTES/DOSAGE

### NSCLC

**PO: ADULTS, ELDERLY:** 250 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Modification

#### Hepatotoxicity

Withhold treatment for worsening of hepatic function. Consider discontinuation in pts who develop severe hepatic impairment.

#### Severe or Persistent Diarrhea

Withhold treatment in pts with severe or persistent (up to 14 days) diarrhea.

#### Ocular Toxicities

Withhold treatment or discontinue treatment in pts with severe or worsening ocular toxicities.

#### Permanent Discontinuation

Permanently discontinue in pts with confirmed interstitial lung disease, GI perforation.

#### Concomitant Use of CYP3A4 Inducers

Consider increasing dose to 500 mg once daily if use of CYP3A4 is unavoidable. If CYP3A4 inducer is discontinued, reduce dose to 250 mg 7 days after discontinuation.

#### Dosage in Renal Impairment

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Use with caution.

**SIDE EFFECTS**

**Frequent (47%–15%):** Skin reactions (e.g., acne, pruritus, rash, xeroderma), diarrhea, decreased appetite, vomiting. **Occasional (7%–5%):** Stomatitis, nail disorders (e.g., infection).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Interstitial lung disease (ILD)/pneumonitis reported in 1% of pts. Grade 3 or 4 hepatotoxicity reported in 5% of pts. GI perforation reported in less than 1% of pts. Grade 3 or 4 diarrhea reported in 3% of pts. Ocular disorders including aberrant eyelash growth, blepharitis, corneal erosion, dry eye, conjunctivitis may occur. Severe cutaneous reactions, including toxic epidermal necrolysis, Steven-Johnson syndrome, erythema multiforme, were reported. Hemorrhagic events, including epistaxis, hematuria, reported in 4% of pts. Hypersensitivity reactions, including angioedema, may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT; pregnancy test in females of reproductive potential. Verify EGRF mutation serostatus. Question history of hepatic impairment, pulmonary disease. Assess risk of GI perforation. Receive full medication history and screen for interactions. Assess usual bowel movement patterns, stool characteristics. Offer emotional support.

**INTERVENTION/EVALUATION**

Periodically monitor LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor

for symptoms of GI perforation (abdominal pain, fever, melena, hematemesis). Consider referral to ophthalmologic if ocular toxicities occur. Assess skin for cutaneous reactions, skin toxicities. Monitor daily pattern of bowel activity, stool consistency; I&O, hydration status.

**PATIENT/FAMILY TEACHING**

- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); symptoms of lung inflammation (excessive cough, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling).
- Treatment may cause severe diarrhea, which may require antidiarrheal medication. Report worsening of diarrhea or dehydration.
- Drink plenty of fluids.
- Allergic reactions, including swelling of face, lips, tongue, may occur. If allergic reaction occurs, seek immediate medical attention.
- Treatment may cause severe rashes, peeling, or blistering of the skin.
- Severe, persistent diarrhea may cause dehydration. Drink plenty of fluids.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment. Do not ingest grapefruit products.

**gemcitabine****HIGH ALERT**

jem-sye-ta-been

**Do not confuse gemcitabine with gemtuzumab.****◆ CLASSIFICATION****PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic.**USES**

Metastatic breast cancer in combination with PAclitaxel. Treatment of locally advanced (stage II, III) or metastatic (stage IV) adenocarcinoma of pancreas. In combination with CISplatin for treatment

of locally advanced or metastatic non-small-cell lung cancer (NSCLC). Treatment of advanced ovarian cancer (in combination with CARBoplatin) that has relapsed. **OFF-LABEL:** Treatment of biliary tract carcinoma, bladder carcinoma, germ cell tumors (e.g., testicular), Hodgkin's lymphoma, non-Hodgkin's lymphoma, cervical cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to gemcitabine. **Cautions:** Renal/hepatic impairment, baseline cytopenias, elderly, concurrent radiation therapy, impaired pulmonary function.

## ACTION

Inhibits ribonucleotide reductase, the enzyme necessary for catalyzing DNA synthesis. Cell-cycle specific for the S-phase. **Therapeutic Effect:** Produces death of cells undergoing DNA synthesis.

## PHARMACOKINETICS

Not extensively distributed after IV infusion (increased with length of infusion). Protein binding: less than 10%. Metabolized intracellularly by nucleoside kinases. Excreted primarily in urine. **Half-life:** Influenced by duration of infusion. Infusion 1 hr or less: 42–94 min; infusion 3–4 hrs: 4–10.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after last dose. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of hematologic toxicity.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase risk of myelo-

suppression. May increase adverse/toxic effect of vaccines (live). May diminish the therapeutic effect of BCG (intravesical), vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct, leukocyte count, platelet count.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 200-mg, 1-g, 2-g vials. **Injection, Solution:** 38 mg/mL, 100 mg/mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Use gloves when handling/preparing. • Reconstitute with 0.9% NaCl injection without preservative to provide concentration of 38 mg/mL. • Shake to dissolve. Further diluted with 50–500 mL 0.9% NaCl to a concentration as low as 0.1 mg/mL.

**Rate of administration** • Infuse over 30 min. • Infusion time greater than 60 min increases toxicity.

**Storage** • Store at room temperature (refrigeration may cause crystallization). • Reconstituted vials or diluted solutions are stable for 24 hrs at room temperature. Do not refrigerate.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B (Fungizone), cefotaxime (Claforan), furosemide (Lasix), ganciclovir (Cytovene), imipenem/cilastatin (Primaxin), irinotecan (Camptosar), methotrexate, methyl-PREDNISolone (SOLU-Medrol), mitoMYcin (Mutamycin), piperacillin/tazobactam (Zosyn), prochlorperazine (Compazine).

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, dexamethasone (Decadron), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), granisetron (Kytril), heparin, hydrocortisone (Solu-CORTEF), LORazepam (Ativan), ondansetron (Zofran), potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Dosage is individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for optimum dosage, sequence of drug administration. See manufacturer guidelines regarding dose modifications.

**Breast Cancer (Metastatic)**

**IV: ADULTS, ELDERLY:** (in combination with PAclitaxel): 1,250 mg/m<sup>2</sup> over 30 min on days 1 and 8 of each 21-day cycle. Continue until disease progression or unacceptable toxicity.

**Non–Small-Cell Lung Cancer (NSCLC) (Inoperable, Locally Advanced, or Metastatic)**

**IV: ADULTS, ELDERLY, CHILDREN:** (in combination with CISplatin): 1,000 mg/m<sup>2</sup> on days 1, 8, and 15, repeated every 28 days; or 1,250 mg/m<sup>2</sup> on days 1 and 8. Repeat every 21 days.

**Ovarian Cancer (Advanced)**

**IV: ADULTS, ELDERLY:** (in combination with CARBOplatin): 1,000 mg/m<sup>2</sup> on days 1 and 8 of each 21-day cycle.

**Pancreatic Cancer (Locally Advanced or Metastatic)**

**IV: ADULTS:** 1,000 mg/m<sup>2</sup> once wkly for up to 7 wks (or until toxicity necessitates decreasing dosage or withholding the dose), followed by 1 wk of rest. Subsequent cycles should consist of once-wkly dose for 3 consecutive wks out of every 4 wks (days 1, 8, 15 q28days).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**Dosage Reduction****Pancreatic Cancer, Non–Small-Cell Lung Cancer**

Dosage adjustments should be based on granulocyte count and platelet count, as follows:

Absolute Granulocyte Counts (cells/mm <sup>3</sup> )	Platelet Count (cells/mm <sup>3</sup> )	% of Full Dose
1,000	100,000	100
500–999	50,000–99,000	75
Less than 500 or	Less than 50,000	Hold

**Breast Cancer****Absolute****Granulocyte**

Counts (cells/mm <sup>3</sup> )	Platelet Count (cells/mm <sup>3</sup> )	% of Full Dose
Equal to or greater than 1,200 and	Greater than 75,000	100
1,000–1,199 or	50,000–75,000	75
700–999 and	Equal to or greater than 50,000	50
Less than 700 or	Less than 50,000	Hold

**Ovarian Cancer****Absolute****Granulocyte**

Counts (cells/mm <sup>3</sup> )	Platelet Count (cells/mm <sup>3</sup> )	% of Full Dose
1,500 or greater and	100,000 or greater	100
1,000–1,499 and/or	75,000–99,999	50
Less than 1,000 and/or	Less than 75,000	Hold

**SIDE EFFECTS**

**Frequent (69%–20%):** Nausea, vomiting, generalized pain, fever, mild to moderate pruritic rash, mild to moderate dyspnea, constipation, peripheral edema. **Occasional (19%–10%):** Diarrhea, petechiae, alopecia, stomatitis, infection, drowsiness, paresthesia. **Rare:** Diaphoresis, rhinitis, insomnia, malaise.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy. Severe, life-threatening toxicity may occur when given during or within 7 days of radiation therapy. Prolongation of infusion time beyond 60 min or doses given more frequently than every wk may increase risk of asthenia, hypotension, severe flu-like symptoms. Pulmonary toxicity including pneumonitis, pulmonary fibrosis, pulmonary edema, acute respiratory distress syndrome (ARDS) was reported. Life-threatening hemolytic

uremic syndrome may lead to renal failure, dialysis, and death. Drug-induced hepatic injury, including hepatic failure and death, has occurred. Posterior reversible encephalopathy syndrome, a dysfunction of the brain caused by swelling, may evolve into an ischemic CVA or cerebral hemorrhage. May cause capillary leak syndrome.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Screen for active infection. Drug should be suspended or dosage modified if myelosuppression is detected. Question history of pulmonary disease, hepatic/renal impairment. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC with differential prior to each dose; LFT, renal function periodically. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Monitor pulmonary status, pulse oximeter readings. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. RPLS should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes),

kidney problems (decreased urine output, flank pain, darkened urine). • Therapy may cause kidney failure, requiring treatment with dialysis. • Nervous system changes including confusion, headache, seizures may indicate life-threatening brain dysfunction/swelling. • Use effective contraception to avoid pregnancy. Do not breastfeed.

## gemfibrozil

jem-fye-broe-zil  
(Lopid)

**Do not confuse Lopid with Levbid, Lipitor, Lodine, or Slo-Bid.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fibric acid derivative. **CLINICAL:** Antihyperlipidemic.

## USES

Treatment of hypertriglyceridemia in Fredrickson types IV and V hyperlipidemia in pts who are at greater risk for pancreatitis and those who have not responded to dietary intervention. Reduce risk of coronary heart disease (CHD) development in Fredrickson type IIb pts without symptoms who have decreased HDL, increased LDL, increased triglycerides.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to gemfibrozil. Hepatic impairment (including primary biliary cirrhosis), preexisting gallbladder disease, severe renal impairment, concurrent use with dasabuvir, repaglinide or simvastatin. **Cautions:** Concurrent use with statins, mild to moderate renal impairment, anticoagulant therapy (e.g., warfarin).

## ACTION

Exact mechanism of action unknown. Can inhibit lipolysis of fat in adipose tissue, decrease hepatic uptake of free fatty acids (reduces hepatic triglyceride production), or inhibit hepatic secretion of very low-

density lipoprotein (VLDL). **Therapeutic Effect:** Lowers serum cholesterol, triglycerides (decreases VLDL, LDL; increases HDL).

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Decision to discontinue breastfeeding or drug should be based on potential for serious adverse effects. **Children:** Not recommended in pts younger than 2 yrs (cholesterol necessary for normal development). **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Statins (e.g., atorvastatin, simvastatin) may increase risk for myopathy/rhabdomyolysis. May increase effects of repaglinide, warfarin. **Bile acid-binding resins** (e.g., colestipol) may decrease concentration. May increase adverse effects of ezetimibe.

**HERBAL:** May increase concentration/effect of red yeast rice. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatine kinase, LDH, ALT, AST. May decrease Hgb, Hct, leukocyte counts, serum potassium.

## AVAILABILITY (Rx)

**Tablets:** 600 mg.

## ADMINISTRATION/HANDLING

### PO

- Give 30 min before morning and evening meals.

## INDICATIONS/ROUTES/DOSAGE

### Hyperlipidemia/Hypertriglyceridemia

**PO: ADULTS, ELDERLY:** 600 mg twice daily 30 min before breakfast and dinner.

### Dosage in Renal Impairment

Use caution. Contraindicated in severe impairment.

### Dosage in Hepatic Impairment

Contraindicated.

## SIDE EFFECTS

**Frequent (20%):** Dyspepsia. **Occasional (10%–2%):** Abdominal pain, diarrhea, nausea, vomiting, fatigue. **Rare (less than 2%):** Constipation, acute appendicitis, vertigo, headache, rash, pruritus, altered taste.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cholelithiasis, cholecystitis, acute appendicitis, pancreatitis, malignancy occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain diet history, esp. fat/alcohol consumption. Obtain serum triglyceride, cholesterol, LFT. Question history of hepatic/renal impairment, cholecystectomy. Receive full medication history and screen for contraindications.

### INTERVENTION/EVALUATION

Monitor LDL, VLDL, serum triglycerides, cholesterol for therapeutic response. Monitor daily pattern of bowel activity, stool consistency. Assess for rash, pruritus. Assess for abdominal pain, esp. right upper quadrant or epigastric pain suggestive of adverse gallbladder effects. Monitor serum glucose in pts receiving insulin, oral antihyperglycemics.

### PATIENT/FAMILY TEACHING

- Follow special diet (important part of treatment).
- Take before meals.
- Periodic lab tests are essential part of therapy.
- Report pronounced dizziness, blurred vision, abdominal pain, diarrhea, nausea, vomiting.

## gentamicin

jen-ta-mye-sin

**BLACK BOX ALERT** Aminoglycoside antibiotics may cause neurotoxicity, nephrotoxicity. Risk of ototoxicity directly proportional to dosage, duration of treatment; ototoxicity

usually is irreversible, precipitated by tinnitus, vertigo. May cause fetal harm if given during pregnancy.

**Do not confuse gentamicin with azithromycin, clindamycin, fidaxomicin, plazomicin, tobramycin, or vancomycin.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aminoglycoside. **CLINICAL:** Antibiotic.

## USES

**Parenteral:** Treatment of infections susceptible to *Pseudomonas*, *Proteus*, *Serratia*, and other gram-negative organisms and gram-positive *Staphylococcus* including skin/skin structure, bone, joint, respiratory tract, intra-abdominal, complicated urinary tract, acute pelvic infections; burns; septicemia; meningitis. **Ophthalmic:** Ophthalmic infections caused by susceptible bacteria. **OFF-LABEL:** Surgical (preoperative) prophylaxis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to gentamicin, other aminoglycosides (cross-sensitivity) or their components. **Cautions:** Elderly, neonates due to renal insufficiency or immaturity, neuromuscular disorders (potential for respiratory depression), vestibular or cochlear impairment, renal impairment, hypocalcemia, myasthenia gravis. Pediatric pts on extracorporeal membrane oxygenation.

## ACTION

Interferes with bacterial protein synthesis. Binds to 30S ribosomal subunit, causing a defective cell membrane. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Rapid, complete absorption after IM administration. Protein binding: less than 30%. Widely distributed (does not cross blood-brain barrier, low concentrations in CSF). Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in renal impairment,

neonates; decreased in cystic fibrosis, burn, or febrile pts).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; unknown if distributed in breast milk. **Children:** Caution in neonates: Immature renal function increases half-life and toxicity. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Nephrotoxic (e.g., furosemide, IV contrast dye), ototoxic medications (e.g., CISplatin, cycloSPORINE, foscarnet, furosemide, mannitol) may increase risk of nephrotoxicity, ototoxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, bilirubin, LDH, ALT, AST. May decrease serum calcium, magnesium, potassium, sodium. **Therapeutic serum level:** peak: 4–10 mcg/mL; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 10 mcg/mL; trough: greater than 2 mcg/mL.

## AVAILABILITY (Rx)

**Injection, Infusion:** 60 mg/50 mL, 80 mg/50 mL, 80 mg/100 mL, 100 mg/50 mL, 100 mg/100 mL, 120 mg/100 mL. **Injection, Solution:** 40 mg/mL. **Ointment, Ophthalmic:** 0.3%. **Solution, Ophthalmic (Gentak):** 0.3%.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl. Amount of diluent for infants, children depends on individual needs.

**Rate of administration** • Infuse over 30–60 min for adults, older children; over 60–120 min for infants, young children.

**Storage** • Store vials at room temperature. • Solution appears clear or slightly yellow. • Intermittent IV infusion (piggyback) is stable for 48 hrs at room temperature or refrigerated. • Discard if precipitate forms.

**IM**

• To minimize discomfort, give deep IM slowly. • Less painful if injected into gluteus maximus than lateral aspect of thigh.

**Ophthalmic**

• Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid. • Place prescribed number of drops or ointment into pocket. Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac). • **Solution:** Instruct pt to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption. • **Ointment:** Instruct pt to roll eyeball to increase contact area of drug to eye. • Remove excess solution or ointment around eye with tissue.

**IV INCOMPATIBILITIES**

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), furosemide (Lasix), heparin, hetastarch (Hespan), IDArubicin (Idamycin), indomethacin (Indocin), propofol (Diprivan).

**IV COMPATIBILITIES**

Amiodarone (Cordarone), dexmedetomidine (Precedex), dilTIAzem (Cardizem), enalapril (Vasotec), filgrastim (Neupogen), HYDROMorphone (Dilaudid), insulin, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, multivitamins.

**INDICATIONS/ROUTES/DOSAGE**

**ALERT** Space parenteral doses evenly around the clock. Peak, trough levels are determined periodically to maintain desired serum concentrations and minimize risk of toxicity. Target peak concentrations based on indication and site of infection (e.g., 4–6 mcg/mL for UTI; 7–10 mcg/mL for serious infection). Trough concentrations should be less than 2 mcg/mL.

**Usual Parenteral Dosage**

**IM, IV: ADULTS, ELDERLY: (Conventional):** 3–5 mg/kg/day in divided doses q8h. (**Once Daily:**) 5–7 mg/kg/dose q24h. **ADOLE-**

**SCENTS, CHILDREN, INFANTS:** 2–2.5 mg/kg/dose q8h.

**Note:** Higher doses and different dosing intervals may be required to achieve target concentrations if MIC is 1 mg/L or less.

Gestational Age	Postnatal Age	Dose
<30 wks	≤14 days	5 mg/kg q48h
	≥15 days	5 mg/kg q36h
30–34 wks	≤10 days	5 mg/kg q36h
	11–60 days	5 mg/kg q24h
≥35 wks	≤7 days	4 mg/kg q24h
	8–60 days	5 mg/kg q24h

**Hemodialysis (HD)**

**Note:** Administer after HD on dialysis days.

**Loading dose:** 2–3 mg/kg, then 1 mg/kg q48–72h for mild UTI or synergy (consider redose for pre- or post-HD concentrations less than 1 mg/L); 1–1.5 mg/kg q48–72h for moderate to severe UTI (consider redose for pre-HD concentration less than 1.5–2 mg/L or post-HD concentrations less than 1 mg/L); 1.5–2 mg/kg q48–72h for systemic gram-negative rod infection (consider redose for pre-HD concentration less than 3–5 mg/L or post-HD concentrations less than 2 mg/L).

**Continuous Renal Replacement Therapy (CRRT)**

**Loading dose:** 2–3 mg/kg, then 1 mg/kg q24–36h for mild UTI or synergy (redose when concentration less than 1 mg/L); 1–1.5 mg/kg q24–36h for moderate to severe UTI (redose when concentration less than 1.5–2 mg/L); 1.5–2.5 mg/kg q24–48h for systemic gram-negative infection (redose when concentration less than 3–5 mg/L).

**Usual Ophthalmic Dosage**

**Ophthalmic ointment: ADULTS, ELDERLY:** Apply 12-inch strip to conjunctival sac 2–3 times/day.

**Ophthalmic solution: ADULTS, ELDERLY, CHILDREN:** 1–2 drops q2–4h up to 2 drops/hr.

**Dosage in Renal Impairment****Adults**

<b>Creatinine Clearance</b>	<b>Conventional Dosage</b>	<b>Once-Daily Dosage</b>
Greater than 60 mL/min	q8h	q24h
41–60 mL/min	q12h	q36h
20–40 mL/min	q24h	q48h
Less than 20 mL/min	Loading dose, then monitor levels to determine dosage interval	Monitor levels

**Children**

<b>Creatinine Clearance</b>	<b>Conventional Dosage</b>
Greater than 50 mL/min	q8h
30–50 mL/min	q12–18h
10–29 mL/min	q18–24h
Less than 10 mL/min	q48–72h

**Dosage in Hepatic Impairment**

Monitor plasma concentrations.

**SIDE EFFECTS**

**Occasional:** **IM:** Pain, induration at injection site. **IV:** Phlebitis, thrombophlebitis, hypersensitivity reactions (fever, pruritus, rash, urticaria). **Ophthalmic:** Burning, tearing, itching, blurred vision. **Rare:** Alopecia, hypertension, fatigue.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Nephrotoxicity may be reversible if drug is stopped at first sign of symptoms. Irreversible ototoxicity (tinnitus, dizziness, diminished hearing), neurotoxicity (headache, dizziness, lethargy, tremor, visual disturbances) occur occasionally. Risk increases with higher dosages, prolonged therapy, or if solution is applied directly to mucosa. Superinfections, particularly with fungi, may result from bacterial imbalance via any route of administration. Ophthalmic application may cause paresthesia of conjunctiva, mydriasis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Dehydration must be treated before beginning parenteral therapy. Establish baseline hearing acuity. Question for history of aller-

gies, esp. aminoglycosides, sulfites (parabens for topical/ophthalmic routes). Screen for risk of acute kidney injury, esp. pts at risk for renal failure (baseline renal insufficiency, elderly, HF, hypertension, septic shock).

**INTERVENTION/EVALUATION**

Monitor I&O (maintain hydration), urinalysis, BUN, creatinine. Be alert to ototoxic, neurotoxic symptoms (see Adverse Effects/Toxic Reactions). Check IM injection site for induration. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess for rash (**Ophthalmic:** redness, burning, itching, tearing). Be alert for superinfection (genital/anal pruritus, changes in oral mucosa, diarrhea). When treating pts with neuromuscular disorders, assess respiratory response carefully. **Therapeutic serum level:** peak: 4–10 mcg/mL; peak levels are 2–3 times greater with once-daily dosing; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 10 mcg/mL; trough: greater than 2 mcg/mL.

**PATIENT/FAMILY TEACHING**

- Discomfort may occur with IM injection.
- Blurred vision, tearing may occur briefly after each ophthalmic dose.
- Report any hearing, visual, balance, urinary problems, even after therapy is completed.
- **Ophthalmic:** Report if tearing, redness, irritation continues.

**gilteritinib**

gil-te-ri-ti-nib  
(Xospata)

■ **BLACK BOX ALERT** ■ Life-threatening and/or fatal differentiation syndrome with symptoms including fever, dyspnea, hypoxia, pulmonary infiltrates, pleural or pericardial effusion, rapid weight gain or peripheral edema, hypotension, renal dysfunction may occur. Initiate corticosteroid therapy and hemodynamic monitoring in pts suspected of differentiation syndrome until symptoms resolve.

**Do not confuse gilteritinib with gefitinib, Gilotrif, or glasdegib.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** FMS-like tyrosine kinase 3 (FLT3) inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of adults who have relapsed or refractory acute myeloid leukemia (AML) with an FMS-like tyrosine kinase 3 (FLT3) mutation.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to gilteritinib. **Cautions:** Baseline neutropenia, hypotension; active infection, cardiac disease, hepatic/renal impairment, electrolyte imbalance, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, QT interval-prolonging medications, hypokalemia, hypomagnesemia); concomitant use of P-gp inhibitors, strong CYP3A inhibitors, strong CYP3A inducers; history of GI perforation, pancreatitis.

## ACTION

Inhibits multiple tyrosine kinases including FLT3 receptor signaling and proliferation in cells expressing FLT3 mutation. **Therapeutic Effect:** Induces apoptosis in mutant-expressing leukemic cells.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 94%. Peak plasma concentration: 4–6 hrs. Steady state reached in 15 days. Excreted in feces (65%), urine (16%). **Half-life:** 113 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at

least 2 mos after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 4 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. CYP3A4 inducers used concomitantly with P-gp inducers, strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. QT interval-prolonging medications (e.g., amiodarone, azithromycin, citalopram, escitalopram, haloperidol, sotalol) may increase risk of QTc interval prolongation. May decrease therapeutic effect of selective serotonin receptor inhibitors (SSRIs) (e.g., escitalopram, fluoxetine, sertraline). **HERBAL:** None significant. **FOOD:** High-fat meals may delay absorption. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatine kinase, triglycerides. May decrease serum calcium, phosphate, sodium; neutrophils.

## AVAILABILITY (Rx)

**Tablets:** 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to meals.
- Administer whole; do not break, cut, crush, or divide tablets.
- Tablets cannot be chewed.
- If vomiting occurs after administration, give next dose at regularly scheduled time.
- If a dose is missed, administer as soon as possible.
- Do not give a missed dose within 12 hrs of next dose.

## INDICATIONS/ROUTES/DOSAGE

### Acute Myeloid Leukemia

**PO: ADULTS:** 120 mg once daily for at least 6 mos. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Differentiation Syndrome

Withhold treatment if symptoms are severe and persist for more than 48 hrs after initiation of corticosteroids. Resume treatment when symptoms improve to Grade 2 or less.

### QT Interval Prolongation

**QTc interval greater than 500 msec:** Withhold treatment until QTc interval returns to within 30 msec of baseline or 480 msec or less, then resume at reduced dose of 80 mg.

**QTc interval increased by greater than 30 msec on ECG on day 8 of cycle 1:** Confirm with ECG on day 9. If confirmed, consider reducing dose to 80 mg.

### Other Adverse Reactions

**Any Grade 3 or higher toxicity:** Withhold treatment until improved to Grade 1, then resume at reduced dose of 80 mg.

### Pancreatitis

Withhold treatment until pancreatitis is resolved, then resume at reduced dose of 80 mg.

### Reversible Posterior

#### Leukoencephalopathy Syndrome

Permanently discontinue.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (50%–21%):** Myalgia, arthralgia, pain (back, bone, chest, extremity, musculoskeletal, neck), asthenia, fatigue,

malaise, fever, mucositis, edema (face, generalized, localized, peripheral), rash, diarrhea, dyspnea, nausea, cough, constipation, eye disorder, headache, dizziness, hypotension, vomiting. **Occasional (18%–11%):** Abdominal pain, neuropathy, insomnia, dysgeusia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening and/or fatal differentiation syndrome, a condition with rapid proliferation and differentiation of myeloid cells, reported in 3% of pts. Reversible posterior leukoencephalopathy syndrome reported in 1% of pts. QT interval prolongation with QTc interval greater than 500 msec (1% of pts) and QTc interval greater than 60 msec from baseline (7% of pts) have occurred. Pancreatitis reported in 4% of pts. Other significant adverse effects may include renal impairment (21% of pts), cardiac failure (4% of pts), pericardial effusion (4% of pts), pericarditis (2% of pts), large intestine perforation (1% of pts).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, CPK; ECG; pregnancy test in female pts of reproductive potential. Replete electrolytes if applicable. Confirm presence of FLT3-positive mutation. Screen for active infection. Confirm compliance of effective contraception. Question history of cardiac/hepatic/renal disease, GI perforation, pancreatitis. Assess risk for QT interval prolongation. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT, CPK at least wklly for 4 wks, then every other week for 4 wks, then monthly until discontinuation. If QT interval-prolonging medications cannot be withheld, diligently monitor ECG; serum potassium, magnesium for QT interval prolongation, cardiac arrhythmias. An increase of serum creatinine greater

than 0.4 mg/dL from baseline may indicate renal impairment. Obtain ECG on days 8 and 15 of cycle 1 and prior to the start of next two subsequent cycles. Monitor B/P for hypotension, esp. in pts taking antihypertensives. Monitor for symptoms of differentiation syndrome (dyspnea, fever hypotension, hypoxia, pulmonary infiltrates, pleural or pericardial effusion, rapid weight gain or peripheral edema, renal dysfunction, or concomitant febrile neutropenic dermatosis). If differentiation syndrome is suspected, initiate corticosteroids and hemodynamic monitoring until symptoms resolve for at least 3 days. Reversible posterior leukoencephalopathy syndrome should be considered in pts with altered mental status, headache, seizures, visual disturbances. Report abdominal pain, fever, melena (may indicate GI perforation). Monitor daily pattern of bowel activity, stool consistency. Assess skin for toxic skin reactions, rash. Monitor for pancreatitis (severe, steady abdominal pain often radiating to the back [with or without vomiting]). Ensure adequate hydration, nutrition.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Treatment may cause life-threatening differentiation syndrome as early as 2 days after starting therapy. Report difficulty breathing, fever, low blood pressure, rapid weight gain, swelling of the hands or feet, decreased urine output.
- Nervous system changes including confusion, headache, seizures may indicate life-threatening brain dysfunction/swelling.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin

or eyes); heart problems (chest tightness, dizziness, fainting, palpitations, shortness of breath skin), kidney problems (decreased urine output, flank pain, darkened urine); toxic skin reactions (rash, skin eruptions).

- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute inflammation of the pancreas.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Do not take herbal products or ingest grapefruit products.
- Report dizziness, chest pain, fainting, palpitations, shortness of breath); may indicate heart arrhythmia.

## glasdegib

glas-deg-ib  
(Daurismo)

**BLACK BOX ALERT** May cause severe birth defects, embryo-fetal death in pregnant females. Obtain pregnancy test in females of reproductive potential prior to initiation. Females of reproductive potential must use effective contraception during treatment and for at least 30 days after discontinuation. Due to potential exposure through semen, males with female partners of reproductive potential or a pregnant partner must use effective contraception (e.g., condoms) during treatment and for at least 30 days after discontinuation despite prior vasectomy.

**Do not confuse glasdegib with gefitinib, gilteritinib, sonidegib, or vismodegib.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hedgehog pathway inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Treatment of newly diagnosed acute myeloid leukemia in adults who are 75 yrs

or older or who have comorbidities that preclude use of intensive induction chemotherapy (in combination with low-dose cytarabine).

## PRECAUTIONS

**◀ALERT▶** Do not donate blood products or sperm during treatment and for at least 30 days after discontinuation. **Contraindications:** Hypersensitivity to glasdegib. **Cautions:** Baseline cytopenias; active infection, cardiac disease, hepatic/renal impairment, electrolyte imbalance; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for QTc interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HF, QT interval-prolonging medications, hypokalemia, hypomagnesemia); concomitant use of anticoagulants, strong CYP3A inhibitors, strong CYP3A inducers.

## ACTION

Blocks translocation of Smoothed (SMO) into cilia, preventing SMO-mediated activation of downstream Hedgehog targets. **Therapeutic Effect:** Inhibits tumor cell growth and reduces the number of blast cells in marrow.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 91%. Peak plasma concentration: 1.3–1.8 hrs. Steady state reached in 8 days. Excreted in urine (49%), feces (42%). **Half-life:** 17.4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 30 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 30 days after discontinuation.

**Males:** May impair fertility. Males with female partners of reproductive potential or a pregnant partner must use effective contraception during treatment and for at least

30 days after discontinuation despite prior vasectomy. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, haloperidol, sotalol) may increase risk of QT interval prolongation. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, CPK, creatinine, potassium. May decrease Hgb, neutrophils, platelets; serum calcium, magnesium, phosphate.

## AVAILABILITY (Rx)

**Tablets:** 25 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to meals.
- Administer whole; do not break, cut, crush, or divide tablets.
- Tablets cannot be chewed.
- If vomiting occurs after administration, give next dose at regularly scheduled time.
- If a dose is missed, administer as soon as possible.
- Do not give a missed dose within 12 hrs of next dose.

## INDICATIONS/ROUTES/DOSAGE

### Acute Myeloid Leukemia

**PO: ADULTS, ELDERLY:** 100 mg once daily on days 1–28 (in combination with cytarabine 20 mg SQ twice daily on days 1–10 of each 28-day cycle) for a minimum of 6 cycles. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Neutropenia

**Neutrophils less than 500 cells/mm<sup>3</sup> for more than 42 days in absence of**

**disease:** Permanently discontinue glasdegib and cytarabine.

### Nonhematologic Toxicity

**Any Grade 3 nonhematologic toxicity:** Withhold treatment (including cytarabine) until improved to Grade 1 or 0, then resume at same dose or reduce to 50 mg (resume cytarabine at same dose or reduce to 15 mg or 10 mg). If toxicity recurs, permanently discontinue glasdegib and cytarabine. If recurrent toxicity is only related to glasdegib, then cytarabine may be continued. **Any Grade 4 nonhematologic toxicity:** Permanently discontinue glasdegib and cytarabine.

### QT Interval Prolongation (On at least two separate ECGs)

**QTc interval 481–500 msec:** Assess and replete electrolyte levels. Assess and adjust concomitant use of medications known to cause QTc interval prolongation. When QTc interval prolongation improves to 480 msec or less, monitor ECG at least wkly for 2 wks. **QTc interval greater 500 msec:** Withhold treatment. Assess and replete electrolyte levels. Assess and adjust concomitant use of medications known to cause QTc interval prolongation. When QTc interval returns to within 30 msec of baseline or 480 msec or less, resume at reduced dose of 50 mg. **QTc interval prolongation with life-threatening arrhythmia:** Permanently discontinue.

### Thrombocytopenia

**Platelets less than 10,000 cells/mm<sup>3</sup> for more than 42 days in absence of disease:** Permanently discontinue glasdegib and cytarabine.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (36%–18%):** Fatigue, asthenia, edema, pain (back, bone, chest, musculoskeletal, neck), myalgia, arthralgia, nausea, dyspnea, mucositis, decreased appetite, dysgeusia, rash, constipation, pyrexia, diarrhea, cough, vomiting, dizziness. **Occasional (15%–12%):** Muscle spasm, headache, toothache, alopecia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy. Cardiac arrhythmias including atrial fibrillation, ventricular fibrillation, ventricular tachycardia may occur. QT interval prolongation with QTc interval greater than 500 msec (5% of pts) and QTc interval greater than 60 msec from baseline (4% of pts) have occurred. Bleeding events including disseminated intravascular coagulation, epistaxis, hemoptysis, hemorrhage (cerebral, eye, conjunctival, GI, retinal, tracheal), thrombotic thrombocytopenic purpura, subdural hematoma reported in 30% of pts. Febrile neutropenia reported in 31% of pts. Renal insufficiency including acute kidney injury, oliguria, renal failure reported in 19% of pts. Infections including pneumonia (19% of pts), sepsis (7% of pts) may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, CK, ECG; pregnancy test in female pts of reproductive potential. Replete electrolytes if applicable. Screen for active infection. Confirm compliance of effective contraception. Receive full medication history and screen for interactions. Assess risk for QT interval prolongation. Question history of cardiac/pulmonary/renal disease, cardiac arrhythmias. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT at least w/ky for 1 mo, then monitor electrolytes, BUN, serum creatinine, GFR, CrCl monthly thereafter. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Obtain ECG approx. 1 wk after initiation, then monthly for 2 mos (or more frequently if indicated). If QT interval-prolonging medications cannot be withheld, diligently monitor ECG; serum potassium, magnesium for QT interval prolongation, cardiac arrhythmias. Obtain CK level if muscle aches or spasms occur. Serum CK level elevations usually occur before muscle symptoms are reported. Diligently monitor for infections, febrile neutropenia. Monitor for bleeding events of any kind; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Assess skin for toxic skin reactions, rash.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Do not donate blood or blood products during treatment and for at least 30 days after last dose.
- Treatment may cause muscle damage, which may lead to kidney failure. Report musculoskeletal symptoms such as muscle pain/spasms/tenderness/weakness.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision), kidney problems (decreased urine output, flank

pain, darkened urine), skin reactions (rash, skin eruptions), bleeding of any kind.

- Report dizziness, chest pain, fainting, palpitations, shortness of breath); may indicate heart arrhythmia.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Avoid grapefruit products, herbal supplements (esp. St. John's wort).

**glatiramer**TOP  
100

gla-tir-a-mer  
(Copaxone, Glatopa, Glatec )  
**Do not confuse Copaxone with Compazine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Immunosuppressive. **CLINICAL:** Neurologic agent for multiple sclerosis.

**USES**

Treatment of relapsing, remitting multiple sclerosis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to glatiramer, mannitol. **Cautions:** Pts exhibiting immediate postinjection reaction (flushing, chest pain, palpitations, anxiety, dyspnea, urticaria); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of chronic opportunistic infections (esp. fungal/viral infections, tuberculosis).

**ACTION**

Induces/activates T-lymphocyte suppressor cells specific to myelin antigens. May also interfere with the antigen-presenting function of immune cells. **Therapeutic**

**Effect:** Slows progression of multiple sclerosis.

## PHARMACOKINETICS

Substantial fraction of glatiramer is hydrolyzed locally. Some fraction of injected material enters lymphatic circulation, reaching regional lymph nodes; some may enter systemic circulation intact.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children/Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase toxic/adverse effects of **live vaccines**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** (*Copaxone, Glatopa*): 20 mg/mL in prefilled syringes, 40 mg/mL in prefilled syringes.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • If refrigerated, allow solution to warm to room temperature (approx. 20 min) with needle cap intact.

• Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, hip, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from intense light. • Do not freeze or expose to heating sources. • May store at room temperature for 30 days.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis

**Note:** Dose forms 20 mg/mL and 40 mg/mL are not interchangeable.

**SQ: ADULTS, ELDERLY:** 20 mg once daily or 40 mg 3 times/wk at least 48 hrs apart.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Expected (73%–40%):** Pain, erythema, inflammation, pruritus at injection site, asthenia. **Frequent (27%–18%):** Arthralgia, vasodilation, anxiety, hypertonia, nausea, transient chest pain, dyspnea, flu-like symptoms, rash, pruritus. **Occasional (17%–10%):** Palpitations, back pain, diaphoresis, rhinitis, diarrhea, urinary urgency. **Rare (less than 9%):** Anorexia, fever, neck pain, peripheral edema, ear pain, facial edema, vertigo, vomiting.

## ADVERSE EFFECTS/TOXIC REACTIONS

Immediate postinjection reactions including anxiety, chest pain, dyspnea, flushing, palpitations, tachycardia, throat constriction may occur. Transient chest pain (not associated with immediate postinjection reactions) have occurred. Localized lipoatrophy, skin necrosis reported in 2% of pts. Severe hepatic injury, hepatic failure may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Screen for active infection.

### INTERVENTION/EVALUATION

Monitor LFT as clinically indicated. Monitor for immediate postreaction symptoms; injection site reactions, necrosis. Conduct neurologic assessment. Assess for symptomatic improvement of MS.

**PATIENT/FAMILY TEACHING**

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report travel plans to possible endemic areas.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- Immediate injections reactions such as anxiety, chest pain, difficulty breathing, fast heart rate, flushing, palpitations, throat constriction may occur.

## glecaprevir/ pibrentasvir

glec-a-pre-vir/pi-brent-as-vir  
(Mavyret)

**BLACK BOX ALERT** ■ Test all pts for hepatitis B virus (HBV) infection before initiation. HBV reactivation was reported in HCV/HBV co-infected pts who were undergoing or had completed treatment with HCV direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

**Do not confuse glecaprevir with boceprevir, grazoprevir, fosamprenavir, paritaprevir, simeprevir, telaprevir, or voxilaprevir, or pibrentasvir with dactatasvir, ledipasvir, ombitasvir, or velpatasvir.**

### FIXED-COMBINATION(S)

**Mavyret:** glecaprevir/pibrentasvir: 100 mg/40 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NS3/4A protease inhibitor, NS5A protein inhibitor. **CLINICAL:** Antihepaticviral.

## USES

Treatment of adults and pediatric pts 12 yrs and older or weighing 45 kg or more with chronic hepatitis C virus (HCV) infection without cirrhosis or with compensated cirrhosis who have genotype 1, 2, 3, 4, 5, or 6 infection. Treatment of adults and pediatric pts 12 yrs and older or weighing 45 kg or more with HCV genotype 1 infection who have previously been treated with an HCV regimen containing an NS5A inhibitor or an NS5A protease inhibitor, but not both.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to glecaprevir, pibrentasvir. Concomitant use with atazanavir, rifampin. Severe hepatic impairment. **Cautions:** HIV infection, hepatic disease unrelated to HCV infection, HBV infection. Concomitant use of P-gp substrates or inhibitors, BCRP substrates, CYP3A4 inducers. Not recommended in pts with moderate hepatic impairment.

## ACTION

Glecaprevir inhibits NS3/4A protease, necessary for proteolytic cleavage of HCV-encoded polyprotein. Pibrentasvir inhibits the HCV NS5A protein, essential for viral replication. **Therapeutic Effect:** Inhibits viral replication of HCV.

## PHARMACOKINETICS

Widely distributed. Glecaprevir metabolized in liver. Pibrentasvir metabolism not specified. Protein binding: (glecaprevir): 98%; (pibrentasvir): greater than 99%. Peak plasma concentration: 5 hrs. Glecaprevir excreted in feces (92%), urine (1%). Pibrentasvir primarily excreted in feces (97%). **Half-life:** (glecaprevir): 6 hrs; (pibrentasvir): 13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Atazanavir, cycloSPORINE, darunavir may increase concentration of glecaprevir/pibrentasvir. Glecaprevir/pibrentasvir may increase concentration of afatinib, atorvastatin, digoxin, lovastatin, simvastatin, topotecan, venetoclax, voxilaprevir. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Ethinyl estradiol-containing hormonal contraceptives may increase risk of hepatotoxicity. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin.

## AVAILABILITY (Rx)

**Fixed-Dose Combination Tablets:** glecaprevir/pibrentasvir: 100 mg/40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- If dose is missed, administer as soon as possible if no more than 18 hrs have passed since the last dose. If more than 18 hrs have passed, skip the missed dose and administer the next dose at regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

### Hepatitis C Virus Infection

**PO: ADULTS, ELDERLY:** 3 tablets once daily (total dose: glecaprevir 300 mg and pibrentasvir 120 mg).

### Treatment Regimen and Duration

**Treatment-Naïve HCV Genotype 1, 2, 3, 4, 5, or 6**

**Without cirrhosis:** glecaprevir/pibrentasvir for 8 wks. **With compensated cirrhosis:** glecaprevir/pibrentasvir for 8 wks.

### Treatment-Experienced Genotype 1

**Prior treatment with NS5A inhibitor (without NS3/4A protease inhibitor) without cirrhosis or with compensated cirrhosis:** glecaprevir/pibrentasvir for 16 wks. **Prior treatment with NS3/4A protease inhibitor (without NS5A inhibitor) without cirrhosis or with compensated cirrhosis:** glecaprevir/pibrentasvir for 12 wks. **Prior treatment with peginterferon, ribavirin, sofosbuvir without cirrhosis:** glecaprevir/pibrentasvir for 8 wks. **Prior treatment with peginterferon, ribavirin, sofosbuvir with compensated cirrhosis:** glecaprevir/pibrentasvir for 12 wks.

### Treatment-Experienced Genotype 2, 4, 5, or 6

**Prior treatment with peginterferon, ribavirin, sofosbuvir without cirrhosis:** glecaprevir/pibrentasvir for 8 wks. **Prior treatment with peginterferon, ribavirin, sofosbuvir with compensated cirrhosis:** glecaprevir/pibrentasvir for 12 wks.

### Treatment-Experienced Genotype 3

**Prior treatment with peginterferon, ribavirin, sofosbuvir without cirrhosis or with compensated cirrhosis:** glecaprevir/pibrentasvir for 16 wks.

### Liver/Kidney Transplant Recipients

Recommend glecaprevir/pibrentasvir for 12 wks. A treatment duration of 16 wks is recommended in pts with HCV genotype 1 who are treatment-experienced (prior treatment with NS5A inhibitor [without NS3/4A protease inhibitor]) or in pts with HCV genotype 3 who are treatment-experienced (prior treatment with peginterferon, ribavirin, sofosbuvir).

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Not recommended. **Severe impairment:** Contraindicated.

**SIDE EFFECTS**

**Frequent (16%–11%):** Headache, fatigue.

**Occasional (9%–7%):** Nausea, diarrhea, pruritus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

HBV reactivation was reported in pts co-infected with HBV/HVC. HBV reactivation may result in fulminant hepatitis, hepatic failure, death.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT, HCV-RNA level. Confirm hepatitis C virus genotype. Test all pts for hepatitis B virus infection. Initiate anti-HBV therapy if warranted. Question history of hepatic disease unrelated to HCV infection, HIV infection; liver/kidney transplantation; concomitant use of other antiretroviral therapy. Receive full medication history and screen for interactions (esp. atazanavir, rifampin).

**INTERVENTION/EVALUATION**

Periodically monitor HCV-RNA level for treatment effectiveness (or upon completion of treatment). Closely monitor for exacerbation of hepatitis or HBV reactivation. Monitor for rhabdomyolysis (muscle weakness, myalgia, myopathy, decreased urinary output) in pts taking HMG-CoA reductase inhibitors.

**PATIENT/FAMILY TEACHING**

- Take with food.
- There is a high risk of drug interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment. Do not take herbal products.
- Pts taking statins (lipid medication) may have an increased risk of rhabdomyolysis, a breakdown of muscle tissue that can cause kidney failure. Report flank pain, muscle pain, darkened urine, decreased urinary output.
- Ethinyl estradiol-containing hormonal contraceptives may increase risk of liver injury and are not recommended.

**glimepiride****HIGH ALERT**

glye-mep-ir-ide  
(Amaryl)

**Do not confuse Amaryl with Altace, Amerge, or Reminyl, or Avandaryl with Benadryl, or glimepiride with glipiZIDE or glyBURIDE.**

**FIXED-COMBINATION(S)**

**Avandaryl:** glimepiride/rosiglitazone (an antidiabetic): 1 mg/4 mg, 2 mg/4 mg, 4 mg/4 mg.

**Duetact:** glimepiride/pioglitazone (an antidiabetic): 2 mg/30 mg, 4 mg/30 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sulfonyl-urea. **CLINICAL:** Antidiabetic agent.

**USES**

Adjunct to diet, exercise in the management of type 2 diabetes mellitus.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to glimepiride, sulfonamides. Diabetic keto-acidosis (with or without coma). **Cautions:** Renal/hepatic impairment, glucose-altering conditions (fever, trauma, infection), G6PD deficiency, elderly, malnourished. Allergy to sulfa.

**ACTION**

Stimulates release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	N/A	2–3 hrs	24 hrs

Widely distributed. Protein binding: greater than 99%. Metabolized in liver. Excreted in urine (60%), feces (40%).

**Half-life:** 5–9.2 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

**INTERACTIONS**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may increase hypoglycemic effect, mask signs of hypoglycemia. **Cimetidine, ciprofloxacin, large doses of salicylates** may increase effect. **RifAMPin** may decrease concentration/effect. **Thiazolidinediones** (e.g., pioglitazone), **glucagon-like peptide-1 agonists** (e.g., liraglutide) may increase hypoglycemic effect. **HERBAL:** Herbs with hypoglycemic properties (e.g., fenugreek) may increase risk of hypoglycemia. **FOOD:** Alcohol may cause rare disulfiram reaction. **LAB VALUES:** May increase LDH concentrations, serum alkaline phosphatase, ALT, AST, bilirubin, C-peptide.

**AVAILABILITY (Rx)**

**Tablets:** 1 mg, 2 mg, 4 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with breakfast or first main meal.

**INDICATIONS/ROUTES/DOSAGE****Diabetes Mellitus**

**PO: ADULTS:** Initially, 1–2 mg once daily with breakfast or first main meal. May increase by 1–2 mg q1–2wks, based on serum glucose response. **Maximum:** 8 mg/day. **ELDERLY:** Avoid use.

**Dosage in Renal Impairment**

Initially, 1 mg/day, then titrate dose based on fasting serum glucose levels.

**Dosage in Hepatic Impairment**

No dose adjustment (not studied).

**SIDE EFFECTS**

**Rare (less than 3%):** Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, stomach fullness, headache, photosensitivity, peeling of skin, pruritus, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose or insufficient food intake may produce hypoglycemia (esp. with increased glucose demands). GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or serum glucose testing technique.

**INTERVENTION/EVALUATION**

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, trauma, surgical procedure).

**PATIENT/ FAMILY TEACHING**

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone defi-

ciencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose).

## glipiZIDE

HIGH  
ALERT

### glip-i-zide

(Glucotrol, Glucotrol XL)

**Do not confuse glipiZIDE with glimepiride or glyBURIDE, or Glucotrol with Glucophage or Glucotrol XL.**

### FIXED-COMBINATION(S)

GlipiZIDE/metFORMIN (an antidiabetic): 2.5 mg/250 mg, 2.5 mg/500 mg, 5 mg/500 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sulfonyl-urea. **CLINICAL:** Antidiabetic agent.

### USES

Adjunct to diet, exercise in management of type 2 diabetes mellitus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to glipiZIDE, sulfonamides. Diabetic ketoacidosis with or without coma, type 1 diabetes mellitus. **Cautions:** Elderly, malnourished, concomitant use of beta blockers, pts with G6PD deficiency, hepatic/renal impairment. Avoid use of extended-release tablets in pts with stricture/narrowing of GI tract.

### ACTION

Stimulates release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15–30 min	2–3 hrs	12–24 hrs
Extended-release	2–3 hrs	6–12 hrs	24 hrs

Widely distributed. Protein binding: 92%–99%. Metabolized in liver. Excreted in urine. **Half-life:** 2–4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Agents other than glipizide are recommended to treat diabetes in pregnant women. GlipiZIDE given within 1 mo of delivery may produce neonatal hypoglycemia. Drug crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

### INTERACTIONS

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may increase hypoglycemic effect, mask signs of hypoglycemia. **Thiazolidinediones** (e.g., pioglitazone), **glucagon-like peptide-1 agonists** (e.g., liraglutide) may increase hypoglycemic effect. **HERBAL:** Herbals with hypoglycemic properties (e.g., fenugreek) may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, LDH, ALT, AST, bilirubin, C-peptide.

### AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg. **Tablets: (Extended-Release):** 2.5 mg, 5 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give immediate-release tablets 30 min before meals. Give extended-release tablets with breakfast.
- Do not crush, cut, dissolve, or divide extended-release tablets.

### INDICATIONS/ROUTES/DOSAGE

#### Diabetes Mellitus

**PO: ADULTS: (Immediate-Release):** Initially, 2.5 mg/day. Adjust dosage in 2.5- to 5-mg increments at intervals of 1–2 wks. **Maximum effective dose:** 20 mg/day. **(Extended-Release):** Initially, 2.5–5 mg/day. May increase dose no more frequently than q7days. **Maximum dose:** 20 mg/day. **ELDERLY: (Immediate-Release):** Ini-

tially, 2.5 mg/day. May increase by 2.5–5 mg/day q1–2wks. Maintenance dose should be conservative to avoid hypoglycemia. (**Extended-Release**): Initially, 2.5 mg/day. Maintenance dose should be conservative to avoid hypoglycemia.

#### Dosage in Renal Impairment

For creatinine clearance of 50 mL/min or less, reduce dose by 50%.

#### Dosage in Hepatic Impairment

(**Immediate-Release**): Initial dose: 2.5 mg/day.

### SIDE EFFECTS

**Rare (less than 3%):** Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, headache, photosensitivity, peeling of skin, pruritus, rash.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose or insufficient food intake may produce hypoglycemia (esp. with increased glucose demands). GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or serum glucose testing technique.

#### INTERVENTION/EVALUATION

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever,

increased activity or stress, trauma, surgical procedure).

#### PATIENT/ FAMILY TEACHING

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose)

## glyBURIDE

TOP 100 HIGH ALERT

glye-bue-ride  
(Euglucon , Glynase)

**Do not confuse glyBURIDE with glimepiride, gliPIZIDE, or Glucotrol.**

### FIXED-COMBINATION(S)

**Glucovance:** glyBURIDE/metFORMIN (an antidiabetic): 1.25 mg/250 mg, 2.5 mg/500 mg, 5 mg/500 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sulfonyl-urea. **CLINICAL:** Antidiabetic agent.

### USES

Adjunct to diet, exercise in management of stable, mild to moderately severe type 2 diabetes mellitus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to glyBURIDE. Diabetic ketoacidosis with or without coma, type 1 diabetes mellitus, concurrent use with bosentan.

**Cautions:** Stress, elderly, debilitated pts, malnourished, severe hepatic/renal impairment, G6PD deficiency, adrenal and/or pituitary insufficiency.

**ACTION**

Stimulates release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose level.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	0.25–1 hr	1–2 hrs	12–24 hrs

Widely distributed. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5–16 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May produce neonatal hypoglycemia if given within 2 wks of delivery. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

**INTERACTIONS**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may increase hypoglycemic effect, mask signs of hypoglycemia. **Thiazolidinediones** (e.g., pioglitazone), **glucagon-like peptide-1 agonists** (e.g., liraglutide) may increase hypoglycemic effect. **HERBAL:** **Herbals with hypoglycemic properties** (e.g., fenugreek) may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, LDH, ALT, AST, bilirubin, C-peptide.

**AVAILABILITY (Rx)**

**Tablets:** 1.25 mg, 2.5 mg, 5 mg. **Tablets, Micronized:** 1.5 mg, 3 mg, 6 mg.

**ADMINISTRATION/HANDLING****PO**

- May give with food at same time each day.

**INDICATIONS/ROUTES/DOSAGE****Diabetes Mellitus**

**PO: (Tablets): ADULTS:** Initially, 1.25–5 mg. May increase by 2.5 mg/day at wkly intervals. **Maintenance:** 1.25–20 mg/day as single or divided doses. **Maximum:** 20 mg/day. **ELDERLY:** Avoid use.

**PO: (Tablets, Micronized): ADULTS:** Initially 0.75–3 mg/day. May increase by 1.5 mg/day at wkly intervals. **Maintenance:** 0.75–12 mg/day as a single dose or in divided doses. **Maximum:** 12 mg/day. **ELDERLY:** Avoid use.

**Dosage in Renal Impairment**

Not recommended for pts with creatinine clearance less than 60 mL/min.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Rare (less than 3%):** Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, headache, photosensitivity, peeling of skin, pruritus, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose or insufficient food intake may produce hypoglycemia (esp. in pts with increased glucose demands). Cholestatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or glucose testing technique.

**INTERVENTION/EVALUATION**

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness,

hunger, diplopia); hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, trauma, surgical procedure).

#### PATIENT/ FAMILY TEACHING

• Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake. • When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose).

## golimumab

goe-**lim**-ue-mab

(Simponi, Simponi Aria)

■ **BLACK BOX ALERT** ■ Tuberculosis (TB), invasive fungal infections, other opportunistic infections reported. Discontinue treatment if active infection or sepsis occurs. Test for TB prior to and during treatment, regardless of initial result; if positive, start treatment for TB prior to initiating therapy. Lymphoma, other malignancies reported in pts treated with tumor necrosis factor blockers.

**Do not confuse Simponi (SQ) with Simponi Aria (IV)**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Monoclonal antibody. Tumor necrosis factor (TNF) blocking agent. **CLINICAL:** Antipsoriatic agent, antirheumatic, disease-modifying agent.

#### USES

**Simponi, Simponi Aria:** Used alone or in combination with methotrexate for the treatment of adults and children 2 yrs of age and older with active psoriatic arthritis. Used in

combination with methotrexate for the treatment of adult pts with moderately to severely active rheumatoid arthritis. Used alone or in combination with methotrexate for the treatment of adult pts with active ankylosing spondylitis. Treatment of active polyarticular juvenile idiopathic arthritis in children 2 yrs of age and older. **Simponi: (Additional)** Treatment of moderate to severe active ulcerative colitis in pts with corticosteroid dependence or who are refractory/intolerant to aminosalicylates, oral steroids, azathioprine, or 6-mercaptopurine.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to golimumab. **Cautions:** Elderly, concomitant immunosuppressants, comorbid conditions predisposing to infections (e.g., diabetes). Residence or travel from areas of endemic mycosis; tuberculosis, underlying hematologic disorders, pre-existing or recent-onset demyelinating disorders (e.g., multiple sclerosis, polyneuropathy), pts with HF or decreased left ventricular function. Avoid concomitant use with live vaccines, abatacept, or anakinra (increased incidence of serious infections). Do not start during an active infection.

#### ACTION

Binds specifically to tumor necrosis factor (TNF) alpha, blocking its interaction with cell surface TNF receptors. **Therapeutic Effect:** Alters biologic activity of TNF alpha, reduces inflammation, may alter pathophysiology of rheumatoid arthritis.

#### PHARMACOKINETICS

Steady state reached by wk 12. Elimination pathway not specified. **Half-life:** 12–14 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of serious infections, malignancy.

## INTERACTIONS

**DRUG:** Anakinra, anti-TNF agents, pimecrolimus, tacrolimus (topical), tocilizumab may increase adverse effects. May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase levels, adverse effects of belimumab, natalizumab, vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase ALT, AST. May decrease Hgb, leukocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection Solution: (Simponi):** 50 mg/0.5 mL, 100 mg/mL in single-dose prefilled autoinjector or prefilled syringe. **Injection Solution: (Simponi Aria):** 50 mg/4 mL per single-use vial (12.5 mg/mL).

## ADMINISTRATION/HANDLING

### Simponi SQ

- Remove prefilled syringe or autoinjector from refrigerator. Allow to sit at room temperature for 30 min; do not warm in any other way.
- Avoid areas where skin is scarred, tender, bruised, red, scaly, hard. Recommended injection site is front of middle thighs, although lower abdomen 2 inches below navel or outer, upper arms are acceptable.
- Inject within 5 min after cap has been removed.

### Autoinjector

- Push open end of autoinjector firmly against skin at 90-degree angle.
- Do not pull autoinjector away from skin until a first “click” sound is heard and then a second “click” sound (injection is finished and needle is pulled back). This usually takes 3 to 6 sec but may take up to 15 sec for the second “click” to be heard. If autoinjector is pulled away from skin before injection is completed, full dose may not be administered.

### Prefilled Syringe

- Gently pinch skin and hold firmly. Use a quick, dart-like motion to insert needle into pinched skin at a 45-degree angle.
- Storage** • Refrigerate; do not freeze. Do not shake.
- Solution appears slightly

opalescent, colorless to light yellow. Discard if cloudy or contains particulate.

### Simponi Aria

**ALERT** Use in-line 0.22-micron filter.

**Reconstitution** • Calculate dosage and number of vials needed based on pt weight.

- Visually inspect for particulate matter.
- Dilute in 100 mL 0.9% NaCl.
- Prior to mixing, withdraw and discard volume of 0.9% NaCl equal to the volume of patient-dosed solution.
- Slowly inject solution into bag and gently mix.
- Do not shake.

**Rate of administration** • Infuse over 30 min using an in-line low protein-binding 0.22-micron filter.

**Storage** • Refrigerate vials, prefilled syringes

- Vial solution should be colorless to light yellow and opalescent.
- It is normal for solution to develop fine translucent particles since drug is a protein.
- Do not use if opaque particles, discoloration, or other foreign particles are present.
- May store diluted solution at room temperature up to 4 hrs.

## IV INCOMPATIBILITIES

Do not infuse concomitantly with other drugs.

## INDICATIONS/ROUTES/DOSAGE

### Active Psoriatic Arthritis

**Note:** Use alone or in combination with methotrexate or other nonbiologic DMARD.

**SQ: (Simponi): ADULTS, ELDERLY:** 50 mg once monthly.

**IV infusion: (Simponi Aria): ADULTS, ELDERLY:** 2 mg/kg at wk 0, 4 then q8wks thereafter. **CHILDREN 2 YRS OF AGE OR OLDER, ADOLESCENTS:** 80 mg/m<sup>2</sup>/dose at wks 0, 4, then q8wks thereafter.

### Moderate to Severe Active Rheumatoid Arthritis (With Methotrexate)

**SQ: (Simponi): ADULTS, ELDERLY:** 50 mg once monthly.

**IV infusion: (Simponi Aria): ADULTS, ELDERLY:** 2 mg/kg at wk 0 and wk 4. Then decrease frequency to q8wks.

**Active Ankylosing Spondylitis**

**Note:** Use alone or in combination with methotrexate or other nonbiologic DMARD.

**SQ:** (*Simponi*): **ADULTS, ELDERLY:** 50 mg once monthly.

**IV infusion:** (*Simponi Aria*): **ADULTS, ELDERLY:** 2 mg/kg at wk 0, 4 then q8wks thereafter.

**Ulcerative Colitis**

**SQ:** (*Simponi*): **ADULTS, ELDERLY:** Initially, 200 mg, then 100 mg 2 wks later, and then 100 mg q4wks thereafter.

**Polyarticular Juvenile Idiopathic Arthritis**

**IV:** (*Simponi Aria*): **CHILDREN 2 YRS OF AGE OR OLDER, ADOLESCENTS:** 80 mg/m<sup>2</sup>/dose at wks 0, 4, then q8wks thereafter.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (13%):** Laryngitis, nasopharyngitis, pharyngitis, rhinitis, upper respiratory tract infection. **Occasional (3%–2%):** Bronchitis, hypertension, rash, pyrexia. **Rare (less than 1%):** Dizziness, paresthesia, constipation.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Neutropenia, lymphopenia may increase risk of infection. New-onset psoriasis, exacerbation of preexisting psoriasis have been reported. Serious infections including sepsis, pneumonia, cellulitis, TB, invasive fungal infections reported. May increase risk of lymphoma, melanoma, new malignancies. New onset or exacerbation of CNS demyelinating disorders, including multiple sclerosis, or worsening of HF have occurred. Viral reactivation of herpes zoster, HIV, hepatitis B virus infection may occur. Pts who receive TNF blockers have risk of autoantibody formation (immunogenicity). Hypersensitivity reactions including anaphylaxis reported. May induce lupus-like symptoms (butterfly rash, new joint pain, peripheral edema, UV sensitivity).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Do not initiate therapy if active infection suspected. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing for latent TB. Antifungal therapy should be considered for those who reside or travel to regions where mycoses are endemic. Question history of anemia, HF, CNS disorders, hepatic impairment, HIV, malignancies. Assess skin for moles, lesions. Receive full medication history including herbal products.

**INTERVENTION/EVALUATION**

Monitor CBC, LFT every 4–8 wks, then periodically. Screen pts for TB (night sweats, hemoptysis, weight loss, fever) regardless of baseline tuberculin skin test result. Monitor hepatitis B virus carriers during treatment and several mos after treatment. If any viral reactivation occurs, interrupt treatment and consider antiviral therapy. Discontinue treatment if acute infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Routinely assess skin for new lesions. Peripheral edema, difficulty breathing, coarse crackles on lung auscultation, elevated BNP may indicate worsening HF. Monitor for hypersensitivity reactions.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Report history of HIV, fungal infections, HF, hepatitis B, multiple sclerosis, TB, or close relatives who have active TB. Report travel plans to possible endemic areas. Blood levels, TB screening will be routinely monitored.
- Hives, swelling of face, difficulty breathing may indicate allergic reaction.
- Do not breast-

feed. • Abdominal pain, yellowing of skin or eyes, dark-amber urine, clay-colored stools, fatigue, loss of appetite may indicate liver problems. • Decreased platelet count may increase risk of bleeding. • Swelling of hands or feet, difficulty breathing may indicate HF.

## goserelin

HIGH ALERT

goe-se-rel-in

(Zoladex, Zoladex LA )

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Gonadotropin-releasing hormone analogue.

**CLINICAL:** Antineoplastic.

### USES

Treatment of locally confined prostate cancer. Palliative treatment of advanced carcinoma of prostate as alternative when orchiectomy, estrogen therapy is either not indicated or unacceptable. In combination with an antiestrogen before and during radiation therapy for early stages of prostate cancer. Management of endometriosis. Treatment of advanced breast cancer in premenopausal and perimenopausal women. Endometrial thinning before ablation for dysfunctional uterine bleeding.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to goserelin, GnRH, GnRH agonist analogues. Pregnancy (except when used for palliative treatment of advanced breast cancer).

**Cautions:** Women of childbearing potential until pregnancy has been excluded. Pts at risk for decreased bone density; diabetes.

### ACTION

Initially, stimulates release of luteinizing hormone (LH) and follicle-stimulating hormone (FSH) from anterior pituitary. Chronic administration causes a sustained suppression of pituitary gonadotropins. **Therapeutic Effect:** In females, reduces

ovarian, uterine, mammary gland size; regresses hormone-responsive tumors. In males, decreases testosterone level, reduces growth of abnormal prostate tissue.

### PHARMACOKINETICS

Protein binding: 27%. Metabolized in liver. Excreted in urine. **Half-life:** 4.2 hrs (male); 2.3 hrs (female).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Medications prolonging the QT interval (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum prostatic acid phosphatase, testosterone, calcium; Hgb A1c.

### AVAILABILITY (Rx)

**Injection, Implant:** (Zoladex): 3.6 mg, 10.8 mg.

### ADMINISTRATION/HANDLING

#### SQ Implant

• Administer implant by inserting needle at 30- to 45-degree angle into anterior abdominal wall below the navel line. Do not attempt to eliminate air bubbles or aspirate prior to injection. Do not penetrate into muscle or peritoneum.

### INDICATIONS/ROUTES/DOSAGE

#### Prostatic Carcinoma (Advanced)

**SQ: ADULTS OLDER THAN 18 YRS, ELDERLY:** 3.6 mg every 28 days or 10.8 mg q12wks subcutaneously into upper abdominal wall.

#### Prostate Carcinoma (Locally Confined)

**SQ: ADULTS, ELDERLY:** (in combination with an antiestrogen and radiotherapy, be-

gin 8 wks prior to radiotherapy): 3.6 mg once. 28 days after initial dose, give 3.6 mg q28days for 4 doses or 10.8 mg one time.

#### Breast Carcinoma (Advanced)

**SQ: ADULTS:** 3.6 mg every 28 days (6 mos for endometriosis). Subcutaneously into upper abdominal wall.

#### Endometrial Thinning

**SQ: ADULTS:** 3.6 mg subcutaneously into upper abdominal wall as a single dose or in 2 doses 4 wks apart.

#### Endometriosis

**SQ: ADULTS:** 3.6 mg every 28 days for 6 mos.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (60%–13%):** Headache, hot flashes, depression, diaphoresis, sexual dysfunction, impotence, lower urinary tract symptoms. **Occasional (10%–5%):** Pain, lethargy, dizziness, insomnia, anorexia, nausea, rash, upper respiratory tract infection, hirsutism, abdominal pain. **Rare:** Pruritus.

### ADVERSE EFFECTS/TOXIC REACTIONS

Arrhythmias, HE, hypertension occur rarely. Ureteral obstruction, spinal cord compression have been observed (immediate orchiectomy may be necessary). Hypersensitivity reactions, including anaphylaxis, may occur. Hyperglycemia, new-onset diabetes occurred in men taking GnRH antagonists. Increased risk of MI, sudden cardiac death was reported. Injection site injuries including hematoma, hemorrhage, hemorrhagic shock may require blood transfusion or surgical intervention.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question history of diabetes, cardiovascular disease, recent MI, prior hypersensitivity reaction. Receive full medication his-

tory; screen for QT interval–prolonging medications, anticoagulant medications. Screen for conditions predisposing to QT interval prolongation. In males, question history of urethral obstruction, urinary retention, spinal cord compression, spinal stenosis. Obtain urine pregnancy. If applicable, obtain bone density test.

#### INTERVENTION/EVALUATION

Monitor pt closely for worsening signs/symptoms of prostatic cancer, esp. during first mo of therapy.

#### PATIENT/FAMILY TEACHING

- Use nonhormonal methods of contraception during therapy.
- Report suspected pregnancy or if regular menstruation does not cease.
- Breakthrough menstrual bleeding may occur if dose is missed.
- Immediately report sudden weakness, paralysis, numbness, tingling; difficulty urinating, bladder distention.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Severe bleeding may occur at the injection site, esp. in pts who take blood-thinning medication.
- Pts with heart disease are at an increased risk of heart attack or sudden death.

## granisetron

gra-nis-e-tron  
(Sancuso, Sustol)

**Do not confuse granisetron with alosetron, cilansetron, dolasetron, ondansetron, or palonosetron.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin receptor antagonist (5-HT<sub>3</sub>). **CLINICAL:** Antiemetic.

#### USES

Prevention of nausea/vomiting associated with emetogenic cancer therapy and cancer radiation therapy. **OFF-LABEL:**

Prevention, treatment of postop nausea, vomiting. Breakthrough treatment of chemotherapy-associated nausea/vomiting.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to granisetron. Hypersensitivity to other 5-HT<sub>3</sub> receptor antagonists. **Cautions:** Congenital QT prolongation, concomitant administration of medications that prolong QT interval, electrolyte abnormalities, cumulative high-dose anthracycline therapy. Following abdominal surgery or in chemotherapy-induced nausea, vomiting (may mask progressive ileus or gastric distention), hepatic disease.

## ACTION

Selectively blocks serotonin stimulation at receptor sites centrally in chemoreceptor trigger zone, peripherally on vagal nerve terminals. **Therapeutic Effect:** Prevents nausea/vomiting.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1–3 min	N/A	24 hrs

Rapidly, widely distributed to tissues. Protein binding: 65%. Metabolized in liver. Excreted in urine (48%), feces (38%). **Half-life:** 10–12 hrs (increased in elderly).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **SSRIs** (e.g., escitalopram, PARoxetine, sertraline), **SNRIs** (e.g., DULoxetine, venlafaxine) may increase risk of serotonin syndrome. **HERBAL:** None

significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

## AVAILABILITY (Rx)

**Injection: (Extended-Release [Sustol]):** 10 mg/0.4 mL single-dose syringe. **Injection Solution:** 1 mg/mL. **Tablets:** 1 mg. **Transdermal Patch: (Sancuso):** 52-cm<sup>2</sup> patch containing 34.3 mg granisetron delivering 3.1 mg/24 hrs.

## ADMINISTRATION/HANDLING

**Reconstitution** • May be given undiluted or dilute with 20–50 mL 0.9% NaCl or D<sub>5</sub>W. Do not mix with other medications.

**Rate of administration** • May give undiluted as IV push over 30 sec. • For IV piggyback, infuse over 5–10 min depending on volume of diluent used.

**Storage** • Appears as a clear, colorless solution. • Store at room temperature. • After dilution, stable for 3 days at room temperature or 7 days if refrigerated. • Inspect for particulates, discoloration.

## PO

• Give 30 min to 1 hr prior to initiating chemotherapy.

## SQ

Administer in skin of back of upper arm, abdomen (at least 1 inch away from umbilicus). Avoid areas of compromised skin. Administer over 20–30 sec.

## Transdermal

• Apply to clean, dry intact skin on upper outer arm. • Remove immediately from pouch before application. • Do not cut patch.

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone).

## IV COMPATIBILITIES

Allopurinol (Aloprim), bumetanide (Bumex), calcium gluconate, CARBOplatin (Paraplatin), CISplatin (Platinol), cyclophosphamide (Cytoxan), cytarabine (Ara-C), dacarbazine (DTIC-Dome), dexameth-

asone (Decadron), dexmedetomidine (Precedex), diphenhydrAMINE (Benadryl), DOCEtaxel (Taxotere), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), magnesium, mitoXANTHONE (Novantrone), PACLitaxel (Taxol), potassium.

## INDICATIONS/ROUTES/DOSAGE

### Prevention of Chemotherapy-Induced Nausea/Vomiting

G

**PO: ADULTS, ELDERLY:** 2 mg up to 1 hr before chemotherapy or 1 mg up to 1 hr before chemotherapy, with a second dose 12 hrs later.

**IV: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER:** 10 mcg/kg/dose (**Maximum:** 1 mg/dose) within 30 min of chemotherapy. **Maximum:** 1 mg.

**SQ: ADULTS, ELDERLY: In combination with dexamethasone:** 10 mg at least 30 min before chemotherapy. Do not repeat more frequently than 7 days.

**Transdermal: ADULTS, ELDERLY:** Apply 24–48 hrs prior to chemotherapy. Remove minimum 24 hrs after completion of chemotherapy. May be worn up to 7 days, depending on chemotherapy duration.

### Prevention of Radiation-Induced Nausea/Vomiting

**PO: ADULTS, ELDERLY: (High-emetogenic-risk radiation therapy):** 2 mg once daily, given 1 hr before each fraction of radiation (in combination with dexamethasone). **Moderate-emetogenic-risk radiation therapy (upper abdomen, craniospinal irradiation):** 2 mg once daily given 1–2 hrs prior to each fraction of radiation. May administer with or without dexamethasone before the first 5 fractions.

### Dosage in Renal/Hepatic Impairment

No dose adjustment. (**Sustol**): **Moderate impairment:** No more frequently than 14 days. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (21%–14%):** Headache, constipation, asthenia. **Occasional (8%–6%):**

Diarrhea, abdominal pain. **Rare (less than 2%):** Altered taste, fever.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reaction, hypertension, hypotension, arrhythmias (sinus bradycardia, atrial fibrillation, AV block, ventricular ectopy), ECG abnormalities occur rarely. Increased risk of serotonin syndrome reported in pts taking concomitant serotonergic drugs (e.g., SSRIs, SNRIs). May prolong QTc interval.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess hydration status. Ensure that granisetron is given within 30 min of starting chemotherapy. Receive full medication history and screen for interactions. Screen for QT interval–prolonging conditions.

### INTERVENTION/EVALUATION

Monitor for therapeutic effect. Assess for headache. Monitor for dehydration due to recurrent vomiting. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Granisetron is effective shortly following administration; prevents nausea/vomiting.
- Transitory taste disorder may occur.

## guselkumab

gue-sel-koo-mab  
(Tremfya)

**Do not confuse guselkumab with golimumab, infliximab, secukinumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-23 inhibitor. Monoclonal antibody. **CLINICAL:** Antipsoriasis agent.

## USES

Treatment of moderate to severe plaque psoriasis in adult pts who are candidates for systemic therapy or phototherapy. Treatment of active psoriatic arthritis in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to guselkumab. **Cautions:** Hepatic impairment, active infection until resolved, history of chronic or recurrent infections, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, open wounds), prior tuberculosis exposure (do not give to pts with active TB infection). Concomitant use of live vaccines not recommended.

## ACTION

Selectively binds to interleukin-23 receptor reducing levels of IL-17A, IL-17E, IL-22. IL-23 is a cytokine that is involved in inflammatory and immune responses. **Therapeutic Effect:** Inhibits release of pro-inflammatory cytokines and chemokines.

## PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic pathways. Peak plasma concentration: 5.5 days. Elimination not specified. **Half-life:** 15–18 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May enhance adverse/toxic effects, diminish therapeutic effects of **natalizumab**, **pimecrolimus**, **vaccines (live)**. May decrease therapeutic effect of **BCG (intravesical)**. **HERBAL:** **Echinacea** may decrease therapeutic effect.

**FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

## AVAILABILITY (Rx)

**Injection, Solution:** 100 mg/mL in pen-injector, prefilled syringe.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow to warm to room temperature (approx. 30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color; may contain small translucent particles. Do not use if solution is cloudy, discolored, or if large particles are observed. • Discard unused portions.

**Administration** • Insert needle subcutaneously into back of upper arms, front of thighs, or into lower abdomen (except for 2 inches around navel), and inject solution. • Do not inject into areas of the skin where it is tender, bruised, red, hard, thick, scaly, or affected by psoriasis. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Do not freeze. • Do not shake. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Plaque Psoriasis

**SQ: ADULTS, ELDERLY:** 100 mg at wk 0, wk 4, and then q8wks thereafter.

### Psoriatic Arthritis

**SQ: ADULTS, ELDERLY:** 100 mg at wks 0 and 4, then q8wks thereafter. May administer alone or in combination with conventional disease-modifying antirheumatic drugs (e.g., methotrexate).

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Occasional (5%–2%):** Headache, tension headache, arthralgia, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of tuberculosis infection. Other infections including upper respiratory tract infection, nasopharyngitis, pharyngitis, viral upper respiratory tract infection (14% of pts), gastroenteritis, viral gastroenteritis (1% of pts), tinea infections (1% of pts), herpes simplex virus (1% of pts) may occur. Mild to moderate elevated serum ALT, AST reported in 3% of pts. Immunogenicity (auto-guselkumab antibodies) occurred in 6% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT in pts with hepatic impairment. Question history of hepatic impairment, herpes zoster infection, parasitic infection. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Conduct dermatologic exam; record characteristics of psoriatic lesions. Assess pt's willingness to self-inject medication.

### INTERVENTION/EVALUATION

Monitor LFT periodically. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Assess skin for improvement of lesions.

### PATIENT/FAMILY TEACHING

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening. Report travel plans to possible endemic areas.
- Report liver problems such as abdominal pain, bruising, clay-colored stool, yellowing of the skin or eyes.

## haloperidol

hal-o-per-i-dol

(Haldol, Haldol Decanoate, Apo-Peridol )

**BLACK BOX ALERT** ■ Increased risk of mortality in elderly pts with dementia-related psychosis with use of injections.

**Do not confuse Haldol with Halcion or Stadol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** First-generation (typical) antipsychotic.

**CLINICAL:** Antipsychotic, antiemetic, antidyskinetic.

### USES

Treatment of schizophrenia, Tourette's disorder (controls tics and vocal utterances), severe behavioral problems in children with combative explosive hyperexcitability without immediate provocation. Management of psychotic disorder, short-term treatment of hyperactive children. **OFF-LABEL:** Treatment of non-schizophrenic psychosis, alcohol dependence, psychosis/agitation related to Alzheimer's dementia, emergency sedation of severely agitated/psychotic pts.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to haloperidol, CNS depression, coma, Parkinson's disease. **Cautions:** Renal/hepatic impairment, cardiovascular disease, history of seizures, prolonged QT syndrome, medications that prolong QT interval, hypothyroidism, thyrotoxicosis, electrolyte imbalance (e.g., hypokalemia, hypomagnesemia), EEG abnormalities, narrow-angle glaucoma, elderly, pts at risk for pneumonia, decreased GI motility, urinary retention, BPH, visual disturbances, myelosuppression. Pts at risk for orthostatic hypotension (e.g., cerebrovascular disease).

### ACTION

Nonselectively blocks postsynaptic Dopamine receptors in brain. **Therapeutic Effect:** Produces tranquilizing effect. Strong extrapyramidal, antiemetic effects; weak anticholinergic, sedative effects.

### PHARMACOKINETICS

Widely distributed. Protein binding: 92%. Metabolized in liver. Excreted in urine. Not removed by hemodialysis. **Half-life:** 20 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** More susceptible to dystonias; not recommended in pts younger than 3 yrs. **Elderly:** More susceptible to orthostatic hypotension, anticholinergic effects, sedation; increased risk for extrapyramidal effects. Decreased dosage recommended.

### INTERACTIONS

**DRUG:** Alcohol, other CNS depressants (e.g., diphenhydramine, gabapentin, lorazepam, morphine) may increase CNS depression. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration. **Medications prolonging QT interval** (e.g., amiodarone, ciprofloxacin, ondansetron) may increase risk of QT prolongation. **Acidinium, ipratropium, tiotropium, umecclidinium** may increase anticholinergic effect. **Metoclopramide** may increase adverse effects. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava, kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant. **Therapeutic serum level:** 0.2–1 mcg/mL; **toxic serum level:** Greater than 1 mcg/mL.

### AVAILABILITY (Rx)

**Injection, Oil: (Decanoate):** 50 mg/mL, 100 mg/mL. **Injection, Solution: (Lactate):** 5 mg/mL. **Oral Concentrate:** 2 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

**ALERT** Only haloperidol lactate is given IV.

**Note:** For IV administration, ECG monitoring for QT prolongation/arrhythmias is recommended.

**Reconstitution** • May give undiluted. • May add to 50–100 mL of D<sub>5</sub>W.

**Rate of administration** • Give IV push at rate of 5 mg/min. • Infuse IV piggyback over 30 min. • For IV infusion, up to 25 mg/hr has been used (titrated to pt response).

**Storage** • Discard if precipitate forms, discoloration occurs. • Store at room temperature; do not freeze. • Protect from light.

## IM

**Parenteral administration** • Pt should remain recumbent for 30–60 min to minimize hypotensive effect. • Prepare Decanoate IM injection using 21-gauge needle. • Do not exceed maximum volume of 3 mL per IM injection site. • Inject slow, deep IM into upper outer quadrant of gluteus maximus.

## PO

• Give without regard to food. • Scored tablets may be crushed. • Dilute oral concentrate with water or juice. • Avoid skin contact with oral concentrate; may cause contact dermatitis.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), fluconazole (Diflucan), foscarnet (Foscavir), heparin, nitroprusside (Nipride), piperacillin/tazobactam (Zosyn).

## IV COMPATIBILITIES

DOBUtamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), HY-

DROMorphone (Dilaudid), lidocaine, LORazepam (Ativan), midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

## Schizophrenia

**IV: (Lactate): ADULTS, ELDERLY:** Initially, 2–10 mg/day in 1–3 divided doses. Adjust dose based on response and tolerability.

**Maximum:** 30 mg/day. **ADOLESCENTS, CHILDREN, INFANTS:** 0.05–0.15 mg/kg. May repeat. **Maximum Dose:** 5 mg. (*Decanoate*):

**ADULTS, ELDERLY:** Initially, 10–20 times stabilized oral dose. **Maximum Initial**

**Dose:** 100 mg (doses greater than the 100 mg should be given as 2 separate injections 3–7 days apart). **Maintenance:** 10–15 times daily oral dose. **Maximum:** 450 mg q4wks.

**PO: ADULTS, ELDERLY:** Initially, 2–10 mg/day in 1–3 divided doses. Adjust dose based on response and tolerability.

**Maximum:** 30 mg/day. **CHILDREN 3 YRS AND OLDER:** 0.5–15 mg/day in 2–3 divided doses. May increase total daily dose by 0.5 mg q5–7 days. **Maintenance:** 0.05–0.15 mg/kg/day in 2–3 divided doses. **Maximum:** 15 mg/day.

## Tourette's Disorder

**PO: CHILDREN 3–12 YRS, ADOLESCENTS:** Initially, 0.25–0.5 mg/day in 2–3 divided doses. May increase daily dose by 0.25–0.5 mg every 5–7 days to usual maintenance dose of 1–4 mg/day. **Maximum:** 15 mg/day.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Blurred vision, constipation, orthostatic hypotension, dry mouth, swelling or soreness of female breasts, peripheral edema. **Occasional:** Allergic reaction, difficulty urinating, decreased thirst, dizziness, diminished sexual function, drowsiness, nausea, vomiting, photosensitivity, lethargy.

## ADVERSE EFFECTS/TOXIC REACTIONS

Extrapyramidal symptoms (EPS) appear to be dose related and typically occur in first few days of therapy. Marked drowsiness/lethargy, excessive salivation, fixed stare may be mild to severe in intensity. Less frequently noted are severe akathisia (motor restlessness), acute dystonias: torticollis (neck muscle spasm), opisthotonos (rigidity of back muscles), oculogyric crisis (rolling back of eyes). Tardive dyskinesia (tongue protrusion, puffing of cheeks, chewing/puckering of the mouth) may occur during long-term therapy or after drug discontinuance and may be irreversible. Elderly female pts have greater risk of developing this reaction. May increase risk of QT interval prolongation, cardiac arrhythmias.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Assess mental status. Screen for comorbidities as listed in Precautions (esp. seizure disorder, long QT syndrome).

### INTERVENTION/EVALUATION

Monitor B/P, heart rate/rhythm. Monitor ECG, QT interval. Supervise suicidal-risk pts closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor for rigidity, tremor, mask-like facial expression, fine tongue movement. Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). **Therapeutic serum level:** 0.2–1 mcg/mL; **toxic serum level:** greater than 1 mcg/mL.

### PATIENT/FAMILY TEACHING

- Full therapeutic effect may take up to 6 wks.
- Do not abruptly withdraw from long-term drug therapy.
- Sugarless gum, sips of water may relieve dry mouth.
- Drowsiness generally subsides during continued therapy.
- Avoid tasks that

require alertness, motor skills until response to drug is established.

- Avoid alcohol.
- Report muscle stiffness, lip puckering, tongue protrusion, restlessness.
- Avoid overheating, dehydration, exposure to sunlight (increased risk of heatstroke).

## heparin

**HIGH ALERT**

hep-a-rin  
(Hepalean Leo )

**Do not confuse heparin with Hespán.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Blood modifier. **CLINICAL:** Anticoagulant.

### USES

Prophylaxis and treatment of thromboembolic disorders and thromboembolic complications associated with atrial fibrillation; anticoagulant for extracorporeal and dialysis procedures; maintain patency of IV devices. Prevents clotting in arterial and cardiac surgery. **OFF-LABEL:** STEMI, non-STEMI, unstable angina, anticoagulant used during percutaneous coronary intervention.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to heparin. Severe thrombocytopenia, uncontrolled active bleeding (unless secondary to disseminated intravascular coagulation [DIC]), history of heparin-induced thrombocytopenia (HIT), heparin-induced thrombocytopenia with thrombosis (HITT), or pts who test positive for HIT antibody. **Cautions:** Allergy to pork. Pts at risk for bleeding (e.g., congenital/acquired bleeding disorders, active GI ulcerative disease, hemophilia, concomitant platelet inhibitors, severe hypertension, menses, recent lumbar puncture or spinal anesthesia; recent major surgery, trauma). Use of preservative-free heparin recommended in neonates, infants, pregnant or nursing mothers.

**ACTION**

Potentiates action of antithrombin III. Interferes with blood coagulation by blocking conversion of prothrombin to thrombin and fibrinogen to fibrin. **Therapeutic Effect:** Prevents further extension of existing thrombi or new clot formation. No effect on existing clots.

**PHARMACOKINETICS**

Well absorbed following SQ administration. Protein binding: Very high. Metabolized in liver. Removed from circulation via uptake by reticuloendothelial system. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–6 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Use with caution, particularly during last trimester, immediate postpartum period (increased risk of maternal hemorrhage). Does not cross placenta. Not distributed in breast milk. **Children:** No age-related precautions noted. Benzyl alcohol preservative may cause gasping syndrome in infants. **Elderly:** More susceptible to hemorrhage. Age-related renal impairment may increase risk of bleeding.

**INTERACTIONS**

**DRUG:** Anticoagulants (e.g., apixaban, dabigatran, rivaroxaban, warfarin) may increase anticoagulant effect; risk of bleeding. **platelet aggregation inhibitors** (e.g., aspirin), **thrombolytics** (e.g., tissue plasminogen activator [TPA]) may increase risk of bleeding. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May increase free fatty acids, serum ALT, AST; aPTT. May decrease serum cholesterol.

**AVAILABILITY (Rx)**

**Injection Solution:** 10 units/mL, 100 units/mL, 1,000 units/mL, 5,000 units/mL, 5,000 units/0.5 mL. **Premix Solution for**

**Infusion:** 25,000 units/250 mL infusion, 25,000 units/500 mL infusion.

**ADMINISTRATION/HANDLING**

**ALERT** Do not give by IM injection (pain, hematoma, ulceration, erythema).

**ALERT** Used in full-dose therapy. Intermittent IV dosage produces higher incidence of bleeding abnormalities. Continuous IV route preferred.

**Reconstitution** • Premix solution requires no reconstitution.

**Rate of administration** • Infuse and titrate per protocol using infusion pump.

**Storage** • Store at room temperature.

**SQ**

**ALERT** Used in low-dose therapy.

• After withdrawal of heparin from vial, change needle before injection (prevents leakage along needle track). • Inject above iliac crest or in abdominal fat layer. Do not inject within 2 inches of umbilicus or any scar tissue. • Withdraw needle rapidly, apply prolonged pressure at injection site. Do not massage or apply heat/cold to injection site. • Rotate injection sites.

**IV INCOMPATIBILITIES**

Amiodarone (Cordarone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ciprofloxacin (Cipro), dacarbazine (DTIC), diazepam (Valium), DOBUTamine (Dobutrex), DOXORubicin (Adriamycin), filgrastim (Neupogen), gentamicin (Garamycin), haloperidol (Haldol), IDARubicin (Idamycin), labetalol (Trandate), niCARDipine (Cardene), phenytoin (Dilantin), quinIDine, tobramycin (Nebcin), vancomycin (Vancocin).

**IV COMPATIBILITIES**

Ampicillin/sulbactam (Unasyn), aztreonam (Azactam), calcium gluconate, ceFAZolin (Ancef), ceftAZidime (Fortaz), ceftRIAXone (Rocephin), dexmedetomidine (Precedex), digoxin (Lanoxin), diTIAZem (Cardizem), DO-Pamine (Intropin), enalapril (Vasotec), famotidine (Pepcid), fentaNYL (Sublimaze), furosemide (Lasix), HYDROmorphone (Dilaudid), insulin, lidocaine, LORazepam (Ativan), mag-

nesium sulfate, methylPREDNISolone (Solu-Medrol), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), oxytocin (Pitocin), piperacillin/tazobactam (Zosyn), procainamide (Pronestyl), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Line Flushing

**IV: ADULTS, ELDERLY, CHILDREN:** 100 units as needed. **INFANTS WEIGHING LESS THAN 10 KG:** 10 units as needed.

### Atrial Fibrillation

**IV infusion: ADULTS, ELDERLY:** 60–80 units/kg bolus **Maximum:** 5,000 units), then 12–18 units/kg/hr **Maximum:** 1,000 units/hr). Adjust infusion rate to maintain anticoagulation target based on institutional protocol.

### Acute Coronary Syndrome

**IV infusion: ADULTS, ELDERLY:** 60 units/kg bolus (**Maximum:** 4,000 units), then 12 units/kg/hr (**Maximum:** 1,000 units/hr as continuous infusion). Adjust infusion rate to maintain anticoagulation target based on institutional protocol.

### Treatment of DVT/PE

**IV infusion: ADULTS, ELDERLY:** 80 units/kg bolus (**Maximum:** 5,000 units), then 18 units/kg/hr. Adjust infusion rate to maintain anticoagulation target based on institutional protocol.

### Usual Infant/Neonatal Dose

**IV infusion:** 75 units/kg bolus over 10 min, then initial maintenance dose of 28 units/kg/hr. Adjust dose according to aPTT per protocol.

### Usual Adolescent/Children Dose

**IV infusion:** 75 units/kg bolus over 10 min, then initial maintenance dose of 20 units/kg/hr. Adjust infusion rate to maintain anticoagulation target based on institutional protocol.

### Thromboembolic Prophylaxis

**SQ: ADULTS, ELDERLY:** 5,000 units q8–12h.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** Pruritus, burning (particularly on soles of feet) caused by vasospastic reaction. **Rare:** Pain, cyanosis of extremity 6–10 days after initial therapy lasting 4–6 hrs, hypersensitivity reaction (chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, headache).

## ADVERSE EFFECTS/TOXIC REACTIONS

Bleeding complications ranging from local ecchymoses to major hemorrhage (cutaneous/GI/genitourinary/intracranial/nasal/oral/pharyngeal/urethral/vaginal bleeding) occur more frequently in high-dose therapy, intermittent IV infusion, women 60 yrs and older. HIT can cause life-threatening thromboembolism such as CVA, MI, DVT, pulmonary embolism, renal artery thrombosis, mesenteric thrombosis. **Antidote:** Protamine sulfate 1–1.5 mg IV for every 100 units heparin SQ within 30 min of overdose, 0.5–0.75 mg for every 100 units heparin SQ if within 30–60 min of overdose, 0.25–0.375 mg for every 100 units heparin SQ if 2 hrs have elapsed since overdose, 25–50 mg if heparin was given by IV infusion.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, PT/INR, aPTT. Cross-check dose with coworker. Assess for bleeding risk. Question history of recent trauma, head injuries, GI/GU bleeding. Ensure that pt has not received spinal anesthesia, spinal procedures.

### INTERVENTION/EVALUATION

Monitor CBC, PT/INR daily. Obtain aPTT 6 hrs after initiation or any change in dosage (or per clinical standards) until maintenance dose is established, then check aPTT q24hrs (or per clinical standards). In long-term therapy, monitor 1–2 times/mo. Diligently assess for bleeding. If platelet count decreases more than 50% from baseline, obtain stat HIT antibody test. If HIT antibody positive, discontinue heparin and consider treatment with direct throm-

bin inhibitor (e.g., argatroban); avoid all heparin products and place heparin allergy on chart. Monitor urine and stool for occult blood. Assess for decrease in B/P, increase in pulse rate, complaint of abdominal/back pain, severe headache (may be evidence of hemorrhage). Question for increase in amount of discharge during menses. Assess peripheral pulses; skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess gums for erythema, gingival bleeding. Assess urine output for hematuria. Avoid IM injections due to potential for hematomas. When converting to warfarin (Coumadin) therapy, monitor PT/INR results (will be 10%–20% higher while heparin is given concurrently).

#### PATIENT/FAMILY TEACHING

- Use electric razor, soft toothbrush to prevent bleeding.
- Report red or dark urine, black or red stool, coffee-ground vomitus, blood-tinged mucus from cough, signs of stroke, nosebleeds, or increase in menstruation.
- Do not use any OTC medication without physician approval (may interfere with platelet aggregation).
- Wear or carry identification that notes anticoagulant therapy.
- Inform dentist, other physicians of heparin therapy.
- Limit alcohol.

## hydrALAZINE

hye-dral-a-zeen  
(Apresoline )

**Do not confuse hydrALAZINE with hydroXYzine.**

#### FIXED-COMBINATION(S)

**Apresazide:** hydrALAZINE/hydro-CHLORothiazide (a diuretic): 25 mg/25 mg, 50 mg/50 mg, 100 mg/50 mg. **BiDil:** hydrALAZINE/isosorbide (a nitrate): 37.5 mg/20 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vasodilator. **CLINICAL:** Antihypertensive.

## USES

Management of moderate to severe hypertension. **OFF-LABEL:** Hypertension secondary to eclampsia, preeclampsia. Treatment of HF with reduced ejection fraction, postoperative hypertension.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to hydrALAZINE. Coronary artery disease, mitral valvular rheumatic heart disease. **Cautions:** Advanced renal impairment, cerebrovascular accident, suspected coronary artery disease. Pts with mitral valvular disease, positive ANA titer, pulmonary hypertension.

## ACTION

Direct vasodilating effects on arterioles. **Therapeutic Effect:** Decreases B/P, systemic vascular resistance.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	20–30 min	N/A	Up to 8 hrs
IV	5–20 min	N/A	1–4 hrs

Widely distributed. Protein binding: 85%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta. Unknown if distributed in breast milk. Thrombocytopenia, leukopenia, petechial bleeding, hematomas have occurred in newborns (resolved within 1–3 wks). **Children:** No age-related precautions noted. **Elderly:** More sensitive to hypotensive effects. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amlODIPine, cloNIDine, lisinopril, valsartan) may increase hypotensive effect. **HERBAL:** Herbals with hypotensive properties (e.g., licorice,

underlined – top prescribed drug

yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Any foods may increase absorption. **LAB VALUES:** May produce positive direct Coombs' test.

## AVAILABILITY (Rx)

**Injection Solution:** 20 mg/mL. **Tablets:** 10 mg, 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

**Rate of administration** • May give undiluted. • Administer slowly: maximum rate 5 mg/min (0.2 mg/kg/min for children).

**Storage** • Store at room temperature.

### PO

• Best given with food at regularly spaced meals. • Tablets may be crushed.

## IV INCOMPATIBILITIES

Ampicillin (Polycillin), furosemide (Lasix).

## IV COMPATIBILITIES

DOBUtamine (Dobutrex), heparin, hydrocortisone (Solu-Cortef), nitroglycerin, potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 10 mg 4 times/day for first 2–4 days. May increase to 25 mg 4 times/day balance of first wk. May increase by 10–25 mg/dose gradually q2–5 days to 50 mg 4 times/day. Usual range: 100–200 mg/day in 2–3 divided doses. **CHILDREN:** Initially, 0.75 mg/kg/day in 2–4 divided doses. May increase over 3–4 wks. **Maximum:** 7.5 mg/kg/day in 2–4 divided doses. **Maximum daily dose:** 200 mg/day in divided doses.

**IV, IM: ADULTS, ELDERLY:** Initially, 10–20 mg/dose q4–6h. May increase to 40 mg/dose. **CHILDREN:** Initially, 0.1–0.2 mg/kg/dose q4–6h. Usual range: 0.2–0.6 mg/kg/dose q4–6h. as needed. **Maximum dose:** 20 mg.

## Dosage in Renal Impairment

Dosage interval is based on creatinine clearance.

Creatinine Clearance	Dosage
10–50 mL/min	q8h
Less than 10 mL/min	q12–24h

## Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** Headache, anorexia, nausea, vomiting, diarrhea, palpitations, tachycardia, angina pectoris. **Rare:** Constipation, ileus, edema, peripheral neuritis (paresthesia), dizziness, muscle cramps, anxiety, hypersensitivity reactions (rash, urticaria, pruritus, fever, chills, arthralgia), nasal congestion, flushing, conjunctivitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

High dosage may produce lupus erythematosus-like reaction (fever, facial rash, muscle/joint aches, glomerulonephritis, splenomegaly). Severe orthostatic hypotension, skin flushing, severe headache, myocardial ischemia, cardiac arrhythmias may develop. Profound shock may occur with severe overdose.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P, pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations).

### INTERVENTION/EVALUATION

Monitor B/P, pulse. Monitor for headache, palpitations, tachycardia. Assess for peripheral edema of hands, feet.

### PATIENT/FAMILY TEACHING

• To reduce hypotensive effect, go from lying to standing slowly. • Report muscle/joint aches, fever (lupus-like reaction), flu-like symptoms. • Limit alcohol use.

## hydroCHLORothiazide

hye-dro-klar-oh-thy-ah-zide  
(Urozide 🌸)

### FIXED-COMBINATION(S)

**Accuretic:** hydroCHLORothiazide/quinapril (an angiotensin-converting enzyme [ACE] inhibitor): 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg. **Aldactazide:** hydroCHLORothiazide/spironolactone (a potassium-sparing diuretic): 25 mg/25 mg, 50 mg/50 mg. **Atacand HCT:** hydroCHLORothiazide/candesartan (an angiotensin II receptor antagonist): 12.5 mg/16 mg, 12.5 mg/32 mg. **Avalide:** hydroCHLORothiazide/irbesartan (an angiotensin II receptor antagonist): 12.5 mg/150 mg, 12.5 mg/300 mg, 25 mg/300 mg. **Benicar HCT:** hydroCHLORothiazide/olmesartan (an angiotensin II receptor antagonist): 12.5 mg/20 mg, 12.5 mg/40 mg, 25 mg/40 mg. **Generic:** hydroCHLORothiazide/captopril (an ACE inhibitor): 15 mg/25 mg, 15 mg/50 mg, 25 mg/25 mg, 25 mg/50 mg. **Diovan HCT:** hydroCHLORothiazide/valsartan (an angiotensin II receptor antagonist): 12.5 mg/80 mg, 12.5 mg/160 mg. **Dutoprol:** hydroCHLORothiazide/metoprolol (a beta blocker): 12.5 mg/25 mg, 12.5 mg/50 mg, 12.5 mg/100 mg. **Maxide:** hydroCHLORothiazide/triamterene (a potassium-sparing diuretic): 25 mg/37.5 mg, 25 mg/50 mg, 50 mg/75 mg. **Exforge HCT:** hydroCHLORothiazide/amLODIPine (a calcium channel blocker)/valsartan (an angiotensin II receptor blocker): 12.5 mg/5

mg/160 mg, 25 mg/5 mg/160 mg, 12.5 mg/10 mg/160 mg, 25 mg/10 mg/160 mg, 25 mg/10 mg/320 mg. **Hyzaar:** hydroCHLORothiazide/losartan (an angiotensin II receptor antagonist): 12.5 mg/50 mg, 12.5 mg/100 mg, 25 mg/100 mg. **Inderide:** hydroCHLORothiazide/propranolol (a beta blocker): 25 mg/40 mg, 25 mg/80 mg, 50 mg/80 mg, 50 mg/120 mg, 50 mg/160 mg. **Lotensin HCT:** hydroCHLORothiazide/benazepril (an ACE inhibitor): 6.25 mg/5 mg, 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg. **Micardis HCT:** hydroCHLORothiazide/telmisartan (an angiotensin II receptor antagonist): 12.5 mg/40 mg, 12.5 mg/80 mg. **Generic:** hydroCHLORothiazide/aMILoride (a potassium-sparing diuretic): 50 mg/5 mg. **Zestoretic:** hydroCHLORothiazide/lisinopril (an ACE inhibitor): 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg. **Tekturna HCT:** hydroCHLORothiazide/aliskiren (a renin inhibitor): 12.5 mg/150 mg, 25 mg/300 mg. **Teveten HCT:** hydroCHLORothiazide/eprosartan (an angiotensin II receptor antagonist): 12.5 mg/600 mg, 25 mg/600 mg. **Tribenzor:** hydroCHLORothiazide/olmesartan/amLODIPine: 12.5 mg/20 mg/5 mg, 12.5 mg/40 mg/5 mg, 25 mg/40 mg/5 mg, 12.5 mg/40 mg/10 mg, 25 mg/40 mg/10 mg. **Generic:** hydroCHLORothiazide/moexipril (an ACE inhibitor): 12.5 mg/7.5 mg, 25 mg/15 mg. **Vaseretic:** hydroCHLORothiazide/enalapril (an ACE inhibitor): 12.5 mg/5 mg, 25 mg/10 mg. **Ziac:** hydroCHLORothiazide/bisoprolol (a beta blocker): 6.25 mg/5 mg, 6.25 mg/10 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sulfonamide derivative. Thiazide diuretic.  
**CLINICAL:** Antihypertensive.

**USES**

Treatment of mild to moderate hypertension, edema in HF, hepatic cirrhosis, renal dysfunction (e.g., nephrotic syndrome). **OFF-LABEL:** Treatment of calcium nephrolithiasis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to hydroCHLORothiazide. Anuria, history of hypersensitivity to sulfonamides or thiazide diuretics. **Cautions:** Severe renal/hepatic impairment, prediabetes or diabetes, elderly or debilitated, history of gout, moderate to high serum cholesterol, hypercalcemia, hypokalemia.

**ACTION**

Inhibits sodium reabsorption in distal renal tubules, causing excretion of sodium, potassium, hydrogen ions, water. **Therapeutic Effect:** Promotes diuresis; reduces B/P.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO (diuretic)	2 hrs	4–6 hrs	6–12 hrs

Variably absorbed from GI tract. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 5.6–14.8 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Small amount distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted, except jaundiced infants may be at risk for hyperbilirubinemia. **Elderly:** May be more sensitive to hypo-

tensive, electrolyte effects. Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Bile acid sequestrants (e.g., cholestyramine, colestipol), antihypertensives (e.g., amlodipine, clonidine, lisinopril, valsartan) may increase hypotensive effect. May increase risk of lithium toxicity. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. Licorice may increase hypokalemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, triglycerides. May decrease urinary calcium, serum magnesium, potassium, sodium.

**AVAILABILITY (Rx)**

**Capsules:** 12.5 mg. **Tablets:** 12.5 mg, 25 mg, 50 mg.

**ADMINISTRATION/HANDLING****PO**

• May take with or without food. If GI upset occurs, give with food or milk, preferably with breakfast (may prevent nocturia). • Give last dose no later than 6 PM unless instructed otherwise.

**INDICATIONS/ROUTES/DOSAGE****Edema**

**PO: ADULTS:** Initially, 25–100 mg/day in 1–2 divided doses. Adjust dose based on response and tolerability. **Maximum:** 200 mg/day in 1–2 divided doses.

**Hypertension**

**PO: ADULTS:** Initially, 12.5–25 mg once daily. May increase up to 50 mg once daily.

**Usual Elderly Dose**

**PO: ADULTS:** Initially, 12.5 mg once daily. Titrate in increments of 12.5 mg as necessary. **Maximum:** 50 mg/day in 1–2 divided doses.

**Usual Pediatric Dosage (Edema/HTN)**

**PO: CHILDREN 2–12 YRS:** 1–2 mg/kg/day. **Maximum:** 100 mg/day. **CHILDREN 6 MOS–2 YRS:** 1–2 mg/kg/day in 1–2 divided doses. **Maximum:** 37.5 mg/day. **CHILDREN YOUNGER THAN 6 MOS:** 1–2 mg/kg/day in 1–2 divided doses. **Maximum:** 37.5 mg/day.

**Dosage in Renal Impairment**

**Creatinine clearance less than 30 mL/min:** Generally not effective. Avoid use with creatinine clearance less than 10 mL/min.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Expected:** Increased urinary frequency (diminishes with continued use), urine volume. **Frequent:** Potassium depletion. **Occasional:** Orthostatic hypotension, headache, GI disturbances, photosensitivity.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Vigorous diuresis may lead to profound water loss/electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Acute hypotensive episodes may occur. Hyperglycemia may occur during prolonged therapy. Pancreatitis, blood dyscrasias, pulmonary edema, allergic pneumonitis, dermatologic reactions occur rarely. Overdose can lead to lethargy, coma without changes in electrolytes or hydration.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Check vital signs, esp. B/P for hypotension, before administration. Assess baseline electrolytes, esp. for hypokalemia. Evaluate skin turgor, mucous membranes for hydration status. Evaluate for peripheral edema. Assess muscle strength, mental

status. Note skin temperature, moisture. Obtain baseline weight. Monitor I&O.

**INTERVENTION/EVALUATION**

Continue to monitor B/P, vital signs, electrolytes, I&O, daily weight. Note extent of diuresis. Watch for changes from initial assessment (hypokalemia may result in weakness, tremor, muscle cramps, nausea, vomiting, altered mental status, tachycardia; hyponatremia may result in confusion, thirst, cold/clammy skin). Be esp. alert for potassium depletion in pts taking digoxin (cardiac arrhythmias). Potassium supplements are frequently ordered. Check for constipation (may occur with exercise diuresis).

**PATIENT/FAMILY TEACHING**

- Expect increased frequency (diminishes with continued use), volume of urination.
- To reduce hypotensive effect, go from lying to standing slowly.
- Eat foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Protect skin from sun, ultraviolet light (photosensitivity may occur).

**HYDROcodone** **TOP 100** **HIGH ALERT**

hye-droe-koe-done  
(Hysingla ER)

**BLACK BOX ALERT** Risk of opioid addiction, abuse, and misuse. Serious, life-threatening, or fatal respiratory depression may occur. Accidental ingestion by children can result in fatal overdose. Prolonged use during pregnancy may result in opioid withdrawal syndrome. Concomitant use of CYP3A4 inhibitors may increase concentration/effect. Discontinuation of CYP3A4 inducers may increase concentration/effect. Concomitant use of CNS depressants (e.g., benzodiazepines) may result in profound sedation, respiratory depression, coma, or death.

**Do not confuse Hycodan with Vicodin.**

**FIXED-COMBINATION(S)**

HYDROcodone 5 mg/acetaminophen 300 mg; HYDROcodone 5 mg/acetaminophen 325 mg; HYDROcodone 7.5 mg/acetaminophen 300 mg; HYDROcodone 7.5 mg/acetaminophen 325 mg; HYDROcodone 10 mg/acetaminophen 300 mg; HYDROcodone 10 mg/acetaminophen 325 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Opioid agonist (Schedule III). **CLINICAL:** Narcotic analgesic.

**USES**

Relief of moderate to moderately severe pain. **Hysingla ER, Zohydro ER:** Around-the-clock management of moderate to severe chronic pain.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to HYDROcodone. Significant respiratory depression, acute or severe bronchial asthma or hypercarbia, GI obstruction including paralytic ileus (known or suspected). **Cautions:** Adrenal insufficiency, biliary tract disease, pancreatitis, CNS depression/coma, acute alcoholism, hypothyroidism; severe renal, hepatic, or pulmonary impairment; urinary stricture, prostatic hypertrophy, seizures, elderly, debilitated, other CNS depressants, history of drug abuse and misuse, drug-seeking behavior, dependency.

**ACTION**

Binds with opioid receptors in CNS. **Therapeutic Effect:** Reduces intensity of incoming pain stimuli from sensory nerve endings, altering pain perception, emotional response to pain; suppresses cough reflex.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO (analgesic)	10–20 min	30–60 min	4–6 hrs
PO (antitussive)	N/A	N/A	4–6 hrs

Well absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3.8 hrs (increased in elderly).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures) in the neonate. **Children:** Pts younger than 2 yrs may be more susceptible to respiratory depression. **Elderly:** May be more susceptible to respiratory depression, may cause paradoxical excitement. Age-related renal impairment, prostatic hypertrophy or obstruction may increase risk of urinary retention; dosage adjustment recommended.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depression. MAOIs (e.g., phenelzine, selegiline) may increase adverse effects. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase or prolong opioid effects. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava, kava, valerian) may increase CNS depression. **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**AVAILABILITY (Rx)**

**Solution, Oral:** HYDROcodone 7.5 mg/acetaminophen 325 mg/15 mL; HYDROcodone 10 mg/acetaminophen 325 mg/15 mL.

**⚡ Capsules:** (*Extended-Release [Zohydro ER]*): 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg. **Tablets:** (*Extended-Release [Hysingla ER]*): 20 mg, 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • Extended-release capsules/tablets must be swallowed whole. Do not cut, crush, or dissolve.

**INDICATIONS/ROUTES/DOSAGE****Analgesia (Combination Products)**

**PO: ADULTS, CHILDREN WEIGHING 50 KG OR MORE:** Initially, 2.5–10 mg q3–4h as needed. **ADULTS, CHILDREN WEIGHING LESS THAN 50 KG:** Initially, 0.1–0.2 mg/kg q4–6h as needed. **ELDERLY:** 2.5–5 mg q4–6h.

**Analgesia (Extended-Release)**

**PO: ADULTS, ELDERLY: (Zohydro ER):** Initially, 10 mg q12h. May increase by 10 mg q12h q3–7 days to achieve adequate analgesia. **(Hysingla ER):** Initially, 20 mg q24h. May titrate in increments of 10–20 mg q3–5 days to achieve adequate analgesia.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent:** Lethargy, hypotension, diaphoresis, facial flushing, dizziness, drowsiness. **Occasional:** Urine retention, blurred vision, constipation, dry mouth, headache, nausea, vomiting, difficult/painful urination, euphoria, dysphoria.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical de-

pendence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. Concomitant use with benzodiazepines may result in profound sedation, respiratory depression, coma, and death. **Antidote:** Naloxone (see Appendix J).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain vital signs. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse). **Analgesic:** Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. **Antitussive:** Assess type, severity, frequency of cough.

**INTERVENTION/EVALUATION**

Palpate bladder for urinary retention. Monitor daily pattern of bowel activity, stool consistency. Initiate deep breathing and coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain, cough. Screen for misuse, abuse, drug-seeking behavior.

**PATIENT/FAMILY TEACHING**

• Go from lying to standing slowly to avoid orthostatic hypotension. • Avoid tasks that require alertness, motor skills until response to drug is established. • Avoid alcohol. • Tolerance or dependence may occur with prolonged use at high dosages. • Report nausea, vomiting, constipation, shortness of breath, difficulty breathing. • Taper slowly after long-term use.

## hydrocortisone

hye-droe-**kor**-ti-sone

(Anusol HC, Colocort, Cortaid, Cortef, SOLU-Cortef, Cortenema, Preparation H, Proctocort, Cortef)

**Do not confuse hydrocortisone with hydroCHLORothiazide, HYDROcodone, or hydroxychloroquine, Cortef with Coreg, or SOLU-Cortef with SOLU-medrol.**

### FIXED-COMBINATION(S)

**Cortisporin:** hydrocortisone/neomycin/polymyxin (an anti-infective): 5 mg/10,000 units/5 mg, 10 mg/10,000 units/5 mg. **Lipsovir:** hydrocortisone/acyclovir (an antiviral): 1%/5%.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Corticosteroid. **CLINICAL:** Glucocorticoid.

## USES

**Systemic:** Management of allergic states; endocrine, hematologic, rheumatic disorders; dermatologic, neoplastic, respiratory diseases. **Topical:** Inflammatory dermatoses, adjunctive treatment of ulcerative colitis, atopic dermatitis, inflamed hemorrhoids. **OFF-LABEL:** Management of septic shock. Treatment of thyroid storm.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to hydrocortisone. Systemic fungal infections. Use in premature infants. Administration of live or attenuated virus vaccines. IM administration in idiopathic thrombocytopenia purpura. Intrathecal administration. **Cautions:** Thyroid dysfunction, cirrhosis, hypertension, osteoporosis, thromboembolic tendencies or thrombophlebitis, HF, seizure disorders, diabetes, respiratory tuberculosis, untreated systemic infections, renal/hepatic impairment, acute MI, myasthenia gravis, glau-

coma, cataracts, increased intraocular pressure, elderly, immunocompromised pts (e.g., diabetes, renal failure, open wounds).

## ACTION

Inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release, synthesis and/or release of mediators of inflammation. Reverses increased capillary permeability. **Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	N/A	4–6 hrs	8–12 hrs

Widely distributed. Metabolized in liver. **Half-life:** Plasma, 1.5–2 hrs; biologic, 8–12 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. May produce cleft palate if used chronically during first trimester. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

## INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease effects. **Live virus vaccines** may decrease pt's antibody response to vaccine, increase vaccine side effects, potentiate virus replication. May decrease therapeutic effect of **aldesleukin, BCG (intravesical)**. May increase hyponatremic effect of **desmopressin**. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None

known. **LAB VALUES:** May increase serum glucose, lipids, sodium. May decrease serum calcium, potassium, thyroxine; WBC count.

### AVAILABILITY (Rx)

**Cream, Rectal:** (*Anusol HC, Preparation H Hydrocortisone*): 1%, 2.5%. **Cream, Topical:** 0.5%, 1%, 2.5%. **Injection, Powder for Reconstitution:** (*Solu-Cortef*): 100 mg, 250 mg, 500 mg, 1 g. **Ointment, Topical:** 0.5%, 1%, 2.5%. **Suppository (*Anusol HC*):** 25 mg. **Suspension, Rectal:** (*Colocort, Cortenema*): 100 mg/60 mL. **Tablets:** (*Cortef*): 5 mg, 10 mg, 20 mg.

### ADMINISTRATION/HANDLING

#### Hydrocortisone Sodium Succinate

**Reconstitution** • Initially, reconstitute vial per manufacturer's instructions. • May further dilute with D<sub>5</sub>W or 0.9% NaCl. For IV push, dilute to 50 mg/mL; for intermittent infusion, dilute to 1 mg/mL. **Note:** 100–3,000 mg may be added to 50 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Administer IV push over 3–5 min (over 10 min for doses 500 mg or greater). Give intermittent infusion over 20–30 min.

**Storage** • Store at room temperature. • Once reconstituted, stable for 3 days at room temperature. Once further diluted with 0.9% NaCl or D<sub>5</sub>W, stability is concentration dependent: 1 mg/mL (24 hrs), 2–60 mg/mL (4 hrs).

#### PO

• Give with food or milk if GI distress occurs.

#### Rectal

• Shake homogeneous suspension well. • Instruct pt to lie on left side with left leg extended, right leg flexed. • Gently insert applicator tip into rectum, pointed slightly toward navel (umbilicus). Slowly instill medication.

#### Topical

• Gently cleanse area before application. • Use occlusive dressings only as ordered. • Apply sparingly; rub into area thoroughly.

### IV INCOMPATIBILITIES

Ciprofloxacin (Cipro), diazepam (Valium), midazolam (Versed), phenytoin (Dilantin).

### IV COMPATIBILITIES

Amphotericin, calcium gluconate, cefepime (Maxipime), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dopamine (Intropin), insulin, lidocaine, lorazepam (Ativan), magnesium sulfate, morphine, norepinephrine (Levophed), procainamide (Pronestyl), potassium chloride, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Acute Adrenal Insufficiency

**IV, ADULTS, ELDERLY:** 100 mg IV bolus, then 25–75 mg q6h for 24 hrs (or 200 mg/24h as continuous infusion), then taper slowly. **INFANTS, CHILDREN, ADOLESCENTS:** 50–100 mg/m<sup>2</sup> once, then 50–100 mg/m<sup>2</sup>/day in 4 divided doses.

#### Anti-inflammation, Immunosuppression

**IV, IM, ADULTS, ELDERLY:** 100–500 mg/dose at intervals of 2 hrs, 4 hrs, or 6 hrs. **CHILDREN:** 1–5 mg/kg/day in divided doses q12h.

**PO: ADULTS, ELDERLY:** 20–240 mg/day in divided doses. **CHILDREN:** 2.5–10 mg/kg/day in divided doses q6–8h.

#### Adjunctive Treatment of Ulcerative Colitis

**Rectal: (*Enema*): ADULTS, ELDERLY:** 100 mg 1 or 2 times/day. Continue for 3–4 wks. Once improved, may taper gradually to a nightly regimen.

**(Rectal Foam): ADULTS, ELDERLY:** 1 applicator 1–2 times/day. Continue for 3–4 wks. Once improved, may taper gradually to a nightly regimen.

### Usual Topical Dose

**ADULTS, ELDERLY:** Apply sparingly 2–4 times/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Insomnia, heartburn, anxiety, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea or constipation. **Occasional:** Headache, edema, change in skin color, frequent urination. **Topical:** Pruritus, redness, irritation. **Rare:** Tachycardia, allergic reaction (rash, hives), psychological changes, hallucinations, depression. **Topical:** Allergic contact dermatitis, purpura. **Systemic:** Absorption more likely with use of occlusive dressings or extensive application in young children.

### ADVERSE EFFECTS/TOXIC REACTIONS

**Long-term therapy:** Hypocalcemia, hypokalemia, muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF. **Abrupt withdrawal after long-term therapy:** Nausea, fever, headache, sudden severe joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain baseline weight, B/P, serum glucose, cholesterol, electrolytes. Screen for infections including fungal infections, TB, viral skin lesions. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

Assess for edema. Be alert to infection (reduced immune response): sore throat, fe-

ver, vague symptoms. Monitor daily pattern of bowel activity, stool consistency. Monitor electrolytes, B/P, weight, serum glucose. Monitor for hypocalcemia (muscle twitching, cramps), hypokalemia (weakness, paresthesia [esp. lower extremities], nausea/vomiting, irritability, ECG changes). Assess emotional status, ability to sleep.

### PATIENT/FAMILY TEACHING

- Report fever, sore throat, muscle aches, sudden weight gain, swelling, visual disturbances, behavioral changes.
- Do not take aspirin or any other medication without consulting physician.
- Limit caffeine; avoid alcohol.
- Inform dentist, other physicians of cortisone therapy now or within past 12 mos.
- **Topical:** Apply after shower or bath for best absorption.
- Do not cover or use occlusive dressings unless ordered by physician; do not use tight diapers, plastic pants, coverings.
- Avoid contact with eyes.

## HYDRomorphone HIGH ALERT

hye-droe-mor-fone  
(Dilaudid, Hydromorph Contin )

**BLACK BOX ALERT** High abuse potential, life-threatening respiratory depression risk. Other opioids, alcohol, CNS depressants increase risk of potentially fatal respiratory depression. Highly concentrated form (Dilaudid HP, 10 mg/mL) not to be interchanged with less concentrated form (Dilaudid); overdose, death may result. *Extended-Release Tablets:* For use in opioid-tolerant pts. Do not crush, break, chew, or dissolve. Swallow whole.

**Do not confuse Dilaudid with Demerol or Dilantin, or HYDROmorphone with HYDROcodone or morphine.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid agonist (Schedule II). **CLINICAL:** Narcotic analgesic.

**USES**

**Immediate-Release:** (Tablet, oral solution, injection, suppository): Management of moderate to severe pain.

**Extended-Release:** Management of pain in opioid-tolerant pts to require daily, around-the-clock, long-term opioid treatment.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to HYDRomorphone. Acute or severe bronchial asthma, severe respiratory depression. GI obstruction including paralytic ileus (known or suspected). **Additional Product-Specific**

**Contraindications: Dilaudid HP injection:** Opioid-intolerant pts. **Extended-Release Tablets:** Opioid-intolerant pts, preexisting GI surgery/diseases causing GI narrowing. **Cautions:** Severe hepatic, renal, respiratory disease; hypothyroidism, adrenal cortical insufficiency, seizures, acute alcoholism, head injury, intracranial lesions, increased intracranial pressure, prostatic hypertrophy, Addison's disease, urethral stricture, pancreatitis, biliary tract disease, cardiovascular disease, morbid obesity, delirium tremens, toxic psychosis, pts with CNS depression or coma, pts with depleted blood volume, obstructive bowel disorder; history of drug abuse and misuse, drug-seeking behavior; dependency.

**ACTION**

Binds to opioid receptors in CNS, reducing intensity of pain stimuli from sensory nerve endings. **Therapeutic Effect:** Alters perception, emotional response to pain; suppresses cough reflex.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	30 min	90–120 min	4 hrs
IV	10–15 min	15–30 min	2–3 hrs
IM	15 min	30–60 min	4–5 hrs
SQ	15 min	30–90 min	4 hrs
Rectal	15–30 min	N/A	N/A

Well absorbed from GI tract after IM administration. Widely distributed. Metabolized in liver. Excreted in urine. **Half-life:** 2.6–4 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. Unknown if distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother receives opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in the neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Pts younger than 2 yrs may be more susceptible to respiratory depression. **Elderly:** May be more susceptible to respiratory depression, may cause paradoxical excitement. Age-related renal impairment, prostatic hypertrophy or obstruction may increase risk of urinary retention; dosage adjustment recommended.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., alcohol, morphine, LORazepam, zolpidem) may increase CNS depression. MAOIs (e.g., phenelzine, selegiline) may increase adverse effects. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava, kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**AVAILABILITY (Rx)**

**Injection, Solution:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 10 mg/mL. **Liquid, Oral:** 1 mg/mL. **Suppository:** 3 mg. **Tablets:** 2 mg, 4 mg, 8 mg.

 **Tablets: (Extended-Release):** 8 mg, 12 mg, 16 mg, 32 mg.

**ADMINISTRATION/HANDLING**

 **IV**

**ALERT** High-concentration injection (10 mg/mL) should be used only in pts tolerant to opiate agonists, currently re-

ceiving high doses of another opiate agonist for severe, chronic pain due to cancer.

**Reconstitution** • May give undiluted. • May further dilute with 5 mL Sterile Water for Injection or 0.9% NaCl. **Rate of administration** • Administer IV push very slowly (over 2–3 min). • Rapid IV increases risk of severe adverse reactions (chest wall rigidity, apnea, peripheral circulatory collapse, anaphylactoid effects, cardiac arrest).

**Storage** • Store at room temperature; protect from light. • Slight yellow discoloration of parenteral form does not indicate loss of potency.

### IM, SQ

• Subcutaneously or intramuscularly insert needle and inject solution. Pulling back the plunger before IM injection may ensure that drug is not delivered directly into bloodstream (however, this topic is currently debated). • Administer slowly; rotate injection sites. • Pts with circulatory impairment experience higher risk of overdosage due to delayed absorption of repeated administration.

### PO

• Give without regard to food. • Tablets may be crushed. • Extended-release tablets must be swallowed whole; do not break, crush, dissolve, or divide.

### Rectal

• Refrigerate suppositories. • Moisten suppository with cold water before inserting well up into rectum.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ceFAZolin (Ancef, Kefzol), diazepam (Valium), PHENobarbital, phenytoin (Dilantin).

### IV COMPATIBILITIES

Dexmedetomidine (Precedex), dilTIAZem (Cardizem), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), furosemide (Lasix), heparin, LORazepam

(Ativan), magnesium sulfate, metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Analgesia (Acute, Moderate to Severe)

**PO: ADULTS: (Immediate-Release):** Initially 2–4 mg q4–6h as needed (tablets) or 2.5–10 mg q3–6h as needed (liquid).

**ELDERLY:** Use with caution; initiating at the low end of the dosage range is recommended. **CHILDREN, ADOLESCENTS WEIGHING MORE THAN 50 KG:** 1–2 mg q3–4h as needed. **CHILDREN OLDER THAN 6 MOS WEIGHING LESS THAN 50 KG:** 0.03–0.08 mg/kg/dose q3–4h as needed.

**IV (For use in opiate-naïve pts): ADULTS:** 0.2–1 mg q2–3h (pts with prior opioid exposure may require higher doses).

**ELDERLY:** 0.2 mg q2–3h PRN or 0.25–0.5 mg q3–4 PRN. **CHILDREN, ADOLESCENTS WEIGHING MORE THAN 50 KG:** 0.2–0.6 mg/dose q2–4h as needed. **CHILDREN WEIGHING 50 KG OR LESS:** 0.015 mg/kg/dose q3–6h as needed.

**Rectal: ADULTS, ELDERLY:** 3 mg q6–8h.

### Patient-Controlled Analgesia (PCA)

**IV: ADULTS, ELDERLY:** Loading dose: 0.4 mg. Demand dose: 0.1–0.4. Lockout interval: 10 min.

**Epidural: ADULTS, ELDERLY:** Bolus dose of 0.4–1 mg; infusion rate: 0.03–0.3 mg/hr; demand dose: 0.02–0.05 mg. Lockout interval: 10–15 min.

### Continuous Infusion

**IV infusion: ADULTS, ELDERLY:** 0.5–3 mg/hr.

### Dosage in Renal/Hepatic Impairment

Decrease initial dose; use with caution.

## SIDE EFFECTS

**Frequent:** Drowsiness, dizziness, hypotension (including orthostatic hypotension), decreased appetite. **Occasional:** Confusion, diaphoresis, facial flushing, urinary retention, constipation, dry mouth, nausea, vomiting, headache, pain at injection site. **Rare:** Allergic reaction, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. Concomitant use with benzodiazepines may result in profound sedation, respiratory depression, coma, and death. **Antidote:** Naloxone (see Appendix J).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain vital signs. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Assess risk of drug abuse, misuse, drug-seeking behavior. **Analgesic:** Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. **Antitussive:** Assess type, severity, frequency of cough. Screen for misuse, abuse, drug-seeking behavior.

### INTERVENTION/EVALUATION

Monitor vital signs; assess for pain relief, cough. To prevent pain cycles, instruct pt to request pain medication as soon as discomfort begins. Monitor daily pattern of bowel activity, stool consistency (esp. in long-term use). Initiate deep breathing and coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain, cough.

### PATIENT/FAMILY TEACHING

- Avoid alcohol.
- Avoid tasks that require alertness/motor skills until response to drug is established.
- Tolerance or dependence may occur with prolonged use at high dosages.
- Change positions slowly to avoid orthostatic hypotension.
- Do not chew, crush, dissolve, or divide extended-release tablets.

## hydrOXYzine

hye-**drox**-ee-zeen  
(Atarax , Novo-Hydroxyzin , Vistaril)

**Do not confuse hydroXYzine with hydrALAZINE or hydroxyurea, or Vistaril with Restoril, Versed, or Zestril.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histamine H<sub>1</sub> antagonist (first generation). **CLINICAL:** Antihistamine, antianxiety, antispasmodic, antiemetic, antipruritic.

### USES

Symptomatic relief of anxiety. Management of pruritus due to allergic conditions and histamine-mediated pruritus. Management of urticaria.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to hydrOXYzine, cetirizine, or levocetirizine. Early pregnancy; SQ, IV administration; pts with prolonged QT interval. **Cautions:** Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma, COPD, elderly.

### ACTION

Competes with histamine for receptor sites in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Produces anxiolytic, anticholinergic, antihistaminic, analgesic effects; relaxes skeletal muscle; controls nausea, vomiting.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15–30 min	N/A	4–6 hrs

Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs (increased in elderly, hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended in newborns or premature infants (increased risk of anticholinergic effects). Paradoxical excitement may occur. **Elderly:** Increased risk of dizziness, sedation, confusion. Hypotension, hyperexcitability may occur.

## INTERACTIONS

**DRUG:** QT interval—prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, torsades de pointes. **CNS depressants** (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depression. **Acclidinium, ipratropium, tiotropium, umeclidinium** may increase anticholinergic effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava, kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May cause false-positive urine 17-hydroxycorticosteroid determinations.

## AVAILABILITY (Rx)

**Oral Solution:** 10 mg/5 mL. **Syrup:** 10 mg/5 mL. **Tablets:** 10 mg, 25 mg, 50 mg.

 **Capsules:** 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food. • Shake oral suspension well. • Scored tablets may be crushed; do not break, crush, or open capsule.

## INDICATIONS/ROUTES/DOSAGE

### Anxiety

**Note:** Initiate elderly dose at the lower end of recommended dosage.

**PO: ADULTS, ELDERLY:** Usual range: 25–50 mg up to 4 times daily. May increase up to 400 mg/day. **Maximum single dose:** 100 mg. **CHILDREN 6 YRS AND OLDER:** 12.5–25 mg 3–4 times/day.

**CHILDREN YOUNGER THAN 6 YRS:** 12.5 mg 3–4 times/day.

### Pruritus

**PO: ADULTS, ELDERLY:** 10–25 mg 3–4 times daily as needed. **CHILDREN 6 YRS AND OLDER:** 12.5–25 mg 3–4 times/day. **CHILDREN YOUNGER THAN 6 YRS:** 12.5 mg 3–4 times/day.

### Urticaria

**PO: ADULTS, ELDERLY** Initially, 10–25 mg at bedtime. May increase in 10–25 mg increments at wkly intervals up to 200 mg/day. **Maximum single dose:** 100 mg.

### Dosage in Renal/Hepatic Impairment

No dose adjustment. Change dosing interval to q24h in pts with primary biliary cirrhosis.

## SIDE EFFECTS

Side effects are generally mild, transient. **Frequent:** Drowsiness, dry mouth, marked discomfort with IM injection. **Occasional:** Dizziness, ataxia, asthenia, slurred speech, headache, agitation, increased anxiety. **Rare:** Paradoxical reactions (hyperactivity, anxiety in children; excitement, restlessness in elderly or debilitated pts) generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reaction (wheezing, dyspnea, chest tightness) may occur. QT interval prolongation, torsades de pointes have been reported. Acute generalized exanthematous pustulosis (AGEP) may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**Anxiety:** Offer emotional support. Assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis). **Anti-emetic:** Assess for dehydration (poor

skin turgor, dry mucous membranes, longitudinal furrows in tongue).

**INTERVENTION/EVALUATION**

For pts on long-term therapy, CBC, BMP, LFT should be performed periodically. Monitor lung sounds for signs of hypersensitivity reaction. Monitor serum electrolytes in pts with severe vomiting. Assess for paradoxical reaction, particularly during early therapy. Assist with ambulation if drowsiness, light-headedness occur. Obtain ECG if palpitations occur or cardiac arrhythmia is suspected. Assess skin for rash, pustules.

**PATIENT/FAMILY TEACHING**

- Marked discomfort may occur with IM injection.
- Sugarless gum, sips of water may relieve dry mouth.
- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Treatment may cause life-threatening heart arrhythmias; report chest pain, difficulty breathing, palpitations, passing out. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.

## ibandronate

eye-ban-droe-nate  
(Boniva)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Bisphosphonate. **CLINICAL:** Calcium regulator.

### USES

Treatment/prevention of osteoporosis in postmenopausal women. **OFF-LABEL:** Hypercalcemia of malignancy; reduces bone pain and skeletal complications from metastatic bone disease due to breast cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ibandronate, other bisphosphonates; oral tablets in pts unable to stand or sit upright for at least 60 min; pts with abnormalities of the esophagus that would delay emptying (e.g., stricture, achalasia), hypocalcemia. **Cautions:** GI diseases (duodenitis, dysphagia, esophagitis, gastritis, ulcers [drug may exacerbate these conditions]), renal impairment with CrCl less than 30 mL/min.

### ACTION

Inhibits bone resorption via activity on osteoclasts or osteoclast precursors. **Therapeutic Effect:** Reduces rate of bone resorption, resulting in indirect increased bone mineral density.

### PHARMACOKINETICS

Absorbed in upper GI tract. Extent of absorption impaired by food, beverages (other than plain water). Protein binding: 85%–99%. Rapidly binds to bone. Unabsorbed portion excreted in urine. **Half-life:** **PO:** 37–157 hrs; **IV:** 5–25 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and ef-

ficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Antacids, calcium, magnesium may decrease concentration/effect. **Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen)** may increase adverse effects. **HERBAL:** None significant. **FOOD:** Beverages (other than plain water), dietary supplements, dairy products, food interfere with absorption. **LAB VALUES:** May decrease serum alkaline phosphatase. May increase serum cholesterol.

### AVAILABILITY (Rx)

**Injection Solution:** 3 mg/3 mL syringe. **Tablets:** 150 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give 60 min before first food or beverage of the day, on an empty stomach with 6–8 oz plain water (not mineral water) while pt is standing or sitting in upright position.
- Pt cannot lie down for 60 min following administration.
- Instruct pt to swallow whole; do not break, crush, dissolve, or divide tablet (potential for oropharyngeal ulceration).

#### IV

- Give over 15–30 sec.
- Give over 1 hr for metastatic bone disease; over 1–2 hrs for hypercalcemia of malignancy.

### INDICATIONS/ROUTES/DOSAGE

**Note:** May consider discontinuing after 3–5 yrs in pts at low risk for fracture. Consider supplemental calcium and vitamin D if dietary intake is inadequate.

#### Osteoporosis

**PO (Prevention/Treatment): ADULTS, ELDERLY:** 150 mg once monthly.

**IV (Treatment): ADULTS, ELDERLY:** 3 mg q3mos.

#### Dosage in Renal Impairment

Not recommended for pts with CrCl less than 30 mL/min.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (13%–6%):** Back pain, dyspepsia, peripheral discomfort, diarrhea, headache, myalgia. **IV:** Abdominal pain, dyspepsia, constipation, nausea, diarrhea. **Occasional (4%–3%):** Dizziness, arthralgia, asthenia. **Rare (2% or less):** Vomiting, hypersensitivity reaction.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Upper respiratory infection occurs occasionally. Overdose results in hypocalcemia, hypophosphatemia, significant GI disturbances.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum calcium, vitamin D level. Hypocalcemia, vitamin D deficiency must be corrected before beginning therapy. Obtain results of bone density study.

**INTERVENTION/EVALUATION**

Monitor serum calcium, phosphate. Monitor renal function tests.

**PATIENT/FAMILY TEACHING**

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water, first thing in the morning and at least 60 min before first food, beverage, medication of the day. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
- Do not chew, crush, dissolve, or divide tablets; swallow whole.
- Do not lie down for at least 60 min after taking medication (potentiates delivery to stomach, reduces risk of esophageal irritation).
- Report swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises; modify behavioral factors (e.g., cigarette smoking, alcohol consumption).
- Calcium and vitamin D supplements should be taken if dietary intake inadequate.

**ibrutinib**

eye-broo-ti-nib  
(Imbruvica)

**Do not confuse ibrutinib with axitinib, dasatinib, erlotinib, gefitinib, imatinib, nilotinib, PONATinib, SORafenib, SUNItinib, or vandetanib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bruton tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of pts with mantle cell lymphoma (MCL) who have received at least one prior therapy, chronic lymphocytic leukemia and small lymphocytic lymphoma (CLL/SLL) (as monotherapy or in combination with bendamustine and ritUXimab or with obinutuzumab), CLL/SLL with 17p deletion, treatment of Waldenstrom's macroglobulinemia (WM) (as monotherapy or in combination with rituximab). Marginal zone lymphoma (MZL) requiring systemic therapy and having received at least one prior anti-CD-20–based therapy. Treatment of chronic graft-versus-host disease (CGVHD) after failure of at least one line of systemic therapy.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ibrutinib. **Cautions:** Hepatic/renal impairment, hypertension, elderly, pregnancy, history of GI disease (e.g., bleeding, ulcers); pts at high risk for tumor lysis syndrome (high tumor burden).

**ACTION**

Inhibits enzymatic activity of Bruton's tyrosine kinase (BTK), a signaling molecule that promotes malignant B-cell proliferation and survival. **Therapeutic Effect:** Decreases malignant B-cell proliferation and survival.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Peak plasma concentration: 1–2 hrs. Protein binding: 97%. Excreted in feces (80%), urine (10%). **Half-life:** 4–6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. **Males:** Males with female partners of reproductive potential must use effective conception during treatment and for at least 1 mo after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of cardiac events (atrial fibrillation, hypertension), infections (pneumonia, cellulitis), GI events (diarrhea, dehydration, bleeding).

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase plasma concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., carbamazepine, rifampin, phenytoin) may decrease plasma concentration/effect; avoid use. Anticoagulants (e.g., warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs may increase risk of bleeding. May decrease the therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse/toxic effects of natalizumab, vaccines (live). **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. Bitter orange may increase concentration/effect. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets.

## AVAILABILITY (Rx)

 **Capsules:** 70 mg, 140 mg. **Tablets:** 140 mg, 280 mg, 420 mg, 560 mg.

## ADMINISTRATION/HANDLING

### PO

• Give with water. • Swallow capsules/tablets whole. Do not break, cut, or open capsules. Do not break, cut, crush, or divide tablets. Capsules/tablets cannot be chewed.

## INDICATIONS/ROUTES/DOSAGE

### MCL, MZL

**PO: ADULTS, ELDERLY:** 560 mg once daily. Continue until disease progression or unacceptable toxicity.

### WM, CGVD

**PO: ADULTS, ELDERLY:** 420 mg once daily. Continue until disease progression or unacceptable toxicity.

### CLL/SL

**PO: ADULTS, ELDERLY:** 420 mg once daily (as monotherapy, or in combination with rituximab or obinutuzumab, or in combination with bendamustine and rituximab). Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### *Any Grade 3 or Greater Nonhematologic Event, Grade 3 or Greater Neutropenia With Infection or Fever, or Any Grade 4 Hematologic Toxicities*

Interrupt treatment until resolution to Grade 1 or baseline, then restart at initial dose. If toxicity recurs, interrupt treatment until resolution to Grade 1 or baseline, then reduce dose to 420 mg daily (one capsule less). If toxicity recurs, interrupt treatment until resolution to Grade 1 or baseline, then reduce dose to 280 mg once daily (one capsule less). If toxicity still occurs at 280 mg dose, discontinue treatment.

### *Concomitant Use of Moderate CYP3A4 Inhibitors (e.g., fluconazole, diltiazem, verapamil)*

Start at reduced dose of 140 mg daily. If toxicity occurs, either discontinue treatment or find alternate agent with less CYP3A inhibition.

**Concomitant Short-Term Use of Strong CYP3A4 Inhibitors (7 days or less) (e.g., antifungals, antibiotics)**

Interrupt treatment until strong CYP3A medications no longer needed.

**Concomitant Chronic Use of Strong CYP3A4 Inhibitors or Inducers**

Treatment not recommended.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** Decrease dose to 140 mg. **Moderate to severe impairment:** Avoid use.

**SIDE EFFECTS**

**Frequent (51%–23%):** Diarrhea, fatigue, musculoskeletal pain, peripheral edema, nausea, bruising, dyspnea, constipation, rash, abdominal pain, vomiting. **Occasional (21%–11%):** Decreased appetite, cough, pyrexia, stomatitis, asthenia, dizziness, muscle spasms, dehydration, headache, dyspepsia, petechiae, arthralgia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Severe myelosuppression (Grade 3–4 CTCAE) reported in 41% of pts: neutropenia (29%), thrombocytopenia (17%), anemia (9%). Infections including upper respiratory tract infection, UTI, pneumonia, skin infection, sinusitis were reported. Hemorrhagic events including epistaxis, GI bleeding, hematuria, intracranial hemorrhage, subdural hematoma reported in 5% of pts. Serious and fatal cases of renal toxicity reported: increased serum creatinine 1.5 times upper limit of normal (ULN) (67% of pts), increased serum creatinine 1.53 times ULN (9% of pts). Second primary malignancies including skin cancer (4%), other carcinomas (1%) occurred. Fatal cardiac arrhythmias (ventricular tachycardia,

atrial fibrillation, atrial flutter) may occur. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain vital signs, CBC, serum chemistries, LFT, PT/INR if on anticoagulants. Question history of arrhythmias, HF, GI bleed, hepatic/renal impairment, peripheral edema, pulmonary disease. Obtain negative pregnancy test before initiating treatment. Assess hydration status. Receive full medication history including herbal products. Assess skin for open/unhealed wounds, lesions, moles. Assess risk of tumor lysis syndrome. Conduct baseline neurologic exam. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC monthly; LFT, serum chemistries, renal function routinely. Monitor stool frequency, consistency, characteristics. Immediately report hemorrhagic events: epistaxis, hematuria, hemoptysis, melena. Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Obtain ECG for arrhythmias, dyspnea, palpitations. Screen for possible intracranial hemorrhage: altered mental status, aphasia, hemiparesis, unequal pupils, homonymous hemianopsia (blindness of one half of vision on same side of both eyes). Monitor for renal toxicity (anuria, hypertension, generalized edema, flank pain). Assess skin for new lesions.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath,

weight loss; bleeding easily, bloody urine or stool. • Report palpitations, chest pain, shortness of breath, dizziness, fainting; may indicate arrhythmia. • Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting. • Report any black/tarry stools, bruising, nausea, RUQ abdominal pain, yellowing of skin or eyes, palpitations, nose bleeds, blood in urine or stool, decreased urine output. • Avoid alcohol. • Do not take herbal products. • Do not ingest grapefruit products. • Severe diarrhea may lead to dehydration. • Contact physician before any planned surgical/dental procedures. • Immediately report neurological changes: confusion, one-sided paralysis, difficulty speaking, partial blindness. • Do not receive live vaccines. • Do not break, crush, or open capsule. • Use effective contraception to avoid pregnancy.

## ibuprofen

eye-bue-**pro**-fen  
(Advil, Caldolor, Motrin, NeoProfen)

**BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Contraindicated in setting of CABG surgery. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

**Do not confuse Motrin with Neurontin or Advil with Aleve.**

### FIXED-COMBINATION(S)

**Children's Advil Cold:** ibuprofen/pseudoephedrine (a nasal decongestant): 100 mg/15 mg per 5 mL. **Combunox:** ibuprofen/oxyCODONE (a narcotic analgesic): 400 mg/5 mg. **Duexis:**

ibuprofen/famotidine (an H<sub>2</sub> antagonist): 800 mg/26.6 mg. **Reprexain CIII:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/5 mg. **Vicoprofen:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/7.5 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID.  
**CLINICAL:** Antirheumatic, analgesic, antipyretic, antidysmenorrheal, vascular headache suppressant.

### USES

**Oral:** Treatment of fever, inflammatory disease, and rheumatoid disorders, osteoarthritis, mild to moderate pain, primary dysmenorrhea. **OTC:** Reduce fever; manage pain due to headache, physical or athletic overexertion (e.g., sprains/strains), dental pain, minor muscle/bone/joint pain, backache. **Caldolor:** Mild to moderate pain; severe pain in combination with an opioid analgesic; fever. **NeoProfen:** To close a clinically significant patent ductus arteriosus (PDA) in premature infants weighing between 500 and 1,500 g who are no more than 32 wks gestational age when usual medical management is ineffective. **OFF-LABEL:** Treatment of cystic fibrosis, pericarditis. Juvenile idiopathic arthritis.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity to ibuprofen, aspirin, other NSAIDs. Treatment of perioperative pain in coronary artery bypass graft (CABG) surgery. Aspirin triad (bronchial asthma, aspirin intolerance, rhinitis). **NeoProfen:** Preterm neonates with proven or suspected untreated infection, elevated total bilirubin, congenital heart disease in whom patency of the patent ductus arteriosus is necessary for satisfactory pulmonary or systemic blood flow (e.g., pulmonary atresia), bleeding, thrombocytopenia, coagulation defects, proven or suspected

necrotizing enterocolitis, significant renal impairment. **Cautions:** Pts with fluid retention, HF, dehydration, coagulation disorders, concurrent use with aspirin, anticoagulants, steroids; history of GI disease (e.g., bleeding, ulcers), smoking, use of alcohol, elderly, debilitated pts, hepatic/renal impairment, asthma.

## ACTION

Reversibly inhibits COX-1 and COX-2 enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Produces analgesic, anti-inflammatory effects; decreases fever.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (analgesic)	0.5 hr	N/A	4–6 hrs
PO (antirheumatic)	2 days	1–2 wks	N/A

Rapidly absorbed from GI tract. Protein binding: 90%–99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended.

## INTERACTIONS

**DRUG:** May decrease effects of **anti-hypertensives** (e.g., amlodipine, lisinopril, valsartan), **diuretics** (e.g., furosemide). **Aspirin, other salicylates** may increase risk of GI side effects, bleeding. May increase effect of **apixaban, dabigatran, edoxaban,**

**rivaroxaban, warfarin.** **Bile acid sequestrants** (e.g., cholestyramine) may decrease absorption/effect. May increase nephrotoxic effect of **cyclosporine.** May increase concentration, risk of toxicity of **lithium, methotrexate.** **HERBAL:** **Glucosamine, herbs with anticoagulant/antiplatelet properties** (e.g., garlic, ginger, ginseng, ginkgo biloba) may increase concentration/effect. **FOOD:** None known. **LAB VALUES:** May prolong bleeding time. May alter serum glucose level. May increase serum BUN, creatinine, potassium, ALT, AST. May decrease serum calcium, glucose; Hgb, Hct, platelets.

## AVAILABILITY (Rx)

**Capsules:** 200 mg. **Injection, Solution:** (*NeoProfen*): 10 mg/mL. (*Caldolor*): 100 mg/mL. **Suspension, Oral:** 100 mg/5 mL. **Suspension, Oral Drops:** 40 mg/mL. **Tablets:** 200 mg, 400 mg, 600 mg, 800 mg. **Tablets, Chewable:** 100 mg.

## ADMINISTRATION/HANDLING

### IV (*Caldolor*)

**Reconstitution** • Dilute with D<sub>5</sub>W or 0.9% NaCl to final concentration of 4 mg/mL or less.

**Rate of administration** • Infuse over at least 30 min.

**Storage** • Store at room temperature. • Stable for 24 hrs after dilution.

### IV (*NeoProfen*)

**Reconstitution** • Dilute to appropriate volume with D<sub>5</sub>W or 0.9% NaCl. • Discard any remaining medication after first withdrawal from vial.

**Rate of administration** • Administer via IV port nearest the insertion site. • Infuse continuously over 15 min.

**Storage** • Store at room temperature. • Stable for 30 min after dilution.

## PO

• Give with food, milk, antacids if GI distress occurs.

**INDICATIONS/ROUTES/DOSAGE**

**Fever**

**PO: ADULTS, ELDERLY:** 200–400 mg q4–6h prn. May titrate up to 600–800 mg q6h. **Maximum:** 3,200 mg/day.

**CHILDREN 12 YRS AND OLDER, ADOLESCENTS:** 200–400 mg q4–6h prn. **Maximum daily dose:** 1,200 mg/day. **CHILDREN 6 MOS AND OLDER:**

Weight		Dosage	
kg	lbs	Age	(mg)
5.4–8.1	12–17	6–11 mos	50
8.2–10.8	18–23	12–23 mos	75
10.9–16.3	24–35	2–3 yrs	100
16.4–21.7	36–47	4–5 yrs	150
21.8–27.2	48–59	6–8 yrs	200
27.3–32.6	60–71	9–10 yrs	250
32.7–43.2	72–95	11 yrs	300

**IV: ADULTS, ELDERLY:** 200–400 mg q4–6h or 100–200 mg q4h prn. **Maximum:** 3.2 g/day. **CHILDREN 12–17 YRS:** 400 mg q4–6h prn. **Maximum:** 2,400 mg/day. **CHILDREN 6 MOS–11 YRS:** 10 mg/kg q4–6h prn. **Maximum dose:** 400 mg. **Maximum:** 40 mg/kg up to 2,400 mg/day.

**Osteoarthritis, Rheumatoid Disorders**

**PO: ADULTS, ELDERLY:** 400–800 mg 3–4 times/day. **Maximum:** 3.2 g/day.

**Pain**

**PO: ADULTS, ELDERLY:** 200–400 mg q4–6h prn or 600–800 mg q6–8h PRN. **Maximum:** 3,200 mg/day. **CHILDREN 12 YRS AND OLDER, ADOLESCENTS:** 200–400 mg q4–6h prn. **Maximum daily dose:** 1,200 mg/day. **CHILDREN 6 MOS–11 YRS:** See chart under Fever dosing.

**IV: ADULTS, ELDERLY:** 200–400 mg q4–6h PRN or 600–800 mg q6–8h PRN. **Maximum:** 3.2 g/day. **CHILDREN, ADOLESCENTS: (12–17 yrs):** 400 mg q4–6h prn. **Maximum:** 2,400 mg/day. **(6 MOS–12 YRS):** 10 mg/kg (**maximum dose:** 400 mg) q4–6h prn. **Maximum:** 40 mg/kg/day or 2,400 mg, whichever is less.

**Primary Dysmenorrhea**

**PO: ADULTS:** Initially, 400 mg q4h PRN or 600–800 mg q6–8h PRN. **Maximum:** 3.2 g/day. For severe symptoms, begin at onset of menses or 1–2 days prior to onset of menses. Usual duration: 1–5 days.

**Patent Ductus Arteriosus (PDA)**

**IV: INFANTS:** Initially, 10 mg/kg followed by 2 doses of 5 mg/kg at 24 hrs and 48 hrs. All doses based on birth weight.

**Dosage in Renal Impairment**

Hold if anuria or oliguria evident. Avoid use in severe impairment.

**Dosage in Hepatic Impairment**

Avoid use in severe impairment.

**SIDE EFFECTS**

**Occasional (9%–3%):** Nausea, vomiting, dyspepsia, dizziness, rash. **Rare (less than 3%):** Diarrhea or constipation, flatulence, abdominal cramps or pain, pruritus, increased B/P.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may result in metabolic acidosis. Rare reactions with long-term use include peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), severe hypersensitivity reaction (particularly in pts with systemic lupus erythematosus or other collagen diseases). **NeoProfen:** Hypoglycemia, hypocalcemia, respiratory failure, UTI, edema, atelectasis may occur. **Caldolor:** Abdominal pain, anemia, cough, dizziness, dyspnea, edema, hypertension, nausea, vomiting have been reported.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, defor-

mities, skin condition. Assess temperature. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

Monitor for evidence of nausea, dyspepsia. Assess skin for rash. Observe for bleeding, bruising, occult blood loss. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for fever.

#### PATIENT/FAMILY TEACHING

Avoid aspirin, alcohol during therapy (increases risk of GI bleeding). • If GI upset occurs, take with food, milk, antacids. • May cause dizziness. • Report ringing in ears, persistent stomach pain, respiratory difficulty, unusual bruising/bleeding, swelling of extremities, chest pain/palpitations.

## idecabtagene vicleucel

eye-de-kab-ta-jeen vik-loo-sel  
(Abecma)

**BLACK BOX ALERT** Life-threatening cytokine release syndrome (CRS), neurologic toxicities were reported. Do not administer in pts with inflammatory disorders or severe active infection. Treat CRS with tocilizumab and corticosteroids. Life-threatening hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLM/MAS) can occur with CRS or neurological toxicities. May cause prolonged cytopenia-associated bleeding and infection, including fatal cases of stem cell transplantation for hematopoietic recovery.

**Do not confuse idecabtagene vicleucel with axicabtagene ciloleucel, brexucabtagene autoleucel, lisocabtagene maraleucel, sipuleucel-T, or tisagenlecleucel.**

#### Classification

**PHARMACOTHERAPEUTIC:** Anti-B-cell maturation antigen (BCMA), chimeric antigen receptor (CAR) T-cell immunotherapy. **CLINICAL:** Antineoplastic.

#### USES

Treatment of adults with relapsed or refractory multiple myeloma after 4 or more prior lines of therapy, including an immunomodulatory agent, a protease inhibitor, and an anti-CD38 monoclonal antibody.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to idecabtagene vicleucel. **Cautions:** Baseline cytopenias; elderly, renal impairment, pulmonary disease, cardiac disease; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for acute thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions; history of venous thromboembolism); history of HIV infection, hepatitis B or C virus infection. Not recommended during active infection or in pts with inflammatory disorders. Avoid administration of live vaccines during treatment and after discontinuation until B cells are no longer depleted.

#### ACTION

An anti-BCMA-directed, genetically modified, autologous T-cell immunotherapy that reprograms T cells with a transgene encoding CAR, which identifies and eliminates BCMA-expressing malignant and normal cells. CAR recognizes BCMA and is fused to CD137 (enhances T-cell expansion) and CD3 zeta (a critical component for initiating T-cell activation).

**Therapeutic Effect:** Causes anti-tumor activity by initiating activation of T cells.

## PHARMACOKINETICS

Widely distributed. Metabolism not specified. Excretion not specified. **Half-life:** Not specified.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm, including hypogammaglobulinemia or plasma cell aplasia. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk of neurological toxicities.

## INTERACTIONS

**DRUG:** Systemic corticosteroids (e.g., dexamethasone, prednisone) may decrease therapeutic effect; may increase risk of infection. May decrease therapeutic effect or may diminish the therapeutic effect of BCG (intravesical), sipuleucel-T, vaccines (live). May enhance the adverse/toxic effect of leflunomide, natalizumab, talimogene laherparepvec, vaccines (live). May enhance the immunosuppressive effect of baricitinib, fingolimod, upadacitinib. **HERBAL:** Echinacea may diminish the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, glucose. May decrease serum albumin, calcium, potassium, phosphorus, sodium; B-cell count, fibrinogen, Hgb, leukocytes, lymphocytes, neutrophils, platelets, RBCs. May prolong aPTT.

## AVAILABILITY (Rx)

**Patient-Specific Autologous Infusion:** Suspension containing  $300\text{--}460 \times 10^6$  CAR-positive T cells.

## ADMINISTRATION/HANDLING

**Infusion Guidelines** • Single-dose infusion(s) contain(s) specimen of CAR-positive viable T cells for autologous use

only. • Upon completion, rinse infusion tubing with 30–60 mL of 0.9% NaCl to ensure as many cells as possible are administered. Do not use a leukocyte-depleting filter. Infusion bags contain human cells genetically modified with a lentivirus vector; follow biosafety handling and safety guidelines.

**Premedication** • Premedicate with acetaminophen (650 mg PO) and either diphenhydramine (12.5 mg IV or 25–50 mg PO) or H<sub>1</sub>-antihistamine approx. 30–60 min prior to infusion. Due to possible drug interactions, dexamethasone, other corticosteroids are not recommended.

**Preparation** • Verify the number of infusion bags needed for dose. • Thawing time must be coordinated with infusion time. If more than 1 bag is needed for dose, recommend thawing 1 bag at a time (allows verification that the previous bag was administered safely). • Match pt identity with infusion bag identifiers. • Visually inspect for cracks or breaks. Do not infuse if cracks or breaks are present. • Prime infusion tubing with 0.9% NaCl.

**Thawing** • Place infusion bag inside a second, sterile bag to safeguard from leaks and to protect ports from contamination. • Thaw 1 bag at a time using either a water bath at 37°C or approved thawing device. • Continue thawing until no ice is visible in the infusion bag. • Visually inspect for clumps. Gently mix if clumps are present (small clumps should disperse). • Do not infuse if bag is leaking, damaged, or if clumps do not disperse after gentle mixing. • Do not spin down, wash, or resuspend contents. Infusion bags must be infused within 1 hr of the start of thaw.

**Rate of Administration** • Infuse by gravity flow within 1 hr of start of thaw.

**Storage** • Infusion bags are frozen until time of use. Storage of frozen bags can only occur at sites capable of onsite storage (see manufacturer guidelines).

Thawed infusion bags are stable at room temperature for up to 2 hrs.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Give 2 days after lymphodepleting chemotherapy with fludarabine and cyclophosphamide. Withhold idecabtagene vicleucel infusion for up to 7 days for active infection, inflammatory disorders; severe adverse effects (e.g., cardiac/pulmonary events, hypotension). Follow manufacturer guidelines regarding dose modification for cytokine release syndrome or neurological toxicities.

#### Multiple Myeloma (Relapsed or Refractory).

**IV; ADULTS:** 300–460 × 10<sup>6</sup> CAR-positive viable T cells.

#### Dosage in Renal Impairment

**Mild to severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (45%–23%):** Musculoskeletal pain, myalgia, diarrhea, nausea, amnesia, bradypnea, cognitive disorder, confusion, decreased level of consciousness, attention disturbance, dyscalculia, dysgraphia, lethargy, memory impairment, mental status change, pyrexia, edema, headache, cough. **Occasional (16%–10%):** Tachycardia, dizziness, syncope, vertigo, hypotension, peripheral neuropathy, carpal tunnel syndrome, hypoesthesia, neuralgia, paresthesia, sciatica, constipation, vomiting, decreased weight, rash, dermatitis, dyspnea, insomnia, oral pain, anxiety, general deterioration, xerosis, (dry eye, dry mouth, dry skin), hypertension, chills, motor dysfunction, muscle spasm, weakness, restless leg syndrome, tremor, aphasia, dysarthria, ataxia, gait disturbance.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including bone marrow depression, febrile neutropenia, may be life-threatening. Prolonged cytopenias may occur for several wks after lymphodepleting chemotherapy. Life-threatening CRS reported in up to 85% of pts. Symptoms of CRS may include fatigue, headache, hypotension, hypoxia, nausea, pyrexia, tachycardia; serious events may include acute respiratory distress syndrome (ARDS), atrial fibrillation, capillary leak syndrome, disseminated intravascular coagulation (DIC), hepatocellular injury, hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLM/MAS), multiorgan dysfunction, pulmonary edema. Infusion reactions may be clinically indistinguishable from CRS. Life-threatening neurological toxicities, including altered mental status, confusion, encephalopathy, seizures, speech disorders, tremors, may occur. Cardiac events, including cardiac failure, cardiac arrest, may occur, esp. in pts with history of cardiac disease. Life-threatening opportunistic infections, bacterial/viral/fungal infections, pneumonia, sepsis were reported. May cause HBV reactivation, resulting in fulminant hepatitis, hepatic failure, or death. May cause cytomegalovirus reactivation, resulting in pneumonia and death. Other life-threatening or fatal events may include abdominal compartment syndrome, acute kidney injury/failure, ARDS, cardiomyopathy, GI hemorrhage, graft-vs.-host disease, multiple organ dysfunction syndrome, respiratory distress/failure, seizures, thrombosis (DVT, PE, venous thrombosis). Hypogammaglobulinemia, plasma cell aplasia reported in 21% of pts. May increase risk of secondary malignancies. Hypersensitivity reactions, including anaphylaxis, may occur. Immunogenicity

(anti-mCAR19 antibodies) occurred in 3%–47% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, vital signs; pregnancy test in females of reproductive potential. Test all pts for hepatitis B or C virus infection, HIV infection prior to cell collection. Confirm drug availability prior to lymphodepleting therapy. Withhold infusion if any of the following are present: active graft-vs.-host disease, unresolved adverse effect from previous chemotherapies (e.g., cardiac reactions, hypotension, pulmonary reactions); severe, uncontrolled infection. Administer in an environment equipped to monitor for and manage infusion-related reactions. Prior to thawing of infusion bags, verify 2 doses of tocilizumab and emergency equipment are readily available for treatment of adverse reactions. Question history of cardiac disease, pulmonary disease, chronic infections, renal impairment, thrombosis. Question for recent administration of vaccines, live vaccines. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT, vital signs as clinically indicated. Manage hypogammaglobulinemia as clinically appropriate. Obtain serum calcium, phosphate, uric acid if tumor lysis syndrome is suspected (presents as acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Diligently monitor for symptoms of CRS, neurological toxicities daily for 7 days during the first wk at a healthcare facility; follow manufacturer guidelines regarding management of symptoms. Monitor for infections of any kind. Due to risk of cardiovascular events, have emergency resuscitation equipment ready available. Conduct routine neurological

assessments. Monitor for symptoms of DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia), bleeding events, renal toxicity (anuria, hypertension, generalized edema, flank pain), secondary malignancies, recurrence of cancer, HBV reactivation (amber to orange-colored urine, fatigue, jaundice, nausea, vomiting), neurological toxicities. Monitor weight, I&Os; daily pattern of bowel activity, stool consistency. Monitor for infection (cough, fatigue, fever). Ensure adequate hydration, nutrition.

### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system and reduce ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- CRS, a life-threatening condition caused by immune activation, may occur; report difficulty breathing, headache, fever, low blood pressure, rash, rapid heart rate; confusion, delirium, tremors. Stay within the proximity of a healthcare facility for at least 4 wks after infusion.
- Effective contraception may be required based on treatment with other medications.
- Report heart problems (difficulty breathing, fainting, irregular heartbeats, palpitations, sweating).
- Report bleeding of any kind.
- Do not receive live vaccines.
- Report liver problems (bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes); kidney problems (decreased urine output, dark-colored urine), allergic reactions (difficulty breathing, hives, low blood pressure, rash, swelling of the face or tongue), symptoms of DVT (e.g., swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (e.g., difficulty breathing,

chest pain, rapid heart rate). • Treatment may cause reactivation of chronic viral infections, new cancers.

## idelalisib

eye-del-a-lis-ib  
(Zydelig)

**BLACK BOX ALERT** Fatal and/or serious hepatotoxicity may occur. Monitor LFT prior to and during treatment. Fatal and/or serious and severe diarrhea or colitis may occur. Monitor for GI symptoms. Fatal and serious pneumonitis may occur. Monitor for pulmonary symptoms and bilateral interstitial infiltrates. Interrupt, then reduce or discontinue treatment if hepatotoxicity, severe diarrhea, or pneumonitis occurs. Fatal and serious intestinal perforation may occur. Discontinue if perforation suspected.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Phosphatidylinositol 3-kinase inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Treatment of relapsed chronic lymphocytic leukemia (CLL), in combination with ritUXimab, in pts for whom ritUXimab alone would not be considered appropriate therapy due to other comorbidities. Treatment of relapsed follicular B-cell non-Hodgkin's lymphoma (FL) or relapsed small lymphocytic lymphoma (SLL) in pts who have received at least two prior systemic therapies.

### PRECAUTIONS

**Contraindications:** History of serious allergic reactions to idelalisib (e.g., anaphylaxis, toxic epidermal necrolysis). **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia; GI bleeding, hepatic impairment. Pts with active infection, high tumor burden. Avoid concomitant use of hepatotoxic or promotility medications.

### ACTION

Inhibits phosphatidylinositol 3-kinase, which is highly expressed in malignant lymphoid B cells. Inhibits several cell-signaling pathways, including B-cell receptor signaling and CXCR4 and CXCR5 signaling, which are involved in trafficking B cells to lymph nodes and bone marrow. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 84%. Peak plasma concentration: 1.5 hrs. Excreted in feces (78%), urine (14%). **Half-life:** 8.3 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm; avoid pregnancy. Use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of side effects/adverse reactions.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, rifampin, phenytoin) may decrease concentration/effect. Strong CYP3A4 inhibitors (clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May increase adverse effects of natalizumab, vaccines (live). May decrease therapeutic effect of BCG (intravesical), vaccines (live). **HERBAL:** None significant. **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, GGT; triglycerides. May decrease Hgb, neutrophils, platelets, serum sodium. May increase or decrease lymphocytes, serum glucose.

### AVAILABILITY (Rx)

**Tablets:** 100 mg, 150 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Swallow tablets whole.

**INDICATIONS/ROUTES/DOSAGE**
**Chronic Lymphocytic Leukemia (in Combination with ritUXimab), Follicular B-cell Non-Hodgkin's Lymphoma, Small Lymphocytic Lymphoma**

**PO: ADULTS/ELDERLY:** 150 mg twice daily. Continue until disease progression or unacceptable toxicity.

**Dose Modification****Hepatotoxicity**

**Elevated serum ALT, AST 3–5 times upper limit of normal (ULN):** Maintain dose. **5–20 times ULN:** Monitor serum ALT, AST w/ky. Withhold until ALT, AST less than 1 time ULN, then resume at 100 mg twice daily. **Greater than 20 times ULN:** Permanently discontinue.

**Elevated Serum Bilirubin**

**1.5–3 times ULN:** Monitor serum bilirubin w/ky. Maintain dose. **3–10 times ULN:** Monitor serum bilirubin w/ky. Withhold until bilirubin less than 1 time ULN, then resume at 100-mg dose. **Greater than 10 times ULN:** Permanently discontinue.

**Diarrhea**

**Moderate diarrhea:** Maintain dose. **Severe diarrhea or hospitalization:** Withhold until resolved, then resume at 100-mg dose. **Life-threatening diarrhea:** Permanently discontinue.

**Neutropenia**

**ANC 1,000–1,500 cells/mm<sup>3</sup>:** Maintain dose. **ANC 500–1,000 cells/mm<sup>3</sup>:** Monitor ANC w/ky and maintain dose. **ANC less than 500 cells/mm<sup>3</sup>:** Permanently discontinue.

**Thrombocytopenia**

**Platelets 50,000–75,000 cells/mm<sup>3</sup>:** Maintain dose. **Platelets 25,000–50,000 cells/mm<sup>3</sup>:** Monitor platelet count w/ky and maintain dose. **Platelets less than 25,000 cells/mm<sup>3</sup>:** Monitor platelet count w/ky. Withhold until platelets greater

than 25,000 cells/mm<sup>3</sup>, then resume at 100-mg dose.

**Pneumonitis**

**Any symptoms:** Permanently discontinue.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution. See dose modification.

**SIDE EFFECTS****CLL**

**Frequent (35%–21%):** Pyrexia, nausea, diarrhea, chills. **Occasional (10%–5%):** Headache, vomiting, generalized pain, arthralgia, stomatitis, gastric reflux, nasal congestion.

**Non-Hodgkin's Lymphoma**

**Frequent (47%–21%):** Diarrhea, fatigue, nausea, cough, pyrexia, abdominal pain, rash. **Occasional (17%–10%):** Dyspnea, decreased appetite, vomiting, asthenia, night sweats, insomnia, headache, peripheral edema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Thrombocytopenia, neutropenia, leukopenia, lymphopenia are expected responses to therapy, but more severe reactions, including bone marrow failure, febrile neutropenia, may occur. Fatal and/or serious events including hepatotoxicity (14% of pts), severe diarrhea or colitis (14% of pts), hypersensitivity reactions (including anaphylaxis), pneumonitis, intestinal perforation were reported. Neutropenia occurred in 31% of pts, which may greatly increase risk of infection. Severe skin reactions including toxic epidermal necrolysis, generalized rash, exfoliative rash were reported. Other infections may include bronchitis, *C. difficile* colitis, pneumonia, sepsis, UTI. Fatal and/or serious intestinal perforation may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, pregnancy test in females of reproductive potential. Receive full medication history includ-

ing herbal products. Question history of hypersensitivity reaction or acute skin reactions to drug class. Perform full dermatologic exam with routine assessment. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC frequently. Any interruption of therapy or dosage change may require wkly lab monitoring until symptoms resolve. Obtain *C. difficile* toxin PCR if severe diarrhea occurs. Screen for acute cutaneous reactions, allergic reactions, other acute infections (sepsis, UTI), hepatic impairment, pulmonary events (dyspnea, pneumonitis, pneumonia), or tumor lysis syndrome (electrolyte imbalance, uric acid nephropathy, acute renal failure). Monitor strict I&O, hydration status, stool frequency and consistency.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report abdominal pain, amber or bloody urine, bruising, black/tarry stools, persistent diarrhea, yellowing of skin or eyes.
- Immediately report difficult breathing, severe coughing, chest tightness.
- Therapy may cause severe allergic reactions, intestinal tearing, or skin rashes or severe diarrhea related to an infected colon.

## ifosfamide

HIGH  
ALERT

eye-fos-fa-mide  
(Ifex)

**BLACK BOX ALERT** ■ Hemorrhagic cystitis may occur. Severe myelosuppressant. May cause CNS toxicity, including confusion, coma. Must be administered by personnel

trained in administration/handling of chemotherapeutic agents. May cause severe nephrotoxicity, resulting in renal failure.

**Do not confuse ifosfamide with cyclophosphamide.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

#### USES

Treatment of germ cell testicular carcinoma (used in combination with other chemotherapy agents and with concurrent mesna for prophylaxis of hemorrhagic cystitis). **OFF-LABEL:** Small-cell lung, non-small-cell lung, ovarian, cervical, bladder cancer; soft tissue sarcomas, Hodgkin's, non-Hodgkin's lymphomas; osteosarcoma; head and neck, Ewing's sarcoma.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to ifosfamide. Urinary outflow obstruction.

**Cautions:** Renal/hepatic impairment, compromised bone marrow reserve, active urinary tract infection, preexisting cardiac disease, prior radiation therapy, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). Avoid use in pts with WBC less than 2,000 cells/mm<sup>3</sup> and platelets less than 50,000 cells/mm<sup>3</sup>.

#### ACTION

Inhibits DNA, protein synthesis by cross-linking with DNA strands, preventing cell growth. **Therapeutic Effect:** Produces cellular death (apoptosis).

#### PHARMACOKINETICS

Metabolized in liver. Protein binding: negligible. Crosses blood-brain barrier (to a limited extent). Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 11–15 hrs (high dose); 4–7 hrs (low dose).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Males must use effective contraception and not conceive a child during treatment and for at least 6 months after discontinuation. May cause fetal harm. Distributed in breast milk. Breastfeeding not recommended. **Children:** Not intended for this pt population. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression. May decrease therapeutic effect of BCG (intravesical). Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, bilirubin, creatinine, uric acid, ALT, AST.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (Ifex): 1 g, 3 g. **Injection, Solution:** 50 mg/mL.

## ADMINISTRATION/HANDLING

**◀ALERT▶** Hemorrhagic cystitis occurs if mesna is not given concurrently. Mesna should always be given with ifosfamide.

**Reconstitution** • Reconstitute vial with Sterile Water for Injection or Bacteriostatic Water for Injection to provide concentration of 50 mg/mL. Shake to dissolve. • Further dilute with 50–1,000 mL D<sub>5</sub>W or 0.9% NaCl to provide concentration of 0.6–20 mg/mL.

**Rate of administration** • Infuse over minimum of 30 min. • Give with at least 2,000 mL PO or IV fluid (prevents bladder toxicity). • Give with protectant against hemorrhagic cystitis (i.e., mesna).

**Storage** • Store vials of powder at room temperature. • Refrigerate vials of solution. • After reconstitution with Bacteriostatic Water for Injection, vials and diluted solutions stable for 24 hrs if refrigerated.

## IV INCOMPATIBILITIES

Cefepime (Maxipime), methotrexate.

## IV COMPATIBILITIES

Granisetron (Kytril), ondansetron (Zofran).

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Dosage individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for optimum dosage, sequence of drug administration.

### Germ Cell Testicular Carcinoma

**IV; ADULTS:** 1,200 mg/m<sup>2</sup>/day for 5 consecutive days. Repeat q3wks or after recovery from hematologic toxicity. Administer with mesna and hydration (to prevent bladder toxicity).

### Dosage in Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent (83%–58%):** Alopecia, nausea, vomiting. **Occasional (15%–5%):** Confusion, drowsiness, hallucinations, infection. **Rare (less than 5%):** Dizziness, seizures, disorientation, fever, malaise, stomatitis (mucosal irritation, glossitis, gingivitis).

## ADVERSE EFFECTS/TOXIC REACTIONS

Hemorrhagic cystitis with hematuria, dysuria occurs frequently if protective agent (mesna) is not used. Myelosuppression (leukopenia, thrombocytopenia) occurs frequently. Pulmonary toxicity, hepatotoxicity, nephrotoxicity, cardiotoxicity, CNS toxicity (confusion, hallucinations, drowsiness, coma) may require discontinuation of therapy. Secondary malignancies including lymphoma, thyroid cancer, sarcoma were

reported. Veno-occlusive hepatic disease may occur. May impair healing of wounds.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain urinalysis before each dose. If hematuria occurs (greater than 10 RBCs per field), therapy should be withheld until resolution occurs. Obtain WBC, platelet count, Hgb before each dose. Question history of hepatic/renal impairment, cardiac disease. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, urinalysis, renal function, LFT. Assess for fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness). Monitor for toxicities.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Drink plenty of fluids (protects against cystitis).
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infections.
- Report unusual bleeding/bruising, fever, chills, sore throat, joint pain, sores in mouth or on lips, yellowing skin or eyes.

## iloperidone

eye-loe-per-i-doan  
(Fanapt, Fanapt Titration Pack)

**BLACK BOX ALERT** Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events.

**Do not confuse iloperidone with amiodarone or dronedarone.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Second-generation (atypical) antipsychotic.  
**CLINICAL:** Antipsychotic.

## USES

Acute treatment of schizophrenia in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to iloperidone. **Cautions:** Cardiovascular disease (HF, history of MI, ischemia, cardiac conduction abnormalities), cerebrovascular disease (increases risk of CVA in pts with dementia, seizure disorders). Pts at risk for orthostatic hypotension. Pts with bradycardia, hypokalemia, hypomagnesemia may be at greater risk for torsades de pointes. History of seizures, conditions lowering seizure threshold, high risk of suicide, risk of aspiration pneumonia, congenital QT syndrome, concurrent use of medications that prolong QT interval, decreased GI motility, urinary retention, BPH, xerostomia, visual problems, hepatic impairment, narrow-angle glaucoma, diabetes, elderly.

## ACTION

Mixed combination of DOPamine type 2 (D<sub>2</sub>) and serotonin type 2 (5-HT<sub>2</sub>) antagonisms (thought to improve negative symptoms of psychosis). **Therapeutic Effect:** Diminishes symptoms of schizophrenia and reduces incidence of extrapyramidal side effects.

## PHARMACOKINETICS

Steady-state concentration occurs in 3–4 days. Well absorbed from GI tract (unaffected by food). Protein binding: 95%. Metabolized in liver. Primarily excreted in urine, with a lesser amount excreted in feces. **Half-life:** 18–33 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is excreted in breast milk. Breastfeeding not recommended.

**Children:** Safety and efficacy not established. **Elderly:** More susceptible to postural hypotension. Increased risk of cerebrovascular events, mortality, including stroke in elderly pts with psychosis.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., diphenhydrAMINE, LORazepam, morphine) may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), **strong CYP2D6 inhibitors** (e.g., FLUoxetine, PARoxetine) may increase concentration/effect. **Medications causing prolongation of QT interval** (e.g., amiodarone, dofetilide, sotalol) may increase effects on cardiac conduction, leading to malignant arrhythmias (torsades de pointes). **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum prolactin levels.

## AVAILABILITY (Rx)

**Tablets:** 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Tablets may be crushed.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Titrate to the proper dose range with dosage adjustments not to exceed 2 mg twice daily (4 mg/day).

### Schizophrenia

**PO: ADULTS:** To avoid orthostatic hypotension, begin with 1 mg twice daily, then adjust dosage to 2 mg twice daily, 4 mg twice daily, 6 mg twice daily, 8 mg twice daily, 10 mg twice daily, and 12 mg twice daily on days 2, 3, 4, 5, 6, and 7, respectively, to reach target daily dose of 12–24 mg/day in 2 divided doses. **Note:** Reduce dose by 50% when receiving strong CYP2D6 or CYP3A4 inhibitors or poor metabolizers of CYP2D6 (see Interactions).

## Dosage in Renal Impairment

No dose adjustment.

## Dosage in Hepatic Impairment

**Mild impairment:** No adjustment. **Moderate impairment:** Use caution. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (20%–12%):** Dizziness, drowsiness, tachycardia. **Occasional (10%–4%):** Nausea, dry mouth, nasal congestion, weight increase, diarrhea, fatigue, orthostatic hypotension. **Rare (3%–1%):** Arthralgia, musculoskeletal stiffness, abdominal discomfort, nasopharyngitis, tremor, hypotension, rash, ejaculatory failure, dyspnea, blurred vision, lethargy.

## ADVERSE EFFECTS/TOXIC REACTIONS

Extrapyramidal disorders, including tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of the mouth), occur in 4% of pts. Upper respiratory infection occurs in 3% of pts. QT interval prolongation may produce torsades de pointes, a form of ventricular tachycardia. Neuroleptic malignant syndrome (e.g., hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or B/P) has been noted.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess pt's behavior, appearance, emotional status, response to environment, speech pattern, thought content. ECG should be obtained to assess for QT prolongation before instituting medication. Question medical history as listed in Precautions.

### INTERVENTION/EVALUATION

Monitor for orthostatic hypotension; assist with ambulation. Monitor for fine tongue movement (may be first sign of tardive dyskinesia, possibly irreversible). Monitor serum potassium, magnesium in pts at risk for electrolyte disturbances. Assess for therapeutic response (greater interest in surroundings, improved

self-care, increased ability to concentrate, relaxed facial expression).

#### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Be alert to symptoms of orthostatic hypotension; slowly go from lying to standing.
- Report if feeling faint, if experiencing heart palpitations, or if fever or muscle rigidity occurs.
- Report extrapyramidal symptoms (e.g., involuntary muscle movements, tics) immediately.

## ***imatinib***

TOP  
100 HIGH  
ALERT

im-at-in-ib  
(Gleevec)

**Do not confuse imatinib with dasatinib, erlotinib, lapatinib, nilotinib, SORafenib, or SUNItinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** BCR-ABL tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Newly diagnosed chronic-phase Philadelphia chromosome positive chronic myeloid leukemia (Ph+ CML) in children and adults. Pts in blast crisis, accelerated phase, or chronic phase Ph+ CML who have already failed interferon therapy. Adults with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL). Treatment in children with Ph+ ALL. Adults with myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements. Adults with aggressive systemic mastocytosis (ASM) without mutation of the D816V c-Kit or unknown mutation status of the c-Kit. Adults with hypereosinophilic syndrome (HES) and/or chronic eosino-

philic leukemia (CEL) with positive, negative, or unknown FIP1L1-PDGFR fusion kinase. Adults with dermatofibrosarcoma protuberans (DFSP) that is unresectable, recurrent, and/or metastatic. Pts with malignant gastrointestinal stromal tumors (GIST) that are unresectable and/or metastatic. Prevention of cancer recurrence in pts following surgical removal of GIST. **OFF-LABEL:** Treatment of desmoid tumors (soft tissue sarcoma). Post-stem cell transplant (allogeneic), follow-up treatment in recurrent CML. Treatment of advanced or metastatic melanoma.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to imatinib. **Cautions:** Hepatic/renal impairment, thyroidectomy pts, hypothyroidism, gastric surgery pts. history of effusions or edema (pleural effusion, pericardial effusion, generalized edema); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract or abdominal malignancies, GI ulcers), pts at high risk for tumor lysis syndrome (high tumor burden)

### ACTION

Inhibits Bcr-Abl tyrosine kinase, an enzyme created by Philadelphia chromosome abnormality found in pts with chronic myeloid leukemia. **Therapeutic Effect:** Blocks tumor cell proliferation and induces cellular death (apoptosis).

### PHARMACOKINETICS

Widely distributed. Protein binding: 95%. Metabolized in liver. Eliminated in feces (68%), urine (13%). **Half-life:** 18 hrs; metabolite, 40 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased frequency of fluid retention.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Bone marrow depressants (e.g., cladribine) may increase myelosuppression. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May decrease effect of warfarin. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May increase serum bilirubin, ALT, AST, creatinine. May decrease platelet count, RBC, WBC count; serum potassium, albumin, calcium.

**AVAILABILITY (Rx)**

**Tablets:** 100 mg, 400 mg.

**ADMINISTRATION/HANDLING**

**PO**

- Give with a meal and large glass of water.
- Tablets may be dispersed in water or apple juice (stir until dissolved; give immediately). Do not crush or chew tablets.

**INDICATIONS/ROUTES/DOSAGE**

**Ph+ Chronic Myeloid Leukemia (CML) (Chronic Phase)**

**PO: ADULTS, ELDERLY:** 400 mg once daily; may increase to 600 mg/day. **Maximum:** 800 mg. **CHILDREN:** 340 mg/m<sup>2</sup>/day. **Maximum:** 600 mg.

**Ph+ CML (Accelerated Phase)**

**PO: ADULTS, ELDERLY:** 600 mg once daily. May increase to 800 mg/day in 2 divided doses (400 mg twice daily). **CHILDREN:** 340 mg/m<sup>2</sup>/day. **Maximum:** 600 mg.

**Ph+ Acute Lymphoblastic Leukemia (ALL)**

**PO: ADULTS, ELDERLY:** 600 mg once daily.

**Gastrointestinal Stromal Tumors (GIST) (Following Complete Resection)**

**PO: ADULTS, ELDERLY:** 400 mg once daily for 3 yrs.

**GIST (Unresectable)**

**PO: ADULTS, ELDERLY:** 400 mg once daily. May increase up to 400 mg twice daily.

**Aggressive Systemic Mastocytosis (ASM) With Eosinophilia**

**PO: ADULTS, ELDERLY:** Initially, 100 mg/day. May increase up to 400 mg/day.

**ASM Without Mutation of the D816V C-Kit or Unknown Mutation Status of C-Kit**

**PO: ADULTS, ELDERLY:** 400 mg once daily.

**Dermatofibrosarcoma Protuberans (DFSP)**

**PO: ADULTS, ELDERLY:** 400 mg twice daily.

**Hypereosinophilic Syndrome (HES)/Chronic Eosinophilic Leukemia (CEL)**

**PO: ADULTS, ELDERLY:** 400 mg once daily.

**HES/CEL With Positive or Unknown FIP1L1-PDGFR Fusion Kinase**

**PO: ADULTS, ELDERLY:** Initially, 100 mg/day. May increase up to 400 mg/day.

**Myelodysplastic/Myeloproliferative Disease (MDS/MPD)**

**PO: ADULTS, ELDERLY:** 400 mg once daily.

**Usual Dosage for Children (2 yrs and older)**

**Ph+ CML (Chronic Phase, Recurrent, or Resistant)**

**PO:** 340 mg/m<sup>2</sup>/day. **Maximum:** 600 mg/day.

**Ph+ CML (Chronic Phase, Newly Diagnosed, Ph+ ALL)**

**PO:** 340 mg/m<sup>2</sup>/day. **Maximum:** 600 mg/day.

**Dosage With Strong CYP3A4 Inducers**

Increase dose by 50% with careful monitoring.

**Dosage in Renal Impairment**

**Creatinine**

Clearance	Maximum Dose
40–59 mL/min	600 mg
20–39 mL/min	400 mg
Less than 20 mL/min	100 mg

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No adjustment. **Severe impairment:** Reduce dosage by 25%.

## SIDE EFFECTS

**Frequent (68%–24%):** Nausea, diarrhea, vomiting, headache, fluid retention, rash, musculoskeletal pain, muscle cramps, arthralgia. **Occasional (23%–10%):** Abdominal pain, cough, myalgia, fatigue, fever, anorexia, dyspepsia, constipation, night sweats, pruritus, dizziness, blurred vision, somnolence. **Rare (less than 10%):** Nasopharyngitis, petechiae, asthenia, epistaxis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe fluid retention (pleural effusion, pericardial effusion, pulmonary edema, ascites), hepatotoxicity occur rarely. Neutropenia, thrombocytopenia are expected responses to the therapy. Respiratory toxicity is manifested as dyspnea, pneumonia. Heart damage (left ventricular dysfunction, HF) may occur. Grade 3 or hemorrhage reported in 2% of pts. May increase risk of GI perforation. Dermal toxicities, including erythema multiform, Stevens-Johnson syndrome, may occur. May retard growth in children and adolescents. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia, which may be fatal. May cause renal toxicity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Question history of hepatic impairment/renal impairment, hypothyroidism, HF, edema. Due to increased risk of tumor lysis syndrome, assess hydration status prior to each treatment. Assess risk of GI perforation. Receive full medication history and screen for interactions. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression w/ky for 4 wks, then biweekly for 4 wks, then periodically thereafter. Obtain LFT if hepatotoxicity (bruising, jaundice, right upper

abdominal pain, nausea, vomiting, weight loss) is suspected. Obtain serum calcium, phosphate, uric acid if tumor lysis syndrome is suspected (presents as acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Diligently monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. If dyspnea occurs, obtain radiologic exam to assess for effusions/pleurisy. Monitor for edema (third spacing, dyspnea, weight gain), symptoms of GI perforation (abdominal pain, fever, melena, hematemesis). Assess skin for cutaneous reactions, skin toxicities. Monitor daily pattern of bowel activity, stool consistency; I&Os, hydration status; be alert for unexpected weight gain.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), toxic skin reactions (blistering, peeling, rash, skin eruptions); symptoms of edema (shortness of breath, swelling of extremities, weight gain), lung effusion (chest pain, dry cough, shortness of breath).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Report severe or persistent abdominal pain, bloody stool, fever, vomiting; may indicate rupture in GI tract.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## immune globulin IV (IGIV)

### im-mune glob-u-lin

(Asceniv, Bivigam, Flebogamma DIF, Gammagard Liquid, Gammagard S/D, Gammaplex, Gamunex-C, Hizentra, Octagam 5%, Privigen)

**BLACK BOX ALERT** Acute renal impairment characterized by increased serum creatinine, oliguria, acute renal failure, osmotic nephrosis, particularly pts with any degree of renal insufficiency, diabetes mellitus, volume depletion, sepsis, and those older than age 65 yrs. Thrombosis may occur (administer at the minimum dose and minimum infusion rate; ensure adequate hydration).

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Immune globulin, blood product. **CLINICAL:** Immunizing agent.

### USES

Treatment of pts with primary humoral immunodeficiency syndromes, acute/chronic immune idiopathic thrombocytopenic purpura (ITP), prevention of coronary artery aneurysms associated with Kawasaki disease, prevention of recurrent bacterial infections in pts with hypogammaglobulinemia associated with B-cell chronic lymphocytic leukemia (CLL). Treatment of chronic inflammatory demyelinating polyneuropathies. Provide passive immunity in pts with hepatitis A, measles, rubella, varicella. **OFF-LABEL:** Guillain-Barré syndrome; myasthenia gravis; prevention of acute infections in immunosuppressed pts; prevention, treatment of infection in high-risk, preterm, low-birth-weight neonates; treatment of multiple sclerosis, HIV-associated thrombocytopenia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to immune globulin. Selective IgA deficiency, hyperprolinemia (Hizentra, Privigen), severe thrombocytopenia, coagulation

disorders where IM injections contraindicated. Hypersensitivity to corn (Octagam); infants/neonates for whom sucrose or fructose tolerance has not been established (Gammaplex). **Cautions:** Cardiovascular disease, history of thrombosis, renal impairment.

### ACTION

Replacement therapy for primary/secondary immunodeficiencies and IgG antibodies against bacteria, viral antigens; interferes with receptors on cells of reticuloendothelial system for autoimmune cytopenias/idiopathic thrombocytopenia purpura (ITP); increases antibody titer and antigen-antibody reaction potential. **Therapeutic Effect:** Provides passive immunity replacement for immunodeficiencies, increases antibody titer.

### PHARMACOKINETICS

Evenly distributed between intravascular and extravascular space. **Half-life:** 21–23 days.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Live virus vaccines may increase vaccine side effects, potentiate virus replication, decrease pt's antibody response to vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (Gammagard S/D): 5 g, 10 g. **Injection, Solution:** (Asceniv, Bivigam 10%, Flebogamma DIF 5%, 10%, Gammagard Liquid 10%, Gammaplex 5%, Gamunex-C 10%, Octagam 5%, Privigen 10%).

### ADMINISTRATION/HANDLING

**◀ALERT▶** Monitor vital signs, B/P diligently during and immediately after IV

administration (precipitous fall in B/P may indicate anaphylactic reaction). Stop infusion immediately. EPINEPHrine should be readily available.

**Reconstitution** • Reconstitute only with diluent provided by manufacturer. • Discard partially used or turbid preparations.

**Rate of administration** • Give by infusion only. • After reconstitution, administer via separate tubing. • Rate of infusion varies with product used.

**Storage** • Refer to individual IV preparations for storage requirements, stability after reconstitution.

## IV INCOMPATIBILITIES

Do not mix with any other medications.

## INDICATIONS/ROUTES/DOSAGE

### Primary Immunodeficiency Syndrome

**IV: ADULTS, ELDERLY, CHILDREN:** (*Privigen*): 200–800 mg/kg q3–4wks. (*Carium NF*): 400–800 mg/kg q3–4 wks. (*Flebogamma DIF*, *Gammagard*, *Gamunex-C*, *Octagam*): 300–600 mg/kg/q3–4wks. (*Asceniv*, *Bivigam*, *Gammaplex*): 300–800 mg/kg q3–4wks.

### Idiopathic Thrombocytopenic Purpura (ITP)

**IV: ADULTS, ELDERLY, CHILDREN:** (*Carium NF*): 400 mg/kg/day for 2–5 days. **Maintenance:** 400–1,000 mg/kg/dose to maintain platelet count or control bleeding. (*Gammagard*): 1,000 mg/kg: up to 3 total doses may be given on alternate days based on pt response and/or platelet count. (*Gammaplex*, *Octagam*, *Flebogamma DIF*): 1,000 mg/kg once daily for 2 consecutive days.

### Kawasaki Disease

**Note:** Must be used with aspirin.

**IV: CHILDREN:** (*Gammagard*): 1,000 mg/kg as single dose or 400 mg/kg/day for 4 consecutive days. Begin within 7 days of onset of fever. **American Heart Association guidelines:** 2,000 mg/kg as a single dose given over 10–12 hrs within 10 days of disease onset.

### Chronic Lymphocytic Leukemia (CLL)

**IV: ADULTS, ELDERLY, CHILDREN:** (*Gammagard*): 400 mg/kg/dose q3–4wks.

### Chronic Inflammatory Demyelinating Polyneuropathy

**IV: ADULTS, ELDERLY, CHILDREN:** (*Gamunex-C*): **Loading Dose:** 2 g/kg divided over 2–4 days (consecutive). **Maintenance:** 1 g/kg/day q3wks or 500 mg/kg for 2 consecutive days q3wks. (*Privigen*): **Loading Dose:** 2 g/kg in divided doses over 2–5 consecutive days. **Maintenance:** 1 g/kg q3wks or 500 mg/kg for 2 consecutive days q3wks.

### Dosage in Renal Impairment

Caution when giving IV.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Tachycardia, backache, headache, arthralgia, myalgia. **Occasional:** Fatigue, wheezing, injection site rash/pain, leg cramps, urticaria, bluish color of lips/nailbeds, light-headedness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anaphylactic reactions occur rarely, but incidence increases with repeated injections. EPINEPHrine should be readily available. Overdose may produce chest tightness, chills, diaphoresis, dizziness, facial flushing, nausea, vomiting, fever, hypotension. Hypersensitivity reaction (anxiety, arthralgia, dizziness, flushing, myalgia, palpitations, pruritus) occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of cardiac disease, thrombosis. Have EPINEPHrine readily available. Pt should be well hydrated prior to administration.

### INTERVENTION/EVALUATION

Control rate of IV infusion carefully; too-rapid infusion increases risk of precipi-

tous fall in B/P, signs of anaphylaxis (facial flushing, chest tightness, chills, fever, nausea, vomiting, diaphoresis). Assess pt closely during infusion, esp. first hr; monitor vital signs continuously. Stop infusion if aforementioned signs noted. For treatment of idiopathic thrombocytopenic purpura (ITP), monitor platelet count.

#### PATIENT/FAMILY TEACHING

- Explain rationale for therapy.
- Report sudden weight gain, fluid retention, edema, decreased urine output, shortness of breath.

## indomethacin

in-doe-meth-a-sin  
(Indocin, Tivorbex)

**BLACK BOX ALERT** Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

**Do not confuse Indocin with Imodium, Minocin, or Vicodin.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID.  
**CLINICAL:** Anti-inflammatory, analgesic.

#### USES

**Indocin:** Treatment of active stages of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, acute gouty arthritis. Relieves acute bursitis, tendinitis. **Tivorbex:** Treatment of mild to moderate acute pain in adults. **IV:** For closure of hemodynamically significant patent ductus arteriosus of premature infants weighing between 500 and 1,750 g when 48-hr usual medical management is ineffective. **OFF-LABEL:** Management of preterm labor.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to aspirin, indomethacin, other NSAIDs.

Perioperative pain in setting of CABG surgery. History of asthma, urticaria, allergic reactions after taking aspirin, other NSAIDs. **Suppositories:** History of proctitis, recent rectal bleeding. **Injection:** In preterm infants with untreated/systemic infection or congenital heart disease where patency of PDA necessary for pulmonary or systemic blood flow; bleeding, thrombocytopenia, coagulation defects, necrotizing enterocolitis, significant renal dysfunction. **Cautions:** Cardiac dysfunction, fluid retention, HF, hypertension, renal/hepatic impairment, epilepsy; concurrent aspirin, steroids, anticoagulant therapy. Treatment of juvenile rheumatoid arthritis in children. History of GI disease (bleeding or ulcers), elderly, debilitated, asthma, depression, Parkinson's disease.

#### ACTION

Reversibly inhibits COX-1 and COX-2 enzymes. Produces antipyretic, analgesic, anti-inflammatory effects by inhibiting prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammatory response, fever, intensity of pain. Closure of patent ductus arteriosus.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	—	4–6 hrs

Widely distributed. Protein binding: 99%. Metabolized in liver. Excreted in urine. **Half-life:** 4.5 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Avoid use during third trimester. **Children:** Safety and efficacy not established in those younger than 14 yrs. **Elderly:** Increased risk of serious adverse effects; GI bleeding, ulceration.

#### INTERACTIONS

**DRUG:** May increase risk of bleeding; adverse effects of apixaban, dabigatran, edoxaban, rivaroxaban. **Bile acid sequestrants (e.g., cholestyramine)**

may decrease absorption/effect. May increase nephrotoxic effect of **cycloSPORINE**. May increase concentration/effect of **lithium**. May decrease effect of **loop diuretics** (e.g., **bumetanide**, **furosemide**). **HERBAL**: **Glucosamine**, **herbals with anticoagulant/antiplatelet properties** (e.g., **garlic**, **ginger**, **ginseng**, **ginkgo biloba**) may increase concentration/effect. **FOOD**: None known. **LAB VALUES**: May prolong bleeding time. May alter serum glucose. May increase serum BUN, creatinine, potassium, ALT, AST. May decrease serum sodium, platelet count, leukocytes.

### AVAILABILITY (Rx)

**Capsules**: 25 mg, 50 mg. (**Tivorbex**): 20 mg. **Injection, Powder for Reconstitution (Indocin IV)**: 1 mg. **Oral Suspension (Indocin)**: 25 mg/5 mL. **Suppository**: 50 mg.

 **Capsules, Extended-Release**: 75 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • To 1-mg vial, add 1–2 mL preservative-free Sterile Water for Injection or 0.9% NaCl to provide concentration of 1 mg/mL or 0.5 mg/mL, respectively. • Do not further dilute.

**Rate of administration** • Administer over 20–30 min.

**Storage** • Use IV solution immediately following reconstitution. • IV solution appears clear; discard if cloudy or precipitate forms. • Discard unused portion.

### PO

• Give after meals or with food, antacids. • Do not break, crush, or open extended-release capsule. Swallow whole.

### IV INCOMPATIBILITIES

Amino acid injection, calcium gluconate, DOBUTamine (Dobutrex), DOPamine (Intropin), gentamicin (Garamycin), tobramycin (Nebcin).

### IV COMPATIBILITIES

Insulin, potassium.

### INDICATIONS/ROUTES/DOSAGE

**Moderate to Severe Rheumatoid Arthritis (RA), Osteoarthritis, Ankylosing Spondylitis**

**PO**: **ADULTS, ELDERLY, CHILDREN OLDER THAN 14 YRS**: (**Immediate-Release**): Initially, 25 mg 2–3 times/day; increased by 25–50 mg/wk up to 150–200 mg/day. (**Extended-Release**): Initially, 75 mg once daily. May increase to 75 mg twice daily. **Maximum**: 150 mg/day. **CHILDREN 2 YRS AND OLDER**: (**Immediate-Release**): 1–2 mg/kg/day in 2–4 divided doses. **Maximum**: 4 mg/kg/day not to exceed 150–200 mg/day.

#### Acute Gouty Arthritis

**PO, rectal**: **ADULTS, ELDERLY**: (**Immediate-Release**): 50 mg 3 times/day for 5–7 days until pain is tolerable, then rapidly reduce dose to complete cessation of medication.

#### Acute Bursitis, Tendonitis

**PO**: **ADULTS, ELDERLY**: (**Immediate-Release**): 75–150 mg/day in 3–4 divided doses for 7–14 days. (**Extended-Release**): 75–150 mg/day in 1–2 doses/day for 7–14 days.

#### Acute Pain

**PO**: **ADULTS, ELDERLY**: (**Tivorbex**): 20 mg 3 times/day or 40 mg 2–3 times/day.

#### Patent Ductus Arteriosus

**IV**: **NEONATES**: Initially, 0.2 mg/kg. Subsequent doses are based on age, as follows: **NEONATES OLDER THAN 7 DAYS**: 0.25 mg/kg for 2nd and 3rd doses. **NEONATES 2–7 DAYS**: 0.2 mg/kg for 2nd and 3rd doses. **NEONATES YOUNGER THAN 48 HRS**: 0.1 mg/kg for 2nd and 3rd doses. In general, dosing interval is 12 hrs if urine output is greater than 1 mL/kg/hr after prior dose, 24 hrs if urine output is less than 1 mL/kg/hr but greater than 0.6 mL/kg/hr. Dose is held if urine output is less than 0.6 mL/kg/hr or if neonate is anuric.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (11%–3%):** Headache, nausea, vomiting, dyspepsia, dizziness. **Occasional (less than 3%):** Depression, tinnitus, diaphoresis, drowsiness, constipation, diarrhea. **Patent ductus arteriosus:** Bleeding abnormalities. **Rare:** Hypertension, confusion, urticaria, pruritus, rash, blurred vision.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Paralytic ileus, ulceration of esophagus, stomach, duodenum, small intestine may occur. Pts with renal impairment may develop hyperkalemia with worsening of renal impairment. May aggravate depression or other psychiatric disturbances, epilepsy, parkinsonism. Nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome) occurs rarely. Metabolic acidosis/alkalosis, bradycardia occur rarely in neonates with patent ductus arteriosus.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain, fever, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question medical history as listed in Precautions.

**INTERVENTION/EVALUATION**

Monitor serum BUN, creatinine, potassium, LFT. Monitor for evidence of nausea, dyspepsia. Assist with ambulation if dizziness occurs. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Observe for weight gain, edema, bleeding, bruising. In neonates, also monitor heart rate, heart sounds for murmur, B/P, urine output, ECG, serum sodium, glucose, platelets.

**PATIENT/FAMILY TEACHING**

- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report ringing in ears, persistent stomach pain, unusual bruising/bleeding.

**inFLIXimab**TOP  
100**in-flix-i-mab**

(Avsola, Remicade, Inflectra, Renflexis)

**BLACK BOX ALERT** Risk of severe/fatal opportunistic infections (tuberculosis, sepsis, fungal), reactivation of latent infections. Rare cases of very aggressive, usually fatal hepatosplenic T-cell lymphoma reported in adolescents, young adults with Crohn's disease. **Do not confuse inFLIXimab with riTUXimab, or Remicade with Reminyl.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Tumor necrosis factor (TNF) blocking agent. Monoclonal antibody. **CLINICAL:** Antirheumatic, disease-modifying, GI, immunosuppressant agent.

**USES**

In combination with methotrexate, reduces signs/symptoms, inhibits progression of structural damage, improves physical function in moderate to severe active rheumatoid arthritis (RA). Treatment of psoriatic arthritis. Reduces signs/symptoms, induces and maintains remission in moderate to severe active Crohn's disease. Reduces number of draining enterocutaneous/rectovaginal fistulas, maintains fistula closure in fistulizing Crohn's disease. Reduces sign/symptoms of active ankylosing spondylitis. Treatment of chronic severe plaque psoriasis in pts who are candidates for systemic therapy. Reduces sign/symptoms, induces and maintains clinical

remission and mucosal healing, eliminates corticosteroid use in moderate to severe active ulcerative colitis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to in-FLIXimab. Moderate to severe HF (doses greater than 5 mg/kg should be avoided). Sensitivity to murine proteins, sepsis, serious active infection. **Cautions:** Hematologic abnormalities, history of COPD, preexisting or recent-onset CNS demyelinating disorders, seizures, mild HF, history of recurrent infections, conditions predisposing pt to infections (e.g., diabetes), pts exposed to tuberculosis, elderly pts, chronic hepatitis B virus infection.

## ACTION

Binds to tumor necrosis factor (TNF), inhibiting functional activity of TNF (induction of proinflammatory cytokines, enhanced leukocytic migration, activation of neutrophils/eosinophils). **Therapeutic Effect:** Prevents disease and allows diseased joints to heal.

## PHARMACOKINETICS

Absorbed into GI tissue; primarily distributed in vascular compartment. **Half-life:** 8–9.5 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use cautiously due to higher rate of infection.

## INTERACTIONS

**DRUG:** Anakinra, anti-TNF agents, baricitinib, pimecrolimus, tacrolimus (topical), tocilizumab may increase adverse effects. May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase levels, adverse effects of belimumab, natalizumab, vaccines (live), vedolizumab. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 100 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each vial with 10 mL Sterile Water for Injection, using 21-gauge or smaller needle. Direct stream of Sterile Water for Injection to glass wall of vial. • Swirl vial gently to dissolve contents (do not shake). • Allow solution to stand for 5 min and inject into 250-mL bag 0.9% NaCl; gently mix. Concentration should range between 0.4 and 4 mg/mL. • Begin infusion within 3 hrs after reconstitution.

**Rate of administration** • Administer IV infusion over at least 2 hrs using a low protein-binding filter.

**Storage** • Refrigerate vials. • Solution should appear colorless to light yellow and opalescent; do not use if discolored or if particulate forms.

## IV INCOMPATIBILITIES

Do not infuse in same IV line with other agents.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Premedicate with antihistamines, acetaminophen, steroids to prevent/manage infusion reactions.

### Rheumatoid Arthritis (RA)

**IV infusion: ADULTS, ELDERLY: In combination with methotrexate:** 3 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. Range: 3–10 mg/kg repeated at 4- to 8-wk intervals.

### Crohn's Disease

**IV infusion: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. For adults who respond then lose response, consideration may be given to treatment with 10 mg/kg.

**Ankylosing Spondylitis**

**IV infusion: ADULTS, ELDERLY:** 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q6wks thereafter.

**Psoriatic Arthritis**

**IV infusion: ADULTS, ELDERLY:** 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter. May be used with or without methotrexate.

**Plaque Psoriasis**

**IV infusion: ADULTS, ELDERLY:** 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter.

**Ulcerative Colitis**

**IV infusion: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 5 mg/kg followed by additional doses at 2 and 6 wks after first infusion, then q8wks thereafter.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (22%–10%):** Headache, nausea, fatigue, fever. **Occasional (9%–5%):** Fever/chills during infusion, pharyngitis, vomiting, pain, dizziness, bronchitis, rash, rhinitis, cough, pruritus, sinusitis, myalgia, back pain. **Rare (4%–1%):** Hypotension or hypertension, paresthesia, anxiety, depression, insomnia, diarrhea, UTI.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Serious infections, including sepsis, occur rarely. Potential for hypersensitivity reaction, lupus-like syndrome, severe hepatic reaction, HF.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess hydration status (skin turgor urinary status). Question history of CNS

disorders, COPD, HF. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Verify that pt has not received live vaccines prior to initiation.

**INTERVENTION/EVALUATION**

Monitor urinalysis, erythrocyte sedimentation rate (ESR), B/P. Monitor for signs of infection. Monitor daily pattern of bowel activity, stool consistency. **Crohn's disease:** Monitor C-reactive protein, frequency of stools. Assess for abdominal pain. **Rheumatoid arthritis (RA):** Monitor C-reactive protein. Assess for decreased pain, swollen joints, stiffness.

**PATIENT/FAMILY TEACHING**

- Report persistent fever, cough, abdominal pain, swelling of ankles/feet.
- Treatment may depress your immune system and reduce your ability to fight infection.
- Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.

**inotuzumab ozogamicin**

in-oh-tooz-ue-mab oh-zoe-ga-mye-sin  
(Besponsa)

■ **BLACK BOX ALERT** ■ Hepato-toxicity, including fatal hepatic veno-occlusive disease may occur, esp. in pts who underwent hematopoietic stem cell transplant (HSCT) or underwent HSCT conditioning

regimens containing two alkylating agents and had a total bilirubin level greater than ULN. Other risk factors for hepatic veno-occlusive disease may include advanced age, prior hepatic disease, later salvage lines, greater number of treatment cycles. Permanently discontinue in pts who develop hepatic veno-occlusive disease. LFT elevations may require treatment interruption, dose reduction, or permanent discontinuation. Increased occurrence of post-HSCT nonrelapse mortality was reported.

**Do not confuse inotuzumab with ado-trastuzumab, alemtuzumab, atezolizumab, benralizumab, dinutuximab, elotuzumab, gemtuzumab, ipilimumab, obinutuzumab, pertuzumab, trastuzumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD22. Antibody drug conjugate (ADC). Monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to inotuzumab. **Cautions:** Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), elderly. Pts at risk for hepatic veno-occlusive disease (e.g., advanced age, prior HSCT, prior hepatic disease (e.g., cirrhosis, hepatitis), later salvage lines, greater number of treatment cycles). Pts at risk for QT interval prolongation or torsades de pointes (congenital long QT syndrome, medications that prolong QT interval, hypokalemia, hypomagnesemia). Pts at risk for hemorrhage (e.g., history of intracranial/GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelets, NSAIDs).

Pts at risk for tumor lysis syndrome (high tumor burden).

### ACTION

Binds to and internalizes ADC-CD22 complex in CD22-expressing tumor cells, promoting cellular release of N-acetyl-gamma-calicheamicin dimethyl hydrazide (a cytotoxic agent). Activation of N-acetyl-gamma-calicheamicin dimethyl hydrazide induces breakage of double-strand DNA, resulting in cell cycle arrest and apoptosis. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis in ALL.

### PHARMACOKINETICS

Widely distributed. N-acetyl-gamma-calicheamicin dimethyl hydrazide metabolized by nonenzymatic reduction. Protein binding: 97%. Steady state reached by treatment cycle 4. Excretion not specified. **Half-life:** 12.3 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Females of reproductive potential must use effective contraception during treatment and for at least 8 mos after discontinuation. Males with female partners of reproductive potential must use effective contraception during treatment and for at least 5 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 2 mos after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, sotalol) may increase risk of QT interval prolongation, torsades de pointes. May increase adverse effects of **natalizumab, vaccines (live)**. May decrease therapeutic effect of **BCG (intravesical)**,

**vaccines (live).** **HERBAL:** Echinacea may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, leukocytes, lymphocytes, neutrophils, platelets. May increase serum alkaline phosphatase, ALT, amylase AST, bilirubin, GGT, lipase, uric acid. May decrease diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:**  
0.9 mg.

## ADMINISTRATION/HANDLING

**Premedication** • Premedicate with a corticosteroid, antipyretic, and antihistamine before each dose.

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials required for dose. • Reconstitute each vial with 4 mL Sterile Water for Injection for a final concentration of 0.25 mg/mL that delivers 3.6 mL (0.9 mg). • Gently swirl vial until completely dissolved. • Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy or discolored, or if visible particles are observed. • Calculate required volume of reconstituted solution according to body surface area. • Dilute in 50 mL 0.9% NaCl polyvinyl chloride (PVC) infusion bag made of (DEHP or non-DEHP), polyolefin, or ethylene vinyl acetate. • Mix by gently inversion. Do not shake or agitate. • Discard unused portions.

**Rate of administration** • Infuse over 60 min via dedicated IV line. • In-line filters are not required. However, if an in-line filter is used, filters made of polyethersulfone (PES), polyvinylidene fluoride (PVDF), or hydrophilic polysulfone (HPS) are recommended. Do not use

filters made of nylon or mixed cellulose ester (MCE). • Do not administer as IV push or bolus.

**Storage** • Refrigerate unused vials in original carton. • Protect vial, reconstituted solution, diluted solution from light. • Do not freeze. • Reconstitution solution must be diluted within 4 hrs. • Diluted solution may be stored at room temperature for up to 4 hrs or refrigerated for up to 3 hrs. • If refrigerated, allow diluted solution to warm to room temperature (approx. 1 hr). • Infusion must be completed within 8 hrs of reconstitution.

## INDICATIONS/ROUTES/DOSAGE

### ALL (Relapsed or Refractory)

**IV: ADULTS, ELDERLY: Induction cycle 1:** 0.8 mg/m<sup>2</sup> on day 1, then 0.5 mg/m<sup>2</sup> on day 8 and day 15 of 21-day cycle (total cycle dose: 1.8 mg/m<sup>2</sup> per cycle, given in 3 divided doses). May extend duration of induction cycle to 28 days if pt achieves complete remission (CR), complete remission with incomplete hematologic recovery (CRi), or to allow time for recovery of toxicity. **Subsequent cycles in pts with CR or CRi:** 0.5 mg/m<sup>2</sup> on days 1, 8, and 15 of 28-day cycle (total cycle dose: 1.5 mg/m<sup>2</sup> per cycle, given in 3 divided doses). **Subsequent cycles in pts who have not achieved CR or CRi:** 0.8 mg/m<sup>2</sup> on day 1, then 0.5 mg/m<sup>2</sup> on day 8 and day 15 of 28-day cycle (total cycle dose: 1.8 mg/m<sup>2</sup> per cycle, given in 3 divided doses). Recommend discontinuation in pts who do not achieve CR or CRi within 3 cycles. **Proceeding to HCST:** Treatment duration of 2 cycles. May consider a third cycle in pts who do not achieve CR or CRi and minimal residual disease after 2 cycles. **Not proceeding to HCST:** May consider up to a maximum of 6 cycles.

### Dose Modification

**Note:** Doses within a treatment cycle (e.g., day 8, day 15) do not require interruption if related to neutropenia or thrombocytopenia. Treatment interrup-

tions within a cycle are recommended for nonhematological toxicities. Do not re-escalate reduced doses that are related to toxicity.

**Duration of Dose Interruption**  
(Nonhematological toxicities)

**Less than 7 days within a cycle:** Interrupt the next dose (ensure a minimum of 6 days between doses). **7 days or more:** Skip the next dose within the cycle. **14 days or more:** Once toxicity is adequately resolved, decrease total dose of subsequent cycle by 25%. May further reduce to 2 doses per cycle for subsequent cycles if further dose modification is required. If unable to tolerate a total dose reduction of 25%, followed by a reduction to 2 doses per cycle, permanently discontinue. **More than 28 days:** Consider permanent discontinuation.

**Hematologic Toxicities**

**ANC greater than or equal to 1,000 cells/mm<sup>3</sup> (prior to treatment):** If ANC decreases, interrupt next cycle until ANC is greater than or equal to 1,000 cells/mm<sup>3</sup>. Discontinue treatment if ANC is less than 1,000 cells/mm<sup>3</sup> for more than 28 days (and related to treatment). **Platelet count greater than or equal to 50,000 cells/mm<sup>3</sup> (prior to treatment):** If platelet count decreases, interrupt next cycle until platelet count is greater than or equal to 50,000 cells/mm<sup>3</sup>. Discontinue treatment if platelet count is less than 50,000 cells/mm<sup>3</sup> for more than 28 days (and related to treatment). **ANC less than 1,000 cells/mm<sup>3</sup> and/or platelet count less than 50,000 cells/mm<sup>3</sup> (prior to treatment):** If ANC or platelet count decreases, interrupt next cycle until one of following occurs: ANC and platelet count recover to at least baseline of the prior cycle; ANC is greater than or equal to 1,000 cells/mm<sup>3</sup> and platelet count is greater than or equal to 50,000 cells/mm<sup>3</sup>; disease is improved or stable, and the decrease of ANC and platelet count is not related to treatment.

**Hepatotoxicity**

**Serum ALT/AST greater than 2.5 times ULN and serum bilirubin greater than 1.5 times ULN:** Interrupt treatment until serum ALT/AST is less than or equal to 2.5 times ULN and serum bilirubin is less than 1.5 times ULN prior to each dose (unless related to Gilbert's syndrome or hemodialysis). Permanently discontinue if serum ALT/AST does not recover to less than or equal to 2.5 times ULN or serum bilirubin does not recover to less than 1.5 times ULN. **Hepatic veno-occlusive disease, severe liver injury:** Permanently discontinue.

**Other Nonhematologic Toxicities**

**Any CTCAE Grade 2 nonhematologic toxicities:** Withhold treatment until recovery to Grade 1 or pretreatment grade levels before each dose.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment to initial dose. **Severe to moderate impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment to initial dose. **Severe impairment, ESRD, HD:** Use caution.

**SIDE EFFECTS**

**Frequent (35%–17%):** Fatigue, asthenia, headache, migraine, sinus headache, pyrexia, nausea, abdominal pain, esophageal pain, abdominal tenderness, hepatic pain. **Occasional (16%–11%):** Constipation, vomiting, stomatitis, aphthous ulcer, mucosal inflammation, mouth ulceration, oral pain, oropharyngeal pain, chills.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy, but more severe reactions, including bone marrow failure, febrile neutropenia, may be life-threatening. Hemorrhagic events including contusion, ecchymosis, epistaxis, gingival bleeding, hematemesis, hematochezia, hematuria, hema-

turia, metrorrhagia, subdural hematoma, postprocedural hematoma, hemorrhagic shock, hemorrhage (conjunctival, gastric, GI, hemorrhoidal, intra-abdominal, intracranial, lip, mesenteric, mouth, muscle, rectal, SQ, vaginal) have occurred. Hepatotoxicity, including fatal hepatic veno-occlusive disease, may occur, esp. in pts who underwent HSCT or underwent HSCT conditioning regimens containing two alkylating agents and had a total bilirubin level greater than ULN. An increased occurrence of post-HSCT nonrelapse mortality was reported. Serious, sometimes fatal, infections including neutropenic sepsis, pneumonia, sepsis, pseudomonal sepsis occurred in 5% of pts. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. May cause QT interval prolongation, esp. in pts with history of long QTc prolongation or in pts taking medications known to prolong QT interval. Immunogenicity (anti-inotuzumab antibodies) occurred in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, LFT; ECG before each dose. Calculate body surface area. Obtain pregnancy test in females of reproductive potential. Screen for active infection. Assess risk for bleeding, hemorrhage, hepatic veno-occlusive disease, infection, QT prolongation. Due to risk of tumor lysis syndrome, assess adequate hydration before initiation. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression. Monitor ECG for QT interval prolongation. LFTs should be obtained before each dose and correlated with symptoms of hepatic veno-occlusive disease (ascites, serum bilirubin elevation, hepatomegaly, rapid weight gain). Diligently monitor pts who underwent HSCT or are planning HSCT. Monitor for infusion-

related reactions (e.g., chills, dyspnea, fever, rash) during infusion and for at least 1 hr after infusion is completed. If infusion-related reaction occurs during administration, interrupt infusion and provide medical support. Severe reactions may require administration of antihistamines, corticosteroids. Permanently discontinue treatment if severe or life-threatening reactions occur. Be alert for serious infection, opportunistic infection, sepsis (fever, decreased urinary output, hypotension, tachycardia, tachypnea). If infection occurs, provide anti-infective therapy as appropriate. Monitor for hemorrhagic events including intracranial hemorrhage (altered mental status, aphasia, blindness, hemiparesis, unequal pupils, seizures), GI bleeding (hematemesis, melena, rectal bleeding), epistaxis. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Avoid pregnancy using effective contraception. Treatment may cause fetal harm. Do not breastfeed during treatment and for at least 2 mos after last dose.
- Life-threatening bleeding may occur; report bloody stool, bloody urine; rectal bleeding, nosebleeds, vomiting up

blood; symptoms of hemorrhagic stroke (confusion, blindness, difficulty speaking, paralysis, seizures). • Do not take any newly prescribed medications unless approved by doctor who originally started treatment. • Report symptoms of long QT syndrome such as chest pain, dizziness, fainting, palpitations, shortness of breath. • Report liver problems such as abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes. • Pts who have had HSCT or are planning HSCT have an increased risk of mortality.

## insulin

TOP  
100 HIGH  
ALERT

in-su-lin

**Do not confuse NovoLOG with HumaLOG or NovoLIN.**

■ **BLACK BOX ALERT** ■ (Afrezza): Acute bronchospasms reported in pts with asthma and COPD.

### FIXED-COMBINATION(S)

**HumaLOG Mix 75/25:** lispro suspension 75% and lispro solution 25%. **HumuLIN Mix 50/50:** NPH 50% and regular 50%. **HumuLIN 70/30, NovoLIN 70/30:** NPH 70% and rapid-acting regular 30%. **NovoLOG Mix 70/30:** aspart suspension 70% and aspart solution 30%. **Ryzodeg 70/30:** degludec suspension 70% and aspart solution 30%. **Soliqua 100/33:** glargine 100 units/mL and lixisenatide (a glucagon-like peptide 1 [GLP-1] receptor agonist) 33 mcg/mL. **Xultophy 100/3.6:** degludec 100 units/mL and liraglutide (a GLP-1 receptor agonist) 3.6 mg/mL.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Exogenous insulin. **CLINICAL:** Antidiabetic.

## USES

Treatment of type 1 diabetes (insulin-dependent) and type 2 diabetes (non-insulin-dependent) to improve glycemic control. **OFF-LABEL: Insulin aspart, insulin lispro, insulin regular:** Gestational diabetes, mild to moderate diabetic ketoacidosis, mild to moderate hyperosmolar hyperglycemic state. **Insulin NPH:** Gestational diabetes.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to insulin, use during episodes of hypoglycemia. **Afrezza only:** Chronic lung disease. **Cautions:** Pts at risk for hypokalemia; renal/hepatic impairment, elderly. **Afrezza only:** Must be used with a long-acting insulin in type 1 diabetes. Not recommended for use in diabetic ketoacidosis or in smokers. Pts with active lung cancer, history of lung cancer, or at risk for lung cancer.

## ACTION

Acts via specific receptor to regulate metabolism of carbohydrates, protein, and fats. Acts on liver, skeletal muscle, and adipose tissue. **Liver:** Stimulates hepatic glycogen synthesis, synthesis of fatty acids. **Muscle:** Increases protein, glycogen synthesis. **Adipose tissue:** Stimulates lipoproteins to provide free fatty acids, triglyceride synthesis. **Therapeutic Effect:** Controls serum glucose levels.

## PHARMACOKINETICS

### Rapid-Acting

	Onset (min)	Peak (hrs)	Duration (hrs)
Fiasp	12–18	1.5–2.2	5–7
Aspart (NovoLOG)	10–20	1–3	3–5
Glulisine (Apidra)	5–15	0.75– 1.25	2–4
Insulin Human (Afrezza)	15–30	1	2
Lispro (HumaLOG)	15–30	0.5–2.5	3–6.5

**Short-Acting**

	Onset (min)	Peak (hrs)	Duration (hrs)
Regular (HumuLIN R)	30–60	1–5	6–10
Regular (NovoLIN R)	30–60	1–5	6–10

**Intermediate-Acting**

	Onset (hrs)	Peak (hrs)	Duration (hrs)
NPH (HumuLIN N)	1–2	6–14	16–24+
NPH (NovoLIN N)	1–2	6–14	16–24+

**Long-Acting**

	Onset (hrs)	Peak (hrs)	Duration (hrs)
Degludec (Tresiba)	0.5–1.5	12	42
Detemir (Levemir)	3–4	3–9	6–23
Glargine (Lantus)	3–4	No peak	24
Glargine (Toujeo)	Over 6	No peak	Over 24

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Insulin is the drug of choice for diabetes in pregnancy; close medical supervision is needed. Following delivery, insulin needs may drop for 24–72 hrs, then rise to prepregnancy levels. Not distributed in breast milk; lactation may decrease insulin requirements. **Children:** No age-related precautions noted. **Elderly:** Decreased vision, fine motor tremors may lead to inaccurate self-dosing.

**INTERACTIONS**

**DRUG:** Alcohol may increase risk of hypoglycemia. **Beta blockers** (e.g., carvedilol, metoprolol) may alter effects; may mask signs, prolong periods of hypoglycemia. **glucagon-like peptide 1 (GLP-1) agents** (e.g., liraglutide), **dipeptidyl peptidase (DPP)-4 agents** (e.g., linagliptin), **thiazolidinediones** (e.g., pioglitazone), **pramlintide** may increase hypoglycemic

effect. **HERBAL:** Herbals with hypoglycemic properties (e.g., fenugreek) may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, phosphate, potassium.

**AVAILABILITY (Rx)****Rapid-Acting**

**Inhalation Powder:** (*Afrezza*): 4 units, 8 units, 12 units as single-use inhalation cartridges. **Aspart** (*NovoLOG*): 100 units/mL vial, 3-mL cartridge, 3-mL Flex-Pen. **Glulisine** (*Apidra*): 100 units/mL vial, 3-mL cartridge. **Lispro** (*Admelog*, *Lyumjev*, *HumaLOG*): 100 units/mL vial, 3-mL cartridge, 3-mL pen.

**Short-Acting**

**Regular:** (*HumuLIN R*): 100 units/mL vial, U-500 Kwik Pen. **Regular:** (*NovoLIN R*): 100 units/mL vial, 3-mL cartridge, 3-mL Innolet prefilled syringe.

**Intermediate-Acting**

**NPH:** (*HumuLIN N*): 100 units/mL vial, 3-mL pen. **NPH:** (*NovoLIN N*): 100 units/mL vial, 3-mL cartridge, 3-mL Innolet prefilled syringe.

**Long-Acting**

**Detemir:** (*Levemir*): 100 units/mL vial, 3-mL Flex-Pen. **Glargine:** (*Lantus*, *Semglee*): 100 units/mL vial, 3-mL cartridge. **Glargine:** (*Toujeo SoloStar*): 300 units/mL. (*Basaglar KwikPen*): 100 units/mL.

**Intermediate- and Short-Acting Mixtures:**

HumuLIN 50/50, HumuLIN 70/30, HumaLOG Mix 75/25, HumaLOG Mix 50/50, NovoLIN 70/30, NovoLOG Mix 70/30.

**Solution, IV** (*Myxredlin*): 100 units/100 mL in NaCl 0.9% (100 mL).

**ADMINISTRATION/HANDLING****Regular and Insulin Glulisine**

- (*Apidra*): Use only if solution is clear.
- May give undiluted.

**Rapid-Acting**

- (**Afrezza**): Administer using a single inhalation/cartridge. Give at beginning of a meal.
- (**Aspart [NovoLOG]**): May give SQ, IV infusion.
- Can mix with NPH (draw aspart into syringe first; inject immediately after mixing).
- After first use, stable at room temperature for 28 days.
- Administer 5–10 min before meals.
- (**Glulisine [Apidra]**): May mix with NPH (draw glulisine into syringe first; inject immediately after mixing).
- After first use, stable at room temperature for 28 days.
- Administer 15 min before or within 20 min after starting a meal.
- (**Lispro [HumaLOG]**): For SQ use only.
- May mix with NPH. Stable for 28 days at room temperature; syringe is stable for 14 days if refrigerated.
- After first use, stable at room temperature for 28 days.
- Administer 15 min before or immediately after meals.

**Short-Acting**

**Regular** • (**HumuLIN R, NovoLIN R**): May give SQ, IM, IV.

- May mix with NPH for immediate use or for storage for future use. Stable for 1 mo at room temperature, 3 mos if refrigerated.
- Can mix with Sterile Water for Injection or 0.9% NaCl.
- After first use, stable at room temperature for 28 days.
- Administer 30 min before meals.

**Intermediate-Acting**

**NPH** • (**HumuLIN N, NovoLIN N**): For SQ use only.

- May mix with aspart (NovoLOG) or lispro (HumaLOG). Draw aspart or lispro first and use immediately.
- May mix with regular (HumuLIN R, NovoLIN R) insulin. Draw regular insulin first, use immediately or may store for future use (up to 28 days).
- After first use, stable at room temperature for 28 days.
- Administer 15 min before meals when mixed with aspart or lispro; 30 min before meals when mixed with regular insulin.

**Long-Acting**

- (**Degludec [Tresiba]**): For SQ use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 56 days.
- May take once daily any time of day.
- (**Detemir [Levemir]**): For SQ use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 42 days.
- Evening dose given at dinner or at bedtime. Twice-daily regimens can be given 12 hrs after morning dose.
- (**Glargine [Lantus, Toujeo]**): For SQ use only.
- Do not mix with other insulins.
- After first use, stable at room temperature for 28 days.
- Administer once daily at same time. Meal timing is not applicable.

**SQ**

- Check serum glucose concentration before administration; dosage highly individualized.
- SQ injections may be given in thigh, abdomen, upper arm, buttocks, upper back if there is adequate adipose tissue.
- Rotation of injection sites is essential; maintain careful record.
- Prefilled syringes should be stored in vertical or oblique position to avoid plugging; plunger should be pulled back slightly and syringe rocked to remix solution before injection.

**IV INCOMPATIBILITIES**

DilTIAZem (Cardizem), DOPamine (Intropin), nafcillin (Nafcil).

**IV COMPATIBILITIES**

Amiodarone (Cordarone), ampicillin/sulbactam (Unasyn), ceFAZolin (Ancef), digoxin (Lanoxin), DOBUTamine (Dobutrex), famotidine (Pepcid), gentamicin, heparin, magnesium sulfate, metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, potassium chloride, propofol (Diprivan), vancomycin (Vancocin).

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Insulin requirements vary dramatically among pts, requiring dosage adjustment.

**Type 1 Diabetes**

Multiple daily injections, guided by glucose monitoring or continuous SQ insulin infusions, is standard of care.

**Usual initial dose:** 0.4–0.5 unit/kg/day in divided doses. **Usual maintenance:** 0.4–1 units/kg/day in divided doses.

**Type 2 Diabetes**

Initially, 4–5 units or 0.1 units/kg given before largest meal of day. Adjust dose by 2 units q3days to reach fasting glucose target (while avoiding hypoglycemia). General goal is to achieve Hgb A1c less than 7% using safe medication titration. Dual therapy (metformin and a second antihyperglycemic agent) is recommended in pts who fail to achieve glycemic goals after 3 mos with lifestyle interventions and metformin monotherapy. (**Afrezza**): Dosage based on metabolic needs, blood glucose results, glycemic goal control.

**Dosage in Renal Impairment****Creatinine**

Clearance	Dose
10–50 mL/min	75% normal dose
Less than 10 mL/min	25%–50% normal dose

**Dosage in Hepatic Impairment**

Insulin requirement may be reduced.

**SIDE EFFECTS**

**Occasional:** Localized redness, swelling, itching (due to improper insulin injection technique), allergy to insulin cleansing solution. **Infrequent:** Somogyi effect (rebound hyperglycemia) with chronically excessive insulin dosages. Systemic allergic reaction (rash, angio-

edema, anaphylaxis), lipodystrophy (depression at injection site due to breakdown of adipose tissue), lipohypertrophy (accumulation of SQ tissue at injection site due to inadequate site rotation).

**Rare:** Insulin resistance.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe hypoglycemia (due to hyperinsulinism) may occur with insulin overdose, decrease/delay of food intake, excessive exercise, pts with brittle diabetes. Diabetic ketoacidosis may result from stress, illness, omission of insulin dose, long-term poor insulin control.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum glucose level, Hgb A1c. Discuss lifestyle to determine extent of learning, emotional needs. If given IV, obtain serum chemistries (esp. serum potassium).

**INTERVENTION/EVALUATION**

Assess for hypoglycemia (refer to pharmacokinetics table for peak times and duration): cool, wet skin, tremors, dizziness, headache, anxiety, tachycardia, numbness in mouth, hunger, diplopia. Assess sleeping pt for restlessness, diaphoresis. Check for hyperglycemia: polyuria (excessive urine output), polyphagia (excessive food intake), polydipsia (excessive thirst), nausea/vomiting, dim vision, fatigue, deep and rapid breathing (Kussmaul respirations). Be alert to conditions altering glucose requirements: fever, trauma, increased activity/stress, surgical procedure.

**PATIENT/FAMILY TEACHING**

- Instruct on proper technique for drug administration, testing of glucose, signs/symptoms of hypoglycemia and hyperglycemia.
- Diet and exercise are essential parts of treatment; do not skip/delay

meals. • Carry candy, sugar packets, other sugar supplements for immediate response to hypoglycemia. • Wear or carry medical alert identification. • Check with physician when insulin demands are altered (e.g., fever, infection, trauma, stress, heavy physical activity). • Do not take other medication without consulting physician. • Weight control, exercise, hygiene (including foot care), not smoking are integral parts of therapy. • Protect skin, limit sun exposure. • Inform dentist, physician, surgeon of medication before any treatment is given.

100

## interferon beta-1a

in-ter-**feer**-on  
(Avonex, Rebif)

**Do not confuse Avonex with Avelox, or interferon beta-1a with interferon beta-1b.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Biologic response modifier. **CLINICAL:** Multiple sclerosis agent.

### USES

Treatment of relapsing multiple sclerosis to slow progression of physical disability, decrease frequency of clinical exacerbations.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to natural or recombinant interferon, human albumin (only for albumin-containing products). **Cautions:** Depression, severe psychiatric disorders, hepatic impairment, increased serum ALT at baseline, alcohol abuse, cardiovascular disease, seizure disorders, myelosuppression.

### ACTION

Exact mechanism unknown. Alters expression and response to surface antigens and may enhance immune cell

activity. **Therapeutic Effect:** Slows progression of multiple sclerosis.

### PHARMACOKINETICS

Peak serum levels attained 3–15 hrs after IM administration. Biologic markers increase within 12 hrs and remain elevated for 4 days. **Half-life:** 10 hrs (Avonex); 69 hrs (Rebif).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has abortifacient potential. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No information available.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, BUN, alkaline phosphatase, bilirubin, calcium, ALT, AST. May decrease Hgb, neutrophil, platelet, WBC.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (Avonex): 30 mcg. **Injection Solution, Prefilled Syringe:** (Rebif): 22 mcg/0.5 mL, 44 mcg/0.5 mL. (Avonex): 30 mcg/0.5 mL. **Titration Pack, Prefilled Syringe:** (Rebif): 8.8 mcg/0.2 mL, 22 mcg/0.5 mL.

### ADMINISTRATION/HANDLING

#### IM (Avonex) Syringe

• Refrigerate syringe. • Allow to warm to room temperature before use. • May store up to 7 days at room temperature.

#### IM (Avonex) Vial

• Refrigerate vials (may store at room temperature up to 30 days). • Following reconstitution, may refrigerate again but use within 6 hrs if refrigerated. • Reconstitute 30-mcg MicroPin (6.6 million international units) vial with 1.1 mL diluent (supplied by manufacturer). • Gently swirl to dissolve medication; do not shake. • Discard if discolored or particulate forms. • Discard unused portion (contains no preservative).

**SQ (Rebif)**

- Refrigerate. May store at room temperature up to 30 days. Avoid heat, light.
- Administer at same time of day 3 days each wk. Separate doses by at least 48 hrs.

**INDICATIONS/ROUTES/DOSAGE****Relapsing Multiple Sclerosis**

**IM: (Avonex): ADULTS:** 30 mcg once wklly.

**SQ: (Rebif): ADULTS: Target dose 44 mcg 3 times/wk:** Initially, 8.8 mcg 3 times/wk for 2 wks, then 22 mcg 3 times/wk for 2 wks, then 44 mcg 3 times/wk thereafter. **Target dose 22 mcg 3 times/wk:** Initially, 4.4 mcg 3 times/wk for 2 wks, then 11 mcg 3 times/wk for 2 wks, then 22 mcg 3 times/wk thereafter.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment (Rebif)**

Use with caution in pts with history of active hepatic disease or ALT more than 2.5 times upper limit of normal (ULN).

**SIDE EFFECTS**

**Frequent (67%–11%):** Headache, flu-like symptoms, myalgia, upper respiratory tract infection, depression with suicidal ideation, generalized pain, asthenia, chills, sinusitis, infection. **Occasional (9%–4%):** Abdominal pain, arthralgia, chest pain, dyspnea, malaise, syncope. **Rare (3%):** Injection site reaction, hypersensitivity reaction.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia occurs in 8% of pts. Hepatic failure has been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT. Assess home situation for support of therapy.

**INTERVENTION/EVALUATION**

Assess for headache, flu-like symptoms, myalgia. Periodically monitor lab results,

re-evaluate injection technique. Assess for depression, suicidal ideation.

**PATIENT/FAMILY TEACHING**

- Do not change schedule, dosage without consulting physician.
- Follow guidelines for reconstitution of product and administration, including aseptic technique.
- Use puncture-resistant container for used needles, syringes; dispose of used needles, syringes properly.
- Injection site reactions may occur. These do not require discontinuation of therapy, but type and extent should be carefully noted. Report flu-like symptoms (fever, chills, fatigue, muscle aches).

**interferon beta-1b** TOP 100

in-ter-fer-on  
(Betaseron, Extavia)

**Do not confuse interferon beta-1b with interferon beta-1a.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Biologic response modifier. **CLINICAL:** Multiple sclerosis agent.

**USES**

Treatment of relapsing forms of multiple sclerosis, including relapsing-remitting disease and active secondary progressive disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to albumin, interferon. **Cautions:** Depression, severe psychiatric disorders, hepatic/renal impairment, alcohol abuse, cardiovascular disease, seizure disorders, myelosuppression, pulmonary disease.

**ACTION**

Exact mechanism unknown. Immunomodulator effects include enhanced suppression of T-cell activity, reduced pro-inflammatory cytokines, reduced movement of lymphocytes into CNS.

**Therapeutic Effect:** Improves MRI lesions, decreases relapse rate and disease severity in multiple sclerosis.

## PHARMACOKINETICS

Slowly absorbed following SQ administration. **Half-life:** 8 min–4.3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Spontaneous abortions reported. Discontinuation of the drug before conception is recommended. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No information available.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase bilirubin, ALT, AST. May decrease neutrophil, lymphocyte, WBC.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 0.3 mg.

## ADMINISTRATION/HANDLING

### SQ

- Store vials at room temperature.
- After reconstitution, stable for 3 hrs if refrigerated.
- Use within 3 hrs of reconstitution.
- Discard if discolored or precipitate forms.
- Reconstitute 0.3-mg (9.6 million international units) vial with 1.2 mL diluent (supplied by manufacturer) to provide concentration of 0.25 mg/mL (8 million units/mL).
- Gently swirl to dissolve medication; do not shake.
- Withdraw 1 mL solution and inject subcutaneously into arms, abdomen, hips, thighs using 27-gauge needle.
- Discard unused portion (contains no preservative).

## INDICATIONS/ROUTES/DOSAGE

### Relapsing-Remitting Multiple Sclerosis

**SQ; ADULTS:** Initially, 0.0625 mg (0.25 mL) every other day; gradually increase

by 0.0625 mg every 2 wks. Target dose: 0.25 mg every other day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (85%–21%):** Injection site reaction, headache, flu-like symptoms, fever, asthenia, myalgia, sinusitis, diarrhea, dizziness, altered mental status, constipation, diaphoresis, vomiting. **Occasional (15%–4%):** Malaise, drowsiness, alopecia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Seizures occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT. Assess home situation for support of therapy.

### INTERVENTION/EVALUATION

Periodically monitor lab results, re-evaluate injection technique. Assess for nausea (high incidence). Monitor sleep pattern. Monitor daily pattern of bowel activity, stool consistency. Assist with ambulation if dizziness occurs. Monitor food intake.

### PATIENT/FAMILY TEACHING

- Report flu-like symptoms (fever, chills, fatigue, muscle aches); occur commonly but decrease over time.
- Wear sunscreen, protective clothing if exposed to sunlight, ultraviolet light until tolerance known.

## ipilimumab

ip-i-lim-ue-mab  
(Yervoy)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Human cytotoxic T-lymphocyte antigen 4 (CTLA-4)–blocking antibody. Monoclonal antibody. **CLINICAL:** Antineoplastic.

## USES

Treatment of unresectable or metastatic melanoma in adults and children 12 yrs of age and older. Adjuvant treatment of pts with cutaneous melanoma with pathologic involvement of regional lymph nodes and who have undergone complete resection, including total lymphadenectomy. Treatment of metastatic colorectal cancer (in combination with nivolumab). Treatment of advanced renal cell carcinoma (in combination with nivolumab). Treatment of hepatocellular carcinoma (in combination with nivolumab) in pts previously treated with sorafenib. First-line treatment (in combination with nivolumab) of unresectable malignant pleural mesothelioma. First-line treatment of metastatic non-small-cell lung cancer (in combination with nivolumab) in adults whose tumors express PD-L1 (greater than or equal to 1%) and with no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor. First-line treatment of metastatic or recurrent non-small-cell lung cancer (in combination with nivolumab and 2 cycles of platinum doublet chemotherapy) in adults with no EGFR or ALK genomic tumor aberrations.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ipilimumab. **Cautions:** Hepatic impairment, chronic peripheral neuropathy, thyroid/adrenal/pituitary dysfunction, autoimmune disorders (ulcerative colitis, Crohn's disease, lupus, sarcoidosis).

## ACTION

Augments T-cell activation and proliferation. Binds to cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) and blocks interaction of CTLA-4 with its ligands, allowing for enhanced T-cell activation and proliferation. **Therapeutic Effect:** May indirectly mediate T-cell immune responses against tumors.

## PHARMACOKINETICS

Metabolized in liver. Steady state reached by third dose. **Half-life:** 14.7 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase hepatotoxic effect of **vemurafenib**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin; eosinophils.

## AVAILABILITY (Rx)

**Injection, Solution:** 5 mg/mL (10 mL, 40 mL vials).

## ADMINISTRATION/HANDLING

**◀ALERT▶** Use sterile, nonpyrogenic, low protein-binding in-line filter. Use dedicated line only.

**Reconstitution** • Calculate number of vials needed for injection. • Inspect for particulate matter or discoloration. • Allow vials to stand at room temperature for approximately 5 min. • Withdraw proper volume and transfer to infusion bag. Dilute in NaCl or D<sub>5</sub>W with final concentration ranging from 1–2 mg/mL. • Mix diluted solution by gentle inversion. Do not shake or agitate.

**Rate of administration** • Infuse over 90 min. Flush with 0.9% NaCl or D<sub>5</sub>W at end of infusion.

**Storage** • Solution should be translucent to white or pale yellow with amorphous particles. • Discard vial if cloudy or discolored. • Refrigerate vials until time of use. • May store diluted solution either under refrigeration or at room temperature for no more than 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Metastatic Melanoma

**IV; ADULTS, CHILDREN 12 YRS AND OLDER:** 3 mg/kg q3wks for maximum of

4 doses. Doses may be delayed due to toxicity, but all doses must be given within 16 wks of initial dose.

**ALERT** Pts presenting with severe immune-mediated adverse reactions must immediately discontinue drug therapy and start predniSONE 1 mg/kg/day.

#### Cutaneous Melanoma

**IV: ADULTS:** 10 mg/kg q3wks for 4 doses, then 10 mg/kg q12wks for up to 3 yrs. If toxicity occurs, doses are omitted (not delayed).

#### Colorectal Cancer

**IV: ADULTS, CHILDREN 12 YRS AND OLDER:** 1 mg/kg q3wks for up to 4 combination doses, followed by nivolumab monotherapy. Continue until disease progression or unacceptable toxicity.

#### Renal Cell Cancer

**IV: ADULTS:** 1 mg/kg q3wks for up to 4 combination doses, followed by nivolumab monotherapy. Continue until disease progression or unacceptable toxicity.

#### Hepatocellular Carcinoma

**IV: ADULTS:** 3 mg/kg q3wks (in combination with nivolumab) for 4 combination doses, then nivolumab monotherapy. Continue until disease progression or unacceptable toxicity.

#### Malignant Pleural Mesothelioma

**IV: ADULTS:** 1 mg/kg q6wks (in combination with nivolumab). Continue until disease progression or unacceptable toxicity, or for up to 2 yrs in pts without disease progression.

#### Non–Small-Cell Lung Cancer (Metastatic, PD-L1-expressing)

**IV: ADULTS:** 1 mg/kg q6wks (in combination with nivolumab). Continue until disease progression or unacceptable toxicity, or up to 2 yrs in pts without disease progression.

#### Non–Small-Cell Lung Cancer (Metastatic or Recurrent)

**IV: ADULTS:** 1 mg/kg q6wks (in combination with nivolumab and 2 cycles of histol-

ogy-based platinum-doublet chemotherapy). Continue until disease progression, unacceptable toxicity, or up to 2 yrs in pts without disease progression.

#### Dosage Modification

Hold scheduled dose for moderate immune-mediated adverse reactions. Pts with complete or partial resolution of adverse reactions and who are receiving less than 7.5 mg/day of predniSONE may resume scheduled doses. Permanently discontinue for persistent moderate adverse reactions or inability to reduce corticosteroid dose to 7.5 mg/day, failure to complete full treatment course in 16 wks, any severe or life-threatening adverse reactions.

#### Hepatotoxicity

**ALT/AST greater than 2.5 times upper limit of normal (ULN) or bilirubin greater than 1.5–3 times ULN:** Withhold treatment. **ALT/AST greater than 5 times ULN or bilirubin greater than 3 times ULN:** Permanently discontinue.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (42%):** Fatigue. **Occasional (32%–29%):** Diarrhea, pruritus, rash, colitis.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Severe and fatal immune-mediated adverse reactions have occurred. Enterocolitis (7% of pts) may present with fever, ileus, abdominal pain, GI bleeding, intestinal perforation, severe dehydrating diarrhea. Endocrinopathies (4% of pts), including hypopituitarism, adrenal insufficiency, hypogonadism, hypothyroidism, may present with fatigue, headache, mental status change, unusual bowel habits, hypotension and may require emergent hormone replacement therapy. Dermatitis including toxic epidermal necrolysis (2% of pts) may present with full-thickness ulceration or necrotic, bullous, hemorrhagic manifestations. Hepatotoxicity (1% of pts), defined as LFT greater than 2.5–5 times ULN, may present

with right upper abdominal pain, jaundice, black/tarry stools, bruising, dark-colored urine, nausea, vomiting. Neuropathy (1% of pts), including Guillain-Barré syndrome or myasthenia gravis, may present with weakness, sensory alterations, paresthesia, paralysis. Other serious adverse reactions such as pneumonitis, meningitis, nephritis, eosinophilia, pericarditis, myocarditis, angiopathy, temporal arteritis, vasculitis, polymyalgia rheumatica, conjunctivitis, blepharitis, episcleritis, scleritis, leukocytoclastic vasculitis, erythema multiforme, psoriasis, pancreatitis, arthritis, autoimmune thyroiditis reported. Anti-ipilimumab antibodies reported in 1.1% of pts. All severe immune-mediated adverse reactions require immediate high-dose corticosteroid therapy.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Screen for history of hepatic impairment, chronic neuropathy, thyroid/adrenal/pituitary dysfunction, autoimmune disorders. Screen for active infection. Receive full medication history including herbal products.

### INTERVENTION/EVALUATION

Monitor vital signs, LFT, thyroid panel before each dose. Continue focused assessment and screen for life-threatening immune-mediated adverse reactions. If adverse reactions occur, immediately notify physician and initiate proper treatment. Report suspected pregnancy. Obtain CBC, blood cultures for fever, suspected infection. ECG for palpitations, chest pain, difficulty breathing, dizziness. If prednisone therapy initiated, monitor capillary blood glucose and screen for side effects.

### PATIENT/FAMILY TEACHING

- Serious and fatal adverse reactions indicate inflammation to certain systems: intestines (diarrhea, dark/tarry stools, abdominal pain), liver (yellowing of the skin, dark-colored urine, right upper quadrant pain, bruising), skin (rash, mouth sores, blisters, ulcers), nerves (weakness, numb-

ness, tingling, difficulty breathing, paralysis), hormonal glands (headaches, weight gain, palpitations, changes in mood or behavior, dizziness), eyes (blurry vision, double vision, eye pain/redness). • Prednisone therapy may be started if adverse reactions occur. • May cause fetal harm, stillbirth, premature delivery. • Report any chest pain, palpitations, fever, swollen glands, stomach pain, vomiting, or any sign of adverse reactions.

## ipratropium

TOP  
100

ip-ra-troe-pee-um

(Atrovent HEA, Apo-Ipravent )

**Do not confuse Atrovent with Alupent or Serevent, or ipratropium with tiotropium.**

### FIXED-COMBINATION(S)

**Combivent, DuoNeb:** ipratropium/albuterol (a bronchodilator): *Aerosol:* 18 mcg/90 mcg per actuation. *Solution:* 0.5 mg/2.5 mg per 3 mL.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinergic. **CLINICAL:** Bronchodilator.

## USES

**Inhalation, Nebulization:** Maintenance treatment of bronchospasm due to COPD, including bronchitis, emphysema. Not indicated for immediate bronchospasm relief.

**Nasal Spray:** Symptomatic relief of rhinorrhea associated with allergic and non-allergic perennial rhinitis (in adults and children 6 yrs and older) and associated with seasonal allergic rhinitis (in adults and children 5 yrs and older).

**OFF-LABEL:** Acute asthma (exacerbation).

## PRECAUTIONS

**Contraindications:** History of hypersensitivity to ipratropium, atropine. **Cautions:** Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, myasthenia gravis.

**ACTION**

Blocks action of acetylcholine at parasympathetic sites in bronchial smooth muscle. Application to nasal mucosa inhibits serous/seromucous gland secretions. **Therapeutic Effect:** Causes bronchodilation, inhibits nasal secretions.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
Inhalation	1–3 min	1.5–2 hrs	Up to 4 hrs
Nasal	5 min	1–4 hrs	4–8 hrs

Minimal systemic absorption after inhalation. Metabolized in liver (systemic absorption). Primarily excreted in feces. **Half-life:** 1.5–4 hrs (nasal).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Anticholinergics (e.g., acclidinium, ipratropium, tiotropium, umeclidinium), medications with anticholinergic properties may increase toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Aerosol for Oral Inhalation:** (*Atrovent HFA*): 17 mcg/actuation. **Solution, Intranasal Spray:** 0.03%; 0.06%. **Solution for Nebulization:** 0.02% (500 mcg).

**ADMINISTRATION/HANDLING****Inhalation**

- Do not shake. Prime before first use or if not used for more than 3 days.
- Instruct pt to exhale completely, place mouthpiece between lips, inhale deeply through mouth while fully depressing top of canister. Hold breath as long as possible before exhaling slowly.
- Allow at least 1 minute between inhalations.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).

**Nebulization**

- May be administered with or without dilution in 0.9% NaCl.
- Stable for 1 hr

when mixed with albuterol. • Give over 5–15 min.

**Nasal**

- Store at room temperature.
- Initial pump priming requires 7 actuations of pump.
- If used regularly as recommended, no further priming is required. If not used for more than 4 hrs, pump will require 2 actuations, or if not used for more than 7 days, the pump will require 7 actuations to reprime.

**INDICATIONS/ROUTES/DOSAGE****Bronchodilator for COPD**

**Inhalation: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 2 inhalations 4 times/day. **Maximum:** 12 inhalations per 24 hrs. **Nebulization: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 500 mcg (1 unit dose vial) 3–4 times/day (doses 6–8 hrs apart).

**Asthma Exacerbation**

**Note:** Should be given in combination with a short-acting beta-adrenergic agonist. **Inhalation: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 8 inhalations q20min as needed for up to 3 hrs. **CHILDREN 6–12 YRS:** 4–8 inhalations q20min as needed for up to 3 hrs. **CHILDREN 5 YRS OR YOUNGER:** 2 inhalations q20 min for 1 hr. **Nebulization: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 500 mcg q20min for 3 doses, then as needed. **CHILDREN 6–12 YRS:** 250–500 mcg q20min for 3 doses, then as needed. **CHILDREN 5 YRS OR YOUNGER:** 250 mcg q20 min for 1 hr.

**Rhinorrhea (Perennial Allergic/Nonallergic Rhinitis)**

**Intranasal: (0.03%): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 2 sprays (21 mcg/spray) per nostril 2–3 times/day. **Maximum:** 168–252 mcg/day.

**Rhinorrhea (Common Cold)**

**Intranasal: (0.06%): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 2 sprays (42 mcg/spray) per nostril 3–4 times/day for up to 4 days. **Maximum:** 504–672 mcg/day. **CHILDREN 5–11 YRS:** 2 sprays per nostril 3 times/day for up to 4 days. **Maximum:** 504 mcg/day.

**Rhinorrhea (Seasonal Allergy)**

**Intranasal: (0.06%): ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER:** 2 sprays (42 mcg/spray) per nostril 4 times/day for up to 3 wks. Total dose: 672 mcg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent: Inhalation (6%–3%):** Cough, dry mouth, headache, nausea. **Nasal:** Dry nose/mouth, headache, nasal irritation.

**Occasional: Inhalation (2%):** Dizziness, transient increased bronchospasm. **Rare (less than 1%): Inhalation:** Hypotension, insomnia, metallic/unpleasant taste, palpitations, urinary retention. **Nasal:** Diarrhea, constipation, dry throat, abdominal pain, nasal congestion.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Worsening of angle-closure glaucoma, acute eye pain, hypotension occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Auscultate lung sounds. Question history of glaucoma, urinary retention, myasthenia gravis.

**INTERVENTION/EVALUATION**

Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Monitor ABGs. Observe for retractions (clavicular, sternal, intercostal), hand tremor. Evaluate for clinical improvement (quieter, slower respirations, relaxed facial expression, cessation of retractions). Monitor for improvement of rhinorrhea.

**PATIENT/ FAMILY TEACHING**

- Increase fluid intake (decreases lung secretion viscosity).
- Do not take more than 2 inhalations at any one time (excessive use may produce paradoxical bronchoconstriction, decreased bronchodilating effect).
- Rinsing mouth with water immediately after inhalation may prevent mouth and throat dryness.
- Avoid ex-

cessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).

**irbesartan**

ir-be-sar-tan  
(Avapro)

**■ BLACK BOX ALERT ■** May cause fetal injury, mortality if used during second or third trimester of pregnancy. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Avapro with Anaprox.**

**FIXED-COMBINATION(S)**

**Avalide:** irbesartan/hydroCHLOROTHIAZIDE (a diuretic): 150 mg/12.5 mg, 300 mg/12.5 mg, 300 mg/25 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

**USES**

Treatment of hypertension alone or in combination with other antihypertensives. Treatment of diabetic nephropathy in pts with an elevated serum creatinine and proteinuria (greater than 300 mg/day) in pts with type 2 diabetes and hypertension.

**OFF-LABEL:** Reduce proteinuria in children with chronic kidney disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to irbesartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal impairment, unstented unilateral or bilateral renal artery stenosis, dehydration, HF, idiopathic or hereditary angioedema or angioedema associated with ACE inhibitor therapy.

**ACTION**

Blocks vasoconstriction, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	—	1–2 hrs	Greater than 24 hrs

Rapidly, completely absorbed after PO administration. Protein binding: 90%. Metabolized in liver. Excreted in feces (80%), urine (20%). Not removed by hemodialysis. **Half-life:** 11–15 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal or neonatal morbidity or mortality. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase adverse of ACE inhibitors (e.g., benazepril, lisinopril). NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May slightly increase serum BUN, creatinine. May decrease Hgb.

**AVAILABILITY (Rx)**

**Tablets:** 75 mg, 150 mg, 300 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.

**INDICATIONS/ROUTES/DOSAGE****Hypertension**

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** Initially, 75–150 mg/day. May increase to 300 mg/day. **CHILDREN 6–12 YRS:** Initially, 75 mg/day. May increase to 150 mg/day.

**Diabetic Nephropathy**

**PO: ADULTS, ELDERLY:** Initially, 150 mg once daily. Titrate based on B/P response and tolerability. **Maximum:** 300 mg once daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (9%–3%):** Upper respiratory tract infection, fatigue, diarrhea, cough. **Rare (2%–1%):** Heartburn, dizziness, headache, nausea, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may manifest as hypotension, syncope, tachycardia. Bradycardia occurs less often.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain B/P, pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). Question possibility of pregnancy. Assess medication history (esp. diuretic therapy).

**INTERVENTION/EVALUATION**

Maintain hydration (offer fluids frequently). Assess for evidence of upper respiratory infection. Assist with ambulation if dizziness occurs. Monitor B/P, pulse. Assess for hypotension.

**PATIENT/FAMILY TEACHING**

- May cause fetal or neonatal morbidity or mortality.
- Report any sign of infection (sore throat, fever).
- Avoid exercising during hot weather (risk of dehydration, hypotension).

**irinotecan**

eye-ri-noe-tee-kan  
(Camptosar, Onivyde)

**BLACK BOX ALERT** (Camptosar, Onivyde): Can induce both early and late forms of severe diarrhea. Early diarrhea (during or shortly after administration) accompanied by salivation, rhinitis, lacrimation, diaphoresis, flushing. Late diarrhea (occurring more than 24 hrs after administration) can be prolonged and life-threatening. (Camptosar):

May produce severe, profound myelosuppression. Administer under supervision of experienced cancer chemotherapy physician. (**Onivyde**): Severe, life-threatening, or fatal neutropenic fever/sepsis occurred. Withhold for ANC below 1,500 cells/mm<sup>3</sup> or neutropenic fever. Monitor blood cell counts.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Topoisomerase-I inhibitor. **CLINICAL:** Antineoplastic.

## USES

**Camptosar:** Treatment of metastatic carcinoma of colon or rectum. **Onivyde:** Treatment of metastatic adenocarcinoma of the pancreas (in combination with 5-fluorouracil and leucovorin) after disease progression following gemcitabine-based therapy. **OFF-LABEL:** Non–small-cell lung cancer; small-cell lung cancer; CNS tumor; cervical, gastric, pancreatic, ovarian, esophageal cancer; Ewing's sarcoma; brain tumor.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to irinotecan. **Cautions:** Pt previously receiving pelvic, abdominal irradiation (increased risk of myelosuppression), pts older than 65 yrs, hepatic dysfunction, hyperbilirubinemia, renal impairment, preexisting pulmonary disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

## ACTION

Binds reversibly with topoisomerase I, an enzyme that relieves torsional strain in DNA by inducing reversible single-strand breaks. Prevents religation of these single-stranded breaks, resulting in damage to double-strand DNA, cell death. **Therapeutic Effect:** Produces cytotoxic effect on cancer cells.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95% (metabolite). Excreted in urine and eliminated by biliary route. **Half-life:** 6–12 hrs; metabolite, 10–20 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** Risk of diarrhea significantly increased.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May decrease the therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of vaccines (live). UGT1A1 inhibitors (e.g., erlotinib, nilotinib) may increase concentration/effect. **HERBAL:** Echinacea may decrease therapeutic effect. **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, AST. May decrease Hgb, leukocytes, platelets.

## AVAILABILITY (Rx)

**Injection Solution:** (*Conventional*): 20 mg/mL (2 mL, 5 mL, 15 mL, 25 mL). (*Liposomal*): 43 mg/10 mL.

## ADMINISTRATION/HANDLING

### Camptosar

**Reconstitution** • Dilute in D<sub>5</sub>W (preferred) or 0.9% NaCl to concentration of 0.12–2.8 mg/mL.

**Rate of administration** • Administer all doses as IV infusion over 30–90

min. • Assess for extravasation (flush site with Sterile Water for Injection, apply ice if extravasation occurs).

**Storage** • Store vials at room temperature, protect from light. • Solution diluted with D<sub>5</sub>W is stable for 24 hrs at room temperature or 48 hrs if refrigerated. • Solution diluted with 0.9% NaCl is stable for 24 hrs at room temperature. • Do not refrigerate solution if diluted with 0.9% NaCl.

### Onivyde

**Reconstitution** • Withdraw dose from vial and dilute with 500 mL D<sub>5</sub>W or 0.9% NaCl. Mix gently.

**Rate of administration** • Infuse over 90 min.

**Storage** • Refrigerate vials; do not freeze. • Protect from light. • Stable for 4 hrs at room temperature or 24 hrs refrigerated.

## IV INCOMPATIBILITIES

Gemcitabine (Gemzar).

## INDICATIONS/ROUTES/DOSAGE

**Carcinoma of the Colon, Rectum (Camptosar)**

**IV: (Single-Agent Therapy): ADULTS, ELDERLY: (WEEKLY REGIMEN):** Initially, 125 mg/m<sup>2</sup> once wky for 4 wks, followed by a rest period of 2 wks. Additional courses may be repeated q6wks. Dosage may be adjusted in 25–50 mg/m<sup>2</sup> increments/decrements to as high as 150 mg/m<sup>2</sup> or as low as 50 mg/m<sup>2</sup>. **(3-WEEK REGIMEN):** 350 mg/m<sup>2</sup> q3wks. Dosage may be adjusted to as low as 200 mg/m<sup>2</sup> in decrements of 25–50 mg/m<sup>2</sup>.

**(In Combination With Leucovorin and 5-Fluorouracil):** (Leucovorin given immediately following irinotecan, then 5-fluorouracil immediately following leucovorin.) **REGIMEN 1:** 125 mg/m<sup>2</sup> on days 1, 8, 15, 22. Dose may be adjusted to 100 mg/m<sup>2</sup>, then 75 mg/m<sup>2</sup>, then decrements of approximately 20%. **REGIMEN 2:** 180 mg/m<sup>2</sup> on days 1, 15, 29. Dose may be adjusted to 150 mg/m<sup>2</sup>, then 120 mg/m<sup>2</sup>, then decrements of approximately 20%.

### Pancreatic Cancer (Onivyde)

**IV Infusion: ADULTS, ELDERLY:** 70 mg/m<sup>2</sup> once q2wks (in combination with leucovorin and 5-fluorouracil). Reduce initial starting dose to 50 mg/m<sup>2</sup> in pts homozygous for the UGT1A1\*28 allele. May increase dose to 70 mg/m<sup>2</sup> as tolerated.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Serum Bilirubin	Dose
Greater than ULN to 2 mg/dL:	Reduce dose one level
Greater than 2 mg/dL:	Not recommended

## SIDE EFFECTS

**Frequent (64%–22%):** Nausea, alopecia, vomiting, diarrhea, constipation, fatigue, fever, asthenia, skeletal pain, abdominal pain, dyspnea. **Occasional (19%–16%):** Anorexia, headache, stomatitis, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression is an expected response to therapy, but more severe reactions including febrile neutropenia may be life threatening. Pts who are homozygous for the UGT1A1\*28 allele are at increased risk for neutropenia. Hypersensitivity reactions including anaphylaxis may occur. Fatal pulmonary toxicities, interstitial pulmonary disease were reported. Diarrhea may cause severe dehydration, renal failure, which can be fatal. Cholinergic reactions including rhinitis, increased salivation, miosis, lacrimation, diaphoresis, flushing, and intestinal hyperperistalsis may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (prior to each dose), LFT; pregnancy test in females of reproductive potential. Due to risk of severe dehydration related to diarrhea, ensure adequate hydration prior

to each dose. Question history pulmonary disease, hepatic/renal impairment. Screen for active infection. Receive full medication history and screen for interactions. Premedicate with antiemetics on day of treatment, starting at least 30 min before administration. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC as indicated. Monitor pulmonary status, pulse oximeter readings. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Severe diarrhea may be life-threatening. Monitor for hypersensitivity reactions, anaphylaxis. Assess skin for rash.

#### PATIENT/ FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- Diarrhea may cause severe dehydration, which can be life-threatening. Report diarrhea of any severity.
- Allergic reactions, including anaphylaxis, can occur.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Report diarrhea, vomiting, fever, light-headedness, dizziness.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infections.

## isatuximab-irfc

eye-sa-tux-i-mab  
(Sarclisa)

**Do not confuse isatuximab with daratumumab, dinutuximab, elotuzumab, ipilimumab, ixabepilone, ixazomib or rituximab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD38 immunoglobulin G1-derived monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Treatment of multiple myeloma (in combination with pomalidomide and dexamethasone) in adults who have received at least two prior therapies including lenalidomide and a proteasome inhibitor. Treatment of relapsed or refractory multiple myeloma (in combination with carfilzomib and dexamethasone) in adults who have received 1–3 prior lines of therapy.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to isatuximab. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

#### ACTION

Binds to and inhibits cell surface glycoprotein CD38 on CD38-expressing tumor cells (highly expressed on myeloma cells). Promotes antibody-dependent cellular phagocytosis and cell-mediated cytotoxicity. Suppresses CD38-positive T-regulatory cells and activates natural killer cells in the absence of CD38-positive target tumor cells. **Therapeutic Effect:** Inhibits tumor cell growth.

#### PHARMACOKINETICS

Widely distributed. Metabolized into small peptides via catabolic pathway. Steady state reached in 8 wks. **Half-life:** Not specified.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 5 mos after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease effect of **BCG intravesical, vaccines (live)**. May increase adverse/toxic effect of **leflunomide, natalizumab, cladribine, upadacitinib** may enhance the immunosuppressive effect. **Pimecrolimus, tacrolimus (topical)** may increase adverse/toxic effects **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May mask detection of antibodies to minor antigens. Drug may be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M-protein. May affect the determination of complete response and disease progression of some pts with IgG kappa myeloma protein. May cause positive Coombs test. May decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mg/5 mL (20 mg/mL), 500 mg/25 mg/mL (20 mg/mL).

## ADMINISTRATION/HANDLING

**Premedication** • Give dexamethasone 40 mg PO or IV (20 mg PO or IV in pts 75 yrs or older), acetaminophen 650–1000 mg PO (or equivalent), an H<sub>2</sub> antagonist, and diphenhydramine 25–50 mg PO or IV (or equivalent) approx. 15–60 min prior to infusion. Diphenhydramine IV is preferred for the first 4 treatments.

**Infusion guidelines** • Infusion bag must be made of polyolefins, polyethylene, polypropylene, polyvinyl chloride (PVC) with di-(2-ethylhexyl) phthalate (DEHP), or ethyl vinyl acetate (EVA). • Infuse via dedicated IV line with a 0.22 micron in-line filter. • Do not administer as IV push or bolus. • Do not administer with other infusions. • If a dose is missed, give as soon as possible and adjust schedule to maintain treatment interval.

**Preparation** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for dose based on weight in kg. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Remove a volume from a 250 mL NaCl or D<sub>5</sub>W infusion bag that is equal to the required volume of vial for dose. • Dilute in 250 mL NaCl or D<sub>5</sub>W infusion bag. • Gently invert to mix. Do not shake or agitate.

**Rate of administration** • **First infusion:** Infuse at 25 mL/hr for 60 min. May increase rate in increments of 25 mL/hr q30min up to a maximum rate of 150 mL/hr if no infusion reactions occur. • **Second infusion:** Infuse at 50 mL/hr for the first 30 min. May increase rate in increments of 100 mL/hr q30min up to a maximum rate of 200 mL/hr if no infusion reactions occur. • **Subsequent infusions:** Infuse at 200 mL/hr if previous infusion rates were tolerated. **Maximum rate:** 200 mL/hr.

**Infusion reactions** • If Grade 1 or 2 infusion-related reactions occur, interrupt infusion and treat symptoms. If symptoms improve, resume infusion at half of the initial infusion rate. If symptoms do not recur after 30 min, may increase to initial rate, and then follow usual titration protocol. • Permanently discontinue in pts with a Grade 3 or 4 infusion-related reaction or if symptoms

do not improve or recur after interrupting infusion.

**Storage** • Refrigerate unused vials in original carton. • Protect from light. • May refrigerate diluted solution for up to 48 hrs or store at room temperature for up to 8 hrs. • Do not shake, agitate, or freeze.

## IV INCOMPATIBILITIES

Do not mix with solutions containing other medications.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma

**IV; ADULTS: Cycle 1:** 10 mg/kg on days 1, 8, 15, and 22 of a 28-day cycle (in combination with pomalidomide and dexamethasone, or in combination with carfilzomib and dexamethasone). **Cycle 2 and thereafter:** 10 mg/kg on days 1 and 15 of 28-day cycle (in combination with pomalidomide and dexamethasone, or in combination with carfilzomib and dexamethasone). Continue until disease progression or unacceptable toxicity. If hematological toxicity occurs, may consider withholding treatment until blood counts improve.

### Dose Modification

#### Neutropenia

**Grade 4 neutropenia:** Withhold treatment until neutrophil count improves to 1000 cells/mm<sup>3</sup>, then resume at same dose.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (26%):** Diarrhea. **Occasional (17%–12%):** Dyspnea, nausea, vomiting.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia)

is an expected response to therapy, but more severe reactions including severe neutropenia, febrile neutropenia may be life threatening. Grade 3 or 4 neutropenia reported in 85% of pts. Infusion-related reactions including chills, cough, dyspnea, nausea reported in 39% of pts. Grade 3 or 4 infusion reactions including dyspnea, hypertension, bronchospasm reported in 1% of pts. Infections including pneumonia (bronchopulmonary aspergillosis, *Haemophilus* pneumonia, influenza, *Pneumocystis jiroveci* pneumonia; bacterial/candidal/streptococcal/viral pneumonia), respiratory tract infections (bronchiolitis, bronchitis, viral bronchitis, nasopharyngitis, laryngitis, pharyngitis, parainfluenza virus infection, rhinitis, tracheitis, bacterial infection), UTI were reported. Secondary malignancies including skin squamous cell carcinoma, breast angiosarcoma, myelodysplastic syndrome were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, blood type and screen; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Inform blood bank of treatment and possible treatment-related interference with serologic testing. Administer in an environment equipped to monitor for and manage infusion-related reactions. Obtain weight in kilograms. Screen for active infection. Question for prior infusion-related reactions before each infusion. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC periodically for myelosuppression. Monitor vital sign during infusion. If infusion-related reaction occurs, interrupt infusion and manage symptoms. Infusion reactions were usually reported during the first infusion. Most infusion reactions resolve on the same day of administration. Monitor for infections (cough, fatigue, fever), new malignancies. If serious infection occurs, initiate appropriate antimicrobial therapy. Moni-

tor daily pattern of bowel activity, stool consistency. Offer antiemetic if nausea/vomiting occurs.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Immediately report symptoms of infusion-related reactions such as chills, cough, difficulty breathing, nausea, throat tightness.
- Pretreatment with acetaminophen, antihistamines, steroidal anti-inflammatories may help reduce infusion reactions.
- Due to pretreatment with a corticosteroid, pts with diabetes may experience a transient rise in blood sugar levels.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Treatment may cause new cancers.

## isavuconazonium

eye-sa-vue-kon-a-zoe-nee-um  
(Cresemba)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Azole antifungal derivative. **CLINICAL:** Antifungal.

#### USES

Treatment of invasive aspergillosis and invasive mucormycosis in pts 18 yrs and older.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to isavuconazonium or isavuconazole, concomitant use of strong CYP3A inhibitors (e.g., ketoconazole, high-dose ritonavir), strong CYP3A inducers (e.g., carBAMaze-

pine, rifAMPin, St. John's wort), history of short QT syndrome. **Cautions:** Renal/hepatic impairment, hypersensitivity to other azoles. Pts at risk for acute pancreatitis; concomitant use of nephrotoxic medications; pts at risk for hypokalemia, hypomagnesemia. Concomitant use of medications that prolong QT interval.

#### ACTION

Isavuconazonium is the prodrug of isavuconazole. Interferes with fungal cytochrome activity, decreasing ergosterol synthesis, inhibiting fungal cell membrane formation. **Therapeutic Effect:** Damages fungal cell wall membrane.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 2–3 hrs. Excreted in feces (46%), urine (46%). **Half-life:** 130 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. May increase concentration/effects of cycloSPORINE, digoxin, eplerenone, estrogen, everolimus, midazolam, mycophenolate sirolimus, tacrolimus. May decrease therapeutic effect of *Saccharomyces boulardii*. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin. May decrease serum potassium, magnesium.

**AVAILABILITY (Rx)**

**Injection Powder:** 372 mg/vial (equivalent to 200 mg isavuconazole). **Capsules:** 186 mg (equivalent to 100 mg isavuconazole).

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute vial with 5 mL Sterile Water for Injection. • Gently shake until completely dissolved. • Visually inspect for particulate matter or discoloration. Solution may contain visible translucent to white particles. • Inject reconstituted solution into 250 mL 0.9% NaCl or 5% Dextrose injection. • Gently invert bag to mix. Do not shake or agitate. Do not use pneumatic transport system. • Diluted solution may also contain visible translucent to white particles (which will be removed by in-line filter).

**Administration** • Do not give as IV push or bolus. Flush IV line with 0.9% NaCl or 5% Dextrose injection prior to and after infusion.

**Rate of administration** • Infuse over 60 min (minimum) using 0.2- to 1.2-micron in-line filter.

**Storage** • Diluted solution may be stored at room temperature up to 6 hrs or refrigerated up to 24 hrs. • Do not freeze.

**PO**

• Give without regard to food. • Do not cut, crush, divide, or open capsules.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** 372 mg is equivalent to 200 mg isavuconazole. Duration of therapy: minimum of 6–12 wks.

**Invasive Aspergillosis, Invasive Mucormycosis**

**IV: ADULTS, ELDERLY: Loading dose:** 372 mg q8h for 6 doses (48 hrs). **Maintenance:** 372 mg once daily. Start maintenance dose 12–24 hrs after last loading dose. **PO: ADULTS, ELDERLY: Loading dose:** 372 mg (2 capsules) q8h for 6

doses (48 hrs). **Maintenance:** 372 mg (2 capsules) once daily. Start maintenance dose 12–24 hrs after last loading dose.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (28%–17%):** Nausea, vomiting, diarrhea, abdominal pain, headache, dyspnea. **Occasional (15%–6%):** Peripheral edema, constipation, fatigue, insomnia, back pain, delirium, agitation, confusion, disorientation, chest pain, rash, pruritus, hypotension, anxiety, dyspepsia, injection site reaction, decreased appetite.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe hepatic injury including cholestasis, hepatitis, hepatic failure reported in pts with underlying medical conditions (e.g., hematologic malignancies). Infusion-related reactions including chills, dizziness, dyspnea, hypoesthesia, hypotension, paresthesia may occur. Acute respiratory failure, renal failure, Stevens-Johnson syndrome, serious hypersensitivity reaction (including anaphylaxis) were reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT, pregnancy test in females of reproductive potential. Specimens for fungal culture, histopathology should be obtained prior to initiating therapy. Receive full medication history and screen for interactions/contraindications. Question history of hypersensitivity reaction, hepatic impairment.

**INTERVENTION/EVALUATION**

Monitor LFT periodically. Monitor for infusion-related reactions, hypersensitivity

reactions, anaphylaxis. Monitor I&O. Report worsening of hepatic/renal function.

#### PATIENT/FAMILY TEACHING

- Swallow capsule whole; do not chew, crush, cut, or open capsules.
- Use effective contraception to avoid pregnancy.
- Do not take herbal products such as St. John's wort.
- Report liver problems such as upper abdominal pain, bleeding, dark or amber-colored urine, nausea, vomiting, or yellowing of the skin or eyes.
- Report decreased urinary output, extremity swelling, dark-colored urine; skin changes such as rash, skin bubbling, or sloughing.

## isoniazid

eye-soe-nye-a-zid  
(Isotamine )

**BLACK BOX ALERT** Severe, potentially fatal hepatitis may occur.

#### FIXED-COMBINATION(S)

**Rifamate:** isoniazid/rifAMPin (antitubercular): 150 mg/300 mg.

**Rifater:** isoniazid/pyrazinamide/rifAMPin (antitubercular): 50 mg/300 mg/120 mg.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Isonicotinic acid derivative. **CLINICAL:** Antitubercular.

#### USES

Treatment of susceptible active tuberculosis due to *Mycobacterium tuberculosis*. Treatment of latent tuberculosis caused by *Mycobacterium tuberculosis*.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to isoniazid (including drug-induced hepatitis), acute hepatic disease, hepatic injury or severe adverse reac-

tions with previous isoniazid therapy. **Cautions:** Chronic hepatic disease, alcoholism, severe renal impairment. Pregnancy, pts at risk for peripheral neuropathy, HIV infection, history of hypersensitivity reactions to latent TB infection medications.

#### ACTION

Inhibits mycolic acid synthesis. Causes disruption of bacterial cell wall, loss of acid-fast properties in susceptible mycobacteria. **Therapeutic Effect:** Bactericidal against actively growing intracellular, extracellular susceptible mycobacteria.

#### PHARMACOKINETICS

**Note:** Isoniazid is metabolized by acetylation. The rate of acetylation is genetically determined (e.g., 50% of black and Caucasian pts are slow inactivators; Eskimo and Asian pts are rapid inactivators. Slower inactivation may lead to higher blood levels and increased adverse effects.

Widely distributed (including to CSF). Protein binding: 10%–15%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** (Fast acetylators): 30–100 min; (slow acetylators): 2–5 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Prophylaxis usually postponed until after delivery. Crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** More susceptible to developing hepatitis.

#### INTERACTIONS

**DRUG:** May increase concentration/effects of **carbamazepine**, **fosphenytoin**, **lomitapide**, **phenytoin**. **Hepatotoxic medications** (e.g., **acetaminophen**, **rifAMPin**) may increase risk of hepatotoxicity. May decrease **ketoconazole** concentration. **HERBAL:** None significant. **FOOD:** **Foods containing tyramine**

may cause hypertensive crisis. **LAB VALUES:** May increase serum bilirubin, ALT, AST.

### AVAILABILITY (Rx)

**Solution, Injection:** 100 mg/mL. **Syrup, Oral:** 50 mg/5 mL. **Tablets:** 100 mg, 300 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give 1 hr before or 2 hrs following meals (may give with food to decrease GI upset, but will delay absorption).
- Administer at least 1 hr before antacids, esp. those containing aluminum.

### INDICATIONS/ROUTES/DOSAGE

#### Active Tuberculosis (in Combination With One or More Antituberculars)

**IM/PO: ADULTS, ELDERLY, CHILDREN WEIGHING 40 KG OR MORE:** 5 mg/kg once daily. **Usual dose:** 300 mg. **CHILDREN WEIGHING LESS THAN 40 KG:** 10–15 mg/kg once daily. **Maximum:** 300 mg.

**Note:** Give isoniazid with rifAMPin, pyrazinamide, and with or without ethambutol for 8 wks, then give with rifAMPin for 18 wks.

#### Latent Tuberculosis

**Note:** Give for 9 mos.

**IM/PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 5 mg/kg once daily (**Maximum:** 300 mg) or 15 mg/kg twice wkly (**Maximum:** 900 mg). **CHILDREN YOUNGER THAN 12 YRS:** 10–20 mg/kg/day as a single daily dose. **Maximum:** 300 mg/day or 20–40 mg/kg 2 times/wk. **Maximum:** 900 mg/dose.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

Use caution. Contraindicated with acute hepatic disease.

### SIDE EFFECTS

**Frequent:** Nausea, vomiting, diarrhea, abdominal pain. **Rare:** Pain at injection site, hypersensitivity reaction.

### ADVERSE EFFECTS/TOXIC REACTIONS

Neurotoxicity (ataxia, paresthesia), optic neuritis, hepatotoxicity occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain LFT. Question for history of hypersensitivity reactions, hepatic injury or disease, sensitivity to nicotinic acid or chemically related medications. Ensure collection of specimens for culture, sensitivity.

#### INTERVENTION/EVALUATION

Monitor LFT, assess for hepatotoxicity: anorexia, nausea, vomiting, weakness, fatigue, dark urine, jaundice (withhold concurrent INH therapy and inform physician promptly). Assess for paresthesia of extremities (pts esp. at risk for neuropathy may be given pyridoxine prophylactically: malnourished, elderly, diabetics, pts with chronic hepatic disease [including alcoholics]). Be alert for fever, skin eruptions (hypersensitivity reaction).

#### PATIENT/FAMILY TEACHING

- Do not skip doses; continue to take isoniazid for full length of therapy (6–24 mos).
- Take preferably 1 hr before or 2 hrs following meals (with food if GI upset).
- Avoid alcohol during treatment.
- Do not take any other medications, including antacids, without consulting physician.
- Must take isoniazid at least 1 hr before antacid.
- Avoid tuna, sauerkraut, aged cheeses, smoked fish (consult list of tyramine-containing foods), which may cause hypertensive reaction (red/itching skin, palpitations, light-headedness, hot or clammy feeling, headache).
- Report any new symptom, immediately for vision difficulties, nausea/vomiting, dark urine, yellowing of skin/eyes (jaundice), fatigue, paresthesia of extremities.

## isosorbide dinitrate

eye-soe-sor-bide  
(ISDN , Dilatrate-SR, Isordil)

## isosorbide mononitrate

(Apo-ISMN , Imdur )

**Do not confuse Imdur with Imuran, Inderal, or K-Dur, Isordil with Inderal, Isuprel, or Plendil.**

### FIXED-COMBINATION(S)

**BiDiI:** isosorbide dinitrate/hydrALAZINE (a vasodilator): 20 mg/37.5 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nitrate.

**CLINICAL:** Antianginal.

### USES

**Dinitrate:** Prevention of angina pectoris due to coronary artery disease. **Mononitrate:** Treatment (immediate-release only) and prevention of angina pectoris due to coronary artery disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to nitrates, concurrent use of sildenafil, tadalafil, vardenafil, or riociguat. **Cautions:** Inferior wall MI, head trauma, increased intracranial pressure (ICP), orthostatic hypotension, blood volume depletion from diuretic therapy, systolic B/P less than 90 mm Hg, hypertrophic cardiomyopathy, alcohol consumption.

### ACTION

Forms free radical nitric oxide which activates intracellular cyclic guanosine monophosphate, leading to smooth muscle relaxation. **Therapeutic Effect:** Relaxes vascular smooth muscle of arterial, venous vasculature. Decreases preload, afterload, cardiac oxygen demand.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
<b>Dinitrate</b>			
Sublingual	3 min	N/A	1–2 hrs
PO	45–60 min	N/A	up to 8 hrs
<b>Mononitrate</b>			
PO (extended-release)	30–60 min	N/A	12–24 hrs

Dinitrate poorly absorbed and metabolized in liver to its active metabolite isosorbide mononitrate. Mononitrate well absorbed after PO administration. Primarily excreted in urine. **Half-life:** Dinitrate, 1–4 hrs; mononitrate, 4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects. Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Alcohol, riociguat, sildenafil, tadalafil, vardenafil may potentiate hypotensive effects (concurrent use of these agents is contraindicated). **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase urine catecholamine, urine vanillylmandelic acid levels.

### AVAILABILITY (Rx)

#### Dinitrate

**Tablets:** 5 mg, 10 mg, 20 mg, 30 mg, 40 mg.

 **Capsules, Extended-Release:** 40 mg.

#### Mononitrate

**Tablets:** 10 mg, 20 mg.

 **Tablets, Extended-Release:** 30 mg, 60 mg, 120 mg.

### ADMINISTRATION/HANDLING

#### PO

- Best if taken on an empty stomach.
- Do not administer around the clock.
- Oral tablets may be crushed. • Do

not crush/break sustained-, extended-release form.

## INDICATIONS/ROUTES/DOSAGE

### Angina

**Note:** Dinitrate used only for prevention.

**PO: (Isosorbide Dinitrate) (Immediate-Release):** ADULTS, ELDERLY: Initially, 5–20 mg 2–3 times/day. **Maintenance:** 10–40 mg (or between 5–80 mg) 2–3 times/day.

**(Sustained-Release):** ADULTS, ELDERLY: 40 mg 1–2 times/day. A nitrate-free interval of greater than 18 hrs is recommended. **Maximum:** 160 mg/day.

**PO: (Isosorbide Mononitrate) (Immediate-Release):** ADULTS, ELDERLY: 20 mg twice daily given 7 hrs apart to decrease tolerance development. In pts with small stature, may start at 5 mg twice daily and titrate to at least 10 mg twice daily in first 2–3 days of therapy. **(Sustained-Release):** Initially, 30–60 mg/day in morning as a single dose. May increase dose at 3-day intervals to 120 mg once daily. **Maximum daily single dose:** 240 mg.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Headache (may be severe) occurs mostly in early therapy, diminishes rapidly in intensity, usually disappears during continued treatment. **Sublingual:** Burning, tingling at oral point of dissolution. **Occasional:** Transient flushing of face/neck, dizziness, weakness, orthostatic hypotension, nausea, vomiting, restlessness. GI upset, blurred vision, dry mouth.

## ADVERSE EFFECTS/TOXIC REACTIONS

Discontinue if blurred vision occurs. Severe orthostatic hypotension manifested by syncope, pulselessness, cold/clammy skin, diaphoresis has been reported. Tolerance may occur with repeated, prolonged therapy, but may not occur with extended-release form. Minor tolerance with intermittent use of sublingual tablets. High dosage tends to produce severe headache.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). If headache occurs during management therapy, administer medication with meals.

### INTERVENTION/EVALUATION

Assist with ambulation if light-headedness, dizziness occurs. Assess for facial/neck flushing. Monitor number of anginal episodes, orthostatic B/P.

### PATIENT/FAMILY TEACHING

- Do not chew, crush, dissolve, or divide sublingual, extended-release, sustained-release forms.
- Take sublingual tablets while sitting down.
- Go from lying to standing slowly (prevents dizziness effect).
- Take oral form on empty stomach (however, if headache occurs during management therapy, take medication with meals).
- Dissolve sublingual tablet under tongue; do not swallow.
- Avoid alcohol (intensifies hypotensive effect).
- If alcohol is ingested soon after taking nitrates, possible acute hypotensive episode (marked drop in B/P, vertigo, pallor) may occur.
- Report signs/symptoms of hypotension, angina.

## itraconazole

it-ra-kon-a-zole

(Sporanox, Tolsura)

**BLACK BOX ALERT** Serious cardiovascular events, including HF, ventricular tachycardia, torsades de pointes, death, have occurred due to concurrent use with colchicine (pts with renal/hepatic impairment), dofetilide, dronedarone, eplerenone, ergot alkaloids, felodipine, fesoterodine, irinotecan, ivabradine, levome-thadyl, lovastatin, lurasidone, methadone, midazolam (oral), pimo-zide, quiniDine, ranolazine, simvastatin, solifenacin, ticagrelor, or triazolam.

Negative inotropic effects observed following IV administration. Contraindicated for treatment of onychomycosis in pts with HF, ventricular dysfunction.

**Do not confuse itraconazole with fluconazole, ketoconazole, miconazole, posaconazole, voriconazole, or Sporanox with Suprax or Topamax.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Azole-derivative antifungal. **CLINICAL:** Antifungal.

### USES

**Oral capsules:** Treatment of aspergillosis, blastomycosis, esophageal and oropharyngeal candidiasis, empiric treatment in febrile neutropenia, histoplasmosis, onychomycosis. **Oral solution:** Treatment of oral and esophageal candidiasis. **Oral tablet:** Treatment of onychomycosis of toenail.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to itraconazole, other azoles. Treatment of onychomycosis in pts with evidence of ventricular dysfunction (e.g., HF or history of HF); concurrent use of dofetilide, dronedarone, eplerenone, ergot derivatives, felodipine, irinotecan, lovastatin, lurasidone, methadone, midazolam (oral), pimozone, ranolazine, simvastatin, ticagrelor, triazolam, quinidine; concurrent use with colchicine, fesoterodine, solifenacin in pts with renal/hepatic impairment; treatment of onychomycosis in women who are pregnant or are intending to become pregnant. **Cautions:** Preexisting hepatic impairment (not recommended in pts with active hepatic disease, elevated LFTs), renal impairment, pts with risk factors for HF (e.g., COPD, myocardial ischemia).

### ACTION

Inhibits synthesis of ergosterol (vital component of fungal cell formation).

**Therapeutic Effect:** Damages fungal cell membrane, altering its function. Fungistatic.

### PHARMACOKINETICS

Moderately absorbed from GI tract. Absorption is increased when taken with food. Protein binding: 99%. Widely distributed, primarily in fatty tissue, liver, kidneys. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 16–26 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May increase concentration/toxicity of aliskiren, calcium channel-blocking agents (e.g., felodipine, nifedipine), cyclosporine, dofetilide, eplerenone, ergot alkaloids, HMG-CoA reductase inhibitors (e.g., lovastatin, simvastatin), midazolam, sirolimus, tacrolimus, warfarin. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May inhibit metabolism of docetaxel, vinca alkaloids. **Antacids, H<sub>2</sub> antagonists, proton pump inhibitors** may decrease absorption. **HERBAL:** None significant. **FOOD:** Grapefruit products may alter absorption. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST, LDH. May decrease serum potassium.

### AVAILABILITY (Rx)

**Capsules:** (*Sporanox*): 100 mg. (*Tolsura*): 65 mg. **Oral Solution:** (*Sporanox*): 10 mg/mL.

**ADMINISTRATION/HANDLING****PO**

• Give capsules with food (increases absorption). • Give solution on empty stomach. Swish vigorously in mouth, then swallow.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Capsules/tablets are not bioequivalent with oral solution.

**Blastomycosis, Histoplasmosis**

**PO: ADULTS, ELDERLY: (*Sporanox [Oral Solution or Capsule]*):** 200 mg 3 times/day for 3 days, then 200 mg twice daily. (*Tolsura*): 130 mg once daily; if no improvement or evidence of progressive fungal infection, increase dose in 65 mg increments to a maximum of 260 mg/day given in 2 divided doses. For life-threatening infections, give a loading dose of 130 mg 3 times/day for the first 3 days of treatment. Treatment should be continued for 3 mos or greater.

**Aspergillosis**

**PO: ADULTS, ELDERLY: (*Sporanox [Oral Solution]*):** 200 mg 2 times/day for minimum of 16 wks. (*Tolsura*): 130 mg 1–2 times/day. For life-threatening infections, give a loading dose of 130 mg 3 times/day for the first 3 days of treatment. Treatment should be continued for at least 3 mos.

**Esophageal Candidiasis**

**PO: ADULTS, ELDERLY: (*Oral Solution*):** Swish 200 mg (20 mL) in mouth for several seconds, then swallow once daily for a minimum of 3 wks. Continue for 2 wks after resolution of symptoms. **Maximum:** 200 mg/day.

**Oropharyngeal Candidiasis**

**PO: ADULTS, ELDERLY:** 200 mg (10 mL) oral solution, swish and swallow once daily for up to 28 days.

**Onychomycosis (Fingernail)**

**PO: ADULTS, ELDERLY: (*Capsule*):** 200 mg twice daily for 7 days, off for 21 days, repeat 200 mg twice daily for 7 days.

**Onychomycosis (Toenail)**

**PO: ADULTS, ELDERLY: (*Tablet*):** 200 mg once daily for 12 wks.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (11%–9%):** Nausea, rash.

**Occasional (5%–3%):** Vomiting, headache, diarrhea, hypertension, peripheral edema, fatigue, fever. **Rare (2% or less):** Abdominal pain, dizziness, anorexia, pruritus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hepatotoxicity (anorexia, abdominal pain, unusual fatigue/weakness, jaundiced skin/sclera, dark urine) occurs rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT. Assess allergies. Receive full medication history (numerous contraindications/cautions).

**INTERVENTION/EVALUATION**

Monitor for hepatotoxicity (abdominal pain, jaundice, nausea, vomiting). Monitor LFT in pts with preexisting hepatic impairment.

**PATIENT/ FAMILY TEACHING**

• Take capsules with food, liquids if GI distress occurs. • Therapy will continue for at least 3 mos, until lab tests, clinical presentation indicate infection is controlled. • Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes). • Avoid grapefruit products.

**ivabradine**

eye-vab-ra-deen  
(Corlanor)

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Hyperpolarization-activated cyclic nucleotide-gated (HCN) channel blocker.

**CLINICAL:** Reduces risk of worsening HF.

## USES

To reduce the risk of hospitalization for worsening HF in pts with stable, symptomatic chronic HF with left ventricular ejection fraction less than or equal to 35%, who are in sinus rhythm with a resting heart rate greater than or equal to 70 bpm, and either are on maximally tolerated dose of beta blockers or have a contraindication to beta blocker use.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ivabradine. Acute decompensated HF, B/P less than 90/50 mm Hg, sick sinus syndrome; sinoatrial block or third-degree AV block (unless a functional pacemaker is present), resting heart rate less than 60 bpm prior to initiation, severe hepatic impairment, pacemaker dependence (heart rate maintained exclusively by a pacemaker), concomitant use of strong CYP3A4 inhibitors.

**Cautions:** History of atrial fibrillation, hypertension. Avoid concomitant use of diltiazem or verapamil. Avoid use in pts with second-degree heart block (unless a functioning pacemaker is present). Pts at risk for bradycardia. Not recommended with pacemakers set to rate of 60 bpm or greater.

## ACTION

Reduces spontaneous pacemaker activity of the cardiac sinus node by blocking HCN channels that are responsible for cardiac current, which regulates heart rate. Does not affect ventricular repolarization or myocardial contractility. Also inhibits retinal current involved in reducing bright light in retina. **Therapeutic Effect:** Reduces heart rate.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver and intestines. Protein binding: 70%. Peak plasma concentration: 1 hr. Eliminated

in feces, urine (% not specified).

**Half-life:** 6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Females of reproductive potential should use effective contraception. Unknown if distributed in breast milk. If treatment is decided to be absolutely necessary, pregnant pts should be closely monitored for destabilizing HF, esp. during the first trimester. Pregnant women with chronic HF in the third trimester should be closely monitored for preterm birth. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** diltiazem, verapamil may increase concentration/effect; may further increase risk of bradycardia. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 7.5 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with meals. May divide 5-mg tablet, providing 2.5-mg dose.

## INDICATIONS/ROUTES/DOSAGE

### HF

**PO: ADULTS, ELDERLY:** Initially, 5 mg twice daily for 14 days, then adjust dose to resting heart rate of 50–60 bpm. Further adjustments based on resting heart rate and tolerability. **Maximum:** 7.5 mg twice daily. (See Dose Modification). **Pts with history of conduction defects, pts in whom bradycardia could lead to**

**hemodynamic compromise:** Initiate therapy at 2.5 mg twice daily.

### Dose Modification

Adjust dose to maintain a resting heart between 50–60 bpm as follows:

Heart Rate	Dose Adjustment
Greater than 60 bpm	Increase by 2.5 mg (given twice daily) up to maximum dose of 7.5 mg daily.
50–60 bpm	Maintain dose.
Less than 50 bpm or symptomatic bradycardia	Decrease by 2.5 mg (given twice daily); if current dose is 2.5 mg twice daily, permanently discontinue.

### Dosage in Renal Impairment

**Mild to moderate impairment: CrCl 15 mL/min or greater:** No dose adjustment. **Severe impairment: CrCl less than 15 mL/min:** Use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Contraindicated.

## SIDE EFFECTS

**Occasional (10%–3%):** Bradycardia, hypertension, phosphenes (visual disturbances, luminous phenomena), visual brightness.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of atrial fibrillation (8.3% of pts). Bradycardia, sinus arrest, or heart block may occur. Bradycardia occurred in 10% of pts. Risk factors for bradycardia may include sinus node dysfunction, conduction defects (e.g., first- or second-degree AV block, bundle branch block), ventricular dyssynchrony, or use of negative chronotropic drugs. Phosphenes, a transient enhanced brightness in the visual field (which may include halos, stroboscopic or kaleidoscopic effect, colored bright lights,

or multiple images) may occur. Phosphenes are usually triggered by sudden variations in light intensity and generally occur within the first 2 mos of treatment. Other adverse reactions such as angioedema, diplopia, erythema, hypotension, pruritus, rash, syncope, urticaria, vertigo, visual impairment occur rarely. Overdose may lead to severe and prolonged bradycardia requiring temporary cardiac pacing or infusion of IV beta-stimulating agents.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain heart rate, B/P. Confirm negative pregnancy test before initiating therapy. Receive full medication history and screen for interactions. Screen for contraindications as listed in Precautions. Question history of atrial fibrillation, bradycardia, hypertension.

### INTERVENTION/EVALUATION

Monitor heart rate, B/P. Diligently monitor for atrial fibrillation, bradycardia, syncope. If symptomatic bradycardia occurs, temporary cardiac pacing or infusion of beta-stimulating agents may be warranted. Monitor for hypersensitivity reaction. Monitor for visual changes. Initiate fall precautions.

### PATIENT/FAMILY TEACHING

- Take medication with meals.
- Avoid grapefruit products, herbal supplements such as St. John's wort.
- Use effective contraception to avoid pregnancy.
- Report symptoms of low heart rate such as confusion, dizziness, fatigue, fainting, low blood pressure, pallor.
- Report symptoms of atrial fibrillation such as chest pressure, palpitations, shortness of breath.
- Treatment may cause luminous phenomena (phosphenes), a transient visual brightness that may include halos, light sensitivity, or colored bright lights.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report allergic reactions such as hives, itching, rash, tongue swelling.

## ivosidenib

eye-voe-sid-e-nib  
(Tibsovo)

**BLACK BOX ALERT** Life-threatening and/or fatal differentiation syndrome with symptoms including fever, dyspnea, hypoxia, pulmonary infiltrates, pleural or pericardial effusion, rapid weight gain or peripheral edema, hypotension, renal dysfunction may occur. Initiate corticosteroid therapy and hemodynamic monitoring in pts suspected of differentiation syndrome until symptoms resolve.

**Do not confuse ivosidenib with enasidenib, ibrutinib, idelalisib, imatinib, or ixazomib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Isocitrate dehydrogenase-1 (IDH1) inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Treatment of acute myeloid leukemia (AML) with a susceptible IDH1 mutation in adults with newly diagnosed AML who are 75 yrs or older or who have comorbidities that preclude use of intensive induction chemotherapy. Treatment of AML with a susceptible IDH1 mutation in adults with relapsed or refractory AML.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ivosidenib. **Cautions:** Baseline leukopenia, hypotension; active infection, cardiac disease, hepatic/renal impairment, electrolyte imbalance; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for QTc interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HE, QT interval-prolonging medications, hypokalemia, hypomagnesemia); concomitant use strong or moderate CYP3A inhibitors, strong CYP3A inducers; dehydration; pts

at high risk for tumor lysis syndrome (high tumor burden).

### ACTION

Inhibits IDH1 enzymes on mutant IDH1 variants, decreasing 2-hydroxyglutarate (2-HG) levels and restoring myeloid differentiation. **Therapeutic Effect:** Reduces blast counts; increases percentage of myeloid cells. Inhibits tumor growth and proliferation.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 92%–96%. Peak plasma concentration: 3 hrs. Steady state reached in 14 days. Excreted in feces (77%), urine (17%). **Half-life:** 93 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 30 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A4 inhibitors (e.g., erythromycin, diTIAZem, fluconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. QT interval-prolonging medications (e.g., amiodarone, azithromycin, citalopram, clarithromycin, escitalopram, haloperidol) may increase risk of QTc interval prolongation. May increase QT prolongation effect of dronedarone. May decrease effect of oral contraceptives. **HERBAL:** None significant. **FOOD:** High-fat meals may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, uric acid. May decrease Hgb, WBCs; se-

rum magnesium, phosphate, potassium, sodium.

## AVAILABILITY (Rx)

**Tablets:** 250 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to low-fat food.
- Do not give with a high-fat meal.
- Administer whole; do not break, cut, crush, or divide tablets.
- Tablets cannot be chewed.
- If vomiting occurs after administration, give next dose at regularly scheduled time.
- If a dose is missed, administer as soon as possible
- Do not give a missed dose within 12 hrs of next dose.

## INDICATIONS/ROUTES/DOSAGE

### Acute Myeloid Leukemia

**PO: ADULTS, ELDERLY:** 500 mg once daily for at least 6 mos. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Differentiation Syndrome

Withhold treatment if symptoms are severe and persist for more than 48 hrs after initiation of corticosteroids. Resume treatment when symptoms improve to Grade 2 or less.

### Guillain-Barré Syndrome

Permanently discontinue.

### Noninfectious Leukocytosis

**WBC count greater than 25,000 cells/mm<sup>3</sup> or absolute increase in total WBC count greater than 15,000 cells/mm<sup>3</sup> from baseline:** If indicated, treat with hydroxyurea and leukapheresis. Taper hydroxyurea after leukocytosis improves or resolves. If leukocytosis does not improve with hydroxyurea, withhold treatment until resolved, then resume at same dose.

### QT Interval Prolongation

**QTc interval 481–500 msec:** Withhold treatment. Assess and replete electrolyte levels. Assess and adjust concomitant use of medications known to cause QTc interval prolongation. When QTc interval prolongation improves to 480 msec or less, resume at same dose and monitor ECG at least wkly for 2 wks. **QTc interval greater than 500 msec:** Withhold treatment. Assess and replete electrolyte levels. Assess and adjust concomitant use of medications known to cause QTc interval prolongation. When QTc interval returns to within 30 msec of baseline or 480 msec or less, resume at reduced dose of 250 mg. **QTc interval prolongation with life-threatening arrhythmia:** Permanently discontinue.

### Other Adverse Reactions

**Any Grade 3 or higher toxicity:** Withhold treatment until improved to Grade 2, then resume at reduced dose of 250 mg. May increase to 500 mg if toxicities further improve to Grade 1 or 0. **Recurrent Grade 3 or higher toxicity:** Permanently discontinue.

### Concomitant Use of CYP3A4 Inhibitor

If concomitant CYP3A4 inhibitor cannot be discontinued, reduce ivosidenib dose to 250 mg. If CYP3A inhibitor is discontinued for 3–5 half-lives, increase ivosidenib dose to 500 mg.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (39%–18%):** Fatigue, asthenia, arthralgia, diarrhea, dyspnea, edema, nausea, abdominal pain, mucositis, rash,

pyrexia, cough, constipation, vomiting, decreased appetite, myalgia. **Occasional (16%–12%):** Chest pain, headache, neuropathy, hypotension.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia are expected responses to therapy. Life-threatening and/or fatal differentiation syndrome, a condition with rapid proliferation and differentiation of myeloid cells, reported in 19%–25% of pts. QT interval prolongation with QTc interval greater than 500 msec (9% of pts) and QTc interval greater than 60 msec from baseline (14% of pts) have occurred. Guillain-Barré syndrome occurred in less than 1% of pts. Noninfectious leukocytosis reported in 12% of pts. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; ECG; pregnancy test in female pts of reproductive potential. Replete electrolytes if applicable. Confirm presence of IDH1 mutations in the blood or bone marrow. Assess adequate hydration prior to initiation due to increased risk of tumor lysis syndrome, diarrhea, vomiting. Screen for active infection. Receive full medication history and screen for interactions. Concomitant use of other medications may need to be adjusted. Assess risk for QT interval prolongation, tumor lysis syndrome. Question history of cardiac/hepatic/renal disease, cardiac arrhythmias. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT at least wkly for 4 wks, then every other wk for 4 wks, then monthly until discontinuation. Monitor CK levels wkly for at least 4 wks. An increase of serum creatinine greater than

0.4 mg/dL from baseline may indicate renal impairment. Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Monitor ECG at least wkly for 3 wks, then monthly until discontinuation. If QT interval—prolonging medications cannot be withheld, diligently monitor ECG; serum potassium, magnesium for QT interval prolongation, cardiac arrhythmias. Monitor B/P for hypotension, esp. in pts taking antihypertensives. Monitor for symptoms of differentiation syndrome (dyspnea, fever hypotension, hypoxia, pulmonary infiltrates, pleural or pericardial effusion, rapid weight gain or peripheral edema, renal dysfunction, or concomitant febrile neutropenic dermatosis). If differentiation syndrome is suspected, initiate corticosteroids and hemodynamic monitoring until symptoms resolve for at least 3 days. Monitor for symptoms of Guillain-Barré syndrome (dysphagia, dysarthria, dyspnea, motor weakness, paresthesia, sensory alterations). Diligently monitor for infection. Assess skin for skin reactions, rash. Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report palpitations, chest pain, shortness of breath, dizziness, fainting; may indicate arrhythmia.
- Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue,

fever, muscle or joint pain, palpitations, seizures, vomiting. • Treatment may cause life-threatening differentiation syndrome as early as 2 days after starting therapy. Report difficulty breathing, fever, low blood pressure, rapid weight gain, swelling of the hands or feet, decreased urine output. • Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine), skin reactions (rash, skin eruptions). • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Avoid grapefruit products, herbal supplements (esp. St. John's wort). • Report suspected pregnancy. Do not breast-feed. • Drink plenty of fluids. • Avoid high-fat meals during administration.

## ixabepilone

ix-ab-ep-i-lone  
(Ixempra)

**BLACK BOX ALERT** ■ Combination therapy with capecitabine is contraindicated in pts with serum ALT or AST greater than 2.5 times upper limit of normal (ULN) or bilirubin greater than 1 times ULN due to increased risk of toxicity, neutropenia-related mortality.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Etoposide microtubule inhibitor, antimetabolic agent. **CLINICAL:** Antineoplastic.

### USES

Combination therapy with capecitabine for treatment of metastatic or locally advanced breast cancer in pts after failure of anthracycline, taxane therapy. As monotherapy, treatment of metastatic or locally advanced breast cancer in pts af-

ter failure of anthracycline, taxane, and capecitabine therapy. **OFF-LABEL:** Treatment of endometrial cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ixabepilone. Severe hypersensitivity reaction (Grade 3 or 4) to Cremophor, baseline neutrophil count less than 1,500 cells/mm<sup>3</sup> or platelet count less than 100,000 cells/mm<sup>3</sup>. **Combination Capecitabine Therapy:** Serum ALT or AST greater than 2.5 times the upper limit of normal, bilirubin greater than 1 times the upper limit of normal. **Cautions:** Diabetes, existing moderate to severe neuropathy, history of cardiovascular disease. **Mono-therapy:** Serum ALT or AST greater than 5 times upper limit of normal bilirubin greater than 3 times upper limit of normal.

### ACTION

Binds directly on microtubules during active stage of G2 and M phases of cell cycle, preventing formation of microtubules, an essential part of the process of separation of chromosomes. **Therapeutic Effect:** Blocks cells in mitotic phase of cell division, leading to cell death.

### PHARMACOKINETICS

Metabolized in liver. Protein binding: 77%. Excreted in feces (65%), urine (21%). **Half-life:** 52 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Higher incidence of severe adverse reactions in those older than 65 yrs.

### INTERACTIONS

**DRUG:** Strong CYP3A4 Inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort

may decrease concentration/effect. **FOOD: Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease WBCs, Hgb, platelets.

### AVAILABILITY (Rx)

**Injection, Solution, Kit:** 15-mg kit supplied with diluent for Ixempra, 8 mL; 45 mg supplied with diluent for Ixempra, 23.5 mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • Withdraw diluent and slowly inject into vial. • Gently swirl and invert until powder is completely dissolved. • Further dilute with 250 mL lactated Ringer's. • Solution may be stored in vial for a maximum of 1 hr at room temperature. • Final concentration for infusion must be between 0.2 mg/mL and 0.6 mg/mL. • Mix infusion bag by manual rotation.

**Rate of administration** • Administer through an in-line filter of 0.2 to 1.2 microns. • Infuse over 3 hrs. Administration must be completed within 6 hrs of reconstitution.

**Storage** • Refrigerate kit. • Prior to reconstitution, kit should be removed from refrigerator and allowed to stand at room temperature for approximately 30 min. • When vials are initially removed from refrigerator, a white precipitate may be observed in the diluent vial. • This precipitate will dissolve to form a clear solution once diluent warms to room temperature. • Once diluted with lactated Ringer's, solution is stable at room temperature and room light for a maximum of 6 hrs.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** An H<sub>1</sub> antagonist (diphenhydramine 50 mg PO or equivalent) and an H<sub>2</sub> antagonist (famotidine 20–40 mg PO or equivalent) must be given prior to beginning treatment with ixabepilone. Pts

who experienced a previous hypersensitivity reaction to ixabepilone require pretreatment with corticosteroids (e.g., dexamethasone 20 mg IV 30 min before infusion, or PO 1 hr before infusion) in addition to pretreatment with H<sub>1</sub> and H<sub>2</sub> antagonists.

### Breast Cancer (Monotherapy or in Combination With Capecitabine)

**IV: ADULTS, ELDERLY:** 40 mg/m<sup>2</sup> infused over 3 hrs q3 wks. **Maximum:** 88 mg. Continue until disease progression or unacceptable toxicity.

### Monotherapy Dosage Adjustments for Hepatic Impairment

**Mild Hepatic Impairment (ALT and AST less than 2.5 times upper limit of normal [ULN] and bilirubin less than 1 time ULN)**

**IV: ADULTS, ELDERLY:** 40 mg/m<sup>2</sup> infused over 3 hrs q3 wks.

**Mild Hepatic Impairment (ALT and AST greater than 2.5 times ULN and less than 10 times ULN and bilirubin greater than 1 time ULN and less than 1.5 times ULN)**

**IV: ADULTS, ELDERLY:** 32 mg/m<sup>2</sup> infused over 3 hrs q3 wks.

**Moderate Hepatic Impairment (ALT and AST less than 10 times ULN and bilirubin greater than 1.5 times ULN and less than 3 times ULN)**

**IV infusion: ADULTS, ELDERLY:** 20–30 mg/m<sup>2</sup> infused over 3 hrs q3 wks (initiate at 20 mg/m<sup>2</sup>; may increase up to a maximum of 30 mg/m<sup>2</sup> in subsequent cycles if tolerated).

### Dosage With Strong CYP3A4 Inhibitors/Inducers

**Inhibitors:** Consider dose reduction to 20 mg/m<sup>2</sup>. **Inducers:** Consider dose increase to 60 mg/m<sup>2</sup>.

### Dosage in Renal Impairment

No dose adjustment.

### Dose Modification

Dosage adjustment based on grade of neuropathy, hematologic conditions.

**Hematologic**

**Neutrophils less than 500 cells/mm<sup>3</sup> for 7 days or longer:** Reduce dose by 20%. **Neutropenic fever:** Reduce dose by 20%. **Platelets less than 25,000 cells/mm<sup>3</sup> (less than 50,000 cells/mm<sup>3</sup> with bleeding):** Reduce dose by 20%.

**Neuropathy**

**Grade 2 for 7 days or longer or Grade 3 for less than 7 days:** Reduce dose by 20%. **Grade 3 for 7 days or longer:** Discontinue treatment. **Grade 3 (other than neuropathy):** Reduce dose by 20%. **Grade 4:** Discontinue treatment.

**SIDE EFFECTS**

**Common (62%):** Peripheral sensory neuropathy. **Frequent (56%–46%):** Fatigue, asthenia, myalgia, arthralgia, alopecia, nausea. **Occasional (29%–11%):** Vomiting, stomatitis, mucositis, diarrhea, musculoskeletal pain, anorexia, constipation, abdominal pain, headache. **Rare (9%–5%):** Skin rash, nail disorder, edema, hand-foot syndrome (blistering/rash/peeling of skin on palms of hands, soles of feet), pyrexia, dizziness, pruritus, gastroesophageal reflux disease (GERD), hot flashes, taste disorder, insomnia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Neuropathy occurs early during treatment; 75% of new onset or worsening neuropathy occurred during first 3 cycles. Diabetics may be at increased risk for severe neuropathy manifested as Grade 4 neutropenia. Neutropenia, leukopenia occur commonly; anemia, thrombocytopenia occur rarely. Hypersensitivity reactions including bronchospasm, flushing, rash, dyspnea may occur. Severe hypersensitivity reactions may require emergent intervention (e.g., epinephrine, corticosteroids).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy in females of reproductive potential. Question history of hepatic impairment, cardiac disease. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor for symptoms of neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain). Assess skin for erythema. Monitor CBC for evidence of neutropenia, thrombocytopenia; LFT for hepatotoxicity. Assess mouth for stomatitis, mucositis. If hypersensitivity reactions occur, provide immediate supportive measures.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report allergic reactions such as bronchospasm, difficulty breathing, flushing.

**ixazomib**

ix-az-oh-mib  
(Ninlaro)

**Do not confuse ixazomib with bortezomib, carfilzomib, idelalisib, or ixekizumab.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Proteasome inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of multiple myeloma (in combination with lenalidomide and dexamethasone) in pts who have received at least 1 prior therapy.

**PRECAUTIONS**

**Contraindications:** Severe hypersensitivity to ixazomib. **Cautions:** Baseline neutropenia, thrombocytopenia; hepatic/renal impairment, chronic peripheral edema, predisposing factors to infection (e.g., diabetes, renal

failure, open wounds). Concomitant use of strong CYP3A inducers not recommended.

## ACTION

Reversibly inhibits activity of beta 5 subunit of the 20S proteasome, leading to cell cycle arrest and tumor cell death (apoptosis). **Therapeutic Effect:** Inhibits tumor cells growth and metastasis.

## PHARMACOKINETICS

Well absorbed following oral administration. Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 1 hr. Excreted in urine (62%), feces (22%). Not removed by hemodialysis. **Half-life:** 9.5 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Female and male pts of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect; avoid use. May decrease effect of oral contraceptives. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** High-fat meals may decrease absorption/concentration. **LAB VALUES:** Expected to decrease neutrophils, platelets.

## AVAILABILITY (Rx)

**Capsules:** 2.3 mg, 3 mg, 4 mg.

## ADMINISTRATION/HANDLING

### PO

- Capsule contents are hazardous; use cytotoxic precautions during handling and disposal.
- Administer capsule whole; do not break, cut, crush, or open.
- Give at least 1 hr before or 2 hrs after food.
- Give on the same day each wk and at the same time that day. If a dose is missed, do not administer within 72 hrs of next scheduled dose.
- If vomiting occurs after dosing, do not readminister; give dose at next scheduled time.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma

**Note:** ANC should be 1,000 cells/mm<sup>3</sup> or greater, platelets 75,000 cells/mm<sup>3</sup> or greater, nonhematologic toxicities at baseline or Grade 1 or less prior to initiating a new cycle of therapy.

**PO: ADULTS, ELDERLY:** 4 mg once wkly on days 1, 8, and 15 of 28-day cycle, in combination with lenalidomide 25 mg daily (on days 1–21 of 28-day cycle) and dexamethasone 40 mg (on days 1, 8, 15, and 22 of 28-day cycle). Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**Initial dose:** 4 mg. **First dose reduction:** 3 mg. **Second dose reduction:** 2.3 mg. **Unable to tolerate 2.3-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Thrombocytopenia

**Platelet count less than 30,000 cells/mm<sup>3</sup>:** Withhold ixazomib and lenalidomide until platelet count is 30,000 cells/mm<sup>3</sup> or greater, then resume ixazomib at the same dose and resume lenalidomide at reduced dose level (see manufacturer guidelines). **Recurrence of platelet count less than 30,000 cells/mm<sup>3</sup>:** Withhold

ixazomib and lenalidomide until platelet count is 30,000 cells/mm<sup>3</sup> or greater, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose. **Additional occurrences:** Alternate dose modification of ixazomib and lenalidomide.

### Neutropenia

**Absolute neutrophil count (ANC) less than 500 cells/mm<sup>3</sup>:** Withhold ixazomib and lenalidomide until ANC is 500 cells/mm<sup>3</sup> or greater, then resume ixazomib at the same dose and resume lenalidomide at reduced dose level (see manufacturer guidelines).

**Recurrence of ANC less than 500 cells/mm<sup>3</sup>:** Withhold ixazomib and lenalidomide until ANC is 500 cells/mm<sup>3</sup> or greater, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose. **Additional occurrences:** Alternate dose modification of ixazomib and lenalidomide.

### Rash

**Grade 2 or 3 rash:** Withhold lenalidomide until resolved to Grade 1 or 0, then resume lenalidomide at next lower dose level (see manufacturer guidelines) and resume ixazomib at the same dose.

**Recurrence of Grade 2 or 3 rash:** Withhold ixazomib and lenalidomide until recovery to Grade 1 or 0, then resume ixazomib at reduced dose level and resume lenalidomide at the same dose.

**Grade 4 rash:** Permanently discontinue. **Additional occurrences:** Alternate dose modification of ixazomib and lenalidomide.

### Peripheral Neuropathy

**Grade 1 (with pain) or Grade 2:** Withhold ixazomib until resolved to baseline or improved to Grade 1 or 0 without pain (at prescriber's discretion), then resume ixazomib at the same dose. **Grade 2 (with pain) or Grade 3:** Withhold ixazomib until resolved to baseline or improved to Grade 1 or 0 without pain (at prescriber's discretion), then resume ixazomib at reduced

dose level. **Grade 4:** Permanently discontinue.

### Any Other Nonhematologic Toxicity

**Grade 3 or 4:** Withhold ixazomib until resolved to baseline or improved to Grade 1 or 0 (at physician's discretion), then resume ixazomib at reduced dose level.

### Dosage in Renal Impairment

**Mild to moderate impairment:** Not specified; use caution. **Severe impairment (CrCl less than 30 mL/min), end-stage renal disease:** Reduce starting dose to 3 mg.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Reduce starting dose to 3 mg.

## SIDE EFFECTS

**Frequent (42%–26%):** Diarrhea, constipation, nausea. **Occasional (22%–5%):** Vomiting, back pain, blurry vision, dry eye.

## ADVERSE EFFECTS/TOXIC REACTIONS

Neutropenia, thrombocytopenia are expected responses to therapy. Thrombocytopenia reported in 78% of pts; neutropenia in 67% of pts. Severe diarrhea may lead to discontinuation of treatment. Peripheral neuropathy reported in 28% of pts (sensory neuropathies were the most common type). Peripheral edema occurred in 28% of pts. Dermatologic toxicities including maculopapular and macular rash may occur. Infectious processes including upper respiratory tract infection (19% of pts), conjunctivitis (6% of pts) may occur. Other toxic reactions including neutrophilic dermatosis, posterior reversible encephalopathy, Stevens-Johnson syndrome, thrombotic thrombocytopenic purpura, transverse myelitis, treatment-induced hepatotoxicity, tumor lysis syndrome, occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC (esp. platelet count), renal function test (in pts with renal impairment), LFT; pregnancy test in female pts of reproductive potential. Screen for active infection. Question history of peripheral neuropathy, peripheral edema, hepatic/renal impairment, current hemodialysis status. Receive full medication history and screen for interactions. Assess hydration status. Obtain baseline visual acuity. Obtain dietary consult for nutritional support. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, platelet count at least monthly, more frequently during first 3 cycles; LFT in pts with hepatic impairment. Consider concomitant granulocyte colony-stimulating factor (e.g., filgrastim, pegfilgrastim) in pts with neutropenia. Monitor for dehydration, electrolyte imbalance if diarrhea occurs. Offer antiemetics for nausea, antidiarrheals for diarrhea. Monitor for infection (esp. in pts with neutropenia); dermal toxicity, skin rashes, petechiae; peripheral neuropathy (with or without pain); peripheral edema. Monitor daily pattern bowel activity, stool consistency. Monitor for side effects of dexamethasone (e.g., hyperglycemia, weight loss, decreased appetite), lenalidomide (see prescribing information). Reversible posterior leukoencephalopathy syndrome should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Obtain visual acuity if vision becomes blurry.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with

active infection. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Do not take ixazomib and dexamethasone at the same time. Take dexamethasone with food to minimize GI upset. • Do not expose the capsule contents to the skin or eyes. If eyes are exposed to the capsule powder, thoroughly flush eyes with water. If skin is exposed to the capsule powder, thoroughly wash skin with soap and water. • Treatment may cause nerve pain; extreme sensitivity to touch; muscle weakness; or prickling, tingling, numbness in your hands and feet. • Report neurologic changes such as blurry vision, confusion, headache, seizures; may indicate life-threatening brain swelling. • Treatment may increase risk of bleeding. • Do not take herbal supplements, esp. St. John's wort.

## ixekizumab

ix-ee-kiz-ue-mab  
(Taltz)

**Do not confuse ixekizumab with daclizumab, eculizumab, gevokizumab, secukinumab, or ustekinumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Human interleukin-17A antagonist. Monoclonal antibody. **CLINICAL:** Antipsoriasis agent.

### USES

Treatment of moderate to severe plaque psoriasis in adults and children 6 yrs and older who are candidates for systemic therapy or phototherapy. Treatment of active psoriatic arthritis in adults. Treatment of active ankylosing spondylitis. Treatment of active nonradiographic axial spondyloarthritis with objective signs of inflammation in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ixekizumab. **Cautions:** Baseline neutropenia, thrombocytopenia; inflammatory bowel disease (Crohn's disease, ulcerative colitis), HIV infection, concomitant immunosuppressant therapy, conditions predisposing to infection (e.g., diabetes, renal failure, open wounds), pts who have been exposed to tuberculosis. Concomitant use of live vaccines not recommended.

## ACTION

Selectively binds to and inhibits interaction of interleukin-17A receptor, a naturally occurring cytokine that is involved in inflammatory and immune response. **Therapeutic Effect:** Alters biologic immune response; inhibits release of pro-inflammatory cytokines and chemokines.

## PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 4 days. Steady state reached in 8–10 wks. Elimination not specified. **Half-life:** 13 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic response of **BCG (intravesical)**, **live vaccines**. May enhance the adverse/toxic effects of **belimumab**, **natalizumab**, **live vaccines**. **HERBAL:** *Echinacea* may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, platelets. May decrease diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Auto-injector Pen:** 80 mg/mL. **Prefilled Syringe:** 80 mg/mL.

## ADMINISTRATION/HANDLING

### SQ

- Follow instructions for preparation according to manufacturer guidelines.
- Remove auto-injector or pre-filled syringe from refrigerator and allow to warm to room temperature (approx. 30 min) with needle cap intact.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, or abdomen, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Refrigerate until time of use. • Do not freeze. • Do not shake. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Ankylosing Spondylitis

**SQ: ADULTS, ELDERLY:** 160 mg (two 80-mg injections) once, then 80 mg q4wks. May give alone or in combination with conventional disease-modifying antirheumatic drugs, corticosteroids, NSAIDs, and/or analgesics.

### Plaque Psoriasis

**SQ: ADULTS, ELDERLY:** Initially, 160 mg (two injections of 80 mg) once, then 80 mg at wks 2, 4, 6, 8, 10, 12, then 80 mg once q4wks. **ADOLESCENTS, CHILDREN 6 YRS AND OLDER: (WEIGHING 50 KG OR MORE):** 160 mg (two 80-mg injections) once, then 80 mg q4wks. **(25–50 KG):** 80 mg once, then 40 mg q4wks. **(LESS THAN 25 KG):** 40 mg once, then 20 mg q4wks.

**Psoriatic Arthritis**

**Note:** For pts with coexisting plaque psoriasis, use dosage for plaque psoriasis.

**SQ: ADULTS, ELDERLY:** 160 mg (two 80-mg injections) once, then 80 mg q4wks. May give alone or in combination with conventional disease-modifying antirheumatic drugs (e.g., methotrexate).

**Nonradiographic Axial Spondyloarthritis**

**SQ: ADULTS, ELDERLY:** 80 mg q4wks.

**Dosage in Renal/Hepatic Impairment**

Not specified; use caution.

**SIDE EFFECTS**

**Occasional (17%):** Injection site reactions (pain, erythema). **Rare (2%):** Nausea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of infection including tuberculosis. Infections including upper respiratory tract infection (14% of pts), nasopharyngitis (14% of pts), tinea infections (2% of pts) have occurred. Cytopenias including neutropenia (11% of pts), thrombocytopenia (3% of pts) were reported. May cause exacerbation of Crohn's disease and ulcerative colitis. Hypersensitivity reactions, including angioedema, occur rarely. Immunogenicity (auto-ixekizumab antibodies) occurred in less than 9% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC in pts with known history of neutropenia, thrombocytopenia. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with

tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Consider administration of age-appropriate immunizations (if applicable) before initiation. Question history of Crohn's disease, ulcerative colitis, hypersensitivity reaction. Conduct dermatologic exam; record characteristics of psoriatic lesions.

**INTERVENTION/EVALUATION**

Monitor for symptoms of tuberculosis, including pts who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Assess skin for improvement of lesions. Monitor for hypersensitivity reaction, symptoms of inflammatory bowel disease.

**PATIENT/FAMILY TEACHING**

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid people with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.
- Immediately report difficulty breathing, itching, hives, rash, swelling of the face or tongue; may indicate allergic reaction.
- Treatment may cause worsening of Crohn's disease or cause inflammatory bowel disease. Report abdominal pain, diarrhea, weight loss.

## ketorolac

kee-toe-role-ak

(Acular, Acular LS, Acuvail, Apo-Ketorolac , Sprix, Toradol )

**BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation. Indicated for the short-term (up to 5 days in adults) management of moderately severe, acute pain that requires analgesia at the opioid level. Oral ketorolac is indicated as continuation treatment after IV/IM ketorolac. The total combined duration of use should not exceed 5 days. Not indicated for use in pediatric pts, nor indicated for minor or chronic painful conditions.

**Do not confuse Acular with Acthar or Ocular, ketorolac with Ketalar, or Toradol with Foradil, Inderal, TEGretol, or traMADol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID.

**CLINICAL:** Analgesic, intraocular anti-inflammatory.

### USES

**PO, Injection, Nasal:** Short-term (5 days or less) relief of mild to moderate pain. **Ophthalmic:** Relief of ocular itching due to seasonal allergic conjunctivitis. Treatment postop for inflammation following cataract extraction, pain following incisional refractive surgery. **OFF-LABEL:** Prevention, treatment of ocular inflammation (ophthalmic form).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ketorolac, aspirin, or other NSAIDs. Intracranial bleeding, hemorrhagic diathesis, incomplete hemostasis, high risk of bleeding; concomitant use of aspirin, NSAIDs, probenecid, or pentoxifylline; labor and delivery, advanced renal impairment or

risk of renal failure, active or history of peptic ulcer disease, chronic inflammation of GI tract, recent or history of GI bleeding/ulceration. Perioperative pain in setting of CABG surgery. Prophylaxis before major surgery. **Cautions:** Hepatic impairment, history of GI tract disease, asthma, coagulation disorders, receiving anticoagulants, fluid retention, HE, renal impairment, inflammatory bowel disease, smoking, use of alcohol, elderly, debilitated.

### ACTION

Inhibits COX-1 and COX-2 enzymes, resulting in decreased prostaglandin synthesis; reduces prostaglandin levels in aqueous humor. **Therapeutic Effect:** Produces analgesic, antipyretic, anti-inflammatory effect; reduces intraocular inflammation.

### PHARMACOKINETICS

Well absorbed (100%) following oral administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5–9 hrs (increased in renal impairment, in elderly).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established, but doses of 0.5 mg/kg have been used. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; decreased dosage recommended.

### INTERACTIONS

**DRUG:** May decrease effects of antihypertensives (e.g., amLODIPine, lisinopril), diuretics (e.g., furosemide, HCTZ). Aspirin, NSAIDs, other salicylates may increase risk of GI side effects, bleeding. May increase risk of bleeding with heparin, oral anticoagulants (e.g., warfarin). May increase concentration, risk of toxicity of lithium. May

increase effect of **apixaban**, **dabigatran**, **edoxaban**, **rivaroxaban**. **Bile acid sequestrants** (e.g., **cholestyramine**) may decrease absorption/effect. May increase nephrotoxic effect of **cycloSPORINE**. **HERBAL**: **Glucosamine**, herbs with anticoagulant/antiplatelet properties (e.g., **garlic**, **ginger**, **ginseng**, **ginkgo biloba**) may increase concentration/effect. **FOOD**: None known. **LAB VALUES**: May prolong bleeding time. May increase serum ALT, AST, BUN, potassium, creatinine.

### AVAILABILITY (Rx)

**Injection Solution**: 15 mg/mL, 30 mg/mL. **Nasal Spray**: (*Sprix*): 1.7-g bottle provides 8 sprays (15.75 mg/spray). **Ophthalmic Solution**: (*Acular LS*): 0.4%, (*Acuvail*): 0.45%, (*Acular*): 0.5%. **Tablets**: 10 mg.

### ADMINISTRATION/HANDLING

IV

• Give undiluted as IV push. • Give over at least 15 sec.

#### IM

• Give deep IM slowly into large muscle mass.

#### PO

• Give with food, milk, antacids if GI distress occurs.

#### Ophthalmic

• Place gloved finger on lower eyelid and pull out until pocket is formed between eye and lower lid. Place prescribed number of drops into pocket. • Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac) and to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize system absorption.

### IV INCOMPATIBILITIES

Promethazine (Phenergan).

### IV COMPATIBILITIES

FentaNYL (Sublimaze), HYDRomorphone (Dilaudid), morphine, nalbuphine (Nubain).

### INDICATIONS/ROUTES/DOSAGE

**Note**: Total duration is 5 days (parenteral and oral). Do not increase dose/frequency; supplement with low-dose opioids if needed.

#### Pain Management

**Note**: Avoid use in the elderly. **Maximum duration**: 5 days combined (parenteral, oral, and nasal). PO only as continuation of IM or IV therapy.

*(Weighing 50 kg or more and less than 65 yrs of age)*

**IV: ADULTS**: 30 mg as single dose or 15–30 mg q6h PRN. **Maximum**: 120 mg/day.

**IM: ADULTS**: 30–60 mg as single dose or 15–30 mg q6h or 10–30 mg q4–6h PRN.

**Maximum**: 120 mg/day.

*(Weighing less than 50 kg or 65 yrs or older)*

**IV: ADULTS**: 15 mg as single dose or 15 mg q6h PRN. **Maximum**: 60 mg/day.

**IM: ADULTS**: 30 mg as single dose or 15 mg q6h or 10 mg q4–6h PRN. **Maximum**: 60 mg/day.

**PO: ADULTS**: Initially, 20 mg (10 mg for elderly), then 10 mg q4–6h. **Maximum**: 40 mg/24 hrs.

**Nasal spray: ADULTS WEIGHING 50 KG OR MORE AND LESS THAN 65 YRS OF AGE**: One spray (15.75 mg) in each nostril (total dose: 31.5 mg) q6-8h. **Maximum dose**: Eight sprays (126 mg/day). **ADULTS WEIGHING LESS THAN 50 KG OR 65 YRS OF AGE OR OLDER**: One spray (15.75 mg) in only one nostril (total dose: 15.75 mg) q6-8h. **Maximum dose**: Four sprays (63 mg/day).

#### Allergic Conjunctivitis

**Ophthalmic: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER**: 1 drop (0.5%) 4 times/day.

**Cataract Extraction**

**Ophthalmic: ADULTS, ELDERLY:** 1 drop (0.5%) 4 times/day. Begin 24 hrs after surgery and continue for 2 wks.

**Corneal Refractive Surgery**

**Ophthalmic: ADULTS, ELDERLY:** 1 drop (0.4%) 4 times/day for up to 4 days after surgery.

**Dosage in Renal Impairment**

See dosage section.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (17%–12%):** Headache, nausea, abdominal cramps/pain, dyspepsia. **Occasional (9%–3%):** Diarrhea. **Nasal:** Nasal discomfort, rhinalgia, increased lacrimation, throat irritation, rhinitis. **Ophthalmic:** Transient stinging, burning. **Rare (3%–1%):** Constipation, vomiting, flatulence, stomatitis. **Ophthalmic:** Ocular irritation, allergic reactions (manifested by pruritus, stinging), superficial ocular infection, keratitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice) occur

rarely. Nephrotoxicity (glomerular nephritis, interstitial nephritis, nephrotic syndrome) may occur in pts with preexisting renal impairment. Acute hypersensitivity reaction (fever, chills, joint pain) occurs rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain. Obtain baseline renal/hepatic function tests.

**INTERVENTION/EVALUATION**

Monitor renal function, LFT, urinary output. Monitor daily pattern of bowel activity, stool consistency. Observe for occult blood loss. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for bleeding (may also occur with ophthalmic route due to systemic absorption).

**PATIENT/FAMILY TEACHING**

- Avoid aspirin, alcohol.
- Report abdominal pain, bloody stools, or vomiting blood.
- If GI upset occurs, take with food, milk.
- **Ophthalmic:** Transient stinging, burning may occur upon instillation.
- Do not administer while wearing soft contact lenses.

K

## labetalol

la-bayt-a-lol  
(Trandate )

**Do not confuse labetalol with atenolol, betaxolol, metoprolol or propranolol, or Trandate with traMADol or TRENTal.**

### FIXED-COMBINATION(S)

**Normozide:** labetalol/hydroCHLORothiazide (a diuretic): 100 mg/25 mg, 200 mg/25 mg, 300 mg/25 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha-, beta-adrenergic blocker. **CLINICAL:** Antihypertensive.

### USES

Management of hypertension. IV for severe hypertension. **OFF-LABEL:** Management of preeclampsia, severe hypertension in pregnancy, hypertension during acute ischemic stroke, pediatric hypertension.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to labetalol. Bronchial asthma, history of obstructive airway disease, cardiogenic shock, uncompensated HF, second- or third-degree heart block (except in pts with functioning pacemaker), severe bradycardia, conditions associated with severe, prolonged hypotension. **Cautions:** Compensated HF, severe anaphylaxis to allergens, myasthenia gravis, psychiatric disease, hepatic impairment, pheochromocytoma, diabetes; concurrent use with digoxin, verapamil, or diltiazem; arterial obstruction, elderly. Pts with peripheral vascular disease, Raynaud's disease.

### ACTION

Blocks alpha-1, beta-1, beta-2 (large doses) adrenergic receptor sites. **Therapeutic Effect:** Decreases peripheral vascular resistance, B/P.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–2 hrs	2–4 hrs	8–12 hrs
IV	2–5 min	5–15 min	2–4 hrs

Incompletely absorbed from GI tract. Protein binding: 50%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 6–8 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta. Small amount distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. May have increased risk of orthostatic hypotension.

### INTERACTIONS

**DRUG:** May decrease effects of beta<sub>2</sub>-adrenergic agonists (e.g., arformoterol, salmeterol), theophylline. **Dronedarone, rivastigmine** may increase bradycardic effect. May increase bradycardic effect of fingolimod, ponesimod. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum antinuclear antibody titer (ANA), BUN, LDH, alkaline phosphatase, bilirubin, creatinine, potassium, triglycerides, lipoprotein, uric acid, ALT, AST.

### AVAILABILITY (Rx)

**Injection Solution:** 5 mg/mL. **Tablets:** 100 mg, 200 mg, 300 mg.

### ADMINISTRATION/HANDLING

**ALERT** Prolonged duration of action: Monitor several hrs after administration. Excessive administration may result in prolonged hypotension and/or bradycardia.

**Reconstitution** • For IV infusion, dilute in D<sub>5</sub>W to provide concentration of 1–2 mg/mL.

**Rate of administration** • For IV push, administer at a rate of 10 mg/min. • For IV infusion, administer at rate of 2 mg/min initially. Rate is adjusted according to B/P. • Monitor B/P immediately before and q5–10min during IV administration (maximum effect occurs within 5 min).

**Storage** • Store at room temperature. • After dilution, IV solution is stable for 72 hrs. • Solution appears clear, colorless to light yellow. • Discard if discolored or precipitate forms.

#### PO

• Give without regard to food. • Tablets may be crushed.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ceftazidime (Teflaro), ceftriaxone (Rocephin), furosemide (Lasix), heparin, nafcillin (Nafcil).

#### IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), fentanyl (Sublimaze), HYDROMorphone (Dilaudid), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, propofol (Diprivan).

#### INDICATIONS/ROUTES/DOSAGE

##### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 100 mg twice daily. Adjust in increments of 100 mg twice daily q2–3days. Usual dose: 200–800 mg/day in 2 divided doses. May require up to 2,400 mg/day. **CHILDREN:** 1–3 mg/kg/day in 2 divided doses. **Maximum:** 10–12 mg/kg/day up to 1,200 mg/day.

##### Severe Hypertension, Hypertensive Crisis

**IV: ADULTS:** Initially, 10–20 mg (bolus over 1–2 min). Additional doses of 20–80 mg may be given at 10-min intervals until target BP reached. **CHILDREN:** 0.2–1 mg/kg/dose. **Maximum:** 40 mg/dose.

**IV infusion: ADULTS:** Initially, 0.5–2 mg/min up to 10 mg/min. **CHILDREN:** 0.25–3 mg/kg/hr. **Maximum:** 3 mg/kg/hr.

##### Dosage in Renal Impairment

No dose adjustment.

##### Dosage in Hepatic Impairment

Use caution.

#### SIDE EFFECTS

**Frequent (20%–11%):** Drowsiness, dizziness, excessive fatigue. **Occasional (10% or less):** Dyspnea, peripheral edema, depression, anxiety, constipation, diarrhea, nasal congestion, weakness, diminished sexual function, transient scalp tingling, insomnia, nausea, vomiting, abdominal discomfort. **Rare:** Altered taste, dry eyes, increased urination, paresthesia.

#### ADVERSE EFFECTS/TOXIC REACTIONS

May precipitate, aggravate HF due to decreased myocardial stimulation. Abrupt withdrawal may precipitate myocardial ischemia, producing chest pain, diaphoresis, palpitations, headache, tremor. May mask signs, symptoms of acute hypoglycemia (tachycardia, B/P changes) in diabetic pts. Rapid reduction of blood pressure may cause CVA, optic nerve infarction, ischemic changes on ECG. May cause severe orthostatic hypotension.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Assess renal function, LFT. Assess B/P, heart rate immediately before drug administration (if pulse is 60/min or less or systolic B/P is lower than 90 mm Hg, withhold medication, contact physician). Question history of bradycardia, HE, second- or third-degree heart block, myasthenia gravis.

##### INTERVENTION/EVALUATION

Monitor B/P for hypotension; heart rate. Monitor ECG for cardiac arrhythmias. Assist with ambulation if dizziness occurs. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), night

cough, peripheral edema, distended neck veins. Monitor I&O (increase in weight, decrease in urine output may indicate HF).

#### PATIENT/FAMILY TEACHING

- Do not discontinue drug except upon advice of physician (abrupt discontinuation may precipitate HF).
- Slowly go from lying to standing.
- Compliance with therapy regimen is essential to control hypertension, arrhythmias.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report shortness of breath, excessive fatigue, weight gain, prolonged dizziness, headache.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
- Limit alcohol.

## lacosamide

la-koe-sa-myde  
(Vimpat)

**Do not confuse lacosamide with zonisamide, or Vimpat with Venofer, Vfend, or Vimovo.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Succinimide (Schedule V). **CLINICAL:** Anticonvulsant.

#### USES

Monotherapy or adjunctive therapy for treatment of partial-onset seizures in pts 4 yrs and older. Adjunctive therapy in treatment of primary generalized tonic-clonic seizures in adult pts 4 years of age and older.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to lacosamide. **Cautions:** Renal/hepatic impairment, cardiac conduction problems (e.g., marked first-degree AV block, second-degree or higher AV block, sick sinus

syndrome without pacemaker), myocardial ischemia, HF, pts at risk of suicide.

#### ACTION

Selectively enhances slow inactivation of sodium channels, stabilizing hyperexcitable neuronal membranes and inhibits neuronal firing. **Therapeutic Effect:** Reduces seizure frequency.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 15%. Peak plasma concentration: 1–4 hrs after oral dosing and is reached at the end of IV infusion. Primarily excreted in urine. Steady-state reached in 3 days. Removed by hemodialysis. **Half-life:** 13 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use in pregnancy if benefits outweigh risk. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 17 yrs. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT; proteinuria.

#### AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL (20 mL).

**Oral Solution:** 10 mg/mL.

 **Tablets:** 50 mg, 100 mg, 150 mg, 200 mg.

#### ADMINISTRATION/HANDLING

**PO**

- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Oral solution should be administered with a calibrated measuring device.
- Discard any unused portion after 7 wks.

#### IV

- Appears as a clear, colorless solution.
- Discard unused portion or if precipitate or discoloration is present. May give without further dilution.
- If mixing with dilu-

ent, may be stored for 24 hrs at room temperature. Infuse over 30–60 min.

### IV COMPATIBILITIES

0.9% NaCl, D<sub>5</sub>W, lactated Ringer's.

### INDICATIONS/ROUTES/DOSAGE

**Note:** IV dose is same as oral dose. May give undiluted or mixed in compatible diluent and infused over 30–60 min.

#### Partial-Onset Seizures

##### *Monotherapy*

**PO/IV: ADULTS, ELDERLY:** Initially, 50–100 mg twice daily. May increase by 50 mg twice daily at wkly intervals. **Maintenance:** 150–200 mg twice daily. **CHILDREN 4–17 YRS, WEIGHING 50 KG OR MORE:** Initially, 50 mg twice daily. May increase by 50 mg twice daily at wkly intervals. **Maintenance:** 150–200 mg twice daily. **WEIGHING 30–49 KG:** Initially, 1 mg/kg/dose twice daily. May increase by 1 mg/kg/dose twice daily at wkly intervals. **Maintenance:** 2–4 mg/kg/dose twice daily. **WEIGHING 11–29 KG:** Initially, 1 mg/kg/dose twice daily. May increase by 1 mg/kg/dose twice daily at wkly intervals. **Maintenance:** 3–6 mg/kg/dose twice daily.

##### *Adjunctive Therapy*

**PO/IV: ADULTS, ELDERLY:** Initially, 50 mg twice daily. May increase by 50 mg twice daily at wkly intervals. **Maintenance:** 100–200 mg twice daily. **Maximum:** 400–600 mg/day. **CHILDREN 4–17 YRS, WEIGHING 50 KG OR MORE:** Initially, 50 mg twice daily. **Maintenance:** 100–200 mg twice daily. **WEIGHING 30–49 KG:** Initially, 1 mg/kg/dose twice daily. **Maintenance:** 2–4 mg/kg/dose twice daily. **WEIGHING 11–29 KG:** Initially, 1 mg/kg/dose twice daily. **Maintenance:** 3–6 mg/kg/dose twice daily.

#### Primary Generalized Tonic-Clonic Seizures

**PO/IV: ADULTS, ELDERLY, ADOLESCENTS 17 YRS OF AGE OR OLDER:** Initially, 50 mg twice daily. May increase at wkly intervals by 50 mg twice daily. Alternatively, may give 200 mg loading dose, followed 12 hrs later by 100 mg twice daily with same titration schedule.

**Maintenance:** 100–200 mg twice daily. **CHILDREN 4–16 YRS: (50 KG OR GREATER):** Initially, 50 mg twice daily. May increase at wkly intervals of 50 mg twice daily. **Maintenance:** 100–200 mg twice daily. **(30–49 KG):** Initially, 1 mg/kg/dose twice daily. May increase at wkly intervals by 1 mg/kg/dose twice daily. **Maintenance:** 2–4 mg/kg/dose twice daily. **(11–29 KG):** Initially, 1 mg/kg/dose twice daily; may be increased at wkly intervals by 1 mg/kg/dose twice daily. **Maintenance:** 3–6 mg/kg/dose twice daily.

#### Switch From IV to PO

When switching from IV to PO form, use same equivalent daily dosage and frequency as IV administration.

#### Switch From PO to IV

When switching from PO to IV form, initial total daily IV dosage should be equivalent to total daily dosage and frequency of PO form and should be infused IV over 30–60 min.

#### Dosage in Renal Impairment

Use caution when titrating. **Mild to moderate impairment:** No dose adjustment. **Severe impairment, end-stage renal disease: Maximum:** 300 mg/day.

#### Dosage in Hepatic Impairment

Use caution when titrating. **Mild to moderate impairment: Maximum:** 300 mg/day. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (31%–13%):** Dizziness, headache. **Occasional (11%–5%):** Nausea, double vision, vomiting, fatigue, blurred vision, ataxia, tremor, nystagmus. **Rare (4%–2%):** Vertigo, diarrhea, gait disturbances, memory impairment, depression, pruritus, injection site discomfort.

### ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of suicidal ideation, behavior. PR interval prolongation, AV block, ventricular tachyarrhythmias may

occur. Sudden discontinuation may increase risk of seizures. Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis. Psychiatric conditions (aggression, agitation, hallucinations, psychotic disorder) may occur. Leukopenia, anemia, thrombocytopenia occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, renal function test. Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate seizure precautions. Question history of cardiac conduction disorders, depression, suicidal ideation and behavior.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, renal function periodically. Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Assist with ambulation if dizziness occurs. Assess for suicidal ideation, depression, behavioral changes. Drug should be withdrawn gradually (over a minimum of 1 wk) to minimize potential for increased seizure frequency. Monitor ECG for QT prolongation. Monitor for symptoms of DRESS; cardiac effects.

### PATIENT/FAMILY TEACHING

- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication (may cause seizures; symptoms of withdrawal syndrome).
- Treatment may affect the electrical properties of the heart; report

palpitations, loss of consciousness.

- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occurs.
- Avoid alcohol, nervous system depressants.
- Report symptoms of drug-induced hypersensitivity syndrome (e.g., fever, swollen face/lymph nodes; skin rash/peeling/inflammation).

## lactulose

**lak**-tyoo-lose

(Constulose, Enulose, Generlac, Kristalose)

**Do not confuse lactulose with lactose.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Lactose derivative. **CLINICAL:** Hyperosmotic laxative, ammonia detoxicant.

### USES

Prevention, treatment of portal-systemic encephalopathy (including hepatic precoma, coma); treatment of constipation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lactulose. Pts requiring a low-galactose diet.

**Cautions:** Diabetes, hepatic impairment, dehydration.

### ACTION

Inhibits diffusion of  $\text{NH}_3$  into blood by converting  $\text{NH}_3$  to  $\text{NH}_4^+$ ; enhances diffusion of  $\text{NH}_3$  from blood to gut, where it is converted to  $\text{NH}_4^+$ ; produces osmotic effect in colon, resulting in colon distention, promoting peristalsis. **Therapeutic Effect:** Promotes increased peristalsis, bowel evacuation; decreases serum ammonia concentration.

### PHARMACOKINETICS

Poorly absorbed from GI tract. Extensively metabolized in colon. Primarily excreted in feces.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Avoid use in pts younger than 6 yrs (usually unable to describe symptoms). **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium (GI loss).

## AVAILABILITY (Rx)

**Packets: (Kristalose):** 10 g, 20 g. **Solution, Oral:** 10 g/15 mL.

## ADMINISTRATION/HANDLING

### PO

- Store solution at room temperature.
- Solution appears pale yellow to yellow, viscous liquid. Cloudiness, darkened solution does not indicate potency loss.
- Drink water, juice, milk with each dose (aids stool softening, increases palatability).
- Mix packets with 4 oz water.

### Rectal

- Lubricate anus with petroleum jelly before enema insertion.
- Insert carefully (prevents damage to rectal wall) with nozzle toward navel.
- Squeeze container until entire dose expelled.
- Instruct pt to retain 30–60 min in divided doses.
- **Maximum:** 60 mL/day (40 g/day).

## INDICATIONS/ROUTES/DOSAGE

### Constipation

**PO: ADULTS, ELDERLY:** 15–30 mL or 1–2 packets (10–20 g)/day, up to 60 mL or 4 packets (40 g)/day. **CHILDREN:** 1.5–3 mL/kg/day (1–2 g/kg/day) in 1–2 divided doses. **Maximum:** 60 mL/day.

### Prevention of Portal-Systemic Encephalopathy

**ADULTS, ELDERLY:** 30–45 mL (20–30 g) 3–4 times/day. Adjust dose q1–2 days to produce 2–3 soft stools/day.

**CHILDREN:** 40–90 mL/day (26.7–60 g/day) in divided doses 3–4 times/day. **INFANTS:** 2.5–10 mL/day (1.7–6.7 g/day) in 3–4 divided doses. Adjust dose q1–2 days to produce 2–3 soft stools/day.

### Treatment of Portal-Systemic Encephalopathy

**PO: ADULTS, ELDERLY:** Initially, 30–45 mL (20–30 g) every hr to induce rapid laxation. Then 30–45 mL 3–4 times/day. Adjust dose q1–2 days to produce 2–3 soft stools/day.

### Rectal Administration (As Retention Enema)

200 g (300 mL) diluted with 700 mL water or NaCl via rectal balloon catheter. Retain 30–60 min q4–6h. (Transition to oral prior to stopping rectal administration.)

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** Abdominal cramping, flatulence, increased thirst, abdominal discomfort. **Rare:** Nausea, vomiting.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe diarrhea may cause dehydration, electrolyte imbalance. Long-term use may result in laxative dependence, chronic constipation, loss of normal bowel function.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum ammonia level in pts being treated for hyperammonemia. Question usual stool pattern, frequency, characteristics. Conduct neurological exam in pts with elevated serum ammonia levels, symptoms of encephalopathy. Assess hydration status.

### INTERVENTION/EVALUATION

Monitor serum ammonia level in pts being treated for hyperammonemia. Encourage adequate fluid intake.

Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency; record time of evacuation. Monitor serum electrolytes in pts with prolonged, frequent, excessive use of medication. Monitor encephalopathic pts for symptom improvement (alertness, orientation, ability to follow commands).

#### PATIENT/FAMILY TEACHING

- Evacuation occurs in 24–48 hrs of initial dose.
- Institute measures to promote defecation: increase fluid intake, exercise, high-fiber diet.
- Drink plenty of fluids.
- If therapy was started to treat high ammonia levels, notify physician if worsening of confusion, lethargy, weakness occurs.

## lamiVUDine

la-miv-yoo-deen

(Apo-LamiVUDine,  Epivir, Epivir-HBV, Heptovir )

**BLACK BOX ALERT** Serious, sometimes fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred. Severe acute exacerbation of hepatitis B virus (HBV) infection was reported in pts coinfecting with HBV and HIV-1 after discontinuation. Monitor hepatic function for several mos after discontinuation. Do not use Epivir-HBV for treatment of HIV infection. Epivir contains a higher dose of active ingredient compared to Epivir-HBV. Pts with HIV-1 infection must receive dosage form that is appropriate for treatment.

**Do not confuse Epivir with Combivir, or lamiVUDine with lamoTRigine.**

#### FIXED-COMBINATION(S)

**Cimduo:** lamiVUDine/tenofovir (Antiviral): 300 mg/300 mg. **Combivir:** lamiVUDine/zidovudine (an

antiviral): 150 mg/300 mg. **Delstrigo:** lamiVUDine/doravirine/tenofovir (antivirals): 300 mg/100 mg/300 mg. **Dovato:** lamiVUDine/dolutegravir (antiviral): 300 mg/50 mg. **Epzicom:** lamiVUDine/abacavir (an antiviral): 300 mg/600 mg. **Symfi:** lamiVUDine/efavirenz/tenofovir: 300 mg/400 mg/300 mg. **Triumeq:** lamiVUDine/abacavir (antiretroviral)/ dolutegravir (integrase inhibitor): 300 mg/600 mg/50 mg. **Trizivir:** lamiVUDine/zidovudine/abacavir (an antiviral): 150 mg/300 mg/300 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nucleoside reverse transcriptase inhibitor, Antihepadnaviral. **CLINICAL:** Antiviral.

#### USES

**Epivir:** Treatment of HIV infection in combination with at least two other antiretroviral agents. **Epivir-HBV:** Treatment of chronic hepatitis B virus infection associated with evidence of hepatitis B viral replication and active hepatic inflammation. **OFF-LABEL:** Prophylaxis in health care workers at risk of acquiring HIV after occupational exposure to virus. Use as part of multidrug regimen.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to lamiVUDine. **Cautions:** Hepatic impairment. Use in children with history of pancreatitis or risk factors for developing pancreatitis autoimmune disease, genetic mutations, pancreas divisum [congenital]). Use in combination with interferon alfa with or without ribavirin in pts coinfecting with HIV/HBV.

#### ACTION

Inhibits HIV reverse transcriptase by viral DNA chain termination. Inhibits RNA-,

DNA-dependent DNA polymerase, an enzyme necessary for HIV, hepatitis B virus replication. **Therapeutic Effect:** Slows HIV replication; reduces progression of HIV infection, chronic hepatitis B virus infection.

## PHARMACOKINETICS

Widely distributed. Protein binding: less than 36%. Primarily excreted unchanged in urine. Not removed by hemodialysis or peritoneal dialysis. **Half-life: Children:** 2 hrs. **Adults:** 5–7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta. Unknown if distributed in breast milk. Breastfeeding not recommended due to risk of postnatal HIV transmission. **Children:** Safety and efficacy not established in pts younger than 3 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Interferon alfa, ribavirin may increase risk of hepatic decompensation. Zalcitabine may inhibit absorption; avoid concurrent administration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, bilirubin. May decrease absolute neutrophil count, Hgb, platelets. May increase serum lipase in children.

## AVAILABILITY (Rx)

**Oral Solution:** 5 mg/mL (Eпивir-HBV), 10 mg/mL (Eпивир). **Tablets:** 100 mg (EпивирHBV), 150 mg (Eпивир), 300 mg (Eпивир).

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Epivir tablets/oral solution contain a higher dose of lamivudine than Epivir-HBV tablets/oral solution.

### HIV Infection (Eпивир)

**PO: ADULTS, ELDERLY:** 150 mg twice daily or 300 mg once daily. **Children 3 yrs and older: 25 KG or more:** 150 mg twice daily. **20–24 KG:** 75 mg (1/2 tablet) in the morning and 150 mg in the evening. **14–19 KG:** 75 mg (1/2 tablet) twice daily. **Infants 3 mos to Children less than 3 yrs: (Oral solution):** 5 mg/kg/dose twice daily. **Maximum:** 150 mg/dose. **(Tablets): 25 KG OR MORE:** 150 mg 2 times/day. **20–24 KG:** 75 mg in AM and 150 mg in PM. **14–19 KG:** 75 mg 2 times/day.

### Chronic Hepatitis B (Eпивир HBV)

**PO: ADULTS:** 100 mg/day. **CHILDREN 2–17 YRS:** 3 mg/kg/day. **Maximum:** 100 mg/day.

### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance	Dosage HIV	Dosage Hepatitis B
30–49 mL/min	150 mg once/daily	100 mg first dose, then 50 mg once/daily
15–29 mL/min	150 mg first dose, then 100 mg once/daily	100 mg first dose, then 25 mg once/daily
5–14 mL/min	150 mg first dose, then 50 mg once/daily	35 mg first dose, then 15 mg once/daily
Less than 5 mL/min	50 mg first dose, then 25 mg once/daily	35 mg first dose, then 10 mg once/daily

**Hemodialysis:** Dosing post-HD recommended.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (35%–10%):** Headache, nausea, malaise, fatigue, nasal disturbances, diarrhea, cough, musculoskeletal pain,

neuropathy, insomnia, anorexia, dizziness, fever, chills. **Occasional (9%–5%):** Depression, myalgia, abdominal cramps, dyspepsia, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Lactic acidosis, severe hepatomegaly with steatosis have occurred. If therapy is discontinued, pts coinfecting with HBV have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. Hepatitis B virus–resistant variants have occurred in pts coinfecting with HIV-1/HBV. May increase risk of pancreatitis in children. May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis or acceleration of autoimmune disorders, including Graves' disease, polymyositis, Guillian-Barre). May cause redistribution/accumulation of body fat (lipodystrophy). Lymphadenopathy, splenomegaly reported in children. Paresthesia, peripheral neuropathy reported in 15% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, CrCl, eGFR; CD4+ count, viral load, HIV-1 RNA level in pts infected with HIV-1. Test for HBV infection in pts being treated for HIV-1 infection. Question history of hepatic/renal impairment. Screen for risk factors of developing pancreatitis in children. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness in pts treated for HIV-1 infection. Monitor for immune recovery syndrome, esp. after initiating treatment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV

infection). Obtain serum lactate level if lactic acidosis is suspected (confusion, dyspnea, muscle cramps, tachypnea). Obtain serum amylase, lipase level if acute pancreatitis (abdominal pain, fever, nausea, steatorrhea, tachycardia, vomiting) is suspected. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- Fatal cases of liver inflammation or failure have occurred; report abdominal pain, clay-colored stools, yellowing of skin or eyes, weight loss.
- Pancreatitis can occur in children; report any new or worsening abdominal pain that radiates to the back or shoulder, with or without nausea/vomiting.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk, while also causing decreased body fat in legs, arms, face.
- Do not breastfeed.

## lamoTRlgine

la-moe-tri-jeen  
(LaMICtal, LaMICtal ODT, LaMICtal XR, Subvenite)

**BLACK BOX ALERT** Severe, potentially life-threatening skin rashes have been reported, including Stevens-Johnson syndrome. Risk increased with coadministration with valproic acid and rapid-dose titration.

**Do not confuse LaMICtal with labetalol, LAMISIL, or Lomotil, or lamoTRlgine with labetalol, levETIRAcetam, lamiVUDine, or levothyroxine.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Phenyl-triazine. **CLINICAL:** Anticonvulsant.

## USES

**Bipolar disorder:** Maintenance treatment to delay the time to occurrence of mood episodes (depression, mania, hypomania, episodes with mixed features), as monotherapy or adjunctive therapy. **Focal partial-onset seizures and generalized-onset seizures:** Treatment of Lennox-Gastaut syndrome (adjunctive therapy only), primary generalized tonic-clonic seizures (adjunctive therapy only), and focal onset seizures (monotherapy or adjunctive therapy).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to lamoTRlgine. **Cautions:** Renal/hepatic impairment, pts at high risk of suicide, pts taking estrogen-containing oral contraceptives, history of adverse hematologic reaction.

## ACTION

Inhibits voltage-sensitive sodium channels, stabilizing neuronal membranes. Inhibits release of glutamide (an excitatory amino acid). **Therapeutic Effect:** Reduces frequency of seizure activity. Delays time to occurrence of acute mood episodes (mania, depression, hypomania).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. Breastfeeding not recommended. Increased fetal risk of oral cleft formation has been noted with use during pregnancy. **Children:** Safety and efficacy not established in pts younger than 18 yrs with bipolar disorder or in pts younger than 13 yrs with epilepsy. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Valproic acid may increase concentration/effects. May increase adverse effects of carbamazepine, dofetilide. Estrogen (contraceptive) may decrease concentration/effect. CNS depressants (e.g., alcohol, morphine, zolpidem) may increase CNS depression. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 25 mg, 100 mg, 150 mg, 200 mg. **Tablets, Chewable:** 5 mg, 25 mg. **Tablets, Orally Disintegrating:** 25 mg, 50 mg, 100 mg, 200 mg.

 **Tablets, Extended-Release:** 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Chewable tablets may be dispensed in water or diluted fruit juice, or swallowed whole.
- Extended-release tablets must be swallowed whole; do not break, crush, dissolve, or divide.
- Place orally disintegrating tablet on tongue, allow to dissolve. Pt must not break, cut, or chew. Can be swallowed without regard to food or water.

## INDICATIONS/ROUTES/DOSAGE

**Lennox-Gastaut, Primary Generalized Tonic-Clonic Seizures, Partial Seizures**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 25 mg/day for 2 wks, then increase to 50 mg/day for 2 wks. After 4 wks, may increase by 50 mg/day at 1- to 2-wk intervals. **Maintenance:** 225–375 mg/day in 2 divided

doses. **CHILDREN 2-12 YRS: Note:** Only whole tablets should be used for dosing. Round dose down to nearest whole tablet. Initially, 0.3 mg/kg/day in 1-2 divided doses for 2 wks, then increase to 0.6 mg/kg/day in 1-2 divided doses for 2 wks. After 4 wks, may increase by 0.6 mg/kg/day at 1- to 2-wk intervals. **Maintenance:** 4.5-7.5 mg/kg/day in 2 divided doses. **Maximum:** 300 mg/day in 2 divided doses.

#### Adjusted Dosage With Antiepileptic Drugs Containing Valproic Acid

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 12.5-25 mg every other day for 2 wks, then increase to 25 mg/day for 2 wks. After 4 wks, may increase by 25-50 mg/day at 1- to 2-wk intervals. **Maintenance:** 100-400 mg/day in 2 divided doses (100-200 mg/day when taking lamotrigine with valproic acid alone). **CHILDREN 2-12 YRS: Note:** Only whole tablets should be used for dosing. Round dose down to nearest whole tablet. Initially, 0.15 mg/kg/day in 1-2 divided doses for 2 wks, then increase to 0.3 mg/kg/day in 1-2 divided doses for 2 wks. After 4 wks, may increase by 0.3 mg/kg/day at 1- to 2-wk intervals. **Maintenance:** 1-5 mg/kg/day in 2 divided doses. **Maximum:** 200 mg/day in 2 divided doses.

#### Adjusted Dosage With EIAED Without Valproic Acid

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 50 mg/day for 2 wks, then increase to 100 mg/day in 2 divided doses for 2 wks. After 4 wks, may increase by 100 mg/day at 1- to 2-wk intervals. **Maintenance:** 300-500 mg/day in 2 divided doses. **CHILDREN 2-12 YRS: Note:** Only whole tablets should be used for dosing. Round dose down to nearest whole tablet. Initially, 0.6 mg/kg/day in 1-2 divided doses for 2 wks, then increase to 1.2 mg/kg/day in 1-2 divided doses for 2 wks. After 4 wks, may increase by 1.2 mg/kg/day at 1- to 2-wk intervals. **Maintenance:** 5-15 mg/kg/

day in 2 divided doses. **Maximum:** 400 mg/day in 2 divided doses.

#### Usual Maintenance Range for Extended-Release Tablets

**PTS TAKING VALPROIC ACID:** 200-250 mg once daily. **PTS TAKING EIAED WITHOUT VALPROIC ACID:** 400-600 mg once daily. **PTS NOT TAKING EIAED:** 300-400 mg once daily.

#### Conversion to Monotherapy for Pts Receiving EIAEDs

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** 500 mg/day in 2 divided doses. Titrate to desired dose while maintaining EIAED at fixed level, then withdraw EIAED by 20% each wk over a 4-wk period.

#### Conversion to Monotherapy for Pts Receiving Valproic Acid

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** Titrate lamotrigine to 200 mg/day, maintaining valproic acid dose. Maintain lamotrigine dose and decrease valproic acid to 500 mg/day, no greater than 500 mg/day, then maintain 500 mg/day for 1 wk. Increase lamotrigine to 300 mg/day and decrease valproic acid to 250 mg/day. Maintain for 1 wk, then discontinue valproic acid and increase lamotrigine by 100 mg/day each wk until maintenance dose of 500 mg/day reached.

#### Bipolar Disorder

**PO: ADULTS, ELDERLY:** Initially, 25 mg/day for 2 wks, then 50 mg/day for 2 wks, then 100 mg/day for 1 wk, then 200 mg/day beginning with wk 6.

#### Bipolar Disorder in Pts Receiving EIAEDs

**PO: ADULTS, ELDERLY:** 50 mg/day for 2 wks, then 100 mg/day for 2 wks, then 200 mg/day for 1 wk, then 300 mg/day for 1 wk, then up to usual maintenance dose 400 mg/day in divided doses.

#### Bipolar Disorder in Pts Receiving Valproic Acid

**PO: ADULTS, ELDERLY:** 25 mg/day every other day for 2 wks, then 25 mg/day for 2 wks, then 50 mg/day for 1 wk, then 100 mg/day. **Usual maintenance dose with valproic acid:** 100 mg/day.

**Usual Dosage for LaMictal XR**

**Adjunct therapy:** Range: 200–600 mg/day.

**Conversion to monotherapy:** Range: 250–500 mg/day.

**Discontinuation Therapy**

**◀ALERT▶** A dosage reduction of approximately 50%/wk over at least 2 wks is recommended.

**Dosage in Renal Impairment**

**◀ALERT▶** Decreased dosage may be effective in pts with significant renal impairment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment without ascites:** Reduce dose by 25%. **Severe impairment with ascites:** Reduce dose by 50%.

**SIDE EFFECTS**

**Frequent (38%–14%):** Dizziness, headache, diplopia, ataxia, nausea, blurred vision, drowsiness, rhinitis. **Occasional (10%–5%):** Rash, pharyngitis, vomiting, cough, flu-like symptoms, diarrhea, dysmenorrhea, fever, insomnia, dyspepsia. **Rare:** Constipation, tremor, anxiety, pruritus, vaginitis, hypersensitivity reaction.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Abrupt withdrawal may increase seizure frequency. Serious rashes, including Stevens-Johnson syndrome, have been reported. May increase risk of suicidal thoughts and behavior. Hemophagocytic lymphohistiocytosis, a life-threatening syndrome of extreme systemic inflammation characterized by hepatosplenomegaly, lymphadenopathy, fever, rash, organ dysfunction, has occurred. Life-threatening eosinophilia and systemic symptoms (DRESS) may occur. May increase risk of aseptic meningitis. Abrupt withdrawal may increase frequency of seizures.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC), medication history (esp. other anticonvulsants), other medical conditions (e.g., renal impairment). Initiate seizure precautions. Assess baseline mood, behavior. Question history of suicidal ideation and behavior.

**INTERVENTION/EVALUATION**

Report occurrence of rash (drug discontinuation may be necessary). Assist with ambulation if dizziness, ataxia occurs. Assess for clinical improvement (decreased intensity/frequency of seizures). Assess for visual abnormalities, headache. Monitor for suicidal ideation, depression, behavioral changes. Monitor for symptoms of DRESS.

**PATIENT/ FAMILY TEACHING**

- Take medication only as prescribed; do not abruptly discontinue medication after long-term therapy.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Carry identification card/bracelet to note anticonvulsant therapy.
- Strict maintenance of drug therapy is essential for seizure control.
- Report any rash, fever, swelling of glands, worsening depression, suicidal ideation, unusual changes in behavior, worsening of seizure control.
- May cause photosensitivity reaction; avoid exposure to sunlight, ultraviolet light.

**lansoprazole**

lan-soe-pra-zole  
(Prevacid, Prevacid Solu-Tab, Prevacid 24HR)

**Do not confuse lansoprazole with ARIPIprazole or dexlansoprazole, or Prevacid with Prava-chol, PriLOSEC, or Prinivil.**

**FIXED-COMBINATION(S)**

**Prevacid NapraPac:** lansoprazole/naproxen (an NSAID): 15 mg/375 mg, 15 mg/500 mg. **Prevpac:** Combination card containing amoxicillin 500 mg (4 capsules), lansoprazole 30 mg (2 capsules), clarithromycin 500 mg (2 tablets).

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Proton pump inhibitor. **CLINICAL:** Anti-ulcer agent.

**USES**

Short-term treatment (4 wks and less) of healing, symptomatic relief of active duodenal ulcer; short-term treatment (8 wks and less) for healing, symptomatic relief of erosive esophagitis. Long-term treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Short-term treatment (8 wks and less) of active benign gastric ulcer, *H. pylori*-associated duodenal ulcer (part of multidrug regimen), maintenance treatment for healed duodenal ulcer. Treatment of gastroesophageal reflux disease (GERD), NSAID-associated gastric ulcer. Reduce risk of NSAID-associated gastric ulcer in pts with history of gastric ulcer requiring NSAIDs. **OTC:** Relief of frequent heartburn (2 or more days/wk). **IV:** Short-term treatment of erosive esophagitis. **OFF-LABEL:** Stress ulcer prophylaxis in critically ill.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to lansoprazole, other proton pump inhibitors. Concomitant use with rilpivirine. **Cautions:** Hepatic impairment. May increase risk of hip, wrist, spine fractures; GI infections.

**ACTION**

Inhibits the (H<sup>+</sup>, K<sup>+</sup>)-ATPase enzyme system, blocking the final step in gastric acid secretion. **Therapeutic Effect:** Suppresses gastric acid secretion.

**PHARMACOKINETICS**

Rapid, complete absorption (food may decrease absorption) once drug has left stomach. Protein binding: 97%. Distributed primarily to gastric parietal cells. Metabolized in liver. Excreted in bile and urine. Not removed by hemodialysis. **Half-life:** 1.5 hrs (increased in hepatic impairment, elderly).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted but doses greater than 30 mg not recommended.

**INTERACTIONS**

**DRUG:** May decrease concentration/effect of **atazanavir**. May increase effect of **warfarin**. May decrease effect of **clopidogrel**, **risedronate**. May decrease concentration/effects of **acalabrutinib**, **cefuroxime**, **erlotinib**, **neratinib**, **pazopanib**. **Strong CYP2C19 inducers (e.g., fluoxetine)**, **strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifAMPin)** may decrease concentration/effect. **HERBAL:** **St. John's wort** may decrease concentration/effect. **FOOD:** **Food** may decrease absorption. **LAB VALUES:** May increase serum LDH, alkaline phosphatase, bilirubin, cholesterol, creatinine, ALT, AST, triglycerides, uric acid; Hgb, Hct. May produce abnormal albumin/globulin ratio, electrolyte balance, platelet, RBC, WBC count.

**AVAILABILITY (Rx)**

**Tablets, Orally Disintegrating:** 15 mg, 30 mg.

**⚡ Capsules, Delayed-Release:** 15 mg, 30 mg.

**ADMINISTRATION/HANDLING****PO**

- Best if taken before breakfast
- Do not cut/crush delayed-release capsules.
- If pt has difficulty swallowing capsules, open capsules, sprinkle granules on 1 tsp of applesauce, give immediately. Do not crush or allow pt to chew granules.

**PO (Solu-Tab)**

• Place tablet on tongue; allow to dissolve, then swallow. • May give via oral syringe or nasogastric tube. • May dissolve in 4 mL (15 mg) or 10 mL (30 mg) water.

**INDICATIONS/ROUTES/DOSAGE****Duodenal Ulcer**

**PO: ADULTS, ELDERLY:** 15 mg/day, for up to 4 wks. **Maintenance:** 15 mg/day.

**Erosive Esophagitis**

**PO: ADULTS, ELDERLY:** 30 mg/day, for up to 8 wks. If healing does not occur within 8 wks may give for additional 8 wks. **Maintenance:** 15 mg/day. **CHILDREN 1–11 YRS, WEIGHING MORE THAN 30 KG:** 30 mg/day for up to 12 wks; **WEIGHING 30 KG OR LESS:** 15 mg/day for up to 12 wks.

**Gastric Ulcer**

**PO: ADULTS:** 30 mg/day for up to 8 wks.

**NSAID Gastric Ulcer**

**PO: ADULTS, ELDERLY: Healing:** 30 mg/day for up to 8 wks. **Prevention:** 15 mg/day for up to 12 wks.

**Gastroesophageal Reflux Disease (GERD)**

**PO: ADULTS:** 15 mg/day for up to 8 wks. If symptoms persist after 8 wks, may increase to 30 mg once daily. Once symptoms are controlled, continue treatment for at least 8 wks. **CHILDREN 12–17 YRS:** 30 mg/day up to 8 wks. **CHILDREN 1–11 YRS, WEIGHING MORE THAN 30 KG:** 30 mg/day for up to 8 wks; **WEIGHING 30 KG OR LESS:** 15 mg/day for up to 8 wks.

***H. pylori* Infection**

**PO: ADULTS, ELDERLY:** (triple drug therapy including amoxicillin, clarithromycin) 30 mg q12h for 10–14 days or (with amoxicillin) 30 mg 3 times/day for 14 days.

**Pathologic Hypersecretory Conditions (Including Zollinger-Ellison syndrome)**

**PO: ADULTS, ELDERLY:** Initially, 60 mg/day. Individualize dosage according to pt needs and for as long as clinically indicated. Administer doses greater than 120 mg/day in divided doses.

**Heartburn (OTC)**

**PO: ADULTS, ELDERLY:** 15 mg once daily for 14 days. May repeat q4mos.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Consider dose reduction in severe impairment.

**SIDE EFFECTS**

**Occasional (3%–2%):** Diarrhea, abdominal pain, rash, pruritus, altered appetite.

**Rare (1%):** Nausea, headache.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Bilirubinemia, eosinophilia, hyperlipidemia occur rarely. May increase risk of *C. difficile* infection. Chronic use may increase risk of osteoporosis, fractures.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess for epigastric/abdominal pain, evidence of GI bleeding.

**INTERVENTION/EVALUATION**

Assess for therapeutic response (relief of GI symptoms). Question if diarrhea, abdominal pain, nausea occurs. Obtain *C. difficile* PCR test in pts with persistent diarrhea, fever, abdominal pain.

**PATIENT/ FAMILY TEACHING**

• Do not chew, crush delayed-release capsules. • For pts who have difficulty swallowing capsules, open capsules, sprinkle granules on 1 tsp of applesauce, swallow immediately.

**lapatinib**

la-pa-tin-ib  
(Tykerb)

**BLACK BOX ALERT** ■ Hepatotoxicity (serum ALT or AST more than 3 times upper limit of normal [ULN] and total bilirubin more than 2 times ULN), possibly severe, has occurred.

**Do not confuse lapatinib with dasatinib, erlotinib, or imatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Combination treatment with capecitabine for the treatment of human epidermal growth receptor type 2 (HER2)-overexpressing advanced or metastatic breast cancer in pts who have received prior therapy including an anthracycline, a taxane, and trastuzumab. Combination treatment with letrozole for treatment of postmenopausal women with *HER2*-overexpressing hormone receptor-positive metastatic breast cancer for whom hormonal therapy is indicated. **OFF-LABEL:** Treatment (in combination with trastuzumab) of *HER2*-overexpressing metastatic breast cancer that progressed on prior trastuzumab-containing therapy. Treatment of *HER2*-overexpressing metastatic breast cancer with brain metastasis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lapatinib. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hepatic impairment, cardiac disease, HF; pts at risk for QT interval prolongation (congenital long QT syndrome, HF, medications that prolong QT interval, hypokalemia, hypomagnesemia); History of treatment with anthracyclines, chest wall irradiation. Avoid concurrent use with strong CYP3A4 inhibitors or inducers.

### ACTION

Reversible inhibitory action against kinases targeting intracellular components of epidermal growth factor receptor ErbB1 and a second receptor, human epidermal receptor (HER2 [ErbB2]). **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	4 hrs	—

Steady-state level reached within 6–7 days. Incomplete and variable oral absorption. Undergoes extensive metabolism. Protein binding: 99%. Minimally excreted in feces and plasma. **Half-life:** 24 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** QT interval-prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), **dexamethasone** may increase concentration/effect. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort decreases concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. (potential for torsades, myelotoxicity). **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease neutrophils, Hgb, platelets.

### AVAILABILITY (Rx)

 **Tablets:** 250 mg.

### ADMINISTRATION/HANDLING

#### PO

- Do not break, crush, dissolve, or divide film-coated tablets.
- Give at least 1 hr before or 1 hr after food. Take full dose at same time each day.

## INDICATIONS/ROUTES/DOSAGE

### Breast Cancer

**PO: ADULTS, ELDERLY:** With **capecitabine:** 1,250 mg (5 tablets) once daily. With **letrozole:** 1,500 mg once daily continuously with letrozole. Continue until disease progresses or unacceptable toxicity.

### Dose Modification

#### Cardiac Toxicity

Discontinue with decreased left ventricular ejection fraction Grade 2 or higher, or in pts with an ejection fraction that drops to lower limit of normal. May be started at a reduced dose (1,000 mg/day) at a minimum of 2 wks when ejection fraction returns to normal and pt is asymptomatic.

#### Pulmonary Toxicity

Discontinue with symptoms indicative of interstitial lung disease or pneumonitis Grade 3 or higher.

#### Severe Hepatic Impairment

**With capecitabine:** 750 mg/day. **With letrozole:** 1,000 mg/day.

#### CYP3A4 Inhibitors/Inducers

Concomitant use of CYP3A4 inhibitors may require dose reduction of lapatinib (e.g., decrease to 500 mg/day with careful monitoring); CYP3A4 inducers may require dose increase of lapatinib (e.g., increase to 4,500 mg with capecitabine or 5,500 mg with letrozole).

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** See dose modification.

## SIDE EFFECTS

**Common (65%–44%):** Diarrhea, hand-foot syndrome (blistering/rash/peeling of skin on palms of hands, soles of feet), nausea. **Frequent (28%–26%):** Rash, vomiting. **Occasional (15%–10%):** Mucosal inflammation, stomatitis, extremity pain, back pain, dry skin, insomnia.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause cardiac toxicity, decreased LVEF, ILD/pneumonitis. Life-threatening hepatotoxicity may occur days to several mos after initiation. Grade 3 or 4 diarrhea reported in less than 10% and less than 15% of pts, respectively. Concentration-dependent QT interval prolongation may occur. Life-threatening cutaneous reactions including erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, ECG; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Assess LVEF by echocardiogram. Confirm HER2-positive status. Question history pulmonary disease, hepatic/renal impairment, cardiac disease, HF. Screen for active infection. Assess hydration status. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT for hepatotoxicity (abdominal pain, nausea, jaundice, weight loss); ECG for QT interval prolongation. Monitor serum electrolytes if severe diarrhea occurs. Diarrhea must be treated promptly. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess LVEF by echocardiogram as clinically indicated. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Monitor for toxicities if discontinuation or dose reduction of strong CYP3A4 inhibitor is avoidable. Assess skin for cutaneous toxicities.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight

infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); heart failure (e.g., chest pain, difficulty breathing, palpitations, swelling of extremities); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes). • Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Diarrhea is a common side effect. • Maintain proper hydration and nutrition. • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.

## larotrectinib

lar-oh-trek-ti-nib  
(Vitrakvi)

**Do not confuse larotrectinib with alectinib, lapatinib, lenvatinib, or lorlatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tropomyosin receptor kinase (TRK) inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of adult and pediatric pts with solid tumors that have a neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatment or that have progressed following treatment.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to larotrectinib. **Cautions:** Baseline anemia, neutropenia; hepatic impairment, active infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); concomitant use of strong CYP3A inhibitors, strong CYP3A inducers.

### ACTION

Inhibits activation of tropomyosin receptor kinase (TRK) proteins resulting from *NTRK* gene fusions, deletion of protein regulatory domain, or in cells with overexpression of TRK proteins. **Therapeutic Effect:** Inhibits tumor cell proliferation.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 70%. Excreted in feces (58%), urine (39%). **Half-life:** 2.9 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility. **Children:** May have increased risk of increased weight, neutropenia. **Elderly:** Not specified; use caution.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST. May decrease serum albumin; Hgb, neutrophils, RBCs.

**AVAILABILITY (Rx)**

**Capsules:** 25 mg, 100 mg. **Solution, Oral:** 20 mg/mL.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • Capsules/oral solution may be used interchangeably. • If vomiting occurs after administration, give next dose at regularly scheduled time. • Do not give a missed dose within 6 hrs of next dose. **Capsules:** Administer capsules whole with water; do not break, cut, or open. • Capsules cannot be chewed. **Solution, Oral:** Refrigerate glass bottle. Do not freeze. • Discard unused contents after 90 days of first opening bottle. • See manufacturer guidelines regarding preparation and administration of oral solution.

**INDICATIONS/ROUTES/DOSAGE****Solid Tumors**

**PO: ADULTS, CHILDREN WITH BODY SURFACE AREA OF AT LEAST 1 m<sup>2</sup>:** 100 mg twice daily. Continue until disease progression or unacceptable toxicity. **CHILDREN WITH BODY SURFACE AREA LESS THAN 1 m<sup>2</sup>:** 100 mg/m<sup>2</sup> twice daily. Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule**

<b>Dose Reduction for Adverse Reactions</b>	<b>Adults/ Children With Body Surface Area of at Least 1 m<sup>2</sup></b>	<b>Children With Body Surface Area Less Than 1 m<sup>2</sup></b>
First	75 mg twice daily	75 mg/m <sup>2</sup> twice daily
Second	50 mg twice daily	50 mg/m <sup>2</sup> twice daily
Third	100 mg once daily	25 mg/m <sup>2</sup> twice daily

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Any Grade 3 or 4 Adverse Reaction**

**Note** (includes hepatotoxicity and neurotoxicity): Withhold treatment until

resolved or improved to Grade 1, then resume at reduced dose level. If not resolved within 4 wks, permanently discontinue.

**Concomitant Use of Strong CYP3A4 Inhibitor**

If strong CYP3A4 inhibitor cannot be discontinued, reduce larotrectinib dose by 50%. If strong CYP3A inhibitor is discontinued for 3–5 half-lives, resume larotrectinib dose prior to use of strong CYP3A4 inhibitor.

**Concomitant Use of Strong CYP3A4 Inducer**

If strong CYP3A4 inducer cannot be discontinued, double the larotrectinib dose. If strong CYP3A inducer is discontinued for 3–5 half-lives, resume larotrectinib dose prior to use of strong CYP3A4 inducer.

**Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Reduce starting dose by 50%.

**SIDE EFFECTS**

**Frequent (37%–15%):** Fatigue, nausea, dizziness, cough, vomiting, constipation, diarrhea, pyrexia, dyspnea, increased weight, peripheral edema. **Occasional (14%–11%):** Arthralgia, myalgia, muscular weakness, headache, abdominal pain, decreased appetite, back pain, extremity pain, nasal congestion, hypertension.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia) is an expected response to therapy. Neurotoxic events including delirium, dysarthria, dizziness, gait disturbance, memory impairment, paresthesia, tremor occurred in 53% of pts. Grade 4 encephalopathy reported in less than 1% of pts. Hepatotoxicity with transaminase elevations of any grade reported in 45%.

Grade 3 hepatotoxicity reported in 6% of pts. Falls reported in 10% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Confirm presence of NTRK gene fusion in tumor specimen. Screen for active infection. Confirm compliance of effective contraception. Question history of hepatic impairment. Receive full medication history and screen for interactions. Initiate fall precautions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for anemia, neutropenia periodically; LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) q2wks for 4 wks, then monthly thereafter (or as clinically indicated). Monitor for neurotoxicities. If concomitant use of strong CYP3A inhibitor or strong CYP3A inducer is unavoidable, monitor for drug toxicities. Diligently screen for infections.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Nervous system changes including altered memory, confusion, delirium, difficulty speaking, gait disturbance, numbness, tremors may occur. Avoid tasks that require alertness, motor skills if neurologic effects are occurring.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## ledipasvir/sofosbuvir

le-**dip**-as-vir/soe-**fos**-bue-vir  
(Harvoni)

■ **BLACK BOX ALERT** ■ Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation was reported in HCV/HBV coinfecting pts who were undergoing or had completed treatment with HCV direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

**Do not confuse ledipasvir with daclatasvir, elbasvir, or ombitasvir, or sofosbuvir with dasabuvir.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Combination nucleotide analog NS5A inhibitor and nucleotide analog NS5B polymerase inhibitor. **CLINICAL:** Antihepaticiviral.

### USES

Treatment of chronic hepatitis C virus (HCV) in adults and children 3 yrs of age and older with genotype 1, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis; genotype 1 infection in adults and children 3 yrs of age and older with decompensated cirrhosis, in combination with ribavirin; genotype 1 or 4 infection in adults and children 3 yrs of age and older who are liver transplant recipients without cirrhosis or with compensated cirrhosis, in combination with ribavirin.

### PRECAUTIONS

**Note:** If used with ribavirin, the Contraindications and Cautions for the use of ribavirin also apply.

**Contraindications:** Hypersensitivity to ledipasvir, sofosbuvir. **Cautions:** Advanced hepatic disease, HIV infection, hepatitis B virus infection. Concomitant use of amiodarone (with or without beta blockers) in pts with underlying cardiac disease. Concomitant use of P-glycoprotein (P-gp) inducers not recommended.

## ACTION

Ledipasvir inhibits HCV NS5A protein, essential for viral replication. Sofosbuvir is converted to its active form and inhibits NS5B RNA-dependent RNA polymerase, also essential for viral replication. **Therapeutic Effect:** Inhibits viral replication of HCV.

## PHARMACOKINETICS

Widely absorbed. Ledipasvir is metabolized by oxidative processes. Sofosbuvir is metabolized in liver. Protein binding: 99.8% (ledipasvir), 61%–65% (sofosbuvir). Peak plasma concentration: 4–4.5 hrs (ledipasvir), 0.8–1 hr (sofosbuvir). Ledipasvir is excreted in feces (87%) and urine (1%). Sofosbuvir is excreted in urine (80%), feces (14%). **Half-life:** 47 hrs (ledipasvir), 0.4 hr (sofosbuvir).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if ledipasvir or sofosbuvir is distributed in breast milk. When administered with ribavirin, therapy is contraindicated in pregnant women and in men whose female partners are pregnant. **Children:** Safety and efficacy not established in pts younger than 12 yrs of age or weight less than 35 kg. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May enhance bradycardic effect of **amiodarone**. May increase concentration of **rosuvastatin**. **Aluminum- or magnesium-containing antacids, H<sub>2</sub>-receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole), anticonvulsants (e.g., carbamazepine, oxcarbamazepine, phenobarbital, primidone), antimycobacterials (e.g., rifAMPin)** may decrease concentration/effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin.

## AVAILABILITY (Rx)

**Tablets, Fixed-Dose Combination:** 90 mg (ledipasvir)/400 mg (sofosbuvir).

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hepatitis C Virus Infection

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS OF AGE AND OLDER, WEIGHING 35 KG OR MORE:** 1 tablet (ledipasvir/sofosbuvir) once daily. See manufacturer guidelines for treatment with ribavirin.

### Treatment Regimen and Duration for Adults

#### Genotype 1

**Treatment-naïve without cirrhosis or with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir for 12 wks. Treatment for 8 wks may be considered in treatment-naïve genotype 1 pts without cirrhosis who have HCV-RNA level less than 6 million international units/mL prior to initiation. **Treatment-experienced without cirrhosis:** Ledipasvir/sofosbuvir for 12 wks. **Treatment-experienced with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir for 24 wks. Ledipasvir/sofosbuvir plus ribavirin for 12 wks may be considered in treatment-experienced genotype 1 pts with cirrhosis who are eligible for ribavirin. **Treatment-naïve and treatment-experienced with decompensated cirrhosis (Child-Pugh B or C):** Ledipasvir/sofosbuvir plus ribavirin for 12 wks.

#### Genotype 1 or 4

**Treatment-naïve and treatment-experienced liver transplant recipients without cirrhosis or with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir plus ribavirin for 12 wks.

### Treatment Regimen and Duration for Children

#### Genotype 1

**Treatment-naïve without cirrhosis or with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir for 12 wks. **Treatment-experienced without cirrhosis:** Ledipasvir/sofosbuvir

for 12 wks. **Treatment-experienced with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir for 24 wks.

**Genotype 4, 5, or 6**

**Treatment-naïve and treatment-experienced without cirrhosis or with compensated cirrhosis (Child-Pugh A):** Ledipasvir/sofosbuvir for 12 wks.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (16%–4%):** Fatigue, headache, nausea, diarrhea. **Rare (3%):** Insomnia. **Ribavirin: Frequent (31%–29%):** Asthenia, headache. **Occasional (18%–5%):** Fatigue, myalgia, irritability, dizziness. **Rare (3%):** Dyspnea.

### ADVERSE EFFECTS/TOXIC REACTIONS

HBV reactivation was reported in pts co-infected with HBV/HCV; may result in fulminant hepatitis, hepatic failure, death. Cardiac arrest, symptomatic bradycardia, pacemaker implantation was reported in pts taking concomitant amiodarone. Bradycardia usually occurred within hrs to days, but may occur up to 2 wks after initiation. Pts with underlying cardiac disease, advanced hepatic disease, or pts taking concomitant beta blockers are at an increased risk for bradycardia when used concomitantly with amiodarone. Psychiatric disorders including depression may occur.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain LFT, HCV-RNA level; pregnancy test in females of reproductive potential; CBC for pts treated with ribavirin. Confirm HCV genotype. Test all pts for

HBV infection prior to initiation. Receive full medication history and screen for contraindications/interactions, esp. concomitant use of amiodarone. Question for history of chronic anemia, HBV infection, HIV infection, liver transplantation.

#### INTERVENTION/EVALUATION

Periodically monitor LFT, HCV-RNA level for treatment effectiveness. Closely monitor for exacerbation of hepatitis or HBV reactivation. If unable to discontinue amiodarone, consider inpatient cardiac monitoring for at least 48 hrs, followed by outpatient or self-monitoring of heart rate for at least 2 wks after initiation. Cardiac monitoring is also recommended in pts who discontinue amiodarone just prior to initiation. In females of reproductive potential who are taking concomitant ribavirin, reinforce birth control compliance and obtain monthly pregnancy tests. Monitor for new-onset or worsening of depression

#### PATIENT/FAMILY TEACHING

- Pts who take amiodarone (an antiarrhythmic) during therapy may require inpatient and outpatient cardiac monitoring (and in some cases pacemaker implantation) due to an increased risk of slow heart rate or cardiac arrest. If amiodarone therapy cannot be withheld or stopped, immediately report symptoms of slow heart rate such as chest pain, confusion, dizziness, fainting, light-headedness, memory problems, palpitations, weakness.
- Treatment may be used in combination with ribavirin (inform pt of contraindications/adverse effects of ribavirin therapy). If therapy includes treatment with ribavirin, use effective contraception to avoid pregnancy. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Do not take herbal products.
- Avoid alcohol.
- Report signs of depression.

## leflunomide

lee-floo-noe-myde  
(Apo-Leflunomide , Arava)

**BLACK BOX ALERT** Do not use during pregnancy. Women of childbearing potential must be counseled regarding fetal risk, use of reliable contraceptives confirmed, possibility of pregnancy excluded. Severe hepatic injury may occur.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Disease-modifying agent. **CLINICAL:** Antirheumatic.

### USES

Treatment of active rheumatoid arthritis (RA). Improve physical function in pts with rheumatoid arthritis. **OFF-LABEL:** Treatment of cytomegalovirus (CMV) disease. Prevention of acute/chronic rejection in recipients of solid organ transplants.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to leflunomide. Pregnancy or plans for pregnancy. Severe hepatic impairment. Concomitant use with teriflunomide. **Cautions:** Hepatic/renal impairment, hepatitis B or C virus infection, pts with immunodeficiency or bone marrow dysplasias, breastfeeding mothers, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), latent TB, significant hematologic abnormalities, diabetes, concomitant use of neurotoxic medications, elderly pts.

### ACTION

Inhibits pyrimidine synthesis, resulting in antiproliferative and anti-inflammatory effects. **Therapeutic Effect:** Reduces signs/symptoms of RA, retards structural damage.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Excreted

in feces (68%), urine (23%). Not removed by hemodialysis. **Half-life:** 16 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Can cause fetal harm. Contraindicated in pregnancy. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** RifAMPin may increase concentration/effect. **Hepatotoxic medications** (e.g., acetaminophen, ketoconazole, simvastatin) may increase risk of side effects, hepatotoxicity. May decrease the therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **natalizumab**, **vaccines (live)**. **HERBAL:** Echinacea may decrease therapeutic effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, bilirubin.

### AVAILABILITY (Rx)

**Tablets:** 10 mg, 20 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Rheumatoid Arthritis (RA)

**PO: ADULTS, ELDERLY:** Initially, 100 mg/day for 3 days, then 10–20 mg/day. (Loading dose may be omitted in pts at increased risk of hepatic or hematologic toxicity.)

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**ALT 2–3 times upper limit of normal (ULN):** Not recommended. **Persistent ALT level greater than 3 times ULN:** Discontinue and initiate accelerated drug elimination. Cholestyramine 8 g 3 times/day for 11 days or activated charcoal 50 g q12h for 11 days.

**SIDE EFFECTS**

**Frequent (20%–10%):** Diarrhea, respiratory tract infection, alopecia, rash, nausea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Pancytopenia, agranulocytosis, leukopenia, neutropenia, thrombocytopenia may occur, esp. in pts taking concomitant methotrexate, other immunosuppressants. Severe hepatic injury, fatal hepatic failure, acute hepatic necrosis, colitis, pancreatitis may occur. Severe infections including aspergillosis, *Pneumocystis jiroveci* pneumonia, tuberculosis, sepsis were reported. Cutaneous skin reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia and systemic symptoms (DRESS), vasculitis, cutaneous lupus erythematosus, psoriasis were reported. May increase risk of malignancies, lymphoproliferative disorders, peripheral neuropathy. Other reactions may include interstitial lung disease (ILD), pneumonitis, thrombophlebitis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Assess onset, location, duration of pain and inflammation. Inspect appearance of affected joints for immobility, deformities. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB. Question history pulmonary disease, hepatic impairment, chronic infections (hepatitis B or C virus, HIV, latent TB). Screen for active infection. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor CBC, LFT periodically. Monitor for TB regardless of baseline PPD. Monitor for hepatotoxicity (abdominal pain, jaundice, nausea, vomiting, weight loss). Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for infections (cough, fatigue, fever). Assess skin for cutaneous toxicities. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect routine tuberculosis screening. Report any travel plans to possible endemic areas.
- Do not receive live vaccines.
- Report liver problems (bruising, confusion, dark- or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes), lung inflammation (excessive coughing, difficulty breathing, chest pain).
- Treatment may cause reactivation of chronic viral infections, new cancers.
- Use effective contraception to avoid pregnancy.

**lenalidomide**

len-a-**lid**-o-myde  
(Revlimid)

**BLACK BOX ALERT** ■ Analogue to thalidomide. High potential for significant birth defects. Hematologic toxicity (thrombocytopenia, neutropenia) occurs in 80% of pts. Greatly increases risk for DVT, pulmonary embolism in multiple myeloma pts.

**Do not confuse lenalidomide with thalidomide.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiogenesis inhibitor. **CLINICAL:** Anti-neoplastic.

## USES

Treatment of low- to intermediate-risk myelodysplastic syndrome (MDS) in pts with deletion 5q cytogenetic abnormality with transfusion-dependent anemia. Treatment of multiple myeloma (in combination with dexamethasone). Treatment of pts with mantle cell lymphoma that has relapsed or progressed after 2 prior therapies (one of which included bortezomib). Maintenance treatment for multiple myeloma (following autologous stem cell transplant). Treatment of previously treated follicular lymphoma (in combination with ritUXimab). Treatment of previously treated marginal zone lymphoma (in combination with ritUXimab). **OFF-LABEL:** Systemic amyloidosis, lower-risk myelodysplastic syndrome, non-Hodgkin's lymphoma. Relapsed or refractory chronic lymphocytic leukemia (CLL).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to lenalidomide. Pregnancy. **Cautions:** Renal/hepatic impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for tumor lysis syndrome (high tumor burden); pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions); history of venous or arterial thrombosis (e.g., CVA, DVT, MI, pulmonary embolism). Avoid use in pts with glucose intolerance, lactase deficiency.

## ACTION

Inhibits secretion of pro-inflammatory cytokines, increases secretion of

anti-inflammatory cytokines. Enhances cell-mediated immunity by stimulation of T cells. **Therapeutic Effect:** Inhibits myeloma cell growth; induces cell cycle arrest and cell death.

## PHARMACOKINETICS

Widely distributed. Protein binding: 30%. Excreted in urine. **Half-life:** 3 hrs (increased in renal impairment).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy; may cause fetal harm/demise. Females of reproductive potential must have two negative pregnancy tests prior to initiation; must either remain abstinent or use two reliable forms of effective contraception, starting 4 wks prior to initiation, during treatment, and for at least 4 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. **Males:** Distributed in semen. Males with female partners of reproductive potential must use latex or synthetic condoms with sexual activity during treatment and up to 4 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require caution in dosage selection. Risk of toxic reactions greater in those with renal insufficiency.

## INTERACTIONS

**DRUG:** May increase toxic effects of **abatacept, anakinra, bisphosphonate derivatives, canakinumab, leflunomide, natalizumab, nivolumab, riloncept, tofacitinib, vedolizumab.** May increase immunosuppressive effects of **certolizumab, fingolimod, ocrelizumab, Denosumab, dipyrone, pimecrolimus** may increase risk of toxicity. **Dexamethasone, erythropoiesis-stimulating agents, estrogens** may increase risk of thrombosis. **Ocrelizumab, roflumilast, tocilizumab** may increase immunosuppressive effects.

May increase concentration effect of **digoxin**. May increase adverse effects/decrease therapeutic of **vaccines (live)**. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease WBC count, Hgb, Hct platelets, troponin I, serum creatinine, sodium, T<sub>3</sub>, T<sub>4</sub>. May decrease serum bilirubin, glucose, potassium, magnesium.

## AVAILABILITY (Rx)

 **Capsules:** 2.5 mg, 5 mg, 10 mg, 15 mg, 20 mg, 25 mg.

## ADMINISTRATION/HANDLING

- Store at room temperature.
- Do not break, crush, dissolve, or divide capsules.
- Swallow whole with water.

## INDICATIONS/ROUTES/DOSAGE

### Myelodysplastic Syndrome

**PO: ADULTS, ELDERLY:** 10 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Modification for Myelodysplastic Syndrome

#### Thrombocytopenia

**Thrombocytopenia within 4 wks with 10 mg/day:** Baseline platelets **100,000 cells/mm<sup>3</sup> or greater:** If platelets less than 50,000 cells/mm<sup>3</sup>, hold treatment. Resume at 5 mg/day when platelets return to 50,000 cells/mm<sup>3</sup> or greater. **Baseline platelets less than 100,000 cells/mm<sup>3</sup>:** If platelets fall to 50% of baseline, hold treatment. Resume at 5 mg/day if baseline is 60,000 cells/mm<sup>3</sup> or greater and platelets return to 50,000 cells/mm<sup>3</sup> or greater. Resume at 5 mg/day if baseline is less than 60,000 cells/mm<sup>3</sup> and platelets return to 30,000 cells/mm<sup>3</sup> or greater.

**Thrombocytopenia after 4 wks with 10 mg/day:** If platelets less than 30,000 cells/mm<sup>3</sup> OR less than 50,000 cells/mm<sup>3</sup> with platelet transfusion, hold treatment.

Resume at 5 mg/day when platelets return to 30,000 cells/mm<sup>3</sup> or greater.

**Thrombocytopenia developing with 5 mg/day:** If platelets less than 30,000 cells/mm<sup>3</sup> OR less than 50,000 cells/mm<sup>3</sup> with platelet transfusion, hold treatment. Resume at 5 mg every other day when platelets return to 30,000 cells/mm<sup>3</sup> or greater.

#### Neutropenia

**Neutropenia within 4 wks with 10 mg/day:** Baseline absolute neutrophil count (ANC) **1,000/mcl or greater:** If ANC less than 750 cells/mm<sup>3</sup>, hold treatment. Resume at 5 mg/day when ANC 1,000 cells/mm<sup>3</sup> or greater. **Baseline ANC less than 1,000 cells/mm<sup>3</sup>:** If ANC less than 500 cells/mm<sup>3</sup>, hold treatment. Resume at 5 mg/day when ANC 500 cells/mm<sup>3</sup> or greater.

**Neutropenia after 4 wks with 10 mg/day:** If ANC less than 500 cells/mm<sup>3</sup> for 7 days or longer or associated with fever, hold treatment. Resume at 5 mg/day when ANC 500 cells/mm<sup>3</sup> or greater.

**Neutropenia developing with 5 mg/day:** If ANC less than 500 cells/mm<sup>3</sup> for 7 days or longer or associated with fever, hold treatment. Resume at 5 mg every other day when ANC 500 cells/mm<sup>3</sup> or greater.

#### Follicular Lymphoma, Marginal Zone Lymphoma

**PO: ADULTS, ELDERLY:** 20 mg once daily for 21 days of 28-day cycle (in combination with ritUXimab) for up to 12 cycles.

#### Mantle Cell Lymphoma

**PO: ADULTS, ELDERLY:** 25 mg once daily on days 1–21 of repeated 28-day cycle. Continue until disease progression or unacceptable toxicity.

#### Multiple Myeloma

**PO: ADULTS, ELDERLY:** 25 mg/day on days 1–21 of repeated 28-day cycle (in combination with dexamethasone). Continue until disease progression or unacceptable toxicity. If eligible for transplant,

HSCT mobilization should occur within 4 cycles of lenalidomide-containing therapy.

#### Multiple Myeloma Following Auto-HSCT

**PO: ADULTS, ELDERLY:** 10 mg once daily continuously on days 1–28 of repeated 28-day cycle. If tolerated, may increase to 15 mg once daily after 3 cycles.

#### Dosage Adjustments for Multiple Myeloma

**Thrombocytopenia:** If platelets fall to less than 30,000 cells/mm<sup>3</sup>, hold treatment, monitor CBC. Resume at 15 mg/day when platelets 30,000 cells/mm<sup>3</sup> or greater. For each subsequent fall to less than 30,000 cells/mm<sup>3</sup>, hold treatment

and resume at 5 mg/day less than previous dose when platelets return to 30,000 cells/mm<sup>3</sup> or greater. Do not dose to less than 5 mg/day.

**Neutropenia:** If neutrophils fall to less than 1,000 cells/mm<sup>3</sup>, hold treatment, add G-CSF, follow CBC wkly. Resume at 25 mg/day when neutrophils return to 1,000 cells/mm<sup>3</sup> and neutropenia is the only toxicity. Resume at 15 mg/day if other toxicity is present. For each subsequent fall to less than 1,000 cells/mm<sup>3</sup>, hold treatment and resume at 5 mg/day less than previous dose when neutrophils return to 1,000 cells/mm<sup>3</sup> or greater. Do not dose to less than 5 mg/day.

Dosage in Renal Impairment	Creatinine Clearance 30–59 mL/min	Creatinine Clearance Less Than 30 mL/min (Non-Dialysis Dependent)	Creatinine Clearance Less Than 30 mL/min (Dialysis Dependent)
Myelodysplastic syndrome	5 mg once daily	2.5 mg once daily	2.5 mg once daily (give after dialysis)
Multiple myeloma	10 mg once daily	15 mg q48h	5 mg once daily (give after dialysis)

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (49%–31%):** Diarrhea, pruritus, rash, fatigue. **Occasional (24%–12%):** Constipation, nausea, arthralgia, fever, back pain, peripheral edema, cough, dizziness, headache, muscle cramps, epistaxis, asthenia, dry skin, abdominal pain. **Rare (10%–5%):** Extremity pain, vomiting, generalized edema, anorexia, insomnia, night sweats, myalgia, dry mouth, ecchymosis, rigors, depression, dysgeusia, palpitations.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including bone marrow depression,

febrile neutropenia, may be life-threatening. May increase risk of venous thromboembolism (DVT, pulmonary embolism) and arterial thromboembolism (CVA, myocardial infarction), esp. in pts being treated for multiple myeloma. Life-threatening tumor lysis syndrome, hepatotoxicity may occur. May increase mortality in pts with multiple myeloma when pembrolizumab is added to a thalidomide analogue and dexamethasone. Severe hypersensitivity reactions, including anaphylaxis, may occur. May cause secondary malignancies, including acute myeloid leukemia, basal or squamous cell carcinoma, myelodysplastic syndrome. Other reactions may include tumor flare reaction, impaired stem cell mobilization, hyperthyroidism, hypothyroidism. Infections, including bronchitis, cellulitis, herpes zoster, influenza, gastroenteritis, nasopharyngitis, pneumonia, respiratory

tract infection, sepsis, sinusitis, UTI, were reported. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Dermatologic toxicities, including Stevens-Johnson syndrome, toxic epidermal necrolysis, may occur. Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, and rash, which may be associated with other organ systems, such as hepatitis, hematological abnormalities, myocarditis, nephritis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, BMP, LFT, thyroid function. Obtain two negative pregnancy tests in females of reproductive potential. The first pregnancy test should be obtained within 10–14 days and the second test within 24 hrs of initiation. Confirm compliance of abstinence or two forms of effective contraception. Due to increased risk of tumor lysis syndrome, assess hydration status routinely. Question history of CVA, DVT, pulmonary embolism, recent MI; prior hypersensitivity reactions. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression weekly (duration based on indication); LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) as appropriate; thyroid function periodically. Obtain pregnancy test w/ky for 4 wks, then either q4wks (normal menstrual cycle) or q2wks (irregular menstrual cycle). Obtain serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Diligently monitor for infections (cough, fatigue, fever,

urinary urgency). Assess skin for rash, new lesions, dermatological toxicities; symptoms of drug reaction with eosinophilia and systemic symptoms. Monitor for symptoms of DVT (leg or arm pain/swelling), CVA (aphasia, altered mental status, hemiplegia, vision loss, seizures); MI (arm/jaw pain, chest pain, diaphoresis, dyspnea), PE (chest pain, dyspnea, tachycardia).

### PATIENT/FAMILY TEACHING

- Treatment may depress immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), toxic skin reactions (inflammation, peeling, rash, sloughing).
- Abstain from sexual activity or use reliable forms of effective contraception. Do not breast-feed.
- New secondary primary cancers may occur.
- Allergic reactions, including anaphylaxis, may occur.
- Treatment may cause blood clots in an artery or vein. Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm, sweating), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision).

## lenvatinib

len-va-ti-nib  
(Lenvima)

**Do not confuse lenvatinib with dasatinib, ibrutinib, imatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Treatment of locally recurrent or metastatic, progressive, radioactive iodine–refractory differentiated thyroid cancer. Treatment of advanced renal cell carcinoma (RCC) in combination with everolimus after one course of another antineoplastic. First-line treatment of unresectable hepatocellular carcinoma (HCC). Treatment of advanced endometrial carcinoma (in combination with pembrolizumab).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lenvatinib. **Cautions:** Electrolyte imbalance (hypokalemia, hypomagnesemia), hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). History of cardiac dysfunction (HF, pulmonary edema, right or left ventricular dysfunction), GI perforation/hemorrhage, hypertension, pts at risk for QT interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), thromboembolic events (e.g., CVA, DVT), pituitary/thyroid disease.

### ACTION

Inhibits tyrosine kinase receptor activity of vascular endothelial growth factor (VEGF) receptors. Inhibits tumor angiogenesis, growth, progression.

**Therapeutic Effect:** Decreases tumor cell growth, slows cancer progression.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%–99%. Peak plasma concentration: 1–4 hrs. Excreted in feces (64%), urine (25%). Not removed by dialysis. **Half-life:** 28 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment for at least 2 wks after discontinuation. Potentially distributed in breast milk. May reduce fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May increase QT-prolonging effects of amiodarone, citalopram, clarithromycin, moxifloxacin, nilotinib, quetiapine, ribociclib, thioridazine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT/AST, amylase, bilirubin, cholesterol, creatinine, lipase. May decrease serum albumin, glucose, magnesium; platelets. May increase or decrease serum calcium, potassium.

### AVAILABILITY (Rx)

**Capsules:** 4 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Do not cut, crush, divide, or open capsules.
- Should be swallowed whole.

May be dissolved with 15 mL water or apple juice by first adding whole capsule to liquid; leave for 10 min, stir for 3 min,

then administer. Then add 15 mL to glass, swirl, swallow additional liquid.

## INDICATIONS/ROUTES/DOSAGE

### Thyroid Cancer

**PO: ADULTS, ELDERLY:** 24 mg once daily. Continue until disease progression or unacceptable toxicity.

### RCC

**PO: ADULTS, ELDERLY:** 18 mg once daily (in combination with everolimus). Continue until disease progression or unacceptable toxicity.

### HCC

**PO: ADULTS, ELDERLY: (60 KG OR GREATER):** 12 mg once daily. (**LESS THAN 60 KG:** 8 mg once daily. Continue until disease progression or unacceptable toxicity.

### Endometrial Carcinoma (Advanced)

**PO: ADULTS, ELDERLY:** 20 mg once daily (in combination with pembrolizumab). Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Adverse Reaction	Modification	Adjusted Dose (Thyroid Cancer)
First occurrence	Interrupt until resolved to Grade 0 or 1 or baseline	20 mg once daily
Second occurrence	Interrupt until resolved to Grade 0 or 1 or baseline	14 mg once daily
Third occurrence	Interrupt until resolved to Grade 0 or 1 or baseline	10 mg once daily

Adjusted dose for RCC is lower. 14 mg for first occurrence, 10 mg for second occurrence, 8 mg for third occurrence.

### Arterial Thrombotic Event

Discontinue treatment.

### Cardiac Dysfunction

**Grade 3 cardiac dysfunction:** Withhold treatment until improved to Grade 1 or 0 (or baseline). Either resume at reduced dose or discontinue (depending on the severity and persistence). Discontinue for Grade 4 event.

### GI Perforation/Fistula Formation

Discontinue treatment.

### Hemorrhagic Events

**Grade 3 hemorrhage:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then either reduce dose or discontinue (based on severity or persistence). Discontinue for Grade 4 hemorrhage.

### Hypertension

**Grade 3 hypertension:** Withhold treatment until improved with hypertensive therapy, then resume at reduced dose when hypertension is controlled at less than or equal to Grade 2. Discontinue for life-threatening hypertension.

### Proteinuria

**Urine protein greater than or equal to 2 g/24 hrs:** Withhold treatment until improved to less than 2 g/24 hrs. Discontinue if nephrotic syndrome occurs.

### QT Prolongation

**Grade 3 or 4 QT interval prolongation:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose.

### Renal Failure/Impairment or Hepatotoxicity

**Grade 3 or 4 renal dysfunction or hepatotoxicity:** Withhold treatment until resolved to Grade 0 or 1 or baseline. Either resume at reduced dose or discontinue (depending on the severity and persistence). Discontinue if hepatic failure occurs.

### Reversible Posterior

#### Leukoencephalopathy Syndrome (RPLS)

Withhold treatment until resolved, then resume at reduced dose or discontinue (depending on the severity and persistence of neurologic symptoms).

**Other Adverse Reactions**

**Other persistent or intolerable Grade 2 or 3 reactions; Grade 4 laboratory abnormality:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose. **Other Grade 4 reactions:** Permanently discontinue.

**Dosage in Renal/Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** 14 mg once daily.

**SIDE EFFECTS**

**Frequent (73%–29%):** Hypertension, diarrhea, fatigue, asthenia, malaise, arthralgia, myalgia, decreased appetite, weight decreased, nausea, stomatitis, glossitis, mouth ulceration, mucosal inflammation, headache, vomiting, dysphonia, abdominal pain, constipation. **Occasional (25%–7%):** Oral pain, glossodynia, cough, peripheral edema, rash, dysgeusia, dry mouth, dizziness, dyspepsia, insomnia, alopecia, hypotension, dehydration, hyperkeratosis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Serious adverse effects may include arterial thromboembolic events (5% of pts); cardiac dysfunction (7% of pts); dental and oral infections including gingivitis, parotitis, pericoronitis, periodontitis, sialoadenitis, tooth abscess, tooth infection (10% of pts); GI perforation/fistula formation (2% of pts); hemorrhagic events (35% of pts); hepatotoxicity (4% of pts); hypertension (73% of pts); Grade 3 or greater hypocalcemia (9% of pts); impairment of thyroid-stimulating hormone (57% of pts); palmar-plantar erythrodysesthesia (32% of pts); proteinuria (34% of pts); QT interval prolongation (9% of pts); renal failure (14% of pts); urinary tract infection (11% of pts). Reverse posterior leukoencephalopathy occurs rarely. The median onset of hypertension was

16 days. The most frequently reported hemorrhagic event was epistaxis. The primary risk factor for renal failure was dehydration and hypovolemia related to diarrhea and vomiting.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; urinalysis for proteinuria. Confirm negative pregnancy status before initiating treatment. Receive full medication history and screen for interactions. Question history of cardiac/pituitary/thyroid disease, CVA/DVT, hypertension, hepatic/renal impairment, long QT interval syndrome. Assess oral cavity for lesions, poor dentation. Ensure that B/P is controlled prior to initiation. Assess hydration status. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor B/P after 1 wk, then q2wks for the first 2 mos, then at least monthly thereafter. Monitor LFT every 2 wks for the first 2 mos, then at least monthly thereafter. Monitor for proteinuria periodically. If urine dipstick proteinuria is greater than or equal to 2+, obtain a 24-hr urine protein test. Monitor blood calcium levels at least monthly and replace as needed depending on severity, presence of ECG changes, persistence of hypocalcemia. Monitor and correct other electrolyte abnormalities as needed. Reversible posterior leukoencephalopathy syndrome should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Immediately report abdominal pain, GI bleeding, hemoptysis (may indicate GI perforation/fistula formation). Obtain cardiac echocardiogram, ECG if cardiac decompensation is suspected.

**PATIENT/FAMILY TEACHING**

- Report liver problems such as upper abdominal pain, bruising, dark or amber-colored urine, nausea, vomiting, or

yellowing of the skin or eyes; heart problems such as chest tightness, dizziness, fainting, palpitations, shortness of breath; kidney problems such as dark-colored urine, decreased urine output, extremity swelling, flank pain; skin changes such as rash, skin bubbling, sloughing. • Neurologic changes including blurry vision, confusion, headache, one-sided weakness, seizures, trouble speaking may indicate high blood pressure crisis, stroke, or life-threatening brain swelling. • Report mouth ulceration, jaw pain. • Swallow capsules whole; do not chew, crush, cut, or open capsules. • Treatment may increase risk of GI bleeding, nosebleeds. • Drink plenty of fluids. • Use effective contraception to avoid pregnancy. Do not breastfeed.

## letrozole

let-roe-zole  
(Femara)

**Do not confuse Femara with Famvir, Femhrt, or Provera, or letrozole with anastrozole.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aromatase inhibitor, hormone. **CLINICAL:** Antineoplastic.

### USES

First-line treatment of hormone receptor–positive or hormone receptor unknown locally advanced or metastatic breast cancer. Treatment of advanced breast cancer in postmenopausal women with disease progression following anti-estrogen therapy. Postsurgical treatment for postmenopausal women with hormone receptor–positive early breast cancer. Extended treatment of early breast cancer after 5 yrs of tamoxifen. **OFF-LABEL:** Treatment of ovarian (epithelial), endometrial cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to letrozole, other aromatase inhibitors. Use in women who are or may become pregnant. **Cautions:** Hepatic impairment, hyperlipidemia.

### ACTION

Decreases circulating estrogen by inhibiting aromatase, an enzyme that catalyzes the final step in estrogen production (inhibits conversion of androgens to estrogens). **Therapeutic Effect:** Inhibits growth of breast cancers stimulated by estrogens.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** Approx. 2 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal harm. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Tamoxifen may reduce concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium, cholesterol, GGT, ALT, AST, bilirubin.

### AVAILABILITY (Rx)

**Tablets:** 2.5 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Breast Cancer (Advanced)

**PO: ADULTS, ELDERLY:** 2.5 mg/day. Continue until tumor progression is evident.

#### Breast Cancer (Early–Adjuvant Treatment)

**PO: ADULTS, ELDERLY: (Postmenopausal):** 2.5 mg/day for planned duration of 5 yrs. Discontinue at relapse.

**Breast Cancer (Early–Extended Adjuvant Treatment)**

**PO: ADULTS, ELDERLY: (Postmenopausal):** 2.5 mg/day for planned duration of 5 yrs (after 5 yrs of tamoxifen). Discontinue at relapse.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Severe Hepatic Impairment**

**PO: ADULTS, ELDERLY:** 2.5 mg every other day.

**SIDE EFFECTS**

**Frequent (21%–9%):** Musculoskeletal pain (back, arm, leg), nausea, headache. **Occasional (8%–5%):** Constipation, arthralgia, fatigue, vomiting, hot flashes, diarrhea, abdominal pain, cough, rash, anorexia, hypertension, peripheral edema. **Rare (4%–1%):** Asthenia, drowsiness, dyspepsia, weight gain, pruritus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Pleural effusion, pulmonary embolism, bone fracture, thromboembolic disorder, MI occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT. Obtain pregnancy test prior to beginning therapy. Offer emotional support.

**INTERVENTION/EVALUATION**

Assist with ambulation if asthenia, dizziness occurs. Assess for headache. Offer antiemetic for nausea, vomiting. Monitor CBC, thyroid function, electrolytes, renal function, LFT. Monitor for evidence of musculoskeletal pain; offer analgesics for pain relief.

**PATIENT/FAMILY TEACHING**

- Report if nausea, asthenia, hot flashes become unmanageable.
- Discuss importance of negative pregnancy test prior to beginning therapy; discuss nonhormonal methods of birth control.
- Ex-

plain possible risk to fetus if pt is or becomes pregnant before or during therapy.

**leucovorin**

loo-koe-vor-in

**Do not confuse leucovorin with Leukeran.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Rescue agent (chemotherapy). **CLINICAL:** Antidote.

**USES**

**Injection:** Treatment of megaloblastic anemias when folate deficient. Palliative treatment of advanced colon cancer (with fluorouracil). IV rescue therapy after high-dose methotrexate for osteosarcoma or orally to diminish toxicity and impaired methotrexate elimination. **OFF-LABEL:** Adjuvant cofactor therapy in methanol toxicity. Prevents pyrimethamine hematologic toxicity in HIV-positive pts.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to leucovorin. Pernicious anemia, other megaloblastic anemias secondary to vitamin B<sub>12</sub> deficiency. **Cautions:** Renal impairment.

**ACTION**

Actively competes with methotrexate for same transport processes into cells, displaces methotrexate from intracellular binding sites, and restores active folate stores necessary for DNA/RNA synthesis. **Therapeutic Effect:** Reverses toxic effects of folic acid antagonists. Reverses folic acid deficiency.

**PHARMACOKINETICS**

Readily absorbed from GI tract. Widely distributed. Metabolized in liver, intestinal mucosa. Primarily excreted in urine. **Half-life:** 15 min; metabolite, 30–35 min.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** May increase risk of seizures by counteracting anticonvulsant effects of **barbiturates, hydantoins**. **Elderly:** Age-related renal impairment may require dosage adjustment when used for rescue from effects of high-dose methotrexate therapy.

**INTERACTIONS**

**DRUG:** May decrease effects of **trimethoprim, anticonvulsants (e.g., phenytoin)**. May increase **5-fluorouracil** toxicity/effects when taken in combination. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease platelets, WBCs (when used in combination with 5-fluorouracil).

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 50 mg, 100 mg, 200 mg, 350 mg, 500 mg. **Injection, Solution:** 10 mg/mL. **Tablets:** 5 mg, 10 mg, 15 mg, 25 mg.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Strict adherence to timing of 5-fluorouracil following leucovorin therapy must be maintained.

**Reconstitution** • Reconstitute each 50-mg vial with 5 mL Sterile Water for Injection or Bacteriostatic Water for Injection containing benzyl alcohol to provide concentration of 10 mg/mL. • Due to benzyl alcohol in 1-mg ampule and in Bacteriostatic Water for Injection, reconstitute doses greater than 10 mg/m<sup>2</sup> with Sterile Water for Injection. • Further dilute with 100–1,000 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Do not exceed 160 mg/min if given by IV infusion (due to calcium content).

**Storage** • Store powdered vials for parenteral use at room temperature. • Refrigerate solution for injection vials.

• Injection appears as clear, yellowish solution. • Use immediately if reconstituted with Sterile Water for Injection; stable for 7 days if reconstituted with Bacteriostatic Water for Injection. Diluted solutions stable for 24 hrs at room temperature or 4 days refrigerated.

**PO**

- Scored tablets may be crushed.

 **IV INCOMPATIBILITIES**

Amphotericin B complex (Abelcet, AmBisome, Amphotec), droperidol (Inapsine), foscarnet (Foscavir).

 **IV COMPATIBILITIES**

CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), DOXOrubicin (Adriamycin), etoposide (VePesid), filgrastim (Neupogen), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), heparin, methotrexate, metoclopramide (Reglan), mitoMYcin (Mutamycin), piperacillin and tazobactam (Zosyn), vinBLAStine (Velban), vinCRIStine (Oncovin).

**INDICATIONS/ROUTES/DOSAGE****Rescue in High-Dose Methotrexate Therapy**

**PO, IV, IM: ADULTS, ELDERLY, CHILDREN:** 15 mg (approximately 10 mg/m<sup>2</sup>) started 24 hrs after starting methotrexate infusion; continue q6h for 10 doses, until methotrexate level is less than 0.05 micromole/L. Additional dose adjusted based on methotrexate levels.

**Folic Acid Antagonist Overdose**

**PO: ADULTS, ELDERLY, CHILDREN:** 5–15 mg/day.

**Megaloblastic Anemia Secondary to Folate Deficiency**

**IM/IV: ADULTS, ELDERLY, CHILDREN:** 1 mg or less per day.

**Colon Cancer**

**◀ALERT▶** For rescue therapy in cancer chemotherapy, refer to specific protocols used for optimal dosage and sequence of leucovorin administration.

**IV: ADULTS, ELDERLY:** (*In Combination With 5-Fluorouracil*): 200 mg/m<sup>2</sup> daily for 5 days. Repeat course at 4-wk intervals for 2 courses, then 4- to 5-wk intervals or 20 mg/m<sup>2</sup> daily for 5 days. Repeat course at 4-wk intervals for 2 courses, then 4- to 5-wk intervals.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** When combined with chemotherapeutic agents: diarrhea, stomatitis, nausea, vomiting, lethargy, malaise, fatigue, alopecia, anorexia. **Occasional:** Urticaria, dermatitis.

### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive dosage may negate chemotherapeutic effects of folic acid antagonists. Anaphylaxis occurs rarely. Diarrhea may cause rapid clinical deterioration.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, LFT, renal function. Give as soon as possible, preferably within 1 hr, for treatment of accidental overdosage of folic acid antagonists.

#### INTERVENTION/EVALUATION

Monitor for vomiting (may need to change from oral to parenteral therapy). Observe elderly, debilitated closely due to risk for severe toxicities. Assess CBC, BMP, LFT.

#### PATIENT/FAMILY TEACHING

- Explain purpose of medication in treatment of cancer.
- Report allergic reaction, vomiting.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Gonadotropin-releasing hormone (GnRH) analogue. **CLINICAL:** Antineoplastic.

### USES

Palliative treatment of advanced prostate carcinoma. Management of endometriosis. Treatment of anemia caused by uterine leiomyomata (fibroids). Treatment of central precocious puberty. **OFF-LABEL:** Treatment of breast cancer, infertility.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to leuprolide, GnRH, GnRH-agonist analogue. Pregnancy or women who may become pregnant, breastfeeding (Lupron Depot 3.75 mg and 11.25 mg), abnormal, undiagnosed vaginal bleeding (Lupron Depot 3.75 mg and 11.25 mg). 22.5 mg, 30 mg, 45 mg Lupron Depot and Eligard (all strengths) not indicated for use in women.

**Cautions:** History of psychiatric illness, QTc prolongation or medications that prolong QTc interval, preexisting cardiac disease, chronic alcohol use, steroid therapy, seizures or medications that decrease seizures threshold.

### ACTION

Inhibits gonadotropin secretion; produces an initial increase in LH and FSH, causing a transient increase in testosterone (males) and estrone/estradiol in premenopausal women. Continuous administration results in decreased levels of testosterone (male) and estrogen (females). **Therapeutic Effect:** Produces pharmacologic castration, decreases growth of abnormal prostate tissue in males; causes endometrial tissue to become inactive, atrophic in females; decreases rate of pubertal development in children with central precocious puberty.

### PHARMACOKINETICS

Rapidly, well absorbed after SQ administration. Absorbed slowly after IM

## leuprolide

loo-proe-lide

(Eligard, Fensolvi, Lupron , Lupron Depot, Lupron Depot-Ped)

administration. Protein binding: 43%–49%. **Half-life:** 3–4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** **Depot:** Contraindicated in pregnancy. May cause spontaneous abortion. **Children:** Long-term safety not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum prostatic acid phosphatase (PAP). Initially increases, then decreases serum testosterone. May increase serum ALT, AST, alkaline phosphatase, glucose, LDH, LDL, cholesterol, triglycerides. May decrease platelets, WBC.

### AVAILABILITY (Rx)

**Injection Depot Formulation:** (*Eligard*): 7.5 mg, 22.5 mg, 30 mg, 45 mg. (*Fensolvi*) (6-month): 45 mg (Ped). (*Lupron Depot-Ped*): 7.5 mg, 11.25 mg (3-month), 11.25 (monthly), 15 mg, 30 mg. (*Lupron Depot*): 3.75 mg, 11.25 mg, 22.5 mg, 30 mg, 45 mg. **Injection Solution:** 5 mg/mL.

### ADMINISTRATION/HANDLING

**⚠️ALERT** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

#### IM

- (*Lupron Depot*): Store at room temperature.
- Protect from light, heat.
- Do not freeze vials.
- Reconstitute only with diluent provided. Follow manufacturer's instructions for mixing.
- Do not use needles less than 22 gauge; use syringes provided by the manufacturer (0.5-mL low-dose insulin syringes may be used as an alternative).
- Administer immediately.

- (*Eligard*): Refrigerate.
- Allow to warm to room temperature before reconstitution.
- Follow manufacturer's instructions for mixing.
- Following reconstitution, administer within 30 min.

#### SQ

- (*Lupron*): Refrigerate vials.
- Injection appears clear, colorless.
- Discard if discolored or precipitate forms.
- Administer into deltoid muscle, anterior thigh, abdomen.

### INDICATIONS/ROUTES/DOSAGE

#### Advanced Prostatic Carcinoma

**IM:** (*Lupron Depot*): **ADULTS, ELDERLY:** 7.5 mg q1mo, 22.5 mg q3mos, 30 mg q4mos, or 45 mg q6mos.

**SQ:** (*Eligard*): **ADULTS, ELDERLY:** 7.5 mg every mo, 22.5 mg q3mos, 30 mg q4mos, or 45 mg q6mos.

**SQ:** (*Lupron*): **ADULTS, ELDERLY:** 1 mg/day.

#### Endometriosis

**IM:** (*Lupron Depot*): **ADULTS, ELDERLY:** 3.75 mg/mo for up to 6 mos or 11.25 mg q3mos for up to 2 doses.

#### Uterine Leiomyomata

**IM:** (*With Iron [Lupron Depot]*): **ADULTS, ELDERLY:** 3.75 mg/mo for up to 3 mos or 11.25 mg as a single injection.

#### Precocious Puberty

**IM:** (*Lupron Depot-Ped*): **CHILDREN WEIGHING MORE THAN 37.5 KG:** 15 mg q1mo. **WEIGHING 25 KG TO 37.5 KG:** 11.25 mg q1mo. **WEIGHING 25 KG OR LESS:** 7.5 mg q1mo. Titrate dose upward by 3.75 mg/mo if down regulation not achieved. **LUPRON DEPOT-PED (3 MOS):** 11.25 mg or 30 mg q12wks.

**SQ:** **CHILDREN:** *Short-acting formulation:* (*Lupron*): Initially, 50 mcg/kg/day. Titrate upward by 10 mcg/kg/day if down regulation is not achieved. *Long-acting formulation:* (*Fensolvi*): 45 mg q6mos.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Hot flashes (ranging from mild flushing to diaphoresis), migraines, hyperhidrosis. **Females:** Amenorrhea, spotting. **Occasional:** Arrhythmias, palpitations, blurred vision, dizziness, edema, headache, burning, pruritus, swelling at injection site, nausea, insomnia, weight gain. **Females:** Deepening voice, hirsutism, decreased libido, increased breast tenderness, vaginitis, altered mood. **Males:** Constipation, decreased testicle size, gynecomastia, impotence, decreased appetite, angina. **Rare:** **Males:** Thrombophlebitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Occasionally, signs/symptoms of prostatic carcinoma worsen 1–2 wks after initial dosing (subsides during continued therapy). Increased bone pain and, less frequently, dysuria, hematuria, weakness, paresthesia of lower extremities may be noted. MI, pulmonary embolism occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pregnancy test in females of reproductive potential. Obtain serum testosterone, prostatic acid phosphates (PAP) periodically during therapy. Question medical history as listed in Precautions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for arrhythmias, palpitations. Assess for peripheral edema. Assess sleep pattern. Monitor for visual difficulties. Assist with ambulation if dizziness occurs. Offer antiemetics if nausea occurs. Serum testosterone, PAP should increase during first wk of therapy. Serum testosterone then should decrease to baseline level or less within 2 wks, PAP within 4 wks.

### PATIENT/FAMILY TEACHING

- Hot flashes tend to decrease during continued therapy.
- Temporary exacerbation of signs/symptoms of disease may occur during first few wks of therapy.

- Use contraceptive measures.
- Report persistent, regular menstruation; pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established (potential for dizziness).

## levalbuterol

lee-val-bue-ter-ole

(Xopenex, Xopenex HFA, Xopenex Concentrate)

**Do not confuse Xopenex with Xanax.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta<sub>2</sub> agonist. **CLINICAL:** Bronchodilator.

## USES

Treatment, prevention of bronchospasm due to reversible obstructive airway disease.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity to albuterol or levalbuterol. **Cautions:** Cardiovascular disorders (cardiac arrhythmias, HF), seizures, hypertension, hyperthyroidism, diabetes, glaucoma, hypokalemia.

## ACTION

Stimulates beta<sub>2</sub>-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	5–10 min	1.5 hrs	5–6 hrs
Nebulization	10–17 min	1.5 hrs	5–8 hrs

**Half-life:** 3.3–4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Pregnancy Category C. Children:** Safety and efficacy not established in pts younger

than 12 yrs. **Elderly:** Lower initial dosages recommended.

## INTERACTIONS

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) antagonize effects; may produce severe bronchospasm. MAOIs (e.g., phenelzine, tranylcypromine), tricyclic antidepressants (e.g., amitriptyline, desipramine) may potentiate cardiovascular effects. Linezolid may enhance the hypertensive effect. May increase adverse effects of loxapine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

## AVAILABILITY (Rx)

**Inhalation Aerosol:** 45 mcg/activation. **Solution for Nebulization:** 0.31 mg in 3-mL vials, 0.63 mg in 3-mL vials, 1.25 mg in 3-mL vials, 1.25 mg in 0.5-mL vials.

## ADMINISTRATION/HANDLING

### Nebulization

- No diluent necessary.
- Protect from light, excessive heat. Store at room temperature.
- Once foil is opened, use within 2 wks.
- Use within 1 wk and protect from light after removal from pouch.
- Discard if solution is not colorless.
- Do not mix with other medications.
- Concentrated solution (1.25 mg in 0.5 mL) should be diluted with 2.5 mL 0.9% NaCl prior to use.
- Give over 5–15 min.

### Inhalation

- Shake well before inhalation.
- Prime before initial use or if not used for more than 3 days.
- Following first inhalation, wait 2 min before inhaling second dose (allows for deeper bronchial penetration).
- Rinsing mouth with water immediately after inhalation prevents mouth/throat dryness.

## INDICATIONS/ROUTES/DOSAGE

### Treatment/Prevention of Bronchospasm

**Nebulization:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 0.63 mg 3 times/day 6–8 hrs apart.

May increase to 1.25 mg 3 times/day with close monitoring. **CHILDREN 5–11 YRS:** Initially, 0.31 mg 3 times/day. **Maximum:** 0.63 mg 3 times/day. **CHILDREN 4 YRS OR YOUNGER:** 0.31–1.25 mg q4–6h as needed.

**Inhalation:** ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 1–2 inhalations q4–6h.

### Acute Asthma Exacerbation

**Nebulization:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 1.25–2.5 mg q20min for 3 doses, then 1.25–5 mg q1–4h as needed. **CHILDREN YOUNGER THAN 12 YRS:** 0.075 mg/kg (minimum dose: 1.25 mg) q20min for 3 doses, then 0.075–0.15 mg/kg (Maximum: 5 mg dose) q1–4h as needed.

**Inhalation:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 4–8 puffs q20min for up to 4 hrs, then q1–4h. **CHILDREN YOUNGER THAN 12 YRS:** 4–8 puffs q20min for 3 doses, then q1–4h.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (11%–4%):** Nervousness, tremor, rhinitis, flu-like illness. **Rare (less than 3%):** Tachycardia, dizziness, anxiety, viral infection, dyspepsia, dry mouth, headache, chest pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Excessive sympathomimetic stimulation may cause palpitations, premature heart contraction, tachycardia, chest pain, slight increase in B/P followed by substantial decrease, chills, diaphoresis, blanching of skin. Too-frequent or excessive use may decrease bronchodilating effectiveness, lead to severe, paradoxical bronchoconstriction.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess lung sounds, pulse, B/P, oxygen saturation. Note color, amount of sputum.

**INTERVENTION/EVALUATION**

Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse, ECG, serum potassium. Assess lung sounds for wheezing (bronchoconstriction). Observe for paradoxical bronchospasm.

**PATIENT/ FAMILY TEACHING**

- Increase fluid intake (decreases lung secretion viscosity).
- Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).
- Report if palpitations, tachycardia, chest pain, tremors, dizziness, headache occurs or shortness of breath is not relieved.

**levETIRAcetam**

lee-ve-tye-ra-se-tam

(Elepsia XR, Keppra, Keppra XR, Roweepra, Spritam)

**Do not confuse Keppra with Kaletra, Keflex, or Keppra XR, or levETIRAcetam with levo-FLOxacin.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Pyrrolidine derivative. **CLINICAL:** Anticonvulsant.

**USES**

Treatment of focal partial-onset seizures in adults, adolescents, children, and infants 1 mo of age and older. Adjunctive therapy in treatment of myoclonic seizures in adults and adolescents 12 yrs of age and older. Adjunctive therapy in treatment of primary generalized tonic-clonic seizures in adults and children 6 yrs of age and older.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to levETIRAcetam. **Cautions:** Renal impairment, pts with depression at high risk for suicide.

**ACTION**

Exact mechanism unknown. May inhibit voltage-dependent calcium channels, facilitate GABA inhibitory transmission, reduce potassium current, or bind to synaptic proteins that modulate neurotransmitter release. **Therapeutic Effect:** Prevents seizure activity.

**PHARMACOKINETICS**

Widely distributed. Protein binding: less than 10%. Metabolized primarily by enzymatic hydrolysis. Primarily excreted in urine as unchanged drug. **Half-life:** 6–8 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in children 4 yrs or younger. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., alcohol, morphine, zolpidem) may increase CNS depression. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, RBC, WBC.

**AVAILABILITY (Rx)**

**Injection, Solution:** 100 mg/mL. **Oral Solution:** 100 mg/mL. **Tablets:** 250 mg, 500 mg, 750 mg, 1,000 mg.

**Tablets, Extended-Release:** 500 mg, 750 mg. **Tablets (ODT):** 250 mg, 500 mg, 750 mg, 1,000 mg.

**ADMINISTRATION/HANDLING**

**Rate of infusion** • Infuse over 15 min.

**Reconstitution** • Dilute with 100 mL 0.9% NaCl or D<sub>5</sub>W.

**Storage** • Store at room temperature. • Stable for 24 hrs following dilution.

**PO**

• Give without regard to food. • **Oral Solution:** Use a calibrated measuring

device. • **Tablet (immediate-release, extended-release):** Administer tablet whole; do not cut, break, or crush. • **Tablet (ODT):** Place whole tablet on tongue and follow with sip of liquid. Swallowing allowed only after tablet has disintegrated. • Use oral solution for pts weighing 20 kg or less. • Use tablets or oral solution for pts weighing more than 20 kg.

## IV COMPATIBILITIES

DiazePAM (Valium), LORazepam (Ativan), valproate (Depacon).

## INDICATIONS/ROUTES/DOSAGE

### Partial-Onset Seizures

**IV/PO: ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER:** (*Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension*): Initially, 500 mg q12h. May increase by 1,000 mg/day q2wks. **Maximum:** 3,000 mg/day in 2 divided doses. (*Extended-Release Tablets*): 1,000 mg once daily. May increase in increments of 1,000 mg/day q2wks. **Maximum:** 3,000 mg once daily.

**IV/PO: CHILDREN 4–16 YRS:** (*Oral Solution, Tablets*): 20 mg/kg/day in 2 divided doses. May increase q2wks by 10 mg/kg/dose up to 60 mg/kg/day in 2 divided doses. **Maximum:** 3,000 mg/day. (*Tablets*): **WEIGHING MORE THAN 40 KG:** 500 mg twice daily. May increase q2wks by 500 mg/dose. **Maximum:** 1,500 mg twice daily. **20–40 KG:** 250 mg twice daily. May increase q2wks by 250 mg/dose. **Maximum:** 750 mg twice daily. **CHILDREN 6 MOS TO YOUNGER THAN 4 YRS:** (*Oral Solution*): 20 mg/kg/day in 2 divided doses. May increase q2wks by 10 mg/kg/dose. **Maximum:** 50 mg/kg/day in 2 divided doses. **CHILDREN 1 MO TO YOUNGER THAN 6 MOS:** (*Oral Solution*): 14 mg/kg/day in 2 divided doses. May increase q2wks by 7 mg/kg/dose. **Maximum:** 42 mg/kg/day in 2 divided doses.

### Myoclonic Seizures

**PO, IV: CHILDREN 16 YRS AND OLDER:** (*Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension*): Initially, 500 mg q12h. May increase by

1,000 mg/day q2wks. **Maximum:** 3,000 mg/day in 2 divided doses. **CHILDREN 6–15 YRS:** Initially, 10 mg/kg twice daily. May increase by 10 mg/kg/dose q2wks up to recommended dose of 30 mg/kg twice daily.

### Tonic-Clonic Seizures

**PO, IV: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** (*Immediate-Release Tablets, Oral Solution, Tablets for Oral Suspension*): Initially, 500 mg twice daily. May increase by 1,000 mg/day q2wks up to recommended dose of 1,500 mg 2 times/day. **CHILDREN 6–15 YRS:** Initially, 10 mg/kg twice daily. May increase by 20 mg/kg/day q2wks up to recommended dose of 30 mg/kg 2 times/day.

### Dosage in Renal Impairment

Dosage is modified based on creatinine clearance. **Note: CrCl less than 50 mL/min:** Not recommended with Keppra XR.

Creatinine Clearance	Dosage (Immediate-Release, IV)	Dosage (Extended-Release)
Greater than 80 mL/min:	500–1,500 mg q12h	1,000–3,000 mg q24h
50–80 mL/min:	500–1,000 mg q12h	1,000–2,000 mg q24h
30–49 mL/min:	250–750 mg q12h	500–1,500 mg q24h
Less than 30 mL/min:	250–500 mg q12h	500–1,000 mg q24h
End-stage renal disease using dialysis:	500–1,000 mg q24h; after dialysis, a 250–to 500-mg supplemental dose is recommended	NA
CRRT	250–750 mg q12h	

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (15%–10%):** Drowsiness, asthenia, headache, infection. **Occasional (9%–3%):** Dizziness, pharyngitis, pain, depression, anxiety, vertigo, rhinitis, anorexia. **Rare (less than 3%):** Amnesia, emotional lability, cough, sinusitis, anorexia, diplopia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Acute psychosis, agitation, delirium, impulsivity have been reported. Sudden discontinuance increases risk of seizure activity. Serious dermatological reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, have been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test. Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. Question prior hypersensitivity reaction.

### INTERVENTION/EVALUATION

Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Monitor renal function tests. Observe for suicidal ideation, depression, behavioral changes. Assist with ambulation if dizziness occurs.

### PATIENT/ FAMILY TEACHING

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Do not abruptly discontinue medication (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Report mood swings, hostile behavior, suicidal ideation, unusual changes in behavior.

transplant, pts older than 60 yrs.)  
May exacerbate myasthenia gravis.

**Do not confuse Levaquin with Levoxyl, Levsin/SL, or Lovenox, or levoFLOXacin with levETI-Acetam or levothyroxine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fluoroquinolone. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to *S. pneumoniae*, *S. aureus*, *E. faecalis*, *H. influenzae*, *M. catarrhalis*, *Serratia marcescens*, *K. pneumoniae*, *E. coli*, *P. mirabilis*, *P. aeruginosa*, *C. pneumoniae*, *Legionella pneumophila*, *Mycoplasma pneumoniae*, including acute bacterial exacerbation of chronic bronchitis, acute bacterial sinusitis, community-acquired pneumonia, nosocomial pneumonia, complicated and uncomplicated UTI, acute pyelonephritis, complicated and uncomplicated mild to moderate skin/skin structure infections, prostatitis. Inhalation anthrax (postexposure); plague. **Ophthalmic:** Treatment of superficial infections to conjunctiva (0.5%), cornea (1.5%). **OFF-LABEL:** Urethritis, traveler's diarrhea, diverticulitis, enterocolitis, Legionnaire's disease, peritonitis. Treatment of prosthetic joint infection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to levoFLOXacin, other fluoroquinolones. **Cautions:** Known or suspected CNS disorders, seizure disorder, renal impairment, bradycardia, rheumatoid arthritis, elderly, myasthenia gravis, severe cerebral arteriosclerosis, pts at risk for QT interval prolongation (congenital long QT syndrome, HF, medications that prolong QT interval, hypokalemia, hypomagnesemia), diabetes, pts at risk for tendon rupture, tendonitis (e.g., renal failure, concomitant use of corticosteroids, organ transplant recipient, rheumatoid arthritis, elderly, strenuous physical activity or exercise).

## levoFLOXacin

TOP  
100

lee-voe-flox-a-sin

(Iquix, Levaquin, Quixin)

■ **BLACK BOX ALERT** ■ May increase risk of tendonitis, tendon rupture. (Risk increased with concurrent corticosteroids, organ

**ACTION**

Inhibits DNA enzyme gyrase in susceptible microorganisms, interfering with bacterial cell replication, repair. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Well absorbed after PO, IV administration. Protein binding: 50%. Widely distributed. Excreted unchanged in urine. Partially removed by hemodialysis. **Half-life:** 6–8 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Distributed in breast milk. Avoid use in pregnancy. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** May decrease therapeutic effect of BCG (intravesical). **Antacids (calcium, magnesium, iron preparations); sucralfate, zinc** decrease absorption. **NSAIDs (e.g., ibuprofen, ketorolac, naproxen)** may increase risk of CNS stimulation, seizures. **Medications that prolong QT interval (e.g., amiodarone, haloperidol, sotalol)** may increase risk of arrhythmias. May increase anticoagulant effect of **warfarin**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum glucose.

**AVAILABILITY (Rx)**

**Infusion Premix:** 250 mg/50 mL, 500 mg/100 mL, 750 mg/150 mL. **Injection, Solution:** 25 mg/mL. **Ophthalmic Solution:** 0.5%. **Oral Solution:** 25 mg/mL. **Tablets:** 250 mg, 500 mg, 750 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • For infusion using single-dose vial, withdraw desired amount (10 mL for 250 mg, 20 mL for 500 mg). Dilute each 10 mL (250 mg) with minimum 40 mL 0.9% NaCl, D<sub>5</sub>W, providing a concentration of 5 mg/mL.

**Rate of administration** • Administer no less than 60 min for 250 mg or 500 mg; 90 min for 750 mg.

**Storage** • Available in single-dose 20-mL (500-mg) vials and premixed with D<sub>5</sub>W, ready to infuse. • Diluted vials stable for 72 hrs at room temperature, 14 days if refrigerated.

**PO**

• Do not administer antacids (aluminum, magnesium), sucralfate, iron, or multivitamin preparations with zinc within 2 hrs of administration (significantly reduces absorption). • Give tablets without regard to food. • Give oral solution 1 hr before or 2 hrs after meals.

**Ophthalmic**

• Place a gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid. • Place prescribed number of drops into pocket. • Instruct pt to close eye gently (so that medication will not be squeezed out of the sac) and to apply digital pressure to lacrimal sac for 1–2 min to minimize systemic absorption.

 **IV INCOMPATIBILITIES**

Furosemide (Lasix), heparin, insulin, nitroglycerin, propofol (Diprivan).

 **IV COMPATIBILITIES**

Dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), lidocaine, lorazepam (Ativan), magnesium, morphine.

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage Range**

**PO, IV; ADULTS, ELDERLY:** 250–750 mg q24h; 750 mg q24h for severe or complicated infections.

**Bacterial Conjunctivitis**

**Ophthalmic; ADULTS, ELDERLY, CHILDREN 1 YR AND OLDER:** 1–2 drops q2h for 2 days while awake (up to 8 times/day), then 1–2 drops q4h while awake up to 4 times/day.

**Dosage in Renal Impairment**

Normal renal function dosage of 250 mg/day:

**Creatinine**

Clearance	Dosage
20–49 mL/min	No change
10–19 mL/min	250 mg initially, then 250 mg q48h

Normal renal function dosage of 500 mg/day:

**Creatinine**

Clearance	Dosage
50–80 mL/min	No change
20–49 mL/min	500 mg initially, then 250 mg q24h
10–19 mL/min	500 mg initially, then 250 mg q48h

For pts undergoing dialysis, 500 mg initially, then 250 mg q48h.

Normal renal function dosage of 750 mg/day:

**Creatinine**

Clearance	Dosage
50–80 mL/min	No change
20–49 mL/min	Initially, 750 mg, then 750 mg q48h
10–19 mL/min	Initially, 750 mg, then 500 mg q48h
Dialysis	500 mg q48h (administer after dialysis on dialysis days)
Continuous renal replacement therapy	
CVVH	500–750 mg once, then 250 mg q24h
CVVHD	500–750 mg once, then 250–500 mg q24h
CVVHDT	500–750 mg once, then 250–750 mg q24h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (3%–1%):** Diarrhea, nausea, abdominal pain, dizziness, drowsiness, headache. **Ophthalmic:** Local burning/discomfort, margin crusting, crystals/scales, foreign body sensation, ocular itching, altered taste. **Rare (less**

**than 1%):** Flatulence; pain, inflammation, swelling in calves, hands, shoulder; chest pain, difficulty breathing, palpitations, edema, tendon pain. **Ophthalmic:** Corneal staining, keratitis, allergic reaction, eyelid swelling, tearing, reduced visual acuity.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may occur. Superinfection (genital/anal pruritus, ulceration/changes in oral mucosa, moderate to severe diarrhea) may occur from altered bacterial balance in GI tract. Hypersensitivity reactions, including photosensitivity (rash, pruritus, blisters, edema, sensation of burning skin), have occurred in pts receiving fluoroquinolones. May increase risk of tendonitis, tendon rupture, peripheral neuropathy; CNS effects including agitation, anxiety, confusion, depression, dizziness, hallucinations, nightmares, paranoia, tremors, vertigo. May exacerbate muscle weakness in pts with myasthenia gravis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for hypersensitivity to levoFLOXacin, other fluoroquinolones. Question history as listed in Precautions. Receive full medication history, and screen for interactions, esp. medications that prolong QT interval. Obtain baseline ECG.

**INTERVENTION/EVALUATION**

Monitor serum glucose, renal function, LFT. Monitor daily pattern of bowel activity, stool consistency. Promptly report hypersensitivity reaction: skin rash, urticaria, pruritus, photosensitivity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor for muscle weakness, voice dystonia in pts with myasthenia gravis; pain, swelling, bruising, popping of tendons.

**PATIENT/FAMILY TEACHING**

• It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increase risk of recurrent infection. • Report any episodes of diarrhea, esp. the first few mos after final dose. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea, which may be contagious to others. • Severe allergic reactions, such as hives, palpitations, rash, shortness of breath, tongue swelling, may occur. • Tendon inflammation/swelling, tendon rupture may occur; report bruising, pain, swelling in tendon areas or snapping, popping of tendons. • Immediately report nervous system problems such as anxiety, confusion, dizziness, nervousness, nightmares, thoughts of suicide, seizures, tremors, trouble sleeping. • Treatment may cause heart problems such as low heart rate, palpitations; permanent nerve damage such as burning, numbness, tingling, weakness. • Do not take aluminum- or magnesium-containing antacids, multivitamins, zinc or iron products at least 2 hrs before or 6 hrs after dose. • Drink plenty of fluids.

**levothyroxine**TOP  
100

lee-voe-thy-rox-een

(Eltroxin , Euthyrox, Levoxyl, Synthroid, Tirosint, Unithroid)

**BLACK BOX ALERT** Ineffective, potentially toxic for weight reduction. High doses increase risk of serious, life-threatening toxic effects, especially when used with some anorectic drugs.

**Do not confuse levothyroxine with lamoTRigine, Lanoxin, levoFLOxacIn or liothyronine, or Levoxyl with Lanoxin, Lev-aquin, or Luvox, or Synthroid with Symmetrel.**

**FIXED-COMBINATION(S)**With liothyronine, T<sub>3</sub> (Thyrolar).**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Synthetic isomer of thyroxine. **CLINICAL:** Thyroid hormone (T<sub>4</sub>).

**USES**

**PO:** Treatment of hypothyroidism, pituitary thyroid-stimulating hormone (TSH) suppression. **IV:** Myxedema coma. **OFF-LABEL:** Management of hemodynamically unstable potential organ donors.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to levothyroxine. Acute MI, untreated subclinical or overt thyrotoxicosis, uncorrected adrenal insufficiency. **Capusle:** Inability to swallow capsules. **Cautions:** Elderly pts, angina pectoris, hypertension, cardiovascular disease, adrenal insufficiency, myxedema, diabetes mellitus and insipidus, swallowing disorders.

**ACTION**

Converts to T<sub>3</sub>, then binds to thyroid receptor proteins exerting metabolic effects through control of DNA transcription and protein synthesis. **Therapeutic Effect:** Involved in normal metabolism, growth and development. Increases basal metabolic rate, enhances gluconeogenesis, stimulates protein synthesis.

**PHARMACOKINETICS**

Variable, incomplete absorption from GI tract. Protein binding: greater than 99%. Widely distributed. Deiodinated in peripheral tissues, minimal metabolism in liver. Eliminated by biliary excretion. **Half-life:** 6–7 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Does not cross placenta. Minimal distribution in breast milk. **Children:** No age-related precautions noted. Caution in neonates in interpreting thyroid function tests. **Elderly:** May be more sensitive to thyroid effects; individualized dosage recommended.

**INTERACTIONS**

**DRUG:** Cholestyramine, colestipol, aluminum- and magnesium-containing antacids, calcium, iron may decrease absorption (do not administer within 4 hrs). **Estrogens** may decrease therapeutic effect. May enhance effects of **oral anticoagulants (e.g., warfarin)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

**AVAILABILITY (Rx)**

**Capsules (Tirosint):** 13 mcg, 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg. **Injection, Powder for Reconstitution:** 100 mcg, 200 mcg, 500 mcg. **Solution, Oral (Tirosint):** 13 mcg/mL, 25 mcg/mL, 50 mcg/mL, 75 mcg/mL, 88 mcg/mL 100 mcg/mL, 112 mcg/mL, 125 mcg/mL, 137 mcg/mL, 150 mcg/mL, 175 mcg/mL, 200 mcg/mL. **Tablets:** 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg.

**ADMINISTRATION/HANDLING**

**⚠️ ALERT** Do not interchange brands (known issues with bioequivalence between manufacturers).

**Reconstitution** • Reconstitute 200-mcg or 500-mcg vial with 5 mL 0.9% NaCl to provide concentration of 40 or 100 mcg/mL, respectively; shake until clear. **Rate of administration** • Use immediately; discard unused portions. • Give each 100 mcg or less over 1 min. **Storage** • Store vials at room temperature.

**PO**

• Administer in the morning on an empty stomach, 30 min before food. • Administer before breakfast to prevent insomnia. • Tablets may be crushed. • Take 4 hrs apart from antacids, iron, calcium supplements.

**IV INCOMPATIBILITIES**

Do not use or mix with other IV solutions.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Doses based on clinical response and laboratory parameters. IV dose is 75–80% of oral dose once daily.

**Hypothyroidism**

**Note:** Adjust dose q3–6wks based on clinical response and serum TSH and/or free T4 concentrations.

**PO: ADULTS 60 YRS OR YOUNGER WITHOUT EVIDENCE OF CORONARY HEART DISEASE:** 1.6 mcg/kg/day as single daily dose. **ADULTS OLDER THAN 60 YRS WITHOUT EVIDENCE OF CORONARY HEART DISEASE:** Initially, 25–50 mcg once daily. **ADULTS WITH CARDIAC DISEASE:** Initially, 12.5–50 mcg/day. Adjust dose by 12.5–25 mcg/day at 6–8-wk intervals. **CHILDREN OLDER THAN 12 YRS, GROWTH AND PUBERTY INCOMPLETE:** 2–3 mcg/kg/day. **CHILDREN 6–12 YRS:** 4–5 mcg/kg/day. **CHILDREN 1–5 YRS:** 5–6 mcg/kg/day. **CHILDREN 6–12 MOS:** 6–8 mcg/kg/day. **CHILDREN 3–5 MOS:** 8–10 mcg/kg/day. **CHILDREN YOUNGER THAN 3 MOS:** 10–15 mcg/kg/day.

**Myxedema Coma**

**IV: ADULTS, ELDERLY:** Initially, 200–400 mcg, then 50–100 mcg once daily until able to tolerate PO administration.

**Pituitary Thyroid-Stimulating Hormone (TSH) Suppression**

**PO: ADULTS, ELDERLY:** Initially, 1.6–2 mcg/kg/day immediately after surgery. Adjust dose after 6 wks based on TSH suppression goals.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional:** Reversible hair loss at start of therapy in children. **Rare:** Dry skin, GI intolerance, rash, urticaria, pseudotumor cerebri, severe headache in children.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Excessive dosage produces signs/symptoms of hyperthyroidism (weight loss, palpitations, increased appetite, tremors, anxiety,

tachycardia, hypertension, headache, insomnia, menstrual irregularities). Cardiac arrhythmias occur rarely. Long-term therapy may decrease bone mineral density.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain TSH, T<sub>3</sub>, T<sub>4</sub>, weight, vital signs. Signs/symptoms of diabetes, diabetes insipidus, adrenal insufficiency, hypopituitarism. Treat with adrenocortical steroids before thyroid therapy in coexisting hypothyroidism and hypoadrenalism.

### INTERVENTION/EVALUATION

Monitor pulse for rate, rhythm (report pulse greater than 100 or marked increase). Observe for tremors, anxiety. Assess appetite, sleep pattern. **Children:** **(Undertreatment):** May decrease intellectual development, linear growth. **(Overtreatment):** Adversely affects brain maturation, accelerates bone age. Monitor thyroid function tests.

### PATIENT/ FAMILY TEACHING

- Do not discontinue therapy; replacement for hypothyroidism is lifelong.
- Follow-up office visits, thyroid function tests are essential.
- Take medication at the same time each day, preferably in the morning.
- Monitor pulse for rate, rhythm; report irregular rhythm or pulse rate over 100 beats/min.
- Promptly report chest pain, weight loss, anxiety, tremors, insomnia.
- Children may have reversible hair loss, increased aggressiveness during first few mos of therapy.
- Full therapeutic effect may take 1–3 wks.

## linaclotide

lin-a-kloe-tide  
(Constella , Linzess)

**BLACK BOX ALERT** Contraindicated in pediatric pts 6 yrs of age and younger. Avoid use in pediatric patients 7 yrs through 17 yrs old.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Guanylate cyclase-C (cGMP) agonist.  
**CLINICAL:** GI agent.

## USES

Treatment of irritable bowel syndrome with constipation (IBS-C), chronic idiopathic constipation (CIC) in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to linaclotide. Pediatric pts 6 yrs and younger, known or suspected mechanical GI obstruction. **Cautions:** Diarrhea.

## ACTION

Binds and agonizes guanylate cyclase-C on the luminal surface of intestinal epithelium. Increases cGMP, which stimulates chloride and bicarbonate into intestinal lumen. **Therapeutic Effect:** Increases intestinal fluid, accelerates transit.

## PHARMACOKINETICS

Metabolized within GI tract. Minimal distribution beyond GI tissue. Minimal systemic absorption. **Half-life:** N/A.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Avoid use in pediatric pts 7–17 yrs. Contraindicated in pediatric pts 6 yrs and younger. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

 **Capsules:** 72 mcg, 145 mcg, 290 mcg.

## ADMINISTRATION/HANDLING

### PO

- Give on empty stomach at least 30 min prior to first meal of day.
- Do not break or crush.
- For pts with swallowing difficulty, capsule may be opened and sprinkled on applesauce or into 30 mL bottled water.

**INDICATIONS/ROUTES/DOSAGE****Irritable Bowel Syndrome With Constipation**

**PO: ADULTS 18 YRS AND OLDER, ELDERLY:** 290 mcg once daily.

**Chronic Idiopathic Constipation**

**PO: ADULTS 18 YRS AND OLDER, ELDERLY:** 72–145 mcg once daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (16%):** Diarrhea (may begin within first 2 wks of initiation of treatment). **Occasional (7%–2%):** Abdominal pain, flatulence, headache, abdominal distention. **Rare (1% and Less):** Gastroesophageal reflux, vomiting.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe diarrhea reported in 2% of pts. Viral gastroenteritis reported in 3% of pts. Fecal incontinence, dehydration reported in 1% of pts. Dose reduced or suspended secondary to diarrhea, other GI adverse reaction.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Assess for abdominal disturbances.

**INTERVENTION/EVALUATION**

For pts with irritable bowel syndrome, assess for improvement in symptoms (relief from bloating, cramping, urgency, abdominal discomfort). Monitor daily bowel activity, stool consistency. Monitor serum electrolytes in pts with prolonged, frequent, or excessive use of medication.

**PATIENT/FAMILY TEACHING**

- Institute measures to promote defecation: increase fluid intake, exercise, high-fiber diet.
- Report new/worsening episodes of abdominal pain, severe diarrhea.
- Do not break, crush, or open capsule. Take whole.

**linagliptin**

lin-a-glip-tin  
(Tradjenta)

**Do not confuse linagliptin with SAXagliptin or SITagliptin.**

**FIXED-COMBINATION(S)**

**Glyxambi:** linagliptin/empagliflozin (an antidiabetic): 5 mg/10 mg, 5 mg/25 mg. **Jentadueto:** linagliptin/metFORMIN (an antidiabetic): 2.5 mg/500 mg; 2.5 mg/850 mg; 2.5 mg/1,000 mg. **Jentadueto XR:** linagliptin/metFORMIN (extended-release): 2.5 mg/1,000 mg; 5 mg/1,000 mg. **Trijardy XR:** empagliflozin (an antidiabetic)/linagliptin (an antidiabetic)/metformin (an antidiabetic): 10 mg/5 mg/1,000 mg; 25 mg/5 mg/1,000 mg; 5mg/2.5 mg/1,000 mg; 12.5 mg/2.5 mg/1,000 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Dipeptidyl peptidase-4 (DDP-4) inhibitor (glip-tin). **CLINICAL:** Antidiabetic agent.

**USES**

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes alone or in combination with other antidiabetic agents.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to linagliptin, other DD4 inhibitors. **Cautions:** Concurrent use of other hypoglycemics. Not recommended for use in type 1 diabetes, diabetic ketoacidosis, history of pancreatitis, HF.

**ACTION**

Prolongs active incretin levels by inhibiting DDP-4 enzyme. **Therapeutic Effect:** Incretin hormones increase insulin synthesis/release from pancreatic beta cells and decrease glucagon secretion from pancreatic alpha cells. Lowers serum glucose levels.

**PHARMACOKINETICS**

Widely distributed. Peak plasma concentration: 1.5 hrs. Extensive tissue

distribution. Protein binding: 70%–99%. Minimal metabolism (90% excreted as unchanged metabolite). Excreted primarily in enterohepatic system (80%), urine (5%). **Half-life:** 12 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Antidiabetic agents (e.g., insulin, metformin, saxagliptin, sitagliptin, sulfonylureas) may increase risk of hypoglycemia. **HERBAL:** Ginseng, ginger, other herbs with hypoglycemic activity may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** Decreases serum glucose. May increase serum uric acid.

### AVAILABILITY (Rx)

**Tablets:** 5 mg.

### ADMINISTRATION/HANDLING

#### PO

- May give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Dose reduction of insulin and/or insulin secretagogues may be needed.

#### Type 2 Diabetes Mellitus

**PO: ADULTS, ELDERLY:** 5 mg once daily.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (5%):** Nasopharyngitis. **Rare (less than 2%):** Cough, headache.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypoglycemia reported in 7% of pts. Concomitant use of hypoglycemic medication may increase hypoglycemic risk.

Pancreatitis, hypersensitivity reactions (angioedema, rash, urticaria, pruritus, bronchospasm) occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain blood glucose, hemoglobin A1c level. Assess pt's understanding of diabetes management, routine glucose monitoring. Receive full medication history including herbal products.

### INTERVENTION/EVALUATION

Monitor blood glucose, hemoglobin A1c level. Assess for hypoglycemia (diaphoresis, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia, difficulty concentrating), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, fatigue, Kussmaul breathing). Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Dietary consult for nutritional education.

### PATIENT/FAMILY TEACHING

- Diabetes requires lifelong control.
- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood glucose regularly.
- When taking combination drug therapy or when glucose demands are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have hypoglycemic treatment available (glucagon, oral dextrose).
- Monitor daily calorie intake.

## linezolid

lin-ez-oh-lid  
(Apo-Linezolid , Zyvox, Zyvoxam )

**Do not confuse Zyvox with Zosyn or Zovirax.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Oxazolidinone. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to aerobic and facultative, gram-positive microorganisms, including *E. faecium* (vancomycin-resistant strains only), *S. aureus* (including methicillin-resistant strains), *S. agalactiae*, *S. pneumoniae* (including multidrug-resistant strains), *S. pyogenes*. Treatment of pneumonia (community-acquired and hospital-acquired), skin, soft tissue infections (including diabetic foot infections), bacteremia caused by susceptible vancomycin-resistant (VRE) organisms. **OFF-LABEL:** Treatment of prosthetic joint infection. Septic arthritis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to linezolid. Concurrent use or within 2 wks of MAOIs. **Cautions:** History of seizures, preexisting myelosuppression, medications that may cause bone marrow depression, uncontrolled hypertension, pheochromocytoma, carcinoid syndrome, untreated hyperthyroidism, diabetes, chronic infection; concurrent use of SSRIs, SNRIs, tricyclic antidepressants, triptans, buPROPion.

## ACTION

Inhibits bacterial protein synthesis by binding to bacterial ribosomal RNA sites, preventing formation of a functional initiation complex that is essential for bacterial translation. **Therapeutic Effect:** Bacteriostatic against enterococci, staphylococci; bactericidal against streptococci.

## PHARMACOKINETICS

Rapidly, extensively absorbed after PO administration. Protein binding: 31%. Metabolized in liver by oxidation. Excreted in urine. **Half-life:** 4–5.4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Adrenergic medications (sympathomimetics) may increase effects. **SSRIs** (e.g., escitalopram, PARoxetine, sertraline), **SNRIs** (e.g., DULoxetine, venlafaxine) may increase risk of serotonin syndrome. **Alcohol, carBAMazepine, maprotiline, tapentadol** may increase adverse effects. **HERBAL:** Supplements containing **caffeine, tyrosine, or tryptophan** may precipitate hypertensive crisis. **FOOD:** Excessive amounts of **tyramine-containing foods, beverages** may cause significant hypertension. **LAB VALUES:** May decrease Hgb, neutrophils, platelets, WBC. May increase serum ALT, AST, alkaline phosphatase, amylase, bilirubin, BUN, creatinine, LDH, lipase.

## AVAILABILITY (Rx)

**Injection Premix:** 2 mg/mL in 100-mL, 300-mL bags. **Powder for Oral Suspension:** 100 mg/5 mL. **Tablets:** 600 mg.

## ADMINISTRATION/HANDLING

**Rate of administration** • Infuse over 30–120 min. • Should be administered without further dilution.

**Storage** • Store at room temperature. • Protect from light. • Yellow color does not affect potency.

### PO

• Give without regard to food. • Use suspension within 21 days after reconstitution. Gently invert 3–5 times before administration. • Do not shake.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), co-trimoxazole (Bactrim), diazepam (Valium), erythromycin (Erythrocin), pentamidine (Pentam IV), phenytoin (Dilantin).

## IV COMPATIBILITIES

Calcium gluconate, dexmedetomidine (Precedex), heparin, magnesium, potassium chloride.

**INDICATIONS/ROUTES/DOSAGE****Vancomycin-Resistant Infections (VRE)**

**PO, IV; ADULTS, ELDERLY, CHILDREN OLDER THAN 11 YRS:** 600 mg q12h. **CHILDREN 11 YRS AND YOUNGER:** 10 mg/kg q8–12h. **Maximum:** 600 mg/dose.

**Pneumonia, Complicated Skin/Skin Structure Infections**

**PO, IV; ADULTS, ELDERLY, CHILDREN OLDER THAN 11 YRS:** 600 mg q12h. **CHILDREN 11 YRS AND YOUNGER:** 10 mg/kg q8h. **Maximum:** 600 mg/dose.

**Uncomplicated Skin/Skin Structure Infections**

**PO; ADULTS, ELDERLY:** 600 mg q12h. **CHILDREN OLDER THAN 11 YRS:** 600 mg q12h. **CHILDREN 5–11 YRS:** 10 mg/kg/dose q12h. **Maximum:** 600 mg/dose. **CHILDREN YOUNGER THAN 5 YRS:** 10 mg/kg q8h. **Maximum:** 600 mg/dose.

**Usual Neonate Dosage**

**PO, IV; NEONATES:** 10 mg/kg/dose q8–12h.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment. Administer after HD on dialysis days.

**SIDE EFFECTS**

**Occasional (9%–2%):** Diarrhea, nausea, vomiting, insomnia, constipation, rash, dizziness, fever, headache. **Rare (less than 2%):** Altered taste, vaginal candidiasis, fungal infection, tongue discoloration.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Thrombocytopenia, myelosuppression occur rarely. Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain appropriate culture specimens for sensitivity testing prior to therapy. Obtain baseline CBC, chemistries. Ques-

tion medical history as listed in Precautions. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor CBC, platelets, Hgb, chemistries.

**PATIENT/ FAMILY TEACHING**

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- May cause GI upset (may take with food, milk).
- Excessive amounts of tyramine-containing foods (red wine, aged cheese) may cause severe reaction (severe headache, neck stiffness, diaphoresis, palpitations).
- Avoid alcohol.
- Report persistent diarrhea, nausea, vomiting.

**liraglutide**TOP  
100**leer-a-gloo-tide**

(Saxenda, Victoza)

**BLACK BOX ALERT** Causes dose-dependent and treatment duration-dependent thyroid C-cell tumors, including medullary thyroid cancer.

**FIXED-COMBINATION(S)**

**Xultophy:** liraglutide 3.6 mg/mL and insulin degludec 100 units/mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antihyperglycemic (glucagon-like peptide-1 [GLP-1]) receptor agonist. **CLINICAL:** Antidiabetic agent.

**USES**

**Saxenda:** Adjunct to diet and increased physical activity for chronic weight management in adults with body mass index (BMI) of 30 kg/m<sup>2</sup> or greater, or 27

kg/m<sup>2</sup> or greater, with at least one comorbid condition (e.g., hypertension, diabetes, dyslipidemia) and pts 12 yrs of age and older with a body weight above 60 kg and an initial BMI corresponding to 30 kg/m<sup>2</sup> for adults (obese) by international cutoffs. **Victoza:** Adjunct to diet and exercise to improve glycemic control in adults and children 10 yrs of age and older with type 2 diabetes. Reduce risk of major cardiovascular events (e.g., MI, stroke) in adults with type 2 diabetes and established cardiovascular (CV) disease.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to liraglutide. Personal or family history of medullary thyroid carcinoma (MTC), pts with multiple endocrine neoplasia syndrome type 2 (MEN2). **Saxenda (additional):** Pregnancy. **Cautions:** History of pancreatitis, cholelithiasis, alcohol abuse, renal/hepatic impairment. History of angioedema to other GLP-1 receptor agonists. Do not use in type 1 diabetes or diabetic ketoacidosis. Medications requiring a narrow therapeutic index or requiring rapid GI absorption.

## ACTION

Stimulates release of insulin from pancreatic beta cells, mimics enhancement of glucose-dependent insulin secretion, decreases inappropriate glucagon secretion, slows gastric emptying, decreases food intake. **Therapeutic Effect:** Improves glycemic control by increasing postmeal insulin secretion, emptying, increasing satiety.

## PHARMACOKINETICS

Maximum concentration achieved in 8–12 hrs. Protein binding: 98%. Metabolized to large proteins without a specific organ as major route of elimination. **Half-life:** 13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase hypoglycemic effect of **insulin, sulfonylureas**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Decreases glucose serum levels (when used in combination with insulin secretagogues [e.g., sulfonylureas]).

## AVAILABILITY (Rx)

**SQ, Solution (Prefilled Pen): (Victoza):** 18 mg/3 mL. **(Saxenda):** 18 mg/3 mL. Delivers doses of 0.6 mg, 1.2 mg, 1.8 mg, 2.4 mg, or 3 mg.

## ADMINISTRATION/HANDLING

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.
- Storage**
- Refrigerate prefilled pens.
- Discard if freezing occurs.
- Discard pen 30 days after initial use.

## INDICATIONS/ROUTES/DOSAGE

### Diabetes (Victoza) With or Without CV Disease

**SQ: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER:** **Initial dose:** 0.6 mg once daily for at least 1 wk. (**Note:** This dose is intended to reduce GI symptoms during initial titration; it is not effective for glycemic control.) After 1 wk, increase dose to 1.2 mg. If 1.2-mg dose does not result in acceptable glycemic control, dose can be increased to 1.8 mg.

### Weight Management (Saxenda)

**SQ: ADULTS, ELDERLY:** Initially, 0.6 mg once daily for 1 week. Increase wkly by 0.6 mg/day to a target dose of 3 mg once daily. **Note:** Evaluate change in body weight after 12 wks at maximum tolerated dose or 16 wks after initiation. Discontinue if less than 4%–5% of baseline weight not achieved. **CHILDREN 12 YRS AND OLDER:** Initially, 0.6 mg once daily for 1 wk. Increase by 0.6 mg/day in increments at wkly intervals to 3 mg once daily. If the 3-mg target daily dose is

not tolerated, reduce dose to 2.4 mg daily. Discontinue if 2.4-mg dose is not tolerated. Discontinue therapy if BMI has not reduced at least 1% from baseline after 12 wks on maintenance dose.

#### Dosage in Renal/Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Frequent (greater than 13%):** Headache, nausea, diarrhea, liraglutide antibody resistance. **Occasional (13%–6%):** Diarrhea, vomiting, dizziness, nervousness, dyspepsia. **Rare (less than 6%):** Weakness, decreased appetite.

### ADVERSE EFFECTS/TOXIC REACTIONS

Serious hypoglycemia may occur when used concurrently with insulin analogue (e.g., sulfonylurea); consider lowering dose.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain blood glucose, hemoglobin A1c level. Discuss pt's lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt/family does not thoroughly understand diabetes management or glucose testing technique. Dose is gradually increased to improve GI tolerance.

#### INTERVENTION/EVALUATION

Monitor blood glucose level, food intake. Assess for hypoglycemia (cool wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia) or hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity/stress, surgical procedures). Consider lowering dose of insulin analogue to reduce risk of hypoglycemia.

#### PATIENT/FAMILY TEACHING

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate

correct preparation and injection techniques before using medication at home. • Diabetes requires lifelong control. • Prescribed diet, exercise are principal parts of treatment; do not skip/delay meals. • Continue following dietary instructions, regular exercise program, regular testing of blood glucose level. • Serious hypoglycemia may occur when used concurrently with insulin analogue (e.g., sulfonylurea). • Have source of glucose available to treat symptoms of low blood sugar.

TOP  
100

## lisdexamfetamine

lis-dex-am-fet-a-meen  
(Vyvanse)

**BLACK BOX ALERT** Potential for drug abuse dependency exists. Assess for abuse potential and monitor for abuse potential/dependence.

**Do not confuse lisdexamfetamine with dextroamphetamine, or Vyvanse with Glucovance, Vivactil, or Vytarin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Amphetamine (Schedule II). **CLINICAL:** CNS stimulant.

### USES

Treatment of attention-deficit/hyperactivity disorder (ADHD), moderate to severe binge eating disorder (BED).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lisdexamfetamine, amphetamine products. Concurrent use or within 2 wks of use of MAOI. **Cautions:** Hyperthyroidism, glaucoma, agitated states, cardiovascular conditions (hypertension, recent MI, ventricular arrhythmias), elderly, psychiatric/seizures, preexisting psychosis or bipolar disorder, Tourette syndrome. Avoid use

in pts with serious structural cardiac abnormalities, cardiomyopathy, arrhythmias, CAD; history of drug abuse and misuse, drug-seeking behavior, dependency.

## ACTION

Exact mechanism unknown. Enhances action of DOPamine, norepinephrine by blocking reuptake from synapses, increasing levels in extraneuronal space. **Therapeutic Effect:** Improves attention span in ADHD. Reduces severity of BED.

## PHARMACOKINETICS

Rapidly absorbed. Converted to dextro-amphetamine. Excreted in urine. **Half-life:** Less than 1 hr.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has potential for fetal harm. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may increase hypertensive effect. May decrease sedative effect of antihistamines (e.g., diphenhydramine). May decrease hypotensive effects of antihypertensives (e.g., amlodipine, lisinopril, valsartan). Urinary acidifying agents (e.g., ammonium chloride) may decrease therapeutic effect. May decrease concentration/ effect of phenobarbital, phenytoin. Tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase stimulatory effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase plasma corticosteroid.

## AVAILABILITY (Rx)

**Capsules:** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg. **Tablets, Chewable:** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg.

## ADMINISTRATION/HANDLING

### PO

• May be given in the morning without regard to food. • Administer capsule

whole; pt must not chew. • Capsules may be opened and dissolved in water and taken immediately. • **Chewable tablets:** Tablets must be chewed thoroughly before swallowing.

## INDICATIONS/ROUTES/DOSAGE

### ADHD

**Note:** Assess for cardiac disease and risk of abuse before initiating.

**PO: ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 30 mg once daily in the morning. May increase dosage in increments of 10 or 20 mg/day at wkly intervals until optimal response obtained. **Maximum:** 70 mg/day.

### BED

**PO: ADULTS, ELDERLY:** Initially, 30 mg once daily in morning. May increase by 20 mg/day at wkly intervals to a target dose of 50–70 mg once daily. **Maximum:** 70 mg/day.

### Dosage in Renal Impairment

**CrCl 30 mL/min or greater: Maximum:** 70 mg/day. **CrCl 15–29 mL/min: Maximum:** 50 mg/day. **CrCl less than 15 mL/min or end-stage renal disease: Maximum:** 30 mg/day.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (39%):** Decreased appetite. **Occasional (19%–9%):** Insomnia, upper abdominal pain, headache, irritability, vomiting, weight decrease. **Rare (6%–2%):** Nausea, dry mouth, dizziness, rash, affect change, fatigue, tic.

## ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal following prolonged administration of high dosage may produce extreme fatigue (may last for wks). Prolonged administration to children with ADHD may produce a suppression of weight and/or height patterns. May produce cardiac irregularities, psychotic syndrome.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess attention span, impulse control, interaction with others. Question history of cardiomyopathy, glaucoma, hypertension, hyperthyroidism, psychiatric disorder, renal impairment. Receive full medication history and screen for interactions. Assess for drug-seeking behavior; risk of drug abuse and misuse.

### INTERVENTION/EVALUATION

Monitor for CNS stimulation, increase in B/P, weight loss, pulse, sleep pattern, appetite; palpitations, cardiac arrhythmia. Observe for signs of hostility, aggression, depression. Screen for drug abuse and misuse, drug-seeking behavior.

### PATIENT/FAMILY TEACHING

- Take early in day.
- May mask extreme fatigue.
- Report pronounced dizziness, decreased appetite, dry mouth, weight loss, new or worsened psychiatric problems, palpitations, dyspnea.
- Suddenly stopping treatment may cause extreme fatigue that can last for wks. Discontinuation must be done under the close supervision of healthcare professional.

## lisinopril

TOP  
100

lye-sin-o-pril  
(Qbrelis, Zestril)

**BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse lisinopril with fosinopril, Lipitor, or Risperdal or Zestril with Desyrel, Restoril, Vistaril, Zetia, Zostrix, or Zyprexa.**

**Do not confuse lisinopril's combination form Zestoretic with PriLOSEC.**

## FIXED-COMBINATION(S)

**Prinzide/Zestoretic:** lisinopril/hydroCHLORothiazide (a diuretic): 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** ACE inhibitor. **CLINICAL:** Antihypertensive.

## USES

Treatment of hypertension in adults and children 6 yrs and older. Adjunctive therapy to reduce signs/symptoms of systolic HF. Treatment of acute MI within 24 hrs in hemodynamically stable pts to improve survival.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to lisinopril, other ACE inhibitors. History of angioedema from treatment with ACE inhibitors, idiopathic or hereditary angioedema. Concomitant use with aliskiren in pts with diabetes. Coadministration with or within 36 hrs of switching to or from a neprilysin inhibitor (e.g., sacubitril). **Cautions:** Renal impairment, unstented unilateral/bilateral renal artery stenosis, volume depletion, ischemic heart disease, cerebrovascular disease, severe aortic stenosis, hypertrophic cardiomyopathy, HF, systolic B/P less than 100, dialysis, hyponatremia; before, during, or immediately after major surgery. Concomitant use of potassium supplements.

## ACTION

Competitive inhibitor of angiotensin-converting enzyme (ACE) (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Reduces blood pressure.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	6 hrs	24 hrs

Incompletely absorbed from GI tract. Protein binding: 25%. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 12 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

### INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase potential for allergic reactions to allopurinol. **Angiotensin receptor blockers (e.g., losartan, valsartan)** may increase adverse effects. May increase adverse effects of lithium, sacubitril. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **Green tea** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

### AVAILABILITY (Rx)

**Solution, Oral:** (*Qbrelis*): 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS:** Initially, 5–10 mg once daily. Evaluate response q4–6wks and titrate dose in 1-step increments prn (e.g., increase the daily dose by doubling), up to 40 mg once daily. **ELDERLY:** Initially, 2.5–5 mg once daily. Evaluate response q4–6wks and titrate dose in 1-step

increments prn (e.g., increase the daily dose by doubling), up to 40 mg once daily. **CHILDREN 6 YRS OR OLDER:** Initially, 0.07 mg/kg once daily (up to 5 mg). Titrate at 1- to 2-wk intervals. **Maximum:** 0.6 mg/kg/day or 40 mg/day.

#### HF

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day. May increase by no more than 10 mg/day at intervals of at least 2 wks to a target dose of 20–40 mg once daily.

#### Acute MI (to Improve Survival)

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg, then titrate slowly to 10 mg/day or higher, if tolerated. **Maximum:** 40 mg/day.

#### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** Not recommended in children. Titrate to pt's needs after giving the following initial dose:

#### Hypertension

Creatinine Clearance	Initial Dose
10–30 mL/min	5 mg
Less than 10 mL/min or Dialysis	2.5 mg

#### HF

**CrCl less than 30 mL/min or serum creatinine greater than 3 mg/dL:** Initial dose: 2.5 mg.

#### Acute MI

**CrCl 30 mL/min or less:** Initial dose: 2.5 mg.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (12%–5%):** Headache, dizziness, postural hypotension. **Occasional (4%–2%):** Chest discomfort, fatigue, rash, abdominal pain, nausea, diarrhea, upper respiratory infection. **Rare (1% or less):** Palpitations, tachycardia, peripheral edema, insomnia, paresthesia, confusion, constipation, dry mouth, muscle cramps.

## ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (first-dose syncope) may occur in pts with HF; severe salt/volume depletion. Angioedema (swelling of face and lips), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in pts with history of renal disease.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP (esp. serum BUN, creatinine, sodium, potassium; CrCl, GFR). Obtain B/P, apical pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). In pts with renal impairment, autoimmune disease, taking drugs that affect leukocytes or immune response, CBC and differential count should be performed before beginning therapy and q2wks for 3 mos, then periodically thereafter. Question history of aortic stenosis, cardiac disease, cardiomyopathy, renal impairment or stenosis.

### INTERVENTION/EVALUATION

Monitor B/P, renal function tests, serum potassium. Assess for edema. Monitor I&O; weigh daily. Monitor daily pattern of bowel activity, stool consistency. Assist with ambulation if dizziness occurs.

### PATIENT/ FAMILY TEACHING

- To reduce hypotensive effect, go from lying to standing slowly.
- Limit alcohol intake.
- Report vomiting, diarrhea, diaphoresis, swelling of face/lips/tongue, difficulty in breathing, persistent cough.
- Limit salt intake.
- Maintain adequate hydration.
- Report decreased urinary output, dark-colored urine, swelling of the hands and feet.
- Immediately report allergic reactions, esp. life-threatening swelling of the face or tongue.

## lithium

### lith-ee-um

(Carbolith , Lithobid, Lithane , Lithmax )

**BLACK BOX ALERT** Lithium toxicity is closely related to serum lithium levels and can occur at therapeutic doses. Routine determination of serum lithium levels is essential during therapy.

**Do not confuse Lithobid with Levbid or Lithostat.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Mood-stabilizing agent. **CLINICAL:** Antimanic.

## USES

**Bipolar disorder:** (*Immediate-Release*): Treatment of acute mania, acute episodes with mixed features, and maintenance treatment in pts 7 yrs of age and older. (*Extended release*): Treatment of manic episodes and maintenance treatment in pts 12 yrs of age and older. **OFF-LABEL:** Augmenting agent for depression.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to lithium. (*Immediate-release capsule, solution and tablet*): Severely debilitated pts, severe cardiovascular disease, concurrent use with diuretics, severe dehydration, severe renal disease, severe sodium depletion or dehydration. **Cautions:** Mild to moderate cardiovascular disease, thyroid disease, elderly, mild to moderate renal impairment, medications altering sodium excretion, pregnancy, pts at risk for suicide, hypovolemia, pts receiving neuromuscular blocking agents.

## ACTION

Alters cation transport across cell membrane in nerve/muscle cells; influences reuptake of serotonin/norepinephrine. **Therapeutic Effect:** Stabilizes mood, reducing episodes of mania.

**PHARMACOKINETICS**

Widely distributed. Protein binding: None. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 18–24 hrs (increased in elderly).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Freely crosses placenta. Distributed in breast milk. **Children:** May increase bone formation or density (alter parathyroid hormone concentrations). **Elderly:** More susceptible to develop lithium-induced goiter or clinical hypothyroidism, CNS toxicity. Increased thirst, urination noted more frequently; lower dosage recommended.

**INTERACTIONS**

**DRUG:** Diuretics (e.g., furosemide, hydroCHLOROthiazide), NSAIDs (e.g., ibuprofen, naproxen, ketorolac), metroNIDAZOLE, ACE inhibitors (e.g., enalapril, lisinopril), angiotensin II antagonists (e.g., losartan, valsartan), SSRIs (e.g., escitalopram, PARoxetine, sertraline), calcium channel blockers (e.g., amLODIPine, diLTIAZem, verapamil) may increase lithium concentration, risk of toxicity. May increase neurotoxic effect of tricyclic antidepressants (e.g., amitriptyline). MAOIs (e.g., phenelzine, selegiline) may enhance serotonergic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, immunoreactive parathyroid hormone, calcium. **Therapeutic serum level:** 0.6–1.2 mEq/L; **toxic serum level:** greater than 1.5 mEq/L.

**AVAILABILITY (Rx)**

**Capsules:** 150 mg, 300 mg, 600 mg. **Oral Solution:** 8 mEq/5 mL (equivalent to 300 mg lithium carbonate). **Tablets:** 300 mg. **Tablets (Extended-Release):** 300 mg, 450 mg.

**ADMINISTRATION/HANDLING****PO**

- Administer with meals, milk to decrease GI upset.
- Do not break, crush, dissolve, or divide extended-release tablets.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** During acute phase, a therapeutic serum lithium concentration of 0.6–1.2 mEq/L is required. For long-term control, desired level is 0.8–1 mEq/L. Monitor serum drug concentration, clinical response to determine proper dosage.

**Usual Dosage**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 600–900 mg. May increase by 300–600 mg increments q1–5days based on response and tolerability. Usual dose: 900–1,800 mg /day in 1–3 divided doses.

**Dosage in Renal Impairment**

Creatinine Clearance	Dosage
10–50 mL/min	50%–75% normal dose
Less than 10 mL/min	25%–50% normal dose
End-stage renal disease with HD	Dose after HD

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**◀ALERT▶** Side effects are dose related and seldom occur at lithium serum levels less than 1.5 mEq/L. **Occasional:** Fine hand tremor, polydipsia, polyuria, mild nausea. **Rare:** Weight gain, bradycardia, tachycardia, acne, rash, muscle twitching, peripheral cyanosis, pseudotumor cerebri (eye pain, headache, tinnitus, vision disturbances).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Lithium serum concentration of 1.5–2.0 mEq/L may produce vomiting, diarrhea, drowsiness, confusion, incoordination, coarse hand tremor, muscle twitching, T-wave depression on ECG. Lithium serum concentration of 2.0–2.5 mEq/L may result in ataxia, giddiness, tinnitus, blurred vision, clonic movements, severe hypotension. Acute toxicity may be

characterized by seizures, oliguria, circulatory failure, coma, death.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of cardiac/thyroid disease, renal impairment. Assess hydration status. Assess mental status (e.g., mood, behavior). Serum lithium levels should be tested q3–4days during initial phase of therapy, q1–2mos thereafter, and wkly if there is no improvement of disorder or adverse effects occur.

### INTERVENTION/EVALUATION

Clinical assessment of therapeutic effect, tolerance to drug effect is necessary for correct dosing-level management. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Monitor serum lithium concentrations, CBC with differential, urinalysis, creatinine clearance. Monitor renal, hepatic, thyroid, cardiovascular function; serum electrolytes. Assess for increased urinary output, persistent thirst. Report polyuria, prolonged vomiting, diarrhea, fever to physician (may need to temporarily reduce or discontinue dosage). Monitor for signs of lithium toxicity. Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). Monitor lithium levels q3–4days at initiation of therapy (then q1–2mos). Obtain lithium levels 8–12 hrs postdose. **Therapeutic serum level:** 0.6–1.2 mEq/L; **toxic serum level:** greater than 1.5 mEq/L.

### PATIENT/ FAMILY TEACHING

- Limit alcohol, caffeine intake.
- Avoid tasks requiring coordination until CNS effects of drug are known.
- May cause dry mouth.
- Maintain adequate salt, fluid intake (avoid dehydration).
- Report vomiting, diarrhea, muscle weakness, tremors, drowsiness, ataxia.
- Monitoring of serum level is necessary to determine proper dose.

## lixisenatide

lix-i-sen-a-tide  
(Adlyxin)

**Do not confuse lixisenatide with exenatide, liraglutide.**

### FIXED-COMBINATION(S)

**Soliqua:** lixisenatide 33 mcg/mL and insulin glargine 100 units/mL.

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antihyperglycemic (glucagon-like peptide-1 [GLP-1]) receptor agonist. **CLINICAL:** Antidiabetic agent.

### USES

Adjunct to diet and exercise to improve glycemic controls in pts with type 2 diabetes mellitus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lixisenatide. **Cautions:** Renal impairment, severe gastroparesis, history of pancreatitis. Not recommended in pts with diabetic ketoacidosis, type 1 diabetes mellitus. Not a substitute for insulin. Medications with narrow therapeutic index or requiring rapid GI absorption.

### ACTION

Increases glucose-dependent insulin secretion; decreases inappropriate glucagon secretion. Slows gastric emptying. **Therapeutic Effect:** Improves glycemic control by lowering fasting glucose and postprandial blood glucose.

### PHARMACOKINETICS

Widely distributed. Protein binding: not specified. Peak plasma concentration: 1–3.5 hrs. Eliminated through glomerulus filtration and proteolytic degradation. **Half-life:** 3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase hypoglycemic effect when added to **insulin, sulfonureas (e.g., glipiZIDE, glyBURIDE)**. May decrease concentration/effect of **oral contraceptives**. **Oral contraceptive** should be taken 1 hr before or 11 hrs after lixisenatide. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum glucose, Hgb A1c.

## AVAILABILITY (Rx)

**Prefilled Injector Pens:** 10 mcg/0.2 mL, 20 mcg/0.2 mL.

## ADMINISTRATION/HANDLING

### SO

**Preparation** • Follow instructions for preparation according to manufacturer guidelines. • Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless. • Do not use if solution is cloudy or discolored or if visible particles are observed.

**Administration** • Administer within 1 hr before the first meal of the day, preferably the same time each day. If a dose is missed, administer within 1 hr prior to next meal. • Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Refrigerate unused injector pens. • Once injector pen is activated, store at room temperature for up to 14 days. • Do not freeze. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes Mellitus

**SO: ADULTS, ELDERLY:** 10 mcg once daily for 14 days. Increase to 20 mcg once daily on day 15. **Maintenance:** 20 mcg once daily.

### Dosage in Renal Impairment

Use caution.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (25%–10%):** Nausea, vomiting. **Occasional (9%–1%):** Headache, diarrhea, dizziness, dyspepsia, constipation, abdominal distention, abdominal pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. in pts with vomiting, dehydration). May increase risk of hypoglycemia when used with other hypoglycemic agents or insulin. Anaphylaxis reported in less than 1% of pts. Other hypersensitivity reactions including angioedema, bronchospasm, laryngeal edema occur rarely. Acute pancreatitis, hemorrhagic or necrotizing pancreatitis were reported. Immunogenicity (auto-lixisenatide antibodies) occurred in 70% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum glucose level, Hgb A1c; BMP. Question history of renal impairment, gastroparesis, hypersensitivity reaction. Screen for use of other hypoglycemic agents or insulin. Assess pt's understanding of diabetes management, routine home glucose monitoring, medication self-administration. Assess hydration status. Obtain dietary consult for nutritional education.

### INTERVENTION/EVALUATION

Monitor capillary blood glucose levels, Hgb A1c; renal function test (esp. in pts with

renal impairment who report diarrhea, gastroparesis, vomiting). Assess for hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (confusion, fatigue, Kussmaul breathing, nausea, polyuria, vomiting). Screen for glucose-altering conditions (fever, stress, surgical procedures, trauma). Monitor for hypersensitivity reactions; abdominal pain that radiates to the back. Encourage fluid intake. Monitor I&O.

#### PATIENT/FAMILY TEACHING

- Diabetes requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood sugar regularly.
- Monitor daily calorie intake.
- When taking additional medications to lower blood sugar or when glucose demands are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have low blood sugar treatment available (glucagon, oral dextrose).
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Report allergic reactions of any kind, esp. difficulty breathing, itching, rash, swelling of the face or throat.
- Oral contraceptives should be taken at least 1 hr before or 11 hrs after dose.
- Therapy may cause acute kidney injury or kidney failure; report decreased urine output, amber-colored urine, flank pain.

## loncastuximab tesirine-lpyl

lon-kas-tux-i-mab tes-ir-een  
(Zynlonta)

**Do not confuse loncastuximab with brentuximab, cetuximab, dinutuximab, isatuximab, margetuximab, rituximab, or siltuximab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD19. Antibody drug conjugate. Monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with relapsed or refractory diffuse large B-cell lymphoma after two or more lines of systemic therapy, including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, DLBCL arising from low-grade lymphoma, and high-grade B-cell lymphoma.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to loncastuximab tesirine-lpyl. **Cautions:** Baseline cytopenias, hepatic impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic opportunistic infections; history of effusions or edema (pleural effusion, pericardial effusion, generalized edema).

### ACTION

An antibody drug conjugate consisting of immunoglobulin G1 (anti-CD19) kappa antibody and SG3199 (an alkylating agent). Binds to CD19 that is overexpressed on the surface of B cells. After cellular internalization, SG3199 binds to the DNA minor groove and creates cytotoxic DNA crosslinking, leading to cell death. **Therapeutic Effect:** Causes DNA damage, apoptosis, and tumor cell death.

### PHARMACOKINETICS

Widely distributed. Metabolized into small peptides and amino acids via catabolic pathway. Minimal renal excretion.

**Half-life:** 20.8 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 9 mos after discontinuation.

Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 3 mos after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of vaccines (live), BCG (intravesical), sipuleucel-T. May enhance the immunosuppressive effect of baricitinib, fingolimod, tofacitinib, upadacitinib. May enhance the adverse/toxic effect of leflunomide, natalizumab. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding in pts with thrombocytopenia. Echinacea may diminish the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, glucose, GGT. May decrease serum albumin; absolute neutrophil count, Hgb, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 10 mg.

## ADMINISTRATION/HANDLING

**Premedication** • Give dexamethasone 4 mg IV or PO twice daily for 3 days starting the day prior to infusion.

**Preparation** • Calculate the dose needed for reconstitution based on weight in kg. For pts with body mass index (BMI) greater than or equal to 35 mg/m<sup>2</sup>, use adjusted body weight (ABW) to calculate dose (35 mg/m<sup>2</sup> × [height in meters])<sup>2</sup>. Covert dose in mg to volume using 5 mg/mL (final concentration).

**Reconstitution** • Must be prepared by personnel trained in aseptic manipula-

tions and admixing of cytotoxic drugs.

- While directing stream toward glass wall of vial, reconstitute each vial with 2.2 mL of Sterile Water for Injection to a final concentration of 5 mg/mL.
- Swirl vial(s) gently until powder is completely dissolved. Do not shake, agitate, or expose to direct sunlight.
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Dilute in 50 mL D5W infusion bag.
- Mix by gentle inversion. Do not shake or agitate.
- Discard used portions of vial.

**Rate of administration** • Infuse over 90 min using a sterile, nonpyrogenic, low-protein-binding 0.2–0.022 micron, in-line filter.

**Storage** • Refrigerate unused vials in original carton.

- May refrigerate or store reconstituted vials at room temperature for up to 4 hrs.
- Diluted solution may be refrigerated for up to 24 hrs or stored at room temperature for up to 8 hrs.
- Do not freeze.

## IV INCOMPATIBILITIES

Do not infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Diffuse Large B-Cell Lymphoma (Relapsed or Refractory)

**Note:** For patients with a BMI 35 kg/m<sup>2</sup> or greater, calculate dose based on ABW.

**IV: ADULTS, ELDERLY:** 0.15 mg/kg on q3wks (day 1 of 21-day cycle) for 2 cycles, then 0.075 mg/kg q3wks thereafter. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). If treatment is withheld for more 3 wks due to toxicities, reduce dose by 50% for subsequent doses. If toxicity recurs, consider discontinuation. If toxicity requires a dose

reduction after the second dose of 0.15 mg/kg (cycle 2), give 0.075 mg/kg dose for cycle 3.

### **Neutropenia**

**Absolute neutrophil count (ANC) less than 1,000 cells/mm<sup>3</sup>:** Withhold treatment until ANC is greater than or equal to 1,000 cells/mm<sup>3</sup>.

### **Thrombocytopenia**

**Platelet count less than 50,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count is greater than or equal to 50,000 cells/mm<sup>3</sup>.

### **Nonhematological Toxicities, Other**

#### **Adverse Reactions**

**Grade 2 or higher edema or effusion; Grade 3 or 4 infection; Grade 3 cutaneous reactions; other adverse reactions:** Withhold treatment until improved to Grade 1 or 0.

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## **SIDE EFFECTS**

**Frequent (17%–38%):** Fatigue, asthenia, lethargy, rash, erythema, dermatitis, edema (face/ generalized/peripheral), ascites, musculoskeletal pain (back/chest/limb/neck), myalgia, nausea, diarrhea. **Occasional (12%–14%):** Abdominal pain, vomiting, dyspnea, pruritus, constipation.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe

reactions including bone marrow depression, febrile neutropenia may be life-threatening. Grade 3 edema and pleural effusion reported in 3% of pts. Grade 3 or 4 pericardial effusion reported in 1% of pts. Life-threatening infections including pneumonia, sepsis reported in 10% of pts. Upper respiratory tract infection, nasopharyngitis, rhinitis, rhinovirus infection, sinusitis reported in 10% of pts. Extravasation may cause injection site irritation, redness, swelling, tissue necrosis. Grade 3 cutaneous reactions including erythema, rash, photosensitivity reported in 4% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, has been reported. Inflammatory conditions including dermatitis, pericarditis, pleurisy, pneumonitis may occur.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Verify use of effective contraception. Obtain weight in kg (or calculate ABW in pts with BMI greater than or equal to 35 kg/m<sup>2</sup>). Consider granulocyte colony-stimulating factor prophylaxis. Screen for active infection. Question for recent administration of vaccines, live vaccines. Question history of hepatic impairment. Offer emotional support.

### **INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression as clinically indicated. Obtain LFT if hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) is suspected. If dyspnea occurs, obtain radiologic exam to assess for effusions/pleurisy. Monitor for edema (third spacing, dyspnea,

weight gain). Monitor for infections (cough, fatigue, fever), esp. respiratory tract infections, sepsis. If serious infection occurs, initiate appropriate antimicrobial therapy. Conduct routine dermatological exams. If cutaneous adverse reactions occur, consider referral to a dermatologist. Assess infusion site for extravasation (pain, redness, swelling).

#### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system and reduce ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), toxic skin reactions (blistering, peeling, rash, skin eruptions); symptoms of edema (shortness of breath, swelling of extremities, weight gain), lung effusion (chest pain, dry cough, shortness of breath).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen, lip balm, clothing to protect against sunburn/skin irritation.

## loperamide

loe-**per**-a-myde  
(Imodium A-D)

**Do not confuse Imodium with Indocin, or loperamide with furosemide.**

#### FIXED-COMBINATION(S)

**Imodium Advanced:** loperamide/simethicone (an antiflatulent): 2 mg/125 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antidiarrheal agent. **CLINICAL:** Antidiarrheal.

#### USES

Controls, provides symptomatic relief of acute nonspecific diarrhea in pts 2 yrs and older; chronic diarrhea associated with inflammatory bowel disease in adults; reduces volume of ileostomy discharge.

**OTC:** Control symptoms of diarrhea, including traveler's diarrhea. **OFF-LABEL:** Chemotherapy-induced diarrhea, irinotecan-induced delayed diarrhea.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to loperamide. Abdominal pain without diarrhea; children younger than 2 yrs; acute dysentery, acute ulcerative colitis, bacterial enterocolitis caused by invasive organisms, including *Salmonella*, *Shigella*, *Campylobacter*; pseudomembranous colitis associated with broad-spectrum antibiotic use. **Cautions:** Hepatic impairment, use in young children. Avoid use when inhibition of peristalsis is undesirable (e.g., potential for ileus, megacolon). Avoid use in pts with risk factors for QT prolongation.

#### ACTION

Directly affects circular and longitudinal intestinal wall muscles through opioid receptor. **Therapeutic Effect:** Slows intestinal motility, prolongs transit time of intestinal contents by reducing fecal volume, diminishing loss of fluid, electrolytes, increasing viscosity, bulk of stool. Increases tone of anal sphincter.

#### PHARMACOKINETICS

Poorly absorbed from GI tract. Protein binding: 97%. Metabolized in liver. Excreted in feces (30%), urine (less than 2%). Not removed by hemodialysis.

**Half-life:** 9–14 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for pts younger than 2 yrs (infants younger than 3 mos more susceptible to CNS effects). **Elderly:** May mask dehydration, electrolyte depletion.

## INTERACTIONS

**DRUG:** May increase concentration/effects of QT-prolonging agents (e.g., amiodarone, haloperidol, sotalol). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Capsules:** 2 mg. **Liquid:** 1 mg/7.5 mL. **Tablet:** 2 mg.

## ADMINISTRATION/HANDLING

### Liquid

- When administering to children, use accompanying plastic dropper to measure the liquid.

## INDICATIONS/ROUTES/DOSAGE

### Acute Diarrhea

**PO: (Capsules): ADULTS, ELDERLY:** Initially, 4 mg, then 2 mg after each unformed stool. **Maximum:** 16 mg/day. **ADOLESCENTS, CHILDREN 12 YRS AND OLDER:** Initially, 4 mg, then 2 mg after each subsequent loose stool. **Maximum:** 8 mg/day. **9–11 YRS WEIGHING 27.1–43 KG:** Initially, 2 mg, then 1 mg after each subsequent loose stool. **Maximum:** 6 mg/day. **6–8 YRS WEIGHING 21–27 KG:** Initially 2 mg, then 1 mg after each subsequent loose stool. **Maximum:** 4 mg/day. **2–5 YRS WEIGHING 13–20 KG:** Initially, 1 mg, then 1 mg after each subsequent loose stool. **Maximum:** 3 mg/day.

### Chronic Diarrhea

**PO: ADULTS, ELDERLY:** Initially, 4 mg, then 2 mg after each unformed stool until diarrhea is controlled. Average maintenance dose: 4–8 mg/day. **Maximum:** 16 mg/day.

### Traveler's Diarrhea

**PO: ADULTS, ELDERLY:** Initially, 4 mg, then 2 mg after each loose bowel movement (LBM). **Maximum:** 16 mg/day (OTC: 8 mg/day).

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Rare:** Dry mouth, drowsiness, abdominal discomfort, allergic reaction (rash, pruritus).

## ADVERSE EFFECTS/TOXIC REACTIONS

Toxicity results in constipation, GI irritation (nausea, vomiting), CNS depression. Activated charcoal is used to treat loperamide toxicity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Do not administer if GI bleeding, mechanical obstruction is suspected. Investigate cause of diarrhea (infectious vs. noninfectious). The use of anti-diarrheals in the presence of *C. difficile*-associated diarrhea or other diarrhea caused by bacteria is controversial (drug may inhibit expulsion of toxic bacteria while elderly and debilitated pts are at an increased risk of mortality due to dehydration).

### INTERVENTION/EVALUATION

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Withhold drug, notify physician promptly in event of abdominal pain, distention, fever.

### PATIENT/FAMILY TEACHING

- Do not exceed prescribed dose.
- May cause dry mouth.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report diarrhea

lasting more than 3 days, abdominal pain with distention, new-onset fever.

## loratadine

lor-at-a-deen  
(Alavert, Claritin, Claritin Reditabs, Loradamed)

**Do not confuse loratadine with clonidine, or Claritin with clarithromycin.**

### FIXED-COMBINATION(S)

**Alavert Allergy and Sinus, Claritin-D:** loratadine/pseudoephedrine (a sympathomimetic): 5 mg/120 mg, 10 mg/240 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** H<sub>1</sub> antagonist, second generation. **CLINICAL:** Antihistamine.

### USES

Relief of nasal, non-nasal symptoms of seasonal allergic rhinitis (hay fever). Treatment of itching due to hives (urticaria).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to loratadine. **Cautions:** Renal/hepatic impairment.

### ACTION

Competes with histamine for H<sub>1</sub> receptor sites on effector cells. **Therapeutic Effect:** Prevents allergic responses mediated by histamine (e.g., rhinitis, urticaria, pruritus).

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1–3 hrs	8–12 hrs	Longer than 24 hrs

Distributed mainly to liver, lungs, GI tract, bile. Protein binding: 97%; metabolite, 73%–77%. Metabolized in liver. Excreted

in urine (40%) and feces (40%). Not removed by hemodialysis. **Half-life:** 8.4 hrs; metabolite, 28 hrs (increased in elderly, hepatic impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth, nose, throat).

### INTERACTIONS

**DRUG:** Acclidinium, ipratropium, tiotropium, umeclidinium may increase anticholinergic effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** All foods delay absorption. **LAB VALUES:** May suppress wheal, flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

### AVAILABILITY (Rx)

**Capsule:** 10 mg. **Solution, Oral:** 5 mg/5 mL. **Syrup:** 5 mg/5 mL. **Tablets:** 10 mg. **Tablets, Chewable:** 5 mg. **Tablets, Orally Disintegrating:** 5 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### PO

- May take without regard for food.

#### Orally Disintegrating Tablets

- Place under tongue.
- Disintegration occurs within seconds, after which tablet contents may be swallowed with or without water.

### INDICATIONS/ROUTES/DOSAGE

#### Allergic Rhinitis

**PO: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 10 mg once daily or 5 mg twice daily. **CHILDREN 2–5 YRS:** 5 mg once daily.

#### Urticaria

**PO: ADULTS, ELDERLY:** Initially, 10 mg once daily. May increase to 10 mg twice daily. **CHILDREN 6 YRS OF AGE AND OLDER:**

10 mg once daily. **CHILDREN 2–5 YRS:** 5 mg once daily.

#### Dosage in Renal Impairment (CrCl less than 30 mL/min)

**PO: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 10 mg every other day. **CHILDREN 2–5 YRS:** No dose adjustment.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (12%–8%):** Headache, fatigue, drowsiness. **Occasional (3%):** Dry mouth, nose, throat. **Rare:** Photosensitivity.

### ADVERSE EFFECTS/TOXIC REACTIONS

None significant.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess lung sounds for wheezing; skin for urticaria, other allergy symptoms.

#### INTERVENTION/EVALUATION

For upper respiratory allergies, increase fluids to decrease viscosity of secretions, offset thirst, replenish loss of fluids from increased diaphoresis. Monitor symptoms for therapeutic response.

#### PATIENT/FAMILY TEACHING

- Drink plenty of water (may cause dry mouth).
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).
- May cause photosensitivity reactions (avoid direct exposure to sunlight).

## LORazepam

lor-az-e-pam

(Ativan, LORazepam Intensol)

**BLACK BOX ALERT** Concomitant use of benzodiazepines and opioids may result in profound

sedation, respiratory depression, coma, and death. Reserve concomitant prescribing of these drugs for use in pts for whom alternative treatment options are inadequate. Limit dosages and durations to the minimum required. Follow pts for signs and symptoms of respiratory depression and sedation. Exposes users to risks of abuse, misuse, and addiction, which can lead to overdose/death. Continued use for several days to wks may lead to clinically significant physical dependence.

**Do not confuse Ativan with Ambien or Atarax, or LORazepam with ALPRAZolam, diazepam, Lovaza, temazepam, or zolpidem.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Antianxiety, sedative-hypnotic, antiemetic, skeletal muscle relaxant, amnesiac, anticonvulsant, antitremor.

### USES

**PO:** Management of anxiety disorders, short-term relief of symptoms of anxiety, anxiety associated with depressive symptoms. **IV:** Status epilepticus, preanesthesia for amnesia, sedation. **OFF-LABEL:** Treatment of alcohol withdrawal, psychogenic catatonia, partial complex seizures, agitation (IV administration only), antiemetic for chemotherapy; rapid tranquilization of agitated pt, status epilepticus in children.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to LORazepam, other benzodiazepines. Acute narrow-angle glaucoma, severe respiratory depression (except during mechanical ventilation). **Cautions:** Neonates, renal/hepatic impairment, compromised pulmonary function, depression, concomitant use of CNS depressants; pts at high risk for suicidal ideation and behavior; history of drug abuse and misuse, drug-seeking behavior, dependency.

**ACTION**

Enhances action of inhibitory neurotransmitter gamma-aminobutyric acid (GABA) in CNS, affecting memory, motor, sensory, cognitive function. **Therapeutic Effect:** Produces anxiolytic, anticonvulsant, sedative, muscle relaxant, antiemetic effects.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	30–60 min	N/A	6–8 hrs
IV	5–20 min	N/A	6–8 hrs
IM	20–30 min	N/A	6–8 hrs

Widely distributed. Protein binding: 85%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 10–20 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** May cross placenta. May be distributed in breast milk. May increase risk of fetal abnormalities if administered during first trimester of pregnancy. Chronic ingestion during pregnancy may produce fetal toxicity, withdrawal symptoms, CNS depression in neonates. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Use small initial doses with gradual increases to avoid ataxia, excessive sedation, or paradoxical CNS restlessness, excitement. May be more susceptible to cognitive impairment, delirium, falls, fractures.

**INTERACTIONS**

**DRUG:** Valproic acid may increase concentration/effects. **Alcohol, other CNS depressants (e.g., morphine, PHENobarbital, zolpidem)** may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant. **Therapeutic serum level:** 50–240 ng/mL; **toxic serum level:** unknown.

**AVAILABILITY (Rx)**

**Injection Solution:** 2 mg/mL, 4 mg/mL. **Oral Solution: (Lorazepam Intensol):** 2 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Dilute with equal volume of Sterile Water for Injection, D<sub>5</sub>W, or 0.9% NaCl.

**Rate of administration** • Give by IV push into tubing of free-flowing IV infusion (0.9% NaCl, D<sub>5</sub>W) at a rate not to exceed 2 mg/min.

**Storage** • Refrigerate parenteral form. • Do not use if discolored or precipitate forms. • Avoid freezing.

**IM**

• Give deep IM into large muscle mass.

**PO**

• Give with food. • Tablets may be crushed. • Dilute oral solution in water, juice, soda, or semisolid food.

**IV INCOMPATIBILITIES**

Aztreonam (Azactam), ondansetron (Zofran).

**IV COMPATIBILITIES**

Bumetanide (Bumex), cefepime (Maxipime), dexmedetomidine (Precedex), dilTIAzem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, labetalol (Normodyne, Trandate), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Anxiety**

**PO: ADULTS, ELDERLY:** Initially, 0.5–2 mg q4–6h as needed up to 10 mg/day. **ADOLESCENTS, CHILDREN 12 YRS AND OLDER:** 0.25–2 mg/dose 2–3 times/day. **Maximum dose:** 2 mg.

**Status Epilepticus**

**IV: ADULTS, ELDERLY:** 4 mg given at maximum rate of 2 mg/min. May repeat

in 3–5 min. **ADOLESCENTS, CHILDREN, INFANTS:** 0.1 mg/kg. **Maximum:** 5 mg. May repeat in 5–10 min. A nonbenzodiazepine, antiseizure agent should be given to prevent recurrence of seizures.

#### Dosage in Renal/Hepatic Impairment

**PO:** No dose adjustment.

**IM, IV: Mild to moderate impairment:** Use caution. Not recommended in severe impairment.

#### SIDE EFFECTS

**Frequent (16%–7%):** Drowsiness, dizziness.

**Rare (less than 4%):** Weakness, ataxia, headache, hypotension, nausea, vomiting, confusion, injection site reaction.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal cramping, muscle cramps, diaphoresis, vomiting, seizures. Overdose results in drowsiness, confusion, diminished reflexes, coma. **Antidote:** Flumazenil (see Appendix J for dosage).

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Offer emotional support to anxious pt. Pt must remain recumbent following parenteral administration to reduce hypotensive effect. Assess motor responses (agitation, trembling, tension), autonomic responses (cold or clammy hands, diaphoresis). Assess for drug-seeking behavior; risk of drug abuse and misuse.

##### INTERVENTION/EVALUATION

Monitor B/P, respiratory rate, heart rate. Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Screen for drug abuse and misuse, drug-seeking behavior. Assess for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response: calm facial expression, decreased restlessness, insomnia,

decrease in seizure-related symptoms. **Therapeutic serum level:** 50–240 ng/mL; **toxic serum level:** N/A.

#### PATIENT/FAMILY TEACHING

- Drowsiness usually subsides during continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Smoking reduces drug effectiveness.
- Do not abruptly discontinue medication after long-term therapy.
- Do not use alcohol, CNS depressants.
- Contraception recommended for long-term therapy.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## lorlatinib

lor-la-ti-nib  
(Lorbrena)

**Do not confuse lorlatinib with alectinib, brigatinib, ceritinib, crizotinib, erlotinib, lapatinib, neratinib, lenvatinib, loratadine, or lorazepam.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anaplastic lymphoma kinase inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

#### USES

First-line treatment of metastatic non-small-cell lung cancer (NSCLC) in adults whose tumors are anaplastic lymphoma kinase (ALK)-positive.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to lorlatinib. Concomitant use of strong CYP3 inducers. **Cautions:** Baseline cytopenias, hyperlipidemia, cardiac or pulmonary disease, hepatic impairment, concomitant use of strong or moderate CYP3A inhibitors, moderate CYP3A inducers; pt at risk

for atrioventricular (AV) block (idiopathic cardiac conduction disorders, ischemic heart disease, increased vagal tone, concomitant use of antiarrhythmics, beta blockers, calcium channel blockers); history of anxiety, depression, suicidal ideation and behavior, mood disorder.

## ACTION

A reversible, potent, third-generation tyrosine kinase inhibitor that is highly selective at targeting ALK and ROS1. Overcomes known ALK resistance mutations. **Therapeutic Effect:** Has anti-tumor activity against multiple mutant forms of the ALK enzyme, including mutations detected in tumors at the time of disease progression on crizotinib and other ALK inhibitors. Anti-tumor activity is dose-dependent correlating with inhibition of ALK phosphorylation.

## PHARMACOKINETICS

Widely distributed. Penetrates blood-brain barrier. Metabolized in liver. Protein binding: 66%. Peak plasma concentration: 1.2–2 hrs. Excreted in urine (48%), feces (41%). **Half-life:** 24 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective non-hormonal contraception during treatment and for at least 6 mos after discontinuation. Hormonal contraception may become ineffective with treatment. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. **Males:** Males with female partners of reproductive potential must use barrier methods during treatment and for at least 3 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/eff. Strong CYP3A4 inducers (e.g.,

carbamazepine, phenytoin, rifampin) may decrease concentration/eff; use contraindicated due to risk of severe hepatotoxicity. **Moderate CYP3A inducers (e.g., bosentan, nafcillin)** may decrease concentration/eff. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, amylase, cholesterol, glucose, lipase, potassium, triglycerides. May decrease Hgb, lymphocytes, platelets, RBCs; serum albumin, phosphate, magnesium.

## AVAILABILITY (Rx)

**Tablets:** 25 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer tablets whole; do not break, crush, cut, or divide. Tablets cannot be chewed. Do not give if tablet is broken, cracked, or not intact.
- If vomiting occurs after administration, give next dose at regularly scheduled time.
- If a dose is missed, administer as soon as possible.
- Do not give a missed dose within 4 hrs of next dose.

## INDICATIONS/ROUTES/DOSAGE

**Non–Small-Cell Lung Cancer (ALK-Positive)**

**PO: ADULTS, ELDERLY:** 100 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**First reduction:** 75 mg once daily.

**Second reduction:** 50 mg once daily.

**Unable to tolerate 50-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Atrioventricular (AV) Block

**Second-degree AV block:** Withhold treatment until PR interval is less than 200 msec, then resume at reduced dose. **First occurrence of complete AV block:** Withhold treatment until PR interval is less than 200 msec or pacemaker is placed. If pacemaker is placed, resume at same

dose. If pacemaker is not placed, resume at reduced dose. **Recurrent complete AV block:** Place pacemaker or permanently discontinue.

#### Central Nervous System (CNS) Effects

**Grade 1 CNS effects:** Maintain dose or withhold treatment until improved to baseline, then resume at same dose or reduced dose. **Grade 2 or 3 CNS effects:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose. **Grade 4 CNS effects:** Permanently discontinue.

#### Hyperlipidemia

**Grade 4 hypercholesterolemia or hypertriglyceridemia:** Withhold treatment until improved to Grade 2 or less, then resume at same dose. **Recurrent severe hypercholesterolemia or hypertriglyceridemia:** Resume at reduced dose.

#### Interstitial Lung Disease (ILD)

**Any grade treatment-related ILD:** Permanently discontinue.

#### Other Adverse Reactions

**Other Grade 1 or Grade 2 reaction:** Maintain dose or reduce dose.

**Other Grade 3 or Grade 4 reaction:** Withhold treatment until improved to Grade 2 or less (or baseline), then resume at reduced dose.

#### Concomitant Use of Strong CYP3A

##### Inhibitors

If strong CYP3A inhibitor cannot be discontinued, reduce dose to 75 mg. If dose was reduced to 75 mg due to adverse reactions and a CYP3A inhibitor is started, reduce dose to 50 mg. If CYP3A inhibitor is discontinued for 3 half-lives, may resume dose prior to starting CYP3A inhibitor.

#### Concomitant Use of Moderate CYP3A

##### Inducers

**Note:** Concomitant use of strong CYP3A inducers is contraindicated.

If moderate CYP3A inducer cannot be discontinued, consider discontinuing CYP3A inducer or discontinuing treatment if Grade 2 or higher hepatotoxicity occurs.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (57%–18%):** Edema (generalized, peripheral), peripheral neuropathy, cognitive effects (amnesia, memory impairment, disorientation), dyspnea, fatigue, asthenia, weight gain, mood effects (aggression, agitation, anxiety, depression, mood swings), arthralgia, diarrhea, headache, cough, nausea. **Occasional (17%–10%):** Myalgia, dizziness, vision disorder, constipation, rash, back pain, extremity pain, vomiting, speech effects (aphasia, dysarthria), pyrexia, sleep effects (abnormal dreams, insomnia, nightmares, sleep talking).

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, thrombocytopenia) is an expected response to therapy. Concomitant use with moderate CYP3A inducers may increase risk of hepatotoxicity. CNS reactions including hallucinations, seizures, suicidal ideation, and changes in cognitive function, mental status, mood, sleep, speech reported in 54% of pts. Grade 3 or 4 elevations in total cholesterol, triglycerides reported in 18% of pts. AV block and PR interval prolongation reported in 1% of pts. Life-threatening ILD/pneumonitis reported in 2% of pts. Other adverse effects, including pneumonia, pulmonary edema, myocardial infarction, embolism, peripheral artery occlusion, respiratory failure, occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, serum cholesterol, triglycerides, ECG; pregnancy test in female pts of reproductive potential. Confirm

compliance of effective contraception. Verify ALK-positive NSCLC status. Discontinue strong CYP3A4 inducers for 3 half-lives prior to initiation. Consider initiating or increasing dose of antihyperlipidemic agents. Screen for active infection. Question history of anxiety, depression, mood disorder, suicidal ideation and behavior; cardiac or pulmonary disease, hepatic impairment. Receive full medication history and screen for interactions/contraindications. Conduct baseline neurologic exam. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT periodically. Monitor serum cholesterol, triglycerides monthly for 2 mos, then periodically thereafter. Monitor ECG periodically (or more frequently if symptoms of AV block occur [dizziness, chest pain, syncope]). If moderate CYP3A inducer cannot be discontinued, monitor LFT 48 hrs after initiation and for at least 3 times during the first week after initiation. Diligently monitor for suicidal ideation and behavior; new-onset or worsening of anxiety, depression, mood disorder. Consider mental health consultation if psychiatric disorder suspected. Conduct regular neurologic exams to rule out CNS effects. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, hypoxia) is suspected. If treatment related toxicities occur, consider referral to specialist. Assess skin for rash, dermatitis.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occurs.
- Neurologic events including altered speech, hallucinations, seizures may occur.
- Report symptoms of heart block (dizziness, chest pain, faint-

ing); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark colored urine, yellowing of the skin or eyes); lung inflammation (excessive cough, difficulty breathing, chest pain); skin reactions (rash).

- Use effective contraception to avoid pregnancy. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber that originally started therapy.
- Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## losartan

loe-sar-tan  
(Cozaar)

**BLACK BOX ALERT** May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Cozaar with Colace, Coreg, Hyzaar, or Zocor, or losartan with lorcaserin, valsartan.**

### FIXED-COMBINATION(S)

**Hyzaar:** losartan/hydroCHLOROthiazide (a diuretic): 50 mg/12.5 mg, 100 mg/12.5 mg, 100 mg/25 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension in adults and children 6 yrs and older. Used alone or in combination with other antihypertensives. Treatment of diabetic nephropathy with an elevated creatinine and proteinuria (in pts with type 2 diabetes and history of hypertension). **OFF-LABEL:** Slow rate of progression of aortic root dilation in children with Marfan's syndrome. HF in pts intolerant of ACE inhibitors.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to losartan. Concomitant use of aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, unstented renal arterial stenosis, significant aortic/mitral stenosis. Concurrent use of potassium supplements. Pts with history of angioedema.

## ACTION

Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	N/A	6 hrs	24 hrs

Widely distributed. Protein binding: 98%. Metabolized in liver. Excreted in feces (60%), urine (35%). Not removed by hemodialysis. **Half-life:** 2 hrs; metabolite, 6–9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has caused fetal/neonatal morbidity, mortality. Potential for adverse effects on breastfed infant. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease effects. Aliskiren may increase hyperkalemic effect. May increase adverse/toxicity of ACE inhibitors (e.g., benazepril, lisinopril). May increase levels/effects of lithium. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, Hgb, Hct. May decrease serum glucose.

## AVAILABILITY (Rx)

**Tablets:** 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 25–50 mg once daily. Evaluate response q4–6 wks. May increase as needed to 100 mg/day in 1–2 divided doses. **CHILDREN 6–16 YRS:** Initially, 0.7 mg/kg (**maximum:** 50 mg) once daily. Adjust dose to BP response. **Maximum:** 1.4 mg/kg or 100 mg/day.

### Diabetic Nephropathy

**PO: ADULTS, ELDERLY:** Initially, 50 mg/day. May increase to 100 mg/day based on B/P response and tolerability.

### Dosage in Renal Impairment

Not recommended if glomerular filtration rate (GFR) less than 30 mL/min.

### Dosage in Hepatic Impairment

**PO: ADULTS, ELDERLY:** Initially, 25 mg/day. May increase up to 100 mg/day.

## SIDE EFFECTS

**Frequent (8%):** Upper respiratory tract infection. **Occasional (4%–2%):** Dizziness, diarrhea, cough. **Rare (1% or less):** Insomnia, dyspepsia, heartburn, back/leg pain, muscle cramps, myalgia, nasal congestion, sinusitis, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often. Institute supportive measures.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P, heart rate immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy. Assess medication history (esp. diuretics).

**INTERVENTION/EVALUATION**

Maintain hydration (offer fluids frequently). Assess for evidence of upper respiratory infection, cough. Monitor B/P, heart rate. Assist with ambulation if dizziness occurs. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Use effective contraception to avoid pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
- Report any sign of infection (sore throat, fever), chest pain.
- Do not take OTC cold preparations, nasal decongestants.
- Do not stop taking medication.
- Limit salt intake.

**lovastatin**

loe-va-stat-in  
(Altoprev)

**Do not confuse lovastatin with atorvastatin, Leustatin, Lotensin, nystatin, pitavastatin, or pravastatin.**

**FIXED-COMBINATION(S)**

**Advicor:** lovastatin/niacin: 20 mg/500 mg, 20 mg/750 mg, 20 mg/1,000 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** HMG-CoA reductase inhibitor. **CLINICAL:** Anti-hyperlipidemic.

**USES**

Adjunct to diet to decrease elevated serum total and LDL cholesterol in primary hypercholesterolemia; primary prevention of coronary artery disease; reduction of risk of MI, unstable angina, and in coronary revascularization procedures. Slows progression of coronary atherosclerosis in pts with coronary heart disease. Adjunct to diet in adolescent pts (10–17 yrs) with heterozygous familial

hypercholesterolemia having LDL greater than 189 mg/dL or LDL greater than 160 mg/dL with positive family history of premature CV disease or LDL greater than 160 mg/dL with presence of at least 2 other CVD risk factors.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to lovastatin. Active hepatic disease, unexplained persistent elevations of serum transaminases. Pregnancy, breastfeeding. Concomitant use of strong CYP3A4 inhibitors.

**Cautions:** History of heavy/chronic alcohol use, renal impairment, hepatic disease; concomitant use of amiodarone, cycloSPORINE, fibrates, gemfibrozil, niacin, verapamil (increased risk of myopathy), elderly.

**ACTION**

Inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. **Therapeutic Effect:** Decreases LDL, VLDL, triglycerides; increases HDL.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO (LDL, cholesterol reduction)	3 days	N/A	N/A

Incompletely absorbed from GI tract (increased on empty stomach). Protein binding: 95%. Hydrolyzed in liver. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 1.1–1.7 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity) and lactation. Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration, risk of myopathy, rhabdomyolysis.

**Colchicine, gemfibrozil** may increase risk of myopathy. **HERBAL:** **St. John's wort** may decrease concentration/effect. **FOOD:** **Grapefruit products** may increase risk of side effects (e.g., myalgia, weakness). **Red yeast rice** may increase concentration (2.4 mg lovastatin/600 mg rice). **LAB VALUES:** May increase serum ALT, AST, creatine kinase (CK).

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 20 mg, 40 mg.

 **Tablets:** (*Extended-Release [Altoprev]*): 20 mg, 40 mg, 60 mg.

## ADMINISTRATION/HANDLING

### PO

- Immediate-release tablet given with evening meal; extended-release at bedtime.
- Avoid intake of large quantities of grapefruit juice (greater than 1 quart).
- Do not break, crush, dissolve, or divide extended-release tablets.

## INDICATIONS/ROUTES/DOSAGE

### Hypercholesterolemia, Primary

#### Prevention of CAD

**PO:** (*Immediate-Release*): **ADULTS, ELDERLY:** Initially, 20 mg/day. Adjust at 4-wk intervals. **Maintenance:** 10–80 mg once daily or in 2 divided doses. **Maximum:** 80 mg/day.

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** Initially, 20–60 mg once daily at bedtime. Adjust at 4-wk intervals. **Maximum:** 60 mg once daily at bedtime.

### Heterozygous Familial Hypercholesterolemia

**PO:** (*Immediate-Release*): **CHILDREN 10–17 YRS:** Initially, 10 mg once daily. May increase in 10-mg increments q3mos until target LDL is achieved. Range: 10–40 mg daily. **Maximum:** 80 mg/day.

### Dosage With Concurrent Medication

**Amiodarone:** **Maximum:** 40 mg/day. **DiTIAZem, dronedarone, verapamil:** **Maximum:** (*Immediate-Release*): 10 mg/day. (*Extended-Release*): 20 mg/day. **Lomitapide:** Consider reduction in dose.

### Dosage in Renal Impairment

Use caution.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

Generally well tolerated. Side effects usually mild and transient. **Frequent (9%–5%):** Headache, flatulence, diarrhea, abdominal pain, abdominal cramping, rash, pruritus. **Occasional (4%–3%):** Nausea, vomiting, constipation, dyspepsia. **Rare (2%–1%):** Dizziness, heartburn, myalgia, blurred vision, eye irritation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Potential for cataract development. Occasionally produces myopathy manifested as muscle pain, tenderness, weakness with elevated creatine kinase (CK). Severe myopathy may lead to rhabdomyolysis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT, serum cholesterol, triglycerides; pregnancy test in females of reproductive potential. Receive full medication history and screen for interactions. Obtain diet history.

### INTERVENTION/EVALUATION

Monitor LFT. Monitor daily pattern of bowel activity, stool consistency. Monitor for headache, dizziness, blurred vision. Assess for rash, pruritus. Monitor serum cholesterol, triglycerides for therapeutic response. Be alert for malaise, muscle cramping/weakness.

### PATIENT/FAMILY TEACHING

- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Maintain appropriate birth control measures.
- Avoid grapefruit juice, alcohol.
- Report severe gastric upset, vision changes, myalgia, weakness, changes in color of urine/stool, yellowing of eyes/skin, unusual bruising.

## lumateperone

loo-ma-te-per-one  
(Caplyta)

**BLACK BOX ALERT** Elderly pts with dementia-related psychosis who are treated with antipsychotic drugs are at increased risk of death. Not approved in pts with dementia-related psychosis.

**Do not confuse lumateperone with abiraterone or testosterone, or Caplyta with Kaletra.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Dopamine and serotonin receptor antagonist. **CLINICAL:** Second-generation (atypical) antipsychotic.

### USES

Treatment of schizophrenia in adults.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lumateperone. **Cautions:** Baseline leukopenia, neutropenia; debilitated, diabetes, dyslipidemia, elderly, fall risk, hepatic impairment; pts at risk for orthostatic hypotension, syncope (e.g., dehydration, elderly, hypovolemia, concomitant use of antihypertensives); pts at risk for aspiration, dysphagia (e.g., CVA, myasthenia gravis, Parkinson's disease); conditions that lower seizure threshold (e.g., drug use/withdraw, head trauma, hyponatremia, hyperthermia, history of seizures); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). Avoid concomitant use of moderate or strong CYP3A inducers, moderate or strong CYP3A inhibitors.

### ACTION

Antagonist of central dopamine D<sub>2</sub> receptors and serotonin 5-HT<sub>2A</sub> receptors. **Therapeutic Effect:** Diminishes symptoms of psychotic behavior.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 97.4%. Excreted in urine (58%), feces (29%). Following oral administration, steady state reached in 5 days.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May increase risk of extrapyramidal symptoms, withdrawal syndrome in neonates when given during the third trimester. Unknown if distributed in breast milk. Breastfeeding not recommended. May impair fertility in females and males. **Males:** May have increased risk of dystonia. **Children:** Safety and efficacy not established. **Elderly:** May increase risk of tardive dyskinesia, orthostatic hypotension, syncope. Not indicated in elderly pts with dementia-related psychosis.

### INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil), UGT inhibitors (e.g., probenecid, valproic acid) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST. May decrease leukocytes, neutrophils.

### AVAILABILITY (Rx)

**Capsules:** 42 mg.

**ADMINISTRATION/HANDLING****PO**

• Give with food. • Administer whole; do not break, crush, cut, or open capsule.

**INDICATIONS/ROUTES/DOSAGE****Schizophrenia**

**PO: ADULTS, ELDERLY:** 42 mg once daily.

**Dose Modification**

Permanently discontinue in pts with neuroleptic malignant syndrome, neutrophil count less than 1000 cells/mm<sup>3</sup>. Consider permanent discontinuation in pts with tardive dyskinesia.

**Dosage in Renal Impairment**

**Mild to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment.  
**Moderate to severe impairment:** Avoid use.

**SIDE EFFECTS**

**Frequent (24%):** Somnolence, sedation.  
**Occasional (9%–6%):** Nausea, dry mouth.  
**Rare (5%–2%):** Dizziness, fatigue, vomiting, decreased appetite.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of death in elderly pts with dementia-related psychosis. Most deaths appeared to be cardiovascular (e.g., HF, sudden death) or infectious (e.g., pneumonia) in nature. May increase risk of life-threatening neuroleptic malignant syndrome (NMS). Symptoms of NMS may include hyperpyrexia, muscle rigidity, altered mental status, autonomic instability (irregular pulse/blood pressure, tachycardia, diaphoresis, cardiac arrhythmias); elevated CPK, rhabdomyolysis, acute renal failure. Tardive dyskinesia (potentially irreversible, involuntary, dyskinetic movements) has occurred. Metabolic changes including hyperglycemia, ketoacidosis, hyperosmolar coma, diabetes, dyslipidemia may

occur. Agranulocytosis, leukopenia, neutropenia was reported. Cognitive and motor impairment reported in 24% of pts. Other effects may include body temperature dysregulation, dysphagia, dystonia, extrapyramidal symptoms, orthostatic hypotension, falls, syncope, seizures.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum blood glucose, fasting lipid profile, vital signs; Hgb A1c in pts with diabetes; CBC in pts with baseline leukopenia, neutropenia; pregnancy test in females of reproductive potential. Screen for active infection. Receive full medication history and screen for interactions. Questions history of diabetes, dementia-related psychosis, hepatic impairment, seizures. Assess risk of dysphagia, aspiration. Initiate fall precautions. Assess appearance, behavior, speech pattern, levels of interest. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor fasting blood glucose, lipid profile after initiation and periodically thereafter. Monitor CBC, orthostatic vital signs frequently during the first mos of therapy. Monitor for hyperglycemia (blurred vision, confusion, excessive thirst, Kussmaul respirations, polyuria), infections (cough, fatigue, fever), body temperature dysregulation, dysphagia, dystonia, tardive dyskinesia, NMS. Monitor for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor is unavoidable. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

**PATIENT/FAMILY TEACHING**

• Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection until response to drug is established. • Report symptoms of high

blood sugar levels (e.g., blurred vision, excessive thirst/hunger, headache, frequent urination); nervous system changes (e.g., abnormal, involuntary movements (e.g., lip smacking, puckering, tongue protrusion or chewing, jaw movement, rapid blinking of the eye), difficulty swallowing, seizures, tremor; spasms of the neck, tongue, face).

- Treatment may cause NMS (confusion, high fever, muscle rigidity, high or irregular B/P, heart arrhythmias), a life-threatening condition that can be confused with symptoms of severe infection.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Go slowly from lying to standing.
- There is a high risk of interactions with other medications. Do not take any newly prescribed medications unless approved by prescriber who originally started treatment. Avoid grapefruit products, herbal supplements (esp. St. John's wort).
- Do not breastfeed. Treatment may impair fertility.
- Avoid overheating and dehydration.

## lurasidone

loo-ras-i-done  
(Latuda)

**BLACK BOX ALERT** ■ Elderly pts with dementia-related psychosis are at increased risk for mortality due to cardiovascular events, infectious diseases. Increased risk of suicidal thinking/behavior in children, adolescents, young adults.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DOPamine, serotonin receptor antagonist.  
**CLINICAL:** Second-generation (atypical) antipsychotic.

### USES

Treatment of schizophrenia in adults and adolescents (13–17 yrs). Treatment of

depression associated with bipolar I disorder as monotherapy (children 10 yrs and older, adults) and as adjunctive therapy (adults) with lithium or valproate.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to lurasidone. Concurrent use with strong CYP3A4 inhibitors (e.g., ketoconazole) and inducers (e.g., rifAMPin). **Cautions:** Cardiovascular disease (HF, history of MI, ischemia, conduction abnormalities), cerebrovascular disease (history of CVA in pts with dementia, seizure disorders), diabetes, Parkinson's disease, renal/hepatic impairment, pts at risk for aspiration pneumonia, pts at risk for suicide, disorders where CNS depression is a feature, pts at risk for hypotension, elderly, head trauma, alcoholism, medications that lower seizure threshold.

### ACTION

Antagonizes central DOPamine type 2 and serotonin type 2 receptors. **Therapeutic Effect:** Diminishes symptoms of schizophrenia. Reduces incidence of extrapyramidal side effects.

### PHARMACOKINETICS

Absorbed in 1–3 hrs. Steady-state concentration occurs in 7 days. Well absorbed from GI tract (unaffected by food). Protein binding: 99%. Metabolized in liver. Excreted in feces (80%), urine (9%). **Half-life:** 18 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to postural hypotension. Increased risk of cerebrovascular events (including stroke), mortality, in elderly pts with psychosis.

### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., lorazepam, morphine,

zolidem) may increase CNS depression. May enhance CNS depressant effect of **azelastine (nasal)**. **Strong CYP3A4 inducers** (e.g., **carbamazepine**, **phenytoin**, **rifampin**) decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., **clarithromycin**, **ketconazole**, **ritonavir**) may increase concentration/effect. **HERBAL: Herbs with sedative properties** (e.g., **chamomile**, **kava kava**, **valerian**) may increase CNS depression. **St. John's wort** may decrease concentration/effect. **FOOD: Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase prolactin levels.

### AVAILABILITY (Rx)

**Tablets:** 20 mg, 40 mg, 60 mg, 80 mg, 120 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give with food.
- Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

#### Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 40 mg once daily with food. Increase dose based on response and tolerability. **Maximum:** 160 mg once daily with food. **ADOLESCENTS:** Initially, 40 mg once daily with food. **Maximum:** 80 mg once daily with food.

#### Bipolar Depression

**PO: ADULTS, ELDERLY: (Monotherapy or adjunct to lithium or divalproex):** Initially, 20 mg once daily, alone or in combination with lithium or divalproex. May increase in 20 mg increments q2–7 days. **Maximum:** 120 mg/day. **CHILDREN 10 YRS AND OLDER: (Monotherapy):** Initially, 20 mg once daily. May increase dose after 1 wk. **Maximum:** 80 mg/day.

#### Concomitant Use of Moderate CYP3A4 Inhibitors/Inducers

**PO: ADULTS, ELDERLY: (Inhibitor):** Initially, 20 mg/day. **Maximum:** 80 mg/

day. **(Inducer):** May need to increase lurasidone dose if inducer used for 7 or more days.

#### Moderate to Severe Renal Impairment

**CrCl less than 50 mL/min:** Initially, 20 mg/day. **Maximum:** 80 mg/day.

#### Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Initially, 20 mg/day. **Maximum:** 80 mg/day. **Severe impairment:** Initially, 20 mg/day. **Maximum:** 40 mg/day.

### SIDE EFFECTS

**Frequent (15%–7%):** Drowsiness, sedation, insomnia (paradoxical reaction).

**Occasional (6%–3%):** Nausea, vomiting, dyspepsia, fatigue, back pain, akathisia, dizziness, agitation, anxiety. **Rare (2%–1%):** Restlessness, salivary hypersecretion, tongue spasm, torticollis, trismus.

### ADVERSE EFFECTS/TOXIC REACTIONS

Extrapyramidal disorder (including cogwheel rigidity, drooling, bradykinesia, tardive dyskinesia, tremors) occurs in 5% of pts. Neuroleptic malignant syndrome (fever, muscle rigidity, irregular B/P or pulse, altered mental status, visual changes, dyspnea) occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question history as listed in Precautions. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Renal function, LFT should be obtained before therapy as dose adjustment is required when initiating therapy.

#### INTERVENTION/EVALUATION

Supervise suicidal risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor for potential neuroleptic malignant syndrome. Assess for therapeutic

tic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

#### PATIENT/FAMILY TEACHING

- Avoid tasks that may require alertness, motor skills until response to drug is established (may cause drowsiness, dizziness).
- Avoid alcohol.
- Report trembling in fingers, altered gait, unusual muscle/skeletal movements, palpitations, severe dizziness, fainting, visual changes, rash, difficulty breathing.
- Report suicidal ideation, unusual changes in behavior.

## lurbinectedin

loor-bin-ek-te-din  
(Zepzelca)

**Do not confuse lurbinectedin with trabectedin or Zepzelca with Zejula, Zelboraf, Zoladex, or Zydelig.**

#### ◆ Classification

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

## USES

Treatment of adults with metastatic small-cell lung cancer (SCLC) with disease progression on or after platinum-based chemotherapy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to lurbinectedin. **Cautions:** Baseline cytopenias, hepatic/renal impairment, pulmonary disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); concomitant use of strong or moderate CYP3A inhibitors or strong or moderate CYP3A inducers.

## ACTION

Selective inhibitor of oncogenic transcription, which binds preferentially to guanine residues in the minor groove of DNA,

forming adducts, and bends the DNA helix towards the major groove. Adduct formation affects the activities of DNA binding proteins, including some transcription factors and DNA repair pathways. **Therapeutic Effect:** Inhibition of oncogenic transcription results in tumor cell apoptosis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Excreted in feces (89%), urine (6%). **Half-life:** 51 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during therapy and for 4 months after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of serious adverse effects; myelosuppression.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. May increase the immunosuppressive effect of baricitinib, fingolimod, tofacitinib, upadacitinib. May increase the adverse/toxic effect of leflunomide, natalizumab. May increase the adverse/toxic effect and diminish the therapeutic effect of vaccines (live). **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding in pts with

thrombocytopenia. **Echinacea** may diminish the therapeutic effect. **FOOD: Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, creatinine, glucose. May decrease serum albumin, magnesium, sodium; absolute neutrophil count, Hgb, leukocytes, lymphocytes, neutrophils, platelets.

## AVAILABILITY (RX)

**Injection, Powder for Reconstitution:** 4 mg.

## ADMINISTRATION/HANDLING

**Premedication** • Consider premedication with dexamethasone 8 mg IV (or equivalent) and ondansetron 8 mg IV (or equivalent).

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the dose needed for reconstitution based on body surface area. • Reconstitute vial with 8 mL of Sterile Water for Injection to a final concentration of 0.5 mg/mL. • Shake vial until powder is completely dissolved. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • **Administration via central venous line (CVL):** Dilute in 100 mL 0.9% NaCl or D5W infusion bag. • **Administration via peripheral IV:** Dilute in 250 mL bag of 0.9% NaCl or D5W infusion bag.

**Rate of administration** • Infuse over 60 min.

**Storage** • Refrigerate unused vials in original carton. • Diluted solution may be refrigerated or stored at room temperature for up to 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Small-Cell Lung Cancer (Metastatic)

**IV ADULTS, ELDERLY:** 3.2 mg/m<sup>2</sup> q3wks if absolute neutrophil count is at least 1,500 cells/mm<sup>3</sup> and platelet count is at least 100,000 cells/mm<sup>3</sup>. Continue until

disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**First dose reduction:** 2.6 mg/m<sup>2</sup> q3wks.

**Second dose reduction:** 2 mg/m<sup>2</sup> q3wks.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Hepatotoxicity

**Grade 2 hepatotoxicity:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose. **Grade 3 or 4 hepatotoxicity:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose.

### Neutropenia

**Grade 4 neutropenia or febrile neutropenia:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose. Consider granulocyte colony-stimulating factor in pts with neutrophil count less than 500 cells/mm<sup>3</sup>.

### Thrombocytopenia

**Grade 3 thrombocytopenia with bleeding:** Withhold treatment until platelet count improves to greater than or equal to 100,000 cells/mm<sup>3</sup>. **Grade 4 thrombocytopenia:** Withhold treatment until platelet count improves to greater than or equal to 100,000 cells/mm<sup>3</sup>, then resume at reduced dose.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (77%–31%):** Fatigue, nausea, musculoskeletal pain (back, bone, chest, extremity, neck), arthralgia, myalgia, decreased appetite, dyspnea, constipation. **Occasional (22%–less than 10%):** Vomiting, constipation, diarrhea, cough, pyrexia,

abdominal pain, peripheral neuropathy, neuralgia, hypoesthesia, hyperesthesia, headache, chest pain, dysgeusia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including bone marrow depression, febrile neutropenia, may be life-threatening. Grade 3 or 4 neutropenia reported in 41% of pts. Grade 3 or 4 thrombocytopenia reported in 10% of pts. Sepsis reported in 2% of pts. Infections, including respiratory tract infection, pneumonia, reported in 18%–10%. Pneumonitis reported in less than 10% of pts. May cause hepatotoxicity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Verify use of effective contraception. Screen for active infection. Question history of hepatic impairment, pulmonary disease. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression prior to each dose. Monitor LFT if hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) periodically. Consider

ABG, radiologic test if pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if pneumonitis is confirmed. Diligently monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Offer antiemetics if nausea occurs; antidiarrheal agent if diarrhea occurs. Monitor for toxicities if discontinuation of CYP3A inhibitor is unavoidable. Monitor daily pattern of bowel activity, stool consistency. Monitor for bleeding of any kind.

### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), inflammation of the lung (excessive cough, difficulty breathing, chest pain).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Avoid grapefruit products, herbal supplements (esp. St John's wort).
- Report bleeding of any kind.

**magnesium****HIGH  
ALERT**mag-*nee*-zee-um**magnesium chloride**

(Mag-Delay, Slow-Mag)

**magnesium citrate**(Citroma, Citro-Mag )**magnesium hydroxide**

(Milk of Magnesia)

**magnesium oxide**

(Mag-Ox 400, Uro-Mag)

**magnesium sulfate**

(Epsom salt, magnesium sulfate injection)

**Do not confuse magnesium sulfate with morphine sulfate.****FIXED-COMBINATION(S)**With aluminum and simethicone, an antiflatulent (**Mylanta**).**◆ CLASSIFICATION****CLINICAL:** Antacid, anticonvulsant, electrolyte, laxative.**USES**

**Magnesium chloride:** Treatment/prevention of hypomagnesemia. Dietary supplement. **Magnesium citrate:** Evacuation of bowel before surgical, diagnostic procedures. Relieves occasional constipation. **Magnesium hydroxide:** Short-term treatment of constipation, symptoms of hyperacidity, laxative. **Magnesium oxide:** Relief of acid indigestion and upset stomach, short-term relief of constipation. Dietary supplement. **Magnesium sulfate:** Treatment/prevention of hypomagne-

mia; prevention and treatment of seizures in severe preeclampsia or eclampsia; pediatric acute nephritis, treatment of arrhythmias due to hypomagnesemia (ventricular fibrillation, ventricular tachycardia, or torsades de pointes). **OFF-LABEL: Magnesium sulfate:** Asthma exacerbation unresponsive to conventional treatment.

**PRECAUTIONS**

**Contraindications:** **Antacid:** Appendicitis, symptoms of appendicitis, ileostomy, intestinal obstruction, severe renal impairment. **Laxative:** Appendicitis, HF, colostomy, hypersensitivity, ileostomy, intestinal obstruction, undiagnosed rectal bleeding. **Systemic:** Heart block, myocardial damage, IV use for pre-eclampsia/eclampsia during the 2 hrs prior to delivery. **Cautions:** Safety in children younger than 6 yrs not known. **Antacids:** Undiagnosed GI/rectal bleeding, ulcerative colitis, colostomy, diverticulitis, chronic diarrhea. **Laxative:** Diabetes, pts on low-salt diet (some products contain sugar, sodium). **Systemic:** Severe renal impairment. Myasthenia gravis or other neuromuscular diseases.

**ACTION**

**Antacid:** Acts in stomach to neutralize gastric acid. **Therapeutic Effect:** Increases pH. **Laxative:** Osmotic effect primarily in small intestine, draws water into intestinal lumen. **Therapeutic Effect:** Promotes peristalsis, bowel evacuation. **Systemic (dietary supplement replacement):** Found primarily in intracellular fluids. **Therapeutic Effect:** Essential for enzyme activity, nerve conduction, muscle contraction. Maintains and restores magnesium levels. **Anticonvulsant:** Blocks neuromuscular transmission, amount of acetylcholine released at motor end plate. **Therapeutic Effect:** Produces seizure control.

**PHARMACOKINETICS**

**Antacid, laxative:** Minimal absorption through intestine. Absorbed dose primarily excreted in urine. **Systemic:** Widely distributed. Primarily excreted in urine.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** **Antacid:** Unknown if distributed in breast milk. **Parenteral:** Readily crosses placenta. Distributed in breast milk for 24 hrs after magnesium therapy is discontinued. Continuous IV infusion increases risk of magnesium toxicity in neonate. IV administration should not be used 2 hrs preceding delivery. **Children:** No age-related precautions noted. **Elderly:** Increased risk of developing magnesium deficiency (e.g., poor diet, decreased absorption, medications).

**INTERACTIONS**

**DRUG:** May decrease absorption of **quinolones** (e.g., **ciprofloxacin**, **levofloxacin**), **tetracycline**, **bisphosphonates**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** **Antacid:** May increase gastrin production, pH. **Laxative:** May decrease serum potassium. **Systemic:** None significant.

**AVAILABILITY (Rx)****MAGNESIUM CHLORIDE**

**Tablets:** (*Mag-Delay*, *Slow-Mag*): 64 mg.

**MAGNESIUM CITRATE**

**Oral Solution:** (*Citroma*): 290 mg/5 mL.

**Tablets:** 100 mg.

**MAGNESIUM HYDROXIDE**

**Suspension, Oral:** (*Milk of Magnesia*): 400 mg/5 mL, 1,200 mg/15 mL.

**Tablets:** 400 mg.

**MAGNESIUM OXIDE**

**Capsules:** (*Uro-Mag*): 140 mg. **Tablets:** (*Mag-Ox 400*): 400 mg.

**MAGNESIUM SULFATE**

**Infusion Solution:** 10 mg/mL, 20 mg/mL, 40 mg/mL, 80 mg/mL. **Injection Solution:** 125 mg/mL, 500 mg/mL.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Must dilute to maximum concentration of 20% for IV infusion. May give IV push, IV piggyback, or continuous infusion.

**Rate of administration** • For IV push (diluted): Give no faster than 150 mg/min. For IV infusion, maximum rate of infusion is 2 g/hr.

**Storage** • Store at room temperature.

**IM**

• For adults, elderly, use 250 mg/mL (25%) or 500 mg/mL (50%) magnesium sulfate concentration. • For infants, children, do not exceed 200 mg/mL (20% diluted solution).

**PO (Antacid)**

• Shake suspension well before use. • Chewable tablets should be chewed thoroughly before swallowing, followed by full glass of water.

**PO (Laxative)**

• Drink full glass of liquid (8 oz) with each dose (prevents dehydration). • Flavor may be improved by following with fruit juice, citrus carbonated beverage. • Refrigerate citrate of magnesia (retains potency, palatability).

**IV INCOMPATIBILITIES**

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), lansoprazole (Prevacid), pantoprazole (Protonix).

**IV COMPATIBILITIES**

Amikacin (Amikin), ceFAZolin (Ancef), ciprofloxacin (Cipro), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), enalapril (Vasotec), gentamicin, heparin, HYDROMorphone (Dilaudid), insulin, linezolid (Zyvox), metoclopramide (Reglan), milrinone (Primacor), morphine, piperacillin/tazobactam (Zosyn), potassium chloride, propofol (Diprivan), tobramycin (Nebcin), vancomycin (Vancocin).

**INDICATIONS/ROUTES/DOSAGE****MAGNESIUM SULFATE****Hypomagnesemia****Mild to Moderate**

**IV: ADULTS, ELDERLY:** 1–4 g as 1 g/hr.

**Maximum:** 12 g/12 hrs.

**Severe Deficiency**

**IV: ADULTS, ELDERLY:** 4–8 g as 1 g/hr.

**IV: CHILDREN:** 25–50 mg/kg/dose over 10–20 min. **Maximum single dose:** 2 g.

**Usual Dose for Neonates**

**IM/IV:** 25–50 mg/kg/dose q8–12h for 2–3 doses.

**Eclampsia/Pre-eclampsia**

**IV: ADULTS:** 4–6 g loading dose over 20–30 min, then 1–2 g/hr continuous infusion. **Maximum:** 40 g/24 hrs.

**MAGNESIUM CHLORIDE****Dietary Supplement**

**PO: ADULTS, ELDERLY:** 2 tablets once daily.

**MAGNESIUM CITRATE****Laxative**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 195–300 mL once or in divided doses. **6–12 YRS:** 100–150 mL once or in divided doses. **2–5 YRS:** 60–90 mL once or in divided doses.

**MAGNESIUM HYDROXIDE****Antacid**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** (400 mg/5 mL): 5–15 mL as needed up to 4 times/day.

**Laxative**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** (400 mg/5 mL): 30–60 mL at HS or in divided doses. (**Tablet:**) 8 tabs/day in divided doses. **CHILDREN 6–11 YRS:** (400 mg/5 mL): 15–30 mL at HS. **CHILDREN 2–5 YRS:** 5–15 mL at HS.

**MAGNESIUM OXIDE****Antacid/Dietary Supplement**

**PO: ADULTS, ELDERLY:** 1–2 tablets daily.

**Dosage in Renal Impairment**

Use caution.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent: Antacid:** Chalky taste, diarrhea, laxative effect. **Occasional: Antacid:** Nausea, vomiting, stomach cramps. **Antacid, laxative:** Prolonged use or large doses in renal impairment may cause hypermagnesemia (dizziness, palpitations, altered mental status, fatigue, weakness). **Laxative:** Cramping, diarrhea, increased thirst, flatulence. **Systemic (dietary supplement, electrolyte replacement):** Reduced respiratory rate, decreased reflexes, flushing, hypotension, decreased heart rate.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Magnesium as antacid, laxative has no known adverse reactions. Systemic use may produce prolonged PR interval, widening of QRS interval. Magnesium toxicity may cause loss of deep tendon reflexes, heart block, respiratory paralysis, cardiac arrest. **Antidote:** 10–20 mL 10% calcium gluconate (5–10 mEq of calcium).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess sensitivity to magnesium. **Antacid:** Assess GI pain (duration, location, quality, time of occurrence, relief with food, causative/exacerbative factors). **Laxative:** Assess for weight loss, nausea, vomiting, history of recent abdominal surgery. **Systemic:** Assess renal function, serum magnesium.

**INTERVENTION/EVALUATION**

**Antacid:** Assess for relief of gastric distress. Monitor renal function (esp. if dosing is long term or frequent). **Laxative:** Monitor daily pattern of bowel activity, stool consistency. Maintain adequate fluid intake. **Systemic:** Monitor renal function, magnesium levels, ECG for cardiac function. Test patellar reflexes before giving repeated, rapid parenteral doses (used as

indication of CNS depression; suppressed reflexes may be sign of impending respiratory arrest). Patellar reflex must be present, respiratory rate should be 16/min or over before each parenteral dose. Initiate seizure precautions.

#### PATIENT/FAMILY TEACHING

- **Antacid:** Take at least 2 hrs apart from other medication.
- Do not take longer than 2 wks unless directed by physician.
- For peptic ulcer, take 1 and 3 hrs after meals and at bedtime for 4–6 wks.
- Chew tablets thoroughly, followed by 8 oz of water; shake suspensions well.
- Repeat dosing or large doses may have laxative effect.
- **Laxative:** Drink full glass (8 oz) liquid to aid stool softening.
- Use only for short term. Do not use if abdominal pain, nausea, vomiting is present.
- **Systemic:** Report symptoms of hypermagnesemia (altered mental status, difficulty breathing, dizziness, fatigue, palpitations, weakness).

## mannitol

man-it-ol  
(Osmitol)

**Do not confuse Osmitol with esmolol.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Polyol (sugar alcohol). **CLINICAL:** Osmotic diuretic.

#### USES

Reduces increased ICP due to cerebral edema, brain mass, IOP due to acute glaucoma. **OFF-LABEL:** Improves renal transplant function. Severe, traumatic brain injury.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to mannitol. Severe dehydration, active intracranial bleeding (except during craniotomy), severe pulmonary edema, congestion, severe renal disease (anuria), progressive HF. **Cautions:** Concurrent nephrotoxic agents, conditions increasing sensitivity to bronchoconstriction (e.g., recent abdominal, thoracic surgery), sepsis, preexisting renal disease, hypernatremia.

#### ACTION

Increases osmotic pressure of glomerular filtrate, inhibiting tubular reabsorption of water and electrolytes, resulting in increased urine output. Reduces intracranial pressure by decreasing blood viscosity, thereby increasing cerebral blood flow/oxygen transport. **Therapeutic Effect:** Produces diuresis; reduces intraocular pressure (IOP), intracranial pressure (ICP), cerebral edema.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV (diuresis)	1–3 hrs	N/A	—
IV (reduced ICP)	15–30 min	N/A	1.5–6 hrs

Remains in extracellular fluid. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 4.7 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

#### INTERACTIONS

**DRUG:** May increase nephrotoxic effect of **aminoglycosides** (e.g., **amikacin, gentamicin, tobramycin**). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum phosphate, potassium. May increase serum sodium, osmolality.

**AVAILABILITY (Rx)**

**Injection Solution:** 5%, 10%, 15%, 20%, 25%.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Assess IV site for patency before each dose. Pain, thrombosis noted with extravasation. Use in-line filter (less than 5 microns) for concentrations over 20%. Central venous access is recommended for repeated or scheduled doses.

**Rate of administration** • Administer test dose for pts with oliguria. • Give IV push over 3–5 min; over 30–60 min for cerebral edema, elevated ICP. Maximum concentration: 25%. • Do not add KCl or NaCl to mannitol 20% or greater. Do not add to whole blood for transfusion.

**Storage** • Store at room temperature. • If crystals are noted in solution, warm bottle in hot water, shake vigorously at intervals. Cool to body temperature before administration. Do not use if crystals remain after warming procedure.

**IV INCOMPATIBILITIES**

Cefepime (Maxipime), filgrastim (Neupogen), imipenem-cilastatin (Primaxin).

**IV COMPATIBILITIES**

CISplatin (Platinol), furosemide (Lasix), linezolid (Zyvox), ondansetron (Zofran), propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****USUAL DOSAGE****Elevated Intracranial Pressure**

**IV: ADULTS, ELDERLY:** 0.25–1 g/kg/dose. May repeat q6–8h as needed to maintain serum osmolality <300–325 mOsm/kg. **CHILDREN:** 0.25–1 g/kg/dose; repeat to maintain serum osmolality <300–320 mOsm/kg.

**IOP Reduction**

**IV: ADULTS, ELDERLY:** 1.5–2 g/kg over 30–60 min 1–1.5 hrs prior to surgery. **CHILDREN:** 1–2 g/kg over 30–60 min 1–1.5 hrs prior to surgery.

**Dosage in Renal Impairment**

Contraindicated with severe impairment; caution with underlying renal disease.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Dry mouth, thirst. **Occasional:** Blurred vision, increased urinary frequency/volume, headache, arm pain, backache, nausea, vomiting, urticaria, dizziness, hypotension, hypertension, tachycardia, fever, angina-like chest pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Fluid, electrolyte imbalance may occur due to rapid administration of large doses or inadequate urine output resulting in overexpansion of extracellular fluid. Circulatory overload may produce pulmonary edema, HF. Excessive diuresis may produce hypokalemia. Fluid loss in excess of electrolyte excretion may produce hypernatremia, hyperkalemia.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum osmolality, sodium. Obtain baseline B/P, pulse. Assess skin turgor, mucous membranes, mental status, muscle strength. Obtain baseline weight. Assess hydration status.

**INTERVENTION/EVALUATION**

Monitor urinary output to assess for therapeutic response. Monitor serum electrolytes, serum osmolality, ICP, renal function, LFT. Assess vital signs, skin turgor, mucous membranes. Weigh daily. Monitor for signs of hypernatremia (confusion, drowsiness, thirst, dry mouth, cold/clammy skin); signs of hypokalemia (changes in muscle strength, tremors, muscle cramps, altered mental status, cardiac arrhythmias). Signs of hyperkalemia include colic, diarrhea, muscle twitching followed by weakness, paralysis, arrhythmias. Inspect IV tubing, in-line filter for crystallization prior to each IV dose.

**PATIENT/FAMILY TEACHING**

- Expect increased urinary frequency/volume.
- May cause dry mouth.

**margetuximab-cmkb**

mar-je-**tux-i-mab**)-cmkb  
(Margenza)

■ **BLACK BOX ALERT** ■ May cause reduction in left ventricular ejection fraction (LVEF). Evaluate cardiac function before initiation and during treatment. Discontinue treatment if clinically significant decrease in LVEF is confirmed. Exposure during pregnancy can cause embryofetal harm.

**Do not confuse margetuximab with brentuximab, cetuximab, dinutuximab, isatuximab, mepolizumab, rituximab, siltuximab, or trastuzumab.**

♦ **Classification**

**PHARMACOTHERAPEUTIC:** HER2/neu receptor antagonist, monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with metastatic HER2-positive breast cancer who have received two or more prior anti-HER2 regimens, at least one of which was for metastatic disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to margetuximab-cmkb. **Cautions:** Baseline cytopenias, hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); cardiomyopathy (treatment not studied in pts with LVEF less than 50%, history of myocardial infarction, unstable angina within 6 mos, or NYHA class II–IV HF).

Due to increased risk of cardiac dysfunction, avoid anthracyclines for up to 4 mos prior to initiation.

**ACTION**

Binds to extracellular domain of human epidermal growth factor receptor-2 (HER2) protein, inhibiting proliferation of HER2-overexpressing tumor cells and mediating antibody-dependent cellular toxicity. **Therapeutic Effect:** Inhibits tumor cell proliferation.

**PHARMACOKINETICS**

Widely distributed. Metabolized into small peptides via catabolic pathway. Steady state reached in 2 mos. Excretion not specified.

**Half-life:** 19.2 days.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions, cardiotoxicity.

**INTERACTIONS**

**DRUG:** May increase cardiotoxicity of anthracyclines (e.g., daunorubicin, doxorubicin, epirubicin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, international normalized ratio (INR), lipase. May decrease Hgb, leukocytes, lymphocytes, neutrophils. May prolong aPTT.

**AVAILABILITY (Rx)**

**Injection Solution:** 250 mg/10 mL (25 mg/mL).

## ADMINISTRATION/HANDLING

**Infusion Guidelines** • Infusion bag must be made of polyvinylchloride (PVC), polyethylene, polypropylene, polyolefins (only), or copolymer of olefins. • Infuse via dedicated IV line using a sterile, nonpyrogenic, low-protein-binding polyethersulfone (PES), 0.2 micron in-line or add-on filter. • If a dose is missed, give as soon as possible and adjust schedule to maintain treatment interval. • If margetuximab-cmkb and chemotherapy regimen are to be given on the same day, may give margetuximab-cmkb immediately after chemotherapy is complete. • Interrupt infusion if dyspnea or significant hypotension occurs. • Consider premedication with antihistamines, antipyretics, corticosteroids for infusion reaction prophylaxis.

**Preparation** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate dose based on weight in kg. Round dose volume to the nearest 0.1 mL. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow or brown. Translucent, proteinaceous particles may be present. Do not use if solution is cloudy or discolored. • Gently swirl vial. Do not shake or agitate. • Dilute in 100 mL or 250 mL 0.9% NaCl infusion bag to a final concentration between 0.5 and 7.2 mg/mL. • Gently invert to mix. Do not shake or agitate. • Discard unused portions of vial.

**Rate of administration** • **Initial infusion:** Infuse over 120 min. **Subsequent infusions:** Infuse over 30 min.

**Infusion reactions** • Decrease infusion rate if mild or moderate infusion reactions occur.

**Storage** • Refrigerate unused vials in original carton. Protect from light. • Di-

luted solution may be refrigerated for up to 24 hrs or stored at room temperature up to 4 hrs. • Do not freeze. • If refrigerated, allow diluted solution to warm to room temperature.

## IV INCOMPATIBILITIES

Do not dilute in D5W. Do not mix or infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Breast Cancer (HER2-Positive, Metastatic)

**IV; ADULTS:** 15 mg/kg q3wks. Continue until disease progression or unacceptable toxicity.

### Dose Modification

#### Cardiac Toxicity

Withhold treatment for at least 4 wks for an absolute decrease in LVEF that is greater than or equal to 16% from baseline; LVEF below institutional limits of normal (or 50% if no limits are available) and an absolute decrease in LVEF greater than or equal to 10% from baseline. May resume treatment if LVEF returns to normal limits and the absolute decrease from baseline is less than or equal to 15% within 8 wks. Permanently discontinue if treatment is withheld for more than 3 occasions due to cardiotoxicity or decline of LVEF persists for more than 8 wks.

#### Infusion-Related Reactions

Interrupt infusion for dyspnea or significant hypotension. Permanently discontinue in pts with severe or life-threatening infusion reactions.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (57%–25%):** Fatigue, asthenia, nausea, diarrhea. **Occasional (21%–6%):** Vomiting, constipation, pyrexia, headache, alopecia, abdominal pain, peripheral neuropathy, cough, decreased appetite, arthralgia, myalgia, dyspnea, extremity pain, dizziness, stomatitis, decreased weight, dysgeusia, rash, insomnia. **Rare (5%–2%):** Hypertension, syncope.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia) is an expected response to therapy. Left ventricular dysfunction reported in 2% of pts. Infusion reactions, including arthralgia, cough, chills, diaphoresis, dizziness, dyspnea, fatigue, fever, flushing, headache, hypotension, nausea, pruritus, rash, tachycardia, urticaria, vomiting, reported in 13% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with skin redness, swelling, numbness, sloughing of the hands and feet, reported in 13% of pts. Immunogenicity (auto-margetuximab-cmkb antibodies) reported in 4% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT.

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Verify use of effective contraception. Obtain weight in kg. Verify presence of HER2 protein overexpression in tumor specimen. Question occurrence of infusion-related reactions prior to each dose. Administer in an environment equipped to monitor for and manage infusion-related reactions; verify emergency resuscitation equipment/

medications are readily available. Assess LVEF by echocardiogram or MUGA scan within 4 wks of initiation. Question history of cardiomyopathy, hepatic/renal impairment; recent administration of anthracyclines. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT as clinically indicated. Diligently monitor for infusion reactions. Severe infusion reactions may require emergency resuscitation; early detection is vital. Assess for symptoms of HF (chest pain, dyspnea, palpitations, swelling of extremities). Assess LVEF by echocardiogram or MUGA scan q3mos until discontinuation. If treatment is withheld due to change in LVEF, monitor LVEF at 4-wk intervals. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Assess skin for PPES.

### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Life-threatening infusion reactions may occur. Immediately report infusion reactions of any kind.
- Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms.
- Report heart problems (difficulty breathing, fainting, palpitations, swelling of extremities), toxic skin reactions (itching, peeling, rash, redness, swelling).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Maintain proper hydration and nutrition.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## medroxyPROGESTERone

me-drox-ee-proe-jes-ter-one  
(Depo-Provera, Depo-SubQ Provera 104, Provera)

**BLACK BOX ALERT** Prolonged use (over 2 yrs) of contraceptive injection form may result in loss of bone mineral density. Limit long-term use (more than 2 yrs). May increase risk of dementia in postmenopausal women. Increased risk of invasive breast cancer in postmenopausal women in combination with conjugated estrogens.

**Do not confuse medroxyPROGESTERone with HYDROXYprogesterone, methylPREDNISolone, or methylTESTOSTERone, or Provera with Covera, Femara, Parlodel, or Premarin.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hormone. **CLINICAL:** Progestin, antineoplastic, contraceptive hormone.

### USES

Reduction of endometrial hyperplasia in nonhysterectomized postmenopausal women (concurrently given with estrogen to women with intact uterus), treatment of secondary amenorrhea, abnormal uterine bleeding due to hormonal imbalance. Adjunctive therapy, palliative treatment of inoperable, recurrent, metastatic endometrial carcinoma; prevention of pregnancy, endometriosis-associated pain. **OFF-LABEL:** Treatment of paraphilia/hypersexuality.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to medroxyPROGESTERone. Breast cancer (known, suspected, or prior history), history of or active thrombotic disorders (thrombophlebitis, DVT, MI, pulmonary embolism), known or suspected pregnancy, severe hepatic impairment,

undiagnosed abnormal vaginal bleeding, cerebrovascular disease. **Cautions:** Conditions aggravated by fluid retention (asthma, seizures, migraine, cardiac/renal dysfunction), diabetes, history of mental depression, preexisting hypercholesterolemia, hypertriglyceridemia.

### ACTION

Inhibits secretion of pituitary gonadotropins, transforming proliferative endometrium into secretory endometrium. **Therapeutic Effect:** When used for contraception, inhibits secretion of pituitary gonadotropins, prevents follicular maturation and ovulation, causing endometrial thinning. Reduces incidence of endometrial hyperplasia and risk of adenocarcinoma. When used for endometriosis, progestogens (e.g., medroxyprogesterone), leads to atrophy of endometrial tissue. Decreases endometriosis-associated pain.

### PHARMACOKINETICS

Widely distributed. Slowly absorbed after IM administration. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life: PO:** 12–17 hrs. **IM:** 40–50 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid use during pregnancy, esp. first 4 mos (congenital heart, limb reduction defects may occur). Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect, resulting in contraceptive failure. May decrease therapeutic effect of anticoagulants (e.g., warfarin). **HERBAL:** St. John's wort may decrease effect of progestin contraceptive. **Herbals with progestogenic properties** (e.g., bloodroot, chasteberry, yucca) may increase adverse effects.

**FOOD:** None known. **LAB VALUES:** May alter serum thyroid, LFT, PT, HDL, total cholesterol, triglycerides; metapyrone test. May increase LDL.

## AVAILABILITY (Rx)

**Injection Suspension: (Depo-SubQ Provera 104):** 104 mg/0.65 mL prefilled syringe. **(Depo-Provera):** 150 mg/mL, 400 mg/mL. **Tablets: (Provera):** 2.5 mg, 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### IM

- Shake vial immediately before administering (ensures complete suspension).
- Administer deep IM into gluteal or deltoid muscle.
- Shake vigorously prior to administration.
- Inject in upper thigh or abdomen (avoid bony areas and umbilicus).
- Give over 5–7 sec; do not rub injection area.

### PO

- Give with food.

## INDICATIONS/ROUTES/DOSAGE

### Endometrial Hyperplasia

**PO: ADULTS:** 5–10 mg/day for 12–14 consecutive days each month starting on day 1 or 16 of cycle.

### Secondary Amenorrhea

**PO: ADULTS:** 5–10 mg/day for 5–10 days, beginning at any time during menstrual cycle.

### Abnormal Uterine Bleeding

**PO: ADULTS:** 5–10 mg/day for 5–10 days, beginning on calculated day 16 or day 21 of menstrual cycle.

### Endometrial Carcinoma

**IM: ADULTS, ELDERLY:** Initially, 400–1,000 mg; repeat at 1-wk intervals.

### Pregnancy Prevention

**IM: (Depo-Provera): ADULTS:** 150 mg q3mos (q13 wks).

**SO: (Depo-Subq Provera 104): ADULTS:** 104 mg q3mos (q12–14wks).

### Endometriosis

**SO: (Depo-Subq Provera 104): ADULTS:** 104 mg q3mos (q12–14 wks).

## Dosage in Renal Impairment

No dose adjustment.

## Dosage in Hepatic Impairment

Contraindicated with severe impairment.

## SIDE EFFECTS

**Frequent:** Transient menstrual abnormalities (spotting, change in menstrual flow/cervical secretions, amenorrhea) at initiation of therapy. **Occasional:** Edema, weight change, breast tenderness, anxiety, insomnia, fatigue, dizziness. **Rare:** Alopecia, depression, dermatologic changes, headache, fever, nausea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Thrombophlebitis, pulmonary/cerebral embolism, retinal thrombosis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain usual menstrual history. Question for hypersensitivity to progestins. Obtain baseline weight, B/P, pregnancy test in females of reproductive potential.

### INTERVENTION/EVALUATION

Check weight daily; report wkly gain of 5 lb or more. Assess B/P periodically. Assess skin for rash, urticaria. Report development of chest pain, sudden shortness of breath, sudden decrease in vision, migraine headache, pain (esp. with swelling, warmth, redness) in calves, numbness of arm/leg (thrombotic disorders) immediately.

### PATIENT/FAMILY TEACHING

- Report sudden loss of vision, severe headache, chest pain, coughing up of blood (hemoptysis), numbness in arm/leg, severe pain/swelling in calf, unusually heavy vaginal bleeding, severe abdominal pain/tenderness.
- Depo-Provera Contraceptive injection should be used as long-term birth control method (e.g., longer than 2 yrs) only if other birth control methods are inadequate.

## megestrol

**HIGH  
ALERT**

meh-jes-trol

**Do not confuse megestrol with mesalamine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic hormone. **CLINICAL:** Antineoplastic, progestin, appetite stimulant.

### USES

Palliative treatment of advanced endometrial or breast carcinoma; treatment of anorexia, cachexia, unexplained significant weight loss in pts with AIDS.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to megestrol. **Suspension:** Known or suspected pregnancy. **Cautions:** History of thrombophlebitis, elderly.

### ACTION

Antiestrogenic; interferes with normal estrogen cycle by decreasing release of luteinizing hormone (LH) from anterior pituitary gland by inhibiting pituitary function. Antineoplastic effect may act through an antiluteinizing effect mediated via the pituitary. May increase appetite by antagonizing metabolic effects of catabolic cytokines. **Therapeutic Effect:** Reduces tumor size. Increases appetite.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Excreted in urine. **Half-life:** 13–105 hrs (mean 34 hrs).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first 4 mos. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Use caution.

### INTERACTIONS

**DRUG:** May decrease therapeutic effect of **anticoagulants (e.g., warfarin)**. May increase concentration/effect of **dofetilide**. **HERBAL:** Avoid **black cohosh, dong quai** in estrogen-dependent tumors. Avoid **herbs with progestogenic properties (e.g., bloodroot, chasteberry, yucca)**; may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May alter serum thyroid, LFT, PT, HDL, total cholesterol, triglycerides. May increase LDL.

### AVAILABILITY (Rx)

**Oral Suspension:** 40 mg/mL, 625 mg/5 mL. **Tablets:** 20 mg, 40 mg.

### ADMINISTRATION/HANDLING

#### PO

- Store tablets, oral suspension at room temperature.
- Shake suspension well before use.
- Oral suspension compatible with water, orange juice, apple juice.
- Administer without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Palliative Treatment of Advanced Breast Cancer

**PO: ADULTS, ELDERLY:** 40 mg 4 times/day for at least 2 mos.

#### Palliative Treatment of Advanced Endometrial Carcinoma

**PO: ADULTS, ELDERLY:** 40–320 mg/day in divided doses for at least 2 mos.

#### Anorexia, Cachexia, Weight Loss

**PO: ADULTS, ELDERLY:** Initially, 625 mg (125 mg/mL suspension) or 800 mg (40 mg/mL suspension) daily.

#### Dosage in Renal Impairment

Use caution.

#### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Weight gain secondary to increased appetite. **Occasional:** Nausea, breakthrough menstrual bleeding, backache, headache, breast tenderness, carpal tunnel syndrome. **Rare:** Feeling of coldness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Thrombophlebitis, pulmonary embolism occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pregnancy test in females of reproductive potential. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for tumor response. Monitor pt weight, caloric intake (appetite stimulant).

### PATIENT/FAMILY TEACHING

- Contraception is imperative.
- Report lower leg (calf) pain, difficulty breathing, vaginal bleeding.
- May cause headache, nausea, vomiting, breast tenderness, backache.

## meloxicam

mel-ox-i-kam

(Anjeso, Mobic, Qmiiz ODT, Vivlodex)

**BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, GI perforation.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID.

**CLINICAL:** Anti-inflammatory, analgesic.

## USES

**Oral:** Relief of signs/symptoms of osteoarthritis, rheumatoid arthritis (RA). Treatment of juvenile idiopathic arthritis

(JIA) in pts 2 yrs of age and older (suspension) and weighing 60 kg or more (tablets). **IV:** Management of moderate to severe pain in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to meloxicam. Pts with aspirin triad (asthma, rhinitis, aspirin intolerance). History of asthma, urticaria with NSAIDs, perioperative pain in setting of CABG surgery. **Injection only:** Moderate to severe renal insufficiency in pts at risk for renal failure due to volume depletion. **Cautions:** Renal/hepatic impairment, asthma, coagulation disorders, hypertension, pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies), history of cardiovascular disease, MI; concurrent use of anticoagulants, fluid retention, HF, dehydration, smoking, alcohol use, elderly, debilitated.

## ACTION

Produces analgesic, antipyretic, anti-inflammatory effects by inhibiting prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammatory response, intensity of pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (Analgesic)	30 min	4–5 hrs	N/A

Widely distributed. Protein binding: 99%. Metabolized in liver. Steady-state reached in 5 days. Excreted equally in urine, feces. Not removed by hemodialysis. **Half-life:** 15–20 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid use at 30 wks gestation or more (may cause premature closure of ductus arteriosus). Distributed in breast milk. May impair fertility in both females and males. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment. More susceptible to GI toxicity; lower dosage recommended.

**INTERACTIONS**

**DRUG:** May increase anticoagulant effect of **apixaban**, **dagibatran**, **edoxaban**, **rivaroxaban**. **Bile acid sequestrants** (e.g., **cholestyramine**) may decrease absorption. May increase nephrotoxic effect of **cycloSPORINE**, **tacrolimus**, **tenofovir**. May decrease effect of **loop diuretics** (e.g., **furosemide**). May decrease antihypertensive effect of **ACE inhibitors** (e.g., **enalapril**, **lisinopril**), **angiotensin receptor blockers** (e.g., **losartan**, **valsartan**), **beta blockers** (e.g., **carvedilol**, **metoprolol**). **HERBAL:** **Glucosamine**, **herbals with anticoagulant/antiplatelet properties** (e.g., **garlic**, **ginger**, **ginkgo biloba**, **ginseng**), **alfalfa**, **anise**, **bilberry**. may increase concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, ALT, AST.

**AVAILABILITY (Rx)**

**Injection Solution:** (**Anjeso**): 30 mg/mL. **Tablets:** (**Mobic**): 7.5 mg, 15 mg. **Cap-sules:** (**Vivlodex**): 5 mg, 10 mg. **Tablet ODT:** (**Qmiiz**): 7.5 mg, 15 mg.

**ADMINISTRATION/HANDLING****IV**

- Administer undiluted as an IV bolus over 15 sec.

**PO**

- Give with food or milk to minimize GI irritation.
- **ODT:** Do not remove from blister until ready to administer. Using dry hands, peel backing off the blister; do not push tablet through foil. Remove tablet and place in mouth or on tongue and allow to disintegrate. Swallow with saliva (with or without drinking liquid).

**INDICATIONS/ROUTES/DOSAGE****Rheumatoid Arthritis (RA)**

**PO:** (**ODT**): **ADULTS, ELDERLY:** Initially, 7.5 mg/day. **Maximum:** 15 mg/day.

**Osteoarthritis**

**PO:** (**Capsule**): **ADULTS, ELDERLY:** Initially, 5 mg once daily. May increase to 10 mg once daily.

**PO:** (**ODT**): **ADULTS, ELDERLY:** Initially, 7.5 mg once daily. May increase to 15 mg once daily.

**PO:** (**Tablet**): **ADULTS, ELDERLY:** Initially, 7.5 mg once daily. May increase to 15 mg once daily.

**Pain (Moderate to severe)**

**IV:** **ADULTS, ELDERLY:** 30 mg once daily.

**JIA**

**PO:** (**ODT**): **ADOLESCENTS, CHILDREN WEIGHING 60 KG OR GREATER:** 7.5 mg once daily.

**Dosage in Renal Impairment**

Not recommended with severe impairment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (9%–7%):** Dyspepsia, headache, diarrhea, nausea. **Occasional (4%–3%):** Dizziness, insomnia, rash, pruritus, flatulence, constipation, vomiting. **Rare (less than 2%):** Drowsiness, urticaria, photosensitivity, tinnitus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of severe HF; cardiovascular thrombotic events, including MI. Life-threatening GI effects including inflammation, GI bleeding, ulceration, and perforation of esophagus, small intestines, stomach, and large intestines were reported. Hepatotoxicity reported in 1% of pts. May cause new onset or worsening of hypertension. Hypersensitivity reactions including anaphylaxis may occur. Cutaneous toxicities including Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis may occur. May mask symptoms of inflammation and fever. Severe renal injury may cause hyperkalemia. In pts treated chronically, peptic ulcer, GI bleeding, gastritis, severe hepatic toxicity (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), severe hypersensitivity reaction (bronchospasm, angioedema) occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question history of GI bleeding, gastric or duodenal ulcers, hepatic/renal impairment, asthma.

### INTERVENTION/EVALUATION

Monitor CBC, renal function, LFT. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor B/P for hypertension. Immediately report abdominal pain, fever, hematemesis, melena; may indicate GI perforation. Monitor for hypersensitivity reactions; symptoms of MI (chest pain, dyspnea, syncope, diaphoresis, arm/jaw pain). Assess skin for cutaneous toxicities. Monitor for symptoms of HF (dyspnea, edema, fatigue, palpitations). Obtain LVEF by echocardiogram if HF is suspected.

### PATIENT/FAMILY TEACHING

- Take with food, milk to reduce GI upset.
- Treatment may worsen high blood pressure.
- Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes); kidney problems (decreased urine output, flank pain, darkened urine); toxic skin reactions (rash, skin eruptions); symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), HF (difficulty breathing, fatigue, palpitations, extremity swelling). Allergic reactions, including anaphylaxis, may occur.
- Avoid use after 30 wks gestation.

## memantine

**TOP  
100**

me-man-teen

 (Ebixa , Namenda, Namenda XR)

### FIXED-COMBINATION(S)

**Namzaric:** memantine/donepezil (a cholinesterase inhibitor): 7 mg/10 mg; 14 mg/10 mg; 21 mg/10 mg; 28 mg/10 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NMDA receptor antagonist. **CLINICAL:** Anti-Alzheimer's agent.

### USES

Treatment of moderate to severe dementia of Alzheimer's type. **OFF-LABEL:** Treatment of mild to moderate vascular dementia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to memantine. **Cautions:** Moderate to severe renal impairment, severe hepatic impairment, cardiovascular disease, seizure disorder, GU conditions that raise urine pH level.

### ACTION

Decreases effects of glutamate, the principal excitatory neurotransmitter in the brain. Persistent CNS excitation by glutamate is thought to cause symptoms of Alzheimer's disease. **Therapeutic Effect:** May slow clinical deterioration in moderate to severe Alzheimer's disease.

### PHARMACOKINETICS

Widely distributed. Protein binding: 45%. Undergoes minimal metabolism. Primarily excreted in urine. **Half-life:** 60–80 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not

prescribed for this pt population. **Elderly:** No age-related precautions noted, but use is not recommended in pts with severe renal impairment (CrCl less than 9 mL/min).

## INTERACTIONS

**DRUG:** Urine alkalinizers (e.g., carbonic anhydrase inhibitors, sodium bicarbonate) may decrease renal elimination. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Oral Solution:** 10 mg/5 mL. **Tablets:** 5 mg, 10 mg.

 **Capsules, Extended-Release:** (*Namenda XR*): 7 mg, 14 mg, 21 mg, 28 mg.

M

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer oral solution using syringe provided. Do not dilute or mix with other fluids.
- Give extended-release capsules whole. Do not crush. May open capsule and sprinkle on applesauce; give immediately.

## INDICATIONS/ROUTES/DOSAGE

### Alzheimer's Disease

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): Initially, 5 mg once daily. May increase dose at intervals of at least 1 wk in 5-mg increments to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg and 10 mg as separate doses), then 20 mg/day (10 mg twice daily). Target dose: 20 mg/day. (*Extended-Release*): Initially, 7 mg once daily. May increase at intervals of at least 7 days in increments of 7 mg. **Maximum:** 28 mg once daily. Switching from immediate-release to extended-release: Begin the day following last dose of immediate-release.

10 mg twice daily: 28 mg once daily.

5 mg twice daily: 14 mg once daily.

## Dosage in Renal Impairment

Creatinine Clearance	Dosage	
	Immediate-Release	Extended-Release
30 mL/min or greater	No adjustments	No adjustments
5–29 mL/min	5 mg twice daily or 10 mg once daily	14 mg once daily

## Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Occasional (7%–4%):** Dizziness, headache, confusion, constipation, hypertension, cough. **Rare (3%–2%):** Back pain, nausea, fatigue, anxiety, peripheral edema, arthralgia, insomnia.

## ADVERSE EFFECTS/TOXIC REACTIONS

None known.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess cognitive, behavioral, functional deficits. Assess renal function. Question history of cardiovascular disease, hepatic/renal impairment, seizure disorder.

### INTERVENTION/EVALUATION

Monitor BUN, CrCl, serum creatinine. Monitor cognitive, behavioral, functional status of pt. Monitor urine pH (alterations of urine pH toward the alkaline condition may lead to accumulation of the drug with possible increase in side effects).

### PATIENT/FAMILY TEACHING

- Do not reduce or stop medication; do not increase dosage without physician direction.
- Ensure adequate fluid intake.
- If therapy is interrupted for several days, restart at lowest dose, titrate to current dose at minimum of 1-wk inter-

vals. • Local chapter of Alzheimer's Disease Association can provide a guide to services.

## meropenem

mer-oh-pen-em

**Do not confuse meropenem with doripenem, ertapenem, or imipenem.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Carbapenem. **CLINICAL:** Antibiotic.

### USES

Treatment of meningitis in children 3 mos and older; intra-abdominal infections; complicated skin/skin structure infections caused by susceptible *S. aureus*, *S. pyogenes*, *S. agalactiae*, *S. pneumoniae*, *H. influenzae*, *N. meningitidis*, *M. catarrhalis*, *E. coli*, *Klebsiella*, *Enterobacter*, *Serratia*, *P. aeruginosa*, *B. fragilis*. **OFF-LABEL:** Febrile neutropenia, liver abscess, otitis external, prosthetic joint infection.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to meropenem, anaphylactic reactions to penicillins, cephalosporins, other beta-lactams. **Cautions:** Renal impairment, CNS disorders (particularly with history of seizures, concurrent use with valproic acid).

### ACTION

Binds to penicillin-binding proteins. Inhibits bacterial cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Widely distributed into tissues and body fluids, including CSF. Protein binding: 2%. Primarily excreted unchanged in

urine. Removed by hemodialysis. **Half-life:** 1 hr.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May decrease effects of **valproic acid**. **Probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, LDH, ALT, AST, bilirubin. May decrease Hgb, Hct, WBC.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 500 mg, 1 g.

### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 500 mg with 10 mL Sterile Water for Injection, 0.9% NaCl, or D<sub>5</sub>W to provide concentration of 50 mg/mL. • Shake to dissolve until clear. • May further dilute with 0.9% NaCl or D<sub>5</sub>W to a concentration of 1–20 mg/mL.

**Rate of administration** • May give by IV push or IV intermittent infusion (piggyback). • If administering as IV intermittent infusion (piggyback), give over 15–30 min (may also give over 3 hrs); if administered by IV push, give over 3–5 min (at a concentration not greater than 50 mg/mL).

**Storage** • Store vials at room temperature. • After reconstitution of vials with 0.9% NaCl, stable for 2 hrs at room temperature or 18 hrs if refrigerated (with D<sub>5</sub>W, stable for 1 hr at room temperature, 8 hrs if refrigerated). IV infusion with 0.9% NaCl stable for 4 hrs at room temperature or 24 hrs if refrigerated.

ated (with D<sub>5</sub>W, 1 hr at room temperature or 4 hrs if refrigerated).

### IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B (Fungizone), diazepam (Valium), doxycycline (Vibramycin), metronidazole (Flagyl), ondansetron (Zofran).

### IV COMPATIBILITIES

Dexamethasone (Decadron), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, magnesium, morphine.

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage

**IV: ADULTS, ELDERLY:** 500 mg q6h or 1–2 g q8h. (*Extended-Infusion*): 1–2 g over 3 hrs q8h. **CHILDREN, ADOLESCENTS:** 20 mg/kg/dose q8h. **Maximum dose:** 1,000 mg. **NEONATES:** 20–30 mg/kg/dose q8–12h.

#### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

#### Creatinine

Clearance	Dosage	Interval
26–49 mL/min	Normal dose	q12h
10–25 mL/min	50% of normal dose	q12h
Less than 10 mL/min	50% of normal dose	q24h
Hemodialysis:	500 mg	q24h
Peritoneal dialysis:	Recommended dose (based on indication)	q24h

#### Continuous Renal Replacement Therapy (CRRT)

	Dosage	Interval
Continuous venovenous hemofiltration	1 gram then 500 mg OR 1 gram	q8h OR q12h
Continuous venovenous hemodialysis/continuous venovenous hemodiafiltration	1 gram then 500 mg OR 1 gram	q6–8h OR q8–12h

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (5%–3%):** Diarrhea, nausea, vomiting, headache, inflammation at injection site. **Occasional (2%):** Oral candidiasis, rash, pruritus. **Rare (less than 2%):** Constipation, glossitis.

### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Anaphylactic reactions have been reported. Seizures may occur in pts with CNS disorders (e.g., brain lesions, history of seizures), bacterial meningitis, renal impairment. Severe cutaneous toxicities including Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme, acute generalized exanthematous pustulosis, drug reaction with eosinophilia and systemic response (DRESS). DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash that may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question history of seizures; hypersensitivity, allergic reaction to penicillins, cephalosporins.

#### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Monitor for nausea, vomiting. Evaluate for inflammation at IV injection site. Monitor skin for cutaneous toxicities. Assess skin for rash. Evaluate hydration status. Monitor I&O, renal function, LFT. Check mental status; be alert to tremors, possible seizures. Assess

temperature, B/P twice daily, more often if necessary. Monitor serum electrolytes, esp. potassium.

#### PATIENT/FAMILY TEACHING

- Report persistent diarrhea, abdominal cramps, fever.

## mesalamine

me-sal-a-meen

(Apriso, Asacol HD, Canasa, Delzicol, Lialda, Mesasal , Pentasa, Rowasa, Salofalk , sfRowasa)

**Do not confuse Asacol with Os-Cal, Lialda with Aldara, or mesalamine with megestrol, memantine, or methenamine.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Salicylic acid derivative. **CLINICAL:** Anti-inflammatory agent.

#### USES

**PO:** Treatment, maintenance of remission of mild to moderate active ulcerative colitis. **Rectal:** Treatment of active mild to moderate distal ulcerative colitis, proctosigmoiditis, or proctitis. **OFF-LABEL:** Crohn's disease.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to mesalamine, salicylates. **Cautions:** Active peptic ulcer, pyloric stenosis, pericarditis, myocarditis, renal/hepatic impairment, elderly.

#### ACTION

Exact mechanism unknown. May modulate local mediators of inflammation, may inhibit tumor necrosis factor. **Therapeutic Effect:** Decreases inflammation in colon.

#### PHARMACOKINETICS

Moderately absorbed from GI tract. Metabolized in liver. Unabsorbed portion

excreted in feces; absorbed portion excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 0.5–1.5 hrs; metabolite, 5–10 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

#### INTERACTIONS

**DRUG:** Antacids, histamine H<sub>2</sub>-receptor antagonists (e.g., famotidine, ranitidine), proton pump inhibitors (e.g., lansoprazole, pantoprazole) may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

#### AVAILABILITY (Rx)

**Rectal Suspension: (Rowasa, sfRowasa):** 4 g/60 mL. **Suppositories: (Canasa):** 1 g.

 **Capsules, Controlled-Release: (Pentasa):** 250 mg, 500 mg. **Extended-Release: (Apriso):** 375 mg. **Capsules, Delayed-Release: (Delzicol):** 400 mg.  **Tablets, Delayed-Release: (Asacol HD):** 800 mg. **(Lialda):** 1.2 g.

#### ADMINISTRATION/HANDLING

**ALERT** Store rectal suspension, suppository, oral forms at room temperature. **PO**

- Have pt swallow whole; do not break outer coating of tablet.
- Give without regard to food.
- **Apriso:** Do not administer with antacids.
- **Lialda:** Administer once daily with meal.

#### Rectal

- Shake bottle well.
- Instruct pt to lie on left side with lower leg extended, upper leg flexed forward.
- Knee-chest position may also be used.
- Insert applicator tip into rectum, pointing toward umbilicus.
- Squeeze bottle steadily until contents are emptied.
- Store sup-

positories at room temperature. Do not refrigerate.

## INDICATIONS/ROUTES/DOSAGE

### Treatment of Ulcerative Colitis

**PO: (Capsule [Pentasa]):** ADULTS, ELDERLY: 1 g 4 times daily.

**PO: (Capsule [Delzicol]):** ADULTS, ELDERLY: 800 mg 3 times daily. **CHILDREN 5 YRS AND OLDER, WEIGHING 54–90 KG:** 1,200 mg in morning and evening. **Maximum:** 2,400 mg/day. **33–53 KG:** 1,200 mg in morning and 800 mg in evening. **Maximum:** 2,000 mg/day. **17–32 KG:** 800 mg in morning and 400 mg in evening. **Maximum:** 1,200 mg/day.

**PO: (Tablet [Asacol HD]):** ADULTS, ELDERLY: 1.6 g 3 times daily.

**PO: (Tablet [Lialda]):** ADULTS, ELDERLY: 2.4–4.8 g once daily. **ADOLESCENTS, CHILDREN WEIGHING 51 KG OR GREATER:** 4,800 mg once daily for 8 wks, then decrease to 2,400 mg once daily. **WEIGHING 36–50 KG:** 3,600 mg once daily for 8 wks, then decrease to 2,400 mg once daily. **WEIGHING 24–35 KG:** 2,400 mg once daily for 8 wks, then decrease to 1,200 mg once daily.

### Maintenance of Remission in Ulcerative Colitis

**PO: (Capsule [Pentasa]):** ADULTS, ELDERLY: 1 g 4 times daily.

**PO: (Capsule [Delzicol]):** ADULTS, ELDERLY: 1.6–2.4 g in 1–4 divided doses/day.

**PO: (Capsule, Extended-Release [Apriso]):** ADULTS, ELDERLY: 1.5–3 g once daily in the morning.

**PO: (Tablet [Lialda]):** 2.4–3.6 g once daily with food.

### Distal Ulcerative Colitis, Proctosigmoiditis, Proctitis

**Rectal: (Retention Enema):** ADULTS, ELDERLY: 60 mL (4 g) at bedtime; retained overnight for approximately 8 hrs for 3–6 wks.

**Rectal: (1 G Suppository):** ADULTS, ELDERLY: Once daily at bedtime. Continue therapy for 3–6 wks.

**◀ALERT▶** Suppository should be retained for 1–3 hrs for maximum benefit.

### Dosage of Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

Mesalamine is generally well tolerated, with only mild, transient effects. **Frequent (greater than 6%):** **PO:** Abdominal cramps/pain, diarrhea, dizziness, headache, nausea, vomiting, rhinitis, unusual fatigue. **Rectal:** Abdominal/stomach cramps, flatulence, headache, nausea. **Occasional (6%–2%):** **PO:** Hair loss, decreased appetite, back/joint pain, flatulence, acne. **Rectal:** Alopecia. **Rare (less than 2%):** **Rectal:** Anal irritation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Sulfite sensitivity may occur in susceptible pts, manifested as cramping, headache, diarrhea, fever, rash, urticaria, pruritus, wheezing. Discontinue drug immediately. Hepatitis, pancreatitis, pericarditis occur rarely with oral forms.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, LFT. Assess for abdominal pain, discomfort.

### INTERVENTION/EVALUATION

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency; record time of evacuation. Assess skin for rash, urticaria. Discontinue medication if rash, fever, cramping, or diarrhea occurs.

### PATIENT/FAMILY TEACHING

- Report rash, fever, abdominal pain, significant diarrhea.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- May discolor urine yellow-brown.
- Suppositories stain fabrics.

**metFORMIN**TOP  
100 HIGH  
ALERT**met-for-min**(Glucophage, Glucophage XR, Glumetza, Glycon , Riomet)**■ BLACK BOX ALERT ■** Lactic acidosis occurs very rarely, but mortality rate is 50%. Risk increases with degree of renal impairment, pt's age, those with diabetes, unstable or acute HF.**Do not confuse Glucophage with Glucotrol, or metFORMIN with metroNIDAZOLE.****FIXED-COMBINATION(S)**

**Actoplus Met:** metFORMIN/pioglitazone (an antidiabetic): 500 mg/15 mg, 850 mg/15 mg. **metFORMIN/glyBURIDE** (an antidiabetic): 250 mg/1.25 mg, 500 mg/2.5 mg, 500 mg/5 mg. **Invokamet:** metFORMIN/canagliflozin (an antidiabetic): 500 mg/50 mg, 500 mg/150 mg, 1,000 mg/50 mg, 1,000 mg/150 mg. **Janumet, Janumet XR:** metFORMIN/SITagliptin (an antidiabetic): 500 mg/50 mg, 1,000 mg/50 mg. **Jentadueto, Jentadueto XR:** metFORMIN/linagliptin (an antidiabetic): 500 mg/2.5 mg; 1,000 mg/2.5 mg; 1,000 mg extended-release/2.5 mg; 1,000 mg extended-release/5 mg. **Kazano:** metFORMIN/alogliptin (an antidiabetic): 500 mg/12.5 mg; 1,000 mg/12.5 mg. **Kombiglyze XR:** metFORMIN/SAXagliptin (an antidiabetic): 500 mg/5 mg, 1,000 mg/5 mg, 1,000 mg/2.5 mg. **Generic:** metFORMIN/glipiZIDE (an antidiabetic): 250 mg/2.5 mg, 500 mg/2.5 mg, 500 mg/5 mg. **Qternmet XR:** metFORMIN/dapagliflozin (an antidiabetic)/saxagliptin (an antidiabetic): 1,000 mg/2.5 mg/2.5 mg; 1,000 mg/5 mg/2.5 mg; 1,000 mg/5 mg/5 mg; 1,000 mg/10 mg/5 mg.

**Generic:** metFORMIN/repaglinide (an antidiabetic): 500 mg/1 mg, 500 mg/2 mg. **Synjardy:** metFORMIN/empagliflozin (an antidiabetic): 500 mg/5 mg, 1,000 mg/5 mg, 500 mg/12.5 mg, 1,000 mg/12.5 mg. **Trijardy XR:** empagliflozin (an antidiabetic)/linagliptin (an antidiabetic)/metFORMIN (an antidiabetic): 10 mg/5 mg/1,000 mg; 25 mg/5 mg/1,000 mg; 5mg/2.5 mg/1,000 mg; 12.5 mg/2.5 mg/1,000 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Biguanide antihyperglycemic. **CLINICAL:** Antidiabetic agent.

**USES**

Management of type 2 diabetes mellitus. **OFF-LABEL:** Polycystic ovarian syndrome, gestational diabetes mellitus. Prevention of type 2 diabetes.

**PRECAUTIONS**

**◀ ALERT ▶** Lactic acidosis is a rare but potentially severe consequence of metformin therapy. Withhold in pts with conditions that may predispose to lactic acidosis (e.g., hypoxemia, dehydration, hypoperfusion, sepsis).

**Contraindications:** Hypersensitivity to metformin. Severe renal disease/dysfunction; acute or chronic metabolic acidosis (with or without coma). **Cautions:** HF, hepatic impairment, excessive acute/chronic alcohol intake, elderly. Recommend temporary discontinuation at time of or before iodinated contrast imaging procedures in pts with CrCl of 30–60 mL/min, or with history of hepatic disease, alcoholism.

**ACTION**

Decreases hepatic production of glucose. Decreases intestinal absorption of glucose, improves insulin sensitivity.

**Therapeutic Effect:** Improves glyce-mic control, stabilizes/decreases body weight, improves lipid profile.

## PHARMACOKINETICS

Slowly, incompletely absorbed. Food delays, decreases extent of absorption. Protein binding: Negligible. Primarily distributed to intestinal mucosa, salivary glands. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 9–17 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Insulin is drug of choice during pregnancy. Distributed in breast milk in animals. **Children:** Safety and efficacy not established in children younger than 10 yrs. **Elderly:** Age-related renal impairment or peripheral vascular disease may require dosage adjustment or discontinuation.

## INTERACTIONS

**DRUG:** Alcohol may increase adverse effects. Cimetidine, dolutegravir, ranolazine may increase concentration/effect. IV contrast dye may increase risk of metformin-induced lactic acidosis, acute renal failure (discontinue metFORMIN 24–48 hrs prior to and up to 72 hrs after contrast exposure). **HERBAL:** Garlic may cause hypoglycemia. **FOOD:** None known. **LAB VALUES:** May alter cholesterol, LDL, triglycerides, HDL.

## AVAILABILITY (Rx)

**Oral Solution:** (Riomet): 100 mg/mL.

**Tablets:** 500 mg, 850 mg, 1,000 mg.

**Tablets, Extended-Release:** 500 mg, 750 mg, 1,000 mg.

## ADMINISTRATION/HANDLING

### PO

• Give extended-release tablets whole. Do not break, crush, dissolve, or divide

extended-release tablets. • Give with meals (to decrease GI upset).

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Allow 1–2 wks between dose titrations.

### Diabetes Mellitus

**PO:** (*Immediate-Release Tablets, Solution*): **ADULTS, ELDERLY:** Initially, 500 mg once or twice daily or 850 mg once daily. Titrate in increments of 500 mg or 850 mg q7days. **Usual Maintenance Dose:** 1,000 mg twice daily or 850 mg twice daily. **Maximum:** 2,550 mg/day in 2 or 3 divided doses. **CHILDREN 10–16 YRS:** Initially, 500–1,000 mg once daily or 500 mg twice daily. May increase in 500–1,000 mg increments q1–2wks. **Maximum:** 1,000 mg twice daily or 850 mg 3 times/day.

**PO:** (*Extended-Release Tablets*): **ADULTS, ELDERLY:** Initially, 500–1,000 mg once daily. May increase by 500 mg at 1-wk intervals (Range: 7 days to 6 wks). **Maximum:** 2,000 mg/day.

### Dosage in Renal Impairment

Contraindicated in pts with serum creatinine greater than 1.5 mg/dL (males) or greater than 1.4 mg/dL (females).

**Alternative recommendation:** **CrCl 45–60 mL/min:** Continue use; monitor renal function q3–6 mos. **CrCl 30–44 mL/min:** Use caution. Consider dose reduction; monitor renal function q3mos. **CrCl less than 30 mL/min:** Discontinue use.

### Dosage in Hepatic Impairment

Avoid use (risk factor for lactic acidosis).

## SIDE EFFECTS

**Occasional (greater than 3%):** GI disturbances (diarrhea, nausea, vomiting, abdominal bloating, flatulence, anorexia) that are transient and resolve spontaneously during therapy. **Rare (3%–1%):** Unpleasant/metallic taste that resolves spontaneously during therapy.

## ADVERSE EFFECTS/TOXIC REACTIONS

Lactic acidosis occurs rarely (0.03 cases/1,000 pts) but is a serious and often fatal (50%) complication. Lactic acidosis is characterized by increase in blood lactate levels (greater than 5 mmol/L), decrease in blood pH, electrolyte disturbances. Symptoms include unexplained hyperventilation, myalgia, malaise, drowsiness. May advance to cardiovascular collapse (shock), acute HF, acute MI, prerenal azotemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Verify pt has not received IV contrast dye within last 48 hrs. Obtain CBC, renal function test, fasting serum glucose, Hgb A1c.

### INTERVENTION/EVALUATION

Monitor fasting serum glucose, Hgb A1c, renal function, CBC. Monitor folic acid, renal function tests for evidence of early lactic acidosis. If pt is on concurrent oral sulfonylureas, assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia). Be alert to conditions that alter glucose requirements: fever, increased activity, stress, surgical procedure. If lactic acidosis occurs, withhold treatment.

### PATIENT/FAMILY TEACHING

- Report symptoms of lactic acidosis (unexplained hyperventilation, muscle aches, extreme fatigue, unusual drowsiness).
- Prescribed diet is principal part of treatment; do not skip, delay meals.
- Diabetes requires lifelong control.
- Avoid alcohol.
- Report persistent headache, nausea, vomiting, diarrhea or if skin rash, unusual bruising/bleeding, change in color of urine or

stool occurs. • Do not take dose for at least 48 hrs after receiving IV contrast dye with radiologic testing.

## methadone

### meth-a-done

(Dolophine, Metadol , Methadone Intensol, Methadose)

**BLACK BOX ALERT** ■ May prolong QT interval, which may cause serious arrhythmias. May cause serious, life-threatening, or fatal respiratory depression. Concomitant use with benzodiazepines, other CNS depressants may increase risk of respiratory depression and death. Monitor for signs of misuse, abuse, addiction. Prolonged maternal use may cause neonatal withdrawal syndrome.

**Do not confuse methadone with Mephyton, Metadate CD, Metadate ER, methylphenidate, or morphine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid agonist (Schedule II). **CLINICAL:** Opioid analgesic. Opioid dependency management.

## USES

**Oral:** Moderate to severe pain when a continuous around-the-clock analgesic is needed. Detoxification/maintenance treatment of opioid addiction in conjunction with social/medical services. **Injection:** Management of pain severe enough to require an opioid analgesic when alternate options are inadequate.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to methadone. Severe respiratory depression, acute or severe bronchial asthma (in absence

of resuscitative equipment or unmonitored setting), hypercarbia, GI obstruction including paralytic ileus (known or suspected). **Cautions:** Renal/hepatic impairment, elderly/debilitated pts, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), cardiovascular disease, pts at high risk for suicidal ideation and behavior; history of drug abuse and misuse, drug-seeking behavior; dependency; respiratory disease, biliary tract dysfunction, acute pancreatitis, hypothyroidism, Addison's disease, head injury, increased intracranial pressure.

### ACTION

Binds with opioid receptors within CNS, causing inhibition of ascending pain pathways. **Therapeutic Effect:** Produces generalized CNS depression. Alters processes affecting analgesia, emotional response to pain; reduces withdrawal symptoms from other opioid drugs.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–1 hr	1.5–2 hrs	6–8 hrs
IM	10–20 min	1–2 hrs	4–5 hrs
IV	N/A	15–30 min	3–4 hrs

Widely distributed. Protein binding: 85%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 7–59 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing,

seizures). **Children:** Paradoxical excitement may occur. Pts younger than 2 yrs more susceptible to respiratory depressant effects. **Elderly:** More susceptible to respiratory depressant effects. Age-related renal impairment may increase risk of urinary retention.

### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS effects, respiratory depression, hypotension. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effects. **Strong CYP3A4 inhibitors** (e.g., rifampin, clarithromycin, ketoconazole, ritonavir) may increase methadone level. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, sotalol) may increase risk of QTc interval prolongation. **MAOIs** (e.g., phenelzine, selegiline) may produce serotonin syndrome. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may alter concentration/effects. **LAB VALUES:** May increase serum amylase, lipase.

### AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL. **Oral Concentrate:** 10 mg/mL. **Oral Solution:** 5 mg/5 mL, 10 mg/5 mL. **Tablets, Dispersible:** 40 mg. **Tablets:** 5 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### IM, SQ

**ALERT** IM preferred over SQ route (SQ produces pain, local irritation, induration).

- Do not use if solution appears cloudy or contains a precipitate.
- Administer slowly.
- Those with circulatory impairment experience higher risk of overdos-

age due to delayed absorption of repeated administration.

#### PO

- Give without regard to food.
- Oral dose for detoxification and maintenance may be given in fruit juice or water.
- Dispersible tablet should not be chewed or swallowed; add to liquid, allow to dissolve before swallowing.

### INDICATIONS/ROUTES/DOSAGE

#### Analgesia

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg q8–12h. May increase by 2.5 mg/dose or 5 mg/day q5–7days.

#### Dosage in Renal Impairment

**CrCl less than 10 mL/min:** 50%–75% normal dose. Avoid in severe hepatic disease.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Avoid use.

#### Detoxification

**PO: ADULTS, ELDERLY:** Initially, dose of 20–30 mg. An additional 5–10 mg may be provided if withdrawal symptoms have not been suppressed or if symptoms reappear after 2–4 hrs. Day 1 dose not to exceed 40 mg. **Maintenance range:** Titrate to a dose that prevents withdrawal symptoms for 24 hrs, reduces craving, reduces euphoria effect of self-administered opioids, while ensuring tolerance to sedative effects of methadone. Usual range: 80–120 mg/day. Dose reduction should be in increments of less than 10% of the maintenance dose every 10–14 days. **Short-term:** Initially, titrate to 40 mg/day in 2 divided doses. Continue 40-mg dose for 2–3 days. After 2–3 days of stabilization at 40 mg, gradually decrease dose to level keeping withdrawal symptoms tolerable.

### SIDE EFFECTS

**Frequent:** Sedation, orthostatic hypotension, diaphoresis, facial flushing, constipation, dizziness, nausea, vomiting. **Occasional:** Confusion, urinary retention, palpitations, abdominal cramps, visual changes, dry mouth, headache, decreased appetite, anxiety, insomnia. **Rare:** Allergic reaction (rash, pruritus).

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Early sign of toxicity presents as increased sedation after being on a stable dose. Cardiac toxicity manifested as QT prolongation, torsades de pointes. Tolerance to analgesic effect, physical dependence may occur with repeated use. **Antidote:** Naloxone (see Appendix J for dosage).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain ECG. Assess type, location, intensity of pain. **Detoxification:** Assess pt for opioid withdrawal. Pt should be in recumbent position before drug administration by parenteral route. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

#### INTERVENTION/EVALUATION

Monitor vital signs 15–30 min after SQ/IM dose, 5–10 min following IV dose. Oral medication is 50% as potent as parenteral. Assess for adequate voiding. Monitor daily pattern of bowel activity, stool consistency. Assess for clinical

improvement, record onset of relief of pain. Provide support to pt in detoxification program; monitor for withdrawal symptoms. Diligently assess for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Screen for drug abuse and misuse, drug-seeking behavior.

#### PATIENT/FAMILY TEACHING

- Methadone may produce drug dependence, has potential for being abused.
- Avoid alcohol.
- Do not stop taking abruptly after prolonged use.
- May cause dry mouth, drowsiness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report severe drowsiness, respiratory depression.

M

## methotrexate

HIGH ALERT

meth-o-trex-ate

(Otrexup, Rasuvo, Trexall, Xatmep)

■ **BLACK BOX ALERT** ■ May cause fetal abnormalities, death. May produce potentially fatal chronic hepatotoxicity, dermatologic reactions, acute renal failure, pneumonitis, myelosuppression, malignant lymphoma, aplastic anemia, GI toxicity secondary malignancies, tumor lysis syndrome, opportunistic infections. Do not use for psoriasis or rheumatoid arthritis treatment in pregnant women. Should only be prescribed by healthcare providers whose knowledge and experience include the use of anti-metabolite therapy.

**Do not confuse methotrexate with metOLazone, methylPREDNISolone, or mitoXANTRONE. MTX is an error-prone abbreviation; do not use as an abbreviation.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic, antirheumatic disease-modifying, immunosuppressant.

#### USES

**Oncology-related:** Treatment of breast, head/neck, non-small-cell lung, small-cell lung carcinomas; trophoblastic tumors, acute lymphocytic, meningeal leukemias; non-Hodgkin's lymphomas (lymphosarcoma, Burkitt's lymphoma), carcinoma of gastrointestinal tract, mycosis fungoides, osteosarcoma. **Non-oncology uses:** Psoriasis, rheumatoid arthritis (including juvenile idiopathic arthritis).

**OFF-LABEL:** Treatment of acute myelocytic leukemia, bladder carcinoma, ectopic pregnancy, management of abortion, systemic lupus erythematosus, treatment of and maintenance of remission in Crohn's disease.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to methotrexate. Breastfeeding. **For pts with psoriasis, juvenile idiopathic arthritis, or rheumatoid arthritis:** Pregnancy, hepatic disease, alcoholism, immunodeficiency syndrome, preexisting blood dyscrasias.

**Cautions:** Peptic ulcer, ulcerative colitis, preexisting myelosuppression, history of chronic hepatic disease, alcohol consumption, obesity, diabetes, hyperlipidemia, use with other hepatotoxic medications, concomitant use of proton pump inhibitors. Use of NSAIDs or aspirin with lower methotrexate doses for rheumatoid arthritis.

#### ACTION

Irreversibly binds to and inhibits dihydrofolate reductase, inhibiting formation of reduced folates and thymidylate synthetase, which inhibits purine/thymidylic acid synthesis. **Therapeutic Effect:** Interferes with DNA synthesis, repair, and cellular replication.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 50%–60%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis but not by peritoneal dialysis. **Half-life:** 3–10 hrs (large doses, 8–15 hrs).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy during therapy and minimum 3 mos after therapy in males or at least one ovulatory cycle after therapy in females. May cause fetal death, congenital anomalies. Distributed in breast milk. Breastfeeding not recommended. **Children/Elderly:** Renal/hepatic impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Alcohol, hepatotoxic medications (e.g., acetaminophen, acitretin) may increase risk of hepatotoxicity. **Bone marrow depressants** (e.g., cladribine) may increase myelosuppression. May decrease the therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **natalizumab**, **BCG (intravesical)**, **vaccines (live)**. **NSAIDs** (e.g., ibuprofen, ketorolac, naproxen) may increase risk of toxicity. **Probenecid, salicylates** (e.g., aspirin) may increase concentration, risk of toxicity. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid, AST.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1 g. **Injection, Autoinjector (Rasuvo):** 7.5 mg, 10 mg, 12.5 mg, 15 mg, 17.5 mg, 20 mg, 22.5 mg, 25 mg, 27.5 mg, 30 mg. **Injection Solution:** 25 mg/mL. **Injection, Syringe (Otrexup):** 7.5 mg/0.4 mL, 10 mg/0.4 mL, 12.5 mg/0.4 mL, 15 mg/0.4 mL, 17.5 mg/0.4 mL, 20 mg/0.4 mL, 22.5 mg/0.4 mL, 25 mg/0.4 mL. **Solution, Oral (Xatmep):** 2.5 mg/mL. **Tablets:** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg.

## ADMINISTRATION/HANDLING

**◀ALERT▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately, thoroughly

with soap, water. May give IM, IV, intrarterially, intrathecally.

**Reconstitution** • Reconstitute powder with D<sub>5</sub>W or 0.9% NaCl to provide concentration of 25 mg/mL or less. • For intrathecal use, dilute with preservative-free 0.9% NaCl to provide a concentration not greater than 2–4 mg/mL.

**Rate of administration** • Give IV push at rate of 10 mg/min. • Give IV infusion at rate of 4–20 mg/hr (refer to specific protocol).

**Storage** • Store vials at room temperature. Diluted solutions stable for 24 hrs at room temperature.

## IV INCOMPATIBILITIES

Droperidol (Inapsine), gemcitabine (Gemzar), idarubicin (Idamycin), midazolam (Versed), nalbuphine (Nubain).

## IV COMPATIBILITIES

CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), DAUNOrubicin (DauNoXome), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, granisetron (Kytrel), leucovorin, mitoMYcin (Mutamycin), ondansetron (Zofran), PACLitaxel (Taxol), vinBLASTine (Velban), vinCRISTine (Oncovin), vinorelbine (Navelbine).

## INDICATIONS/ROUTES/DOSAGE

### Oncology Uses

**◀ALERT▶** Refer to individual specific protocols for optimum dosage, sequence of administration.

### Head/Neck Cancer

**PO, IV, IM: ADULTS, ELDERLY:** 40 mg/m<sup>2</sup> once wkly. Continue until disease progression or unacceptable toxicity.

### Breast Cancer

**IV: ADULTS, ELDERLY:** 40 mg/m<sup>2</sup> days 1 and 8 q4wks in combination with cyclophosphamide and fluorouracil.

**Mycosis Fungoides**

**IM, PO: ADULTS, ELDERLY:** 25–75 mg PO once wkly (as a single agent) or 10 mg/m<sup>2</sup> PO twice wkly (as part of a combination regimen), **or** 5–50 mg once wkly (for early stage) or 15–37.5 mg twice wkly IM (if poor response to wkly therapy), **or** 25 mg PO once wkly. May increase to 50 mg once wkly.

**Rheumatoid Arthritis (RA)**

**PO: ADULTS:** Initially, 10–15 mg once wkly. May increase by 5 mg q2–4wks to a maximum dose of 20–30 mg once weekly. **SQ/IM:** Initially, 7.5 mg/wk. Adjust dose gradually to optimal response. **ELDERLY:** Initially, 5–7.5 mg/wk. **Maximum:** 20 mg/wk.

**Juvenile Rheumatoid Arthritis (JRA)**

**PO, IM, SQ: CHILDREN:** Initially, 10 mg/m<sup>2</sup> once wkly, then adjust gradually to 20–30 mg/m<sup>2</sup>/wk as a single dose. **Usual Maximum Dose:** 25 mg.

**Psoriasis**

**PO, IM, SQ: ADULTS, ELDERLY:** Initially, 10–25 mg once wkly. Adjust dose gradually to optimal response. Titrate to lowest effective dose. Doses greater than 30 mg/wk should usually not be exceeded.

**Dosage in Renal Impairment**

Creatinine Clearance	Reduce Dose to
61–80 mL/min	75% of normal
51–60 mL/min	70% of normal
10–50 mL/min	30–50% of normal
Less than 10 mL/min	Avoid use

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (10%–3%):** Nausea, vomiting, stomatitis, burning/erythema at psoriatic site (in pts with psoriasis). **Occasional (3%–1%):** Diarrhea, rash, dermatitis, pruritus, alopecia, dizziness, anorexia, malaise, headache, drowsiness, blurred vision.

**ADVERSE EFFECTS/TOXIC REACTIONS**

High potential for various severe toxicities. GI toxicity may produce gingivitis, glossitis,

pharyngitis, stomatitis, enteritis, hemateme-sis. Hepatotoxicity more likely to occur with frequent small doses than with large intermittent doses. Pulmonary toxicity characterized by interstitial pneumonitis. Hematologic toxicity, resulting from marked myelosuppression, may manifest as leukopenia, thrombocytopenia, anemia, hemorrhage. Dermatologic toxicity may produce rash, pruritus, urticaria, pigmentation, photosensitivity, petechiae, ecchymosis, pustules. Severe nephrotoxicity produces azotemia, hematuria, renal failure.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain pregnancy test in females of reproductive potential. **Rheumatoid arthritis:** Assess pain, range of motion. Obtain baseline CBC, BMP, LFT, rheumatoid factor. **Psoriasis:** Assess skin lesions. Obtain all functional tests before therapy, repeat throughout therapy. Antiemetics may prevent nausea, vomiting.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT, urinalysis, chest X-rays, serum uric acid. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess skin for evidence of dermatologic toxicity. Keep pt well hydrated, urine alkaline. Avoid rectal temperatures, traumas that induce bleeding. Apply 5 full min of pressure to IV sites.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain,

darkened urine); toxic skin reactions (rash, skin eruptions). • Use effective contraception to avoid pregnancy.

## methylergonovine

**meth-il-er-goe-noe-veen**  
(Methergine)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Ergot alkaloid. **CLINICAL:** Oxytocic agent, uterine stimulant.

### USES

Management of uterine atony, hemorrhage and subinvolution of uterus following delivery of placenta. Control uterine hemorrhage following delivery of anterior shoulder in second stage of labor.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to methylergonovine. Hypertension, pregnancy, toxemia. **Cautions:** Renal/hepatic impairment, coronary artery disease, pts at risk for coronary artery disease (diabetes, obesity, smoking, hypercholesterolemia), concurrent use with CYP3A4 inhibitors, occlusive peripheral vascular disease, sepsis, second stage of labor.

### ACTION

Increases tone, rate, amplitude of contraction of uterine smooth muscle. **Therapeutic Effect:** Produces sustained contractions, which shortens third stage of labor, reduces blood loss.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	5–10 min	N/A	3 hrs
IV	Immediate	N/A	45 min
IM	2–5 min	N/A	3 hrs

Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 0.5–2 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated during pregnancy. Small amounts distributed in breast milk. **Children/Elderly:** No information available.

### INTERACTIONS

**DRUG:** May increase hypertensive effect of **DOPamine, norepinephrine, phenylephrine, vasopressin**. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Beta blockers (e.g., carvedilol, labetalol, metoprolol)** may increase vasoconstrictive effect. May decrease vasodilation effect of **nitroglycerin**. May increase vasoconstricting effect of **serotonin 5-HT<sub>1D</sub> receptor agonists (e.g., SUMatriptan)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum prolactin.

### AVAILABILITY (Rx)

**Injection Solution:** 0.2 mg/mL. **Tablets:** 0.2 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • Dilute with 0.9% NaCl to volume of 5 mL.

**Rate of administration** • Give over at least 1 min, carefully monitoring B/P.

**Storage** • Refrigerate ampules.

### ⚠️ IV INCOMPATIBILITIES

None known.

### ⚠️ IV COMPATIBILITIES

Heparin, potassium.

### INDICATIONS/ROUTES/DOSAGE

**Prevention/Treatment of Postpartum, Postabortion Hemorrhage**

**PO: ADULTS:** 0.2 mg 3–4 times daily. Continue for up to 7 days.

**IV, IM: ADULTS:** Initially, 0.2 mg after delivery of anterior shoulder, after delivery of placenta, or during puerperium. May repeat q2–4h as needed.

**Note:** Initial dose may be given parenterally, followed by oral regimen.

IV use in life-threatening emergencies only.

#### Dosage in Renal/Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Frequent:** Nausea, uterine cramping, vomiting. **Occasional:** Abdominal pain, diarrhea, dizziness, diaphoresis, tinnitus, bradycardia, chest pain. **Rare:** Allergic reaction (rash, pruritus), dyspnea, severe or sudden hypertension.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe hypertensive episodes may result in CVA, serious arrhythmias, seizures. Hypertensive effects are more frequent with pt susceptibility, rapid IV administration, concurrent use of regional anesthesia, vasoconstrictors. Peripheral ischemia may lead to gangrene.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain serum calcium level, B/P, pulse. Assess for any evidence of bleeding before administration.

#### INTERVENTION/EVALUATION

Monitor uterine tone, bleeding, B/P, pulse q15min until stable (about 1–2 hrs). Assess extremities for color, warmth, movement, pain. Report chest pain promptly. Provide support with ambulation if dizziness occurs.

#### PATIENT/FAMILY TEACHING

- Avoid smoking: causes increased vasoconstriction.
- Report increased cramping, bleeding, foul-smelling lochia.
- Report pale, cold hands/feet (possibility of diminished circulation).

## methylnaltrexone

meth-il-nal-trex-own  
(Relistor)

**Do not confuse methylnaltrexone with naltrexone.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid receptor antagonist. **CLINICAL:** GI agent.

### USES

**Injection:** Treatment of opioid-induced constipation in pts with advanced illness or pain caused by active cancer who require opioid dosage escalation for palliative care. **Injection/Tablets:** Treatment of opioid-induced constipation in pts with chronic pain unrelated to cancer including pts with chronic pain related to prior cancer or its treatment not requiring frequent opioid dosage escalation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to methylnaltrexone. Known or suspected GI obstruction. Pts at increased risk of recurrent GI obstruction. **Cautions:** Renal impairment, history of GI tract lesions (e.g., peptic ulcer disease, GI tract malignancies).

### ACTION

Blocks binding of opioids to peripheral opioid receptors within GI tract. Inhibits opioid-induced decreased GI motility and delay in GI transit time. **Therapeutic Effect:** Decreases constipating effect of opioids.

### PHARMACOKINETICS

Absorbed rapidly. Undergoes moderate tissue distribution. Protein binding: 11%–15%. Excreted in urine (50%), feces (35%). **Half-life:** 8 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety

and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase adverse/toxic effects of **naloxegol, opioid antagonists.**

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** 8 mg/0.4 mL, 12 mg/0.6 mL. **Tablets:** 150 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer with water on an empty stomach at least 30 min before first meal of day.

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or if large particles are observed.

**Administration** • Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Once solution is drawn into syringe, may be stored at room temperature. • Administer within 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Usual schedule is once every other day, as needed, but no more frequently than once every 24 hrs.

### Constipation (Chronic Non-cancer Pain)

**PO: ADULTS, ELDERLY:** 450 mg once daily in the morning. **SQ: ADULTS, ELDERLY:** 12 mg/day. **Note:** Discontinue all laxatives prior to use (if response is not optimal after 3 days, may resume laxative therapy).

### Constipation (Advanced Illness)

**SQ: ADULTS, ELDERLY WEIGHING 38 KG TO LESS THAN 62 KG:** 8 mg. **ADULTS, ELDERLY WEIGHING 62–114 KG:** 12 mg. **ADULTS,**

**ELDERLY WHOSE WEIGHT FALLS OUTSIDE THESE RANGES:** Dose at 0.15 mg/kg (round dose up to nearest 0.1 mL of volume).

### Dosage in Severe Renal Impairment (CrCl less than 60 mL/min)

**SQ: ADULTS, ELDERLY:** Administer 50% of recommended dose.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (29%–12%):** Abdominal pain, flatulence, nausea. **Occasional (7%–5%):** Diarrhea, dizziness.

## ADVERSE EFFECTS/TOXIC REACTIONS

None known.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, perforation, baseline GI disease; renal impairment. Receive full medication history, including herbal products, and screen for interactions. Assess hydration status.

### INTERVENTION/EVALUATION

30% of pts report defecation within 30 min after drug administration. Encourage fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. If opioid medication is stopped, drug should be discontinued. Assess for abdominal disturbances.

### PATIENT/FAMILY TEACHING

- Laxative effect usually occurs within 30 min but may take up to 24 hrs after medication administration.
- Common side effects include transient abdominal pain, nausea, vomiting.
- Report persistent or worsening symptoms, or if severe or persistent diarrhea occurs.

## methylphenidate

TOP  
100

meth-il-fen-i-date

(Adhansia XR, Aptensio XR, Concerta, Cotempla XR, Daytrana, Jornay PM, Metadate ER, Methylin, Quillichew ER, Quilivant XR, Relexxii, Ritalin, Ritalin LA)

**BLACK BOX ALERT** Chronic abuse can lead to marked tolerance, psychological dependence. Abrupt withdrawal from prolonged use may lead to severe depression, psychosis.

**Do not confuse Metadate ER with Metadate CD, methylphenidate with methadone, or Ritalin with Rifadin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** CNS stimulant (Schedule II). **CLINICAL:** CNS stimulant.

### USES

Treatment of attention-deficit hyperactivity disorder (ADHD). Management of narcolepsy. **OFF-LABEL:** Secondary mental depression (especially elderly pts, medically ill).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to methylphenidate. Use during or within 14 days following MAOI therapy; marked anxiety, tension, agitation, motor tics; family history or diagnosis of Tourette's syndrome, glaucoma. **Metadate:** Severe hypertension, HF, arrhythmia, hyperthyroidism, recent MI or angina. **Cautions:** Hypertension, seizures, acute stress reaction, emotional instability, HF, recent MI, hyperthyroidism or thyrotoxicosis, known structural cardiac abnormality, bipolar disorder, cardiomyopathy, arrhythmias, history of drug abuse and misuse, drug-seeking behavior, dependency.

### ACTION

Blocks reuptake of norepinephrine, dopamine into presynaptic neurons. Stimulates cerebral cortex and subcortical structures.

**Therapeutic Effect:** Decreases motor restlessness, fatigue. Increases motor activity, attention span, mental alertness. Produces mild euphoria.

### PHARMACOKINETICS

Onset	Peak	Duration
Immediate-release	2 hrs	3–6 hrs
Sustained-release	4–7 hrs	8 hrs
Extended-release	N/A	12 hrs
Transdermal	2 hrs	N/A

Widely distributed. Protein binding: 15%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 2–4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** May be more susceptible to developing anorexia, insomnia, stomach pain, decreased weight. Chronic use may inhibit growth. Not approved for children younger than 6 yrs. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may increase hypertensive effects. **Other CNS stimulants** (e.g., caffeine, dextroamphetamine, phentermine) may have additive effect. May inhibit metabolism of **warfarin**, **anticonvulsants** (e.g., carbamazepine, phenytoin), **antidepressants**. **Alcohol** may increase adverse effects. **HERBAL:** Ephedra may cause hypertension, arrhythmias. **Yohimbe** may increase CNS stimulation. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Oral Solution:** (*Methylin*): 5 mg/5 mL, 10 mg/5 mL, 10 mg/1 mL. **Tablets, Chewable:** (*Methylin*): 2.5 mg, 5 mg, 10 mg. **Tablets:** (*Methylin, Ritalin*): 5 mg, 10 mg, 20 mg. **Topical Patch:** (*Daytrana*): 10 mg/9 hrs, 15 mg/9 hrs, 20 mg/9 hrs, 30 mg/9 hrs. **Powder for Suspension, Extended-Release:** (*Quilivant XR*): 25 mg/5 mL.

 **Capsules, Extended-Release:** (*Adhansia XR*): 25 mg, 35 mg, 45 mg, 55 mg, 70 mg, 85 mg. (*Aptensio XR*): 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. (*Jornay PM*), 20 mg, 40 mg, 60 mg, 80 mg, 100 mg. (*Ritalin LA*): 10 mg, 20 mg, 30 mg, 40 mg.  **Tablets, Extended-Release:** (*Concerta*): 18 mg, 27 mg, 36 mg, 54 mg, 72 mg. (*Relaxxii*): 72 mg. (*Metadate ER, Methylin ER*): 10 mg, 20 mg. **Sustained-Release:** (*Ritalin SR*): 20 mg. **Tablets, Extended-Release ODT:** (*Cotempla XR*): 8.6 mg, 17.3 mg, 25.9 mg. **Tablets, Chewable, Extended-Release:** (*Quillichew ER*): 20 mg, 30 mg, 40 mg.

## ADMINISTRATION/HANDLING

 **ALERT** Sustained-release, extended-release tablets may be given in place of regular tablets once the daily dose is titrated using regular tablets and the titrated dosage corresponds to sustained-release or extended-release tablet strength.

### PO

- Do not give in afternoon or evening (may cause insomnia).
- Do not crush, break extended-release capsules, extended- or sustained-release tablets.
- Immediate-release tablets may be crushed.
- Give dose 30–45 min before meals.
- **Concerta:** Administer once daily in morning. May take without regard to food but must be taken with water, milk, or juice.
- **Methylin Chewable:** Give with at least 8 oz of water or other fluid.
- **Metadate CD, Ritalin LA:**
  - May be opened, sprinkled on applesauce.
  - Instruct pt to swallow applesauce without chewing. Do not crush or chew capsule contents.
- **Quilivant XR:** Administer in morning with or without food. Shake bottle more than 10 sec prior to administration.

### Patch

- To be worn daily for 9 hrs.
- Replace daily in morning.
- Apply to dry, clean area of hip.
- Avoid applying to waistline (clothing may cause patch to rub off).
- Alternate application site

daily.

- Press firmly in place for 30 sec to ensure patch is in good contact with skin.
- Do not cut patch.

## INDICATIONS/ROUTES/DOSAGE

### ADHD

**PO: ADULTS:** (*Immediate-Release*): Initially, 10–20 mg twice daily, before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Maximum:** 60 mg/day in 2–3 divided doses. **CHILDREN 6 YRS AND OLDER:** Initially, 2.5–5 mg before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Usual dose:** 20–30 mg/day in 2–3 divided doses. **Maximum:** 60 mg/day not to exceed 2 mg/kg/day.

**PO: (*Concerta*): CHILDREN 6–12 YRS, ADOLESCENTS 13–17 YRS, ADULTS 18–65 YRS:** Initially, 18 mg once daily; may increase by 18 mg/day at wkly intervals. **Maximum:** 54 mg/day in children 6–12 yrs of age (up to 72 mg/day in adolescents younger than 18 yrs).

**PO: (*Metadate CD*): ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 20 mg/day. May increase by 10–20 mg/day at wkly intervals. **Maximum:** 60 mg/day.

**PO: (*Quillichew ER*): ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 20 mg/day. May increase by 10 mg, 15 mg or 20 mg/day at wkly intervals. **Maximum:** 60 mg/day.

**PO: (*Quilivant XR*): ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 20 mg once daily in the morning. May increase in increments of 10–20 mg/day at wkly increments. **Maximum:** 60 mg/day.

**PO: (*Ritalin LA*): ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 10–20 mg/day. May increase by 10 mg/day at wkly intervals. **Maximum:** 60 mg/day.

**PO: (*Jornay PM*): ADULTS:** Initially, 20 mg once daily in the evening (between 6:30 PM [1830 hrs] and 9:30 PM [2130 hrs]). May increase by 20 mg/day at wkly intervals. **Maximum:** 100 mg/day.

**PO: (*Adhansia XR*): ADULTS:** Initially, 25 mg in the morning. May increase by 10–15 mg at 5-day intervals or more. **Maximum:** 100 mg/day.

**PO: (Metadate ER): CHILDREN 6 YRS AND OLDER:** May replace regular tablets after daily dose is titrated and 8-hr dosage corresponds to sustained-release or extended-release tablet strength. **Maximum:** 60 mg/day.

**PO: (Cotempla XR): CHILDREN, 6–18 YRS:** Initially, 17.3 mg once daily. May increase in wkly intervals in 8.6 to 17.3 mg increments. **Maximum:** 51.8 mg/day.

**Patch: (Daytrana): ADULTS, ADOLESCENTS, CHILDREN 6–12 YRS:** Initially, 10 mg daily (applied and worn for 9 hrs). Dosage is titrated up to 60 mg/day to desired effect. May increase dose no more frequently than every wk.

### Narcolepsy

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 10 mg twice daily, before breakfast and lunch. May increase by 5–10 mg/day at wkly intervals. **Maximum:** 60 mg/day in 2–3 divided doses. **(Extended-Release):** May be given once the immediate-release dose is titrated and the titrated 8-hr dose corresponds to sustained-release or extended-release tablet strength. **Maximum:** 60 mg/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Anxiety, insomnia, anorexia.

**Occasional:** Dizziness, drowsiness, headache, nausea, abdominal pain, fever, rash, arthralgia, vomiting. **Rare:** Blurred vision, Tourette's syndrome (uncontrolled vocal outbursts, repetitive body movements, tics), palpitations, priapism.

### ADVERSE EFFECTS/TOXIC REACTIONS

Prolonged administration to children with ADHD may delay normal weight gain pattern. Overdose may produce tachycardia, palpitations, arrhythmias, chest pain, psychotic episode, seizures, coma. Hypersensitivity reactions, blood dyscrasias occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**ADHD:** Assess attention span, impulsivity, interaction with others, distractibility. **Narcolepsy:** Observe/assess frequency of episodes. Question history of seizures. Assess for potential of abuse/misuse (e.g., drug seeking behavior, mental health conditions, history of substance abuse).

### INTERVENTION/EVALUATION

Monitor B/P, pulse, changes in ADHD symptoms. CBC with differential should be performed routinely during therapy. If paradoxical return of attention-deficit occurs, dosage should be reduced or discontinued. Monitor growth. Screen for drug abuse and misuse, drug-seeking behavior.

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report any increase in seizures.
- Take daily dose early in morning to avoid insomnia.
- Report anxiety, palpitations, fever, vomiting, skin rash.
- Report new or worsened symptoms (e.g., behavior, hostility, concentration ability).
- Avoid caffeine.
- Do not stop taking abruptly after prolonged use.

## methylPREDNISolone

meth-il-pred-nis-oh-lone  
(Medrol)

## methylPREDNISolone acetate

(DEPO-Medrol)

## methylPREDNISolone sodium succinate

(SOLU-Medrol)

**Do not confuse DEPO-Medrol with SOLU-Medrol, Medrol with**

**Mebaral, or methylPREDNISolone with medroxyPROGESTERone or prednisOLONE.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenal corticosteroid. **CLINICAL:** Anti-inflammatory.

### USES

Anti-inflammatory or immunosuppressant in the treatment of hematologic, allergic, neoplastic, dermatologic, endocrine, GI, nervous system, ophthalmic, renal, or rheumatic disorders. **OFF-LABEL:** Acute spinal cord injury.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to methylprednisolone. Administration of live or attenuated virus vaccines, systemic fungal infection. **IM:** Idiopathic thrombocytopenia purpura. Intrathecal administration. **Cautions:** Respiratory tuberculosis, untreated systemic infections, hypertension, HF, diabetes, GI disease (e.g., peptic ulcer), myasthenia gravis, renal/hepatic impairment, seizures, cataracts, glaucoma, following acute MI, thyroid disorder, thromboembolic tendencies, cardiovascular disease, elderly, psychiatric conditions, osteoporosis.

### ACTION

**Anti-inflammatory:** Suppresses migration of polymorphonuclear leukocytes, reverses increased capillary permeability. Exerts effects on modulating carbohydrate, protein, lipid metabolism. Maintains fluid/electrolyte hemostasis. Influences CV, immunologic, endocrine, musculoskeletal, neurologic physiology. **Therapeutic Effect:** Decreases inflammation.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	Rapid	1–2 hrs	30–36 hrs
IM	Rapid	4–8 days	1–4 wks
IV	Rapid	N/A	N/A

Widely distributed. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 3.5 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause cleft palate (chronic use in first trimester). Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase anticoagulant effects of warfarin. **Strong CYP3A inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Live virus vaccines** may decrease antibody response to vaccine, increase vaccine side effects, potentiate virus replication. May increase hyponatremic effect of desmopressin. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May decrease therapeutic effect of BCG (intravesical). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, lipids, amylase, sodium. May decrease serum calcium, potassium, thyroxine, hypothalamic-pituitary-adrenal (HPA) axis.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (SOLU): 40 mg, 125 mg, 500 mg, 1 g. **Injection, Suspension:** (DEPO): 20 mg/mL, 40 mg/mL, 80 mg/mL. **Tablets:** (Medrol): 2 mg, 4 mg, 8 mg, 16 mg, 32 mg. (Medrol Dosepak): 4 mg (21 tablets).

### ADMINISTRATION/HANDLING

◀ **ALERT** ▶ Do not give methylPREDNISolone acetate IV.

**Reconstitution** • For infusion, add to D<sub>5</sub>W, 0.9% NaCl.

**Rate of administration** • Give IV push over 3–15 min. • Give IV piggyback. Dose of 250 mg over 15–30 min; dose of 500–999 mg over at least 30 min; dose of 1 g or greater over 1 hr.

**Storage** • Store vials at room temperature. Diluted solution is stable for 48 hrs at room temperature or refrigerated.

### IM

• MethylPREDNISolone acetate should not be further diluted. • MethylPREDNISolone sodium succinate should be reconstituted with Bacteriostatic Water for Injection. • Give deep IM in gluteus maximus (avoid injection into deltoid muscle).

### PO

• Give with food, milk.

### IV INCOMPATIBILITIES

Ciprofloxacin (Cipro), dilTIAZem (Cardizem), potassium chloride, propofol (Diprivan).

### IV COMPATIBILITIES

Dexmedetomidine (Precedex), DOPamine (Intropin), heparin, midazolam (Versed), theophylline.

### INDICATIONS/ROUTES/DOSAGE

#### Anti-inflammatory, Immunosuppressive

**IV: ADULTS, ELDERLY:** 40–125 mg/day as a single dose or in divided doses. **CHILDREN:** Initially, 0.11–1.6 mg/kg/day in 3–4 divided doses. Range: 0.5–1.7 mg/kg/day in 2–4 divided doses.

**PO: ADULTS, ELDERLY:** 16–64 mg/day once daily or in divided doses. **CHILDREN:** 0.5–1.7 mg/kg/day or 5–25 mg/m<sup>2</sup>/day in 2–4 divided doses.

**IM: (MethylPREDNISolone Succinate): ADULTS, ELDERLY:** 40–60 mg as a single dose.

**IM: (Methylprednisolone Acetate): ADULTS, ELDERLY:** 40–60 mg as a single dose.

**Intra-articular, intralesional: ADULTS, ELDERLY:** 4–80 mg q1–5wks.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Insomnia, heartburn, anxiety, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, GI distress, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. **Occasional:** Headache, edema, tachycardia, change in skin color, frequent urination, depression. **Rare:** Psychosis, increased blood coagulability, hallucinations.

### ADVERSE EFFECTS/TOXIC REACTIONS

**Long-term therapy:** Hypocalcemia, hypokalemia, muscle wasting (esp. in arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HE. **Abrupt withdrawal after long-term therapy:** Anorexia, nausea, fever, headache, severe arthralgia, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question for hypersensitivity to corticosteroids, components. Obtain height, weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, ECG). Question history as listed in Precautions.

#### INTERVENTION/EVALUATION

Monitor I&O, daily weight; assess for edema. Monitor daily pattern of bowel activity, stool consistency. Check vital signs at least twice daily. Be alert for infection (sore throat, fever, vague symptoms). Monitor serum electrolytes, including B/P, glucose. Monitor for hypocalcemia (muscle twitching, cramps, positive Trousseau's or Chvostek's signs), hypokalemia (weakness, muscle cramps, numbness,

tingling [esp. lower extremities], nausea/vomiting, irritability, ECG changes). Assess emotional status, ability to sleep.

#### PATIENT/FAMILY TEACHING

- Take oral dose with food, milk.
- Do not change dose/schedule or stop taking drug; must taper off gradually under medical supervision.
- Report fever, sore throat, muscle aches, sudden weight gain or loss, edema, loss of appetite, fatigue.
- Severe stress (serious infection, surgery, trauma) may require increased dosage.
- Follow-up visits, lab tests are necessary.
- Children must be assessed for growth retardation.
- Inform dentist, other physicians of methylprednisolone therapy now or within past 12 mos.

## metoclopramide

met-oh-kloe-pra-myde  
(Gimoti, Metonia , Reglan)

**BLACK BOX ALERT** Prolonged use may cause tardive dyskinesia.

**Do not confuse metoclopramide with metolazone or metoprolol, or Reglan with Renagel.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DOPa-mine, serotonin receptor antagonist.

**CLINICAL:** GI agent, antiemetic.

#### USES

**PO:** Symptomatic treatment of diabetic gastroparesis, gastroesophageal reflux.

**IV/IM:** Symptomatic treatment of diabetic gastroparesis, prevent/treat nausea/vomiting with chemotherapy or after surgery. **Nasal:** Relief of symptoms associated with acute and recurrent diabetic gastroparesis.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to metoclopramide. Concurrent use of medications likely to produce extrapyramidal reactions. Situations in which GI motility may be

dangerous (e.g., GI hemorrhage, GI perforation/obstruction), history of seizure disorder, pheochromocytoma. **Cautions:** Renal impairment, HF, cirrhosis, hypertension, depression, Parkinson's disease, elderly.

#### ACTION

Blocks dopamine/serotonin receptors in chemoreceptor trigger zone of the CNS. Enhances acetylcholine response in upper GI tract, causing increased motility and accelerated gastric emptying without stimulating gastric, biliary, or pancreatic secretions; increases lower esophageal sphincter tone. **Therapeutic Effect:** Accelerates intestinal transit, promotes gastric emptying. Relieves nausea, vomiting.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30–60 min	N/A	1–2 hrs
IV	1–3 min	N/A	1–2 hrs
IM	10–15 min	N/A	1–2 hrs

Widely distributed. Metabolized in liver. Protein binding: 30%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 4–6 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** More susceptible to dystonic reactions. **Elderly:** More likely to have parkinsonian dyskinesias after long-term therapy.

#### INTERACTIONS

**DRUG:** May increase adverse effects of antipsychotic (e.g., haloperidol), promethazine. Strong CYP2D6 inhibitors (e.g., FLUoxetine, PARoxetine) may increase concentration/effect. May decrease therapeutic effect of anti-parkinson agents (e.g., pramipexole, ropinirole), cabergoline. May increase hypertensive effect of MAOIs (e.g., phenelzine, selegiline). Rivastigmine may increase adverse/toxic effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum aldosterone, prolactin.

**AVAILABILITY (Rx)**

**Injection Solution:** 5 mg/mL. **Solution, Nasal:** (*Gimoti*): 15 mg/actuation (9.8 mL). **Solution, Oral:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg.

 **Tablets, Orally Disintegrating:** 5 mg, 10 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Dilute doses greater than 10 mg in 50 mL D<sub>5</sub>W or 0.9% NaCl. **Rate of administration** • Infuse over 15–30 min. • May give undiluted slow IV push at rate of 10 mg over 1–2 min. • Too-rapid IV injection may produce intense feeling of anxiety, restlessness, followed by drowsiness.

**Storage** • Store vials at room temperature. • After dilution, IV infusion (piggyback) is stable for 24 hrs.

**PO**

• Give 30 min before meals and at bedtime. • Tablets may be crushed. • Do not cut, divide, break orally disintegrating tablets. Place on tongue, swallow with saliva.

**IV INCOMPATIBILITIES**

Allopurinol (Aloprim), cefepime (Maxipime), furosemide (Lasix), propofol (Diprivan).

**IV COMPATIBILITIES**

Dexamethasone, dexmedetomidine (Precedex), diltiazem (Cardizem), diphenhydramine (Benadryl), fentaNYL (Sublimaze), heparin, HYDROMORPHONE (Dilaudid), morphine, potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**Prevention of Chemotherapy-Induced Nausea/Vomiting**

**PO: ADULTS, ELDERLY:** 10 mg q6h prn.

**Diabetic Gastroparesis**

**PO, IV: ADULTS, ELDERLY:** 5–10 mg 30 min before meals and at bedtime for up to 12 wks.

**INTRANASAL:** One spray (15 mg) in one nostril 4 times/day (30 min prior to

each meal and at bedtime) for 2–8 wks. **Maximum:** 4 sprays (60 mg)/day.

**Dosage in Renal Impairment**

Dosage is modified based on creatinine clearance.

**Creatinine Clearance Dosage**

Less than 40 mL/min 50% of normal dose

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**ALERT** Doses of 2 mg/kg or greater, or increased length of therapy, may result in a greater incidence of side effects.

**Frequent (10%):** Drowsiness, restlessness, fatigue, lethargy. **Occasional (3%):** Dizziness, anxiety, headache, insomnia, breast tenderness, altered menstruation, constipation, rash, dry mouth, galactorrhea, gynecomastia. **Rare (less than 3%):** Hypotension, hypertension, tachycardia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Extrapyramidal reactions occur most frequently in children, young adults (18–30 yrs) receiving large doses (2 mg/kg) during chemotherapy and usually are limited to akathisia (involuntary limb movement, facial grimacing, motor restlessness). Neuroleptic malignant syndrome (diaphoresis, fever, unstable B/P, muscular rigidity) has been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess for nausea, vomiting, abdominal distention, bowel sounds. **Antiemetic:** Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue).

**INTERVENTION/EVALUATION**

Monitor renal function, B/P, heart rate. Monitor for anxiety, restlessness, extrapyramidal symptoms (EPS) during IV administration. Monitor daily pattern of

bowel activity, stool consistency. Assess skin for rash. Evaluate for therapeutic response from gastroparesis (nausea, vomiting, bloating).

#### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report involuntary eye, facial, limb movement (extrapyramidal reaction).
- Avoid alcohol.

## metOLazone

meh-toe-la-zone  
(Zaroxolyn )

**Do not confuse metOLazone with metaxalone, methotrexate, metoclopramide, or metoprolol, or Zaroxolyn with Zarontin.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Thiazide diuretic. **CLINICAL:** Diuretic, antihypertensive.

#### USES

Treatment of edema due to HF, nephrotic syndrome, or impaired renal function.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to metolazone. Anuria, hepatic coma/precoma. **Cautions:** Hypersensitivity to sulfonamides, thiazide diuretics. Severe renal disease, severe hepatic impairment, gout, prediabetes or diabetes, elevated serum cholesterol, triglycerides.

#### ACTION

Blocks reabsorption of sodium, potassium, chloride at distal convoluted tubule, increasing excretion of sodium, potassium, water. **Therapeutic Effect:** Reduces B/P, promotes diuresis.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (diuretic)	1 hr	—	24 hrs

Incompletely absorbed from GI tract. Protein binding: 95%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 20 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Small amount distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** May be more sensitive to hypotensive or electrolyte imbalance. Age-related renal impairment may require dosage adjustment.

#### INTERACTIONS

**DRUG:** Bile acid sequestrants (e.g., cholestyramine) may decrease absorption. May increase the hypokalemic effect of topiramate. **HERBAL:** Licorice may increase the hypokalemic effect. **Herbals with hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) or **hypertensive properties** (e.g., yohimbe) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, triglycerides. May decrease urinary calcium, serum magnesium, potassium, sodium.

#### AVAILABILITY (Rx)

**Tablets:** 2.5 mg, 5 mg, 10 mg.

#### ADMINISTRATION/HANDLING

##### PO

- May give with food, milk if GI upset occurs, preferably with breakfast (may prevent nocturia).

#### INDICATIONS/ROUTES/DOSAGE

##### Edema

**PO: ADULTS:** 2.5–10 mg/day. May increase to 20 mg/day.

##### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

##### Dosage in Hepatic Impairment

No dose adjustment. Contraindicated with hepatic coma or precoma.

**SIDE EFFECTS**

**Expected:** Increased urinary frequency/volume. **Frequent (10%–9%):** Dizziness, light-headedness, headache. **Occasional (6%–4%):** Muscle cramps/spasm, drowsiness, fatigue, lethargy. **Rare (less than 2%):** Asthenia, palpitations, depression, nausea, vomiting, abdominal bloating, constipation, diarrhea, urticaria.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Vigorous diuresis may lead to profound water loss and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Acute hypotensive episodes may occur. Hyperglycemia may occur during prolonged therapy. Pancreatitis, paresthesia, blood dyscrasias, pulmonary edema, allergic pneumonitis, dermatologic reactions occur rarely. Overdose can lead to lethargy, coma without changes in electrolytes, hydration.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess vital signs, esp. B/P for hypotension. Obtain serum electrolytes. Assess skin turgor, mucous membranes for hydration status. Assess for peripheral edema. Obtain baseline weight. Monitor I&O.

**INTERVENTION/EVALUATION**

Monitor B/P, vital signs, serum electrolytes, I&O, weight. Note extent of diuresis. Monitor for electrolyte disturbances (hypokalemia may result in weakness, tremors, muscle cramps, nausea, vomiting, altered mental status, tachycardia; hyponatremia may result in confusion, thirst, cold/clammy skin).

**PATIENT/FAMILY TEACHING**

- Expect increased urinary frequency/volume.
- Slowly go from lying to standing to reduce hypotensive effect.
- Avoid tasks requiring motor skills, mental alert-

ness until response to drug is established. • Eat foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.

**metoprolol**TOP  
100 HIGH  
ALERT

me-toe-pro-lol

(Kaspargo, Lopressor, Toprol XL)

■ **BLACK BOX ALERT** ■ Abrupt withdrawal can produce acute tachycardia, hypertension, ischemia. Drug should be gradually tapered over 1–2 wks.

**Do not confuse metoprolol with atenolol, labetalol, nadolol, or stanazolol, or Toprol XL with TEGretol, TEGretol XR, or Topamax.**

**FIXED-COMBINATION(S)**

**Dutoprol:** metoprolol/hydroCHLORothiazide (a diuretic): 25 mg/12.5 mg, 50 mg/12.5 mg, 100 mg/12.5 mg.

**Lopressor HCT:** metoprolol/hydrochlorothiazide (a diuretic): 50 mg/25 mg, 100 mg/25 mg, 100 mg/50 mg.

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Beta<sub>1</sub>-adrenergic blocker. **CLINICAL:** Antianginal, antihypertensive, MI adjunct.

**USES**

Treatment of hemodynamically stable acute myocardial infarction (AMI) to reduce CV mortality. Long-term treatment of angina pectoris. Management of hypertension. Treatment of stable symptomatic HF of ischemic, hypertensive, or cardiomyopathic origin to reduce rate of hospitalization in pts receiving ACE inhibitors, diuretics, and/or digoxin. **OFF-LABEL:** Treatment of ventricular arrhythmias, migraine prophylaxis, essential tremor, aggressive behavior, prevent reinfarction post-MI, prevent/treat atrial fibrillation/atrial flutter, hypertrophic cardiomyopathy, thyrotoxicosis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to metoprolol. Second- or third-degree heart block. **Immediate-Release: MI:** Severe sinus bradycardia (HR less than 45 beats/min), systolic B/P less than 100 mm Hg, moderate to severe HF, significant first-degree heart block. **Immediate-Release: HTN/Angina:** Sinus bradycardia, cardiogenic shock, overt HF, sick sinus syndrome (except with pacemaker), severe peripheral arterial disease. **Extended-Release:** Severe bradycardia, cardiogenic shock, decompensated HF, sick sinus syndrome (except with functioning pacemaker). **Cautions:** Arterial obstruction, bronchospastic disease, hepatic impairment, peripheral vascular disease, hyperthyroidism, diabetes mellitus, myasthenia gravis, psychiatric disease, history of severe anaphylaxis to allergens. **Extended-Release:** Compensated HF.

## ACTION

Selectively blocks beta<sub>1</sub>-adrenergic receptors. **Therapeutic Effect:** Slows heart rate, decreases cardiac output, reduces B/P. Decreases myocardial ischemia severity.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	10–15 min	1–2 hrs	N/A
PO (extended-release)	N/A	6–12 hrs	N/A
IV	Immediate	20 min	N/A

Widely distributed. Protein binding: 12%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis.

**Half-life:** 3–7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery, low-birth-weight infants. **Children:** Safety and efficacy not

established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation.

## INTERACTIONS

**DRUG:** Alpha<sub>2</sub> agonists (e.g., clonidine) may increase AV-blocking effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Dronedarone, fingolimod, rivastigmine, siponimod** may increase bradycardic effect. May increase vasoconstriction of **ergot derivatives** (e.g., ergotamine). **Obinutuzumab** may increase hypotensive effect. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum anti-nuclear antibody titer (ANA), serum BUN, lipoprotein, LDH, alkaline phosphatase, bilirubin, creatinine, potassium, uric acid, ALT, AST, triglycerides.

## AVAILABILITY (Rx)

**Injection Solution:** 5 mg/5 mL. **Tablets, Immediate-Release:** 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg.

**Capsules, Extended-Release Sprinkle:** 25 mg, 50 mg, 100 mg, 200 mg. **Tablets, Extended-Release:** 25 mg, 50 mg, 100 mg, 200 mg.

## ADMINISTRATION/HANDLING

**Rate of administration** • May give undiluted. • Administer IV injection over 1 min. • May give by IV piggyback (in 50 mL D<sub>5</sub>W or 0.9% NaCl) over 30–60 min. • Monitor ECG, B/P during administration.

**Storage** • Store at room temperature.

### PO

• Tablets may be crushed; do not crush extended-release tablets. • Extended-release tablets may be divided in half. • Give

at same time each day. • May be given with or immediately after meals (enhances absorption). • Sprinkle capsules may be given whole or contents may be mixed (1 teaspoonful) on soft food and used within 60 min.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), lidocaine, nitroglycerin.

#### IV COMPATIBILITIES

Amiodarone, dilTIAZem, furosemide, heparin, morphine.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 50 mg twice daily. Increase at wkly (or longer) intervals. Usual range: 100–200 mg/day in 2 divided doses. **Maximum:** 400 mg/day. **CHILDREN:** Initially, 0.5–1 mg/kg/dose twice daily. **Maximum Initial Dose:** 25 mg twice daily. **Maximum Daily Dose:** 6 mg/kg/day or 200 mg/day, whichever is less.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 25–100 mg/day as single dose. May increase at least at wkly intervals until optimum B/P attained. Usual range: 50–200 mg once daily. **Maximum:** 400 mg/day. **CHILDREN 6 YRS OR OLDER:** Initially, 1 mg/kg once daily. **Maximum Initial Dose:** 50 mg. May increase to 2 mg/kg/day or 200 mg/day, whichever is less.

#### Angina Pectoris

**PO: (Immediate-Release): ADULTS:** Initially, 50 mg twice daily. Increase at wkly (or longer) intervals. Usual range: 50–200 mg twice daily. **Maximum:** 400 mg/day.

**PO: (Extended-Release): ADULTS:** Initially, 100 mg/day as single dose. May increase by at least at wkly intervals until optimum clinical response achieved. **Maximum:** 400 mg/day.

#### HF

**PO: (Extended-Release): ADULTS:** Initially, 12.5–25 mg/day. May titrate

gradually by doubling dose q2wks or longer up to target dose of 200 mg/day.

#### Early Treatment of MI

**IV: ADULTS:** 5 mg q5min for up to 3 doses, followed by 12.5–50 mg q6–12h in acute setting (begin oral 15–30 min after last IV dose). Transition to metoprolol tartrate twice daily or metoprolol succinate once daily. May increase up to a maximum of 200 mg/day.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Diminished sexual function, drowsiness, insomnia, unusual fatigue/weakness. **Occasional:** Anxiety, diarrhea, constipation, nausea, vomiting, nasal congestion, abdominal discomfort, dizziness, difficulty breathing, cold hands/feet. **Rare:** Altered taste, dry eyes, nightmares, paresthesia, allergic reaction (rash, pruritus).

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce profound bradycardia, hypotension, bronchospasm. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremulousness, exacerbation of angina, MI, ventricular arrhythmias. May precipitate HF, MI in pts with heart disease, thyroid storm in those with thyrotoxicosis, peripheral ischemia in those with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes (may mask signs of hypoglycemia). **Antidote:** Glucagon (see Appendix J for dosage).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess B/P, heart rate immediately before drug administration (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Antianginal:** Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**INTERVENTION/EVALUATION**

Measure B/P near end of dosing interval (determines whether B/P is controlled throughout day). Monitor B/P for hypotension, respiration for shortness of breath. Assess pulse for quality, rate, rhythm. Assess for evidence of HF: dyspnea (esp. on exertion, lying down), night cough, peripheral edema, distended neck veins. Monitor I&O (increased weight, decreased urinary output may indicate HF). Therapeutic response to hypertension noted in 1–2 wks.

**PATIENT/FAMILY TEACHING**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension, arrhythmias.
- Go from lying to standing slowly.
- Report excessive fatigue, dizziness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
- Monitor B/P, pulse before taking medication.
- Restrict salt, alcohol intake.

**metroNIDAZOLE**

me-troe-nye-da-zole

(Flagyl, MetroCream, MetroGel, NidaGel , Noritate, Vandazole)

**Do not confuse metroNIDAZOLE with meropenem, metFORMIN, methotrexate, or miconazole.**

**FIXED-COMBINATION(S)**

**Helidac:** metronidazole/bismuth/tetracycline (an anti-infective): 250 mg/262 mg/500 mg. **Pylera:** metroNIDAZOLE/bismuth/tetracycline (an anti-infective): 125 mg/140 mg/125 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Nitroimidazole derivative. **CLINICAL:** Antibacterial, antiprotozoal, amebicide.

**USES**

**Systemic:** Treatment of anaerobic infections (skin/skin structure, CNS, lower respiratory tract, bone/joints, intra-abdominal, gynecologic, endocarditis, septicemia). Treatment of *H. pylori* (part of multidrug regimen); surgical prophylaxis (colorectal), trichomoniasis, amebiasis. **Topical:** Treatment of acne rosacea or inflammatory lesions. **Vaginal gel:** Treatment of bacterial vaginosis. **OFF-LABEL:** Crohn's disease, urethritis. Antibiotic-associated pseudomembranous colitis (AAPC) caused by *C. difficile*.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to metronidazole. Pregnancy (first trimester with trichomoniasis), use of disulfiram within 2 wks, use of alcohol during therapy or within 3 days of discontinuing metroNIDAZOLE. **Cautions:** Severe hepatic impairment, end-stage renal disease, seizure disorder, HF, other sodium-retaining states, elderly.

**ACTION**

Diffuses into organism, interacting with DNA causing a loss of helical DNA structure and strand breakage, inhibiting protein synthesis. **Therapeutic Effect:** Produces bactericidal, antiprotozoal, amebicidal, trichomonocidal effects. Produces anti-inflammatory, immunosuppressive effects when applied topically.

**PHARMACOKINETICS**

Widely distributed; crosses blood-brain barrier. Minimally absorbed after topical application. Metabolized in liver. Excreted in urine (80%), feces (15%). Removed by hemodialysis. **Half-life:** 8 hrs (increased in cirrhosis, neonates). Active metabolite prolonged in renal failure.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk.

Contraindicated during first trimester in those with trichomoniasis. Topical use during pregnancy, lactation discouraged. **Children:** Safety and efficacy of topical administration not established in pts younger than 21 yrs. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Alcohol may cause disulfiram-type reaction (e.g., abdominal cramps, nausea, vomiting, headache, psychotic reactions). **Disulfiram** may increase risk of toxicity. May increase effects of **oral anticoagulants (e.g., warfarin)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum LDH, ALT, AST.

## AVAILABILITY (Rx)

**Capsules:** 375 mg. **Injection, Infusion:** 500 mg/100 mL. **Tablets:** 250 mg, 500 mg. **Topical Cream: (MetroCream):** 0.75% (**Noritate**): 1%. **Topical Gel: (MetroGel):** 0.75%, 1%. **Vaginal Gel: (MetroGel-Vaginal, Vandazole):** 0.75%.

## ADMINISTRATION/HANDLING

**Rate of administration** • Infuse IV over 30–60 min. Do not give by IV bolus.

**Storage** • Store at room temperature (ready-to-use infusion bags).

### PO

• Give without regard to food. Give with food to decrease GI irritation.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Dexmedetomidine (Precedex), dilTIA-Zem (Cardizem), DOPamine (Intropin), heparin, HYDROMorphone (Dilaudid),

LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine.

## INDICATIONS/ROUTES/DOSAGE

### Amebiasis

**PO: ADULTS, ELDERLY: (Immediate-Release):** 500–750 mg q8h for 7–10 days. **CHILDREN:** 35–50 mg/kg/day in divided doses q8h for 7–10 days.

### Anaerobic Infections

**PO, IV: ADULTS, ELDERLY:** 500 mg q6–8h. **PO: CHILDREN, INFANTS:** 30–50 mg/kg/day in divided doses q8h. **IV: CHILDREN, INFANTS:** 22.5–40 mg/kg/day in 3 divided doses. **Maximum:** 1,500 mg/day.

### Intra-abdominal Infections

**IV: ADULTS, ELDERLY:** 500 mg q6–8h. **CHILDREN:** 30–40 mg/kg/day in 3 divided doses. **Maximum dose:** 500 mg/dose.

### Pseudomembranous Colitis

**PO: ADULTS, ELDERLY:** 500 mg 3 times/day. **CHILDREN:** 7.5 mg/kg/dose 3–4 times/day for 7–10 days. **Maximum:** 500 mg/dose.

### Bacterial Vaginosis

**Intravaginal: ADULTS:** 0.75% apply 1–2 times/day for 5 days. 1.3% apply once as a single dose. **PO: 500 mg** twice daily for 7 days.

## ALERT

Centers for Disease Control and Prevention (CDC) does not recommend the use of topical agents during pregnancy.

### Rosacea

**Topical: ADULTS, ELDERLY: (1%):** Apply to affected area once daily. **(0.75%):** Apply to affected area twice daily.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Use caution. No dose adjustment. **Severe**

**impairment:** Reduce dose by 50% for immediate-release; not recommended for extended-release.

## SIDE EFFECTS

**Frequent: Systemic:** Anorexia, nausea, dry mouth, metallic taste. **Vaginal:** Symptomatic cervicitis/vaginitis, abdominal cramps, uterine pain. **Occasional: Systemic:** Diarrhea, constipation, vomiting, dizziness, erythematous rash, urticaria, reddish-brown urine. **Topical:** Transient erythema, mild dryness, burning, irritation, stinging, tearing when applied too close to eyes. **Vaginal:** Vaginal, perineal, vulvar itching; vulvar swelling. **Rare:** Mild, transient leukopenia; thrombophlebitis with IV therapy.

## ADVERSE EFFECTS/TOXIC REACTIONS

Oral therapy may result in furry tongue, glossitis, cystitis, dysuria, pancreatitis. Peripheral neuropathy (manifested as numbness, tingling of hands/feet) usually is reversible if treatment is stopped immediately upon appearance of neurologic symptoms. Seizures occur occasionally.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT. Question for history of hypersensitivity to metronidazole, other nitroimidazole derivatives (and parabens with topical). Obtain specimens for diagnostic tests, cultures before giving first dose (therapy may begin before results are known).

### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Monitor I&O, assess for urinary problems. Be alert to neurologic symptoms (dizziness, paresthesia of extremities). Assess for rash, urticaria. Monitor for onset of superinfection (ulceration/change of oral mucosa, furry tongue, vaginal discharge, genital/anal pruritus).

## PATIENT/FAMILY TEACHING

- Urine may be red-brown or dark.
- Avoid alcohol, alcohol-containing preparations (cough syrups, elixirs) for at least 48 hrs after last dose.
- If taking metroNIDAZOLE for trichomoniasis, refrain from sexual intercourse until full treatment is completed.
- For amebiasis, frequent stool specimen checks will be necessary.
- **Topical:** Avoid contact with eyes.
- May apply cosmetics after application.
- Metronidazole acts on erythema, papules, pustules but has no effect on rhinophyma (hypertrophy of nose), telangiectasia, ocular problems (conjunctivitis, keratitis, blepharitis).
- Other recommendations for rosacea include avoidance of hot/spicy foods, alcohol, extremes of hot/cold temperatures, excessive sunlight.

M

## micafungin

mye-ka-fun-jin  
(Mycamine)

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Echinocandin antifungal. **CLINICAL:** Antifungal.

## USES

Treatment of esophageal candidiasis, candidemia, candida peritonitis, abscesses, acute disseminated candidiasis, prophylaxis of *Candida* infection in pts undergoing hematopoietic stem cell transplant. **OFF-LABEL:** Treatment of infections due to *Aspergillus* spp.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to micafungin. **Cautions:** Hepatic/renal impairment, concomitant hepatotoxic medications.

## ACTION

Inhibits synthesis of glucan (vital component of fungal cell formation), damaging

fungal cell membrane. **Therapeutic Effect:** Decreased glucan content leads to cellular lysis.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: greater than 99%. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 11–21 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May reduce sperm count. May be embryotoxic. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of *Saccharomyces boulardii*. May increase concentration/effect of **sirolimus**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, alkaline phosphatase, LDH, ALT, AST.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Add 5 mL 0.9% NaCl (without bacteriostatic agent) to each 50-mg vial (10 mL to 100-mg vial) to yield micafungin 10 mg/mL. • Gently swirl to dissolve; do not shake. • Further dilute in 0.9% NaCl or D<sub>5</sub>W to final concentration of 0.5–1.5 mg/mL. • Alternatively, D<sub>5</sub>W may be used for reconstitution and dilution. • Flush existing IV line with 0.9% NaCl or D<sub>5</sub>W before infusion.

**Rate of administration** • Infuse over 60 min.

**Storage** • Reconstituted solution is stable for 24 hrs at room temperature. • Discard if precipitate is present.

## IV INCOMPATIBILITIES

Amiodarone, nicardipine.

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, heparin.

## INDICATIONS/ROUTES/DOSAGE

### Esophageal Candidiasis

**IV: ADULTS, ELDERLY:** 150 mg/day for 10–30 days. **CHILDREN 4 MOS OR OLDER WEIGHING MORE THAN 30 KG:** 2.5 mg/kg/day. **Maximum:** 150 mg daily. **30 KG OR LESS:** 3 mg/kg/day.

### Candida Prophylaxis in Stem Cell Pts

**IV: ADULTS, ELDERLY:** 50 mg/day. **CHILDREN 4 MOS OR OLDER:** 1 mg/kg/day. **Maximum:** 50 mg/day.

### Candidemia, Disseminated Candidiasis, Peritonitis, Abscesses

**IV: ADULTS, ELDERLY:** 100 mg/day for 15 days. **CHILDREN 4 MOS OR OLDER:** 2 mg/kg/day. **Maximum:** 100 mg daily.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (3%–2%):** Nausea, headache, diarrhea, vomiting, fever. **Rare (1%):** Dizziness, drowsiness, pruritus, abdominal pain, dyspepsia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reaction characterized by rash, pruritus, facial edema occurs rarely. Anaphylaxis, hemoglobinuria, hemolytic anemia have been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function, LFT.

### INTERVENTION/EVALUATION

Monitor BUN, serum creatinine, CrCl, LFT. Monitor for hepatotoxicity.

**PATIENT/FAMILY TEACHING**

- Report liver problems such as bruising, confusion; dark amber or orange-colored urine; right upper abdominal pain; yellowing of the skin or eyes.
- Report decreased urine output; dark, amber urine; swelling of the hands or feet.
- Do not take OTC medications that are toxic to the liver (e.g., acetaminophen).

**midazolam****HIGH ALERT**

mye-**da**-zoe-lam  
(Nayzilam)

**BLACK BOX ALERT** ■ May cause severe respiratory depression, respiratory arrest, apnea. Initial doses in elderly should be conservative. Do not administer by rapid IV injection in neonates (may cause severe hypotension/seizures). Use with opioids may cause profound sedation, respiratory depression, coma, or death. Exposes users to risks of abuse, misuse, and addiction, which can lead to overdose or death. Chronic use may cause clinically significant physical dependence.

**Do not confuse midazolam with, ALPRAZolam or LORazepam.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Sedative, anxiolytic.

**USES**

Sedation, anxiolytic, amnesia before procedure or induction of anesthesia, conscious sedation before diagnostic/radiographic procedure, continuous IV sedation of intubated or mechanically ventilated pts. **Nasal:** Acute treatment of seizure clusters. **OFF-LABEL:** Anxiety, status epilepticus, conscious sedation (intranasal route).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to midazolam. Acute narrow-angle glaucoma, concurrent use of protease

inhibitors (e.g., atazanavir, darunavir). **Cautions:** Renal/hepatic/pulmonary impairment, impaired gag reflex, HF, treated open-angle glaucoma, concurrent CNS depressants, obesity, elderly, debilitated.

**ACTION**

Enhances action of gamma-aminobutyric acid (GABA), one of the major inhibitory neurotransmitters in the brain. **Therapeutic Effect:** Produces anxiolytic, hypnotic, anticonvulsant, muscle relaxant, amnesic effects.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	10–20 min	N/A	N/A
IV	1–5 min	5–7 min	20–30 min
IM	5–15 min	30–60 min	2–6 hrs

Widely distributed. Metabolized in liver. Protein binding: 97%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–5 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Children:** Neonates more likely to have respiratory depression. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS effects, respiratory depression, hypotensive effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products increase oral absorption, systemic availability. **LAB VALUES:** None significant.

**M**

**AVAILABILITY (Rx)****Injection Solution:** 1 mg/mL, 5 mg/mL.**Nasal Spray:** 5 mg/0.1 mL. **Syrup:** 2 mg/mL.**ADMINISTRATION/HANDLING****Rate of administration**

- May give undiluted or as infusion.
- Resuscitative equipment, O<sub>2</sub> must be readily available before IV administration.
- Administer by slow IV injection over at least 2–5 min at concentration of 1–5 mg/mL.
- Reduce IV rate in those older than 60 yrs, debilitated pts with chronic disease states, pulmonary impairment.
- Too-rapid IV rate, excessive doses, or single large dose increases risk of respiratory depression/arrest.

**Storage** • Store vials at room temperature.**IM**

- Give deep IM into large muscle mass.

**Maximum concentration:** 1 mg/mL.**PO**

- Do not mix with grapefruit juice.

**IV INCOMPATIBILITIES**

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), bumetanide (Bumex), co-trimoxazole (Bactrim), dexamethasone (Decadron), fosphenytoin (Cerebyx), furosemide (Lasix), hydrocortisone (Solu-Cortef), methotrexate, nafcillin (Nafcil), sodium bicarbonate.

**IV COMPATIBILITIES**

Amiodarone (Cordarone), atropine, calcium gluconate, dexmedetomidine (Precedex), dilTIAZem (Cardizem), diphenhydramine (Benadryl), DOBUTAMINE (Dobutrex), DOPAMINE (Intropin), etomidate (Amidate), fentanyl (Sublimaze), glycopyrrolate (Robinul), heparin, HYDROMORPHONE (Dilaudid), hydroxyzine (Vistaril), insulin, LORAZEPAM (Ativan), milrinone (Primacor), morphine, nitroglycerin, norepinephrine

(Levophed), potassium chloride, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Continuous Sedation During Mechanical Ventilation**

**IV: ADULTS, ELDERLY:** Initially, 0.01–0.05 mg/kg (1–5 mg in 70-kg adult). May repeat at 5- to 15-min intervals until adequate sedation achieved or continuous infusion rate of 0.02–0.1 mg/kg/hr and titrated to desired effect. **CHILDREN:** Initially, 0.05–0.2 mg/kg followed by continuous infusion of 0.06–0.12 mg/kg/hr (1–2 mcg/kg/min) titrated to desired effect. Usual range: 0.4–6 mcg/kg/min.

**Seizure Clusters****Nasal: ADULTS, CHILDREN 12 YRS AND OLDER:**

Initially, one spray (5-mg dose) into one nostril. One additional spray (5-mg dose) into the opposite nostril may be administered after 10 min.

**Maximum dose:** 10 mg (2 sprays) per episode. **Maximum frequency:** 1 episode q3days; 5 episodes/mos.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (10%–4%):** Decreased respiratory rate, tenderness at IM or IV injection site, pain during injection, oxygen desaturation, hiccups. **Occasional (3%–2%):** Hypotension, paradoxical CNS reaction. **Rare (less than 2%):** Nausea, vomiting, headache, coughing.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Inadequate or excessive dosage, improper administration may result in cerebral hypoxia, agitation, involuntary movements, hyperactivity, combativeness. Too-rapid IV rate, excessive doses, or single large dose increases risk of respiratory depression/arrest. Respiratory depression/apnea may produce hypoxia, cardiac arrest.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Resuscitative equipment, oxygen must be available. Obtain vital signs before administration. Assess level of consciousness.

### INTERVENTION/EVALUATION

Monitor respiratory rate, oxygen saturation continuously during administration for underventilation, apnea. Monitor vital signs, level of sedation q3–5min during recovery period. Assess level of consciousness for effectiveness.

## midodrine

mye-doe-dreen

(Amatine , Apo-Midodrine )

**■ BLACK BOX ALERT ■** Can cause marked rise in supine blood pressure; use in pts for whom orthostatic hypotension significantly impairs daily life.

**Do not confuse Amatine with amantadine or protamine, or midodrine with Midrin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha<sub>1</sub> agonist. **CLINICAL:** Vasopressor.

## USES

Treatment of symptomatic orthostatic hypotension. **OFF-LABEL:** Vasovagal syncope, prevention of dialysis-induced hypotension.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to midodrine. Acute renal failure, persistent supine hypertension, poorly controlled hypertension, pheochromocytoma, severe cardiac disease, thyrotoxicosis, urinary retention. **Cautions:** Renal/hepatic impairment, history of visual problems, diabetes, immobility, pts who are unable to stand. Concurrent administration with digoxin, beta blockers (e.g., metoprolol), vasoconstrictors (e.g., norepinephrine).

## ACTION

Forms active metabolite desglymidodrine, an alpha<sub>1</sub> agonist, increasing arteriolar and venous tone. **Therapeutic Effect:** Increases standing, sitting, and supine systolic B/P in pts with orthostatic hypotension.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	—	2–3 hrs

Widely distributed. Protein binding: Low. Metabolized via enzymatic hydrolysis. Excreted in urine. **Half-life:** 0.5 hr.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Ergot derivatives (e.g., ergotamine), linezolid, MAOIs (e.g., phenelzine, selegiline) may increase hypertensive effects. May increase bradycardic effect of beta blockers (e.g., metoprolol), digoxin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 2.5 mg, 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

- Give without regard to food.
- Give during the day when pt is upright (upon rising, midday, late afternoon). Do not give within 4 hrs of evening bedtime.

## INDICATIONS/ROUTES/DOSAGE

### Orthostatic Hypotension

**PO: ADULTS, ELDERLY:** Initially, 2.5 mg 2–3 times/day during daytime hours (e.g., q3–4hrs). Titrate based on response and tolerability. **Maximum:** 10 mg 3 times/day.

**Dosage in Renal Impairment**

2.5 mg 3 times/day; increase gradually, as tolerated. **Hemodialysis:** Dose after HD unless used to prevent HD-induced hypotension.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (20%–7%):** Paresthesia, pilo-erection, pruritus, dysuria, supine hypertension. **Occasional (6%–1%):** Pain, rash, chills, headache, facial flushing, confusion, dry mouth, anxiety.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May cause marked increase of supine systolic BP (supine hypertension). May cause bradycardia due to vagal reflex.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain B/P, heart rate. Assess sensitivity to midodrine, other medications (esp. digoxin, sodium-retaining vasoconstrictors). Assess medical history, esp. for renal impairment, severe hypertension, cardiac disease. Ensure pt is able to remain in the upright position.

**INTERVENTION/EVALUATION**

Monitor B/P, heart rate; renal, hepatic, cardiac function.

**PATIENT/FAMILY TEACHING**

- Do not take last dose of the day after evening meal or less than 4 hrs before bedtime (lying flat after dose may cause significant increase of blood pressure).
- Do not give if pt will be supine.
- Use caution with OTC medications that may affect B/P (e.g., cough and cold, diet medications).

**midostaurin**

mye-doe-staw-rim  
(Rydapt)

**Do not confuse midostaurin with midodrine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** FLT inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adult pts with newly diagnosed acute myeloid leukemia (AML) who are FLT3 mutation–positive, as detected by an FDA-approved test (in combination with standard cytarabine and daunorubicin induction and cytarabine consolidation chemotherapy). Treatment of adult pts with aggressive systemic mastocytosis (ASM), systemic mastocytosis with associated hematologic neoplasm (SM-AHN), or mast cell leukemia (MCL).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to midostaurin. **Cautions:** Baseline cytopenias; concomitant use of strong CYP3A inhibitors, strong CYP3A inducers; pts at risk for hemorrhage (e.g., history of GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, NSAIDs, antiplatelet medication).

**ACTION**

Inhibits multiple receptors including FLT3 receptor signaling, and cell proliferation. **Therapeutic Effect:** Induces apoptosis in ITD and ITD mutant expressing leukemic cells.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 99.8%. Peak plasma concentration: 1–3 hrs. Steady state reached in 28 days. Excreted in feces (95%), urine (5%). **Half-life:** 21 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive

potential should use effective contraception during treatment and for at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Moderate CYP3A4 inhibitors (e.g., ciprofloxacin, fluconazole, verapamil), strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **QT-prolonging agents** (e.g., amiodarone, haloperidol, moxifloxacin, sotalol) may enhance QT-prolonging effect. May decrease therapeutic effect of BCG (intravesical). **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, GGT, glucose, lipase, sodium, uric acid. May decrease Hgb, Hct, lymphocytes, leukocytes, neutrophils, platelets, RBCs; serum albumin, magnesium, phosphate, potassium. May increase or decrease serum calcium or sodium. May prolong aPTT.

## AVAILABILITY (Rx)

 **Capsules:** 25 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Administer whole; do not cut, crush, open capsules.

## INDICATIONS/ROUTES/DOSAGE

### Acute Myeloid Leukemia (FLT Positive)

**PO: ADULTS, ELDERLY:** 50 mg twice daily (at 12-hr intervals) on days 8–21 of each induction in combination with cytarabine and daunorubicin, and on days 8–21 of

each cycle of consolidation with high-dose cytarabine.

### Systemic Mastocytosis, Mast Cell Leukemia

**PO: ADULTS, ELDERLY:** 100 mg twice daily. Continue until disease progression or unacceptable toxicity.

## DOSE MODIFICATION FOR SYSTEMIC MASTOCYTOSIS

### Neutropenia

**ANC less than 1,000 cells/mm<sup>3</sup> in pts without MCL; ANC less than 500 cells/mm<sup>3</sup> in pts with baseline ANC 500–1,500 cells/mm<sup>3</sup>:** Withhold treatment until ANC greater than or equal to 1,000 cells/mm<sup>3</sup>, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50 mg dose is tolerated. If neutropenia persists for more than 21 days, permanently discontinue.

### Thrombocytopenia

**Platelet count less than 50,000 cells/mm<sup>3</sup> in pts without MCL; platelet count less than 25,000 cells/mm<sup>3</sup> in pts with baseline platelet count 25,000–75,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count greater than or equal to 50,000 cells/mm<sup>3</sup>, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated. If thrombocytopenia persists for more than 21 days, permanently discontinue.

### Anemia

**Hgb less than 8 g/dL in pts without MCL; life-threatening anemia with baseline Hgb 8–10 g/dL:** Withhold treatment until Hgb greater than or equal to 8 g/dL, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated. If treatment-induced anemia persists for more than 21 days, permanently discontinue.

### Nausea, Vomiting

**Grade 3 or 4 nausea, vomiting despite antiemetic therapy:** Withhold treatment for 3 days (6 doses), then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated.

**Nonhematologic Toxicities**

**Any other grade toxicities:** Withhold treatment until resolved to Grade 2 or less, then resume at 50 mg twice daily. May increase to 100 mg twice daily if 50-mg dose is tolerated.

**Dosage in Renal/Hepatic Impairment**

Not specified; use caution.

**SIDE EFFECTS**

**AML: Frequent (83%–24%):** Nausea, mucositis, stomatitis, laryngeal pain, vomiting, headache, petechiae, musculoskeletal pain. **Occasional (20%–7%):** Hyperglycemia, hemorrhoids, arthralgia, hyperhidrosis, insomnia, hypertension, dry skin, increased weight. **Rare (4%–3%):** Tremor, eyelid edema. **Systemic mastocytosis: Frequent (82%–23%):** Nausea, vomiting, diarrhea, edema, peripheral edema, fatigue, asthenia, musculoskeletal pain, back pain, extremity pain, abdominal pain, constipation, pyrexia, headache, dyspnea, bronchospasm. **Occasional (19%–6%):** Arthralgia, cough, rash, dizziness, insomnia, hypotension, dyspepsia. **Rare (5%–4%):** Vertigo, chills, mental status change.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Hypersensitivity reactions including anaphylaxis, angioedema, dyspnea, itching, flushing may occur. Infections including bronchitis, bronchopulmonary aspergillosis, colitis, cellulitis, device-related infection, erysipelas, fungal pneumonia, gastroenteritis, hepatic candidiasis, herpes zoster, nasopharyngitis, oral herpes, pneumonia, sepsis, sinusitis, splenic fungal infection, upper respiratory tract infection, UTI have occurred. Renal failure, acute kidney injury may occur. Other adverse effects including angina pectoris, cardiac failure, contusion, duodenal ulcer hemorrhage, epistaxis, gastritis, febrile neutropenia, GI bleeding, hematoma, interstitial lung disease, myocardial infarction, myocardial ischemia,

pericardial effusion, pneumonitis, pulmonary congestion, pulmonary edema, thrombosis were reported. May prolong QT interval.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, LFT; serum magnesium; vital signs. Ensure electrolytes are corrected prior to initiation. In females of reproductive potential, obtain pregnancy test within 7 days of initiation. Screen for active infection. To reduce risk of nausea/vomiting, administer antiemetic before treatment. Obtain ECG in pts taking QT interval-prolonging medications. Receive full medication history and screen for interactions. Question history as listed in Precautions. Confirm compliance of effective contraception. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor ANC, CBC for myelosuppression. Monitor BMP for renal insufficiency, electrolyte imbalance (esp. in pts with diarrhea, vomiting, malnutrition); LFT for transaminitis, hepatotoxicity. Diligently screen for infections, sepsis; provide appropriate antimicrobial therapy if indicated. Obtain ABG, radiologic test if interstitial lung disease or pneumonitis suspected. Monitor for toxicities at least w/ky for 4 wks, then every other wk for 8 wks, then monthly thereafter. If treatment-related toxicities occur, consider referral to specialist. Monitor for hemorrhage, melena, hematuria; hypersensitivity reactions; myocardial infarction, pulmonary disease, thrombosis. Monitor I&O.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of kidney failure (decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet); liver problems (bruising, confusion; amber, dark,

orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); lung problems (severe cough, difficulty breathing, lung pain, shortness of breath). • Use effective contraception to avoid pregnancy. • Avoid grapefruit products, herbal supplements. • Do not take newly prescribed medications unless approved by the prescriber who originally started treatment. • Heart attacks have occurred; immediately report chest pain, sweating, fainting, palpitations, jaw pain, pain that radiates to the left arm. • Report bleeding of any kind, esp. nosebleeds, blood in stool or urine. • Allergic reactions such as anaphylaxis, difficulty breathing, itching, flushing, rash may occur.

## ***milrinone***

**HIGH  
ALERT**

mil-ri-none

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cardiac inotropic agent. **CLINICAL:** Vasodilator (phosphodiesterase-3 enzyme inhibitor).

### USES

Short-term management of decompensated HF. **OFF-LABEL:** Inotropic therapy for pts unresponsive to other therapy, outpatient inotropic therapy for heart transplant candidates, palliation of symptoms in end-stage HF.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to milrinone. **Cautions:** Severe obstructive aortic or pulmonic valvular disease, history of ventricular arrhythmias, atrial fibrillation/flutter, renal impairment. Not recommended in pts with acute MI.

### ACTION

Inhibits phosphodiesterase in cardiac and vascular tissue. **Therapeutic Effect:** Relaxes vascular muscle, causing vasodilation. Increases cardiac output,

decreases pulmonary capillary wedge pressure, vascular resistance.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	5–15 min	N/A	N/A

Protein binding: 70%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1.7–2.7 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injection Solution (Primacor):** 1 mg/mL, 10-mL vial. **Injection Solution, Premix (Primacor):** 200 mcg/mL (100 mL, 200 mL).

### ADMINISTRATION/HANDLING

**Reconstitution** • For IV infusion, dilute 20-mg (20-mL) vial with 80 mL 0.9% NaCl or D<sub>5</sub>W to provide concentration of 0.2 mg/mL (200 mcg/mL).

**Rate of administration** • For IV injection (loading dose), administer undiluted slowly over 10 min. • Monitor for arrhythmias, hypotension during IV therapy; reduce or temporarily discontinue infusion until condition stabilizes. Infuse via infusion pump.

**Storage** • Diluted solutions stable for 72 hrs at room temperature.

### ⚠️ IV INCOMPATIBILITIES

Furosemide (Lasix), imipenem-cilastatin (Primaxin), procainamide (Pronestyl).

### ⚠️ IV COMPATIBILITIES

Calcium gluconate, dexamethasone (Decadron), dexmedetomidine (Precedex), digoxin (Lanoxin), dilTIAZem (Cardizem),

DOBUtamine (Dobutrex), DOPamine (Intropin), heparin, HYDRomorphine (Dilaudid), lidocaine, magnesium, midazolam (Versed), morphine, nitroglycerin, potassium, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Loading doses are usually not recommended due to risk of hypotension.

### Management of HF

**IV: ADULTS, ELDERLY:** Initially, 0.125 mcg/kg/min. Range: 0.125–0.75 mcg/kg/min. Titrate based on clinical goal.

### Dosage in Renal Impairment

**CrCl 10–50 mL/min:** Initially, 0.0625–0.125 mcg/kg/min. Titrate cautiously esp. in pts with worsening renal function.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (3%–1%):** Headache, hypotension. **Rare (less than 1%):** Angina, chest pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Supraventricular/ventricular arrhythmias, nonsustained ventricular tachycardia, sustained ventricular tachycardia may occur. Ventricular fibrillation (0.2% of pts) has been documented.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BN peptide. Assess B/P, heart rate before treatment begins and during IV therapy. Assess lung sounds; observe for edema.

### INTERVENTION/EVALUATION

Monitor B/P, heart rate, cardiac output, ECG, serum potassium, renal function, signs/symptoms of HF.

## mirabegron

mir-a-beg-ron  
(Myrbetriq)

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta<sub>3</sub>-adrenergic agonist. **CLINICAL:** Smooth muscle relaxant.

## USES

Treatment of overactive bladder with symptoms of urinary incontinence, urgency, frequency as monotherapy or in combination with solifenacin. Treatment of neurogenic detrusor overactivity in pts 3 yrs of age and older and weighing 35 kg or greater.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to mirabegron. **Cautions:** Bladder outlet obstruction, pts taking antimuscarinic medications (increases urinary retention), mild to moderate hepatic/renal impairment, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia). Not recommended in pts with severe uncontrolled hypertension (SBP equal to or greater than 180 mm Hg and/or DBP equal to or greater than 110 mm Hg).

## ACTION

Relaxes detrusor smooth muscle of bladder through beta<sub>3</sub> stimulation during storage phase of urinary bladder fill–void cycle. **Therapeutic Effect:** Increases bladder capacity, reduces symptoms of urinary urgency, increased voiding frequency, urge incontinence, nocturia.

## PHARMACOKINETICS

Widely distributed. Protein binding: 71%. Eliminated in urine (55%), feces (35%). **Half-life:** 50 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **desipramine, digoxin, thioridazine,**

**flecainide, propafenone.** May decrease concentration/effect of **tamoxifen.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase GGT, LDH; temporarily increase ALT, AST.

## AVAILABILITY (Rx)

 **Tablets, Extended-Release:** 25 mg, 50 mg. **Oral Suspension, Extended-Release:** 8 mg/mL after reconstitution.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer with water.
- Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO: ADULTS, ELDERLY:** Initially, 25 mg once daily. Efficacy seen within 8 wks for 25-mg dose. May increase to 50 mg once daily.

### Neurogenic Detrusor Overactivity

**PO: CHILDREN 3 YRS OR OLDER WEIGHING 35 KG OR MORE): (Tablet):** 25 mg once daily. After 4–8 wks, may increase to 50 mg once daily.

**PO: (Granules):** 6 mL (48 mg) once daily. After 4–8 wks, increase to 10 mL (80 mg) once daily.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dosage adjustment. **Severe impairment:** Do not exceed 25 mg once daily.

### Dosage in Hepatic Impairment

**Mild impairment:** No dosage adjustment. **Moderate impairment:** Do not exceed 25 mg once daily. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Occasional (9%–4%):** Hypertension, headache, nasopharyngitis. **Rare (2%–1%):** Constipation, arthralgia, diarrhea, tachycardia, fatigue.

## ADVERSE EFFECTS/TOXIC REACTIONS

Worsening of preexisting hypertension reported infrequently. UTI occurred in

6% of pts, influenza in 3%, and upper respiratory infection in 1.5%.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P. Receive full medication history, and screen for possible drug interactions. Monitor I&O (particularly in pts with history of urinary retention).

### INTERVENTION/EVALUATION

Palpate bladder for urinary retention. Measure B/P near end of dosing interval (determines whether B/P is controlled throughout day). Monitor B/P periodically especially in hypertensive pts. For pts taking digoxin, monitor digoxin serum level for therapeutic effect (very narrow line between therapeutic and toxic level). Assess pulse for quality, irregular rate, bradycardia. Question for evidence of headache.

### PATIENT/FAMILY TEACHING

- Report urinary retention.
- Do not use nasal decongestants, over-the-counter cold preparations without doctor approval. Restrict salt, alcohol intake.

## mirtazapine

mir-taz-a-peen

(Remeron, Remeron Soltab)

**BLACK BOX ALERT** Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse Remeron with Premarin, Rozerem, or Zemuron.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha 2-antagonist. **CLINICAL:** Antidepressant.

## USES

Treatment of major depressive disorder (MDD).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to mirtazapine. Use of MAOIs to treat psychiatric disorders (concurrently or within 14 days of discontinuing either MAOI or mirtazapine), initiation of mirtazapine in pts receiving linezolid or IV methylene blue. **Cautions:** Renal/hepatic impairment, elderly, seizure disorder, suicidal ideation or behavior, alcoholism, concurrent medications that lower seizure threshold, cardiovascular disease, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia).

**ACTION**

Acts as antagonist at presynaptic  $\alpha_2$ -adrenergic receptors, increasing norepinephrine, serotonin neurotransmission. Has low anticholinergic activity. **Therapeutic Effect:** Relieves depression.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 85%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 20–40 hrs (longer in males [37 hrs] than females [26 hrs]).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressant medications (e.g., **LORazepam, morphine, zolpidem**) may increase impairment of cognition, motor skills. **Serotonergic drugs** (e.g., **venlafaxine**) may increase risk of serotonin syndrome. **Strong CYP3A4 inducers** (e.g., **carbamazepine, phenytoin, rifampin**) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., **clarithromycin, ketoconazole, ritonavir**) may increase concentration/

effect. **MAOIs** (e.g., **phenelzine, selegiline**) may increase risk of neuroleptic malignant syndrome, hypertensive crisis, severe seizures. **QT interval-prolonging medications** (e.g., **amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol**) may increase risk of QTc interval prolongation. **HERBAL:** Herbs with sedative properties (e.g., **chamomile, kava kava, valerian**) may increase CNS depression. **St. John's wort** may decrease concentration/effects, may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, triglycerides, ALT.

**AVAILABILITY (Rx)**

**Tablets:** 7.5 mg, 15 mg, 30 mg, 45 mg. **Tablets, Orally Disintegrating:** 15 mg, 30 mg, 45 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • May crush/break scored tablets.

**Orally Disintegrating Tablets**

• Give without regard to food. • Do not split tablet. • Place on tongue; dissolves without water.

**INDICATIONS/ROUTES/DOSAGE****Depression**

**Note:** When discontinuing, gradually taper dose to minimize withdrawal symptoms and to allow detection of re-emerging symptoms. **PO: ADULTS:** Initially, 15 mg at bedtime. May increase by 15 mg/day q1–2wks. **Maximum:** 45 mg/day. **ELDERLY:** Initially, 7.5 mg at bedtime. May increase by 7.5–15 mg/day q1–2wks. **Maximum:** 45 mg/day.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (54%–12%):** Drowsiness, dry mouth, increased appetite, constipation, weight gain. **Occasional (89%–4%):** Asthenia,

dizziness, flu-like symptoms, abnormal dreams. **Rare:** Abdominal discomfort, vasodilation, paresthesia, acne, dry skin, thirst, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Higher incidence of seizures than with tricyclic antidepressants (esp. in pts with no history of seizures). Overdose may produce cardiovascular effects (severe orthostatic hypotension, dizziness, tachycardia, palpitations, arrhythmias). Abrupt discontinuation from prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams. Agranulocytosis occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess mental status, appearance, behavior, speech pattern, level of interest, mood. Obtain baseline weight.

### INTERVENTION/EVALUATION

For pts on long-term therapy, renal function, LFT, CBC should be performed periodically. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Children, adolescents are at increased risk for suicidal thoughts/behavior and worsening of depression, esp. during first few mos of therapy. Assess appearance, behavior, speech pattern, level of interest, mood. Monitor for hypotension, arrhythmias.

### PATIENT/FAMILY TEACHING

- Take as single bedtime dose.
- Avoid alcohol, depressant/sedating medications.
- Avoid tasks requiring alertness, motor skills until response to drug established.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

## miSOPROStol

mis-oh-pros-tol  
(Cytotec)

**BLACK BOX ALERT** Use during pregnancy can cause abortion,

premature birth, birth defects. Not recommended in women of childbearing potential unless pt is capable of complying with effective contraception.

**Do not confuse Cytotec with Cytoxan, or miSOPROStol with metoprolol or miFEPRStone.**

## FIXED-COMBINATION(S)

**Arthrotec:** miSOPROStol/diclofenac (an NSAID): 200 mcg/50 mg, 200 mcg/75 mg.

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Prostaglandin. **CLINICAL:** Antisecretory, gastric protectant.

## USES

Prevention of NSAID-induced gastric ulcers and in pts at high risk for developing gastric ulcer/gastric ulcer complications. Medical termination of intrauterine pregnancy through 70 days' gestation (in conjunction with miFEPRStone). **OFF-LABEL:** Cervical ripening, labor induction, treatment/prevention of postpartum hemorrhage, treatment of incomplete or missed abortion.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to misoprostol, other prostaglandins; pregnancy. **Cautions:** Renal impairment, cardiovascular disease, elderly.

## ACTION

Replaces protective prostaglandins consumed with prostaglandin-inhibiting therapies (e.g., NSAIDs). Induces uterine contractions. **Therapeutic Effect:** Reduces acid secretion from gastric parietal cells, stimulates bicarbonate production from gastric/duodenal mucosa.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	1–1.5 hrs	3–6 hrs

Widely distributed. Protein binding: 80%–90%. Primarily excreted in urine.

Unknown if removed by hemodialysis.  
**Half-life:** 20–40 min.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Produces uterine contractions, uterine bleeding, expulsion of products of conception (abortifacient property). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Antacids may increase concentration. May increase adverse effects of **oxytocin**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Tablets:** 100 mcg, 200 mcg.

### ADMINISTRATION/HANDLING

#### PO

- Give with or after meals (minimizes diarrhea).

### INDICATIONS/ROUTES/DOSAGE

#### Prevention of NSAID-Induced Gastric Ulcer

**PO: ADULTS, ELDERLY:** 200 mcg 4 times/day with food (last dose at bedtime). Continue for duration of NSAID therapy. May reduce dosage to 100 mcg 4 times/day.

#### Termination of Intrauterine Pregnancy

See manufacturer guidelines for mifepristone.

#### Early Pregnancy Loss

**Intravaginal:** 800 mcg once; may repeat 3 or more hrs after first dose and within 7 days of no response to initial dose.

#### Incomplete Abortion, Postpartum Hemorrhage

**PO:** 600 mcg as a single dose.

#### Labor Induction or Cervical Ripening

**Intravaginal:** 25 mcg q2h.

#### Postpartum Hemorrhage (Prevention)

**PO: ADULTS:** 600 mcg as a single dose given immediately after delivery.

#### Postpartum Hemorrhage (Treatment)

**PO/Rectal: ADULTS:** 600–1,000 mcg as a single dose.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (40%–20%):** Abdominal pain, diarrhea. **Occasional (3%–2%):** Nausea, flatulence, dyspepsia, headache. **Rare (1%):** Vomiting, constipation.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage may produce sedation, tremor, seizures, dyspnea, palpitations, hypotension, bradycardia.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question for possibility of pregnancy before initiating therapy.

#### PATIENT/FAMILY TEACHING

- Avoid magnesium-containing antacids (minimizes potential for diarrhea).
- Women of childbearing potential must not be pregnant before or during medication therapy (may result in hospitalization, surgery, infertility, fetal death).
- Take with food to reduce diarrhea.

## mitoMYcin

**HIGH ALERT**

mye-toe-mye-sin  
(Mutamycin)

**BLACK BOX ALERT** Potent vesicant. Marked myelosuppression. Infiltration produces ulceration, necrosis, cellulitis, tissue sloughing. Hemolytic-uremic syndrome reported. Must be administered by certified chemotherapy personnel.

**Do not confuse mitoMYcin with mithramycin or mitoXANTRONE.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antibiotic. **CLINICAL:** Antineoplastic.

## USES

Treatment of disseminated adenocarcinoma of stomach, pancreas (in combination with other chemotherapy agents and as palliative treatment when other modalities have failed). **OFF-LABEL:** Treatment of bladder cancer, anal carcinoma; cervical, esophageal, gastric, non–small-cell lung cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to mitomycin. Coagulation disorders, other increased bleeding tendencies, thrombocytopenia. **Cautions:** Myelosuppression, renal (serum creatinine greater than 1.7 mg/dL)/hepatic impairment, pregnancy, prior radiation treatment.

## ACTION

Alkylating agent, produces DNA cross-linking. **Therapeutic Effect:** Inhibits DNA, RNA synthesis.

## PHARMACOKINETICS

Widely distributed. Does not cross blood-brain barrier. Metabolized in liver. Excreted in urine. **Half-life:** 50 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May increase adverse/toxic effects of **natalizumab**. **Pimecrolimus, tacrolimus (topical)** may increase adverse/toxic effect. May decrease therapeutic effect of **BCG (intravesical)**. **HERBAL:** Echinacea may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 5 mg, 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

**◀ALERT▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Give via IV push, IV infusion. Extremely irritating to vein. Injection may produce pain with induration, thrombophlebitis, paresthesia.

**Reconstitution** • Reconstitute with Sterile Water for Injection to provide solution containing 0.5–1 mg/mL. • Do not shake vial to dissolve. • Allow vial to stand at room temperature until complete dissolution occurs. • For IV infusion, further dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl (concentration 20–40 mcg/mL).

**Rate of administration** • Give slow IV push or by IV infusion over 15–30 min. • Extravasation may produce cellulitis, ulceration, tissue sloughing. Terminate administration immediately, inject ordered antidote. Apply ice intermittently for up to 72 hrs; keep area elevated.

**Storage** • Use only clear, blue-gray solutions. • Concentration of 0.5 mg/mL (reconstituted vial or syringe) is stable for 7 days at room temperature or 2 wks if refrigerated. Further diluted solution with D<sub>5</sub>W is stable for 3 hrs, 12 hrs if diluted with 0.9% NaCl at room temperature.

## IV INCOMPATIBILITIES

Aztreonam (Azactam), bleomycin (Blenoxane), cefepime (Maxipime), filgrastim (Neupogen), heparin, piperacillin/tazobactam (Zosyn), sargramostim (Leukine), vinorelbine (Navelbine).

## IV COMPATIBILITIES

Cisplatin (Platinol AQ), cyclophosphamide (Cytoxan), DOXOrubicin (Adriamycin), 5-fluorouracil, granisetron (Kytril), leucovorin, methotrexate, ondansetron (Zofran), vinBLASTine (Velban), vinCRISTine (Oncovin).

**INDICATIONS/ROUTES/DOSAGE****Stomach, Pancreatic Cancer**

**IV: ADULTS, ELDERLY, CHILDREN:** 20 mg/m<sup>2</sup> as single dose. Repeat q6–8wks.

**Bladder Cancer (Non–muscle Invasive)**

**Intravesicular Instillation: ADULTS, ELDERLY:** Low risk of recurrence: 40 mg as single dose postoperatively (retain in bladder for 1–2 hrs). High risk of recurrence: 20 mg/wk for 6 wks, then 20 mg qmo for 3 yrs (retain in bladder for 1–2 hrs).

**Dose Modification for Toxicity**

Leukocytes 2,000 to less than 3,000 cells/mm <sup>3</sup>	Hold therapy until leukocytes 4,000 or more cells/mm <sup>3</sup> ; reduce dose to 70% or more in subsequent cycles
Leukocytes less than 2,000 cells/mm <sup>3</sup>	Hold therapy until leukocytes 4,000 or more cells/mm <sup>3</sup> ; reduce dose to 50% in subsequent cycles
Platelets 25,000 to less than 75,000 cells/mm <sup>3</sup>	Hold therapy until platelets 100,000 or more cells/mm <sup>3</sup> ; reduce dose to 70% in subsequent cycles
Platelets less than 25,000 cells/mm <sup>3</sup>	Hold therapy until platelets 100,000 or more cells/mm <sup>3</sup> ; reduce dose to 50% in subsequent cycles

**Dosage in Renal Impairment**

**CrCl less than 10 mL/min:** Give 75% of normal dose.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (greater than 10%):** Fever, anorexia, nausea, vomiting. **Occasional (10%–2%):** Stomatitis, paresthesia, purple colored bands on nails, rash, alopecia, unusual fatigue. **Rare (less than 1%):** Thrombophlebitis, cellulitis with extravasation.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Marked myelosuppression results in hematologic toxicity manifested as

leukopenia, thrombocytopenia, and, to a lesser extent, anemia (generally occurs within 2–4 wks after initial therapy). Renal toxicity may be evidenced by increased serum BUN, creatinine levels. Pulmonary toxicity manifested as dyspnea, cough, hemoptysis, pneumonia. Long-term therapy may produce hemolytic uremic syndrome, characterized by hemolytic anemia, thrombocytopenia, renal failure, hypertension.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC. Antiemetics before and during therapy may alleviate nausea/vomiting. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, BUN, serum creatinine, GFR. Assess IV site for phlebitis, extravasation. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess for renal toxicity (foul odor from urine, elevated serum BUN, creatinine).

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Maintain strict oral hygiene.
- Immediately report stinging, burning, pain at injection site.
- Do not have immunizations without physician's approval (drug lowers resistance to infection).
- Report nausea/vomiting, fever, sore throat, bruising, bleeding, shortness of breath, painful urination.

**modafinil**

TOP  
100

moe-daf-i-nil  
(Alertec , Provigil)

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha<sub>1</sub>-agonist, CNS stimulant (Schedule IV).  
**CLINICAL:** Wakefulness-promoting agent, antinarcotic.

## USES

Treatment of excessive daytime sleepiness associated with narcolepsy, shift work sleep disorder, adjunct therapy for obstructive sleep apnea/hypopnea syndrome. **OFF-LABEL:** Treatment of ADHD, multiple sclerosis–related fatigue.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to modafinil, armodafinil. **Cautions:** History of clinically significant mitral valve prolapse, left ventricular hypertrophy, renal/hepatic impairment, angina, cardiac disease, myocardial ischemia, recent MI, preexisting psychosis or bipolar disorder, Tourette's syndrome.

## ACTION

Exact mechanism unknown. Increases dopamine in brain. Increases alpha activity, decreasing delta, theta, brain wave activity. **Therapeutic Effect:** Reduces number of sleep episodes, total daytime sleep. Increases mental alertness.

## PHARMACOKINETICS

Widely distributed. Protein binding: 60%. Widely distributed. Metabolized in liver. Excreted by kidneys. Unknown if removed by hemodialysis. **Half-life:** 15 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if excreted in breast milk. Use caution if given to pregnant women. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** Age-related renal/hepatic impairment may require decreased dosage.

## INTERACTIONS

**DRUG:** May decrease concentration/effect of cycloSPORINE, oral contraceptives.

**Alcohol** may decrease therapeutic effect. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifAMPin)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets (Provigil):** 100 mg, 200 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**Narcolepsy, Obstructive Sleep Apnea/Hypopnea Syndrome**

**PO: ADULTS:** 200 mg/day in the morning.

**ELDERLY:** 100 mg/day in the morning.

**Shift Work Sleep Disorder**

**PO: ADULTS:** 200 mg about 1 hr before start of work shift.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. Reduce dose 50% with severe impairment.

## SIDE EFFECTS

Generally well tolerated. **Occasional (5%):** Headache, nausea, dizziness, insomnia, palpitations, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Agitation, excitation, increased B/P, insomnia may occur. Psychiatric disturbances (anxiety, hallucinations, suicidal ideation), serious allergic reactions (angioedema, Stevens-Johnson syndrome) have been noted.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline evidence of narcolepsy or other sleep disorders, including pattern, environmental situations, length of

sleep episodes. Question for sudden loss of muscle tone (cataplexy) precipitated by strong emotional responses before sleep episode. Assess frequency/severity of sleep episodes before drug therapy.

#### INTERVENTION/EVALUATION

Monitor sleep pattern, evidence of restlessness during sleep, length of insomnia episodes at night. Assess for dizziness, anxiety; initiate fall precautions.

#### PATIENT/FAMILY TEACHING

- Avoid alcohol.
- Do not increase dose without physician approval.
- Use alternative contraceptives during therapy and 1 mo after discontinuing modafinil (reduces effectiveness of oral contraceptives).

M

## mometasone

TOP  
100

moe-met-a-sonē

(Asmanex, Asmanex HEA, Elocon, Nasonex, Apo-Mometasone )

### FIXED-COMBINATION(S)

**Dulera:** mometasone/formoterol (beta-adrenergic agonist): 100 mcg/5 mcg, 200 mcg/5 mcg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenocorticosteroid. **CLINICAL:** Anti-inflammatory.

### USES

**Nasal:** Treatment of nasal symptoms of seasonal/perennial allergic rhinitis in adults, children 2 yrs and older. Relief of nasal symptoms of seasonal allergic rhinitis in adults, children 2 yrs and older. Treatment of nasal polyps in adults. **Inhalation:** Maintenance treatment of asthma as prophylactic therapy in adults and children 4 yrs and older. **Topical:** Relief of inflammatory, pruritic manifestations of steroid-responsive dermatoses.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to mometasone. Primary treatment of status asthmaticus or acute bronchospasm. **Cautions:** Thyroid/hepatic/renal impairment, elderly, diabetes, cardiovascular disease, glaucoma, cataracts, myasthenia gravis, pts at risk for osteoporosis, seizures, GI disease (e.g., ulcer, colitis); following MI. Untreated systemic fungal, viral, bacterial infections.

### ACTION

Inhibits formation, release, and activity of mediators of inflammation (e.g., histamine, kinins). Reverses the dilation and increased nasal permeability of inflammation. **Therapeutic Effect:** Improves symptoms of asthma, rhinitis.

### PHARMACOKINETICS

Undetectable in plasma. Protein binding: 98%–99%. Swallowed portion undergoes extensive metabolism. Excreted in bile (74%), urine (8%). **Half-life:** 5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Prolonged treatment/high doses may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase hyponatremic effect of **desmopressin**. May increase antineoplastic effect of **aldesleukin**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Cream: (Elocon):** 0.1%. **Lotion: (Elocon):** 0.1%. **Nasal Spray: (Nasonex):** 50 mcg/spray. **Ointment: (Elocon):** 0.1%. **Powder for Oral Inhaler: (Asmanex Twisthaler):** 110 mcg (delivers 100 mcg/actuation), 220 mcg (delivers 200 mcg/actuation). **(Asmanex HFA):** 50 mcg/actuation, 100 mcg/actuation, 200 mcg/actuation.

## ADMINISTRATION/HANDLING

### Inhalation

- Do not shake or prime.
- Hold twist-haler straight up with pink portion (base) on bottom, remove cap.
- Exhale fully.
- Firmly close lips around mouthpiece and inhale a fast, deep breath.
- Hold breath for 10 sec.

### Intranasal

- Instruct pt to clear nasal passages as much as possible before use.
- Tilt head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds other nostril closed, concurrently inspiring through nose to permit medication as high into nasal passages as possible.

### Topical

- Apply thin layer of cream, lotion, ointment to cover affected area. Rub in gently.
- Do not cover area with occlusive dressing.

## INDICATIONS/ROUTES/DOSAGE

### Allergic Rhinitis

**Nasal Spray:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 2 sprays (100 mcg) in each nostril once daily. Total daily dose: 200 mcg. When used to prevent nasal rhinitis, begin 2–4 wks before start of pollen season. **CHILDREN 2–11 YRS:** 1 spray (50 mcg) in each nostril once daily. Total daily dose: 100 mcg.

### Asthma

**Inhalation:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** *Asmanex HFA:* (No prior treatment with inhaled corticosteroid): Initially, 200 mcg twice daily. **Maximum:** 400 mcg twice daily (800 mcg/day). (Previously received oral corticosteroids): Initially, 400 mcg twice daily. **Maximum:** 400 mcg twice daily (800 mcg/day). **CHILDREN 4–11 YRS:** 100 mcg twice daily. **Maximum:** 200 mcg/day. *Asmanex Twisthaler:* (Previously received bronchodilators alone): Initially, 220 mcg once daily in evening. **Maximum:**

440 mcg/day. (Previously received inhaled corticosteroids): Initially, 220 mcg once daily in evening. **Maximum:** 440 mcg/day. (Previously received oral corticosteroids): Initially, 440 mcg twice daily. **Maximum:** 880 mcg/day. **CHILDREN 4–11 YRS:** (Regardless of prior therapy): 110 mcg once daily in evening. Reduce predniSONE no faster than 2.5 mg/day beginning after at least 1 wk of mometasone.

### Skin Disease

**Topical:** **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Apply cream, lotion, or ointment sparingly to affected area once daily.

### Nasal Polyp

**Nasal Spray:** **ADULTS, ELDERLY:** 2 sprays (100 mcg) in each nostril once or twice daily. Total daily dose: 400 mcg.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** **Inhalation:** Headache, allergic rhinitis, upper respiratory infection, muscle pain, fatigue. **Nasal:** Nasal irritation, stinging. **Topical:** Burning. **Rare:** **Inhalation:** Abdominal pain, dyspepsia, nausea. **Nasal:** Nasal/pharyngeal candidiasis. **Topical:** Pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) occurs rarely. Transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for hypersensitivity to any corticosteroids. Auscultate lung sounds. Teach proper use of nasal spray, oral inhaler.

### INTERVENTION/EVALUATION

Monitor for relief of rhinitis, asthma symptoms. Assess lung sounds for wheezing, rales.

**PATIENT/FAMILY TEACHING**

• Do not change dose schedule or stop taking drug; must taper off gradually under medical supervision. **Nasal:** Report if symptoms do not improve; report if sneezing, nasal irritation occur. • Clear nasal passages prior to use. **Inhalation:** Inhale rapidly, deeply; rinse mouth after inhalation. • Not indicated for acute asthma attacks. **Topical:** Do not cover affected area with bandage, dressing.

**montelukast**

mon-tee-loo-kast

(Singulair)

**Do not confuse Singulair with SINEquan.****◆ CLASSIFICATION****PHARMACOTHERAPEUTIC:** Leukotriene receptor inhibitor. **CLINICAL:** Antiasthmatic.**USES**

Prophylaxis, chronic treatment of asthma. Prevention of exercise-induced bronchoconstriction. Relief of symptoms of seasonal allergic rhinitis (hay fever), perennial allergic rhinitis. **OFF-LABEL:** Urticaria.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to montelukast. **Cautions:** Systemic corticosteroid treatment reduction during montelukast therapy. Concomitant use of CYP3A4 inducers. Not for use in acute asthma attacks.

**ACTION**

Binds to cysteinyl leukotriene receptors, inhibiting effects of leukotrienes on bronchial smooth muscle. **Therapeutic Effect:** Decreases bronchoconstriction, vascular permeability, mucosal edema, mucus production.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	N/A	N/A	24 hrs
PO (chewable)	N/A	N/A	24 hrs

Widely distributed. Protein binding: 99%. Metabolized in liver. Excreted primarily in feces. **Half-life:** 2.7–5.5 hrs (slightly longer in elderly).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children/Elderly:** No age-related precautions noted in pts older than 6 yrs or the elderly.

**INTERACTIONS**

**DRUG:** Gemfibrozil may increase concentration/effect. May increase adverse/toxic effect of loxapine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, eosinophils.

**AVAILABILITY (Rx)**

**Oral Granules:** 4 mg per packet. **Tablets:** 10 mg. **Tablets, Chewable:** 4 mg, 5 mg.

**ADMINISTRATION/HANDLING****PO**

• May take without regard to food. When treating asthma, administer in evening. • When treating allergic rhinitis, may individualize administration times. • Granules may be given directly in mouth or mixed with carrots, rice, applesauce, ice cream, baby formula, or breast milk (do not add to any other liquid or food). • Give within 15 min of opening packet.

**INDICATIONS/ROUTES/DOSAGE****Bronchial Asthma**

**PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** 10-mg tablet daily, taken in the evening. **CHILDREN 6–14 YRS:** 5-mg chewable tablet daily, taken in the evening. **CHILDREN 1–5 YRS:** 4-mg chewable tablet or oral granules daily, taken in the evening.

**Seasonal Allergic Rhinitis**

**PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** 10-mg tablet, taken in the

evening. **CHILDREN 6–14 YRS:** 5-mg chewable tablet, taken in the evening. **CHILDREN 2–5 YRS:** 4-mg chewable tablet, or oral granules taken in the evening.

### Perennial Allergic Rhinitis

**PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** 10-mg tablet, taken in the evening. **CHILDREN 6–14 YRS:** 5-mg chewable tablet, taken in the evening. **CHILDREN 2–5 YRS:** 4-mg chewable tablet or oral granules, taken in the evening. **CHILDREN 6–23 MOS:** 4 mg oral granules, taken in the evening.

### Exercise-Induced Bronchoconstriction Prevention

**PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** 10 mg 2 or more hrs before exercise. No additional doses within 24 hrs. **CHILDREN 6–14 YRS:** 5 mg (chew tab) 2 or more hrs prior to exercise. No additional doses within 24 hrs.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**ADULTS, CHILDREN 15 YRS AND OLDER:** **Frequent (18%):** Headache. **Occasional (4%):** Influenza. **Rare (3%–2%):** Abdominal pain, cough, dyspepsia, dizziness, fatigue, dental pain. **CHILDREN 6–14 YRS:** **Rare (less than 2%):** Diarrhea, laryngitis, pharyngitis, nausea, otitis media, sinusitis, viral infection.

### ADVERSE EFFECTS/TOXIC REACTIONS

Suicidal ideation and behavior, depression have been noted.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Chewable tablet contains phenylalanine (component of aspartame); parents of phenylketonuric pts should be informed. Assess lung sounds for wheezing. Assess for allergy symptoms. Question history of depression, suicidal ideation.

#### INTERVENTION/EVALUATION

Monitor rate, depth, rhythm, type of respirations; quality/rate of pulse. Assess

lung sounds for wheezing. Monitor for change in mood, behavior.

### PATIENT/FAMILY TEACHING

- Increase fluid intake (decreases lung secretion viscosity).
- Take as prescribed, even during symptom-free periods as well as during exacerbations of asthma.
- Drug is not for treatment of acute asthma attacks.
- Report increased use or frequency of short-acting bronchodilators, changes in behavior, suicidal ideation.

## morphine

TOP 100 HIGH ALERT

### mor-feen

(Infumorph, Kadian, M-Eslon , Mitigo, MS Contin, MS-IR )

**■ BLACK BOX ALERT ■** Risk of severe adverse effects when epidural route of administration is used. Ingestion of alcohol with morphine ER may increase risk of overdose. Risk of opioid addiction, abuse, and misuse. Serious, life-threatening, or fatal respiratory depression may occur. Prolonged use during pregnancy may result in neonatal opioid withdrawal syndrome. Accidental ingestion of even one dose may result in a fatal overdose. Concomitant use with benzodiazepines, other CNS depressants may result in profound sedation, respiratory depression, coma, or death.

**Do not confuse morphine with HYDROMORPHONE, or morphine sulfate with magnesium sulfate, MS Contin with OxyCONTIN. MSO<sub>4</sub> and MS are error-prone abbreviations.**

### FIXED-COMBINATION(S)

**Embeda:** morphine/naloxone (an opioid antagonist): 20 mg/0.8 mg, 30 mg/1.2 mg, 50 mg/2 mg, 60 mg/2.4 mg, 80 mg/3.2 mg, 100 mg/4 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid agonist (Schedule II). **CLINICAL:** Opioid analgesic.

**USES**

**Injection:** Management of severe pain.

**Oral: (Extended-Release):** Management of pain severe enough to require daily, around-the-clock, long-term opioid treatment. **(Immediate-Release): Oral**

**Solution:** Management of acute pain (adults; pts 2 yrs of age and older) and chronic pain (adults only). **Tablets:** Management of acute pain (pts 50 kg or more and adults) and chronic pain (adults only).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to morphine. Acute or severe asthma, GI obstruction, known or suspected paralytic ileus, concurrent use of MAOIs or use of MAOIs within 14 days, severe respiratory depression. **Extreme Caution:** COPD, cor pulmonale, hypoxia, hypercapnia, preexisting respiratory depression, head injury, increased ICP, severe hypotension. **Cautions:** Biliary tract disease, pancreatitis, Addison's disease, cardiovascular disease, morbid obesity, adrenal insufficiency, elderly, hypothyroidism, urethral stricture, prostatic hyperplasia, debilitated pts, pts with CNS depression, toxic psychosis, seizure disorders, history of drug abuse and misuse, drug-seeking behavior, dependency.

**ACTION**

Binds with opioid receptors within CNS, inhibiting ascending pain pathways.

**Therapeutic Effect:** Alters pain perception, emotional response to pain.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
Oral solution	30 min	1 hr	3–5 hrs
Tablets	30 min	1 hr	3–5 hrs
Tablets (extended-release)	N/A	3–4 hrs	8–12 hrs
IV	Rapid	0.3 hr	3–5 hrs
IM	5–30 min	0.5–1 hr	3–5 hrs
Epidural	15–60 min	1 hr	12–20 hrs
SQ	10–30 min	1.1–5 hrs	3–5 hrs
Rectal	20–60 min	0.5–1 hr	3–7 hrs

Variably absorbed from GI tract. Readily absorbed after IM, SQ administration. Protein binding: 20%–35%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in hepatic disease).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Paradoxical excitement may occur; those younger than 2 yrs are more susceptible to respiratory depressant effects. **Elderly:** Paradoxical excitement may occur. Age-related renal impairment may increase risk of urinary retention.

**INTERACTIONS**

**DRUG:** Alcohol, other CNS depressants (e.g., lorazepam, gabapentin, zolpidem) may increase CNS effects, respiratory depression, hypotension. **MAOIs (e.g., phenelzine, selegiline)** may produce serotonin syndrome. (Reduce dosage to one-fourth of usual morphine dose.) **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**AVAILABILITY (Rx)**

**Injection Solution:** 2 mg/mL, 4 mg/mL, 5 mg/mL, 10 mg/mL. **Injection Solution (Epidural, Intrathecal, IV Infusion): (Duramorph):** 0.5 mg/mL, 1 mg/mL. **Injection Solution, Epidural or Intrathecal: (Infu-morph):** 10 mg/mL, 25 mg/mL. **Injection Solution: (Mitigo):** 10 mg/mL, 25 mg/mL. **Injection Solution, Patient-Controlled**

**Analgesia (PCA) Pump:** 1 mg/mL. **Solution, Oral:** 10 mg/5 mL, 20 mg/5 mL, 20 mg/mL. **Suppository:** 5 mg, 10 mg, 20 mg, 30 mg. **Tablets:** 15 mg, 30 mg.

**Capsules, Extended-Release:** 45 mg, 75 mg, 90 mg, 120 mg. **Capsules, Sustained-Release:** 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 100 mg. **Tablets, Extended-Release:** 15 mg, 30 mg, 60 mg, 100 mg, 200 mg. **Tablets, Extended-Release (Abuse Deterrent):** 15 mg, 30 mg, 60 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • May give undiluted.

- For IV injection, may dilute in Sterile Water for Injection or 0.9% NaCl to final concentration of 1–2 mg/mL.
- For continuous IV infusion, dilute to concentration of 0.1–1 mg/mL in D<sub>5</sub>W and give through controlled infusion device.

**Rate of administration** • Always administer very slowly. Rapid IV increases risk of severe adverse reactions (apnea, chest wall rigidity, peripheral circulatory collapse, cardiac arrest, anaphylactoid effects).

**Storage** • Store at room temperature.

### IM, SQ

• Administer slowly, rotating injection sites. • Pts with circulatory impairment experience higher risk of overdose due to delayed absorption of repeated administration.

### PO

• May give without regard to food. • Mix liquid form with fruit juice to improve taste. • Do not break, crush, dissolve, or divide extended-release capsule, tablets. • **Avinza, Kadian:** May mix with applesauce immediately prior to administration.

### Rectal

• If suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper. • Moisten supposi-

tory with cold water before inserting well into rectum.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), doxorubicin (Doxil), phenytoin (Dilantin).

## IV COMPATIBILITIES

Amiodarone (Cordarone), atropine, bumetanide (Bumex), bupivacaine (Marcaine, Sensorcaine), dexmedetomidine (Precedex), dilTIAZem (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), glycopyrrolate (Robinul), heparin, hydrOXYzine (Vistaril), lidocaine, LORazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), nitroglycerin, potassium, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

◀ **ALERT** ▶ Dosage should be titrated to desired effect.

### Analgesia

**PO: (Immediate-Release): ADULTS, ELDERLY:** 10–30 mg q4h as needed. **CHILDREN 6 MOS AND OLDER WEIGHING 50 KG OR MORE:** 15–20 mg q3–4h as needed. **CHILDREN 6 MOS AND OLDER WEIGHING LESS THAN 50 KG:** 0.2–0.5 mg/kg q3–4h as needed. **CHILDREN YOUNGER THAN 6 MOS: (Oral Solution):** 0.08–0.1 mg/kg q3–4h as needed.

◀ **ALERT** ▶ For the Avinza dosage below, be aware that this drug is to be administered once daily only.

◀ **ALERT** ▶ For the Kadian dosage information below, be aware that this drug is to be administered q12h or once daily.

◀ **ALERT** ▶ Be aware that pediatric dosages of extended-release preparations of Kadian and AVINza have not been established.

◀ **ALERT** ▶ For the MS Contin dosage information below, be aware that the daily dosage is divided and given q8h or q12h.

**PO: (Extended-Release [Avinza]):**

**ADULTS, ELDERLY:** Dosage requirement should be established using prompt-release formulations and is based on total daily dose. AVINza is given once daily only.

**PO: (Extended-Release [Kadian]):**

**ADULTS, ELDERLY:** Dosage requirement should be established using prompt-release formulations and is based on total daily dose. Dose is given once daily or divided and given q12h.

**PO: (Extended-Release [MS Contin]):**

**ADULTS, ELDERLY:** Dosage requirement should be established using prompt-release formulations and is based on total daily dose. Daily dose is divided and given q8h or q12h.

**IV: ADULTS, ELDERLY:** 2.5–5 mg q3–4h as needed. **Note:** Repeated doses (e.g., 1–2 mg) may be given more frequently (e.g., every hr) if needed. **CHILDREN WEIGHING 50 KG OR MORE:** Initially, 2–5 mg q2–4h as needed. **CHILDREN WEIGHING LESS THAN 50 KG:** Initially, 0.05 mg/kg. Range: 0.1–0.2 mg/kg q2–4h as needed. **NEONATES:** Initially, 0.05–0.1 mg/kg/dose q4–6h as needed.

**IV Continuous Infusion: ADULTS, ELDERLY:** 0.8–10 mg/hr. Range: 20–50 mg/hr. **CHILDREN WEIGHING 50 KG OR MORE:** 1.5 mg/hr. **CHILDREN WEIGHING LESS THAN 50 KG:** Initially, 0.01 mg/kg/hr. Range: 0.01–0.04 mg/kg/hr (10–40 mcg/kg/hr). **NEONATES:** Initially, 0.01 mg/kg/hr (10 mcg/kg/hr). **Maximum:** 0.015–0.02 mg/kg/hr.

**Patient-Controlled Analgesia (PCA)**

**IV: ADULTS, ELDERLY: Usual concentration:** 1 mg/mL. **Demand dose:** 1 mg (range: 0.5–2.5 mg). **Lockout interval:** 5–10 min.

**Dosage in Renal Impairment****Creatinine**

Clearance	Dose
10–50 mL/min, CRRT	75% of normal dose
Less than 10 mL/min, HD, PD	50% of normal dose

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**▲ALERT▲** Ambulatory pts, pts not in severe pain may experience nausea, vomiting more frequently than pts in supine position or who have severe pain. **Frequent:** Sedation, decreased B/P (including orthostatic hypotension), diaphoresis, facial flushing, constipation, dizziness, drowsiness, nausea, vomiting. **Occasional:** Allergic reaction (rash, pruritus), dyspnea, confusion, palpitations, tremors, urinary retention, abdominal cramps, vision changes, dry mouth, headache, decreased appetite, pain/burning at injection site. **Rare:** Paralytic ileus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. **Antidote:** Naloxone (see Appendix J for dosage).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Effect of medication is reduced if full pain recurs before next dose. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

**INTERVENTION/EVALUATION**

Monitor vital signs 5–10 min after IV administration, 15–30 min after SQ, IM. Be alert for decreased respirations, B/P. Check for adequate voiding. Monitor daily pattern of bowel activity, stool consistency; avoid constipation. Initiate deep breathing, coughing exercises, particularly in those with pulmonary impairment. Assess for clinical improvement; record onset of pain relief. Screen for drug abuse and misuse, drug-seeking behavior.

**PATIENT/FAMILY TEACHING**

- Change positions slowly to avoid orthostatic hypotension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, CNS depressants.
- Tolerance, dependence may occur with prolonged use of high doses.
- Report ineffective pain control, constipation, urinary retention.

## mycophenolate

mye-koe-fen-o-late  
(CellCept, Myfortic)

**BLACK BOX ALERT** ■ Increased risk of congenital malformation, spontaneous abortion. Increased risk for development of lymphoma, skin malignancy. Increased susceptibility to infections. Administer under supervision of physician experienced in immunosuppressive therapy.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Immunologic agent. **CLINICAL:** Immunosuppressant.

**USES**

Should be used concurrently with other immunosuppressants **CellCept:** Prophylaxis of organ rejection in pts receiving allogeneic hepatic/renal/cardiac transplant. **Myfortic:** Prophylaxis of organ rejection in pts receiving renal

transplants. **OFF-LABEL:** Treatment of hepatic transplant rejection in pts unable to tolerate tacrolimus or cycloSPORINE due to toxicity, mild heart transplant rejection, moderate to severe psoriasis, proliferative lupus nephritis, myasthenia gravis, graft-vs-host disease. Treatment of autoimmune hepatitis (refractory).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to mycophenolate, mycophenolic acid or polysorbate 80 (IV formulation). **Cautions:** Active severe GI disease, renal impairment, neutropenia, women of childbearing potential (use caution when handling).

**ACTION**

Suppresses immunologically mediated inflammatory response by inhibiting inosine monophosphate dehydrogenase, an enzyme that deprives lymphocytes of nucleotides necessary for DNA, RNA synthesis, thus inhibiting proliferation of T and B lymphocytes. **Therapeutic Effect:** Prevents transplant rejection.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 97%. Metabolized via hydrolysis to active metabolite mycophenolic acid. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 17.9 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid use; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 wks after discontinuation. Breastfeeding not recommended. **Children:** Safety and efficacy not established in children younger than 3 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** May increase concentration/effects of **acyclovir, ganciclovir. Antacids (aluminum- and magnesium-containing), cholestyramine** may

decrease absorption. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Rifampin** may decrease concentration/effect. May decrease therapeutic effect of **oral contraceptives**. May increase adverse/toxic effect of **natalizumab**. May decrease therapeutic effect of **BCG (intravesical)**. **Pimecrolimus, tacrolimus (topical)** may increase adverse/toxic effect. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD: All foods** may decrease concentration. **LAB VALUES:** May increase serum cholesterol, alkaline phosphatase, creatinine, ALT, AST. May alter serum glucose, lipids, calcium, potassium, phosphate, uric acid.

### AVAILABILITY (Rx)

**Capsules: (CellCept):** 250 mg. **Injection, Powder for Reconstitution: (CellCept):** 500 mg. **Oral Suspension: (CellCept):** 200 mg/mL. **Tablets: (CellCept):** 500 mg.

 **Tablets, Delayed-Release: (Myfortic):** 180 mg, 360 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 500-mg vial with 14 mL D<sub>5</sub>W. Gently agitate. • For 1-g dose, further dilute with 140 mL D<sub>5</sub>W; for 1.5-g dose, further dilute with 210 mL D<sub>5</sub>W, providing a concentration of 6 mg/mL.

**Rate of administration** • Infuse over at least 2 hrs. • Begin infusion within 4 hrs of reconstitution.

**Storage** • Store at room temperature.

#### PO

• Give on empty stomach (1 hr before or 2 hrs after food). • Do not break, crush, or open capsules or break, crush, dissolve, or divide delayed-release tablets. Avoid inhalation of powder in capsules, direct contact of powder on skin/mucous membranes. If contact occurs, wash thoroughly with soap, water. Rinse eyes profusely with plain water. • May store reconstituted

suspension in refrigerator or at room temperature. • Suspension is stable for 60 days after reconstitution. • Suspension can be administered orally or via an NG tube (minimum size 8 French).

### IV INCOMPATIBILITIES

Mycophenolate is compatible only with D<sub>5</sub>W. Do not infuse concurrently with other drugs or IV solutions.

### INDICATIONS/ROUTES/DOSAGE

#### Prevention of Renal Transplant Rejection

**PO, IV: (CellCept): ADULTS, ELDERLY:** 1 g twice daily. **PO: CHILDREN 3 MONTHS AND OLDER: (CellCept Suspension):** 600 mg/m<sup>2</sup>/dose twice daily. **Maximum:** 1 g twice daily. **(Tablets, Capsules): BSA greater than or equal to 1.5 m<sup>2</sup>:** 1,000 mg twice daily. **BSA 1.25–1.5 m<sup>2</sup>:** 750 mg twice daily. **PO: (Myfortic): ADULTS, ELDERLY:** 720 mg twice daily. **CHILDREN 5–16 YRS:** 400 mg/m<sup>2</sup> twice daily. **Maximum:** 720 mg twice daily. **BSA greater than 1.58 m<sup>2</sup>:** 720 mg twice daily. **BSA 1.19–1.58 m<sup>2</sup>:** 540 mg twice daily.

#### Prevention of Heart Transplant Rejection

**PO, IV: (CellCept): ADULTS, ELDERLY:** 1–1.5 g twice daily in combination with cyclosporine and initially with corticosteroids; or 1 g twice daily in combination with other immunosuppressants (e.g., tacrolimus, everolimus, or sirolimus).

#### Prevention of Hepatic Transplant Rejection

**PO, IV: (CellCept): ADULTS, ELDERLY:** 1 g twice daily in combination with cyclosporine and initially with corticosteroids; or 1 g twice daily in combination with other immunosuppressants (e.g., tacrolimus, everolimus, or sirolimus).

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (37%–20%):** UTI, hypertension, peripheral edema, diarrhea, constipation, fever, headache, nausea. **Occasional**

**(18%–10%):** Dyspepsia, dyspnea, cough, hematuria, asthenia, vomiting, edema, tremors, oral candidiasis, acne; abdominal, chest, back pain. **Rare (9%–6%):** Insomnia, respiratory tract infection, rash, dizziness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Significant anemia, leukopenia, thrombocytopenia, neutropenia, leukocytosis may occur, particularly in pts undergoing renal transplant rejection. Sepsis, infection occur occasionally. GI tract hemorrhage occurs rarely. May increase risk of new malignancies. Immunosuppression results in increased susceptibility to infection.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pregnancy test in females of reproductive potential. Assess medical history, esp. renal function, existence of

active digestive system disease, drug history, esp. other immunosuppressants.

### INTERVENTION/EVALUATION

CBC should be performed wkly during first mo of therapy, twice monthly during second and third mos of treatment, then monthly throughout the first yr. If rapid fall in WBC occurs, dosage should be reduced or discontinued. Assess for delayed bone marrow suppression. Monitor for infections (cough, fatigue, fever).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report unusual bleeding/bruising, sore throat, mouth sores, abdominal pain, fever.
- May cause new cancers.
- Use effective contraception to avoid pregnancy. Laboratory follow-up while taking medication is important part of therapy.

## nafcillin

naf-sil-in

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

### USES

Treatment of respiratory tract, skin/skin structure infections, osteomyelitis, endocarditis, meningitis; perioperatively, esp. in cardiovascular, orthopedic procedures. Predominant treatment of infections caused by susceptible strains of staphylococci.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to nafcillin, other penicillins. **Cautions:** History of allergies, particularly cephalosporins; severe renal/hepatic impairment, asthma, HF.

### ACTION

Binds to bacterial membranes. **Therapeutic Effect:** Inhibits cell wall synthesis. Bactericidal.

### PHARMACOKINETICS

Widely distributed. Poor CSF penetration, but may be enhanced by meningeal inflammation. Metabolized in liver. Protein binding: 90%. Peak plasma concentration: 30–60 min. Excreted in feces, urine. **Half-life:** (Adults): 33–61 mins; (Infants, children aged 1 mo–14 yrs): 0.75–1.9 hrs; (Neonates aged less than 3 wks): 2.2–5.5 hrs; (Neonates aged 4–9 wks): 12–2.3 hrs.

### 🕒 LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk. May lead to rash, diarrhea, candidiasis in neonate, infant. **Children:** Immature renal function in neonates may delay renal excretion. **Elderly:** Age-related

renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** High doses (2 g q4h) may decrease effects of warfarin. May decrease effects of BCG (intravesical), axitinib, bosutinib, cobimetinib, elbasvir, grazoprevir, neratinib, olaparib, ranolazine, sonidegib. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause false-positive Coombs' test.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1 g, 2 g. **Infusion, Premix:** 1 g/50 mL, 2g/100 mL.

### ADMINISTRATION/HANDLING

◀ **ALERT** ▶ Space doses evenly around the clock.

**Reconstitution** • Reconstitute each vial with 10 mL Sterile Water for Injection or 0.9% NaCl. • For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • Infuse over 30–60 min. • Stop infusion if pt complains of pain at IV site.

**Storage** • Refrigerate diluted solution for up to 7 days or store at room temperature for up to 24 hrs. • Discard if precipitate forms.

### IM

• Reconstitute each 500 mg with 1.7 mL Sterile Water for Injection or 0.9% NaCl to provide concentration of 250 mg/mL. • Inject IM into large muscle mass.

### 🚫 IV INCOMPATIBILITIES

Aztreonam (Azactam), dilTIAZem (Cardizem), droperidol (Inapsine), fentaNYL, gentamicin, insulin, labetalol (Normodyne, Trandate), methylPREDNISolone (Solu-Medrol), midazolam (Versed), nalbuphine (Nubain), vancomycin (Vancocin), verapamil (Isoptin).

## IV COMPATIBILITIES

Acyclovir, famotidine (Pepcid), fluconazole (Diflucan), heparin, HYDROMORPHONE (Dilaudid), lidocaine, lipids, magnesium, morphine, potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage

**IV: ADULTS, ELDERLY:** 1–2 g q4–6h. **CHILDREN: Mild to moderate infections:** 100–150 mg/kg/day in divided doses q6h. **Maximum:** 4 g/day. **Severe infections:** 150–200 mg/kg/day in divided doses q4–6h. **Maximum:** 12 g/day. **NEONATES:** 25 mg/kg/dose in divided doses q6–12h. Dose based on body weight and postnatal age.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Mild hypersensitivity reaction (fever, rash, pruritus), GI effects (nausea, vomiting, diarrhea). **Occasional:** Hypokalemia with high IV dosages, phlebitis, thrombophlebitis (common in elderly).

**Rare:** Extravasation with IV administration.

## ADVERSE EFFECTS/TOXIC REACTIONS

Potentially fatal antibiotic-associated colitis, superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Hematologic effects (esp. involving platelets, WBCs), severe hypersensitivity reactions, anaphylaxis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, esp. penicillins, cephalosporins.

### INTERVENTION/EVALUATION

Hold medication, promptly report rash (possible hypersensitivity), diarrhea (fever, abdominal pain, mucus/blood in stool may indicate antibiotic-associated

colitis). Evaluate IV site frequently for phlebitis (heat, pain, red streaking over vein), infiltration (potential extravasation). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Continue antibiotic for full length of treatment.
- Doses should be evenly spaced.
- Discomfort may occur with IM injection.
- Report IV discomfort immediately.
- Report diarrhea, rash, other new symptoms.

## naloxone

nal-ox-own

(Kloxxado, Narcan)

**Do not confuse naloxone with Lanoxin or naltrexone.**

### FIXED-COMBINATION(S)

**Embeda:** naloxone/morphine (an opioid agonist): 0.8 mg/20 mg, 1.2 mg/30 mg, 2 mg/50 mg, 2.4 mg/60 mg, 3.2 mg/80 mg, 4 mg/100 mg. **Suboxone (sublingual film):** naloxone/buprenorphine (an analgesic): 0.5 mg/2 mg, 1 mg/4 mg, 2 mg/8 mg, 3 mg/12 mg. **Zubsolv:** naloxone/buprenorphine: 0.36 mg/1.4 mg, 1.4 mg/5.7 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid antagonist. **CLINICAL:** Antidote.

## USES

**Narcan:** Complete or partial reversal of opioid depression including respiratory depression. Diagnosis of suspected opioid tolerance or acute opioid overdose. **Nasal Spray:** Emergency treatment of known or suspected opioid overdose. **OFF-LABEL:** Opioid-induced pruritus.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to naloxone. **Cautions:** Cardiac/pulmonary disease. Medications with potential for adverse cardiovascular effects (e.g., hypotension, arrhythmias).

## ACTION

Competes with and displaces opioids at opioid-occupied receptor sites in CNS. **Therapeutic Effect:** Reverses opioid-induced sleep/sedation, increases respiratory rate, raises B/P to normal range.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1–2 min	N/A	20–60 min
IM	2–5 min	N/A	20–60 min
SQ	2–5 min	N/A	20–60 min

Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 60–100 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** **Methylnaltrexone** may increase adverse/toxic effects. May increase adverse/toxic effects of **naldemedine, naloxegol**.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** 0.4 mg/mL, 1 mg/mL. **Injection Solution, Prefilled Syringe:** 2 mg/2 mL. **Liquid, Nasal: (Narcan):** 4 mg/0.1 mL. **(Kloxxado):** 8 mg/0.1 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • For IV push, may give undiluted (0.4 mg/mL or diluted with 9 mL 0.9% NaCl to concentration of 0.04 mg/mL). • For continuous IV infusion, dilute each 2 mg of naloxone with 500 mL

of D<sub>5</sub>W or 0.9% NaCl, producing solution containing 0.004 mg/mL (4 mcg/mL).

**Rate of administration** • May give IV push over 30 sec.

**Storage** • Store parenteral form at room temperature. • Use mixture within 24 hrs; discard unused solution. • Protect from light. • Stable in D<sub>5</sub>W or 0.9% NaCl at 4 mcg/mL for 24 hrs.

## IM

• Give deep IM in large muscle mass.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Heparin, ondansetron (Zofran), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**Note:** If no response seen after a total of 10 mg, consider other causes of respiratory depression.

### Opioid Overdose

**IV, IM, SQ: ADULTS, ELDERLY:** 0.4–2 mg q2–3min as needed. After reversal, additional doses may be required at later intervals (e.g., 20–60 min) depending on type/duration of opioid. **CHILDREN 5 YRS AND OLDER, WEIGHING 20 KG OR MORE:** 2 mg/dose; if no response, may repeat q2–3min. May need to repeat doses q20–60min. **CHILDREN YOUNGER THAN 5 YRS, WEIGHING LESS THAN 20 KG:** 0.1 mg/kg if no response, repeat q2–3min. May need to repeat doses q20–60min. **(Narcan Nasal Spray): ADULTS, ELDERLY, CHILDREN:** Single spray (4 mg or 8 mg) into one nostril. May give q2–3min until emergency medical assistance arrives. **IM: ADULTS, ELDERLY, CHILDREN:** 2 mg (contents of 1 auto-injector) as a single dose; may repeat q2–3min until emergency medical assistance becomes available.

### Reversal of Respiratory Depression With Therapeutic Opioid Dosing

**IV, IM, SQ: ADULTS, ELDERLY:** Initially, 0.02–0.2 mg. Titrate to avoid profound

withdrawal, seizures, arrhythmias, or severe pain. **CHILDREN:** 0.001–0.02 mg/kg/dose. May increase up to 0.1 mg/kg/dose. **Maximum:** 2 mg/dose. May repeat dose q2min as needed.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

None known; little or no pharmacologic effect in absence of narcotics.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Too-rapid reversal of narcotic-induced respiratory depression may result in agitation, nausea, vomiting, tremors, increased B/P, tachycardia, seizures. Excessive dosage in postoperative pts may produce significant reversal of analgesia, agitation, tremors. Hypotension or hypertension, ventricular tachycardia/fibrillation, pulmonary edema may occur in pts with cardiovascular disease.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Maintain patent airway. Obtain weight of children to calculate drug dosage.

##### INTERVENTION/EVALUATION

Monitor vital signs, esp. rate, depth, rhythm of respiration, during and frequently following administration. Carefully observe pt after satisfactory response (duration of opiate may exceed duration of naloxone, resulting in recurrence of respiratory depression). Assess for increased pain, seizure activity with reversal of opiate.

## naproxen

na-**prox**-en

(Aleve, EC-Naprosyn, Naprelan, Naprosyn)

#### ■ BLACK BOX ALERT ■

Increased risk of serious cardiovascular thrombotic events,

including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines.

**Do not confuse Aleve with Allese, or Anaprox with Anaspaz or Avapro.**

#### FIXED-COMBINATION(S)

**Prevacid NapraPac:** naproxen/lan-soprazole (proton pump inhibitor): 375 mg/15 mg, 500 mg/15 mg.

**Treximet:** naproxen/SUMatriptan (an antimigraine): 60 mg/10 mg; 500 mg/85 mg. **Vimovo:** naproxen/esomeprazole (proton pump inhibitor): 375 mg/20 mg, 500 mg/20 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID.

**CLINICAL:** Analgesic, nonopioid.

#### USES

Relief of the signs and symptoms of gout, ankylosing spondylitis, bursitis, polyarticular juvenile idiopathic arthritis (excluding ER tablets), osteoarthritis, rheumatoid arthritis, and tendinopathy. Treatment of primary dysmenorrhea. Relief of mild to moderate pain and/or fever. **OFF-LABEL:** Migraine prophylaxis.

#### PRECAUTIONS

**Contraindications:** History of asthma, urticaria; hypersensitivity to naproxen, other NSAIDs. Perioperative pain in setting of CABG surgery. **Cautions:** GI disease (bleeding, ulcers), fluid retention, renal/hepatic impairment, asthma, HF, concurrent use of anticoagulants, smoking, use of alcohol, elderly pts, debilitated pts.

#### ACTION

Reversibly inhibits COX-1 and COX-2 enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Reduces inflammatory response, fever, intensity of pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (analgesic)	1 hr	2–4 hrs	7 hrs or less
PO (anti-inflammatory)	2 wks	2–4 wks	12 hrs

Widely distributed. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 13 hrs.

 LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closing of ductus arteriosus). **Children:** Safety and efficacy not established in pts younger than 2 yrs. Children older than 2 yrs at increased risk for skin rash. **Elderly:** Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended. More likely to have serious adverse effects with GI bleeding/ulceration.

## INTERACTIONS

**DRUG:** May increase effect of **apixaban, dabigatran, edoxaban, rivaroxaban**. **Bile acid sequestrants** (e.g., **cholestyramine**) may decrease absorption. May increase nephrotoxic effect of **aliskiren, cyclosporine**. **HERBAL:** **Glucosamine, herbals with anticoagulant/antiplatelet properties** (e.g., **garlic, ginger, ginseng, ginkgo biloba**) may increase concentration/effect. **FOOD:** None known. **LAB VALUES:** May prolong bleeding time. May increase serum BUN, creatinine, ALT, AST, alkaline phosphatase. May decrease Hgb, Hct, leukocytes, platelets, uric acid.

## AVAILABILITY (Rx)

**Capsule:** 220 mg. **Oral Suspension:** 125 mg/5 mL naproxen. **Tablets:** 220 mg, 250 mg, 275 mg, 375 mg, 500 mg, 550 mg.

 **Tablets, Delayed-Release:** 375 mg, 500 mg. **Extended-Release:** 375 mg, 500 mg, 750 mg.

## ADMINISTRATION/HANDLING

## PO

• Give controlled-release form whole. Do not break, crush, dissolve, or divide. • Best taken with food or milk (decreases GI irritation). • Shake suspension well.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Dosage expressed as naproxen base (200 mg naproxen base equivalent to 220 mg naproxen sodium).

**Rheumatoid Arthritis (RA), Osteoarthritis, Ankylosing Spondylitis**

**PO: ADULTS, ELDERLY:** (**Immediate-Release**): 250–500 mg q12h. **Maximum:** 1.5 g/day. (**Extended-Release**): 750 mg–1 g once daily. **Maximum:** 1.5 g/day.

**Acute Gouty Arthritis**

**PO: ADULTS, ELDERLY:** 500 mg twice daily (start within 24–48 hrs of flare-up). Discontinue 2–3 days after clinical signs resolve. (Usual duration: 5–7 days.)

**Mild to Moderate Pain, Dysmenorrhea, Bursitis, Tendonitis**

**PO: ADULTS, ELDERLY:** (**Immediate-Release**): Initially, 500 mg, then 500 mg q12h or 250 mg q6–8h as needed. **Maximum:** 1,250 mg on day 1, then 1,000 mg once daily. (**Extended-Release**): Initially, 1,000 mg once daily. May temporarily increase to 1,500 mg once daily, then reduce to 1,000 mg once daily.

**Juvenile Idiopathic Arthritis (JIA)**

**PO: (Oral Suspension Recommended): CHILDREN OLDER THAN 2 YRS:** 10–15 mg/kg/day in 2 divided doses. **Maximum:** 1,000 mg/day.

**OTC Uses (Pain, Fever)**

**PO: ADULTS 65 YRS AND YOUNGER, CHILDREN 12 YRS AND OLDER:** Initially, 400 mg once, then 200 mg q8–12h. **Maximum:** 400 mg in any 8- to 12-hr period or 600 mg/day. **ELDERLY:** Use with caution (consider a lower dose).

**Dosage in Renal Impairment**

Not recommended with CrCl less than 30 mL/min.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (9%–4%):** Nausea, constipation, abdominal cramps/pain, heartburn, dizziness, headache, drowsiness. **Occasional (3%–1%):** Stomatitis, diarrhea, indigestion. **Rare (less than 1%):** Vomiting, confusion.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Rare reactions with long-term use include peptic ulcer, GI bleeding, gastritis, severe hepatic reactions (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), and severe hypersensitivity reaction (fever, chills, bronchospasm).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Question history of GI bleeding, gastric or duodenal ulcers, hypertension.

**INTERVENTION/EVALUATION**

Periodically monitor renal function test during chronic use. Monitor daily pattern of bowel activity, stool consistency. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility, reduced joint tenderness, improved grip strength.

**PATIENT/FAMILY TEACHING**

- Take with food, milk.
- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- Report headache, rash, visual disturbances, weight gain, black or tarry stools, bleeding, persistent headache.

**naratriptan**

nar-a-trip-tan  
(Amerge)

**Do not confuse naratriptan with eletriptan or almotriptan, or Amerge with Altace or Amaryl.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin receptor agonist. **CLINICAL:** Antimigraine.

**USES**

Treatment of acute migraine headache with or without aura in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to naratriptan. Basilar/hemiplegic migraine, cerebrovascular disease, peripheral vascular disease, coronary artery disease, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal's angina), severe hepatic impairment (Child-Pugh Grade C), severe renal impairment (CrCl less than 15 mL/min), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, 5-HT agonist (e.g., SUMatriptan), MAOI use within 14 days. **Cautions:** Mild to moderate renal/hepatic impairment, elderly.

**ACTION**

Binds selectively to serotonin receptors, producing vasoconstrictive effect on cranial blood vessels. **Therapeutic Effect:** Relieves migraine headache.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 28%–31%. Metabolized in liver. Eliminated primarily in urine. **Half-life:** 6 hrs (increased in hepatic/renal impairment).

N

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not recommended in the elderly.

**INTERACTIONS**

**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. **SSRIs (e.g., escitalopram, paroxetine, sertraline), SNRIs (e.g., duloxetine, venlafaxine)** may produce serotonin syndrome. May increase serotonergic effect of **MAOIs (e.g., phenelzine, selegiline).** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

 **Tablets:** 1 mg, 2.5 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • Do not break, crush, dissolve, or divide tablets. Administer whole with water.

**INDICATIONS/ROUTES/DOSAGE****Acute Migraine Attack**

**PO: ADULTS:** 1–2.5 mg. If headache improves but then returns, dose may be repeated after 4 hrs. **Maximum:** 5 mg/24 hrs.

**Dosage in Renal/Hepatic Impairment**

Hepatic Failure	Creatinine Clearance	Dosage
Mild to moderate	15–39 mL/min	Initial, 1 mg; Max: 2.5 mg/24 hrs
Severe	Less than 15 mL/min	Contraindicated

**SIDE EFFECTS**

**Occasional (5%):** Nausea. **Rare (2%):** Paresthesia, dizziness, fatigue, drowsiness, feeling of pressure in throat, neck, jaw.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Corneal opacities, other ocular defects may occur. Cardiac events (ischemia,

coronary artery vasospasm, MI), non-cardiac vasospasm-related reactions (hemorrhage, cerebrovascular accident [CVA]) occur rarely, particularly in pts with hypertension, diabetes, strong family history of coronary artery disease, obesity, smokers, males older than 40 yrs, postmenopausal women.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question medical history as listed in Precautions. Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms).

**INTERVENTION/EVALUATION**

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, fogging).

**PATIENT/FAMILY TEACHING**

- May cause dizziness, fatigue, drowsiness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report any chest pain, palpitations, tightness in throat, rash, hallucinations, anxiety, panic.

**naxitamab-gqgk**

nax-it-a-mab-gqgk  
(Danyelza)

**BLACK BOX ALERT** Severe infusion reactions, including anaphylaxis, bronchospasm, cardiac arrest, hypotension, stridor, may occur. Recommend infusion reaction prophylaxis before each infusion. Decrease infusion rate, interrupt infusion, or discontinue infusion based on severity of reactions. Monitor pts for at least 2 hrs after infusion is complete. Severe neurotoxicity, including neuropathic pain, transverse myelitis, reversible posterior leukoencephalopathy syndrome, may occur. Premedicate to treat neuropathic pain. Permanently discontinue in pts with severe neurotoxicity.

**Do not confuse naxitamab with dinutuximab**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-GD2 (glycolipid disialoganglioside). Monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults and pediatric pts 1 yr of age and older with relapsed or refractory high-risk neuroblastoma in the bone or bone marrow (in combination with granulocyte-macrophage colony-stimulating factor) who have demonstrated a partial response, minor response, or stable disease to prior therapy.

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to naxitamab-gqgk, anaphylaxis.

**Cautions:** Baseline cytopenias, hepatic impairment, hypertension, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

### ACTION

Binds to the glycolipid GD2, which is highly expressed in neuroblastomas and other cells of neuroectodermal origin, including the central nervous system and peripheral nerves. **Therapeutic Effect:** Induces cell lysis of GD2-expressing cells through antibody-dependent cell-mediated cytotoxicity (ADCC) and complement-dependent cytotoxicity (CDC).

### PHARMACOKINETICS

Widely distributed. Metabolized into small peptides via catabolic pathway. Excretion not specified. **Half-life:** 8.2 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 2 mos

after discontinuation. Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk. Breastfeeding not recommended during treatment and for at least 2 mos after discontinuation. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May decrease serum albumin, calcium, magnesium, phosphate, potassium, sodium; Hgb, lymphocytes, neutrophils, platelets. May increase or decrease serum glucose.

### AVAILABILITY (Rx)

**Injection Solution:** 4 mg/mL (10 mL).

### ADMINISTRATION/HANDLING

**Premedication** • Administer prophylaxis for neuropathic pain (e.g., gabapentin) for 12 days starting 5 days before each dose; oral opioid 45–60 min prior to each infusion. • Premedicate with acetaminophen, antiemetic, antihistamine, H2 antagonist prior to each infusion. • Give corticosteroids (e.g., methylprednisolone 2 mg/kg [80 mg maximum dose] or equivalent) 30–120 min prior to initial infusion (or prior to each infusion if severe infusion reaction has occurred).

**Preparation** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the dose based on weight in kg. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Using the following table, add the required volume of 5% albumin (human) and 0.9% NaCl to an empty, sterile infusion bag (allow 5–10 min of passive mixing).

Naxitamab-gqgk Dose (mg)	Naxitamab-gqgk Volume (mL)	Volume of 5% Albumin (human), (mL)	Total Infusion Volume With 0.9% NaCl (mL)	Final Concentration (mg/mL)
80 mg or less	20 mL or less	10 mL	50 mL	1.6 or less mg/mL
81–120 mg	21–30 mL	15 mL	75 mL	1.1–1.6 mg/mL
121–160 mg	31–40 mL	20 mL	100 mL	1.2–1.6 mg/mL
161–200 mg	41–50 mL	25 mL	125 mL	1.3–1.6 mg/mL
201–240 mg	51–60 mL	30 mL	150 mL	1.3–1.6 mg/mL
241–280 mg	61–70 mL	35 mL	175 mL	1.4–1.6 mg/mL

**Infusion guidelines • Grade 2 infusion reactions:** Decrease infusion rate by 50% until reaction improves to Grade 1 or 0, then increase infusion rate gradually to the rate prior to reaction. • **Grade 3 infusion reaction:** Interrupt infusion until improved to Grade 2 or less, then resume infusion at 50% of the infusion rate prior to interruption. May gradually increase infusion rate as tolerated. Permanently discontinue if infusion reaction does not improve after medical intervention. • **Grade 4 infusion reaction:** Permanently discontinue.

**Rate of administration • Initial infusion (day 1, cycle 1):** Infuse over 60 min. • **Subsequent infusions:** Infuse over 30–60 min as tolerated.

**Storage •** Refrigerate unused vials in original carton. Protect from light. • Diluted solution may be refrigerated for up to 24 hrs or stored at room temperature for up to 8 hrs. Once removed from refrigerator, infusion must be given within 8 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Neuroblastoma in the Bone or Bone Marrow (Relapsed or Refractory)

**IV; ADULTS, CHILDREN 1 YR OF AGE OR OLDER:** 3 mg/kg/day (maximum: 150 mg/day) on days 1, 3, and 5 of each cycle; repeat q4wks until a complete or partial response occurs, then give 5 additional cycles 4 wks apart. Subsequent cycles may be repeated q8wks. Give in combination with **sargramostim**, a granulocyte-macrophage colony-stimulating factor [**GM-CSF**] (see manufacturer guidelines).

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Ocular Toxicity

**Grade 2–4 toxicity causing decreased visual acuity or limiting activities of daily living:** Withhold treatment until resolved, then resume at a decreased dose of 50%. May increase dose if toxicity does not recur. Permanently discontinue if toxicity recurs or if symptoms do not resolve within 2 wks of withholding treatment.

### Hypertension

**Grade 3 hypertension:** Withhold treatment or interrupt infusion until improved to Grade 2 or less, then resume infusion at 50% of the infusion rate prior to interruption. Permanently discontinue if hypertension does not improve after medical intervention. **Grade 4 hypertension:** Permanently discontinue.

### Other Toxic Reactions

**Other Grade 3 toxic reactions:** Withhold treatment until improved to Grade 2 or less, then continue at same dose. Permanently discontinue if not improved to Grade 2 or less within 2 wks. **Other Grade 4 toxic reactions:** Permanently discontinue.

### Permanent Discontinuation

Permanently discontinue in pts with Grade 3 or 4 anaphylaxis, Grade 3 pain not responsive to maximum supportive measures, Grade 2 or greater motor neuropathy, Grade 3 or 4 sensory neuropathy; subtotal or total vision loss; persistent urinary retention after discontinuation of

opioids; any occurrence of reversible posterior leukoencephalopathy or transverse myelitis.

#### Dosage in Renal Impairment

**Mild to severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (94%–32%):** Pain (abdominal, bone, extremity, musculoskeletal, neck, oropharyngeal), vomiting, nausea, cough, decreased appetite, diarrhea, fatigue, asthenia, tachycardia, urticaria.

**Occasional (28%–11%):** Hypertension, injection site reaction, anxiety, irritability, edema, headache, hyperhidrosis, rhinorrhea, constipation, abnormal breath sounds, lethargy, decreased weight, praxia, erythema.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia) is an expected response to therapy. Severe infusion reactions, including anaphylaxis, angioedema, bronchospasm, cardiac arrest, hypotension, hypoxia, stridor, may require emergent medical attention such as bronchodilators, corticosteroids, fluid resuscitation, admission to the intensive care unit. Severe infusion reactions reported in 32%–68% of pts. Other infusion reactions, including chills, dyspnea, pruritus, pyrexia, rash, reported in 94%–100% of pts. Hypotension reported in 89%–100% of pts. Anaphylaxis reported in 8%–12% of pts. Most infusion reactions occurred within 24 hrs of administration, specifically within the first 30 min of infusion. Grade 3 pain reported in 72% of pts. Neurotoxicities including reversible posterior leukoencephalopathy (aphasia, cognition impairment, paralysis, vision loss,

weakness), transverse myelitis (pain, muscle weakness, paralysis, bowel/bladder dysfunction), eye disorders (accommodation disorder, blurred vision, mydriasis, unequal pupils, visual impairment), prolonged urinary retention have occurred. Grade 3 hypertension reported in 4%–7% of pts. Contusions (injury) reported in 25% of pts. Infections including rhinovirus (14% of pts), enterovirus (13% of pts), influenza (12% of pts) were reported. Immunogenicity (auto-naxitamab-gqgk antibodies) reported in 8%–23% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Verify use of effective contraception. Obtain weight in kg. Administer in an environment equipped to monitor for and manage infusion-related reactions; verify emergency resuscitation equipment/medications are readily available. Question history and severity of infusion reactions prior to each infusion. Obtain visual acuity. Question history of hepatic/renal impairment, hypertension, chronic opportunistic infections. Screen for active infection. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT as clinically indicated. Diligently monitor for infusion reactions during infusion and for at least 2 hrs after completion. Severe infusion reactions may require emergency resuscitation; early detection is vital. Give IV opioids as needed for breakthrough pain. Consider IV ketamine for pain uncontrolled by opioids. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor for neurotoxicities including reversible posterior leukoencephalopathy, transverse myelitis, eye disorders, urinary retention. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

• Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Life-threatening infusion reactions, including anaphylaxis, may occur. Immediately report infusion reactions of any kind. • Pain is a common side effect. Narcotic pain medication will be given to lessen effects. • Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); eye problems (blurred vision, pupil dilation, unequal pupils, vision impairment), neurological effects (bowel/bladder dysfunction, confusion, difficulty speaking, inability to urinate, paralysis, vision loss, weakness). • Use effective contraception to avoid pregnancy. Do not breastfeed. • Maintain proper hydration and nutrition. • Avoid tasks that require alertness, motor skills until response to drug is established.

N

**necitumumab**

ne-si-toom-oo-mab  
(Portrazza)

**BLACK BOX ALERT** ■ Cardio-pulmonary arrest and/or sudden death may occur (when treated in combination with gemcitabine and cisplatin). Closely monitor serum electrolytes, esp. serum calcium, magnesium, potassium, and aggressively replace as appropriate. Hypomagnesemia occurred in 83% of pts and was severe in 20%. Monitor for hypomagnesemia, hypocalcemia, hypokalemia prior to each dose, during treatment, and up to 8 wks after discontinuation. Withhold treatment for CTCAE Grade 3 or 4 electrolyte abnormality.

**Do not confuse necitumumab with adalimumab, belimumab, daratumumab, ipilimumab, nivolumab, ofatumumab, or panitumumab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Monoclonal antibody.  
**CLINICAL:** Antineoplastic.

**USES**

First-line treatment (in combination with gemcitabine and Cisplatin) of metastatic squamous non-small-cell lung cancer (NSCLC).

**PRECAUTIONS**

**Contraindications:** Severe hypersensitivity to necitumumab. **Cautions:** COPD, cardiac arrhythmias, coronary artery disease, HE, recent MI (within 6 mos), pts at risk for electrolyte imbalance (e.g., adrenal insufficiency, alcoholism, renal failure, thyroid disorders, malnutrition, chronic diarrhea; concomitant use of medication known to cause electrolyte abnormalities); history of venous or arterial thrombosis (e.g., CVA, DVT, MI, pulmonary embolism). Not indicated for treatment of nonsquamous non-small-cell lung cancer.

**ACTION**

Binds to ligand-binding site of EGFR and prevents activation, expression, signaling of EGFR. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**PHARMACOKINETICS**

Widely distributed. Metabolism not specified. Elimination not specified. **Half-life:** 14 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May

have increased risk of venous thromboembolism (including pulmonary embolism).

## INTERACTIONS

**DRUG:** None known. **HERBAL:** None known. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, magnesium, potassium.

## AVAILABILITY (Rx)

**Injection Solution:** 800 mg/50 mL (16 mg/mL).

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect for particulate matter or discoloration. • Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Discard if solution is cloudy or particulate matter is observed. • Dilute in 250 mL 0.9% NaCl bag. • Do not use solutions containing dextrose. • Gently invert to mix. Do not shake or agitate.

**Infusion guidelines** • For pts with prior Grade 1 or 2 infusion reaction, premedicate with diphenhydramine (or equivalent) before each subsequent infusion. • For pts with recurrent Grade 1 or 2 infusion reaction (despite administration of diphenhydramine), premedicate with dexamethasone (or equivalent), acetaminophen, diphenhydramine (or equivalent) before each subsequent infusion. • Once infusion is complete, flush IV line with 0.9% NaCl only.

**Rate of administration** • Infuse over 60 min via dedicated line.

**Storage** • Refrigerate unused vials in original carton until time of use. • Protect from light. • May refrigerate diluted solution up to 24 hours or at room temperature up to 4 hrs.

## IV INCOMPATIBILITIES

Do not mix with dextrose-containing solutions. Do not infuse with other medications or electrolytes.

## INDICATIONS/ROUTES/DOSAGE

### Non–Small–Cell Lung Cancer

**IV: ADULTS, ELDERLY:** 800 mg on days 1 and 8 of each 3-wk cycle (in combination with gemcitabine and cisplatin). Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Infusion Reactions

**Any Grade 1 reaction:** Decrease rate by 50%. **Grade 2 reaction:** Interrupt infusion until resolved to Grade 1 or 0, then resume with rate reduced by 50% for all subsequent infusions. **Grade 3 reaction:** Permanently discontinue.

### Dermatological Toxicity

**Grade 3 rash or acneiform rash:** Withhold treatment until resolved to Grade 2 or better, then reduce dose to 400 mg for at least 1 treatment cycle. If tolerated, may increase dose to 600 mg and 800 mg for subsequent cycles.

**Permanent discontinuation:** Grade 3 rash or acneiform rash that does not resolve to Grade 2 or better within 6 wks; worsening of skin reaction or intolerance at 400 mg dose; Grade 3 skin induration or fibrosis; Grade 4 dermatologic toxicity.

### Electrolyte Imbalance

Withhold treatment for any Grade 3 or 4 electrolyte abnormalities. Resume once abnormalities resolve to Grade 2 or less.

### Venous/Arterial Thrombosis

**Any occurrence:** Permanently discontinue.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (44%–29%):** Rash, vomiting.

**Occasional (16%–5%):** Diarrhea, dermatitis acneiform, decreased weight, stomatitis, headache, acne, pruritus, dry skin, paronychia, conjunctivitis, blurry vision, dry eye, reduced visual acuity, blepharitis, eye pain, increased lacrimation, ocular hyperemia, visual impairment, eye pruritus, skin fissures. **Rare (3%–1%):** Dysphagia, muscle spasm, oropharyngeal pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

All cases were reported in combination with gemcitabine and CISplatin. Pts with severe hypomagnesemia, hypokalemia, hypocalcemia are at an increased risk for cardiac arrhythmias or sudden death. Cardiopulmonary arrest and/or sudden death occurred in 3% of pts. Most cases of cardiopulmonary arrest occurred within 30 days of the last dose and involved comorbidities including COPD, coronary artery disease, hypomagnesemia, hypertension. Hypomagnesemia reported in 83% of pts with median onset of approx. 6 wks. Severe hypomagnesemia (Grade 3 or 4) reported in 20% of pts. Infusion reaction (any grade) reported in 1.5% of pts. Life-threatening venous and arterial thromboembolic events including pulmonary embolism (5% of pts), DVT (2% of pts), CVA (2% of pts), MI (1% of pts); thrombosis of mesenteric veins, pulmonary artery/vein, axillary vein, vena cava, subclavian vein; thrombophlebitis may occur. Hemoptysis reported in 10% of pts. Ocular toxicities including conjunctivitis, conjunctival hemorrhage, eye infections were reported. Severe skin toxicities occurred in 8% of pts. Immunogenicity (auto-necitumumab antibodies) occurred in 4% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, serum magnesium, ionized calcium; vital signs prior to each dose.

Obtain pregnancy test in female pts of reproductive potential. Receive full medication history and screen for drugs known to cause electrolyte imbalance. Assess nutritional status. Question history of CVA, DVT, pulmonary embolism, cardiac disease, recent MI; conditions known to cause electrolyte imbalance; prior hypersensitivity reaction to any drug in treatment regimen; prior infusion reaction. Offer emotional support. Conduct full dermatological exam.

### INTERVENTION/EVALUATION

Diligently monitor serum electrolytes, esp. serum magnesium, potassium, calcium, ionized calcium, during therapy and up to 8 wks after discontinuation. Monitor for symptoms of hypocalcemia, hypokalemia, hypomagnesemia. Obtain ECG, vital signs if arrhythmia, chest pain, palpitations, syncope occurs. Aggressively replace electrolytes as appropriate. Pts with sudden chest pain, dyspnea, hypoxia, tachycardia should be evaluated for pulmonary embolism. Monitor for symptoms of DVT (leg or arm pain/swelling), CVA (aphasia, altered LOC, hemiplegia, vision loss, headache, homonymous hemianopsia [vision loss on the same side of both eyes]), MI (chest pain, dyspnea, syncope, diaphoresis, left arm pain, jaw pain). Monitor for hemoptysis. Assess skin for rash, hypersensitivity reaction; eyes for infection, subconjunctival hemorrhage.

### PATIENT/FAMILY TEACHING

- Therapy may cause low levels of potassium, magnesium, calcium in the blood and may be life-threatening. Replace electrolytes exactly as instructed.
- Report symptoms of electrolyte imbalance such as fainting, fatigue, muscle cramps, palpitations, paralysis, numbness or tingling, seizures, weakness.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Treatment may cause blood clots in the arms, legs, lungs, brain,

heart, or abdomen. Immediately report symptoms of stroke (difficulty speaking, confusion, paralysis, vision loss), heart attack (chest pain, shortness of breath, fainting, dizziness, profuse sweating, left arm or jaw pain), lung embolism (difficulty breathing, fast heart rate, chest pain), or blood clots in the arms or legs (pain/swelling). • Report skin rashes, allergic reactions, coughing up blood; eye problems such as infection, vision impairment, collection of blood in the whites of the eyes. • Avoid sunlight, tanning beds. Wear protective clothing, high SPF sunscreen, and lip balm when outdoors.

## neratinib

ne-ra-ti-nib  
(Nerlynx)

**Do not confuse neratinib with afatinib, axitinib, bosutinib, cabozantinib, dasatinib, gefitinib, imatinib, ponatinib, tofacitinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor (anti-HER2). Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Extended adjuvant treatment of adult pts with early stage HER2-overexpressed/amplified breast cancer, to follow adjuvant trastuzumab-based therapy. Treatment of advanced or metastatic HER2-positive breast cancer (in combination with capecitabine) in pts who have received 2 or more prior anti-HER2-based regimens in the metastatic setting.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to neratinib. **Cautions:** Dehydration, electrolyte imbalance, hepatic impairment,

irritable bowel syndrome with diarrhea. Avoid concomitant use of strong or moderate CYP3A inhibitors, CYP3A inducers; proton pump inhibitors, H<sub>2</sub> receptor antagonists, antacids.

### ACTION

Irreversibly binds to epidermal growth factor receptor (EGFR), human epidermal growth factor receptor 2 (HER2), HER4, reducing autophosphorylation and signaling of EGFR and HER2. **Therapeutic Effect:** Exhibits antitumor activity in EGFR and/or HER2 expressing cancer cell lines.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 2–8 hrs. Excreted in feces (97%), urine (1%). **Half-life:** 7–17 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 month after last dose. Females of reproductive potential should use effective contraception during treatment and for at least 1 mo after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions/toxic effects. Use caution.

### INTERACTIONS

**DRUG:** Aluminum-, magnesium-, calcium-containing antacids, H<sub>2</sub> receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors**

(e.g., erythromycin, ciprofloxacin, diflucan, dronedarone, fluconazole, verapamil) may increase concentration/effect. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration of pazopanib, topotecan. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin.

## AVAILABILITY (Rx)

**Tablets:** 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Administer whole; do not break, cut, crush, or divide tablets.
- If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.
- Take 3 hours after aluminum-, magnesium-, or calcium-containing antacids are given.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Recommend antidiarrheal prophylaxis during first 2 cycles (56 days) of therapy. For pts with early stage and metastatic breast cancer, a dose escalation strategy may be used to improve tolerability and decrease the rate, severity, and duration of neratinib-induced diarrhea. **Dose Escalation:** Wk 1 (days 1–7): 120 mg once daily. Wk 2 (days 8–14): 160 mg once daily. Wk 3 (day 15 and thereafter): 240 mg once daily.

### Breast Cancer (Extended Adjuvant Therapy)

**PO: ADULTS, ELDERLY:** 240 mg (6 tablets) once daily for 1 yr.

### Breast Cancer (HER2-Positive; Advanced or Metastatic)

**PO: ADULTS, ELDERLY:** 240 mg once daily on days 1–21 of a 21-day cycle (in combination with capecitabine on days 1–14). Continue until disease progression or unacceptable toxicity.

### Loperamide (Antidiarrheal) Prophylaxis

**Wks 1–2 (days 1–14):** 4 mg three times/day. **Wks 3–8 (days 15–56):** 4 mg twice daily. **Wks 9–52 (days 57–365):** 4 mg as needed (do not exceed 16 mg/day).

### Dose Reduction Schedule (Neratinib)

**First dose reduction:** 200 mg daily.

**Second dose reduction:** 160 mg daily.

**Third dose reduction:** 120 mg daily.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Diarrhea

**Grade 1 diarrhea; Grade 2 diarrhea lasting more than 5 days; Grade 3 diarrhea lasting more than 2 days:** Adjust antidiarrheal therapy, diet. Maintain fluid intake (approx. 2 L/day). Once improved to Grade 1 or 0, start loperamide 4 mg with each administration. **Any grade diarrhea with complications (fever, hypotension, renal failure, or Grade 3 or 4 neutropenia):** Withhold treatment and adjust antidiarrheal therapy, diet. Maintain fluid intake (approx. 2 L/day). If diarrhea improves to Grade 1 or 0 within 7 days, resume treatment at same dose level. If diarrhea improves to Grade 1 or 0 for more than 7 days, resume treatment at the next reduced dose level. Once improved to Grade 1 or 0, start loperamide 4 mg with each administration. **Grade 4 diarrhea; recurrent Grade 2 diarrhea (or higher) at 120 mg dose:** Permanently discontinue.

### Hepatotoxicity

**Grade 3 serum ALT elevation; Grade 3 serum bilirubin elevation:** Withhold treatment until improved to Grade 1 or 0 and investigate cause. If serum ALT elevation improves to Grade 1 or 0 within 3 wks, resume treatment at reduced dose level. **Grade 4 serum ALT elevation; Grade 4 serum bilirubin elevation:** Permanently discontinue and investigate cause.

**Other Toxicities**

**Any other Grade 3 toxicity:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose level. **Any other Grade 4 toxicity:** Permanently discontinue.

**Dosage in Renal Impairment**

Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce starting dose to 80 mg.

**SIDE EFFECTS**

**Frequent (95%–26%):** Diarrhea, nausea, abdominal pain, vomiting. **Occasional (18%–4%):** Rash (erythematous, follicular, generalized, pruritic, pustular, maculo-papular, papular, dermatitis, dermatitis acneiform, toxic skin eruption), stomatitis, mouth ulceration, oral mucosal blistering, mucosal inflammation, oropharyngeal pain, oral pain, glossodynia, glossitis, cheilitis, decreased appetite, muscle spasm, dyspepsia, nail disorder (paronychia, onychoclasia, nail discoloration, nail toxicity, abnormal nail growth, nail dystrophy), dry skin, abdominal distention, decreased weight, dehydration. **Rare (3%):** Dry mouth.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Diarrhea reported in 95% of pts. Grade 3 diarrhea reported in 40% of pts. Grade 4 diarrhea reported in less than 1% of pts. Median time of onset of diarrhea was days to wks. Severe diarrhea, dehydration, hypotension, renal failure may occur. Hepatotoxicity reported in 5%–10% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT, vital signs. Obtain BMP and screen for electrolyte imbalance. Confirm HER2-positive status. Obtain pregnancy test prior to initiation. Stress the

importance of antidiarrheal therapy. Question history of IBS with chronic diarrhea, hepatic impairment. Assess hydration status. Question usual bowel movement patterns, stool characteristics. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor LFT monthly for the first 3 mos, then q3mos thereafter. Monitor for hepatotoxicity (abdominal pain, ascites, confusion, dark-colored urine, jaundice). Obtain BMP (note electrolytes) if severe diarrhea occurs. Ensure compliance of antidiarrheal therapy. Additional antidiarrheal medication may be needed to manage diarrhea despite treatment with loperamide. Monitor daily pattern of bowel activity, stool consistency. If treatment-related toxicities occur, consider referral to specialist. Monitor I&O. Assess skin, nails, oral mucosa for toxic reactions.

**PATIENT/FAMILY TEACHING**

- Treatment may cause severe diarrhea, which may lead to life-threatening dehydration or hospitalization. Take antidiarrheal medication exactly as prescribed (goal is 1–2 bowel movements/day). Report worsening of diarrhea or dehydration.
- Drink plenty of fluids (at least 2 L/day if severe diarrhea occurs).
- Report liver problems such as bruising; confusion; amber, dark, orange-colored urine; right upper abdominal pain; yellowing of the skin or eyes.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Avoid grapefruit products, Seville oranges, starfruit, herbal supplements.
- Acid-reducing medications may interfere with absorption; avoid use. Do not take aluminum-, magnesium-, calcium-containing antacids 3 hrs before or 3 hrs after dose.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## niCARDipine

nye-kar-di-peen  
(Cardene IV)

**Do not confuse niCARDipine with NIFedipine or niMODipine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcium channel blocker. Dihydropyridine.

**CLINICAL:** Antianginal, antihypertensive.

### USES

**PO: Immediate-Release:** Treatment of chronic stable (effort-associated) angina, hypertension. **Sustained-Release:** Treatment of hypertension. **Parenteral:** Short-term treatment of hypertension when oral therapy not feasible or desirable. **OFF-LABEL:** Blood pressure control in acute ischemic stroke and intracranial hemorrhage.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to niCARDipine. Advanced aortic stenosis.

**Cautions:** Cardiac/renal/hepatic dysfunction, HF, hypertrophic cardiomyopathy with outflow tract obstruction, aortic stenosis, coronary artery disease, portal hypertension.

### ACTION

Inhibits calcium ion movement across cell membranes of cardiac, vascular smooth muscle during depolarization.

**Therapeutic Effect:** Relaxes coronary vascular smooth muscle. Causes coronary vasodilation, increasing myocardial oxygen delivery in angina.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–2 hrs	—	8 hrs
IV	10 min	—	8 hrs or less

Widely distributed. Protein binding: 95%. Metabolized in liver. Primarily excreted

in urine. Not removed by hemodialysis.

**Half-life:** 2–4 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May increase concentration/effects of cycloSPORINE. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Grapefruit products may decrease concentration/effect. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Capsules:** 20 mg, 30 mg. **Infusion, Ready to Use:** 20 mg/200 mL, 40 mg/200 mL. **Injection Solution:** 2.5 mg/mL (10-mL vial).

### ADMINISTRATION/HANDLING

**Reconstitution** • Dilute in 240 mL D<sub>5</sub>W, 0.45% NaCl, or 0.9% NaCl to provide concentration of 0.1 mg/mL.

**Rate of administration** • Titrate to desired effect. • Change IV site q12h if administered peripherally.

**Storage** • Store at room temperature. • Diluted IV solution is stable for 24 hrs at room temperature.

### PO

• Give without regard to food. • Do not break, crush, or open capsules. Give whole.

## IV INCOMPATIBILITIES

Ampicillin (Principen), ampicillin/sulbactam (Unasyn), cefepime (Maxipime), ceftazidime (Fortaz), furosemide (Lasix), heparin, sodium bicarbonate.

## IV COMPATIBILITIES

Diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPI-NEPHrine, HYDROMorphone (Dilaudid), labetalol (Trandate), LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

### Chronic Stable Angina, Hypertension

**PO: ADULTS, ELDERLY:** Initially, 20 mg 3 times/day. Range: 20–40 mg 3 times/day (allow at least 3 days between dosage increases).

### Acute Hypertension

**IV: ADULTS, ELDERLY (GRADUAL B/P DECREASE):** Initially, 5 mg/hr. May increase by 2.5 mg/hr q5–15min. **Maximum:** 15 mg/hr. After B/P goal is achieved, adjust dose to maintain desired BP.

### Dosage in Renal Impairment

**ADULTS, ELDERLY: PO:** Initially, give 20 mg q8h (30 mg twice daily [sustained-release capsules]), then titrate. **IV:** No dose adjustment.

### Dosage in Hepatic Impairment

**ADULTS, ELDERLY: PO:** Initially, give 20 mg twice daily, then titrate. **IV:** No dose adjustment.

## SIDE EFFECTS

**Frequent (10%–7%):** Headache, facial flushing, peripheral edema, light-headedness, dizziness. **Occasional (6%–3%):** Asthenia, palpitations, angina, tachycardia. **Rare (less than 2%):** Nausea, abdominal cramps, dyspepsia, dry mouth, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces confusion, slurred speech, drowsiness, marked hypotension, bradycardia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Concurrent therapy with sublingual nitroglycerin may be used for relief of anginal pain. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

### INTERVENTION/EVALUATION

Monitor B/P, heart rate during and following IV infusion. Assess for peripheral edema, thrombophlebitis. Assess skin for facial flushing, dermatitis, rash. Question for asthenia, headache. Monitor LFT results. Assess ECG, pulse for tachycardia. Rotate infusion sites to decrease occurrence of thrombophlebitis.

### PATIENT/FAMILY TEACHING

- Sustained-release capsule taken whole; do not break, chew, crush, or open.
- Avoid alcohol, grapefruit products; limit caffeine.
- Report if anginal pain not relieved or if palpitations, shortness of breath, swelling, dizziness, constipation, nausea, hypotension occurs.
- Avoid tasks requiring motor skills, alertness until response to drug is established.

## nicotine

### nik-o-teen

(GoodSense Nicotine, Habitrol, Nicoderm CQ Nicorelief, Nicorette Mini, Nicorette Starter Kit, Nicorette, Nicotine Mini; Nicotine Step 1, 2, 3; Nicotrol, Nicotrol NS, Thrive)

**Do not confuse NicoDerm with Nitroderm or Nicorette with Nordette.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cholinergic-receptor agonist. **CLINICAL:** Smoking deterrent.

**USES**

Treatment to aid smoking cessation for relief of nicotine withdrawal symptoms (including nicotine craving). **OFF-LABEL:** **Transdermal:** Management of ulcerative colitis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to nicotine. **Cautions:** Smoking post-MI period, severe or worsening angina, active temporomandibular joint disease (gum), pregnancy, hyperthyroidism, pheochromocytoma, insulin-dependent diabetes, severe renal impairment, eczematous dermatitis, oropharyngeal inflammation, esophagitis, peptic ulcer (delays healing in peptic ulcer disease), coronary artery disease, recent MI, serious cardiac arrhythmias, vasospastic disease, angina, hypertension, hepatic impairment, use of oral inhaler/nasal spray with bronchospastic disease.

**ACTION**

Binds to nicotinic-cholinergic receptors at the autonomic ganglia, in the adrenal medulla, at neuromuscular junction, and in the brain, producing stimulating effect in the cortex and a rewards effect in the limbic system. **Therapeutic Effect:** Provides source of nicotine during nicotine withdrawal, reduces withdrawal symptoms.

**PHARMACOKINETICS**

Absorbed slowly after transdermal administration. Protein binding: 5%. Metabolized in liver. Excreted primarily in urine. **Half-life:** 4 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Distributed in breast milk. Use of cigarettes, nicotine gum associated with decrease in fetal breathing movements. **Children:** Not recommended in this pt population. **Elderly:** Age-related decrease in cardiac function may require dosage adjustment.

**INTERACTIONS**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (OTC)**

**Chewing Gum:** 2 mg, 4 mg. **Inhalation (Nicotrol Inhaler):** 10-mg cartridge. **Lozenges:** 2 mg, 4 mg. **Nasal Spray (Nicotrol NS):** 0.5 mg/spray. **Transdermal Patch:** 7 mg/24 hrs, 14 mg/24 hrs, 21 mg/24 hrs.

**ADMINISTRATION/HANDLING****Gum**

- Do not swallow.
- Chew 1 piece when urge to smoke present.
- Chew slowly and intermittently for 30 min.
- Chew until distinctive nicotine taste (peppery) or slight tingling in mouth perceived, then stop; when tingling almost gone (about 1 min), repeat chewing procedure (this allows constant slow buccal absorption).
- Too-rapid chewing may cause excessive release of nicotine, resulting in adverse effects similar to oversmoking (e.g., nausea, throat irritation).

**Inhaler**

- Insert cartridge into mouthpiece.
- Puff on nicotine cartridge mouthpiece for 20 min.

**Lozenge**

- Do not chew or swallow.
- Allow to dissolve slowly (20–30 min).

**Transdermal**

- Apply promptly upon removal from protective pouch (prevents evaporation, loss of nicotine).
- Use only intact pouch. Do not cut patch.
- Apply only once daily to hairless, clean, dry skin on upper body, outer arm.
- Replace daily; rotate sites; do not use same site within 7 days; do not use same patch longer than 24 hrs.
- Normal exposure to water (e.g., bathing, swimming) should not affect patch.
- Wash hands with water alone after applying patch

(soap may increase nicotine absorption). • Discard used patch by folding patch in half (sticky side together), placing in pouch of new patch, and throwing away in such a way as to prevent child or pet accessibility. • Patch may contain conducting metal; remove prior to MRI.

## INDICATIONS/ROUTES/DOSAGE

### Smoking Cessation Aid to Relieve Nicotine Withdrawal Symptoms

**PO: (Chewing Gum): ADULTS, ELDERLY:** 2 mg. Use 4 mg in pts who smoke first cigarette within 30 min of waking. Chew 1 piece of gum when urge to smoke, up to 24/day. Use following schedule: wks 1–6: q1–2h (at least 9 pieces/day); wks 7–9: q2–4h; wks 10–12: q4–8h.

### PO: (Lozenge):

**⚠️ ALERT** For pts who smoke the first cigarette within 30 min of waking, administer the 4-mg lozenge; otherwise, administer the 2-mg lozenge.

**ADULTS, ELDERLY:** One 4-mg or 2-mg lozenge q1–2h for the first 6 wks (use at least 9 lozenges/day first 6 wks); 1 lozenge q2–4h for wks 7–9; and 1 lozenge q4–8h for wks 10–12. **Maximum:** 1 lozenge at a time, 5 lozenges/6 hrs, 20 lozenges/day.

### Transdermal:

**⚠️ ALERT** Apply 1 new patch q24h. **ADULTS, ELDERLY WHO SMOKE 10 CIGARETTES OR MORE PER DAY:** Follow the guidelines below. **Step 1:** 21 mg/day for 6 wks. **Step 2:** 14 mg/day for 2 wks. **Step 3:** 7 mg/day for 2 wks. **ADULTS, ELDERLY WHO SMOKE LESS THAN 10 CIGARETTES PER DAY:** Follow the guidelines below. **Step 1:** 14 mg/day for 6 wks. **Step 2:** 7 mg/day for 2 wks.

**Nasal: ADULTS, ELDERLY:** Each dose (2 sprays, 1 spray in each nostril) = 1 mg nicotine. Initially, 1–2 doses/hr. **Maximum:** 5 doses/hr (10 sprays), 40 doses/day (80 sprays). For best results, take at least 8 doses/day (16 sprays). Use beyond 6 mos not recommended.

**Inhaler: (Nicotrol): ADULTS, ELDERLY:** Initially, 6–16 cartridges per day. Puff on nicotine cartridge mouthpiece for about 20 min as needed. **Maximum:** 16 cartridges/day. Use beyond 6 mos not recommended.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent: All forms:** Hiccups, nausea. **Gum:** Mouth/throat soreness. **Transdermal:** Erythema, pruritus, burning at application site. **Occasional: All forms:** Eructation, GI upset, dry mouth, insomnia, diaphoresis, irritability. **Gum:** Hoarseness. **Inhaler:** Mouth/throat irritation, cough. **Rare: All forms:** Dizziness, myalgia, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces palpitations, tachyarrhythmias, seizures, depression, confusion, diaphoresis, hypotension, rapid/weak pulse, dyspnea. Lethal dose for adults is 40–60 mg. Death results from respiratory paralysis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Screen, evaluate those with coronary heart disease (history of MI, angina pectoris), serious cardiac arrhythmias, Buerger's disease, Prinzmetal's variant angina.

### INTERVENTION/EVALUATION

Monitor smoking habits, B/P, pulse, sleep pattern, skin for erythema, pruritus, burning at application site if transdermal system used.

### PATIENT/FAMILY TEACHING

- Follow guidelines for proper application of transdermal system.
- Chew gum slowly to avoid jaw ache, maximize benefit.
- Report persistent rash, pruritus that occurs with patch.
- Do not smoke while wearing patch.

## NIFedipine

nye-fed-i-peen

(Adalat XL , Procardia XL)

**Do not confuse NIFedipine with niCARDipine or niMODipine, or Procardia XL with Cartia XT.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcium channel blocker, dihydropyridine.

**CLINICAL:** Antianginal, antihypertensive.

### USES

#### Immediate-/Extended-Release:

Treatment of angina due to coronary artery spasm (Prinzmetal's variant angina), chronic stable angina (effort-associated angina). **Extended-Release:** Treatment of hypertension. **OFF-LABEL:** Treatment of Raynaud's phenomenon, pulmonary hypertension, preterm labor, prevention/treatment of high-altitude pulmonary edema.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to NIFEdipine. ST elevation myocardial infarction (STEMI). **Cautions:** Renal/hepatic impairment, obstructive coronary disease, HF, severe aortic stenosis, edema, severe left ventricular dysfunction, hypertrophic cardiomyopathy, before major surgery, bradycardia, concurrent use with beta blockers or digoxin, CYP3A4 inhibitors/inducers.

### ACTION

Inhibits calcium ion movement across cell membranes of vascular smooth muscle and myocardium during depolarization.

**Therapeutic Effect:** Relaxes coronary vascular smooth muscle and coronary vasodilation, increases myocardial oxygen delivery (angina), reduces peripheral vascular resistance, reduces arterial B/P.

### PHARMACOKINETICS

Widely distributed. Protein binding: 92%–98%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Insignificant amount distributed in breast milk. **Children:** Safety and efficacy not established.

**Elderly:** Age-related renal impairment may require dosage adjustment. Use lower initial doses and titrate to response.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., rifAMPin, PHENobarbital, phenytoin, carbAMazepine) may decrease concentration/effect. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. Beta blockers (e.g., carvedilol, metoprolol) may have additive effect. May increase digoxin concentration, risk of toxicity. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Grapefruit products may increase risk for flushing, headache, tachycardia, hypotension. **LAB VALUES:** May cause positive ANA, direct Coombs' test.

### AVAILABILITY (Rx)

**Capsules:** 10 mg, 20 mg.

 **Tablets, Extended-Release:** 30 mg, 60 mg, 90 mg.

### ADMINISTRATION/HANDLING

#### PO

- Do not break, crush, dissolve, or divide extended-release tablets.
- Give without regard to food (Adalat CC, Nifediac CC should be taken on an empty stomach).

#### Sublingual

- Capsules must be punctured, chewed, and/or squeezed to express liquid into mouth.

### INDICATIONS/ROUTES/DOSAGE

#### Prinzmetal's Variant Angina, Chronic Stable (Effort-Associated) Angina

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** Initially, 30–60 mg/day. May increase at 7- to 14-day intervals. **Maximum:** 120 mg/day.

#### Hypertension

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** Initially, 30–60 mg once daily.

May increase at 7- to 14-day intervals. **Usual range:** 30–90 mg once daily. **Maximum:** 90–120 mg/day. **CHILDREN 1–17 YRS:** Initially, 0.25–0.5 mg/kg/day once daily or divided in 2 doses q12h. Do not exceed initial adult daily dose of 30–60 mg/day. Titrate at 7- to 14-day intervals. **Maximum:** 3 mg/kg/day or 120 mg/day.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (30%–11%):** Peripheral edema, headache, flushed skin, dizziness. **Occasional (12%–6%):** Nausea, shakiness, muscle cramps/pain, drowsiness, palpitations, nasal congestion, cough, dyspnea, wheezing. **Rare (5%–3%):** Hypotension, rash, pruritus, urticaria, constipation, abdominal discomfort, flatulence, sexual dysfunction.

#### ADVERSE EFFECTS/TOXIC REACTIONS

May precipitate HF, MI in pts with cardiac disease, peripheral ischemia. Overdose produces nausea, drowsiness, confusion, slurred speech. **Antidote:** Glucagon (see Appendix J for dosage).

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Concurrent therapy with sublingual nitroglycerin may be used for relief of anginal pain. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). Check B/P for hypotension immediately before giving medication.

##### INTERVENTION/EVALUATION

Monitor B/P. Assist with ambulation if light-headedness, dizziness occurs. Assess for peripheral edema. Assess skin for flushing. Monitor LFT. Observe for signs/symptoms of HF.

#### PATIENT/FAMILY TEACHING

- Go from lying to standing slowly.
- Report palpitations, shortness of breath, pronounced dizziness, nausea, exacerbations of angina.
- Avoid alcohol; concomitant grapefruit product use.

## niMODipine

nye-**mode**-i-peen

(Nimotop , Nymalize)

**BLACK BOX ALERT** Severe cardiovascular events, including fatalities, have resulted when capsule contents have been withdrawn by syringe and administered by IV injection rather than orally or via nasogastric tube.

**Do not confuse niMODipine with niCARDipine or NIFEDipine.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcium channel blocker, dihydropyridine.

**CLINICAL:** Cerebral vasospasm agent.

#### USES

Improvement of neurologic deficits due to cerebral vasospasm following subarachnoid hemorrhage from ruptured intracranial aneurysms.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to niMODipine. Concurrent use with strong CYP3A4 inhibitors (e.g., clarithromycin, voriconazole). **Cautions:** Pts with cirrhosis, baseline hypotension, bradycardia.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage

adjustment. May experience greater hypotensive response, constipation.

## ACTION

Inhibits movement of calcium ions across vascular smooth muscle cell membranes during depolarization. Exerts greatest effect on cerebral arteries. **Therapeutic Effect:** Produces favorable effect on severity of neurologic deficits due to cerebral vasospasm. May prevent cerebral vasospasm.

## PHARMACOKINETICS

Widely distributed. Protein binding: 95%. Metabolized in liver. Excreted in bile (80%), urine (20%). Not removed by hemodialysis. **Half-life:** 1–2 hrs.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) increase concentration/effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration, risk of toxicity. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Solution, Oral (Nymalize):** 6 mg/mL.

 **Capsules:** 30 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer 1 hr before or 2 hrs after meals.
- If pt unable to swallow, place hole in both ends of capsule with 18-gauge needle to extract contents into syringe. Empty into NG tube; flush tube with 30 mL water.

## INDICATIONS/ROUTES/DOSAGE

### Subarachnoid Hemorrhage

**PO: ADULTS, ELDERLY:** 60 mg q4h for 21 days. Begin within 96 hrs of subarachnoid hemorrhage.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**PO: ADULTS, ELDERLY:** Reduce dose to 30 mg q4h in pts with cirrhosis.

## SIDE EFFECTS

**Occasional (6%–2%):** Hypotension, peripheral edema, diarrhea, headache. **Rare (less than 2%):** Allergic reaction (rash, urticaria), tachycardia, flushing of skin.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces nausea, weakness, dizziness, drowsiness, confusion, slurred speech.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess level of consciousness, neurologic response, initially and throughout therapy. Assess B/P, heart rate immediately before drug administration. Assess hydration status.

### INTERVENTION/EVALUATION

The benefit of giving nimodipine for prevention of cerebral vasospasm must be considered if manageable bradycardia or hypotension occurs. Consider administering 30-mg dose q2h if bradycardia; hypotension is a concern in the acute care setting. Monitor CNS response, heart rate, B/P for evidence of hypotension, bradycardia. Monitor transcranial Doppler results for evidence of vasospasm.

### PATIENT/FAMILY TEACHING

- Report palpitations, shortness of breath, swelling, constipation, nausea, dizziness. Immediately report headache,

blurry vision, confusion (may indicate vasospasm). Drink plenty of fluids to maintain hydration.

## niraparib

nye-**rap**-a-rib  
(Zejula)

**Do not confuse niraparib with olaparib, neratinib, or rucaparib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Poly(ADP-ribose) polymerase (PARP) inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Maintenance treatment of adult pts with recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to platinum-based chemotherapy. Treatment of adults with advanced ovarian, fallopian tube, or primary peritoneal cancer who have been treated with 3 or more prior chemotherapy regimens and whose cancer is associated with homologous recombination deficiency (HRD)-positive status. Maintenance treatment of adults with advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to first-line platinum-based chemotherapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to niraparib. **Cautions:** Baseline cytopenias; history of hypertension, cardiac disease; pts at risk for hemorrhage (e.g., history of GI bleeding, coagulation disorders, recent trauma; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); concomitant use of anticoagulants, antiplatelet medication, NSAIDs).

### ACTION

Inhibits poly(ADP-ribose) polymerase (PARP) enzymatic activity, resulting in

DNA damage, apoptosis, and cellular death. **Therapeutic Effect:** Induces cytotoxicity in tumor cell lines with and without BRCA deficiencies.

### PHARMACOKINETICS

Widely distributed. Metabolized by carboxylesterase to inactive metabolite. Protein binding: 83%. Peak plasma concentration: 3 hrs. Excreted in urine (48%), feces (39%). **Half-Life:** 36 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 1 mo after discontinuation. May impair fertility in males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase immunosuppressive effects of **baricitinib, fingolimod, tofacitinib, upadacitinib**. May increase the adverse/toxic effect of **natalizumab. Pimecrolimus, tacrolimus (topical)** may increase adverse/toxic effect. May increase adverse/toxic effect, decrease therapeutic effect of **vaccines (live)**. May decrease therapeutic effect of **BCG (intravesical)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, GGT. May decrease ANC, Hgb, Hct, leukocytes, neutrophils, RBCs; serum potassium.

### AVAILABILITY (Rx)

**Capsules:** 100 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give with or without food. • Administer whole; do not break, cut, crush, or

open capsules. • If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time. • Administration at bedtime may decrease occurrence of nausea.

## INDICATIONS/ROUTES/DOSAGE

### Recurrent Epithelial Ovarian, Fallopian Tube, Peritoneal Cancer

**PO: ADULTS, ELDERLY:** 300 mg once daily or 200–300 mg once daily, initiated no later than 8 wks after most recent platinum-containing regimen. Continue until disease progression or unacceptable toxicity.

### Advanced Epithelial Ovarian, Fallopian Tube, Peritoneal Cancer

**PO: ADULTS, ELDERLY:** 200 mg once daily (if weight less than 77 kg or platelet count is less than 150,000 cells/mm<sup>3</sup>) or 300 mg once daily (if weight greater than or equal to 77 kg and platelet count greater than or equal to 150,000 cells/mm<sup>3</sup>).

### Dose Reduction Schedule

**First dose reduction:** 200 mg daily.

**Second dose reduction:** 100 mg daily.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Note:** If acute myeloid leukemia or myelodysplastic syndrome is confirmed, permanently discontinue.

### Anemia, Neutropenia

**ANC less than 1,000 cells/mm<sup>3</sup>, Hgb less than 8 g/dL:** Withhold treatment for maximum of 28 days until ANC improves to greater than or equal to 1,500 cells/mm<sup>3</sup> or Hgb level improves to 9 g/dL or greater, then resume at reduced dose level. If ANC or Hgb level does not improve to an acceptable level within 28 days or if dose is already reduced to 100 mg/day, permanently discontinue.

### Hematologic Toxicity Requiring Transfusion

**Platelet count less than or equal to 10,000 cells/mm<sup>3</sup>:** Consider transfusion, then resume at reduced dose level.

### Nonhematologic Toxicity

**Any nonhematologic Grade 3 or 4 toxicity when prophylactic treatment is not possible or toxicity persists despite treatment:** Withhold treatment for maximum of 28 days until resolved, then resume at next lower dose level.

**Any nonhematologic Grade 3 or 4 toxicity lasting more than 28 days with 100 mg/day regimen:** Permanently discontinue.

### Thrombocytopenia

**Platelet count less than 100,000 cells/mm<sup>3</sup>:** **First occurrence:** Withhold treatment for maximum of 28 days until improved to greater than or equal to 100,000 cells/mm<sup>3</sup>, then resume at same dose or reduced dose level. If platelet count is less than 75,000 cells/mm<sup>3</sup>, resume at reduced dose level. **Second occurrence:** Withhold treatment for maximum of 28 days until improved to greater than or equal to 100,000 cells/mm<sup>3</sup>, then resume at reduced dose level. If platelet count does not improve to an acceptable level within 28 days or if dose is already reduced to 100 mg/day, permanently discontinue.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (74%–20%):** Nausea, fatigue, asthenia, constipation, vomiting, abdominal pain/distention, insomnia, headache, decreased appetite, rash, mucositis, stomatitis, hypertension, dyspnea. **Occasional (19%–10%):** Myalgia, back pain, dizziness, dyspepsia, cough, arthralgia, anxiety, dysgeusia, dry mouth, palpitations, tachycardia, peripheral edema, decreased weight, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia neutropenia, leukopenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including bone marrow failure may result in life-threatening event. Fatal cases of acute myeloid leukemia, myelodysplastic syndrome reported in 1% of pts. Hypertension, hypertensive crisis reported in 9% of pts. Infections including bronchitis, conjunctivitis, nasopharyngitis (23% of pts), UTI (13% of pts) may occur. Epistaxis may occur, esp. in pts with treatment-induced thrombocytopenia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, BMP, LFT; vital signs. Obtain pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Question history of cardiac disease, hypertension. Assess hydration status. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression w/ky for first 4 wks, then monthly for 11 mos, then periodically thereafter. In pts with platelet count less than 10,000 cells/mm<sup>3</sup>, consider withholding anticoagulant, antiplatelet drugs or proceed with transfusion (if applicable). Monitor for acute myeloid leukemia, myelodysplastic syndrome (bleeding or bruising easily, fatigue, frequent infections, pyrexia, hematuria, melena, weakness, weight loss, cytopenias, increased requirements for blood transfusion). Diligently screen for infections (cough, fatigue, fever). Monitor vital signs for arrhythmia, hypertension, tachycardia. Offer antiemetic if nausea, vomiting occurs. Assess skin for rash, toxic reactions. Encourage nutritional intake.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills,

cough, fatigue, fever. Avoid those with active infection. • Treatment may cause severe bone marrow depression or new-onset myeloid leukemia; report bruising, fatigue, fever, frequent infections, shortness of breath, weight loss, bleeding easily, blood in urine or stool. • Use effective contraception to avoid pregnancy. Do not breast-feed. • Dose administration at bedtime may decrease occurrence of nausea.

## nitrofurantoin

nye-troe-fue-ran-toyn  
(Macrobid, Macrochantin)

**Do not confuse Macrobid with MicroK or Nitro-Bid, or nitrofurantoin with Neurontin or nitroglycerin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antibacterial. **CLINICAL:** Antibiotic, UTI prophylaxis.

### USES

Treatment of acute uncomplicated cystitis caused by susceptible gram-negative, gram-positive organisms, including *E. coli*, *S. aureus*, *Enterococcus*, *Klebsiella*, *Enterobacter*. Prophylaxis for recurrent urinary tract infections.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to nitrofurantoin. Anuria, oliguria, renal impairment (CrCl less than 60 mL/min), infants younger than 1 mo due to risk of hemolytic anemia. Pregnancy at term, during labor, or delivery, or when onset of labor is imminent. History of cholestatic jaundice or hepatic impairment with previous nitrofurantoin therapy. **Cautions:** Renal impairment, diabetes, electrolyte imbalance, anemia, vitamin B deficiency, debilitated (greater risk of peripheral neuropathy), G6PD deficiency (greater risk of hemolytic anemia), elderly, prolonged therapy (may cause pulmonary toxicity).

**ACTION**

Inhibits bacterial enzyme systems, interfering with protein synthesis, anaerobic energy metabolism, DNA, RNA, and cell wall synthesis. **Therapeutic Effect:** Bactericidal at therapeutic doses.

**PHARMACOKINETICS**

Microcrystalline form rapidly, completely absorbed; macrocrystalline form more slowly absorbed. Food increases absorption. Protein binding: 60%. Primarily concentrated in urine, kidneys. Metabolized in most body tissues. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 20–60 min.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Contraindicated at term and during lactation when infant suspected of having G6PD deficiency. **Children:** No age-related precautions noted in pts older than 1 mo. **Elderly:** Avoid use. More likely to develop acute pneumonitis, peripheral neuropathy. Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Antacids containing magnesium trisilicate may decrease absorption. Probenecid may increase concentration, risk of toxicity. May decrease effect of norfloxacin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, phosphorus. May decrease Hgb.

**AVAILABILITY (Rx)**

**Capsules:** (Macrocrystalline [Macrobid]): 100 mg. **Capsules:** (Macrocrystalline [Macrocrystalline]): 25 mg, 50 mg, 100 mg. **Oral Suspension:** (Microcrystalline): 25 mg/5 mL.

**ADMINISTRATION/HANDLING****PO**

• Give with food, milk to enhance absorption, reduce GI upset. • May mix

suspension with water, milk, fruit juice; shake well.

**INDICATIONS/ROUTES/DOSAGE****UTI**

**PO:** (Macrodantin): **ADULTS, ELDERLY:** 50–100 mg q6h; treat males for 7 days or females for 5 days. **Maximum:** 400 mg/day. **CHILDREN, ADOLESCENTS:** 5–7 mg/kg/day in divided doses q6h for 7 days or at least 3 days after obtaining sterile urine. **Maximum:** 400 mg/day (100 mg/dose).

**PO:** (Macrobid): **ADULTS, ELDERLY, ADOLESCENTS:** 100 mg twice daily; treat males for 7 days or females for 5 days.

**Long-Term Prevention of UTI**

**PO:** **ADULTS, ELDERLY:** 50–100 mg at bedtime. **CHILDREN OLDER THAN 1 MONTH:** 1–2 mg/kg/day in 2 divided doses. **Maximum:** 100 mg/day.

**Dosage in Renal Impairment**

Contraindicated in pts with CrCl less than 60 mL/min.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Anorexia, nausea, vomiting, dark urine. **Occasional:** Abdominal pain, diarrhea, rash, pruritus, urticaria, hypertension, headache, dizziness, drowsiness. **Rare:** Photosensitivity, transient alopecia, asthmatic exacerbation in those with history of asthma.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Superinfection, hepatotoxicity, peripheral neuropathy (may be irreversible), Stevens-Johnson syndrome, permanent pulmonary impairment, anaphylaxis occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of asthma. Question medical history as listed in Precautions, and screen for contraindications.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT if used long-term; I&O. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, urticaria. Be alert for numbness/tingling, esp. of lower extremities (may signal onset of peripheral neuropathy). Observe for signs of hepatotoxicity (fever, rash, arthralgia, hepatomegaly). Monitor respiratory status, esp. in pts with asthma.

**PATIENT/ FAMILY TEACHING**

- Urine may become dark yellow/brown.
- Take with food, milk for best results, to reduce GI upset.
- Complete full course of therapy.
- Avoid sun, ultraviolet light; use sunscreen, wear protective clothing.
- Report cough, fever, chest pain, difficulty breathing, numbness/tingling of fingers, toes.
- Rare occurrence of alopecia is transient.

## nitroglycerin

nye-troe-**glis**-er-in

(GoNitro, Minitran, Nitro-Bid, Nitro-Dur, Nitrolingual, NitroMist, Nitrostat, Nitro-Time, Rectiv, Trinipatch )

**Do not confuse Nitro-Bid with Macrobid or Nicobid, Nitro-Dur with Nicoderm, nitroglycerin with nitrofurantoin or nitroprusside, or Nitrostat with Nilstat or Nystatin.**

**♦ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Nitrate.

**CLINICAL:** Antianginal, antihypertensive, coronary vasodilator.

**USES**

Treatment/prevention of angina pectoris. Extended-release, topical forms used for prophylaxis, long-term angina management. IV form used in treatment of HE, acute MI, perioperative hypertension, induction of intraoperative

hypotension. **Rectiv:** Treatment of moderate to severe pain associated with chronic anal fissure. **OFF-LABEL:** Short-term management of pulmonary hypertension, esophageal spastic disorders, uterine relaxation, treatment of sympathomimetic vasopressor extravasation.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to nitroglycerin. Allergy to adhesives (transdermal); concurrent use of sildenafil, tadalafil, vardenafil (PDE5 inhibitors). Concurrent use with riociguat. **IV:** Restrictive cardiomyopathy, pericardial tamponade, constrictive pericarditis, increased ICP, uncorrected hypovolemia. **Sublingual, Rectal:** Increased intracranial pressure, severe anemia. **Sublingual:** Acute circulatory failure or shock, early MI. **Cautions:** Blood volume depletion, severe hypotension (systolic B/P less than 90 mm Hg), bradycardia (less than 50 beats/min), inferior wall MI and suspected right ventricular involvement.

**ACTION**

Forms nitric oxide, which increases cGMP, causing dephosphorylation of myosin light chains and smooth muscle relaxation. Produces vasodilation on peripheral veins and arteries (more prominent effect on veins). **Therapeutic Effect:** Decreases myocardial oxygen demand by decreasing preload (LVDP). Improves collateral flow to ischemic areas. **Rectal:** Decreases sphincter tone and intra-anal pressure.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
Sublingual	1–3 min	4–8 min	30–60 min
Translingual spray	2 min	4–10 min	30–60 min
Buccal tablet	2–5 min	4–10 min	2 hrs
PO (extended-release)	20–45 min	45–120 min	4–8 hrs

Route	Onset	Peak	Duration
Topical	15–60 min	30–120 min	2–12 hrs
Transdermal patch	40–60 min	60–180 min	18–24 hrs
IV	1–2 min	Immediate	3–5 min

Well absorbed after PO, sublingual, topical administration. Metabolized in liver, by enzymes in bloodstream. Protein binding: 60%. Excreted in urine. Not removed by hemodialysis. **Half-life:** 1–4 min.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to hypotensive effects. Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Alcohol, other antihypertensives (e.g., amLODIPine, lisinopril, valsartan), vasodilators may increase risk of orthostatic hypotension. Concurrent use of sildenafil, tadalafil, vardenafil (PDE5 inhibitors) produces significant hypotension. **Ergot derivatives (e.g., ergotamine)** may decrease effect of vasodilation. May increase hypotensive effect of riociguat. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum methemoglobin, urine catecholamine concentrations.

### AVAILABILITY (Rx)

**Infusion, Premix:** 25 mg/250 mL, 50 mg/250 mL, 100 mg/250 mL. **Injection Solution:** 5 mg/mL. **Ointment, (Nitro-Bid):** 2%. **Ointment, Rectal (Rectiv):** 0.4%. **Translingual Spray:** 0.4 mg/

spray. **Transdermal Patch:** 0.1 mg/hr, 0.2 mg/hr, 0.4 mg/hr, 0.6 mg/hr.

 **Capsules, Extended-Release:** 2.5 mg, 6.5 mg, 9 mg.  **Tablets, Sublingual:** 0.3 mg, 0.4 mg, 0.6 mg.

### ADMINISTRATION/HANDLING

**ALERT** Cardioverter/defibrillator must not be discharged through paddle electrode overlying nitroglycerin (transdermal, ointment) application. May cause burns to pt or damage to paddle via arcing.

**Reconstitution** • Available in ready-to-use injectable containers. • Dilute vials in D<sub>5</sub>W or 0.9% NaCl. **Maximum concentration:** 400 mcg/mL. • Use glass bottles.

**Rate of administration** • Use micro-drop or infusion pump.

**Storage** • Store at room temperature. • Reconstituted solutions stable for 48 hrs at room temperature or 7 days if refrigerated.

#### PO

• Do not break, crush, or open extended-release capsules. • Do not shake oral aerosol canister before lingual spraying.

#### Sublingual

• Instruct pt to not swallow. • Dissolve under tongue. • Administer while seated. • Slight burning sensation under tongue may be lessened by placing tablet in buccal pouch. • Keep sublingual tablets in original container.

#### Topical

• Spread thin layer on clean, dry, hairless skin of upper arm or body (not below knee or elbow), using applicator or dose-measuring papers. Do not use fingers; do not rub/massage into skin.

#### Transdermal

• Apply patch on clean, dry, hairless skin of upper arm or body (not below

knee or elbow). • May keep patch on when bathing/showering. • Do not cut/trim to adjust dose.

## IV INCOMPATIBILITIES

Alteplase (Activase), phenytoin (Dilantin).

## IV COMPATIBILITIES

Amiodarone (Cordarone), dexmedetomidine (Precedex), dilTIAZem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPINEPHrine, famotidine (Pepcid), fentaNYL (Sublimaze), furosemide (Lasix), heparin, HYDROMorphone (Dilaudid), insulin, labetalol (Trandate), lidocaine, lipids, LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, niCARDipine (Cardene), nitroprusside (Nipride), norepinephrine (Levophed), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Angina, CAD

**Translingual spray: ADULTS, ELDERLY:** 1 spray (0.4 mg) q5min up to 3 doses in response to chest pain. If chest pain fails to improve or worsens in 3–5 min after 1 dose, call 911.

**Sublingual: ADULTS, ELDERLY:** One tablet (0.3–0.4 mg) under tongue. If chest pain fails to improve or worsens in 3–5 min, call 911. After the call, may take additional tablet. A third tablet may be taken 5 min after second dose (maximum of 3 tablets).

**PO: (Extended-Release): ADULTS, ELDERLY:** 2.5–6.5 mg 3–4 times/day. **Maximum:** 26 mg 4 times/day.

**Topical: ADULTS, ELDERLY:** Initially, 1/2 inch upon waking and 1/2 inch 6 hrs later. May double dose to 1 inch and double again to 2 inches. **Maximum:** 2 doses/day including nitrate-free interval of 10–12 hrs.

**Transdermal patch: ADULTS, ELDERLY:** Initially, 0.2–0.4 mg/hr. **Maintenance:** 0.4–0.8 mg/hr. Consider patch on for 12–14 hrs, patch off for 10–12 hrs (prevents tolerance).

### HF, Acute MI

**IV: ADULTS, ELDERLY:** Initially, 5–10 mcg/min. Titrate as needed based on

response and tolerability in increments of 5–10 mcg/minute q3–5min. **Maximum:** 200 mcg/min.

### Anal Fissure

**Rectal: ADULTS, ELDERLY:** After cleansing, apply around fissure(s) twice daily as directed for 4 wks. If symptoms persist, continue for another 4 wks for a total duration of 8 wks.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Headache (possibly severe; occurs mostly in early therapy, diminishes rapidly in intensity, usually disappears during continued treatment), transient flushing of face/neck, dizziness (esp. if pt is standing immobile or is in a warm environment), weakness, orthostatic hypotension. **Sublingual:** Burning, tingling sensation at oral point of dissolution. **Ointment:** Erythema, pruritus. **Occasional:** GI upset. **Transdermal:** Contact dermatitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe orthostatic hypotension may occur, manifested by syncope, pulselessness, cold/clammy skin, diaphoresis. Tolerance may occur with repeated, prolonged therapy; minor tolerance may occur with intermittent use of sublingual tablets. High doses tend to produce severe headache.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain; precipitating factors (exertion, emotional stress). Assess B/P, apical pulse before administration and periodically following dose. Pt must have continuous ECG monitoring for IV administration.

Rule out right-sided MI, if applicable (may precipitate life-threatening hypotension). Receive full medication history, and screen for interactions, esp. use of PDE5 inhibitors. Question medical history and screen for contraindications.

#### INTERVENTION/EVALUATION

Monitor B/P, heart rate. Assess for facial, neck flushing. Cardioverter/defibrillator must not be discharged through paddle electrode overlying nitroglycerin (transdermal, ointment) system (may cause burns to pt or damage to paddle via electrical arcing). Consider NS boluses for hypotension.

#### PATIENT/FAMILY TEACHING

• Go from lying to standing slowly. • Take oral form on empty stomach (however, if headache occurs during therapy, take medication with meals). • Use spray only when lying down. • Dissolve sublingual tablet under tongue; do not swallow. • Take at first sign of angina. • May take additional dose q5min if needed up to a total of 3 doses. • If not relieved within 5 min, contact physician or immediately go to emergency room. • Do not inhale lingual aerosol but spray onto or under tongue (avoid swallowing after spray is administered). • Expel from mouth any remaining lingual, sublingual, intrabuccal tablet after pain is completely relieved. • Place transmucosal tablets under upper lip or buccal pouch (between cheek and gum); do not chew/swallow tablet. • Avoid alcohol (intensifies hypotensive effect). If alcohol is ingested soon after taking nitroglycerin, possible acute hypotensive episode (marked drop in B/P, vertigo, diaphoresis, pallor) may occur. • Do not use within 48 hrs of sildenafil, tadalafil, vardenafil (PDE5 inhibitors); may cause acute hypotensive episode.

## nivolumab

nye-vol-ue-mab  
(Opdivo)

**Do not confuse nivolumab with denosumab, adalimumab, or palivizumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-PD-1 monoclonal antibody. Immune checkpoint inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Treatment of BRAF V600 wild-type unresectable or metastatic melanoma, as a single agent; BRAF V600 mutation-positive unresectable melanoma, as a single agent; unresectable or metastatic melanoma, in combination with ipilimumab. Adjuvant treatment of melanoma with involvement of lymph nodes or metastatic disease following complete resection. Treatment of metastatic non-small-cell lung cancer (NSCLC) with progression on or after platinum-based chemotherapy. Treatment of metastatic small-cell lung cancer (SCLC) in pts with progression following platinum-based chemotherapy and at least one other line of therapy. Treatment of advanced renal cell cancer (RCC) in pts receiving prior antiangiogenic therapy. First-line treatment of advanced previously untreated RCC (in combination with ipilimumab). Treatment of classical Hodgkin lymphoma (cHL) that relapsed or progressed following autologous hematopoietic stem cell transplant (HSCT) and post-brentuximab, or 3 or more lines of systemic therapy that includes autologous HSCT. Treatment of recurrent or metastatic squamous cell carcinoma of the head and neck. Treatment of locally advanced or metastatic urothelial carcinoma with disease progression during or following platinum-containing chemotherapy; or within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing

chemotherapy. Treatment (as a single agent or in combination with ipilimumab) of microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic colorectal cancer in adults and children 12 yrs of age and older that has progressed following treatment with fluoropyrimidine, oxaliplatin, and irinotecan. Treatment of hepatocellular carcinoma in pts previously treated with sorafenib. Treatment of unresectable advanced, recurrent, or metastatic esophageal squamous cell carcinoma after prior fluoropyrimidine- and platinum-based chemotherapy. First-line treatment of metastatic non-small-cell lung cancer (NSCLC) (in combination with ipilimumab) in adults whose tumors express PD-L1 (greater than or equal to 1%) and with no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations. First-line treatment of metastatic or recurrent NSCLC (in combination with ipilimumab and 2 cycles of platinum doublet chemotherapy) in adults with no EGFR or ALK genomic tumor aberrations. First-line treatment in adults (in combination with ipilimumab) of unresectable malignant pleural mesothelioma. Treatment of advanced or metastatic gastric cancer and gastroesophageal junction cancer (in combination with fluoropyrimidine- and platinum-containing chemotherapy). Adjuvant treatment of completely resected esophageal or gastroesophageal junction cancer in pts with residual pathologic disease who have received neoadjuvant chemoradiotherapy. Treatment of advanced or metastatic esophageal adenocarcinoma (in combination with fluoropyrimidine- and platinum-containing chemotherapy). Adjuvant treatment of urothelial carcinoma in pts at high risk of recurrence after undergoing radical resection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to nivolumab. **Cautions:** Thyroid/pituitary disease, hepatic/renal impairment, interstitial lung disease, electrolyte imbalance.

## ACTION

Binds PD-1 ligands to PD-1 receptor found on T cells, blocking its interaction with the ligands (PD-L1 and PD-L2). Releases PD-1 pathway-mediated inhibition of immune response (including antitumor immune response). **Therapeutic Effect:** Inhibits T-cell proliferation and cytokine production. Inhibits tumor cell growth and metastasis.

## PHARMACOKINETICS

Metabolism not specified. Steady-state concentration reached in 12 wks. Excretion not specified. **Half-life:** 26.7 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Females of reproductive potential should use effective contraception during treatment and up to 5 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of endocrine/hepatic/pulmonary/optic/renal injury due to age-related diseases.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES: Single Therapy:** May increase serum alkaline phosphatase, ALT, AST, potassium. May decrease serum sodium. **Combo Therapy:** May increase serum alkaline phosphatase, ALT, AST, amylase, creatinine, lipase. May decrease RBC, Hct, Hgb, lymphocytes, neutrophils, platelets; serum calcium, sodium, magnesium. May increase or decrease serum calcium, potassium.

## AVAILABILITY (Rx)

**Injection Solution:** 40 mg/4 mL, 100 mg/10 mL, 240 mg/24 mL vials.

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect solution for particulate matter or discoloration. Solution should appear opalescent, colorless to pale yellow. Discard if solution is

cloudy or contains particulate matter other than a few translucent to white proteinaceous particles. • Do not shake vial. • Withdraw required dose volume and dilute in 0.9% NaCl or D<sub>5</sub>W. Final concentration will equal 1–10 mg/mL based on volume of diluent. • Mix by gentle inversion. • Do not shake. • Discard partially used or empty vials.

**Rate of administration** • Infuse over 60 min using sterile, nonpyrogenic, low protein-binding, 0.2- to 1.2-micron in-line filter. • Flush IV line upon completion.

**Storage** • Refrigerate diluted solution up to 24 hrs or store at room temperature for no more than 4 hrs (includes time of preparation and infusion). • Do not freeze.

### IV INCOMPATIBILITIES

Do not infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Melanoma

**IV: ADULTS, ELDERLY: (Single Agent):** 240 mg q2wks or 480 mg q4wks until disease progression or unacceptable toxicity. **(In combination with ipilimumab):** 1 mg/kg, followed by ipilimumab on the same day, q3wks for 4 doses. Subsequent single-agent therapy dose is 240 mg q2wks or 480 mg q4wks until disease progression or unacceptable toxicity.

### Metastatic Non–Small-Cell Lung Cancer (NSCLC)

**IV: ADULTS, ELDERLY:** 240 mg q2wks until disease progression or unacceptable toxicity.

### Advanced Renal Cell Carcinoma (Previously Treated), Urothelial Carcinoma, Hepatocellular Carcinoma, Melanoma (Adjuvant Treatment)

**IV: ADULTS, ELDERLY:** 240 mg q2wks or 480 mg q4wks until disease progression or unacceptable toxicity.

### Urothelial Carcinoma (Adjuvant Therapy Following Resection)

**IV: ADULTS, ELDERLY:** 240 mg q2wks or 480 mg q4wks. Continue until disease

recurrence or unacceptable toxicity for up to 1 year.

### cHL (Recurrent or Metastatic), Esophageal Carcinoma, Squamous Cell Carcinoma (Unresectable Advanced, Recurrent, or Metastatic)

**IV: ADULTS, ELDERLY:** 240 mg once q2wks or 480 mg once q4wks until disease progression or unacceptable toxicity.

### Colorectal Cancer, Metastatic (Single Agent)

**IV: ADULTS, ELDERLY:** 240 mg q2wks or 480 mg once q4wks until disease progression or unacceptable toxicity.

### Colorectal Cancer, Metastatic (Combination Therapy)

**IV: ADULTS, ELDERLY: (In combination with ipilimumab):** 3 mg/kg, in combination with ipilimumab, q3wks for 4 doses. Subsequent single-agent therapy dose is 240 mg q2wks or 480 mg once q4wks until disease progression or unacceptable toxicity.

### Esophageal Adenocarcinoma (Advanced or Metastatic), Gastric Cancer, or Gastroesophageal Junction Cancer (Advanced or Metastatic)

**IV: ADULTS, ELDERLY:** 240 mg q2wks or 360 mg q3wks (in combination with fluoropyrimidine- and platinum-containing chemotherapy) Continue until disease progression, unacceptable toxicity for up to 2 yrs.

### Esophageal or Gastroesophageal Junction Cancer (Resected, Adjuvant Treatment)

**IV: ADULTS, ELDERLY:** 240 mg q2wks or 480 mg q4wks. Continue until disease progression or unacceptable toxicity for up to 1 yr.

### Metastatic SCLC

**IV: ADULTS, ELDERLY: (Single Agent):** 3 mg/kg once q2wks until disease progression or unacceptable toxicity. **(In combination with ipilimumab):** 1 mg/kg once q3wks for 4 combination doses, then 3 mg/kg once q2wks as single agent until disease progression or unacceptable toxicity.

### RCC Combination Therapy (Previously Untreated)

**IV: ADULTS, ELDERLY: (In combination with ipilimumab):** 3 mg/kg, in combination with ipilimumab, q3wks for 4 doses. Subsequent single-agent therapy dose is 240 mg q2wks or 480 mg q4wks until disease progression or unacceptable toxicity.

### Head and Neck Carcinoma

**IV: ADULTS, ELDERLY:** 240 mg once q2wks or 480 mg once q4wks until disease progression or unacceptable toxicity.

### NSCLC (Metastatic, PD-L1–Expressing)

**IV: ADULTS, ELDERLY:** 3 mg/kg q2wks (with ipilimumab). Continue until disease progression or unacceptable toxicity or for up to 2 yrs in pts without disease progression.

### NSCLC (Metastatic or Recurrent)

**IV: ADULTS, ELDERLY:** 360 mg q3wks (in combination with ipilimumab and 2 cycles of histology-based platinum-doublet chemotherapy). Continue until disease progression or unacceptable toxicity or for up to 2 yrs in pts without disease progression.

### Malignant Pleural Mesothelioma

**IV: ADULTS, ELDERLY:** 360 mg q3wks (in combination with ipilimumab). Continue until disease progression or unacceptable toxicity or for up to 2 yrs in pts without disease progression.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Withhold Treatment for Any of the Following Adverse Events

Grade 2 or 3 diarrhea or colitis; single-agent therapy–associated colitis; Grade 2 pneumonitis; serum AST or ALT greater than 3–5 times upper limit of normal (ULN) or serum bilirubin 1.5–3 times ULN; Grade 2 or 3 hypophysitis; Grade 2 adrenal insufficiency; serum creatinine greater than 1.5–6 times ULN; Grade 3 rash; first occurrence of any other Grade 3 adverse reaction. When nivolumab is administered in combination with

ipilimumab and nivolumab is withheld, then ipilimumab should also be withheld.

### Restarting Therapy

Resume when adverse reactions return to Grade 0 or 1.

### Permanently Discontinue for Any of the Following Adverse Events

Combo-agent therapy (ipilimumab)–associated colitis; Grade 3 or 4 pneumonitis; serum AST or ALT greater than 5 times ULN or serum bilirubin 3 times ULN; pts with liver metastasis who begin treatment with baseline Grade 2 serum ALT or AST elevation who experience serum ALT or AST elevation greater than or equal to 50% from baseline that persists for at least 1 wk; Grade 4 hypophysitis; Grade 3 or 4 adrenal insufficiency; serum creatinine greater than 6 times ULN; Grade 4 rash; recurrence of any other Grade 3 adverse reaction; any life-threatening or Grade 4 adverse reaction; requirement for prednisONE 10 mg/day or greater (or equivalent) for more than 12 wks; persistent Grade 2 or 3 adverse reaction lasting longer than 12 wks.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Note:** Percentage of side effects may vary depending on the use of single or combination therapy. **Frequent (50%–24%):** Fatigue, dyspnea, musculoskeletal pain, decreased appetite, cough, nausea, headache, constipation. **Occasional (19%–10%):** Vomiting, asthenia, diarrhea, edema, pyrexia, cough, dehydration, rash, abdominal pain, chest pain, arthralgia, decreased weight, blurred vision, pruritus, peripheral edema, generalized pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an

expected response to therapy. May cause severe immune-mediated events including interstitial lung disease or pneumonitis (3%–10% of pts), colitis (21%–57% of pts), hepatitis (15%–28% of pts), hypophysitis (13% of pts), renal failure or nephritis (1%–2% of pts), hyperthyroidism (1% of pts), hypothyroidism (3%–19% of pts), rash (up to 37% of pts). Other adverse events including autoimmune nephropathy, demyelination, diabetic ketoacidosis, duodenitis, erythema multiforme, exfoliative dermatitis, facial and abducens nerve paresis, gastritis, iridocyclitis, motor dysfunction, pancreatitis, psoriasis, sarcoidosis, uveitis, vasculitis, ventricular arrhythmia, vitiligo reported in less than 2% of pts. Severe infusion-related reactions reported in less than 1% of pts. Occurrence of events is dependent on use of single or combination therapy. Upper respiratory tract infections including nasopharyngitis, pharyngitis, rhinitis reported in 11% of pts. Immunogenicity (auto-nivolumab antibodies) occurred in 8.5% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, TSH; vital signs; urine pregnancy. Record weight in kg. Screen for history of arrhythmias, pituitary/pulmonary/thyroid disease, autoimmune disorders, diabetes, hepatic/renal impairment; allergy to predniSONE. Along with routine assessment, conduct full dermatologic exam, ophthalmologic exam/visual acuity. Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, serum electrolytes; thyroid panel if applicable. Diligently monitor for immune-mediated adverse events as listed in Adverse Effects/Toxic Reactions. Notify physician if any toxicities occur (see Appendix M) and initiate proper treatment. Obtain chest X-ray if interstitial lung disease, pneumonitis sus-

pected. Screen for tumor lysis syndrome in pts with high tumor burden. Monitor I&O, daily weight. If predniSONE therapy is initiated for immune-mediated events, monitor capillary blood glucose and screen for corticosteroid side effects.

### PATIENT/FAMILY TEACHING

- Serious adverse reactions may affect lungs, GI tract, kidneys, or hormonal glands; anti-inflammatory medication may need to be started.
- Immediately contact physician if serious or life-threatening inflammatory reactions occur in the following body systems: colon (severe abdominal pain or diarrhea); kidney (decreased or dark-colored urine, flank pain); lung (chest pain, cough, shortness of breath); liver (bruising easily, dark-colored urine, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]).
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## norepinephrine

**HIGH ALERT**

**nor-ep-i-nef-rin**  
(Levophed)

### BLACK BOX ALERT

Extravasation may produce severe tissue necrosis, sloughing. Using fine hypodermic needle, liberally infiltrate area with 10–15 mL saline solution containing 5–10 mg phentolamine.

**Do not combine Levophed with Levaquin or levoFLOXacin, or norepinephrine with EPINEPHrine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha, beta agonist. **CLINICAL:** Vasopressor.

**USES**

Treatment of severe hypotension, cardiogenic shock, septic shock persisting after adequate fluid volume replacement.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to norepinephrine. Hypotension related to hypovolemia (except in emergency to maintain coronary/cerebral perfusion until volume replaced), mesenteric/peripheral vascular thrombosis (unless it is lifesaving procedure). **Cautions:** Concurrent use of MAOIs.

**ACTION**

Stimulates beta<sub>1</sub>-adrenergic receptors, alpha-adrenergic receptors, increasing contractility, heart rate and producing vasoconstriction. **Therapeutic Effect:** Increases systemic B/P, coronary blood flow.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
IV	Rapid	1–2 min	N/A

Localized in sympathetic tissue. Metabolized in liver. Primarily excreted in urine.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. May produce fetal anoxia due to uterine contraction, constriction of uterine blood vessels. **Children/Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** MAOIs (e.g., phenelzine, selegiline), antidepressants (tricyclic) may prolong hypertension. SNRIs (e.g., duloxetine), may increase tachycardic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Injection Solution:** 1 mg/mL.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Add 4 mL (4 mg) to 250 mL D<sub>5</sub>W (16 mcg/mL). **Maximum concentration:** 32 mL (32 mg) to 250 mL (128 mcg/mL).

**Rate of administration** • Closely monitor IV infusion flow rate (use infusion pump). • Monitor B/P q2min during IV infusion until desired therapeutic response is achieved, then q5min during remaining IV infusion. • Never leave pt unattended. • Maintain B/P at 90–100 mm Hg in previously normotensive pts, and 30–40 mm Hg below preexisting B/P in previously hypertensive pts. • Reduce IV infusion gradually. Avoid abrupt withdrawal. • If using peripherally inserted catheter, it is imperative to check the IV site frequently for free flow and infused vein for blanching, hardness to vein, coldness, pallor to extremity. • If extravasation occurs, area should be infiltrated with 10–15 mL sterile saline containing 5–10 mg phentolamine (does not alter pressor effects of norepinephrine).

**Storage** • Do not use if solution is brown or contains precipitate. • Store at room temperature. Diluted solution stable for 24 hrs at room temperature.

**IV INCOMPATIBILITIES**

Pantoprazole (Protonix), regular insulin.

**IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), EPINEPHrine, esmolol (Brevibloc), fentaNYL (Sublimaze), furosemide (Lasix), haloperidol (Haldol), heparin, HYDROMorphone (Dilaudid), labetalol (Trandate), lipids, LORazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), morphine, niCARdipine (Cardene), nitroglycerin, potassium chloride, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE**

◀**ALERT**▶ If possible, blood, fluid volume depletion should be corrected before drug is administered. Recommend infusion via central venous access.

**Acute Hypotension Unresponsive to Fluid Volume Replacement**

**IV infusion: ADULTS, ELDERLY:** Initially, 0.05–0.15 mcg/kg/min. Titrate to goal mean arterial pressure (MAP). Usual dose range: 0.025–1 mcg/kg/min. **Maximum dose range for refractory shock:** 1–3.3 mcg/kg/min. **CHILDREN:** Initially, 0.05–0.1 mcg/kg/min; titrate to desired effect. **Maximum:** 2 mcg/kg/min.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

Norepinephrine produces less pronounced, less frequent side effects than EPINEPHrine.

**Occasional (5%–3%):** Anxiety, bradycardia, palpitations. **Rare (2%–1%):** Nausea, anginal pain, shortness of breath, fever.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Extravasation may produce tissue necrosis, sloughing. Overdose manifested as severe

hypertension with violent headache (may be first clinical sign of overdose), arrhythmias, photophobia, retrosternal or pharyngeal pain, pallor, diaphoresis, vomiting. Prolonged therapy may result in plasma volume depletion. Hypotension may recur if plasma volume is not maintained.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess ECG, B/P continuously (be alert for sudden drop in B/P). Be alert to pt complaint of headache.

**INTERVENTION/EVALUATION**

Monitor IV flow rate diligently. Assess for extravasation characterized by blanching of skin over vein, coolness (results from local vasoconstriction); color, temperature of IV site extremity (pallor, cyanosis, mottling). Assess nailbed capillary refill. Monitor I&O; measure output hourly, report urine output less than 30 mL/hr. Once B/P parameter has been reached, IV infusion should not be restarted unless systolic B/P falls below 90 mm Hg.

## obinutuzumab

oh-bi-nue-too-z-ue-mab  
(Gazyva)

**■ BLACK BOX ALERT ■** Hepatitis B virus reactivation, resulting in hepatic failure, fulminant hepatitis, and death have occurred. Screen all pts for hepatitis B virus infection before initiating treatment. Progressive multifocal leukoencephalopathy (PML) including fatal PML reported.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD20 monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Treatment of previously untreated chronic lymphocytic leukemia (CLL), in combination with chlorambucil. Treatment of follicular lymphoma (in combination with bendamustine) in pts who relapsed after, or are refractory to, a rituximab-containing regimen. Treatment of previously untreated stage II bulky, stage III, or stage IV follicular lymphoma in combination with chemotherapy and followed by obinutuzumab monotherapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to obinutuzumab. **Cautions:** Baseline cytopenias, HBV infection, preexisting cardiac/pulmonary impairment; hematologic abnormalities (e.g., leukopenia, thrombocytopenia); electrolyte imbalance; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

### ACTION

Targets CD20 antigen expressed on surface of B lymphocytes. Mediates B-cell lysis by activating complement-dependent cytotoxicity, antibody-dependent cellular cytotoxicity. **Therapeutic Effect:** Inhibits tumor cell growth and proliferation in CLL.

### PHARMACOKINETICS

Metabolism and elimination not specified. **Half-life:** 28 days.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Monoclonal antibodies are known to cross placenta. Effective contraception, discontinuation of breastfeeding recommended during therapy and for at least 18 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions.

### INTERACTIONS

**DRUG:** May increase hypotensive effect of ACE inhibitors (e.g., enalapril, lisinopril), angiotensin receptor blockers (e.g., losartan), beta blockers (e.g., metoprolol). May decrease the therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of natalizumab, vaccines (live). **HERBAL:** Echinacea may diminish the therapeutic effect. **Herbals with hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may increase the hypotensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, uric acid. May decrease albumin, Hgb, Hct, lymphocytes, neutrophils, platelets; serum potassium, sodium.

### AVAILABILITY (Rx)

**Injection Solution:** 1,000 mg/40 mL (25 mg/mL) single-use vial.

### ADMINISTRATION/HANDLING

**◀ ALERT ▶** Administer via dedicated line. Do not administer IV push or bolus. Withhold hypertensive medications at least 12 hrs before and 1 hr after administration. Do not mix with dextrose-containing fluids.

**Reconstitution** • Visually inspect for particulate matter or discoloration. • For 100-mg dose: withdraw 40 mL solution from vial and dilute only 4 mL (100 mg) in

100 mL 0.9% NaCl for immediate administration. Dilute remaining 36 mL (900 mg) into 250 mL 0.9% NaCl at same time and refrigerate for up to 24 hrs for cycle 1: day 2. For remaining infusions (day 8 and day 15 of cycle 1 and day 1 of cycles 2–6), dilute 40 mL (1,000 mg) solution in 250 mL NaCl infusion bag. • Gently mix by inversion. • Do not shake.

**Rate of administration • Day 1 of cycle 1 (100 mg):** Infuse over 4 hrs (25 mg/hr). • Do not increase infusion rate. • **Day 2 of cycle 1 (900 mg):** Infuse at 50 mg/hr. • May increase by 50 mg/hr every 30 min to maximum rate of 400 mg/hr. • Increase rate based on tolerability.

**Storage** • Solution should appear clear, colorless to slightly brown. • May refrigerate diluted solution up to 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Chronic Lymphocytic Leukemia (CLL)

**◀ALERT▶** Premedicate with glucocorticoid, acetaminophen, and antihistamine to decrease severity of infusion reaction. Consider premedication with antihyperuricemics (allopurinol) 12–24 hrs for pts with high tumor burden or high circulating absolute lymphocyte count greater than  $25 \times 10^9/L$ . Recommend antimicrobial prophylaxis throughout treatment for pts with neutropenia.

**IV: ADULTS/ELDERLY:** Six treatment cycles of 28-day cycle. **Day 1 of cycle 1:** 100 mg. **Day 2 of cycle 1:** 900 mg. **Day 8 and Day 15 of cycle 1:** 1000 mg. **Cycles 2–6:** 1000 mg on day 1 of each subsequent 28-day cycle for 5 doses. Discontinue treatment if any severe to life-threatening infusion reactions occur.

### Follicular Lymphoma (Relapsed/Refractory)

**IV: ADULTS, ELDERLY:** Six treatment cycles of 28 days (in combination with bendamustine). **Cycle 1:** 1,000 mg on days 1, 8, 15. **Cycles 2–6:** 1,000 mg on day 1 of each subsequent 28-day cycle for 5 doses. If achieves stable disease, complete or partial response,

continue obinutuzumab (as monotherapy) 1,000 mg q2mos for 2 yrs.

### Follicular Lymphoma (Previously Untreated)

**IV: ADULTS, ELDERLY: Cycle 1 (either in combination with bendamustine or with CHOP or CVP chemotherapy):** 1,000 mg wky on days 1, 8, and 15. **Cycles 2–6 (in combination with bendamustine):** 1,000 mg on day 1 q28days for 5 doses. **Cycles 2–8 (in combination with CHOP):** 1,000 mg on day 1 q21days for 5 doses (with CHOP), then 1,000 mg on day 1 q21 days for 2 doses (as monotherapy). **Cycles 2–8 (in combination with CVP):** 1,000 mg on day 1 q21days for 7 doses. **Then as monotherapy:** 1,000 mg q2mos for up to 2 yrs beginning approximately 2 mos after last induction phase.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (69%):** Infusion reactions (pruritus, flushing, urticaria). **Occasional (10%):** Pyrexia, cough.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including bone marrow failure, febrile neutropenia, opportunistic infection may result in life-threatening events. Hepatitis B virus reactivation may occur. Infusion reactions including hypotension, tachycardia, dyspnea, bronchospasm, wheezing, laryngeal edema, nausea, vomiting, flushing, pyrexia may occur during infusion. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia within 12–24 hrs of infusion. Immunogenicity (autoantibodies) occurred in 13% of pts. Progressive multifocal leukoencephalopathy (PML) occurred rarely and may include weakness, paralysis, vision loss, aphasia, cognition impairment.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, uric acid; pregnancy test in females of reproductive potential. Screen for history of anemia, asthma, arrhythmias, COPD, diabetes, GI bleeding, hypertension, hepatitis B virus infection, hepatic/renal impairment, peripheral edema. Receive full medication history, esp. hypertension, anticoagulant medications. Perform baseline visual acuity. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, serum electrolytes, LFT, vital signs. Monitor for cardiovascular alterations, respiratory distress. If respiratory reactions occur, consider administration of oxygen, EPINEPHrine, albuterol treatments. Locate rapid-sequence intubation kit if respiratory compromise occurs. Monitor strict I&O, hydration status. If PML suspected, consult neurologist for proper management. Obtain ECG for palpitations, severe hypokalemia, hyponatremia. Monitor for infection (cough, fatigue, fever).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid alcohol.
- Immediately report difficult breathing, severe coughing, chest tightness, wheezing.
- Paralysis, vision changes, impaired speech, altered mental status may indicate life-threatening neurologic event.
- Use effective contraception to avoid pregnancy.

## ocrelizumab

ok-re-liz-ue-mab  
(Ocrevus)

**Do not confuse ocrelizumab with certolizumab, daclizumab, efalizumab, mepolizumab, natalizumab, or omalizumab.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD20 monoclonal antibody. **CLINICAL:** Multiple sclerosis agent.

## USES

Treatment of adult pts with relapsing or primary progressive forms of multiple sclerosis (MS).

## PRECAUTIONS

**Contraindications:** Life-threatening infusion reaction to ocrelizumab. Active hepatitis B virus (HBV) infection confirmed by positive results for hepatitis B surface antigen (HBsAg) and anti-HBV tests.

**Cautions:** History of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, tuberculosis); active infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); intolerance to corticosteroids; history of depression, malignancies, breast cancer. Avoid administration of live or live attenuated vaccines during treatment and after discontinuation until B cells are no longer depleted.

## ACTION

Monoclonal antibody that is directed against B cells, which express the cell surface antigen CD20 (thought to influence the course of MS through antigen presentation, autoantibody production, cytokine regulation, and formation of ectopic lymphoid aggregates in meninges). Binds to the cell surface to deplete CD20-expressing B cells. **Therapeutic Effect:** Reduces progression of MS.

## PHARMACOKINETICS

Onset of action: serum CD-19+ B-cell count reduced within 14 days. Duration of action: 72 wks (Range: 27–175 wks). Antibodies are primarily cleared by catabolism. **Half-life:** 26 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause transient peripheral B-cell depletion and lymphocytopenia in neonates when used during pregnancy. Immunoglobulins are known to cross the placenta. Females of reproductive potential must use effective contraception during treatment and up to 6 mos after discontinuation. Unknown if distributed in breast milk; however, immunoglobulin G (IgG) is present in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease effect of **BCG, vaccines (live)**. May increase adverse effects/toxicity of **natalizumab, tacrolimus**. **HERBAL:** **Echinacea** may diminish therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease immunoglobulin A (IgA), immunoglobulin M (IgM), immunoglobulin G (IgG), neutrophils.

## AVAILABILITY (Rx)

**Injection Solution:** 300 mg/10 mL (30 mg/mL).

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale brown in color. • Do not use if solution is cloudy, discolored, or if visible particles are observed. • Withdraw proper dose from vial (10 mL for 300-mg dose; 20 mL for 600-mg dose) and dilute into 0.9% NaCl bag to a final concentration of approx. 1.2 mg/mL (300-mg dose in 250 mL 0.9% NaCl; 600-mg dose in 500 mL 0.9% NaCl). • Mix by gentle inversion. • Do not shake or agitate.

**Rate of administration** • **First and Second Infusion:** Start at 30 mL/hr via dedicated line using 0.2- or 0.22-micron in-line filter. If tolerated, increase rate by 30

mL/hr q30min to a maximum rate of 180 mL/hr for a duration of 2.5 hrs or longer. • **Subsequent Infusions: (Option 1):** Start at 40 mL/hr via dedicated line using 0.2- or 0.22-micron in-line filter. If tolerated, increase rate by 40 mL/hr q30min to a maximum rate of 200 mL/hr for a duration of 3.5 hrs or longer. **(Option 2)** (without previous serious infusion reactions): Start infusion at 100 mL/hr for first 15 min, then increase to 200 mL/hr for the next 15 min. If no infusion reaction occurs, may increase to 250 mL/hr for the next 30 min, then increase to 300 mL/hr for the remaining 60 min (infusion duration) 2 hrs or longer. • **Mild Infusion Reactions:** Decrease rate by 50% and continue reduced rate for at least 30 min. If tolerated, may increase infusion rate as described above. • **Severe Infusion Reactions:** Interrupt infusion until symptoms resolve, then resume infusion at 50% of the initial infusion rate. • **Life-threatening Infusion Reaction:** Immediately stop infusion and permanently discontinue; do not restart.

**Storage** • May refrigerate diluted solution up to 24 hrs or store at room temperature for up to 8 hrs (includes infusion time). • If diluted solution is refrigerated, allow to warm to room temperature before administration. • Discard solution if not administered within required time frame.

## IV INCOMPATIBILITIES

Do not dilute with other IV solutions. Do not mix or infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

**⚠️ ALERT ⚠️** Must be administered under the direct supervision of healthcare professionals with access to emergency medical supplies and who are trained to manage severe infusion reactions. If a dose is missed, administer as soon as possible; do not wait until the next regularly scheduled dose. Reset administration schedule so that the next subsequent infusion is 6 mos after the most recent dose. Subsequent doses must be separated by at least 5 mos.

### Premedication

• To reduce severity and frequency of infusion reaction, premedicate with methylprednisolone 100 mg (or equivalent) approx. 30 min prior to infusion and an antihistamine (e.g., diphenhydramine) approx. 30–60 min prior to infusion. • Consider an antipyretic (e.g., acetaminophen) based on previous infusion reactions.

### Multiple Sclerosis

**IV: ADULTS, ELDERLY:** 300 mg once at wk 0 and wk 2, then 600 mg q6mos (beginning 6 mos after the first 300-mg dose). Observe pt for at least 1 hr after completion of infusion.

### Dosage in Renal/Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Occasional (8%–5%):** Back pain, cough, diarrhea, peripheral edema, extremity pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Infusion-related reactions including bronchospasm, dizziness, dyspnea, erythema, fatigue, flushing, headache, hypotension, nausea, oropharyngeal pain, pharyngeal/laryngeal edema, pruritus, pyrexia, rash, tachycardia, throat irritation, urticaria was reported in 34%–40% of pts. Serious infusion reactions requiring hospitalization occurred in less than 1% of pts. Infections including upper respiratory tract infections (40%–49% of pts), lower respiratory tract infections (10% of pts), skin infections (16% of pts), herpes infection (6% of pts) may occur. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, has occurred in pts treated with other anti-CD20 antibodies; may result in progressive permanent disability and death. Symptoms of PML include altered mental status, aphasia, paralysis, vision loss, weakness. HBV reactivation was reported in pts treated with other anti-CD20 antibodies; may result in

fulminant hepatitis, hepatic failure, death. May increase risk of malignancies including breast cancer. Immunogenicity (auto anti-ocrelizumab antibodies) reported in 1% of pts. Depression reported in 8% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Obtain vital signs. Question history of hypersensitivity reactions, infusion-related reactions. Ensure that proper resuscitative equipment, medical supplies are readily available (e.g., albuterol, antipyretics, antihistamines, epinephrine, isotonic IV fluids, bag-valve mask, oxygen, rapid sequence intubation kit). Screen for active HBV. Pts who test negative for HBsAg and positive for anti-HBcAb+ should be referred to a hepatic specialist. If applicable, immunizations should be up-to-date according to guidelines at least 6 wks prior to initiation. Question history of chronic infections, herpes infection, depression, malignancies, breast cancer. Screen for active infection. Verify use of effective contraception in females of reproductive potential.

### INTERVENTION/EVALUATION

Monitor vital signs. Diligently monitor for infusion-related reactions during infusion and for at least 1 hr after completion (esp. during initial infusions). If severe or life-threatening reactions occur, immediately stop infusion and provide appropriate medical support. Due to risk of respiratory compromise, pts with bronchospasm, dyspnea, hypoxia should be given immediate supplemental oxygen, hypersensitivity medications, hemodynamic support. If laryngeal or pharyngeal edema occurs, airway protection or possible intubation may be required. Mild to

moderate infusion reactions may require interruption of infusion, decrease of infusion rate, symptom management. Closely monitor for HBV reactivation, symptoms of PML, new malignancies including breast cancer, infections. Conduct neurologic assessment. Assess for symptom improvement of MS.

#### PATIENT/FAMILY TEACHING

- Life-threatening infusion reactions, allergic reactions may occur during infusion and up to 24 hrs after completion of infusion. Immediately report difficulty breathing, chest pain, chest tightness, chills, dizziness, fast heart rate, fever, flushing, headache, hives, itching, low blood pressure, nausea, throat pain or swelling, rash.
- If applicable, vaccinations should be up to date at least 6 wks before starting treatment. Do not receive live vaccines.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Due to pretreatment with a corticosteroid, pts with diabetes may experience a transient rise in blood sugar levels.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities and death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- Treatment may cause reactivation of HBV, depression, new cancers including breast cancer.
- Notify physician if symptoms of MS do not improve.

## octreotide

ock-tree-oh-tide

(Mycapssa, SandoSTATIN, SandoSTATIN LAR Depot)

**Do not confuse SandoSTATIN with SandIMMUNE, SandoSTA-**

**TIN LAR, sargramostim, or simvastatin.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Somatostatin analogue. **CLINICAL:** Secretory inhibitory, growth hormone suppressant; antidiarrheal.

#### USES

Control of diarrhea and flushing in pts with metastatic carcinoid tumors, treatment of watery diarrhea associated with vasoactive intestinal peptic-secreting tumors (VIPomas), acromegaly (to reduce blood levels of growth hormone and insulin-like growth factor). **OFF-LABEL:** Control of bleeding esophageal varices, treatment of AIDS-associated secretory diarrhea, diarrhea, diarrhea associated with graft-vs-host disease, chemotherapy-induced diarrhea, insulinomas, small-bowel fistulas, Zollinger-Ellison syndrome, Cushing's syndrome, hypothalamic obesity, malignant bowel obstruction, postgastrectomy dumping syndrome, islet cell tumors, sulfonyleurea-induced hypoglycemia.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to octreotide. **Cautions:** Diabetic pts with gastroparesis, renal failure, hepatic impairment, HF, concomitant medications altering heart rate or rhythm. Concurrent use of medications that prolong QT interval, elderly.

#### ACTION

Suppresses secretion of serotonin, gastrin, VIP, insulin, glucagon, secretin, pancreatic polypeptide. **Therapeutic Effect:** Prolongs intestinal transit time. Decreases growth hormone in acromegaly.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
SQ	N/A	N/A	Up to 12 hrs

Rapidly, completely absorbed from injection site. Protein binding: 65%.

Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 1.7–1.9 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease concentration/effect of cycloSPORINE, hormonal contraceptives. Glucagon, growth hormone, insulin, oral antidiabetics (e.g., glipizide, metFORMIN) may alter glucose concentrations. **HERBAL:** Herbals with hypoglycemic properties (e.g., fenugreek), maitake may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May decrease serum thyroxine (T<sub>4</sub>). May increase serum alkaline phosphatase, ALT, AST, GGT.

### AVAILABILITY (Rx)

**Capsules, Delayed-Release:** 20 mg. **Injection Solution:** 50 mcg/mL, 100 mcg/mL, 200 mcg/mL, 500 mcg/mL, 1,000 mcg/mL. **Injection Suspension: (SandoSTATIN LAR):** 10-mg, 20-mg, 30-mg vials.

### ADMINISTRATION/HANDLING

**⚠️ ALERT** SandoSTATIN may be given IV, IM, SQ. SandoSTATIN LAR Depot may be given only IM. Refrigerate.

#### IM

- Give immediately after mixing.
- Administer deep IM in large muscle mass at 4-wk intervals.
- Avoid deltoid injections.

#### SQ

- Do not use if discolored or particulates form.
- Avoid multiple injections at same site within short periods.

#### IV

- Dilute in 50–100 mL 0.9% NaCl or D<sub>5</sub>W and infuse over 15–30 min. In emergency, may give IV push over 3 min. Following dilution, stable for 96 hrs at room

temperature when diluted with 0.9% NaCl (24 hrs with D<sub>5</sub>W). Infuse over 15–30 min.

#### PO

- Take at least 1 hr before or 2 hrs after meals. Administer whole; do not crush or break. Capsules cannot be chewed.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Schedule injections between meals (to decrease GI effects).

#### Carcinoid Tumor

**IV, SQ: (Sandostatin): ADULTS, ELDERLY:** Initial 2 wks, 100–600 mcg/day in 2–4 divided doses. Range: 50–750 mcg.

**IM: (Sandostatin Lar): ADULTS, ELDERLY:** Must be stabilized on SQ octreotide for at least 2 wks; 20 mg q4wks for 2 mos, then modify based on response. **Maximum:** 30 mg q4wks.

#### Vasoactive Intestinal Peptic-Secreting Tumor (VIPoma)

**IV, SQ: (Sandostatin): ADULTS, ELDERLY:** Initial 2 wks, 200–300 mcg/day in 2–4 divided doses. Titrate dose based on response/tolerance. Range: 150–750 mcg.

**IM: (Sandostatin Lar): ADULTS, ELDERLY:** Must be stabilized on SQ octreotide for at least 2 wks; 20 mg q4wks for 2 mos, then modify based on response. **Maximum:** 30 mg q4wks.

#### Acromegaly

**IV, SQ: (Sandostatin): ADULTS, ELDERLY:** Initially, 50 mcg 3 times/day. Increase as needed. Range: 300–1,500 mcg/day. Usual effective dose: 100 mcg 3 times/day.

**IM: (Sandostatin Lar): ADULTS, ELDERLY:** Must be stabilized on SQ octreotide for at least 2 wks. 20 mg q4wks for 3 mos, then modify based on response. **Maximum:** 40 mg q4wks.

**PO: ADULTS, ELDERLY:** (Long-term maintenance treatment in pts who respond to and tolerate treatment with injectable octreotide or lanreotide): Initially, 20 mg twice daily. May adjust dose in 20 mg/day increments q2–4wks based on clinical response as follows: (60 mg/day): 40 mg every morning and 20 mg at night. (80 mg/day): 40 mg twice daily. **Maximum:** 80 mg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (10%–6%; 58%–30% in acromegaly pts):** Diarrhea, nausea, abdominal discomfort, headache, injection site pain.

**Occasional (5%–1%):** Vomiting, flatulence, constipation, alopecia, facial flushing, pruritus, dizziness, fatigue, arrhythmias, ecchymosis, blurred vision. **Rare (less than 1%):** Depression, diminished libido, vertigo, palpitations, dyspnea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Increased risk of cholelithiasis. Prolonged high-dose therapy may produce hypothyroidism. GI bleeding, hepatitis, seizures occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Establish baseline B/P, weight, thyroid function, serum glucose, electrolytes.

**INTERVENTION/EVALUATION**

Monitor serum glucose, electrolytes, thyroid function. In acromegaly, monitor growth hormone levels. Weigh every 2–3 days, report over 5-lb gain per wk. Monitor B/P, pulse, respirations periodically during treatment. Be alert for decreased urinary output, peripheral edema. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Therapy should provide significant improvement of severe, watery diarrhea.

**ofatumumab**

oh-fa-tue-mue-mab  
(Arzerra, Kesimpta)

**BLACK BOX ALERT** Hepatitis B virus (HBV) reactivation may occur, resulting in hepatitis, hepatic failure, death. Progressive multifocal leukoencephalopathy (PML) resulting in death may occur.

**Do not confuse ofatumumab with omalizumab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-CD20 monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

**Arzerra:** Treatment of chronic lymphocytic leukemia (CLL) in pts previously untreated, relapsed, or who require extended therapy. Treatment of CLL refractory to fludarabine and alemtuzumab. **Kesimpta:** Treatment of relapsing forms of multiple sclerosis in adults, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ofatumumab. **Cautions:** Hepatitis B virus infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

**ACTION**

Binds to CD20 molecule, the antigen on surface of B-cell lymphocytes; inhibits early-stage B-lymphocyte activation. **Therapeutic Effect:** Controls tumor growth, triggers cell death.

**PHARMACOKINETICS**

Eliminated through both a target-independent route and a B-cell-mediated route. Due to depletion of B cells, clearance is decreased substantially after subsequent infusions compared with first infusion. **Half-life:** 12–16 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppres-

sion. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May increase adverse/toxic effect of **natalizumab**. **HERBAL:** *Echinacea* may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection Solution:** (*Azerra*): 100 mg/5 mL, 1000 mg/50 mL. **Solution, Autoinjector:** (*Kesimpta*): 20 mg/0.4 mL.

## ADMINISTRATION/HANDLING

**◀ALERT▶** Do not give by IV push or bolus. Use in-line filter supplied with product.

**Reconstitution** • **300-mg dose:** Withdraw and discard 15 mL from 1,000 mL 0.9% NaCl bag. • Withdraw 5 mL from each of 3 single-use 100-mg vials and add to bag. • Gently invert. • **1,000-mg dose:** Withdraw and discard 50 mL from 1,000 mL NaCl bag. Withdraw 50 mL from 1 single-use 1,000-mg vial and add to bag. • Gently invert to mix. • **2,000-mg dose:** Withdraw and discard 100 mL from 1,000 mL NaCl bag. Withdraw 50 mL from 2 single-use 1,000-mg vials and add to bag. • Gently invert to mix.

**Rate of administration** • **Dose 1:** Initiate infusion at rate of 3.6 mg/hr (12 mL/hr). • **Dose 2:** Initiate infusion at rate of 24 mg/hr (12 mL/hr). • **Dose 3–12:** Initiate infusion at rate of 50 mg/hr (25 mL/hr). • If no infusion toxicity, rate of infusion may be increased every 30 min, using following table:

Interval After Start of Infusion (min)	Doses		
	Dose 1 (mL/hr)	Dose 2 (mL/hr)	3–12 (mL/hr)
0–30	12	12	25
31–60	25	25	50
61–90	50	50	100
91–120	100	100	200
Over 120	200	200	400

**Storage** • Refrigerate vials. • Diluted solution should be used within first 12 hrs; discard preparation after 24 hrs. • Discard if discoloration is present, but solution may contain visible, translucent-to-white particulates (will be removed by in-line filter).

## IV COMPATIBILITIES

Prepare all doses with 0.9% NaCl. Do not mix with dextrose solutions or any other medications.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Premedicate 30 min to 2 hrs before each infusion with acetaminophen, an antihistamine, and a corticosteroid as prophylaxis for infusion reaction. Flush IV line with 0.9% NaCl before and after each dose. Interrupt infusion if infusion reaction of any severity occurs (do not resume for Grade 4 reaction).

### CLL (Untreated)

**IV: ADULTS, ELDERLY:** Cycle 1: 300 mg, then 1,000 mg on day 8. Subsequent cycles: 1,000 mg on day 1 q28days. Continue for at least 3 cycles or a maximum of 12 cycles (in combination with chlorambucil).

### CLL (Refractory)

**IV: ADULTS, ELDERLY:** Recommended dosage is 12 doses given on the following schedule: 300 mg initial dose (dose 1), followed 1 wk later by 2,000 mg wky for 7 doses (doses 2–8), followed 4 wks later by 2,000 mg every 4 wks for 4 doses (doses 9–12).

### CLL (Relapsed)

**IV: ADULTS, ELDERLY:** 300 mg once on day 1, then 1,000 mg on day 8, then 1,000 mg on day 1 of subsequent 28-day cycles for a maximum of 6 cycles (in combination with fludarabine and cyclophosphamide).

### Extended Treatment of CLL

**IV: ADULTS, ELDERLY:** 300 mg once on day 1, then 1,000 mg on day 8, then 1,000 mg 7 wks later and q8wks thereafter up to a maximum of 2 yrs.

**Multiple Sclerosis (Relapsing)**

**SQ: ADULTS, ELDERLY:** Initially, 20 mg once w/ky for 3 doses (wks 0, 1, and 2). **Maintenance:** 20 mg once monthly starting at wk 4.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (20%–14%):** Fever, cough, diarrhea, fatigue, rash. **Occasional (13%–5%):** Nausea, bronchitis, peripheral edema, nasopharyngitis, urticaria, insomnia, headache, sinusitis, muscle spasm, hypertension.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Most common serious adverse reactions were bacterial, viral, fungal infections (including pneumonia and sepsis), septic shock, neutropenia, thrombocytopenia. Infusion reactions occur more frequently with first 2 infusions. Severe infusion reactions manifested as angioedema, bronchospasm, dyspnea, fever, chills, back pain, hypotension. Progressive multifocal leukoencephalopathy may occur. Small bowel obstruction has been noted.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC; pregnancy test in females of reproductive potential. Test for hepatitis B virus infection. Screen for active infection. Screen pts at high risk of hepatitis B virus. Assess baseline CBC prior to therapy. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor renal function, electrolytes. Monitor CBC for evidence of myelosuppression during therapy, and increase frequency of monitoring in pts who develop Grade 3 or 4 cytopenia. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Closely monitor for infusion reactions.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of infusion reactions (e.g., fever, chills, breathing problems, rash); bleeding, bruising, petechiae, worsening weakness or fatigue; new neurologic symptoms (e.g., confusion, loss of balance, vision problems); symptoms of hepatitis (e.g., fatigue, yellow discoloration of skin/eyes); worsening abdominal pain, nausea.

**OLANZapine**

oh-lan-za-peen

(Apo-OLANZapine , ZYPREXA, ZYPREXA Relprevv, ZYPREXA Zydis)

**BLACK BOX ALERT**

Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events. Sedation (including coma), delirium reported following use of ZYPREXA Relprevv.

**Do not confuse OLANZapine with olsalazine or QUetiapine, or ZYPREXA with CeleXA or ZyrTEC.**

**FIXED-COMBINATION(S)**

**Symbyax:** OLANZapine/FLUoxetine (an antidepressant): 6 mg/25 mg, 6 mg/50 mg, 12 mg/25 mg, 12 mg/50 mg.

**Lybalvi:** OLANZapine/samidorphan: 5 mg/10 mg, 10 mg/10 mg, 15 mg/10 mg, 20 mg/10 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Second-generation (atypical) antipsychotic.

**CLINICAL:** Antipsychotic.

**USES**

Treatment of acute agitation associated with schizophrenia and bipolar I mania. Treatment of acute mania, acute episodes with

mixed features of bipolar I disorder (as monotherapy or in combination with lithium or valproate), and as maintenance treatment. Treatment of bipolar depression in combination with fluoxetine. Treatment of treatment-resistant depression in combination with fluoxetine. Treatment of schizophrenia.

**OFF-LABEL:** Prevention of chemotherapy-induced nausea/vomiting. Acute treatment of delirium. Treatment of anorexia nervosa, Tourette's syndrome, tic disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to OLANZapine. **Cautions:** Disorders in which CNS depression is prominent; cardiac disease, hemodynamic instability, prior MI, ischemic heart disease; hyperlipidemia, pts at risk for aspiration pneumonia, decreased GI motility, urinary retention, BPH, narrow-angle glaucoma, diabetes, elderly, pts at risk for suicide, Parkinson's disease, severe renal/hepatic impairment, predisposition to seizures.

## ACTION

Antagonizes  $\alpha_1$ -adrenergic, DOPamine, histamine, muscarinic, serotonin receptors. Produces anticholinergic, histaminic, CNS depressant effects. **Therapeutic Effect:** Diminishes psychotic symptoms through combined antagonism of dopamine and serotonin receptors.

## PHARMACOKINETICS

Widely distributed. Protein binding: 93%. Excreted in urine (57%), feces (30%). Not removed by dialysis. **Half-life:** 21–54 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution. Consider lower starting doses.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant

effects. **Anticholinergics** (e.g., acclidinium, ipratropium, tiotropium, umeclidinium) may increase anticholinergic effect. **QT-prolonging agents** (e.g., amiodarone, haloperidol, moxifloxacin, sotalol) may cause QT interval prolongation. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum GGT, cholesterol, prolactin, ALT, AST.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (ZyPREXA): 10 mg. **Suspension for IM Injection:** (Relprevv): 210 mg, 300 mg, 405 mg. **Tablets:** (ZyPREXA): 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. **Tablets, Orally Disintegrating:** (ZyPREXA Zydys): 5 mg, 10 mg, 15 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

### Orally Disintegrating

- Remove by peeling back foil (do not push through foil).
- Place in mouth immediately.
- Tablet dissolves rapidly with saliva and may be swallowed with or without liquid.

### IM (ZyPREXA Intramuscular)

- Reconstitute 10-mg vial with 2.1 mL Sterile Water for Injection to provide concentration of 5 mg/mL.
- Use within 1 hr following reconstitution.
- Discard unused portion.

### IM (Relprevv)

- Dilute to final concentration of 150 mg/mL.
- Shake vigorously to mix.
- Store at room temperature for up to 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Schizophrenia

**Note:** Discontinue gradually to avoid withdrawal symptoms and reduce relapse.

**PO: ADULTS, ELDERLY:** Initially, 5–10 mg once daily. May increase to 10 mg/day

within 5–7 days. If further adjustments are indicated, may increase by 5 mg/day at 7-day intervals. **Maintenance:** 10–20 mg/day. **Maximum:** 20 mg/day. **CHILDREN 13 YRS AND OLDER:** Initially, 2.5–5 mg/day. Titrate in 2.5- or 5-mg increments at wkly intervals. Target dose: 10 mg. **Maximum:** 20 mg/day.

**IM: (Long-Acting [Relprevv]): ADULTS, ESTABLISHED ON 10 MG/DAY ORALLY:** 210 mg q2wks for 4 doses or 405 mg q4wks for 2 doses. **Maintenance:** 150 mg q2wks or 300 mg q4wks. **ESTABLISHED ON 15 MG/DAY ORALLY:** 300 mg q2wks for 4 doses. **Maintenance:** 210 mg q2wks or 405 mg q4wks. **ESTABLISHED ON 20 MG/DAY ORALLY:** 300 mg q2wks.

#### Depression Associated With Bipolar Disorder (With FLUoxetine)

**PO: ADULTS, ELDERLY:** Initially, 5 mg in evening. May increase dose in 5 mg increments at intervals of q1–7 days based on response and tolerability up to 15 mg/day (adjunctive therapy) or up to 20 mg/day (monotherapy). **CHILDREN 10–17 yrs:** Initially, 2.5 mg once daily in evening. Adjust dose as tolerated.

#### Treatment-Resistant Depression (With FLUoxetine)

**PO: ADULTS, ELDERLY:** Initially, 5 mg in evening. May gradually increase dose based on response and tolerability up to 20 mg/day. Range: 5–20 mg/day.

#### Bipolar Mania

**PO: ADULTS, ELDERLY: (Monotherapy):** Initially, 10–15 mg/day. May increase by 5 mg/day at intervals of at least 24 hrs. Range: 5–20 mg/day. **Maximum:** 20 mg/day. **(In Combination With Lithium or Valproate):** Initially, 10 mg/day. Range: 5–20 mg/day. **CHILDREN 13 YRS OF AGE AND OLDER:** Initially, 2.5–5 mg/day. Adjust dose by 2.5–5 mg daily to target dose of 10 mg/day. Range: 2.5–20 mg/day.

**Dosage for Elderly, Debilitated Pts, Pts Predisposed to Hypotensive Reactions**  
Initial dosage: 5 mg/day.

#### Control of Agitation

**IM: ADULTS, ELDERLY: (Short-Acting):** Initially, 5–10 mg. Additional doses (up to 10 mg) may be considered. However, allow at least 2 hrs (after initial dose) or 4 hrs (after second dose) to evaluate response. **Maximum:** 30 mg/day.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (26%–10%):** Drowsiness, agitation, insomnia, headache, nervousness, hostility, dizziness, rhinitis. **Occasional (9%–5%):** Anxiety, constipation, nonaggressive atypical behavior, dry mouth, weight gain, orthostatic hypotension, fever, arthralgia, restlessness, cough, pharyngitis, visual changes (dim vision). **Rare:** Tachycardia; back, chest, abdominal, or extremity pain; tremor.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Rare reactions include seizures, neuroleptic malignant syndrome, a potentially fatal syndrome characterized by hyperpyrexia, muscle rigidity, irregular pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias. Extrapyramidal symptoms (EPS), dysphagia may occur. Overdose (300 mg) produces drowsiness, slurred speech.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain LFT, serum glucose, weight, lipid profile before initiating treatment. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Question history of suicidal ideation and behavior.

##### INTERVENTION/EVALUATION

Monitor B/P, serum glucose, lipids, LFT. Assess for tremors, changes in gait, abnormal muscular movements, behavior. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing sui-

cide potential). Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). Assist with ambulation if dizziness occurs. Assess sleep pattern. Notify physician if extrapyramidal symptoms (EPS) occur.

#### PATIENT/FAMILY TEACHING

- Avoid dehydration, particularly during exercise, exposure to extreme heat, concurrent use of medication causing dry mouth, other drying effects.
- Take medication as prescribed; do not stop taking or increase dosage.
- Slowly go from lying to standing.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## olaparib

oh-lap-a-rib  
(Lynparza)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** PARP inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Treatment of deleterious or suspected deleterious germline BRCA-mutated advanced ovarian cancer in pts who have been treated with three or more prior lines of chemotherapy. First-line maintenance treatment (in combination with bevacizumab) of advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in complete or partial response to first-line, platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD)-positive status. Maintenance treatment of recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in adults who are in complete or partial response to platinum-based

chemotherapy. Maintenance treatment of adults with recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in complete or partial response to platinum-based chemotherapy. Treatment of germline BRCA-mutated, HER2-negative metastatic breast cancer in pts who have been treated with chemotherapy. First-line treatment of germline BRCA-mutated metastatic pancreatic cancer in pts whose disease has not progressed on at least 16 wks of first-line, platinum-based chemotherapy. Treatment of deleterious or suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer in adults who have progressed following prior enzalutamide or abiraterone treatment.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to olaparib. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). History of pulmonary disease. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

#### ACTION

Inhibits poly(ADP-ribose) polymerase (PARP) enzymes, involved in normal cellular hemostasis (e.g., DNA transcription, cell cycle regulation, and DNA repair). Disrupts cellular homeostasis, resulting in cell death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 82%. Peak plasma concentration: 1–3 hrs. Steady-state concentration: 3–4 days. Excreted in urine (44%), feces (42%). **Half-life:** 11.9 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of

reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., atazanavir, ciprofloxacin) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine), moderate CYP3A inducers (e.g., nafcillin) may decrease concentration/effect. **HERBAL:** Bitter orange may increase concentration/effect. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. High-fat food may delay absorption. **LAB VALUES:** May increase mean corpuscular volume, serum creatinine. May decrease Hct, Hgb, lymphocytes, neutrophils, RBC.

## AVAILABILITY (Rx)

**Tablets:** 100 mg, 150 mg.

## ADMINISTRATION/HANDLING

### PO

**Capsules:** • Give without regard to food. • Administer capsules whole; do not break, cut, crush, or open. **Tablets:** May give with or without food. Administer tablet whole; do not break, cut, crush, or divide.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Do not substitute tablets with capsules on a mg to mg basis.

**Ovarian Cancer (Advanced, Germline or Somatic BRCA-mutated), First-Line Maintenance Therapy (Monotherapy)**

**PO: ADULTS, ELDERLY:** 300 mg twice daily until disease progression, unacceptable toxicity, or completion of 2 yrs of therapy. Pts with complete response at 2 yrs should discontinue treatment. Pts with evidence

of disease at 2 yrs may continue treatment beyond 2 yrs.

**Ovarian Cancer (Advanced, Recurrent)**

**PO: ADULTS, ELDERLY:** 300 mg twice daily until disease progression or unacceptable toxicity.

**Ovarian Cancer (Advanced HRD-Positive), First-Line Maintenance Therapy (Combination Therapy)**

**PO: ADULTS, ELDERLY:** 300 mg twice daily (in combination with bevacizumab). Continue until disease progression, unacceptable toxicity, or completion of 2 yrs of therapy. Pts with a complete response at 2 yrs should discontinue olaparib. Pts with evidence of disease at 2 yrs may continue treatment (beyond 2 years). Bevacizumab duration is for a total of 15 mos.

**Breast Cancer (Metastatic, HER2-Negative, BRCA-Mutated)**

**PO: ADULTS, ELDERLY: (Tablet):** 300 mg (2 × 150 mg) twice daily. Continue until disease progression or unacceptable toxicity.

**Pancreatic Cancer**

**PO: ADULTS, ELDERLY:** 300 mg twice daily until disease progression or unacceptable toxicity.

**Prostate Cancer (Metastatic, Castration-Resistant, Homologous Recombination Repair Gene-Mutated)**

**PO: ADULTS, ELDERLY: (Tablets):** 300 mg twice daily until disease progression or unacceptable toxicity. Pts should also receive a gonadotropin-releasing hormone analog or have had bilateral orchiectomy.

**Dose Modification**

**Dose Reduction for Adverse Reactions**

**PO: ADULTS, ELDERLY:** Interrupt treatment until resolved. Then decrease to 200 mg twice daily. If further dose reduction is indicated, decrease to 100 mg twice daily.

**Concomitant Use of Strong CYP3A Inhibitors**

**PO: ADULTS, ELDERLY:** 150 mg twice daily.

### Concomitant Use of Moderate CYP3A Inhibitors

**PO: ADULTS, ELDERLY:** 200 mg twice daily.

### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Frequent (66%–21%):** Fatigue, asthenia, nausea, vomiting, abdominal pain, diarrhea, dyspepsia, decreased appetite, headache, back pain, rash, myalgia, arthralgia, musculoskeletal pain, dysgeusia, cough.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelodysplastic syndrome/acute myeloid leukemia reported in 2% of pts. Pneumonitis, including fatal cases, occurred in less than 1% of pts. Respiratory tract infections including nasopharyngitis, pharyngitis, upper respiratory tract infection occurred in 43% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC. Do not initiate therapy until pts have recovered from hematologic toxicities caused by previous chemotherapy. Question history of pulmonary disease. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC monthly. For prolonged hematologic toxicities, interrupt treatment and monitor CBC w/ky until recovery. If hematologic levels have not recovered to CTCAE Grade 1 or 0 after 4 wks of treatment interruption, consider hematology consultation for further investigations such as bone marrow analysis and blood sample for cytogenetics. Monitor for myelodysplastic syndrome/acute myeloid

leukemia, pneumonitis. Monitor for infections (cough, fatigue, fever).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report new or worsening respiratory symptoms such as cough, difficulty breathing, fever, wheezing; may indicate severe lung inflammation.
- Do not ingest grapefruit product, Seville oranges.
- Do not take herbal products.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## omacetaxine

oh-ma-se-tax-een  
(Synribo)

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Protein synthesis inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of adult pts with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to omacetaxine. **Cautions:** Glucose intolerance, poorly controlled diabetes, elderly, recent GI bleeding. Avoid all use of anticoagulants, aspirin, NSAIDs; all pts with baseline platelets less than 50,000 cells/mm<sup>3</sup>.

## ACTION

Binds to A-site cleft of ribosomal unit. Interferes with chain elongation and

inhibits protein synthesis. **Therapeutic Effect:** Inhibits tumor proliferation and growth during accelerated and chronic stages of CML.

## PHARMACOKINETICS

Widely distributed. Peak plasma concentration: 30 min. Protein binding: Less than 50%. Hydrolyzed via plasma esterases. **Half-life:** 6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Not recommended in nursing mothers. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk for toxicity (e.g., hematologic).

## INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), anticoagulants (e.g., heparin, warfarin), aspirin, antiplatelets (e.g., clopidogrel) may increase risk for bleeding. May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse/toxic effects of natalizumab, vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease platelets, Hgb, Hct, leukocytes, lymphocytes. May increase serum ALT.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 3.5-mg vial.

## ADMINISTRATION/HANDLING

**◀ALERT▶** Must be administered by healthcare workers trained in proper chemotherapy handling and disposal procedures.

### SQ

**Reconstitution** • Reconstitute with 1 mL 0.9% NaCl. • Gently swirl until powder is completely dissolved. • Inspect vial for particular matter or discoloration. • Reconstituted vial will provide a concentration of 3.5 mg/mL. • Avoid contact with skin.

**Storage** • Solution should appear clear. • May store solution at room temperature for up to 12 hrs or may refrigerate up to 24 hrs. • Discard unused solution.

## INDICATIONS/ROUTES/DOSAGE

**Note:** If dose is missed, skip dose and resume next regularly scheduled dose.

### Chronic or Accelerated Myeloid Leukemia

**SQ: ADULTS, ELDERLY: Induction dose:** 1.25 mg/m<sup>2</sup> twice daily for 14 consecutive days every 28 days, over 28-day cycle. Continue induction dose until hematologic response achieved. **Maintenance dose:** 1.25 mg/m<sup>2</sup> twice daily for 7 consecutive days every 28 days of a 28-day cycle. Continue until no longer achieving clinical treatment benefit.

### Dose Modification

**Hematologic toxicity:** If neutrophils less than 500 cells/mm<sup>3</sup> or platelets less than 50,000 cells/mm<sup>3</sup>, interrupt therapy. Restart when neutrophil count greater than or equal to 1000 cells/mm<sup>3</sup> or platelet count greater than or equal to 50,000 cells/mm<sup>3</sup> and reduce number of dosing days by 2. **Nonhematologic toxicity:** Interrupt therapy until toxicity/adverse effects resolved. Continue indefinitely until pt no longer benefits from therapy.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

### Chronic Phase

**Frequent (45%–25%):** Diarrhea, nausea, fatigue, pyrexia, asthenia. **Occasional (20%–11%):** Headache, arthralgia, cough, epistaxis, alopecia, constipation, abdominal pain, peripheral edema, vomiting, back pain, insomnia, rash.

### Accelerated Phase

**Occasional (19%–7%):** Diarrhea, nausea, fatigue, pyrexia, asthenia, vomiting, cough, abdominal pain, chills, anorexia, headache. **Rare (7% or less):** Dyspnea, epistaxis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including bone marrow failure, febrile neutropenia may result in life-threatening events. Pts with neutropenia are at increased risk for infection. Thrombocytopenia may increase risk for intracranial hemorrhage, GI bleeding. Hyperglycemic events including hyperglycemic hyperosmolar nonketotic syndrome (HHNK) may occur. Pts with uncontrolled diabetes are at increased risk for hyperglycemic emergency.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; pregnancy test in females of reproductive potential. Obtain full medication history including herbal products, anticoagulants. Question for history of diabetes, GI bleeding. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC wkly, then q2wks during maintenance phase. Obtain frequent blood glucose levels, especially in diabetic pts. Monitor LFT if hepatic impairment suspected. If drug exposure occurs, immediately wash affected area with soap and water. Consider isolation protocol if pt develops neutropenia.

### PATIENT/FAMILY TEACHING

- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Immediately report yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, dehydration, GI bleeding, nausea, vomiting, rash.
- Report fever, cough, night sweats, flu-like symptoms, skin changes.
- Shortness of breath, pale skin, weakness may indicate bleeding or severe myelosuppression.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## omalizumab

**TOP  
100**

oh-ma-liz-ue-mab  
(Xolair)

**BLACK BOX ALERT** Anaphylaxis (severe bronchospasm, hypotension, angioedema, syncope, urticaria) has occurred after first dose and in some cases after 1 yr of regular treatment.

**Do not confuse omalizumab with ofatumumab.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Monoclonal antibody. **CLINICAL:** Antiasthmatic.

## USES

Treatment of moderate to severe persistent asthma in adults and children 6 yrs of age and older reactive to perennial allergens and with symptoms inadequately controlled with inhaled corticosteroids. Chronic idiopathic urticaria in adults and children 12 yrs and older. Add-on maintenance treatment of nasal polyps in adults with inadequate response to nasal corticosteroids.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to omalizumab. Do not use to treat acute bronchospasm, status asthmaticus. **Cautions:** Pts at risk for parasitic infections.

## ACTION

Selectively binds to human immunoglobulin E (IgE). Inhibits binding of IgE on surface of mast cells, basophils. **Therapeutic Effect:** Prevents/reduces number of asthmatic attacks and corticosteroid use.

## PHARMACOKINETICS

Absorbed slowly after SQ administration, with peak concentration in 7–8 days. Excreted primarily via hepatic degradation. **Half-life:** 26 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Because IgE is present in breast milk, omalizumab is expected to be present in breast milk. Use only if clearly needed. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May enhance the adverse/toxic effects of **loxapine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum IgE levels.

**AVAILABILITY (Rx)**

**Injection, Prefilled Syringe:** 75 mg/0.5 mL, 150 mg/mL. **Injection, Powder for Reconstitution:** 150 mg/1.2 mL after reconstitution.

**ADMINISTRATION/HANDLING****SQ**

**Reconstitution** • Use only Sterile Water for Injection to prepare for SQ administration. • Medication takes 15–20 min to dissolve. • Draw 1.4 mL Sterile Water for Injection into 3-mL syringe with 1-inch, 18-gauge needle; inject contents into powdered vial. • Swirl vial for approximately 1 min (do not shake) and again swirl vial for 5–10 sec every 5 min until no gel-like particles appear in the solution. • Do not use if contents do not dissolve completely within 40 min. • Invert vial for 15 sec (allows solution to drain toward the stopper). • Using new 3-mL syringe with 1-inch 18-gauge needle, obtain required 1.2-mL dose, replace 18-gauge needle with 25-gauge needle for SQ administration.

**Rate of administration** • SQ administration may take 5–10 sec to administer due to its viscosity.

**4-Wk Dosing Table**

Pretreatment Serum IgE Levels (units/mL)	Weight 30–60 kg	Weight 61–70 kg	Weight 71–90 kg	Weight 91–150 kg
30–100	150 mg	150 mg	150 mg	300 mg
101–200	300 mg	300 mg	300 mg	See next table
201–300	300 mg	See next table	See next table	See next table

**Storage** • Use only clear or slightly opalescent solution; solution is slightly viscous. • Refrigerate. • Reconstituted solution is stable for 8 hrs if refrigerated or within 4 hrs of reconstitution when stored at room temperature.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Give only under direct medical supervision. Should be administered in healthcare setting by health professionals. Dosage and frequency of administration are based upon total IgE levels and body weight (see table). IgE levels should be measured prior to initiating treatment and not during treatment. Pts should be observed a minimum of 2 hrs following each omalizumab treatment.

**Asthma**

**SQ: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 75–375 mg every 2 or 4 wks; dose and dosing frequency are individualized based on body weight and pretreatment IgE level (as shown in table). (Consult specific product labeling.)

**Chronic Idiopathic Urticaria**

**SQ: ADULTS, CHILDREN 12 YRS AND OLDER:** 150 mg or 300 mg q4wks. Dosing not dependent on IgE level or body weight.

**Nasal Polyps**

**SQ: ADULTS, ELDERLY:** 75–600 mg q2–4wks. Dose and frequency based on body weight and pretreatment total serum immunoglobulin E (IgE) levels (see manufacturer guidelines).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

## 2-Wk Dosing Table

Pretreatment Serum IgE Levels (units/mL)	Weight 30–60 kg	Weight 61–70 kg	Weight 71–90 kg	Weight 91–150 kg
101–200	See preceding table	See preceding table	See preceding table	225 mg
201–300	See preceding table	225 mg	225 mg	300 mg
301–400	225 mg	225 mg	300 mg	Do not dose
401–500	300 mg	300 mg	375 mg	Do not dose
501–600	300 mg	375 mg	Do not dose	Do not dose
601–700	375 mg	Do not dose	Do not dose	Do not dose

## SIDE EFFECTS

**Frequent (45%–11%):** Injection site ecchymosis, redness, warmth, stinging, urticaria, viral infection, sinusitis, headache, pharyngitis. **Occasional (8%–3%):** Arthralgia, leg pain, fatigue, dizziness. **Rare (2%):** Arm pain, earache, dermatitis, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anaphylaxis, occurring within 2 hrs of first dose or subsequent doses, occurs in 0.1% of pts. Malignant neoplasms occur in 0.5% of pts.

## NURSING CONSIDERATIONS

## BASELINE ASSESSMENT

Obtain baseline serum total IgE level before initiation of treatment (dosage is based on pretreatment levels). Drug is not for treatment of acute exacerbations of asthma, acute bronchospasm, status asthmaticus.

## INTERVENTION/EVALUATION

Monitor rate, depth, rhythm, type of respirations, quality/rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Observe lips, fingernails for cyanosis.

## PATIENT/FAMILY TEACHING

- Increase fluid intake (decreases viscosity of pulmonary secretions).
- Do not alter/stop other asthma medications.
- Report allergic reactions (e.g., breathing difficulty, swelling of throat/tongue).

## omega-3 acid-ethyl esters

TOP 100

oh-may-ga 3 as-id eth-il es-ters  
(Lovaza, Vascepa)  
**Do not confuse Lovaza with LORazepam.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Omega-3 fatty acid. **CLINICAL:** Antilipemic agent.

## USES

Adjunct to diet to reduce very high (500 mg/dL or higher) serum triglyceride levels in adult pts. Dietary supplement for pts with early risk of CAD. (**Vascepa**): Cardiovascular risk reduction with mild hypertriglyceridemia. **OFF-LABEL:** Treatment of IgA nephropathy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to omega-3 fatty acids. **Cautions:** Known sensitivity, allergy to fish.

## ACTION

Reduces hepatic production of triglyceride-rich very low density lipoproteins (VLDL). **Therapeutic Effect:** Reduces serum triglyceride levels.

## PHARMACOKINETICS

Well absorbed following PO administration. Incorporated into phospholipids. **Half-life:** N/A.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase antiplatelet effect of antiplatelets (e.g., aspirin, clopidogrel). May increase anticoagulant effect of anticoagulants (e.g., warfarin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, LDL.

## AVAILABILITY (Rx)

**Capsules:** 500 mg, 1,000 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Before initiating therapy, pt should be on standard cholesterol-lowering diet for minimum of 3–6 mos. Continue diet throughout therapy.

### Hypertriglyceridemia

**PO: ADULTS, ELDERLY: (Lovaza):** 4 g (4 capsules) once daily or 2 g (2 capsules) twice daily. **(Vascepa):** 2 g (2 [1 gram] capsules or 4 [0.5 g] capsules) twice daily with meals. 4 g/day, given as a single daily dose or twice daily.

### Cardiovascular Risk Reduction With Mild Hypertriglyceridemia (Adjunctive Agent)

**Note:** Consider for use in addition to maximally tolerated statin therapy in pts with triglyceride levels 150 mg/dL or greater, and either established cardiovascular disease or type 2 diabetes mellitus with two or more risk factors for cardiovascular disease.

**PO: ADULTS, ELDERLY: (Vascepa):** 2 g twice daily with meals.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (5%–3%):** Eructation, altered taste, dyspepsia. **Rare (2%–1%):** Rash, back pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

None known.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess serum triglyceride level, LFT. Obtain diet history, esp. fat consumption.

### INTERVENTION/EVALUATION

Monitor serum triglyceride levels for therapeutic response. Monitor serum ALT, LDL periodically during therapy. Discontinue therapy if no response after 2 mos of treatment.

### PATIENT/FAMILY TEACHING

- Continue to adhere to lipid-lowering diet (important part of treatment).
- Periodic lab tests are essential part of therapy to determine drug effectiveness.

## omeprazole

TOP  
100

### oh-mep-ra-zole

(Losec , PriLOSEC, PriLOSEC OTC)

**Do not confuse omeprazole with ARIPIprazole, pantoprazole, or esomeprazole, or PriLOSEC with Plendil, Prevacid, Prinivil, or PROzac.**

### FIXED-COMBINATION(S)

**Yosprala:** omeprazole/aspirin (a platelet aggregation inhibitor): 40 mg/81 mg, 40 mg/325 mg. **Zegerid:** omeprazole/sodium bicarbonate (an antacid): 20 mg/1,100 mg, 40 mg/1,100 mg. **Zegerid Powder:** 20 mg/1,680 mg, 40 mg/1,680 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzimidazole. **CLINICAL:** Proton pump inhibitor.

## USES

**Gastroesophageal reflux disease (GERD):** Short-term treatment of erosive esophagitis (EE) due to acid-mediated GERD diagnosed by endoscopy in pts 1 yr of age or older. Short-term treatment (up to 6 wks) of EE due to acid-mediated GERD in pts 1 mo to less than 1 yr of age. Maintenance healing of EE due to acid-mediated GERD in pts 1 yr of age or older. Treatment of heartburn and other symptoms associated with GERD for up to 4 wks in pts 1 yr of age or older. **Heartburn (OTC only):** Treatment of frequent, uncomplicated heartburn (occurring 2 or more days/wk) in adults. Treatment of *Helicobacter pylori* infection and duodenal ulcer disease in an appropriate combination regimen with antibiotics. **Peptic ulcer disease:** Short-term treatment of active duodenal or gastric ulcers in adults. **Hypersecretory conditions:** Long-term treatment of adults with pathological hypersecretory conditions (e.g., Zollinger-Ellison syndrome). **OFF-LABEL:** Prevention/treatment of NSAID-induced ulcers, stress ulcer prophylaxis in critically ill pts.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to omeprazole, other proton pump inhibitors. Concomitant use with products containing rilpivirine. **Cautions:** May increase risk of fractures, gastrointestinal infections. Hepatic impairment, pts of Asian descent.

## ACTION

Inhibits hydrogen-potassium adenosine triphosphatase ( $H^+/K^+$  ATP pump), an enzyme on the surface of gastric parietal cells. **Therapeutic Effect:** Increases gastric pH, reduces gastric acid production.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	2 hrs	72 hrs

Rapidly absorbed from GI tract. Protein binding: 95%. Primarily distributed into gastric parietal cells. Metabolized in liver. Primarily excreted in urine. Unknown if

removed by hemodialysis. **Half-life:** 0.5–1 hr (increased in hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution (bioavailability may be increased).

## INTERACTIONS

**DRUG:** May decrease concentration/effects of **acalabrutinib, atazanavir, bosutinib, cefuroxime, clopidogrel, dasatinib, neratinib.** May increase concentration/effects of **escitalopram, voriconazole, oral anticoagulants (e.g., warfarin), phenytoin.** **HERBAL:** St. John's wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

## AVAILABILITY (Rx)

**Oral Suspension:** 2.5 mg/packet, 10 mg/packet.

 **Capsules, Delayed-Release: (PriLOSEC):** 10 mg, 20 mg, 40 mg.  **Tablets, Delayed-Release: (PriLOSEC OTC):** 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Give before meals (breakfast preferred).
- Give whole. Do not break, crush, dissolve, or divide delayed-release forms.
- May open capsule, mix with applesauce, and give immediately.

### PO (Suspension)

- Following reconstitution, allow to thicken (2–3 min).
- Administer within 30 min.

## INDICATIONS/ROUTES/DOSAGE

### Mild/Intermittent GERD (Fewer than 2 Episodes/wk With No Evidence of EE)

**PO: ADULTS, ELDERLY, CHILDREN WEIGHING 20 KG OR MORE:** 10 mg once daily. May increase to 20 mg once daily after 4–8 wks if necessary. Discontinue once asymptomatic for 8 wks. **10–19 KG:** 10 mg/day for 4–8 wks. **5–9 KG:** 5 mg/day for 4–8 wks.

**Severe and/or Frequent GERD (2 or More Episodes/wk With/Without EE)**

**PO: ADULTS, ELDERLY:** 20–40 mg once daily. Once symptoms are controlled, continue for at least 8 wks. **CHILDREN 1–16 YRS WEIGHING 20 KG OR MORE:** 20 mg/day. **WEIGHING 10–19 KG:** 10 mg/day. **WEIGHING 5–9 KG:** 5 mg/day. **CHILDREN 1–11 MOS WEIGHING 10 KG OR MORE:** 10 mg/day. **WEIGHING 5–9 KG:** 5 mg/day. **WEIGHING 3–4 KG:** 2.5 mg/day.

**Pathologic Hypersecretory Conditions**

**Note:** Doses more than 80 mg in divided doses. **PO: ADULTS, ELDERLY:** Initially, 40 mg twice daily. May titrate up to 180 mg/day.

**H. pylori and Duodenal Ulcer Disease**

**PO: ADULTS, ELDERLY:** 20 mg or 40 mg twice daily as part of an appropriate combination regimen with antibiotics (dose depends on the selected regimen).

**Peptic Ulcer Disease, Duodenal/ Gastric Ulcer**

**PO: ADULTS, ELDERLY:** 20–40 mg once daily. Duration depends on the size, location, and cause of the ulcer. Range: 4–8 wks.

**OTC Use (Frequent Heartburn)**

**PO: ADULTS, ELDERLY:** 20 mg/day for 14 days. May repeat after 4 mos if needed.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (7%):** Headache. **Occasional (3%–2%):** Diarrhea, abdominal pain, nausea. **Rare (2%):** Dizziness, asthenia, vomiting, constipation, upper respiratory tract infection, back pain, rash, cough.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Pancreatitis, hepatotoxicity, interstitial nephritis occur rarely. May increase risk of *C. difficile* infection.

**NURSING CONSIDERATIONS****INTERVENTION/EVALUATION**

Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea, diarrhea occurs.

**PATIENT/FAMILY TEACHING**

- Report headache, onset of black, tarry stools, diarrhea, abdominal pain.
- Avoid alcohol.
- Swallow capsules whole; do not chew, crush, dissolve, or divide.
- Take before eating.

**ondansetron**

on-dan-se-tron  
(Zofran)

**Do not confuse ondansetron with dolasetron, granisetron, or palonosetron, or Zofran with Zantac or Zosyn.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective 5-HT<sub>3</sub> receptor antagonist. **CLINICAL:** Antinausea, antiemetic.

**USES**

Prevention/treatment of nausea/vomiting due to cancer chemotherapy (including high-dose CISplatin). Prevention and treatment of postop nausea, vomiting. Prevention of radiation-induced nausea, vomiting. **OFF-LABEL:** Breakthrough treatment of nausea and vomiting associated with chemotherapy, hyperemesis gravidarum.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ondansetron, other HT<sub>3</sub> antagonists. Concomitant use of apomorphine. **Cautions:** Mild to moderate hepatic impairment, pts at risk for QT prolongation or ventricular arrhythmia (congenital long QT prolongation, medications prolonging QT interval, hypokalemia, hypomagnesemia).

**ACTION**

Blocks serotonin, both peripherally on vagal nerve terminals and centrally in chemoreceptor trigger zone. **Therapeutic Effect:** Prevents nausea/vomiting.

## PHARMACOKINETICS

Readily absorbed from GI tract. Protein binding: 70%–76%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 3–6 hrs (increased in hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 1 mo. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Apomorphine may cause profound hypotension, altered LOC. **QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol)** may increase risk of QT interval prolongation, torsades de pointes. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May transiently increase serum bilirubin, ALT, AST.

## AVAILABILITY (Rx)

**Injection Solution:** 2 mg/mL. **Oral Solution:** 4 mg/5 mL. **Tablets:** 4 mg, 8 mg, 24 mg. **Tablets, Orally Disintegrating:** 4 mg, 8 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • May give undiluted. • For IV infusion, dilute with 50 mL D<sub>5</sub>W or 0.9% NaCl before administration.

**Rate of administration** • Give IV push over 2–5 min. • Give IV infusion over 15–30 min.

**Storage** • Store at room temperature. • Stable for 48 hrs at room temperature following dilution.

### IM

• Inject undiluted into large muscle mass.

### PO

• Give without regard to food.

## Orally Disintegrating Tablets

• Do not remove from blister pack until needed. • Peel backing off; do not push through. • Place tablet on tongue; allow to dissolve. • Swallow with saliva.

## Oral Soluble Film

• Keep film in pouch until ready to use. • Remove film strip from pouch and place on top of tongue; allow to dissolve. • Swallow after film dissolves. Do not chew or swallow film whole. • If using more than one, each should be allowed to dissolve before administering the next one.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), allopurinol (Aloprim), amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), cefepime (Maxipime), 5-fluorouracil, LORazepam (Ativan), meropenem (Merrem IV), methyl-PREDNISolone (SOLU-Medrol).

## IV COMPATIBILITIES

CARBOplatin (Paraplatin), CISplatin (Platinol), cyclophosphamide (Cytosan), cytarabine (Cytosar), dacarbazine (DTIC-Dome), DAUNOrubicin (Cerubidine), dexmedetomidine (Precedex), dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOCEtaxel (Taxotere), DOPamine (Intropin), etoposide (VePesid), gemcitabine (Gemzar), heparin, HYDROMorphone (Dilaudid), ifosfamide (Ifex), magnesium, mannitol, mesna (Mesnex), methotrexate, metoclopramide (Reglan), mitoMYcin (Mutamycin), mitoXANTRONE (Novantrone), morphine, PACLitaxel (Taxol), potassium chloride, teniposide (Vumon), topotecan (Hycamtin), vinBLAStine (Velban), vinCRIStine (Oncovin), vinorelbine (Navelbine).

## INDICATIONS/ROUTES/DOSAGE

### Chemotherapy-Induced Nausea/Vomiting

**IV: ADULTS, ELDERLY, CHILDREN 6 MOS AND OLDER:** 8 mg or 0.15 mg/kg as a single dose. (**Maximum:** 16 mg/dose).

**PO: ADULTS, ELDERLY:** 8 mg twice daily with first dose administered prior to chemotherapy.

#### Prevention of Postop Nausea/Vomiting

**IV, IM: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 4 mg as a single dose. **CHILDREN 1 MO–12 YRS WEIGHING MORE THAN 40 KG:** 4 mg as a single dose. **CHILDREN 1 MO–12 YRS WEIGHING 40 KG OR LESS:** 0.1 mg/kg as a single dose.

**PO: ADULTS, ELDERLY:** 8 mg 1 hr before induction of anesthesia.

#### Prevention of Radiation-Induced Nausea/Vomiting

**IV: ADULTS, ELDERLY:** 8 mg or 0.15 mg/kg (maximum: 16 mg) once or twice daily 1–2 hrs prior to each fraction of radiation (give with dexamethasone).

**PO:** 8 mg once or twice daily 1–2 hrs prior to each fraction of radiation (give with dexamethasone).

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment: Maximum daily dose:** 8 mg.

### SIDE EFFECTS

**Frequent (13%–5%):** Anxiety, dizziness, drowsiness, headache, fatigue, constipation, diarrhea, hypoxia, urinary retention. **Occasional (4%–2%):** Abdominal pain, xerostomia, fever, feeling of cold, redness/pain at injection site, paresthesia, asthenia (loss of strength, energy). **Rare (1%):** Hypersensitivity reaction (rash, pruritus), blurred vision.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypertension, acute renal failure, GI bleeding, respiratory depression, coma, extrapyramidal effects occur rarely. QT interval prolongation, torsades de pointes may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess degree of nausea, vomiting. Assess for dehydration if excessive vomiting occurs (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue). Provide emotional support.

### INTERVENTION/EVALUATION

Monitor ECG in pts with electrolyte abnormalities (e.g., hypokalemia, hypomagnesemia), HE, bradyarrhythmias, concurrent use of other medications that may cause QT prolongation, pts receiving high doses or frequent doses. Provide supportive measures. Assess mental status. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Record time of evacuation.

### PATIENT/FAMILY TEACHING

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Avoid alcohol, barbiturates.
- Report persistent vomiting.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness, dizziness).

## oseltamivir

TOP  
100

oh-sel-tam-i-veer  
(Tamiflu)

**Do not confuse Tamiflu with Thera-flu.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Neuraminidase inhibitor. **CLINICAL:** Antiviral.

### USES

Symptomatic treatment of uncomplicated acute illness caused by influenza A or B virus in adults and children 2 wks of age and older who are symptomatic no longer than 2 days. Prevention of influenza in adults, children.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to oseltamivir. **Cautions:** Renal impairment.

## ACTION

Selective inhibitor of influenza virus neuraminidase, an enzyme essential for viral replication. Acts against influenza A and B viruses. **Therapeutic Effect:** Suppresses spread of infection within respiratory system, reduces duration of clinical symptoms.

## PHARMACOKINETICS

Readily absorbed after PO administration. Protein binding: 3%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 6–10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 wks. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Live attenuated influenza virus vaccine intranasal may interfere with effect. **Probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Capsules:** 30 mg, 45 mg, 75 mg. **Powder for Oral Suspension:** 6 mg/mL.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- May open capsules and mix with sweetened liquid.
- Oral suspension stable for 10 days (room temperature) or 17 days (refrigerated) following reconstitution.

## INDICATIONS/ROUTES/DOSAGE

### Influenza

**Note:** Hospitalized pts may require longer treatment course. Initiate within 48 hrs of onset of symptoms. Consider

duration longer than 5 days in pts with severe or complicated influenza.

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 75 mg twice daily for 5 days. **CHILDREN 1–12 YRS, WEIGHING MORE THAN 40 KG:** 75 mg twice daily for 5 days. **WEIGHING 24–40 KG:** 60 mg twice daily for 5 days. **WEIGHING 16–23 KG:** 45 mg twice daily for 5 days. **WEIGHING 15 KG OR LESS:** 30 mg twice daily for 5 days. **NEONATES, INFANTS AGES 2 WKS TO YOUNGER THAN 1 YR:** 3 mg/kg twice daily for 5 days.

### Prevention of Influenza

**Note:** Initiate within 48 hrs of contact with an infected individual. Duration: 7–10 days (longer during community outbreaks).

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 75 mg once daily. **CHILDREN 1–12 YRS, WEIGHING MORE THAN 40 KG:** 75 mg once daily. **WEIGHING 24–40 KG:** 60 mg once daily. **WEIGHING 15–23 KG:** 45 mg once daily. **WEIGHING LESS THAN 15 KG:** 30 mg once daily. **INFANTS 9–11 MOS:** 3.5 mg/kg/dose. **INFANTS 3–8 MOS:** 3 mg/kg/dose.

### Dosage in Renal Impairment

**CrCl 31–60 mL/min:** Treatment: 30 mg twice daily. Prevention: 30 mg once daily. **CrCl 11–30 mL/min:** Treatment: 30 mg once daily. Prevention: 30 mg every other day. **End-stage renal disease:** Not recommended.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (10%–7%):** Nausea, vomiting, diarrhea. **Rare (2%–1%):** Abdominal pain, bronchitis, dizziness, headache, cough, insomnia, fatigue, vertigo.

## ADVERSE EFFECTS/TOXIC REACTIONS

Colitis, pneumonia, tympanic membrane disorder, fever occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Confirm presence of influenza A or B virus.

**INTERVENTION/EVALUATION**

Monitor for improvement of flu-like symptoms.

**PATIENT/FAMILY TEACHING**

- Begin as soon as possible from first appearance of flu symptoms (recommended within 2 days from symptom onset).
- Avoid contact with those who are at high risk for influenza.
- Not a substitute for flu shot.

## osimertinib

oh-sim-er-ti-nib  
(Tagrisso)

**Do not confuse osimertinib with afatinib, dasatinib, erlotinib, ibrutinib, imatinib, olaparib, or ospemifene, or Tagrisso with Targretin or Tasigna.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

**USES**

Treatment of pts with metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer (NSCLC), as detected by FDA-approved test, who have progressed on or after EGFR therapy. First-line treatment of metastatic NSCLC in pts with EGFR exon 19 deletions or exon 21 L858R mutations. Adjuvant therapy after tumor resection for NSCLC in adults whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 L858R mutations.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to osimertinib. **Cautions:** Baseline cytopenias, COPD, heart disease (bradycardia, cardiomyopathy, heart block, HF, recent MI),

conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for QTc interval prolongation or ventricular arrhythmia (congenital long QT syndrome, history for QT prolongation, medications that prolong QT interval, hypokalemia, hypomagnesemia); history of CVA, pulmonary embolism. Concomitant use of CYP3A inducers.

**ACTION**

Exhibits antitumor activity by irreversibly binding to mutant forms of EGFR. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: Likely high. Peak plasma concentration: 3–24 hrs (median: 6 hrs). Steady state reached in 15 days. Excreted in feces (68%), urine (14%). **Half-life:** 48 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 wks after discontinuation. Males with female partners of reproductive potential must use effective barrier methods during treatment and at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for up to 2 wks after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of Grade 3 or 4 adverse events. May require more frequent dose modifications.

**INTERACTIONS**

**DRUG:** QTc interval-prolonging medications (e.g., amiodarone, FLUoxetine, haloperidol, sotalol) may increase risk of QTc prolongation. **Strong CYP3A inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Strong CYP3A inhibitors** (e.g.,

clarithromycin, ketoconazole, ritonavir) may increase concentration/risk of adverse effects. May decrease the therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse/toxic effects of belimumab, natalizumab, vaccines (live). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium, magnesium; Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs. May decrease diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Tablets:** 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Tablets are hazardous; use cytotoxic precautions during handling and disposal. Recommend single gloving when handling intact tablets; double gloving, protective gown when handling liquid preparations.
- Do not divide, crush, cut, or ultrasonicate tablets.
- Give without regard to food.
- If a dose is missed, skip missed dose and administer the next dose on schedule.
- **Pts with dysphagia:** Disperse tablet in 60 mL of water (noncarbonated) only.
- Stir until dissipated into small pieces (does not completely dissolve).
- Deliver orally or via gastric tube.
- Rinse container with 120–240 mL of water and administer any remaining drug residue. After oral administration of residue, instruct pt to thoroughly rinse mouth with water and swallow.

## INDICATIONS/ROUTES/DOSAGE

### Non–Small-Cell Lung Cancer (Adjuvant Therapy)

**PO: ADULTS, ELDERLY:** 80 mg once daily. Continue until disease progression or unacceptable toxicity, or for up to 3 yrs.

### Non–Small-Cell Lung Cancer (Metastatic)

**PO: ADULTS, ELDERLY:** 80 mg once daily. Continue until disease progression or unacceptable toxicity.

## Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Cardiac Toxicity

**QTc interval greater than 500 msec on at least two separate ECGs:** Withhold treatment until QTc interval is less than 481 msec or recovers to baseline. Once resolved, resume at 40 mg once daily.

**QTc interval prolongation with symptoms of life-threatening arrhythmia:** Permanently discontinue. **Asymptomatic, absolute decrease in left ventricular ejection fraction (LVEF) of 10% from baseline and below 50%:** Withhold treatment for up to 4 wks. Resume treatment if improved to baseline. If not improved to baseline, permanently discontinue.

### Pulmonary Toxicity

**Interstitial lung disease/pneumonitis:** Permanently discontinue.

### Other Toxicities

**Any Grade 3 or higher reaction:** Withhold treatment for up to 3 wks. Resume treatment at 80 mg once daily or 40 mg once daily if improved to Grade 2 or lower within 3 wks. If not improved within 3 wks, permanently discontinue.

**Concomitant use of strong CYP3A4 inducers:** Start dose at 160 mg once daily. May decrease dose to 80 mg once daily if strong CYP3A4 inducer has been discontinued for at least 3 wks.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (42%–17%):** Diarrhea, rash (generalized, erythematous, macular, maculopapular, papular, pustular), erythema, folliculitis, acne, dermatitis, acneiform dermatitis, dry skin, eczema, skin fissures, xerosis, nail disorders (inflammation, tenderness, discoloration, dystrophy, infection, ridging, onychoclasis, onycholysis,

0

onychomadesis, paronychia), dry eye, blurry vision, keratitis, cataract, eye irritation, blepharitis, eye pain, increased lacrimation, vitreous floaters, nausea. **Occasional (16%–10%)**: Decreased appetite, constipation, pruritus, cough, fatigue, back pain, stomatitis, headache.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Interstitial lung disease/pneumonitis reported in 3% of pts. May cause QTc interval prolongation (up to 3% of pts); cardiac toxicities including cardiomyopathy (1% of pts), decreased LVEF (2% of pts); other adverse effects including CVA, intracranial hemorrhage; pneumonia (4% of pts); venous thromboembolism including pulmonary embolism, jugular venous thrombosis, DVT (7% of pts).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, serum magnesium; vital signs; ECG. Confirm presence of T790M mutation in tumor specimen prior to initiation. Obtain pregnancy test in females of reproductive potential. Receive full medication history and screen for interactions. Question history of CVA, DVT, pulmonary embolism, pulmonary disease, cardiac disease. Obtain baseline echocardiogram to assess LVEF. Obtain visual acuity. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for cytopenias; BMP, serum magnesium for electrolyte abnormalities. Pts with cough, dyspnea, fever, worsening of respiratory status should be investigated for interstitial lung disease/pneumonitis. Pts with sudden chest pain, dyspnea, hypoxia, tachycardia should be evaluated for pulmonary embolism. Monitor for symptoms of DVT (leg or arm pain/swelling); CVA, intracranial hemorrhage (aphasia, altered LOC, facial

droop, headache, hemiplegia, seizures). Assess LVEF by echocardiogram q3mos during therapy or more frequently in pts suspected of HF, congestive HF. Assess for eye pain, visual changes. Monitor for skin rash/toxicities, hypersensitivity reaction. Diligently monitor for infection. Monitor daily stool pattern, consistency.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report symptoms of abnormal heartbeats (dizziness, fainting, light-headedness, palpitations), heart failure (shortness of breath, fast or slow heart rate, exercise intolerance, swelling of the ankles or legs), severe lung inflammation (difficulty breathing, cough with fever, lung pain).
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Treatment may cause blood clots in the arms, legs, lungs, or brain. Immediately report symptoms of stroke (difficulty speaking, confusion, paralysis, vision loss), lung embolism (difficulty breathing, fast heart rate, chest pain), blood clots in the arms or legs (pain/swelling).
- Do not take any newly prescribed medications unless approved by doctor who originally started treatment.
- Do not take herbal supplements.

## oxaliplatin

**HIGH ALERT**

ox-al-i-pla-tin

### BLACK BOX ALERT

Anaphylactic-like reaction may occur within minutes of administration; may be controlled with

EPINEPHrine, corticosteroids, antihistamines.

**Do not confuse oxaliplatin with Aloxi, CARBOplatin, or CISplatin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Platinum-containing complex. Alkylating agent. **CLINICAL:** Antineoplastic.

### USES

Adjuvant treatment of stage III colon cancer after complete resection of primary tumor (in combination with infusional 5-fluorouracil and leucovorin); treatment of advanced colon cancer (in combination with infusional 5-fluorouracil and leucovorin). **OFF-LABEL:** Treatment of ovarian cancer, pancreatic cancer, hepatobiliary cancer, testicular cancer, esophageal cancer, gastric cancer, non-Hodgkin's lymphoma, chronic lymphocytic leukemia.

### PRECAUTIONS

**Contraindications:** History of allergy to oxaliplatin, other platinum compounds.

**Cautions:** Previous therapy with other antineoplastic agents; radiation, renal impairment, pregnancy, immunosuppression, presence or history of peripheral neuropathy, elderly pts.

### ACTION

Inhibits DNA replication and transcription by cross-linking with DNA strands. Cell cycle-phase nonspecific. **Therapeutic Effect:** Causes cellular death (apoptosis).

### PHARMACOKINETICS

Widely distributed. Protein binding: 90%. Undergoes rapid, extensive nonenzymatic biotransformation. Excreted in urine.

**Half-life:** 391 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester.

May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of diarrhea, dehydration, hypokalemia, fatigue.

### INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression, GI effects. **HERBAL:** None significant.

**FOOD:** None known. **LAB VALUES:** May increase serum creatinine, bilirubin, ALT, AST, INR. May prolong prothrombin time.

### AVAILABILITY (Rx)

**Injection Solution:** 5 mg/mL (10-mL, 20-mL vials).

### ADMINISTRATION/HANDLING

**◀ALERT▶** Wear protective gloves during handling of oxaliplatin. If solution comes in contact with skin, wash skin immediately with soap, water. Do not use aluminum needles or administration sets that may come in contact with drug; may cause degradation of platinum compounds.

**◀ALERT▶** Pt should avoid ice, drinking cold beverages, touching cold objects during infusion and for 5 days thereafter (can exacerbate acute neuropathy).

**Reconstitution** • Dilute with 250–500 mL D<sub>5</sub>W (never dilute with sodium chloride solution or other chloride-containing solutions) to final concentration of 0.2–0.6 mg/mL.

**Rate of administration** • Infuse over 2–6 hrs.

**Storage** • Do not freeze. • Protect from light. • Store vials at room temperature. • After dilution, solution is stable for 6 hrs at room temperature, 24 hrs if refrigerated.

### IV INCOMPATIBILITIES

Do not infuse oxaliplatin with alkaline medications.

## IV COMPATIBILITIES

Dexamethasone, diphenhydramine (Benadryl), granisetron (Kytril), ondansetron (Zofran), palonosetron (Aloxi).

## INDICATIONS/ROUTES/DOSAGE

Refer to individual protocols.

◀**ALERT**▶ Pretreat pt with antiemetics. Repeat courses should not be given more frequently than every 2 wks.

### Colon Cancer, Advanced

**IV: ADULTS:** 85 mg/m<sup>2</sup> q2wks until disease progression or unacceptable toxicity (in combination with fluorouracil/leucovorin).

### Colon Cancer, Stage III (Adjuvant Therapy)

**IV: ADULTS:** 85 mg/m<sup>2</sup> q2wks for total of 6 months (in combination with fluorouracil/leucovorin).

### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** Reduce dose to 65 mg/m<sup>2</sup>.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (76%–20%):** Peripheral/sensory neuropathy (usually occurs in hands, feet, perioral area, throat but may present as jaw spasm, abnormal tongue sensation, eye pain, chest pressure, difficulty walking, swallowing, writing), nausea, fatigue, diarrhea, vomiting, constipation, abdominal pain, fever, anorexia. **Occasional (14%–10%):** Stomatitis, earache, insomnia, cough, difficulty breathing, backache, edema. **Rare (7%–3%):** Dyspepsia, dizziness, rhinitis, flushing, alopecia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Peripheral/sensory neuropathy can occur without any prior event by drinking or holding a glass of cold liquid during IV infusion. Pulmonary fibrosis (characterized as nonproductive cough, dyspnea, crackles, radiologic

pulmonary infiltrates) may warrant drug discontinuation. Hypersensitivity reaction (rash, urticaria, pruritus) occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question medical history as listed in Precautions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for decrease in WBC, platelets (myelosuppression is minimal). Monitor daily pattern of bowel activity, stool consistency. Monitor for diarrhea, GI bleeding (bright red, black tarry stool), neuropathy. Pt should avoid ice or drinking, holding glass of cold liquid during IV infusion and for 5 days following completion of infusion; may precipitate/exacerbate neuropathy (occurs within hrs or 1–2 days of dosing, lasts up to 14 days). Maintain strict I&O. Assess oral mucosa for stomatitis.

### PATIENT/FAMILY TEACHING

- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, persistent diarrhea, difficulty breathing.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently taken oral polio vaccine.
- Avoid cold drinks, ice, cold objects (may produce neuropathy).

## OXcarbazepine

ox-kar-baz-e-peen  
(Oxtellar XR, Trileptal)

**Do not confuse OXcarbazepine with carBAMazepine, or Trileptal with TriLipix.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Carboxamide derivative, anticonvulsant.  
**CLINICAL:** Anticonvulsant.

## USES

**Immediate-Release:** Monotherapy, adjunctive therapy in treatment of partial seizures in adults. Monotherapy in children 4 yrs and older, adjunctive therapy in children 2 yrs and older. **Extended-Release:** Treatment of partial seizures in adults and children 6 yrs and older. **OFF-LABEL:** Treatment of neuropathic pain, bipolar disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to OXcarbazepine. **Cautions:** Renal impairment, sensitivity to carbamazepine, pts at increased risk for suicide.

## ACTION

Blocks sodium channels, stabilizing hyperexcited neural membranes, inhibiting repetitive neuronal firing, diminishing synaptic impulses. **Therapeutic Effect:** Prevents seizures.

## PHARMACOKINETICS

Completely absorbed from GI tract. Metabolized in liver. Protein binding: 40%. Primarily excreted in urine. **Half-life:** 2 hrs; metabolite, 6–10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., lorazepam, morphine, zolpidem) may have additive sedative effect. May decrease effectiveness of oral contraceptives, dolutegravir, doravirine, elvitegravir, rilpivirine, simeprevir, sofosbuvir, tenofovir alafenamide. May increase serotonergic effect of selegiline. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST. May decrease serum sodium.

## AVAILABILITY (Rx)

**Oral Suspension:** 300 mg/5 mL. **Tablets:** 150 mg, 300 mg, 600 mg.

 **Tablets, Extended-Release:** 150 mg, 300 mg, 600 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. Do not break, crush, dissolve, or divide extended-release tablets. Swallow whole.

## INDICATIONS/ROUTES/DOSAGE

### Adjunctive Treatment of Seizures

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 300–600 mg/day in 2 divided doses. May increase by up to 600 mg/day at wkly intervals. **Maximum:** 2.4 g/day in 2–3 divided doses. **ADOLESCENTS:** Initially, 300 mg twice daily. May increase in increments up to 600 mg/day at wkly intervals to a target dose of 1,200 mg/day in 2 divided doses. **CHILDREN 4–16 YRS:** Initially, 8–10 mg/kg in 2 divided doses. **Maximum:** 600 mg/day. Increase dose slowly over 2 wks. **Maintenance (based on weight): CHILDREN WEIGHING MORE THAN 39 KG:** 1,800 mg/day in 2 divided doses; **CHILDREN WEIGHING 29.1–39 KG:** 1,200 mg/day in 2 divided doses; **CHILDREN WEIGHING 20–29 KG:** 900 mg/day in 2 divided doses. **CHILDREN 2–3 YRS:** Initially, 8–10 mg/kg/day in 2 divided doses. **Maximum:** 600 mg/day in 2 divided doses. Increase dose slowly over 2–4 wks up to a **maximum** of 60 mg/kg/day in 2 divided doses. **(Extended-Release): ADULTS:** Initially, 600 mg once daily. May increase by 600 mg/day at wkly intervals. **Maximum:** 2.4 g/day. **ELDERLY:** Initially, 300–450 mg/day. May increase by 300–450 mg/day at wkly intervals to desired clinical response. Range: Up to 2,400 mg/day.

### Conversion to Monotherapy

**PO: ADULTS, ELDERLY: (Immediate-Release):** 600 mg/day in 2 divided doses (while decreasing concomitant anticonvulsant over 3–6 wks). May increase by 600 mg/day at wkly intervals

up to 2,400 mg/day. **CHILDREN 4–16 YRS:** Initially, 8–10 mg/kg/day in 2 divided doses with simultaneous initial reduction of dose of concomitant anti-epileptic over 3–6 wks. May increase by maximum of 10 mg/kg/day at wkly intervals (see below for recommended daily dose by weight).

#### Initiation of Monotherapy

**PO: ADULTS, ELDERLY: (*Immediate-Release*):** 600 mg/day in 2 divided doses. May increase by 300 mg/day every 3 days up to 1,200 mg/day. (*Extended-Release*): Initially, 600 mg once daily. May increase by 600 mg/day at wkly intervals up to 1,200–2,400 mg once daily. **CHILDREN 4–16 YRS: (*Immediate-Release*):** Initially, 8–10 mg/kg/day in 2 divided doses. Increase at 3-day intervals by 5 mg/kg/day to achieve maintenance dose by weight as follows:

Weight	Dosage
70+ kg	1,500–2,100 mg/day
60–69 kg	1,200–2,100 mg/day
50–59 kg	1,200–1,800 mg/day
41–49 kg	1,200–1,500 mg/day
35–40 kg	900–1,500 mg/day
25–34 kg	900–1,200 mg/day
20–24 kg	600–900 mg/day

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **CrCl less than 30 mL/min:** Give 50% of normal starting dose, then titrate slowly to desired dose.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution with immediate-release; not recommended with extended-release.

### SIDE EFFECTS

**Frequent (22%–13%):** Dizziness, nausea, headache. **Occasional (7%–5%):** Vomiting, diarrhea, ataxia (muscular incoordination), nervousness, dyspepsia, constipation. **Rare (4%):** Tremor, rash, back pain, epistaxis, sinusitis, diplopia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Clinically significant hyponatremia may occur, manifested as leg cramping, hypotension, cold/clammy skin, increased pulse rate, headache, nausea, vomiting, diarrhea. Suicidal ideation occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC), drug history (esp. other anticonvulsants). Provide safety precautions; quiet, dark environment.

#### INTERVENTION/EVALUATION

Assist with ambulation if dizziness, ataxia occur. Assess for visual abnormalities, headache. Monitor serum sodium. Assess for signs of hyponatremia (nausea, malaise, headache, lethargy, confusion). Assess for clinical improvement (decrease in intensity, frequency of seizures). Monitor for worsening depression, suicidal ideation.

#### PATIENT/FAMILY TEACHING

- Do not abruptly stop taking medication (may increase seizure activity).
- Report if rash, nausea, headache, dizziness occurs.
- May need periodic blood tests.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- May decrease effectiveness of oral contraceptives.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## oxybutynin

ox-i-bue-ti-nin  
(Ditropan XL, Gelnique, Oxytrol for Women)

**Do not confuse oxybutynin with OxyContin.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinergic. **CLINICAL:** Urinary antispasmodic.

## USES

Relief of symptoms (urgency, incontinence, frequency, nocturia, urge incontinence) associated with uninhibited neurogenic bladder, reflex neurogenic bladder. **Extended-Release (additional):** Treatment of symptoms associated with detrusor overactivity due to neurologic disorder (e.g., spina bifida).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to oxybutynin. Uncontrolled narrow-angle glaucoma, urinary retention, gastric retention, or conditions with severely decreased GI motility. **Cautions:** Renal/hepatic impairment, bladder outflow obstruction, treated narrow-angle glaucoma, hyperthyroidism, coronary artery disease, HE, hypertension, arrhythmias, prostatic hyperplasia, myasthenia gravis, reduced GI motility, GI obstructive disorder, gastroesophageal reflux.

## ACTION

Direct antispasmodic effect on smooth muscle; inhibits action of acetylcholine on smooth muscle. **Therapeutic Effect:** Increases bladder capacity, delays desire to void. Decreases urgency and frequency.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–1 hr	3–6 hrs	6–10 hrs

Rapidly, well absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 1–2.3 hrs; metabolite, 7–8 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related

precautions noted in pts older than 5 yrs. **Elderly:** May be more sensitive to anticholinergic effects (e.g., dry mouth, urinary retention).

## INTERACTIONS

**DRUG:** Medications with anticholinergic action (e.g., acclidinium, ipratropium, tiotropium, umecclidinium) may increase anticholinergic effects.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Syrup:** 5 mg/5 mL. **Tablets:** 5 mg. **Topical Gel (10%):** (*Gelnique*): 100 mg/unit dose sachet. **Transdermal:** (*Oxytrol for Women*): 3.9 mg/24 hrs.

 **Tablets, Extended-Release:** 5 mg, 10 mg, 15 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Extended-release tablet must be swallowed whole; do not break, crush, dissolve, or divide.

### Transdermal

- Apply patch to dry, intact skin on abdomen, hip, buttock.
- Use new application site for each new patch; avoid reapplication to same site within 7 days.
- Normal exposure to water (e.g., bathing, swimming) should not affect patch.

### Topical Gel

- **Gelnique:** Apply contents of 1 sachet once daily to dry, intact skin on abdomen, upper arms/shoulders, or thighs.
- Do not bathe/shower until 1 hr after gel is applied.

## INDICATIONS/ROUTES/DOSAGE

### Neurogenic Bladder

**PO:** (*Immediate-Release*): **ADULTS:** 5 mg 2–3 times/day. May increase to 5 mg 4 times/day. **ELDERLY:** 2.5–5 mg 2–3 times/day. **CHILDREN OLDER THAN 5 YRS:** 5 mg twice daily. May increase to 5 mg 3 times/day. **Maximum:** 5 mg 4 times/day.

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** 5–10 mg/day. May increase by 5-mg increments at wkly intervals. **Maximum:** 30 mg/day. **CHILDREN 6 YRS AND OLDER:** Initially, 5–10 mg once daily. May increase in 5 mg increments at wkly intervals. **Maximum:** 20 mg/day.

**Transdermal:** **ADULTS:** 3.9 mg applied twice wkly. Apply every 3–4 days.

**Topical gel:** **ADULTS, ELDERLY:** (10%) 100 mg once daily.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Constipation, dry mouth, drowsiness, decreased perspiration. **Occasional:** Decreased lacrimation/salivation, impotence, urinary hesitancy/retention, suppressed lactation, blurred vision, mydriasis, nausea/vomiting, insomnia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces CNS excitation (nervousness, restlessness, hallucinations, irritability), hypotension/hypertension, confusion, tachycardia, facial flushing, respiratory depression.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess degree of dysuria, urgency, frequency, incontinence. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

Monitor for symptomatic relief. Monitor I&O; palpate bladder for urine retention. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Avoid alcohol.
- May cause dry mouth (sugarless candy/gum may reduce effect).
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause drowsiness).
- Avoid strenuous activity in warm environment.

## oxyCODONE

TOP  
100

HIGH  
ALERT

ox-ee-koe-done

(Oxaydo, OxyCONTIN, OxyIR , Roxicodone, Supeudol , Xtampza ER)

**BLACK BOX ALERT** **OxyContin (controlled-release):** Not intended as an “as needed” analgesic or for immediate postop pain control. Extended-release should not be crushed, broken, or chewed (otherwise leads to rapid release and absorption of potentially fatal dose). Be alert to signs of abuse, misuse, and diversion. May cause potentially life-threatening respiratory depression. Prolonged use during pregnancy can cause neonatal withdrawal syndrome. Use of CYP3A4 inhibitors may increase effects/cause fatal respiratory depression. Concomitant use with benzodiazepines, other CNS depressants, may result in profound sedation, respiratory depression, coma, and death.

**Do not confuse oxyCODONE with HYDROcodone, oxybutynin, or oxyMORphone, OxyCONTIN with MS Contin or oxybutynin, or Roxicodone with Roxanol.**

### FIXED-COMBINATION(S)

**Combunox:** oxyCODONE/ibuprofen (an NSAID): 5 mg/400 mg. **Endocet:** oxyCODONE/acetaminophen (a nonnarcotic analgesic): 5 mg/325 mg, 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg, 10 mg/650 mg. **Percocet:** oxyCODONE/acetaminophen: 2.5 mg/325 mg, 5 mg/325 mg, 5 mg/500 mg, 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg, 10 mg/650 mg. **Percocet, Roxicet, Tylox:** oxyCODONE/acetaminophen (a nonnarcotic analgesic): 5 mg/500 mg. **Percodan:** oxyCODONE/aspirin (a nonnarcotic analgesic): 2.25 mg/325 mg, 4.5 mg/325 mg. **Targiniq ER:** oxyCODONE/naloxone (opioid antagonist): 10 mg/5 mg, 20 mg/10 mg, 40 mg/20 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid agonist (Schedule II). **CLINICAL:** Analgesic.

## USES

**Immediate-Release:** Relief of acute or chronic, moderate to severe pain where the use of an opioid analgesic is appropriate and alternative treatments are inadequate. **Extended-Release Tablets (*Oxycontin*):** Management of pain requiring daily, around-the-clock, long-term treatment in adults and opioid-tolerant pts 11 yrs of age or older. **Capsules (*Xtampza ER*):** Indicated for adults only.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to oxyCODONE. Acute or severe bronchial asthma, hypercarbia, paralytic ileus (known or suspected), GI obstruction, significant respiratory depression. **Extreme Caution:** CNS depression, anoxia, hypercapnia, respiratory depression, seizures, acute alcoholism, shock, untreated myxedema, respiratory dysfunction. **Cautions:** Elevated ICP, hepatic/renal impairment, coma, debilitated pts, head injury, biliary tract disease, toxic psychosis, acute abdominal conditions, hypothyroidism, prostatic hypertrophy, Addison's disease, urethral stricture, COPD, elderly, history of drug abuse and misuse, drug-seeking behavior, dependency.

## ACTION

Binds with opioid receptors within CNS, causing inhibition of ascending pain pathway. **Therapeutic Effect:** Alters perception of and emotional response to pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (immediate-release)	10–15 min	0.5–1 hr	3–6 hrs
PO (controlled-release)	10–15 min	0.5–1 hr	Up to 12 hrs

Widely distributed. Protein binding: 38%–45%. Metabolized in liver. Excreted

in urine. Unknown if removed by hemodialysis. **Half-life:** 2–3 hrs (5 hrs controlled-release).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Paradoxical excitement may occur. Pts younger than 2 yrs are more susceptible to respiratory depressant effects. **Elderly:** Age-related renal impairment may increase risk of urinary retention. May be more susceptible to respiratory depressant effects.

## INTERACTIONS

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, gabapentin, zolpidem) may increase CNS effects, respiratory depression, hypotension. **Strong CYP3A4 inhibitors (clarithromycin, ketoconazole, ritonavir)** may increase concentration, toxicity. **Strong CYP3A4 inducers (carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **MAOIs** may produce serotonin syndrome, a severe, sometimes fatal reaction. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may increase potential for respiratory depression. **LAB VALUES:** May increase serum amylase, lipase.

## AVAILABILITY (Rx)

◀ **ALERT** ▶ New formulation of controlled-release is intended to prevent medication from being cut, broken, chewed, crushed, or dissolved to reduce risk of overdose due to tampering, snorting, or injection.

**Capsules:** 5 mg. **Oral Concentrate:** 20 mg/mL. **Oral Solution:** 5 mg/5 mL. **Tablets:** 5

mg, 10 mg, 15 mg, 20 mg, 30 mg. **Tablets, Abuse Deterrent: (Oxaydo):** 5 mg, 7.5 mg.

 **Capsules, Extended-Release: (Xtampza):** 9 mg, 13.5 mg, 18 mg, 27 mg, 36 mg. **Tablets, Controlled-Release 12-Hour Abuse Deterrent: (OxyCONTIN):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • **Controlled-release:** Swallow whole; do not break, crush, dissolve, or divide.

## INDICATIONS/ROUTES/DOSAGE

**Note:** All doses should be titrated to desired effect. Do not abruptly discontinue in physically dependent pts. **Discontinuation: (Immediate-Release):** Reduce dose by 25%–50% q2–4 days while monitoring for withdrawal; **(Extended-Release):** Gradually titrate downward.

### Analgesia

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 5–10 mg q4–6h PRN. Range: 5–15 mg q4–6h. **CHILDREN** 0.05–0.15 mg/kg/dose q4–6h PRN. **Maximum:** 5 mg/dose.

### Opioid Naive

**PO: (Controlled-Release): ADULTS, ELDERLY: (Tablets):** Initially, 10 mg q12h. **(Capsules):** Initially, 9 mg q12h.

 **ALERT** To convert from other opioids or nonopioid analgesics to oxyCODONE controlled-release, refer to OxyCONTIN package insert. Dosages are reduced in pts with severe hepatic disease.

### Dosage in Renal/Hepatic Impairment

Use caution. Titrate carefully.

## SIDE EFFECTS

 **ALERT** Effects are dependent on dosage amount. Ambulatory pts, pts not in severe pain may experience dizziness, nausea, vomiting, hypotension more frequently than those in supine position or having severe pain. **Frequent:** Drowsiness, dizziness, hy-

potension (including orthostatic hypotension), anorexia. **Occasional:** Confusion, diaphoresis, facial flushing, urinary retention, constipation, dry mouth, nausea, vomiting, headache. **Rare:** Allergic reaction, depression, paradoxical CNS hyperactivity, nervousness in children, paradoxical excitement, restlessness in elderly, debilitated pts.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Hepatotoxicity may occur with overdose of acetaminophen component of fixed-combination product. Tolerance to analgesic effect, physical dependence may occur with repeated use. **Antidote:** Naloxone (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. Obtain vital signs before giving medication. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

### INTERVENTION/EVALUATION

Palpate bladder for urinary retention. Monitor daily pattern of bowel activity, stool consistency. Initiate deep breathing, coughing exercises, esp. in pts with pulmonary impairment. Monitor pain relief, respiratory rate, mental status, B/P, level of consciousness. Screen for drug abuse and misuse, drug-seeking behavior

### PATIENT/FAMILY TEACHING

• May cause dry mouth, drowsiness. • Avoid tasks that require alertness, motor skills until response to drug is established. • Avoid alcohol. • May be habit forming. • Do not chew,

crush, dissolve, or divide controlled-release tablets. • Report severe constipation, absence of pain relief.

## oxytocin

HIGH  
ALERT

ox-ee-toe-sin  
(Pitocin)

**BLACK BOX ALERT** ■ Not to be given for elective labor induction, but can be used when there is a clear medical indication for induction.

**Do not confuse Pitocin with Pitressin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Uterine smooth muscle stimulant. **CLINICAL:** Oxytocic agent.

### USES

**Antepartum:** Induction of labor in pts with medical indication (e.g., at or near term), to stimulate reinforcement of labor, as adjunct in managing incomplete or inevitable abortion. **Postpartum:** To produce uterine contractions during third stage of labor and to control postpartum bleeding/hemorrhage.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to oxytocin. Adequate uterine activity that fails to progress, cephalopelvic disproportion, fetal distress without imminent delivery, grand multiparity, hyperactive or hypertonic uterus, obstetric emergencies that favor surgical intervention, prematurity, unengaged fetal head, unfavorable fetal position/presentation, when vaginal delivery is contraindicated (e.g., active genital herpes infection, invasive cervical cancer, placenta previa, cord presentation). **Cautions:** Induction of labor should be for medical, not elective, reasons. Generally not recommended in fetal distress, hydramnios,

partial placental previa, predisposition to uterine rupture.

### ACTION

Activates receptors that trigger increase in intracellular calcium levels in uterine myofibrils; increases prostaglandin production. **Therapeutic Effect:** Stimulates uterine contractions.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	Immediate	N/A	1 hr
IM	3–5 min	N/A	2–3 hrs

Rapidly absorbed through nasal mucous membranes. Protein binding: 30%. Distributed in extracellular fluid. Metabolized in liver, kidney. Primarily excreted in urine. **Half-life:** 1–6 min.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Used as indicated, not expected to present risk of fetal abnormalities. Small amounts in breast milk. Breastfeeding not recommended. **Children/Elderly:** Not used in these pt populations.

### INTERACTIONS

**DRUG:** Dinoprostone, misoprostol may increase adverse effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injection: (Pitocin):** 10 units/mL. **Injection Solution:** 30 units/500 mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • Dilute 10–40 units (1–4 mL) in 1,000 mL of 0.9% NaCl, lactated Ringer's, or D<sub>5</sub>W to provide concentration of 10–40 milliunits/mL solution.

**Rate of administration** • Give by IV infusion (use infusion device to carefully control rate of flow as ordered by physician).

**Storage** • Store at room temperature.

### IV INCOMPATIBILITIES

No known incompatibilities via Y-site administration.

### IV COMPATIBILITIES

Heparin, insulin (regular), multivitamins, potassium chloride, zidovudine.

## INDICATIONS/ROUTES/DOSAGE

### Induction or Stimulation of Labor

**IV: ADULTS:** 0.5–1 milliunit/min. May gradually increase in increments of 1–2 milliunits/min q30–60 minutes until desired contraction pattern is established. Rates greater than 9–10 milliunits/min are rarely required.

### Abortion

**IV: ADULTS: (Midterm elective abortion):** 10–20 milliunits/min. **Maximum:** 30 units/12-hr dose. **(Incomplete, inevitable, or elective abortion):** 10 units as IV infusion after suction or a sharp curettage.

### Control of Postpartum Bleeding

**IV infusion: ADULTS:** 5–10 units may be given initially and can be followed by a maintenance infusion of 10–40 units in 1,000 mL IV fluid at rate sufficient to sustain uterine contractions and control uterine atony.

**IM: ADULTS:** 10 units (total dose) after delivery.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** Tachycardia, premature ventricular contractions, hypotension, nausea, vomiting. **Rare:** **Nasal:** Lacrimation/tearing, nasal irritation, rhinorrhea, unexpected uterine bleeding/contractions.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypertonicity may occur with tearing of uterus, increased bleeding, abruptio placentae (i.e., placental abruption),

cervical/vaginal lacerations. **Fetal:** Bradycardia, CNS/brain damage, trauma due to rapid propulsion, low Apgar score at 5 min, retinal hemorrhage occur rarely. Prolonged IV infusion of oxytocin with excessive fluid volume has caused severe water intoxication with seizures, coma, death.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess baselines for vital signs, B/P, fetal heart rate. Determine frequency, duration, strength of contractions.

### INTERVENTION/EVALUATION

Monitor B/P, pulse, respirations, fetal heart rate, intrauterine pressure, contractions (duration, strength, frequency) q15min. Notify physician of contractions that last longer than 1 min, occur more frequently than every 2 min, or stop. Maintain careful I&O; be alert to potential water intoxication. Check for blood loss.

### PATIENT/FAMILY TEACHING

- Keep pt, family informed of labor progress.

## ozanimod

oh-zan-i-mod  
(Zeposia)

**Do not confuse ozanimod with fingolimod, ponesimod, or siponimod.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sphingosine 1-phosphate (S1P) receptor modulator. **CLINICAL:** Multiple sclerosis agent.

## USES

Treatment of relapsing forms of multiple sclerosis (MS) in adults, including clinically isolated syndrome,

relapsing-remitting disease, and active secondary progressive disease. Treatment of moderately to severely active ulcerative colitis in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ozanimod; recent (within 6 mos) MI; unstable angina; CVA; TIA; decompensated HF requiring hospitalization; NYHA class III/IV HF; sick sinus syndrome; Mobitz type II second- or third-degree AV block (unless pt has functioning pacemaker); severe, untreated sleep apnea; concomitant use of MAOIs. **Cautions:** Baseline lymphopenia; conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); baseline sinus bradycardia; hypertension; altered pulmonary function; pts at risk for developing AV block (congenital heart disease, ischemic heart disease, HF); pts at risk for macular edema (e.g., diabetes, history of uveitis); concomitant use of antiarrhythmics, beta blockers, calcium channel blockers. Not recommended with concomitant QT interval-prolonging medications, strong CYP2C8 inhibitors or inducers, breast cancer resistance protein (BCRP) inhibitors, adrenergic and serotonergic drugs (e.g., SSRI, SNRI, opioids), foods containing high amounts of tyramine. Not recommended in pts with severe active infection, history of cardiac arrest, hepatic impairment, cerebrovascular disease, uncontrolled hypertension.

## ACTION

Binds to S1P receptors 1 and 5, blocking capacity of lymphocytes to move out from lymph nodes, reducing the number of lymphocytes available to the CNS. **Therapeutic Effect:** May involve reduction of lymphocyte migration into the CNS, reducing inflammation.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%. Peak plasma

concentration: 6–8 hrs. Excreted in feces (37%), urine (26%). **Half-life:** 21 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not specified; use caution.

## INTERACTIONS

**DRUG:** Beta-blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil), ceritinib, lacosamide may increase risk of AV block, bradycardia. **Class III antiarrhythmics** (e.g., amiodarone, sotalol) may increase risk of Torsades de Pointes in pts with baseline sinus bradycardia. **QT-interval prolonging agents** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol) may enhance QT prolongation. May decrease therapeutic effect of BCG (intravesical), vaccines (live) varicella vaccines. **Strong CYP2C8 inhibitors** (e.g., gemfibrozil) may increase concentration/effect. **Strong CYP2C8 inducers** (e.g., rifampin) may decrease concentration/effect. **MAOIs** (e.g., phenelzine, selegiline), **SSRIs** (e.g., escitalopram, sertraline), **SNRIs** (e.g., duloxetine, venlafaxine) may increase risk of hypertensive crisis. **Alemtuzumab** may enhance immunosuppressive effect. May increase adverse/toxic effects of **natalizumab**. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Foods or beverages containing high amounts of tyramine (e.g., aged cheese, pickled herring, red wine) may cause release of norepinephrine, resulting hypertension. **LAB VALUES:** May increase serum ALT, AST, bilirubin. Expected to cause a dose-dependent reduction in peripheral

lymphocyte count to 45% of baseline values.

## AVAILABILITY (Rx)

**Capsules:** 0.23 mg, 0.46 mg, 0.92 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to meals. Administer capsule whole; do not break, cut, or crush.
- If a dose is missed during the first 2 wks of therapy, reinstitute treatment starting with day 1 of titration regimen. If a dose is missed after the first 2 wks of therapy, continue maintenance regimen.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis

**PO: ADULTS: Titration:** 0.23 mg once daily on days 1–4, then increase to 0.46 mg once daily on days 5–7, then increase to 0.92 mg once daily on day 8. **Maintenance:** 0.92 mg once daily.

### Ulcerative Colitis

**PO: ADULTS:** Initially, 0.23 mg once daily on days 1–4, then 0.46 mg once daily on days 5–7. **Maintenance:** 0.92 mg once daily starting on day 8.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not recommended.

## SIDE EFFECTS

**Rare (4%–2%):** Orthostatic hypotension, back pain, hypertension, abdominal pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening infections (bronchitis, laryngitis, pharyngitis, upper respiratory tract infection, UTI) may occur. Fatal cases of cryptococcal meningitis, disseminated cryptococcal infections were reported. Herpes zoster infections

reported in less than 1% of pts. Reactivation of herpes zoster infection may cause varicella zoster meningitis. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may evolve into an ischemic CVA or cerebral hemorrhage, may occur. Macular edema reported in less than 1% of pts. Pts with diabetes or history of uveitis are at an increased risk for developing macular edema. May result in transient bradycardia, AV conduction delays. Dose-dependent reductions of pulmonary function (absolute forced expiratory volume over 1 second) were reported. Hepatic injury (transaminitis) reported in 3–5% of pts. Severe exacerbation of disability, including rebound disease, may occur after discontinuation. Malignancies including basal cell carcinoma, breast cancer, melanoma, seminoma may occur. Hypersensitivity reactions including rash, urticaria were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, ECG. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Consultation with a cardiologist is advised in pts with QT interval prolongation greater than 450 msec in males or greater than 470 in females; arrhythmias requiring treatment with Class Ia or Class III antiarrhythmics; ischemic heart disease, HF, recent MI; history of Mobitz type II second- or third-degree AV block, sick sinus syndrome, sino-atrial heart block, cerebrovascular disease, uncontrolled hypertension. Pts without a documented history of vaccination against varicella zoster or a confirmed history of varicella infection (chickenpox) should be tested

for antibodies prior to initiation. A full vaccination course for varicella in antibody-negative pts is recommended prior to initiation. If live attenuated vaccine immunization is required, give at least 1 mo prior to initiation. Receive full medication history and screen for interaction. Question history as listed in PRECAUTIONS. Conduct ophthalmologic evaluation of the fundus (including the macula) prior to initiation. Withhold treatment in pts with active infection until resolved.

#### INTERVENTION/EVALUATION

Obtain LFT if hepatotoxicity (abdominal pain, clay-colored stool, amber or dark colored urine, jaundice, nausea) is suspected. During initiation, bradycardia and AV conduction delay is transient (initial effects lessened by titration). Conduct ophthalmic examination with any change of vision (or at regular intervals in pts with diabetes or history of uveitis). Pts with altered mental status, seizures, visual disturbances, unilateral weakness should be evaluated for cryptococcal meningitis, varicella zoster meningitis, posterior reversible encephalopathy syndrome, PML. Closely monitor for infections (body aches, cough, fever) during treatment and for at least 3 mos after discontinuation. If herpes zoster infection or other serious infection occurs, consider withholding treatment and initiate antimicrobial therapy. Closely monitor for adverse effects if other immunosuppressants are initiated within 3 mos after discontinuation. Monitor B/P for hypertension. Monitor for hypersensitivity reactions, new malignancies. Con-

duct neurological assessment. Assess for symptoms improvement of MS.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection. Report travel plans to possible endemic areas.
- Any changes of vision will require an immediate eye examination.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities or death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, loss of vision, seizures, weakness.
- Posterior reversible encephalopathy syndrome, a condition resulting in brain swelling and narrowing of blood vessels, may lead to stroke; report confusion, severe headache, loss of vision, seizures, weakness.
- Treatment may worsen high blood pressure or cause new cancers.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark colored urine, yellowing of the skin or eyes), lung problems (reduced lung function, shortness of breath), heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate).
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Severe worsening of MS symptoms may occur after stopping treatment.
- Avoid foods high in tyramine (aged, cured, fermented, pickled, smoked food).

## PACLitaxel

**HIGH  
ALERT**

**pak-li-tax-el**

(Abraxane, Apo-Paclitaxel )

**■ BLACK BOX ALERT ■** Myelosuppression is a major dose-limiting toxicity. Must be administered by certified chemotherapy personnel. Severe hypersensitivity reactions reported.

**Do not confuse PACLitaxel with DOCEtaxel, PARoxetine, or Paxil.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Taxane derivative, antimetabolic agent. **CLINICAL:** Antineoplastic.

### USES

**Conventional:** Treatment of node-positive breast cancer, metastatic breast cancer after failure of combination therapy or relapse within 6 mos of adjuvant therapy; subsequent therapy for advanced ovarian cancer or as first-line therapy (in combination with CISplatin). Treatment of AIDS-related Kaposi's sarcoma; non-small-cell lung cancer (NSCLC) as first-line therapy (in combination with CISplatin). **Abraxane:** Treatment of breast cancer after failure of combination chemotherapy or relapse within 6 mos of adjuvant chemotherapy. First-line treatment of metastatic adenocarcinoma of pancreas. Treatment of locally advanced or metastatic NSCLC. **OFF-LABEL:** Bladder, cervical, small-cell lung, head and neck cancers. Treatment of adenocarcinoma. **Abraxane:** Recurrent/persistent ovarian, fallopian tube, primary peritoneal cancers.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to PACLitaxel. Hypersensitivity to drugs developed with Cremophor EL (polyoxyethylated castor oil). Treatment of solid tumors with baseline neutrophil count less than 1,500 cells/mm<sup>3</sup>; treatment of Kaposi's sarcoma with baseline neutrophil count less than 1,000 cells/mm<sup>3</sup>.

**Cautions:** Baseline cytopenias, cardiovascular disease, pulmonary disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hepatic impairment, concomitant use of strong CYP3A inhibitors, strong CYP3A inducers.

### ACTION

Promotes microtubule assembly by enhancing action of tubulin dimers; stabilizes existing microtubules; inhibits their disassembly; interferes with late G<sub>2</sub> mitotic phase and inhibits cell ligation. **Therapeutic Effect:** Inhibits cellular mitosis; suppresses cell proliferation, and modulates immune response.

### PHARMACOKINETICS

Does not readily cross blood-brain barrier. Protein binding: 89%–98%. Metabolized in liver. Excreted in feces (71%), urine (14%). Not removed by hemodialysis. **Half-life:** 3-hr infusion: 13.1–20.2 hrs; 24-hr infusion: 15.7–52.7 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. May impair fertility in both females and males. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease effect. Bone marrow depressants (e.g., cladribine) may increase myelosuppression. Strong CYP2C8

**inhibitors (e.g., gemfibrozil)** may increase concentration/effect. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Herbs with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST, triglycerides.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution (Abraxane):** 100-mg vial. **Injection Solution:** 6 mg/mL (5-mL, 16.7-mL, 25-mL, 50-mL vials).

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Wear gloves during handling; if contact with skin occurs, wash hands thoroughly with soap, water. If contact with mucous membranes occurs, flush with water.

**PACLitaxel**

**Reconstitution** • Dilute with 250–1,000 mL 0.9% NaCl, D<sub>5</sub>W to final concentration of 0.3–1.2 mg/mL.

**Rate of administration** • Administer at rate per protocol (range: 1–96 hrs) through in-line filter not greater than 0.22 microns. • Monitor vital signs during infusion, esp. during first hour. • Discontinue administration if severe hypersensitivity reaction occurs.

**Storage** • Store unopened vials at room temperature. • Reconstituted solution is stable at room temperature for 72 hrs. • Store diluted solutions in bottles or plastic bags. Administer through polyethylene-lined administration sets (avoid plasticized PVC equipment or devices).

**Abraxane (PACLitaxel—Protein Bound)**

**Reconstitution** • Reconstitute each vial with 20 mL 0.9% NaCl to provide

concentration of 5 mg/mL. • Slowly inject onto inside wall of vial; gently swirl over 2 min to avoid foaming. • Inject appropriate amount into empty PVC-type bag.

**Rate of administration** • Infuse over 30 min. Do not use in-line filter.

**Storage** • Store unopened vials at room temperature. • Once reconstituted, use immediately but may refrigerate for up to 8 hrs.

**IV INCOMPATIBILITIES**

**◀ALERT▶** Data for Abraxane not known; avoid mixing with other medication.

Amphotericin B complex (Abelcet, AmBisome, Amphotec), DOXOrubicin liposomal (Doxil), hydrOXYzine (Vistaril), methylPREDNISolone (SOLU-Medrol), mitoXANTRONE (Novantrone).

**IV COMPATIBILITIES**

CARBOplatin (Paraplatin), CISplatin (Platinol AQ), cyclophosphamide (Cytosan), cytarabine (Cytosar), dacarbazine (DTIC-Dome), dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), HYDROmorphone (Dilaudid), lipids, magnesium sulfate, mannitol, methotrexate, morphine, ondansetron (Zofran), potassium chloride, vinBLASTine (Velban), vinCRISTine (Oncovin).

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Premedication with dexamethasone, diphenhydrAMINE, and cimetidine, famotidine, or ranITidine recommended. Refer to individual protocols.

**PACLitaxel (Conventional)**

**Ovarian Cancer**

**IV: ADULTS, ELDERLY: (Previously treated):** 135–175 mg/m<sup>2</sup>/dose over 3 hrs q3wks. **(Previously untreated):** 175 mg/m<sup>2</sup> over 3 hrs q3wks (in combination with CISplatin) or 135 mg/m<sup>2</sup> over 24 hrs q3wks (in combination with CISplatin).

**Breast Cancer (Adjuvant)**

**IV: ADULTS, ELDERLY:** 175 mg/m<sup>2</sup> over 3 hrs q3wks for 4 cycles (give sequentially following anthracycline-containing regimen).

**Breast Cancer (Metastatic/Relapsed)**

**IV: ADULTS, ELDERLY:** 175 mg/m<sup>2</sup> over 3 hrs q3wks.

**Non–Small-Cell Lung Cancer**

**IV: ADULTS, ELDERLY:** 135 mg/m<sup>2</sup> over 24 hrs q3wks (in combination with CISplatin) **or** 200 mg/m<sup>2</sup> q3wks for 4 cycles (in combination with pembrolizumab and carboplatin), followed by pembrolizumab maintenance therapy **or** 200 mg/m<sup>2</sup> (175 mg/m<sup>2</sup> for Asian pts) q3wks for 4–6 cycles (in combination with atezolizumab, bevacizumab, and CARBOplatin), followed by atezolizumab/bevacizumab maintenance therapy.

**Kaposi's Sarcoma (AIDS-Related)**

**IV: ADULTS, ELDERLY:** 135 mg/m<sup>2</sup>/dose over 3 hrs q3wks **or** 100 mg/m<sup>2</sup>/dose over 3 hrs q2wks.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment****Transaminase**

Level	Bilirubin	Dose
<b>24-HR INFUSION</b>		
Less than 2 times ULN	1.5 mg/dL or less	135 mg/m <sup>2</sup>
2 to less than 10 times ULN	1.5 mg/dL or less	100 mg/m <sup>2</sup>
Less than 10 times ULN	1.6–7.5 mg/dL or less	50 mg/m <sup>2</sup>
<b>3-HR INFUSION</b>		
Less than 10 times ULN	1.25 mg/dL or less	175 mg/m <sup>2</sup>
Less than 10 times ULN	1.26–2 times ULN	135 mg/m <sup>2</sup>
Less than 10 times ULN	2.01–5 times ULN	90 mg/m <sup>2</sup>
10 times ULN or greater	Greater than 5 times ULN	Avoid use

ULN: upper limit of normal

**Dose Modification**

Courses of PACLitaxel should be withheld until neutrophil count is 1,500 cells/mm<sup>3</sup>

or more, and platelet count is 100,000 cells/mm<sup>3</sup> or more.

**Abraxane (Protein Bound)****Breast Cancer (metastatic)**

**IV infusion: ADULTS, ELDERLY:** 260 mg/m<sup>2</sup> q3wks **or** 100 mg/m<sup>2</sup> on days 1, 8, 15 of a 28-day cycle (in combination with atezolizumab). Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Severe neutropenia (ANC less than 500 cells/mm<sup>3</sup> for 1 wk or longer); severe sensory neuropathy:** Reduce dose to 220 mg/m<sup>2</sup> for subsequent courses. **Recurrence of severe neutropenia, severe neuropathy:** Reduce dose to 180 mg/m<sup>2</sup> q3wks for subsequent courses. **CTCAE Grade 3 sensory neuropathy:** Hold until resolved to Grade 2 or 1, then reduce dose for subsequent courses. **Dosage of Abraxane for serum bilirubin greater than 1.5 mg/dL:** Dose unknown.

**NSCLC (Locally Advanced or Metastatic)**

**IV: ADULTS, ELDERLY:** 100 mg/m<sup>2</sup> on days 1, 8, 15 of each 21-day cycle (in combination with CARBOplatin) **or** 100 mg/m<sup>2</sup> on days 1, 8, 15 of a 28-day cycle (in combination with atezolizumab and CARBOplatin) for 4–6 cycles, followed by atezolizumab maintenance therapy **or** 100 mg/m<sup>2</sup> on days 1, 8, 15 of a 28-day cycle (in combination with pembrolizumab and CARBOplatin) for 4 cycles, followed by pembrolizumab maintenance therapy.

**Adenocarcinoma of Pancreas (Metastatic) (in Combination With Gemcitabine)**

**IV: ADULTS, ELDERLY:** 125 mg/m<sup>2</sup> on days 1, 8, 15 of each 28-day cycle (in combination with gemcitabine).

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

	Mild Impairment (AST less than 10 times upper limit of normal [ULN], bilirubin 1.25 times ULN or less)		Severe Impairment (AST less than 10 times ULN, bilirubin 2.01–5 times ULN)	
		Moderate Impairment (AST less than 10 times ULN, bilirubin 1.26–2 times ULN)		(AST more than 10 times ULN or bilirubin > 5 times ULN)
Breast cancer	No adjustment	Reduce dose to 200 mg/m <sup>2</sup>	Reduce dose to 130 mg/m <sup>2</sup> (may increase to 200 mg/m <sup>2</sup> in subsequent cycles)	Not recommended
NSCLC	No adjustment	Reduce dose to 75 mg/m <sup>2</sup>	Reduce dose to 50 mg/m <sup>2</sup> (may increase to 75 mg/m <sup>2</sup> in subsequent cycles)	Not recommended
Pancreatic	No adjustment	Not recommended	Not recommended	Not recommended

**SIDE EFFECTS**

**Expected (90%–70%):** Diarrhea, alopecia, nausea, vomiting. **Frequent (48%–46%):** Myalgia, arthralgia, peripheral neuropathy. **Occasional (20%–13%):** Mucositis, hypotension during infusion, pain/redness at injection site. **Rare (3%):** Bradycardia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including febrile neutropenia, sepsis may occur. Infections (candidiasis, respiratory tract infections, pneumonia) reported in 24% of pts. Pts with hepatic impairment may have increased risk of myelosuppression. Severe neuropathy was reported. Ocular toxicities (blurry vision, keratitis) reported in 10% of pts. Fatal interstitial lung disease (ILD), pneumonitis reported in 4% of pts. Severe hypersensitivity reactions, including anaphylaxis, may occur. Severe cardiovascular events (cardiac ischemia/infarction, chest pain, cardiac arrest, CVA, edema, hypertension, pulmonary embolism, SVT, transient ischemic attack, thrombosis) were reported.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC, LFT prior to each course; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Screen for active infection. Question history of cardiovascular disease, pulmonary disease, hepatic impairment. Receive full medication history and screen for interactions. Assess hydration status. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression; LFT for hepatotoxicity. Monitor for symptoms of hepatotoxicity (abdominal pain, jaundice, nausea, vomiting, weight loss) esp. in pts with hepatic impairment. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for infections (cough, fatigue, fever). Monitor daily pattern of bowel activity, stool consistency. Monitor for ocular toxicities, hypersensitivity reactions. Monitor for symptoms of DVT (leg or arm pain/swelling), CVA (aphasia, altered mental status, headache, hemiplegia, vision loss); MI (chest

pain, dyspnea, syncope, diaphoresis, arm/jaw pain), PE (chest pain, dyspnea, tachycardia).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- Life-threatening blood clots may occur; report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, one-sided weakness or paralysis, difficulty speaking), heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm or jaw, sweating).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report any vision changes, eye redness.
- Maintain proper hydration and nutrition.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Report allergic reactions of any kind.

## palbociclib

pal-boe-sye-klib  
(Ibrance)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cyclin-dependent kinase inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Used in combination with an aromatase inhibitor (e.g., letrozole) for treatment

of postmenopausal women and adult men with estrogen receptor–positive, human epidermal growth factor receptor 2 (*HER2*)–negative advanced breast cancer as initial endocrine-based therapy for metastatic disease or in combination with fulvestrant in women with disease progression following endocrine therapy.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to palbociclib. **Cautions:** Baseline cytopenias. History of pulmonary embolism. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

#### ACTION

Reduces proliferation of breast cancer cell lines by preventing cellular progression from G1 into S phase of cell cycle. Combination with an aromatase inhibitor provides increased inhibition. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 85%. Peak plasma concentration: 6–12 hrs. Steady state reached in 8 days. Excreted in feces (74%), urine (18%). **Half-life:** 29 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Treatment is indicated for postmenopausal women. However, treatment may cause fetal harm when administered during pregnancy. Females of reproductive potential should use effective contraception during treatment and up to 2 wks after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. Not indicated for this pt population. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g.,

dilTIAZem, fluconazole, verapamil) may increase concentration/effect. **Strong CYP3A inducers** (e.g., carbAMazepine, rifAMPin), **moderate CYP3A inducers** (e.g., naficillin) may decrease concentration/effect. May decrease the therapeutic effect of **vaccines (live)**. May increase adverse/toxic effects of **natalizumab, vaccines (live)**. **HERBAL:** St. John's wort may decrease concentration/effect. **Echinacea** may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease Hgb, lymphocytes, neutrophils, platelets, WBC.

**AVAILABILITY (Rx)**

**Capsules:** 75 mg, 100 mg, 125 mg.

**ADMINISTRATION/HANDLING**

**PO**

- Give with food.
- Administer whole; do not break, crush, cut, or open capsule.
- If vomiting occurs after dosing, do not readminister dose; give next dose at next scheduled time.

**INDICATIONS/ROUTES/DOSAGE**

**Breast Cancer (Initial Endocrine-Based Therapy)**

**PO: ADULTS, ELDERLY:** 125 mg once daily for 21 days, followed by a 7-day rest period to complete a 28-day cycle. Use in combination with an aromatase inhibitor (e.g., letrozole) once daily throughout 28-day cycle. Continue until disease progression or unacceptable toxicity.

**Breast Cancer (Disease Progression)**

**PO: ADULTS, ELDERLY:** 125 mg once daily for 21 days, then 7 days off. Repeat q28 days (in combination with fulvestrant [and an LHRH agonist (e.g., goserelin) if pre- or perimenopausal]). Continue until disease progression or unacceptable toxicity.

**Dose Reduction for Adverse Events**

Dose Level	Dose
Recommended starting dose	125 mg/day
First dose reduction	100 mg/day
Second dose reduction	75 mg/day

**Dose Level**

Unable to tolerate 75 mg/day

**Dose**

Permanently discontinue

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Hematologic Toxicities**

**Grade 1 or 2:** No dose adjustment. **Grade 3 (except lymphopenia unless associated with clinical events [e.g., opportunistic infection]):** No dose adjustment. Withhold treatment until recovery to less than Grade 2. **Grade 3, ANC 500–1000 cells/mm<sup>3</sup> plus fever that is greater than or equal to 38.5°C and/or active infection:** Interrupt treatment (and initiation of the next cycle) until recovery to Grade 2 or less. Resume at reduced dose upon starting.

**Nonhematologic Toxicities**

**Grade 1 or 2:** No dose adjustment. **Grade 3 or greater (if persistent despite optimal medical management):** Interrupt treatment until resolved to Grade 1 or less; Grade 2 or less if the event is not considered a serious medical risk. Resume at reduced dose upon starting.

**Concomitant Use of Strong CYP3A Inhibitors**

**PO: ADULTS, ELDERLY:** 75 mg once daily if unable to use alternative drug with minimal CYP3A inhibition. If CYP3A inhibitor is discontinued, increase palbociclib dose (after 3–5 half-lives of CYP3A inhibitor have elapsed) to the dose used prior to initiating strong CYP3A inhibitor.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not studied; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not studied; use caution.

**SIDE EFFECTS**

**Frequent (41%–21%):** Fatigue, nausea, alopecia, diarrhea. **Occasional (16%–**

✦ Canadian trade name

 Non-Crushable Drug

 High Alert drug

**13%):** Decreased appetite, vomiting, asthenia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Grade 3 neutropenia reported in 57% of pts. The median onset of neutropenia was 15 days. Pulmonary embolism (5% of pts); upper respiratory tract infections including influenza, laryngitis, nasopharyngitis, pharyngitis, rhinitis, sinusitis (31% of pts); peripheral neuropathy (31% of pts); cheilitis, glossitis, glossodynia, mouth ulceration, stomatitis (25% of pts); epistaxis (11% of pts) were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC; pregnancy test in females of reproductive potential. Confirm estrogen receptor–positive, *HER2*-negative status. Screen for history of pulmonary embolism. Receive full medication history and screen for interactions. Assess hydration status. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC at start of each cycle and on day 14 on the first two cycles. If any Grade 3 or 4 hematologic toxicity occurs, repeat CBC 7 days after interruption of therapy and at start of next cycle. If neutropenia occurs specifically, recommend treatment interruption, dose reduction, or delay in starting treatment for next cycle. Monitor for neurotoxicity (peripheral neuropathy), epistaxis. If chest pain, dyspnea, tachycardia occurs, provide supplemental O<sub>2</sub> and obtain radiologic testing to rule out pulmonary embolism.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.

- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Immediately report chest pain, difficult breathing, fast heart rate, rapid breathing; may indicate life-threatening blood clot in the lungs.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Drink plenty of fluids.
- Do not ingest grapefruit products or herbal supplements.

## paliperidone

TOP  
100

pal-ee-per-i-done  
(Invega, Invega Sustenna, Invega Trinza)

**Do not confuse Invega with Intuniv.**

**BLACK BOX ALERT** Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzisoxazole derivative. **CLINICAL:** Second-generation (atypical) antipsychotic.

## USES

**PO:** Treatment of schizophrenia. **PO, IM:** Treatment of schizoaffective disorder. **OFF-LABEL:** Treatment of irritability associated with autistic disorder.

## PRECAUTIONS

**Contraindications:** Sensitivity to paliperidone, risperidone. **Cautions:** History of cardiac arrhythmias, mild renal impairment (not recommended in moderate to severe impairment), HF, active seizures or predisposition to seizures, history of seizures, cardiovascular disease, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), pts at risk for aspiration pneumonia. May increase risk of stroke in pts with dementia-related psychosis. CNS depression,

concomitant use of antihypertensives, hypovolemia or dehydration, high risk for suicide. Pts with breast cancer, other prolactin-dependent tumors; children, adolescents.

## ACTION

May be a result of mixed central DOPamine and serotonin antagonism. **Therapeutic Effect:** Improves negative symptoms of psychosis; reduces incidence of extrapyramidal side effects.

## PHARMACOKINETICS

Absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. **Half-life:** 23 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Potential for orthostatic hypotension. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** May decrease effects of **DOPamine agonists, levodopa. Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem)** may increase CNS depression. **Strong CYP3A4 inducers (e.g., carbAMazepine, phenytoin, rifAMPin)** may decrease concentration/effect. **QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol)** may increase risk of QTc interval prolongation. **HERBAL:** **St. John's wort** may decrease concentration/effect. **Herbals with sedative properties (e.g., chamomile, kava kava, valerian)** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum creatine phosphatase, uric acid, triglycerides, ALT, AST, prolactin. May decrease serum potassium, sodium, protein, glucose.

## AVAILABILITY (Rx)

**Injection Suspension:** (*Invega Sustenna*): 39 mg/0.25 mL, 78 mg/0.5 mL, 117 mg/0.75

mL, 156 mg/mL, 234 mg/1.5 mL. (*Invega Trinza*): 273 mg, 410 mg, 546 mg, 819 mg.

 **Tablets, Extended-Release:** 1.5 mg, 3 mg, 6 mg, 9 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.
- Do not break, crush, dissolve, or divide extended-release tablets.

### IM

- Administer both initial injections (first injection on day 1 and the second injection 1 wk later) into deltoid muscle (helps attain therapeutic concentration rapidly).
- Maintenance doses may be given in gluteal or deltoid muscle.

## INDICATIONS/ROUTES/DOSAGE

### Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 6 mg once daily. May increase dose in increments of 3 mg/day at intervals of more than 5 days. Range: 6–12 mg/day. **ADOLESCENTS 18 YRS AND OLDER:** Usual dose: 6 mg once daily. May increase in increments of 3 mg/day at intervals of 5 days or more. **Maximum:** 12 mg/day. **CHILDREN 12 YRS AND OLDER, ADOLESCENTS YOUNGER THAN 18 YRS:** 3 mg once daily (titration not necessary). May increase in increments of 3 mg/day at intervals of 5 days or more. **Maximum:** (Less than 51 kg): 6 mg/day. (51 kg or greater): 12 mg/day.

**IM: (*Invega Sustenna*): ADULTS, ELDERLY:** Initially, 234 mg on day 1 followed by 156 mg 1 wk later (second dose may be given 4 days before or after the wklly time point). **Maintenance:** 39–234 mg monthly starting 5 wks after initial dose (may adjust monthly based on response and tolerability). Monthly maintenance dose may be given 7 days before or after the monthly time point. (*Invega Trinza*): 273 mg to 819 mg q3mos (based on last dose of *Invega Sustenna*). Three-month IM used only after monthly IM dose established for at least 4 mos. The last 2 mos of monthly IM should be the same dosage strength before starting 3-mo injections.

Adjustments can be made q3mos based on response and tolerability.

### Schizoaffective Disorder

**PO: ADULTS, ELDERLY:** 6 mg once daily in the morning. May increase in increments of 3 mg/day at intervals of 5 days or more. Range: 6–12 mg/day. **ADOLESCENTS 18 YRS AND OLDER:** Usual dose: 6 mg once daily. May increase in increments of 3 mg/day at intervals of 5 days or more. **Maximum:** 12 mg daily.

**IM: ADULTS, ELDERLY, ADOLESCENTS 18 YRS AND OLDER:** Initially, 234 mg, then 156 mg 1 wk later. **Maintenance range:** 39–234 mg monthly starting 5 wks after initial dose (may adjust monthly based on response and tolerability). May be given 7 days before or after the monthly time point.

### Dosage in Renal Impairment

#### Creatinine

Clearance	Oral Dosage	IM Dosage
50–79 mL/min	Initially, 3 mg/d Maximum: 6 mg/d	Initially, 156 mg, then 117 mg 1 wk later, then 78 mg monthly
10–49 mL/min	Initially, 1.5 mg/d Maximum: 3 mg/d	Not recommended
Less than 10 mL/min	Not recommended	Not recommended

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (14%–4%):** Tachycardia, headache, drowsiness, akathisia, anxiety, dizziness, dyspepsia, nausea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Neuroleptic malignant syndrome (NMS), hyperpyrexia, muscle rigidity, change in mental status, unstable pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, acute renal failure, tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of mouth) may occur rarely. May prolong QT interval.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Screen for comorbidities as listed in Precautions.

### INTERVENTION/EVALUATION

Monitor B/P, heart rate, weight, renal function tests, ECG. Monitor for fine tongue movement (may be first sign of tardive dyskinesia). Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor for potential neuroleptic malignant syndrome (fever, muscle rigidity, unstable B/P or pulse, altered mental status).

### PATIENT/FAMILY TEACHING

- Avoid tasks that may require alertness, motor skills until response to drug is established.
- Use caution when changing position from lying or sitting to standing.
- Report trembling in fingers, altered gait, unusual muscle/skeletal movements, palpitations, severe dizziness, fainting, swelling/pain in breasts, visual changes, rash, difficulty in breathing.

## palonosetron

pal-oh-noe-se-tron

(Aloxi)

**Do not confuse Aloxi with Eloxatin or oxaliplatin, or palonosetron with dolasetron, granisetron, or ondansetron.**

### FIXED-COMBINATION(S)

**Akynzeo:** palonosetron/netupitant (a substance P/neurokinin receptor antagonist): 0.5 mg/300 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective 5-HT<sub>3</sub> receptor antagonist. **CLINICAL:** Antiemetic.

## USES

Prevention of acute and delayed nausea/vomiting associated with initial/repeated courses of moderately or highly emetogenic chemotherapy. Prevention of postop nausea/vomiting for up to 24 hrs following surgery.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to palonosetron. **Cautions:** History of cardiovascular disease; pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), pts at risk for ventricular arrhythmias.

## ACTION

Antagonizes 5-HT<sub>3</sub> receptors, blocking serotonin on both peripheral and vagal nerve terminals in chemoreceptor trigger zone. **Therapeutic Effect:** Decreases episodes of nausea/vomiting associated with chemotherapy or postoperative recovery.

## PHARMACOKINETICS

Protein binding: 52%. Metabolized in liver. Excreted in urine. **Half-life:** 40 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** FentaNYL, lithium, MAOIs (e.g., phenelzine, selegiline), SNRIs (e.g., DULoxetine, venlafaxine), SSRIs (e.g., citalopram, FLUoxetine, sertraline), tricyclic antidepressants (e.g., amitriptyline, doxepin) may increase risk of serotonin syndrome. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin,

haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May transiently increase serum bilirubin, ALT, AST.

## AVAILABILITY (Rx)

**Injection Solution:** 0.25 mg/5 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Give undiluted as IV push.

**Rate of administration** • Give IV push over 30 sec. Children: Infuse over 15 min. • Flush IV line with 0.9% NaCl before and following administration.

**Storage** • Store at room temperature. Solution should appear colorless, clear. Discard if cloudy precipitate forms.

## IV COMPATIBILITIES

Famotidine (Pepcid), LORazepam (Ativan), midazolam (Versed), potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

### Chemotherapy-Induced Nausea/Vomiting

**IV: ADULTS, ELDERLY:** 0.25 mg as single dose 30 min before starting chemotherapy. **CHILDREN 1 MO TO YOUNGER THAN 17 YRS:** 20 mcg/kg as single dose 30 min before starting chemotherapy. **Maximum:** 1.5 mg.

### Postop Nausea/Vomiting

**IV: ADULTS, ELDERLY:** 0.075 mg over 10 sec immediately before induction of anesthesia.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (9%–5%):** Headache, constipation. **Rare (less than 1%):** Diarrhea, dizziness, fatigue, abdominal pain, insomnia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce combination of CNS stimulation, depressant effects.

May prolong QT interval. 5-HT<sub>3</sub> receptor antagonists are known to potentiate serotonin syndrome, esp. in pts taking serotonergic medications.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, serum magnesium in pts at risk for hypokalemia, hypomagnesemia, QT interval prolongation. Assess for signs of dehydration due to excessive vomiting (poor skin turgor, dry mucous membranes). Question history of cardiac disease, long QT syndrome, cardiac arrhythmias. Screen for concomitant home medications that prolong QT interval, increase risk of serotonin syndrome.

### INTERVENTION/EVALUATION

Monitor BMP, serum magnesium; ECG in pts suspected of arrhythmia, QT interval prolongation. Monitor for nausea/vomiting. Assess for symptoms of serotonin syndrome (e.g., altered mental status, tachycardia, labile B/P, diaphoresis, hyperthermia, tremor, hyperreflexia, diarrhea, seizures). Monitor for hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Report symptoms of serotonin overproduction such as confusion, excessive talking, fever, hallucinations, headache, hyperactivity, insomnia, racing thoughts, seizure activity, sexual dysfunction, tremors.
- Report persistent vomiting.
- Report palpitations, light-headedness, fainting; allergic reactions of any kind.

## pamidronate

pam-id-roe-nate

**Do not confuse pamidronate with alendronate, ibandronate, or risedronate.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Bisphosphonate. **CLINICAL:** Hypocalcemic.

## USES

Treatment of moderate to severe hypercalcemia associated with malignancy (with/without bone metastases). Treatment of moderate to severe Paget's disease. Treatment of osteolytic bone lesions of multiple myeloma or bone metastases of breast cancer. **OFF-LABEL:** Inhibition of bone resorption in osteogenesis imperfecta. Treatment of bone metastases of thyroid cancer. Prevention of bone loss associated with androgen deprivation treatment in prostate cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to pamidronate, other bisphosphonates (e.g., risedronate, alendronate). **Cautions:** Baseline cytopenias, renal impairment, concurrent use with other nephrotoxic medications, history of thyroid surgery.

## ACTION

Inhibits bone resorption, decreases mineralization by disrupting activity of osteoclasts. **Therapeutic Effect:** Lowers serum calcium concentration.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	24–48 hrs	3–7 days	N/A

Rapidly absorbed by bone. Excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 21–35 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta. Recommend discontinuation of drug as early as possible before a planned pregnancy. Unknown if fetal harm can occur. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May become overhydrated. Careful monitoring of fluid and electrolytes indicated; recommend dilution in smaller volume.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., diclofenac, meloxicam, naproxen) may increase adverse/

toxic effects (e.g., increased risk of ulcer). **Proton pump inhibitors** (e.g., omeprazole, pantoprazole) may decrease effect. **Aminoglycosides** (e.g., gentamicin) may increase risk of hypokalemia. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 30 mg, 90 mg. **Injection Solution:** 3 mg/mL, 6 mg/mL, 9 mg/mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each vial with 10 mL Sterile Water for Injection to provide concentration of 3 mg/mL or 9 mg/mL. • Allow drug to dissolve before withdrawing. • Dilute in 250–1,000 mL bag containing 0.45% or 0.9% NaCl or D<sub>5</sub>W (1,000 mL for hypercalcemia of malignancy, 500 mL for Paget's disease, multiple myeloma, 250 mL for breast cancer). **Rate of administration** • Adequate hydration is essential in conjunction with pamidronate therapy (avoid overhydration in pts with potential for HF). • Administer as IV infusion over 2–24 hrs for treatment of hypercalcemia; over 2 hrs for breast cancer; over 4 hrs for Paget's disease or multiple myeloma.

**Storage** • Store at room temperature. • Reconstituted vial is stable for 24 hrs if refrigerated; IV solution is stable for 24 hrs after dilution.

## IV INCOMPATIBILITIES

Calcium-containing IV fluids.

## INDICATIONS/ROUTES/DOSAGE

### Hypercalcemia of Malignancy

**IV infusion: ADULTS, ELDERLY: Moderate hypercalcemia (corrected serum calcium level 12–13.5 mg/dL):** 60–90 mg as a single dose over 2–24 hrs. **Severe hypercalcemia (corrected serum calcium level greater than 13.5 mg/dL):** 90 mg as a single dose over 2–24 hrs.

### Paget's Disease

**IV infusion: ADULTS, ELDERLY:** 30 mg/day over 4 hrs for 3 consecutive days. May retreat if clinically indicated.

### Osteolytic Bone Lesion (Multiple Myeloma)

**IV infusion: ADULTS, ELDERLY:** 90 mg over 4 hrs once monthly.

### Osteolytic Bone Metastases (Breast Cancer)

**IV infusion: ADULTS, ELDERLY:** 90 mg over 2 hrs q3–4wks.

### Dosage in Renal Impairment

Not recommended.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (27%–18%):** Temperature elevation (at least 1°C) 24–48 hrs after administration; erythema, swelling, induration, pain at catheter site in pts receiving 90 mg; anorexia, nausea, fatigue. **Occasional (10%–1%):** Constipation, rhinitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypophosphatemia, hypokalemia, hypomagnesemia, hypocalcemia occur more frequently with higher dosages. Anemia, hypertension, tachycardia, atrial fibrillation, drowsiness occur more frequently with 90-mg doses. GI hemorrhage occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, serum calcium, ionized calcium, magnesium, phosphate; renal function test level prior to therapy. Assess hydration status.

### INTERVENTION/EVALUATION

Monitor serum calcium, ionized calcium, potassium, magnesium, creatinine, CBC. Provide adequate hydration; assess overhydration. Monitor I&O; assess lungs for crackles, dependent body parts for edema.

Monitor B/P, temperature, pulse. Assess catheter site for redness, swelling, pain. Monitor food intake, daily pattern of bowel activity, stool consistency. Monitor for potential GI hemorrhage with 90-mg dosage.

#### PATIENT/FAMILY TEACHING

- Report symptoms of low blood calcium levels, including confusion, muscle twitching/cramps, numbness, seizures, tingling, jaw pain.
- Immediately report GI bleeding.

## panitumumab

pan-i-toom-ue-mab  
(Vectibix)

**BLACK BOX ALERT** 90% of pts experience dermatologic toxicities (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, skin fissures, abscess). Severe infusion reactions (anaphylaxis, bronchospasm, fever, chills, hypotension), fatal reactions have occurred.

**Do not confuse panitumumab with daratumumab, necitumumab, ofatumumab.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor, monoclonal antibody.  
**CLINICAL:** Antineoplastic.

#### USES

Treatment of wild-type RAS metastatic colorectal cancer either as first-line therapy in combination with FOLFOX or as monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, or irinotecan-based regimens.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to panitumumab. **Cautions:** Baseline electrolyte imbalance (esp. hypomagnesemia, hypokalemia), pulmonary disease, ocular disease, dehydration, skin disease (e.g.,

poorly healed wounds, skin fissures), elderly. Not indicated in pts with RAS-mutant metastatic colorectal cancer or for whom RAS mutation status is unknown.

#### ACTION

Binds specifically to epidermal growth factor receptor (EGFR) and competitively inhibits binding of epidermal growth factor. Blocks activation of intracellular tyrosine kinase. **Therapeutic Effect:** Inhibits tumor cell growth, survival, and proliferation.

#### PHARMACOKINETICS

Clearance varies by body weight, gender, tumor burden. **Half-life:** 3–10 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 2 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects, severe diarrhea.

#### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, calcium.

#### AVAILABILITY (Rx)

**Injection Solution:** 20 mg/mL vial (5-mL, 20-mL vials).

#### ADMINISTRATION/HANDLING

**ALERT** Do not give by IV push or bolus. Use low protein-binding 0.2- or 0.22-micron in-line filter. Flush IV line before and after chemotherapy administration with 0.9% NaCl.

**Reconstitution** • Dilute in 100–150 mL 0.9% NaCl to provide concentration of 10 mg/mL or less. • Do not shake

solution. Invert gently to mix. • Discard any unused portion.

**Rate of administration** • Give as IV infusion over 60 min. • Infuse doses greater than 1,000 mg over 90 min.

**Storage** • Refrigerate vials. • After dilution, solution may be stored for up to 6 hrs at room temperature, up to 24 hrs if refrigerated. • Discard if discolored, but solution may contain visible, translucent-to-white particulates (will be removed by in-line filter).

## IV INCOMPATIBILITIES

Do not mix with dextrose solutions or any other medications.

## INDICATIONS/ROUTES/DOSAGE

**ALERT** Stop infusion immediately in pts experiencing severe infusion reactions.

### Metastatic Colorectal Cancer

**IV infusion: ADULTS, ELDERLY:** 6 mg/kg once q14 days as a single agent or in combination with FOLFOX (fluorouracil, leucovorin, and oxaliplatin). Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Infusion Reactions

**Mild to moderate reactions:** Reduce infusion rate by 50% for remainder of infusion. **Severe reactions:** Discontinue infusion. Depending on severity, consider permanent discontinuation.

### Skin Toxicity

For all Grade 3 skin toxicities, withhold treatment for 1–2 doses until improved to Grade 2 or less, then reduce dose as follows: **First occurrence of Grade 3:** Resume at same dose. **Second occurrence of Grade 3:** Reduce dose to 80% of initial dose. **Third occurrence of Grade 3:** Reduce dose to 60% of initial dose. **Fourth occurrence of Grade 3:** Permanently discontinue.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (66%–17%):** Erythema, pruritus, fatigue, nausea, rash, diarrhea, vomiting, dyspnea, pyrexia. **Occasional (15%–6%):** Cough, acne, dry skin, stomatitis, mucosal inflammation, growth of eyelashes.

## ADVERSE EFFECTS/TOXIC REACTIONS

Dermatologic toxicities (acneiform dermatitis, erythema, paronychia, pruritus, rash, skin exfoliation, fissures) reported in 90% of pts. Fatal cutaneous or soft issue toxicities including abscesses, bullous mucocutaneous disease, necrotizing fasciitis, sepsis may occur. Sunlight/UV exposure may worsen dermatologic toxicities. May cause electrolyte depletion (hypomagnesemia, hypokalemia). Grade 3 or 4 infusion reactions (bronchospasm, chills, dyspnea, hypotension) reported in 4% of pts. Severe diarrhea may lead to dehydration, acute renal failure. Fatal interstitial lung disease (ILD), pneumonitis reported in 1% of pts. Ocular toxicities (keratitis, ulcerative keratitis, corneal perforation) may occur. Increased mortality/toxicity was reported when therapy used in combination with bevacizumab and chemotherapy. Immunogenicity (auto-panitumumab antibodies) reported in less than 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum magnesium, potassium; pregnancy test in females of reproductive potential. Screen for active infection. Question history of pulmonary/ocular/skin disease. Conduct dermatologic exam. Review occurrence of prior infusion reactions prior to each dose. Assess usual bowel movement patterns, stool characteristics. Assess and correct hydration status. Offer emotional support. Assess *KRAS* mutational status in colorectal tumors and confirm the absence of a *RAS* mutation.

**INTERVENTION/EVALUATION**

Monitor serum magnesium, potassium periodically and for 8 wks after discontinuation. Monitor serum electrolytes if severe diarrhea occurs. Replete electrolytes as clinically indicated. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Monitor daily pattern of bowel activity, stool consistency. Diarrhea must be treated promptly to reduce occurrence of severe dehydration, acute renal failure. Diligently assess for ocular toxicities (redness, pain of eye; dry eye, change of vision); skin for cutaneous and soft tissue toxicities.

**PATIENT/FAMILY TEACHING**

- Severe infusion reaction may occur; report chills, difficulty breathing, dizziness, fever.
- Diarrhea may cause dehydration, electrolyte imbalance, low blood pressure, kidney injury, and may be life-threatening. Drink plenty of fluids. Report diarrhea or dehydration that does not improve with medical management.
- Report toxic skin reactions (abscess, itching, peeling, rash, redness, sloughing, swelling); kidney problems (decreased urine output, flank pain, darkened urine), symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); eye problems (redness, pain of eye; dry eye, change of vision).
- Limit sunlight, UV exposure. Wear protective sunscreen, hats, clothing when outdoors.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

**panobinostat**

pan-oh-bin-oh-stat  
(Farydak)

**BLACK BOX ALERT** Severe diarrhea reported in 25% of pts. If diarrhea occurs, interrupt treatment, initiate antidiarrheal therapy, then reduce or discontinue treatment. Severe and/or fatal cardiac arrhythmias, cardiac ischemic events, ECG changes may occur. Electrolyte abnormalities may increase risk of arrhythmias. Obtain ECG, serum electrolytes at baseline and monitor during treatment.

**Do not confuse panobinostat with febusostat or pentostatin.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Histone deacetylase (HDAC) inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Used in combination with bortezomib and dexamethasone for treatment of pts with multiple myeloma who have received at least 2 prior regimens, including bortezomib and an immunomodulatory agent.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to panobinostat. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia). Not recommended in pts with recent MI or unstable angina, severe hepatic impairment. Concurrent use of strong CYP3A inhibitors and/or CYP3A inducers, CYP2D6 substrates not recommended. Avoid use in pts with active infection.

**ACTION**

Inhibits enzymatic activity of histone deacetylase. Increases acetylation of histone proteins, resulting in cell cycle arrest and/or cellular death (apoptosis). **Therapeutic Effect:** Inhibits tumor growth and survival.

**PHARMACOKINETICS**

Widely distributed. Extensively metabolized. Protein binding: 90%. Peak plasma concentration: 2 hrs. Excreted in feces (44%–77%), urine (29%–51%). **Half-life:** 37 hrs.

**🕒 LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations.

Females of reproductive potential should use effective contraception during treatment and up to 1 mo after discontinuation. Unknown if distributed in breast milk. **Males:** Males should use condoms during sexual activity during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (e.g., cardiac/GI/hematologic toxicities).

## INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, rifampin) may decrease concentration/effect. May increase concentration/effects of CYP2D6 substrates (e.g., metoprolol, venlafaxine). QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. May decrease the therapeutic effect; increase adverse effects of vaccines (live). May increase the adverse/toxic effect of natalizumab. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease Hct, Hgb, leukocytes, lymphocytes, neutrophils, platelets; serum albumin, calcium, potassium, sodium. May increase serum bilirubin, creatinine, magnesium. May increase or decrease phosphate.

## AVAILABILITY (Rx)

**Capsules:** 10 mg, 15 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food; avoid grapefruit products (dexamethasone should be given with food to decrease GI upset).
- Administer capsule whole; do not break, cut, crush, or open.
- If vomiting

occurs after dosing, do not readminister dose; give dose at next scheduled time.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma

**PO: ADULTS, ELDERLY:** 20 mg once every other day for 3 doses/wk during wk 1 and 2 of each 21-day cycle for up to 8 cycles, in combination with bortezomib and dexamethasone. Consider continuing treatment for additional 8 cycles based on tolerability. **Total duration:** Up to 16 cycles (48 wks). **Recommended dose of bortezomib:** 1.3 mg/m<sup>2</sup> as injection/day per dosing schedule. **Recommended dose of dexamethasone:** 20 mg orally/day on a full stomach per dosing schedule.

### Dosing Schedule for Cycles 1–8 of 21-Day Cycle

**Wk 1:** Panobinostat: days 1, 3, 5. Bortezomib: days 1, 4. Dexamethasone: days 1, 2, 4, 5. **Wk 2:** Panobinostat: days 8, 10, 12. Bortezomib: days 8, 11. Dexamethasone: days 8, 9, 11, 12. **Wk 3:** Rest period (all 3 drugs).

### Dosing Schedule for Cycles 9–16 of 21-Day Cycle

**Wk 1:** Panobinostat: days 1, 3, 5. Bortezomib: day 1 only. Dexamethasone: days 1, 2. **Wk 2:** Panobinostat: days 8, 10, 12. Bortezomib: day 8 only. Dexamethasone: days 8, 9. **Wk 3:** Rest period (all 3 drugs).

### Dose Reduction for Adverse Events

If reduction required, reduce panobinostat in increments of 5 mg. If the reduced dose is less than 10 mg 3 times/wk, discontinue treatment. Keep same schedule (21-day cycle) when dose reduced.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Thrombocytopenia

**Grade 3:** No dose adjustment. (**Bortezomib**): No dose adjustment. **Grade 3 with bleeding/Grade 4:** Interrupt treatment until platelet count 50,000

cells/mm<sup>3</sup> or greater, then resume at reduced dose. (**Bortezomib**): Interrupt bortezomib until platelet count 75,000 cells/mm<sup>3</sup> or greater. If only 1 dose was held prior to resolution of platelet count, resume bortezomib at same dose. If more than 2 doses were held consecutively, resume bortezomib at reduced dose.

#### Neutropenia

**Grade 3:** No dose adjustment. (**Bortezomib**): No dose adjustment. **Two or more occurrences of Grade 3:** Withhold treatment until ANC 1,000 cells/mm<sup>3</sup> or greater, then resume at same dose. (**Bortezomib**): No dose adjustment. **Grade 3 with febrile neutropenia/Grade 4:** Withhold treatment until febrile neutropenia resolves and ANC is 1,000 cells/mm<sup>3</sup> or greater, then resume at reduced dose. (**Bortezomib**): Withhold bortezomib until febrile neutropenia resolves and ANC is 1,000 cells/mm<sup>3</sup> or greater. If only 1 dose was held prior resolution of platelet count, resume bortezomib at same dose. If more than 2 doses were held consecutively, resume bortezomib at reduced dose.

#### Anemia

**Grade 3:** Withhold panobinostat until Hgb greater than or equal to 10 g/dL, then resume at reduced dose. (**Bortezomib**): Not specified.

#### Diarrhea

**Grade 2:** Withhold treatment until resolved, then resume at same dose. (**Bortezomib**): Consider interruption of bortezomib until resolved, then resume at same dose. **Grade 3 or hospitalization/administration of IV fluids:** Interrupt until resolved, then resume at reduced dose. (**Bortezomib**): Withhold until resolved, then resume bortezomib at reduced dose. **Grade 4:** Permanently discontinue panobinostat and bortezomib.

#### Nausea/Vomiting

**Grade 3 or 4:** Withhold until resolved, then resume at reduced dose. (**Bortezomib**): Not specified.

#### Other Toxicities (Other CTCAE grades)

**Any Grade 2 recurrence, any other Grade 3 or 4:** Withhold until resolved to Grade 1 or 0, then resume at reduced dose. (**Bortezomib**): Not specified. **Any other Grade 3 or 4 recurrence:** Consider further dose reduction once resolved to Grade 1 or 0.

#### Concomitant Use of Strong CYP3A Inhibitors

**PO: ADULTS, ELDERLY:** 10 mg per dosing schedule.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**PO: ADULTS, ELDERLY: Mild impairment:** 15 mg per dosing schedule. **Moderate impairment:** 10 mg per dosing schedule. **Severe impairment:** Treatment not recommended.

#### SIDE EFFECTS

**Frequent (60%–2%):** Fatigue, asthenia, lethargy, diarrhea, nausea, peripheral edema, decreased appetite, vomiting, pyrexia. **Occasional (12%):** Decreased weight.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Diarrhea occurred in 68% of pts. Severe cases of diarrhea occurred in 25% of pts. Cardiac toxicities such as cardiac ischemic events, ST-segment depression, T-wave abnormalities were reported. Cardiac arrhythmias including atrial fibrillation, atrial flutter, bradycardia, SVT, atrial/ventricular/sinus tachycardia occurred in 12% of pts. Severe thrombocytopenia may increase risk of fatal hemorrhage. Infectious processes such as bacterial infections, invasive fungal infections, pneumonia, sepsis, viral infections were reported. Severe and/or fatal infections occurred in 31% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, BMP, LFT; serum magnesium, phosphate; ECG, pregnancy test in females of reproductive potential. Correct electrolyte imbalances prior to each cycle. Verify platelet count is at least 100,000 cells/mm<sup>3</sup>, ANC is 1,500 cells/mm<sup>3</sup>, QTc interval is less than 450 msec on ECG prior to each cycle. Verify pregnancy status. Assess hydration status, usual stool characteristics. Question history if acute MI, unstable angina, arrhythmia. Screen for active infection.

### INTERVENTION/EVALUATION

Monitor CBC, BMP; serum magnesium, phosphate wkly; LFT as indicated; vital signs. Monitor ECG periodically. If QTc interval increases to greater than 480 msec on ECG, interrupt treatment and correct any electrolyte abnormalities. If QT prolongation does not resolve, permanently discontinue treatment. Initiate medical management for nausea, vomiting, diarrhea prior to any interruption or dose reduction. Consider blood transfusion in pts with severe anemia, thrombocytopenia. Diligently monitor daily pattern bowel activity, stool consistency. Start antidiarrheal therapy at first sign of loose stool/diarrhea. Obtain 2D cardiac echocardiogram, ECG if cardiac decompensation is suspected. Monitor for infection.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes); heart problems (chest tightness,

dizziness, fainting, palpitations, shortness of breath); kidney problems (dark-colored urine, decreased urine output, extremity swelling, flank pain), skin problems (redness, rash); mouth ulceration.

- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report bleeding of any kind.

## pantoprazole

**TOP  
100**

pan-toe-pra-zole  
(Protonix, Tecta )

**Do not confuse pantoprazole with ARIPIprazole.**

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzimidazole. **CLINICAL:** Proton pump inhibitor.

## USES

**PO:** Treatment, maintenance of healing of erosive esophagitis associated with gastroesophageal reflux disease (GERD) and reduction of relapse rate of heartburn symptoms in GERD. Treatment of hypersecretory conditions including Zollinger-Ellison syndrome. **IV:** Short-term treatment of erosive esophagitis associated with GERD, treatment of hypersecretory conditions. **OFF-LABEL:** Peptic ulcer disease, active ulcer bleeding (injection), adjunct in treatment of *H. pylori*, stress ulcer prophylaxis in critically ill pts.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to pantoprazole, other proton pump inhibitors (e.g., omeprazole). In combination with rilpivirine-containing products. **Cautions:** May increase risk of fractures, GI infections.

## ACTION

Irreversibly binds to, inhibits hydrogen-potassium adenosine triphosphate, an enzyme on surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen.

**Therapeutic Effect:** Increases gastric pH, reduces gastric acid production.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	N/A	N/A	24 hrs

Primarily distributed into gastric parietal cells. Metabolized in liver. Protein binding: 98%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1 hr.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease concentration/effects of acalabrutinib, cefuroxime, erlotinib, neratinib, pazopanib. Strong CYP2C19 inducers (e.g., FLUoxetine), strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, cholesterol, uric acid, glucose, lipoprotein, ALT.

## AVAILABILITY (Rx)

**Granules for Suspension:** 40 mg/packet.

**Injection, Powder for Reconstitution:** 40 mg.

 **Tablets, Delayed-Release:** 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

 IV

**Reconstitution** • Mix 40-mg vial with 10 mL 0.9% NaCl injection. • May be further diluted with 100 mL D<sub>5</sub>W, 0.9% NaCl.

**Rate of administration** • Infuse 10 mL solution over at least 2 min. • Infuse 100 mL solution over at least 15 min. or as continuous infusion. • Flush IV line after administration.

**Storage** • Store vials at room temperature. • Once diluted with 10 mL 0.9% NaCl, stable for 96 hrs at room temperature; when further diluted with 100 mL, stable for 96 hrs at room temperature.

## PO

• Give without regard to food. Best given before breakfast. • Do not break, crush, dissolve, or divide tablets; give whole. • Administer oral suspension only in apple juice or applesauce. Best taken 30 min before a meal.

## IV INCOMPATIBILITIES

DOBUTamine.

## IV COMPATIBILITIES

DOPamine, EPINEPHrine, furosemide (Lasix), insulin (regular), potassium chloride, vasopressin.

## INDICATIONS/ROUTES/DOSAGE

### Erosive Esophagitis (Treatment)

**PO: ADULTS, ELDERLY:** 40 mg/day for up to 8 wks. If not healed after 8 wks, may continue an additional 8 wks. **CHILDREN 5 YRS AND OLDER (WEIGHING 40 KG OR MORE):** 40 mg/day for up to 8 wks. **(WEIGHING 15–39 KG):** 20 mg/day for up to 8 wks.

**IV: ADULTS, ELDERLY:** 40 mg/day for 7–10 days.

### Maintenance of Healing of Erosive Esophagitis

**PO: ADULTS, ELDERLY:** 40 mg once daily.

### Hypersecretory Conditions

**PO: ADULTS, ELDERLY:** Initially, 80 mg twice daily. May titrate upward early in therapy. **Maximum:** 240 mg/day (as either 80 mg three times daily or 120 mg twice daily).

**IV: ADULTS, ELDERLY:** 80 mg twice daily. May increase to 80 mg q8h.

### Prevention of Rebleeding in Peptic Ulcer Bleed (Unlabeled)

**IV: ADULTS, ELDERLY:** 80 mg followed by 8 mg/hr infusion for 72 hrs or 80 mg then 40 mg q12h for 72 hrs.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Rare (less than 2%):** Diarrhea, headache, dizziness, pruritus, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hyperglycemia occurs rarely. May increase risk of *Clostridioides difficile*-associated diarrhea.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of GI disease, ulcers, GERD.

### INTERVENTION/EVALUATION

Evaluate for therapeutic response (relief of GI symptoms). Monitor for symptoms of *C. difficile* (abdominal pain, diarrhea, fever).

### PATIENT/FAMILY TEACHING

- Best if taken before breakfast.
- Frequent, loose stool; fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.

## PARoxetine

par-ox-e-teen

(Brisdelle, Paxil, Paxil CR, Pexeva)

**BLACK BOX ALERT** Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse PARoxetine with DULoxetine, FLUoxetine, piroxicam, pyridoxine, or vortioxetine, or Paxil with Doxil, Plavix, PROzac, or Taxol.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor (SSRI).

**CLINICAL:** Antidepressant.

## USES

Treatment of major depressive disorder (MDD). Treatment of panic disorder, obsessive-compulsive disorder (OCD). Treatment of social anxiety disorder (SAD), generalized anxiety disorder (GAD), premenstrual dysphoric disorder (PMDD), posttraumatic stress disorder (PTSD). **Brisdelle:** Treatment of moderate to severe vasomotor symptoms associated with menopause. **OFF-LABEL:** Social anxiety disorder in children, self-injurious behavior, treatment of depression and OCD in children.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to PARoxetine. Concurrent use of MAOIs with or within 14 days of MAOIs intended to treat psychiatric disorders, initiation in pts treated with linezolid or methylene blue; concomitant use with thioridazine, pimozide. **Brisdelle:** Pregnancy. **Cautions:** History of suicidal ideation and behavior; seizure disorder, hepatic/renal impairment, elderly, narrow-angle glaucoma, alcohol use. Avoid use in first trimester of pregnancy, alcohol use.

## ACTION

Selectively blocks uptake of neurotransmitter serotonin at CNS neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression, reduces obsessive-compulsive behavior, decreases anxiety.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95%. Excreted in urine. Not removed by hemodialysis. **Half-life:** 24 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May impair reproductive function. Not distributed in breast milk. May increase risk of congenital malformations. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment. Use caution.

## INTERACTIONS

**DRUG:** Alcohol may increase adverse effects. Lithium, MAOIs (e.g., phenelzine, selegiline) may increase the serotonergic effect. May increase antiplatelet effect of NSAIDs (e.g., diclofenac, meloxicam, naproxen). May decrease concentration/effect of tamoxifen. May increase adverse effects of tricyclic antidepressants (e.g., amitriptyline). **HERBAL:** Glucosamine, herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, WBC count.

## AVAILABILITY (Rx)

**Capsules:** (*Brisdelle*): 7.5 mg. **Oral Suspension:** (*Paxil*): 10 mg/5 mL. **Tablets:** (*Paxil*, *Pexeva*): 10 mg, 20 mg, 30 mg, 40 mg.

 **Tablets, Controlled-Release:** (*Paxil CR*): 12.5 mg, 25 mg, 37.5 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Give with food, milk if GI distress occurs.
- Scored tablet may be crushed.
- Do not crush, break, dissolve, or divide controlled-release tablets.

## INDICATIONS/ROUTES/DOSAGE

### Depression

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 10–20 mg/day. May increase by 10–20 mg/day at intervals of more than 1 wk. **Maximum:** 50 mg/day.

**PO:** (*Controlled-Release*): **ADULTS:** Initially, 25 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. **Maximum:** 62.5 mg/day.

### Generalized Anxiety Disorder (GAD)

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 10 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20–50 mg/day.

### Obsessive-Compulsive Disorder (OCD)

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 20 mg/day. May increase by 10

mg/day at intervals of more than 1 wk. Recommended dose: 40–60 mg/day.

### Panic Disorder

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 10 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Usual dose: 20–40 mg/day. **Maximum:** 60 mg/day.

**PO:** (*Controlled-Release*): **ADULTS, ELDERLY:** Initially, 12.5 mg once daily. May increase by 12.5 mg/day at wkly intervals. **Maximum:** 75 mg/day.

### Social Anxiety Disorder (SAD)

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 10 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. **Maximum:** 60 mg/day.

**PO:** (*Controlled-Release*): **ADULTS, ELDERLY:** Initially, 12.5 mg once daily. May increase by 12.5 mg/day at wkly intervals. **Maximum:** 37.5 mg/day.

### Posttraumatic Stress Disorder (PTSD)

**PO:** (*Immediate-Release*): **ADULTS:** Initially, 20 mg/day. May increase by 10–20 mg/day at intervals of more than 1 wk. **Maximum:** 60 mg/day.

### Premenstrual Dysphoric Disorder (PMDD)

**PO:** (*Controlled-Release*): **ADULTS:** Initially, 12.5 mg/day. May increase by 12.5 mg at wkly intervals. **Maximum:** 50 mg/day.

### Vasomotor Symptoms

**PO:** **ADULTS:** (*Brisdelle*): 7.5 mg once daily at bedtime.

### Usual Elderly Dosage

**PO:** Initially, 10 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. **Maximum:** 40 mg/day.

**PO:** (*Controlled-Release*): Initially, 12.5 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. **Maximum:** 50 mg/day (37.5 mg for SAD).

### Dosage Renal/Hepatic Impairment

**CrCl less than 30 mL/min, severe hepatic impairment:** (*Immediate-Release*): Initially, 10 mg/day. May increase by 10 mg/dose at wkly intervals. **Maximum:** 40 mg/day. (*Extended-*

**Release):** Initially, 12.5 mg/day. May increase by 12.5 mg/day at wkly intervals. **Maximum:** 50 mg/day. (**Brisdelle):** No dosage adjustment.

## SIDE EFFECTS

**Frequent (26%–8%):** Nausea, drowsiness, headache, dry mouth, asthenia, constipation, dizziness, insomnia, diarrhea, diaphoresis, tremor. **Occasional (6%–3%):** Decreased appetite, respiratory disturbance (e.g., increased cough), anxiety, flatulence, paresthesia, yawning, decreased libido, sexual dysfunction, abdominal discomfort.

**Rare:** Palpitations, vomiting, blurred vision, altered taste, confusion.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hyponatremia, seizures have been reported. Serotonin syndrome (agitation, confusion, diaphoresis, hallucinations, hyperreflexia) occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT. Assess appearance, behavior, speech pattern, level of interest, mood. Question history of suicidal ideation and behavior.

### INTERVENTION/EVALUATION

For pts on long-term therapy, CBC, LFT, renal function test should be performed periodically. Assess mental status for depression, suicidal ideation (esp. at beginning of therapy or change in dosage), anxiety, social functioning, panic attacks. Assess appearance, behavior, speech pattern, level of interest, mood.

### PATIENT/FAMILY TEACHING

- Avoid alcohol, St. John's wort.
- Therapeutic effect may be noted within 1–4 wks.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## PAZOPanib

paz-oh-pa-nib  
(Votrient)

■ **BLACK BOX ALERT** ■ Severe, fatal hepatotoxicity has been observed.

**Do not confuse PAZOPanib with nintedanib, pegaptanib, tivozanib, or vandetanib.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

## USES

Treatment of advanced renal cell carcinoma (RCC), advanced soft-tissue sarcoma (STS) (in pts previously treated with chemotherapy). **OFF-LABEL:** Advanced thyroid cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to PAZOPanib. **Cautions:** Baseline cytopenias, hepatic impairment, hypertension, cardiac disease (cardiomyopathy, HF), pulmonary disease, hypothyroidism, ocular disease, poorly healed wound, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); history of thromboembolic events (CVA, DVT, MI, pulmonary embolism (PE)). Pts at risk for: GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), tumor lysis syndrome (high tumor burden, dehydration), QTc interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HF, QT interval–prolonging medications, hypokalemia, hypomagnesemia), bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, NSAIDs, antiplatelets). Do not initiate in pts with uncontrolled hypertension. Avoid use concomitant use of strong CYP3A4 in-

hibitors or inducers, gastric acid–reducing agents, QT interval–prolonging medications.

## ACTION

Inhibits cell surface vascular endothelial growth factor receptors (VEGFR), platelet-derived growth factor receptors (PDGFR), fibroblast growth factor receptor (FGFR), cytokine receptor (cKIT), interleukin-2 receptor inducible T-cell kinase, lymphocyte-specific protein tyrosine kinase, and transmembrane glycoprotein receptor tyrosine kinase. **Therapeutic Effect:** Inhibits angiogenesis, blocks tumor growth.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 2–4 hrs. Excreted primarily in feces, urine (4%). **Half-life:** 31 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 2 wks after discontinuation. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. May impair fertility in both female and males. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects.

## INTERACTIONS

**DRUG:** Antacids, H<sub>2</sub> antagonists (e.g., famotidine, ranitidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease the therapeutic effect; increase adverse

effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Food may increase absorption/concentration. **Grapefruit products** may increase concentration, potential for torsades de pointes, myelotoxicity. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease serum magnesium, phosphate, potassium, sodium; leukocytes, lymphocytes, neutrophils, platelets. May increase or decrease serum glucose.

## AVAILABILITY (Rx)

 **Tablets:** 200 mg.

## ADMINISTRATION/HANDLING

### PO

- Give at least 1 hr before or 2 hrs after ingestion of food.
- Give tablets whole; do not break, crush, dissolve, or divide.

## INDICATIONS/ROUTES/DOSAGE

### Renal Cell Carcinoma, Soft-Tissue Sarcoma

**PO: ADULTS, ELDERLY:** 800 mg once daily. If concomitant CYP3A4 inhibitor cannot be discontinued, reduce initial dose to 400 mg/day.

### Dose Reduction Schedule

**(Renal cell carcinoma): First reduction:** 400 mg once daily. **Second reduction:** 200 mg once daily. **(Soft tissue carcinoma): First reduction:** 600 mg once daily. **Second reduction:** 400 mg once daily.

### Dose Modification

Based on Common Terminology for Adverse Events.

### Cardiac Toxicity

**Symptomatic or Grade 3 left ventricular systolic dysfunction:** Withhold treatment until improved to less than Grade 3, then resume if benefit outweighs risk. **Grade 4:** Permanently discontinue.

### GI Fistula

**Grade 2 or 3 GI fistula:** Withhold treatment until improved, then resume if benefit outweighs risk. **Grade 4 GI fistula:** Permanently discontinue.

### Hemorrhagic Events

**Grade 2 hemorrhage:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose. **Grade 3 or 4 hemorrhage; recurrence of Grade 2 hemorrhage:** Permanently discontinue.

### Hepatotoxicity

**Serum ALT 3–8 times ULN:** Continue same dose and monitor LFT w/ky until improved to Grade 1 or baseline. **Serum ALT greater than 8 times ULN:** Withhold treatment until improved to Grade 1 or baseline, then resume at no more than 400 mg daily if benefit outweighs risk. Continue to monitor LFT w/ky for 8 wks. **Serum ALT greater than 3 times ULN with serum bilirubin greater than 2 times ULN; recurrence of serum ALT greater than 3 times ULN despite dose reduction:** Permanently discontinue.

### Hypertension

**Grade 2 or 3 hypertension:** Reduce dose and start antihypertensive therapy. Permanently discontinue if Grade 3 hypertension persists despite dose reduction and antihypertensive therapy. **Grade 4 hypertension:** Permanently discontinue.

### Proteinuria

**24-hr urine protein 3 grams or greater:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose. Permanently discontinue if 24-hr urine protein does not improve or recurs. **Confirmed nephrotic syndrome:** Permanently discontinue.

### Venous Thrombosis

**Grade 3 venous thrombosis:** Withhold treatment and manage for at least 1 wk, then resume at same dose. **Grade 4 venous thrombosis:** Permanently discontinue.

### Other Events Requiring Permanent Discontinuation

Permanently discontinue if arterial thrombosis, thrombotic microangiopathy, GI perforation, IILD/pneumonitis, posterior reversible encephalopathy syndrome occurs.

### Concomitant Use of Strong CYP3A4 Inhibitors, Gastric Acid Reducers

If strong CYP3A4 inhibitor cannot be discontinued, reduced PAZOPanib dose to 400 mg. If gastric acid–reducing agents cannot be discontinued, consider short-acting antacid instead of proton pump inhibitor, H<sub>2</sub>-receptor antagonist.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Reduce dose to 200 mg/day. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Note:** Frequency and occurrence of side effects may vary depending on indicated treatment.

**Frequent (69%–20%):** Fatigue, diarrhea, nausea, decreased weight, hypertension, decreased appetite, change of hair color, vomiting, tumor pain, dysgeusia, headache, musculoskeletal pain, myalgia, abdominal pain, dyspnea. **Occasional (18%–5%):** Rash, cough, edema, mucositis, alopecia, dizziness, skin disorder, skin hypopigmentation, stomatitis, chest pain, insomnia, dysphonia, dyspepsia, dry skin, chills, vision blurred, nail disorder.

## ADVERSE EFFECTS/TOXIC REACTIONS

Fatal hepatotoxicity may occur. Cardiac toxicities including QT interval prolongation, torsades de pointes; cardiac dysfunction (decreased left ventricular ejection fraction, HF) were reported. Fatal hemorrhagic events including epistaxis (8% of pts), mouth hemorrhage (3% of pts), rectal hemorrhage (2% of pts), Grade 4 hemorrhage (intracranial/subarachnoid/peritoneal hemorrhage), hemoptysis may occur. Fatal thromboembolism including CVA, DVT, MI, pulmonary embolism, transient ischemic attack was reported. Thrombotic microangiopathy including throm-

botic thrombocytopenic purpura (TTP), hemolytic uremic syndrome reported in 1%–5% of pts. GI perforation or fistula reported in 1% of pts. Fatal interstitial lung disease (ILD), pneumonitis reported in less than 1% of pts. Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may evolve into an ischemic CVA or cerebral hemorrhage, may occur. Grade 3 hypertension reported in 1%–3% of pts. May impair healing of wounds. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Vascular disorders including arterial aneurysm, dissection, rupture may occur. Other reactions may include retinal changes/detachment, hypothyroidism, pancreatitis, pneumothorax, nephrotic syndrome.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT; ECG; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Assess LVEF by echocardiogram in pts with cardiomyopathy. Screen for active infection. Assess risk for bleeding. Assess usual bowel movement patterns, stool characteristics. Receive full medication history and screen for interactions. Assess skin for open wounds, surgical incisions. Assess adequate hydration prior to initiation due to increased risk of tumor lysis syndrome, diarrhea, vomiting. Question history as listed in Precautions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT for hepatotoxicity; ECG for QT interval prolongation; urine protein level. Monitor for symptoms of hepatotoxicity (abdominal pain, jaundice, nausea, vomiting, weight loss) esp. in pts with hepatic impairment. Monitor B/P for hypertension. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess LVEF by echocardiogram periodically if cardiomyopathy

(dyspnea, extremity swelling, palpitations) is suspected. Monitor for infections (cough, fatigue, fever). Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration/nutrition. Monitor for ocular toxicities; symptoms of DVT (leg or arm pain/swelling); CVA, intracranial hemorrhage (aphasia, altered mental status, facial droop, hemiplegia, vision loss); MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation), PE (chest pain, dyspnea, tachycardia). Bleeding of any kind can be life-threatening and must be treated promptly. Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Conduct neurological assessment. Pts with altered mental status, seizures, visual disturbances, unilateral weakness should be evaluated for posterior reversible encephalopathy syndrome. Assess for skin toxicities, poorly healed wounds.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), eye problems (eye pain, change of vision), toxic skin reactions (rash, redness, sloughing, swelling).
- Life-threatening blood clots may occur; report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, one-sided weakness or paralysis, difficulty speaking), heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that

radiates to the arm or jaw, sweating). • Life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure, may occur. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting. • Bleeding of any kind can be life-threatening. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Drink plenty of fluids. • Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Treatment may affect the heart's ability to pump blood or alter the electrical conduction of the heart; report chest pain, difficulty breathing, dizziness, swelling of extremities, fainting, palpitations. • Take on empty stomach. • Treatment may worsen high blood pressure. • Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract.

## pegfilgrastim

TOP

100

peg-fil-gras-tim

(Neulasta, Neulasta Onpro, Fulphila, Udenyca, Ziextenzo)

**Do not confuse Neulasta with Lunesta, Neumega, or Neupogen, or pegfilgrastim with filgrastim.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Colony-stimulating factor. **CLINICAL:** Hematopoietic agent.

### USES

Decreases incidence of infection (as manifested by febrile neutropenia) in cancer pts receiving myelosuppressive chemotherapy associated with febrile neutropenia. To increase survival in pts acutely exposed to myelosuppressive doses of radiation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to pegfilgrastim, filgrastim. **Cautions:** Any

malignancy with myeloid characteristics, sickle cell disease. The 6-mg fixed dose should not be used in infants, children, or adolescents weighing less than 45 kg. Do not administer within 14 days before and 24 hrs after cytotoxic chemotherapy.

### ACTION

Stimulates production, maturation, and activation of neutrophils within bone marrow. **Therapeutic Effect:** Increases phagocytic ability, antibody-dependent destruction; decreases incidence of infection.

### PHARMACOKINETICS

Readily absorbed after SQ administration. **Half-life:** 15–80 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 12 yrs. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Pegloticase may decrease effect. May increase adverse/toxic effect of **bleomycin, tisagenlecleucel, topotecan.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum LDH, alkaline phosphatase, uric acid.

### AVAILABILITY (Rx)

**Injection Solution: (Neulasta):** 6 mg/0.6 mL syringe. **Prefilled Syringe Kit: (Neulasta Onpro):** 6 mg/0.6 mL; dose delivers over 45 min time period about 27 hrs after application. **Prefilled Syringe: (Fulphila, Udenyca, Ziextenzo):** 6 mg/0.6 mL.

### ADMINISTRATION/HANDLING

#### SQ

**Preparation** • Remove syringe from refrigerator and allow solution to warm to room temperature. • Visually inspect for particulate matter or discoloration. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously into outer abdomen, upper

arm, or outer thigh and inject solution.

- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.
- Do not administer IV or intramuscularly.

**Storage** • Refrigerate in original carton until time of use. • Protect from light. • Do not shake. • Discard if left at room temperature for more than 48 hrs. • May store syringe at room temperature for up to 4 hrs. • Avoid freezing. If accidentally frozen, may thaw in refrigerator. Discard if frozen more than once.

### On Body Injector (Onpro)

A healthcare provider must fill the injector prior to applying to pt's skin. Apply to intact, nonirritated skin on back of arms or abdomen. • Delivers pegfilgrastim over 45 min time period about 27 hrs after application. • May apply on same day as chemotherapy. Keep injector at least 4 inches away from electrical equipment.

**Storage** • Store in refrigerator until 30 min prior to use. • Kit should not be at room temperature for more than 12 hrs (including injecting time). Discard if at room temperature for more than 12 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Neutropenia (Chemotherapy-Induced)

**SQ: ADULTS, ELDERLY, CHILDREN 12–17 YRS, WEIGHING MORE THAN 45 KG:** Give as single 6-mg injection once per chemotherapy cycle beginning at least 24 hrs after completion of chemotherapy.

**◀ALERT▶** Do not administer between 14 days before and 24 hrs after cytotoxic chemotherapy. Manufacturer Recommendation: Do not use in infants, children, adolescents weighing less than 45 kg (dose less than 6 mg).

### Radiation Injury Syndrome

**Note:** Prefilled syringe not designed to give doses less than 6 mg. Not recommended; use caution to avoid dosing errors.

**SQ: ADULTS, ELDERLY, CHILDREN WEIGHING 45 KG OR MORE:** 6 mg once wkly for 2 doses. **31–44 KG:** 4 mg once wkly for 2 doses. **21–30 KG:** 2.5 mg once wkly for 2 doses. **10–20 KG:** 1.5 mg once wkly

for 2 doses. **LESS THAN 10 KG:** 0.1 mg/kg once wkly for 2 doses.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (72%–15%):** Bone pain, nausea, fatigue, alopecia, diarrhea, vomiting, constipation, anorexia, abdominal pain, arthralgia, generalized weakness, peripheral edema, dizziness, stomatitis, mucositis, neutropenic fever.

## ADVERSE EFFECTS/TOXIC REACTIONS

Capillary leak syndrome (hypoalbuminemia, hypotension, fluid overload, leukocytosis, hemoconcentration), glomerulonephritis, fatal splenic rupture may occur. Acute respiratory distress syndrome (ARDS) may occur in pts with sepsis. Serious hypersensitivity reactions including anaphylaxis, skin rash, urticaria, erythema, flushing may occur. Fatal sickle cell crisis may occur in pts with sickle cell disease. May act as growth factor stimulator for tumors of any type. Potential device failures of Neulasta Onpro may cause partial delivery of medication, increasing risk of neutropenia, febrile neutropenia. Abdominal pain, malaise, back pain, increased inflammatory markers (C-reactive protein, WBC) may indicate aortitis. Other reactions including Sweet syndrome (acute febrile neutropenic dermatosis), contact dermatitis, and local skin reactions may occur. Immunogenicity (auto-pegfilgrastim antibodies) reported in 6% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC prior to initiation and routinely thereafter. Question history of sickle cell disease, glomerulonephritis, splenic disease, hypersensitivity reaction to acrylic adhesive on body (injector uses acrylic adhesive).

### INTERVENTION/EVALUATION

Monitor neutrophil count for treatment effectiveness. Monitor for hypersensitivity reactions. Assess for hypoalbuminemia, peripheral edema, respiratory symptoms

(cough, dyspnea) if weight has increased by 5% (or greater) and pt is hypotensive; may indicate capillary leak syndrome. Severe capillary leak syndrome should be treated with supportive measures (corticosteroids; monitoring of weight, B/P, albumin levels) until resolution. Monitor Neulasta Onpro for device failures. Septic pts should be monitored for ARDS.

#### PATIENT/FAMILY TEACHING

- Drink plenty of fluids to maintain hydration.
- Immediately report symptoms of capillary leak syndrome (dizziness, fatigue, sudden weight gain, shortness of breath, swelling of face or extremities). A delay in reporting symptoms may be life-threatening.
- Fatal rupturing of the spleen can occur; report sudden abdominal pain or swelling, low blood pressure, fast heart rate.
- Report chest pain, fever, palpitations, severe bone pain.

## pembrolizumab

**pem-broe-liz-ue-mab**  
(Keytruda)

**Do not confuse pembrolizumab with atezolizumab, durvalumab, necitumumab, nivolumab, pal-ivizumab, or panitumumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti PD-1 monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Treatment of unresectable or metastatic melanoma. Treatment of metastatic head and neck squamous cell carcinoma (HNSCC) (recurrent or metastatic) with disease progression on or after platinum-containing chemotherapy. Treatment of metastatic non-small-cell lung cancer (NSCLC) in pts with PD-L1-expressing tumors as a single agent for first-line tx, with disease progression on or after platinum-containing chemotherapy; or in combination with pemetrexed and carboplatin, as first-line

tx of metastatic nonsquamous NSCLC or as first-line single-agent treatment of metastatic NSCLC in pts with tumors with PD-L1 expression and with no EGFR or ALK genomic tumor aberrations. Treatment of refractory classical Hodgkin lymphoma (cHL) or relapse after 3 or more lines of therapy. Treatment of locally advanced or metastatic urothelial carcinoma not eligible for cisplatin-containing chemotherapy or who have disease progression during or following platinum-containing chemotherapy; or with 12 mos of neoadjuvant or adjuvant tx with platinum-containing chemotherapy. Treatment of unresectable or metastatic microsatellite instability high (MSI-H) or mismatch repair deficient solid tumors or colorectal cancer. Treatment of gastric cancer (advanced or metastatic) or gastroesophageal junction adenocarcinoma in pts with tumors with PD-L1 expression and with disease progression on or after 2 or more lines of therapy. Treatment of recurrent or metastatic cervical cancer in pts with tumors with PD-L1 expression and with disease progression on or after chemotherapy. Treatment of primary mediastinal large B-cell lymphoma (PMBCL) in adult and pediatric pts with refractory disease or relapsed after 2 or more lines of therapy. Treatment of hepatocellular carcinoma in pts previously treated with sorafenib. Adjuvant treatment of melanoma with lymph node involvement following complete resection. Treatment of recurrent locally advanced or metastatic Merkel cell carcinoma. Treatment of advanced renal cell carcinoma (in combination with axitinib). Treatment of metastatic small-cell lung cancer (SCLC) in pts with disease progression on or after platinum-based chemotherapy and at least one other prior line of therapy. Treatment of HNSCC. Treatment of advanced endometrial carcinoma (in combination with lenvatinib) that is not MSI-H or dMMR, having disease progression following prior systemic therapy, and who are not candidates for curative surgery or radiation. Treatment of recurrent or metastatic cutaneous squamous cell carcinoma (cSCC) not curable by surgery or radiation. Treatment of classical Hodg-

kin lymphoma (relapsed or refractory) in adults and pediatric pts who have relapsed after 3 or more prior lines of therapy. Treatment of locally recurrent unresectable or metastatic triple-negative breast cancer (TNBC) in combination with chemotherapy. Treatment of locally advanced or metastatic esophageal or gastroesophageal junction (GEJ) (in combination with platinum- and fluoropyrimidine-based chemotherapy) or as single agent after 1 or more prior lines of systemic therapy for pts with tumors of squamous cell histology that express PD-L1.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to pembrolizumab. **Cautions:** Thyroid disease, hepatic/renal impairment, interstitial lung disease, electrolyte imbalance, hypertriglyceridemia.

## ACTION

Inhibits programmed cell death-1 (PD-1) activity by binding to PD-1 receptors on T cell, blocking PD-1 ligands from binding, which inhibits the negative immune regulation caused by PD-1 signaling. **Therapeutic Effect:** Inhibits T-cell proliferation and cytokine production. Induces antitumor responses.

## PHARMACOKINETICS

Metabolism not specified. Elimination not specified. Steady-state concentration: 18 wks. **Half-life:** 26 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Females of reproductive potential must use effective contraception during treatment and up to 4 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum AST, glucose, triglycerides. May decrease albumin, serum calcium, sodium.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mg/4 mL.

## ADMINISTRATION/HANDLING

**ALERT** Use 0.2–0.5-micron in-line filter.

**Reconstitution** • Withdraw required dose and mix into 0.9% NaCl infusion bag (diluent volume depends on dose required). • Final concentration of diluent bag should equal 1–10 mg/mL. • Allow refrigerated solution to warm to room temperature before infusing.

**Rate of administration** • Infuse via dedicated line over 30 min using a 0.2–0.5-micron filter.

**Storage** • Diluted solution up to 24 hrs, or at room temperature up to 4 hrs. Store time should not exceed total combined time of reconstitution, dilution, storage, and infusion.

## INDICATIONS/ROUTES/DOSAGE

**cHL, MSI-H Cancer, Merkel Cell Carcinoma, cSCC**

**IV: ADULTS, ELDERLY:** 200 mg q3wks (or 400 mg q6wks) until disease progression or unacceptable toxicity for up to 2 mos. **CHILDREN:** 2 mg/kg (up to 200 mg) q3wks until disease progression or unacceptable toxicity for up to 2 mos.

**Cervical Cancer, Gastric Cancer, HNSCC, NSCLC (Single-Agent Therapy), Primary Mediastinal Large B-Cell Lymphoma, Melanoma, Urothelial Cancer, Hepatocellular Carcinoma, Head and Neck Squamous Cell, Melanoma (Adjuvant Treatment), Renal Cell Carcinoma, SCLC, Endometrial Carcinoma**

**IV: ADULTS, ELDERLY:** 200 mg q3wks (or 400 mg q6wks. Continue until disease progression or unacceptable toxicity, or in pts without disease progression.

**NSCLC (Combination Therapy)**

**IV: ADULTS, ELDERLY:** 200 mg q3wks (in combination with pemetrexed and carboplatin) for 4 cycles, then 200 mg q3wks (with or without optional indefi-

nite pemetrexed maintenance therapy). Continue until disease progression or unacceptable toxicity, or in pts without disease progression for up to 24 months.

### TNBC

**IV: ADULTS, ELDERLY:** 200 mg q3wks or 400 mg q6wks. Continue until disease progression, unacceptable toxicity or (pts without disease progression) for up to 24 mos.

### Esophageal Cancer (Recurrent, Locally Advanced, or Metastatic) (Single-Agent)

**IV: ADULTS, ELDERLY:** Either 200 mg q3wks or 400 mg q6wks for up to 24 mos or until disease progression or unacceptable toxicity.

### Esophageal Cancer (Locally Advanced or Metastatic) (Combination Therapy)

**IV: ADULTS, ELDERLY:** Either 200 mg q3wks or 400 mg q6wks (initially in combination with 6 cycles of fluorouracil and cisplatin) for up to 24 mos or until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Withhold treatment for any of the following adverse events:** ALT or AST greater than 3–5 times upper limit of normal (ULN) or bilirubin 1.5–3 times ULN, Grade 2 or 3 colitis, Grade 3 hyperthyroidism, Grade 2 nephritis, Grade 2 pneumonitis, symptomatic hypophysitis; any Grade 3 treatment-related adverse reaction.

**Permanently discontinue for any of the following adverse events:** ALT or AST greater than 5 times ULN or bilirubin 3 times ULN (or pts with liver metastasis who begin treatment with Grade 2 ALT, AST, if ALT or AST increases greater than or equal to 50% from baseline and lasts for at least 1 wk), Grade 3 or 4 infusion-related reaction, Grade 3 or 4 nephritis, Grade 3 or 4 pneumonitis; inability to reduce corticosteroid dose to 10 mg/day or less (or predniSONE equivalent) after last dose; persistent Grade 2 or 3 adverse reaction that does not recover to Grade 0–1 within 12 wks after last dose; any severe or Grade 3 treatment-related adverse reaction that recurs.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not studied, use caution.

## SIDE EFFECTS

**Frequent (47%–20%):** Fatigue, nausea, cough, pruritus, rash, decreased appetite, constipation, diarrhea, arthralgia. **Occasional (18%–11%):** Dyspnea, extremity pain, peripheral edema, vomiting, headache, chills, insomnia, myalgia, abdominal pain, back pain, pyrexia, vitiligo, dizziness, upper respiratory tract infection.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause severe immune-mediated events such as pneumonitis (2.9% of pts), colitis (1% of pts), hepatitis (0.5% of pts), hypophysitis (0.5% of pts), renal failure or nephritis (0.7% of pts), hyperthyroidism (1.2% of pts), hypothyroidism (8.3% of pts). Other reported events include adrenal insufficiency, arthritis, cellulitis, exfoliative dermatitis, hemolytic anemia, myositis, myasthenic syndrome, pancreatitis, partial seizures, pneumonia, optic neuritis, rhabdomyolysis, sepsis. Immunogenicity (anti-pembrolizumab antibody formation) may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, TSH; pregnancy test in females of reproductive potential. Obtain weight in kg. Question history of adrenal/pituitary/pulmonary/thyroid disease, autoimmune disorders, hepatic/renal impairment, allergy to predniSONE. Conduct dermatologic exam, visual acuity. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, serum electrolytes; thyroid panel if applicable. Monitor for immune-mediated adverse events. Notify physician if any CTCAE toxicities occur (see Appendix M) and initiate proper

treatment. Obtain chest X-ray if pneumonitis suspected. Screen for tumor lysis syndrome in pts with high tumor burden. Offer antiemetics if nausea, vomiting occurs. Monitor I&O, daily weight.

#### PATIENT/FAMILY TEACHING

- Serious adverse reactions may affect lungs, GI tract, kidneys, or hormonal glands, and predniSONE therapy may need to be started.
- Immediately contact physician if serious or life-threatening inflammatory reactions occur in the following body systems: lung (chest pain, cough, shortness of breath); colon (severe abdominal pain or diarrhea); liver (bruising, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); kidney (decreased or dark-colored urine, flank pain); thyroid (insomnia, hypertension, tachycardia [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]).
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## PEMEtrexed

TOP 100 HIGH ALERT

pem-e-trex-ed  
(Alimta)

**Do not confuse PEMEtrexed with methotrexate or PRALatrexate.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Folate analog metabolic inhibitor. Antimetabolite. **CLINICAL:** Antineoplastic.

#### USES

Treatment of unresectable malignant pleural mesothelioma in combination with CISplatin. Initial treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer (NSCLC) (in combination with cisplatin). Initial treatment of metastatic, non-squamous NSCLC (in combination with platinum chemotherapy and pembrolizumab) in pts with no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK)

tumor aberrations. Maintenance treatment (single agent) of locally advanced or metastatic non-squamous NSCLC if no progression after 4 cycles of platinum-based first-line therapy. Single-agent treatment (after prior chemotherapy) of recurrent, metastatic non-squamous NSCLC. **OFF-LABEL:** Treatment of bladder, cervical, ovarian, thymic malignancies; malignant pleural mesothelioma.

#### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to PEMEtrexed. **Cautions:** Hepatic/renal impairment, concurrent use of nephrotoxic medications, preexisting myelosuppression. Not indicated for squamous cell NSCLC.

#### ACTION

Inhibits biosynthesis of purine and thymidine nucleotides. Inhibits protein synthesis. **Therapeutic Effect:** Disrupts folate-dependent enzymes essential for cell replication.

#### PHARMACOKINETICS

Protein binding: 81%. Not metabolized. Excreted in urine. **Half-life:** 3.5 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. Males must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Higher incidence of fatigue, leukopenia, neutropenia, thrombocytopenia in pts 65 yrs and older.

#### INTERACTIONS

**DRUG:** **Ibuprofen** may increase concentration/effect. **Bone marrow depressants (e.g., cladribine)** may increase risk of myelosuppression. May decrease therapeutic effect of **BCG (intravesical)**.

**Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May increase adverse/toxic effect of **natalizumab**. **HERBAL:** *Echinacea* may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, creatinine.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 100 mg; 500 mg.

## ADMINISTRATION/HANDLING

### IV Infusion

**Reconstitution** • Dilute 500-mg vial with 20 mL (4.2 mL to 100-mg vial) 0.9% NaCl to provide concentration of 25 mg/mL. • Gently swirl each vial until powder is completely dissolved. • Solution appears clear and ranges in color from colorless to yellow or green-yellow. • Dilute in 100 mL 0.9% NaCl.

**Rate of administration** • Infuse over 10 min.

**Storage** • Store at room temperature. • Diluted solution is stable for up to 24 hrs at room temperature or if refrigerated.

## IV INCOMPATIBILITIES

Use only 0.9% NaCl to reconstitute; flush line prior to and following infusion. Do not add any other medications to IV line.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Pretreatment with dexamethasone (or equivalent) will reduce risk, severity of cutaneous reaction; treatment with folic acid and vitamin B<sub>12</sub> beginning 1 wk before treatment and continuing for 21 days after last PEMExred dose will reduce risk of side effects. Do not begin new treatment cycles unless ANC 1,500 cells/mm<sup>3</sup> or greater, platelets 100,000 cells/mm<sup>3</sup> or greater, and CrCl 45 mL/min or greater.

### Malignant Pleural Mesothelioma

**IV: ADULTS, ELDERLY:** 500 mg/m<sup>2</sup> on day 1 of each 21-day cycle in combination

with CISplatin. Continue until disease progression or unacceptable toxicity.

### Nonsquamous Non-Small-Cell Lung Cancer (NSCLC)

**IV: ADULTS, ELDERLY:** Initial treatment 500 mg/m<sup>2</sup> on day 1 of each 21-day cycle (in combination with CISplatin) for up to 6 cycles or until disease progression or unacceptable toxicity. **Maintenance or second-line treatment:** 500 mg/m<sup>2</sup> on day 1 of each 21-day cycle (as single agent). Continue until disease progression or unacceptable toxicity.

### Dose Modification for Hematologic Toxicity

**ANC less than 500 cells/mm<sup>3</sup> and platelets 50,000 cells/mm<sup>3</sup> or more:** Reduce dose to 75% of previous dose. **Platelets less than 50,000 cells/mm<sup>3</sup> without bleeding:** Reduce dose to 75% of previous dose. **Platelets less than 50,000 cells/mm<sup>3</sup> with bleeding:** Reduce dose to 50% of previous dose. **Nonhematologic toxicity Grade 3 or greater (excluding neurotoxicity):** Reduce dose to 75% of previous dose (excluding mucositis). **Grade 3 or 4 mucositis:** Reduce dose to 50% of previous dose.

### Dosage in Renal Impairment

Not recommended with CrCl less than 45 mL/min.

### Dosage in Hepatic Impairment

**Grade 3 or 4 hepatic impairment:** 75% of previous dose.

## SIDE EFFECTS

**Frequent (12%–10%):** Fatigue, nausea, vomiting, rash, desquamation. **Occasional (8%–4%):** Stomatitis, pharyngitis, diarrhea, anorexia, hypertension, chest pain. **Rare (less than 3%):** Constipation, depression, dysphagia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy. Severe, sometimes

fatal renal toxicity may occur. Serious cutaneous events including bullous, blistering, and exfoliative skin toxicities, Stevens-Johnson syndrome, epidermal necrolysis may occur. Fatal cases of interstitial pneumonitis were reported. Radiation recall may occur in pts who have received radiation wks to yrs previously.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Question history of hepatic/renal impairment. Receive full medication history and screen for interactions (esp. use of NSAIDs). Assess hydration status. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC as clinically indicated; BMP, LFT periodically. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness), renal toxicity. Assess skin for rash, lesions, dermatological toxicities. Obtain CXR if interstitial lung disease, pneumonitis suspected. Ensure adequate hydration.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report unusual bruising or bleeding of any kind.
- Treatment may cause severe lung inflammation; report cough, difficulty breathing, fever.
- Report skin toxicities such as blistering, bubbling, sloughing of the skin; liver problems (bruising, confusion, amber- or orange-colored urine, abdominal pain, yellowing of the skin or eyes); kidney problems (decreased urine output, dark-colored urine, flank pain).

## penicillin G potassium

pen-i-sil-in G po-tas-ee-um  
(Pfizerpen-G)

**Do not confuse penicillin with penicillAMINE.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections including sepsis, meningitis, endocarditis, pneumonia. Active against gram-positive organisms (except *S. aureus*), some gram-negative organisms (e.g., *N. gonorrhoeae*), and some anaerobes and spirochetes.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to any penicillin. **Cautions:** Renal/hepatic impairment, seizure disorder, hypersensitivity to cephalosporins, asthma.

### ACTION

Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins of bacteria. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Protein binding: 60%. Widely distributed (poor CNS penetration). Metabolized in liver. Primarily excreted in urine. **Half-life:** 0.5–1 hr (increased in renal impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. **Children:** May delay renal excretion in neonates, young infants. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** **Probenecid** may increase concentration/effect. **HERBAL:** None significant.

**FOOD:** None significant. **LAB VALUES:** May cause positive Coombs' test. May increase serum ALT, AST, alkaline phosphatase, LDH. May decrease WBC count.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 5 million units.

## ADMINISTRATION/HANDLING

**Reconstitution** • After reconstitution, further dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl for final concentration of 100,000–500,000 units/mL (50,000 units/mL for infants, neonates).

**Rate of administration** • Infuse over 15–30 min.

**Storage** • Reconstituted solution is stable for 7 days if refrigerated.

## IV INCOMPATIBILITIES

DOPamine (Intropin), sodium bicarbonate.

## IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, dILTIAzem (Cardizem), heparin, magnesium sulfate, potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage

**IV: ADULTS, ELDERLY:** 12–24 million units/day in divided doses q4–6h. **CHILDREN:** **Mild to moderate infection:** 100,000–150,000 units/kg/day in divided doses q6h. **Maximum:** 8 million units/day. **Severe infections:** 200,000–300,000 units/kg/day in divided doses q4–6h. **Maximum:** 24 million units/day. **NEONATES:** 25,000–50,000 units/kg/dose q8–12h.

### Dosage in Renal Impairment

Dosage interval is modified based on creatinine clearance.

### Creatinine

Clearance	Dosage
Greater than 50 mL/min	No dose adjustment
10–50 mL/min	75% normal dose
Less than 10 mL/min	20%–50% normal dose

### Creatinine

Clearance	Dosage
Hemodialysis	50%–100% normal dose q8–12h
Continuous renal replacement therapy	
Continuous venovenous hemofiltration	Loading dose 4 million units, then 2 million units q4–6h
Continuous venovenous hemodialysis	Loading dose 4 million units, then 2–3 million units q4–6h
Continuous venovenous hemodiafiltration	Loading dose 4 million units, then 2–4 million units q4–6h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional:** Lethargy, fever, dizziness, rash, electrolyte imbalance, diarrhea, thrombophlebitis. **Rare:** Seizures, interstitial nephritis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions ranging from rash, fever, chills to anaphylaxis occur occasionally.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, particularly penicillins, cephalosporins.

### INTERVENTION/EVALUATION

Promptly report rash (hypersensitivity), diarrhea (with fever, abdominal pain, mucus, or blood in stool, may indicate antibiotic-associated colitis). Monitor I&O, urinalysis, electrolytes, renal function tests for nephrotoxicity.

## penicillin V potassium

pen-i-sil-in V po-tas-ee-um  
(Apo-Pen-VK , Novo-Pen-VK , NuPen VK )

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

### USES

Treatment of infections of respiratory tract, skin/skin structure, otitis media, necrotizing ulcerative gingivitis; prophylaxis for rheumatic fever, dental procedures. **OFF-LABEL:** Prosthetic joint infection.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to any penicillin. **Cautions:** Severe renal impairment, history of allergies (particularly cephalosporins), seizure disorder, asthma.

### ACTION

Inhibits cell wall synthesis by binding to bacterial cell membranes. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from GI tract. Protein binding: 80%. Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1 hr (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Use caution in neonates and young infants (may delay renal elimination). **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May increase concentration/effect of **methotrexate**. **Probenecid** may increase concentration/effect. **Tetracycline** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive Coombs' test. May increase serum ALT, AST, alkaline phosphatase, LDH. May decrease WBC count.

### AVAILABILITY (Rx)

**Powder for Oral Solution:** 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give on empty stomach 1 hr before or 2 hrs after meals (increases absorption).
- After reconstitution, oral solution is stable for 14 days if refrigerated.
- Space doses evenly around the clock.

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 125–500 mg q6–8h. **CHILDREN YOUNGER THAN 12 YRS:** 25–50 mg/kg/day in divided doses q6h. **Maximum:** 2,000 mg/day.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Mild hypersensitivity reaction (chills, fever, rash), nausea, vomiting, diarrhea. **Rare:** Bleeding, allergic reaction.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe hypersensitivity reactions, including anaphylaxis, may occur. Nephrotoxicity, antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from high dosages, prolonged therapy.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question for history of allergies, particularly penicillins, cephalosporins.

#### INTERVENTION/EVALUATION

Monitor for rash (hypersensitivity), diarrhea (with fever, abdominal pain, mucus or blood in stool may indicate antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal change (ulceration, pain, erythema). Monitor I&O, urinalysis, renal function tests for nephrotoxicity.

**PATIENT/FAMILY TEACHING**

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Report immediately if rash, diarrhea, bleeding, bruising, other new symptoms occur.

**pertuzumab**

per-tue-zue-mab  
(Perjeta)

**BLACK BOX ALERT** ■ Can result in embryo-fetal death, birth defects. Pts must be made aware of danger to fetus, need for effective contraception. May result in cardiac failure. Assess left ventricular ejection fraction.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** *HER2* receptor antagonist. Monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of *HER2*-positive metastatic breast cancer in pts who have not received prior anti-*HER2* therapy or chemotherapy for metastatic disease in combination with trastuzumab and DOCeTaxel. Neoadjuvant treatment of pts with *HER2*-positive, locally advanced inflammatory, or early-stage breast cancer in combination with trastuzumab and DOCeTaxel. Adjuvant treatment of *HER2*-positive early breast cancer at high risk of recurrence (in combination with trastuzumab and chemotherapy).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to pertuzumab. **Cautions:** Cardiomyopathy, HE, history of infusion-related reaction. Prior anthracycline therapy or irradiation. Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), pts at risk for tumor lysis syndrome (high tumor burden).

**ACTION**

Targets human epidermal growth factor 2 (*HER2*), blocking ligand-initiated intercellular signaling, which can result in

cell growth arrest and cell death. **Therapeutic Effect:** Inhibits cell growth and metastasis.

**PHARMACOKINETICS**

Peak plasma concentration reached after first maintenance dose. **Half-life:** 18 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, leukocytes, neutrophils.

**AVAILABILITY (Rx)**

**Injection Solution:** 420 mg/14 mL (30 mg/mL) vial.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Visually inspect for particulate matter or discoloration. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 250 mL 0.9% NaCl only (do not use D<sub>5</sub>W). • Mix by gentle inversion. • Do not shake.

**Rate of administration** • Initial dose to be infused over 60 min. • Subsequent doses may be infused over 30–60 min.

**Storage** • Refrigerate unused vials. Store vials in outside cartons (protects from light). • May refrigerate diluted solution for up to 24 hrs. • Do not freeze.

## IV INCOMPATIBILITIES

Do not mix with any other medications.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Give as an IV infusion only. Do not give by IV push or bolus.

### Breast Cancer (Metastatic)

**IV infusion: ADULTS/ELDERLY:** Initially, 840, followed by maintenance dose of 420 mg given over q3wks until disease progression or unacceptable toxicity (in combination with trastuzumab [or trastuzumab/hyaluronidase] and DOCetaxel).

### Breast Cancer (Adjuvant)

**IV infusion: ADULTS, ELDERLY:** 840 mg, followed by maintenance dose of 420 mg q3wks for a total of 1 yr (up to 18 cycles) or until disease progression or unacceptable toxicity (as part of combination regimen containing trastuzumab [or trastuzumab/hyaluronidase] and standard anthracycline- and/or taxane-based therapy). Pertuzumab and trastuzumab (or trastuzumab/hyaluronidase) should begin on day 1 of the first taxane-containing cycle.

### Breast Cancer (Neoadjuvant)

**IV infusion: ADULTS, ELDERLY:** 840 mg once, followed by 420 mg q3wks for 3–6 cycles. May be administered as one of the following regimens: 4 preoperative cycles of pertuzumab, trastuzumab (or trastuzumab/hyaluronidase), DOCetaxel, then 3 postoperative cycles of 5-fluorouracil, epiRUBicin, and cyclophosphamide (FEC) **or** 3 or 4 preoperative cycles of FEC alone, then 3 or 4 preoperative cycles of pertuzumab, trastuzumab (or trastuzumab/hyaluronidase), DOCetaxel **or** 6 preoperative cycles of pertuzumab, trastuzumab (or trastuzumab/hyaluronidase), DOCetaxel, and CARBOplatin **or** 4 preoperative cycles of dose-dense DOXO rubicin and cyclophosphamide alone, then 4 preoperative cycles of pertuzumab, trastuzumab (or trastuzumab/hyaluronidase), and PACLitaxel. **Note:** Continue trastuzumab (or trastuzumab/hyaluronidase) postoperatively to complete 1 yr of treatment.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (67%–21%):** Diarrhea, alopecia, nausea, fatigue, rash, peripheral neuropathy, anorexia, asthenia, mucosal inflammation, vomiting, peripheral edema, myalgia, nail disorder, headache. **Occasional (19%–12%):** Stomatitis, pyrexia, dysgeusia, arthralgia, constipation, increased lacrimation, pruritus, insomnia, dizziness. **Rare (10%–7%):** Nasopharyngitis, dry skin, paronychia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia) is an expected response to therapy, but more severe reactions including febrile neutropenia may be life-threatening. Upper respiratory tract infection occurs in 17% of pts. Pleural effusion occurred in 5% of pts. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Immunogenicity (auto-pertuzumab antibodies) reported in 3% of pts. Decreases in LVEF occurred in 4% of pts. Prior treatment with anthracyclines, chest radiotherapy may further increase risk of decreased LVEF.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC. Assess left ventricular ejection fraction (LVEF) by echocardiogram. Negative pregnancy test must be confirmed before initiating treatment. Obtain *HER2* testing by an FDA-approved laboratory. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC periodically. Assess LVEF at regular intervals. Monitor for symptoms of left ventricular dysfunction (arrhythmia, cough, dyspnea, peripheral edema). Monitor for infusion reactions, hypersensitivity reactions, anaphylaxis. If a significant infusion reaction occurs, slow or inter-

rupt infusion and administer appropriate medical treatment. Observe pt closely for 60 min after the first infusion and for 30 min after subsequent infusions. Monitor for symptoms of tumor lysis syndrome (acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- New-onset left heart dysfunction may occur; report shortness of breath, cough, swelling of ankles or feet, palpitations.
- Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## pertuzumab/ trastuzumab/ hyaluronidase-zzxf

per-too-zoo-mab/ tras-tu-zoo-mab/  
hye-al-ure-on-i-dase  
(Phesgo)

**BLACK BOX ALERT** ■ May cause cardiac failure; decreased left ventricular ejection fraction (LVEF), esp. in pts with anthracycline-containing chemotherapy regimens. Monitor LVEF prior to initiation and during treatment. Serious and fatal cases of interstitial lung disease (ILD), pneumonitis were reported.

Symptoms usually occurred during or within 24 hrs of administration. Permanently discontinue if anaphylaxis, ILD, acute respiratory distress syndrome occurs. Treatment can result in embryo-fetal death and birth defects. Recommend effective contraception.

**Do not confuse pertuzumab/trastuzumab/hyaluronidase-zzxf with trastuzumab/hyaluronidase, ado-trastuzumab emtansine, fam-trastuzumab deruxtecan, pertuzumab, trastuzumab, or rituximab/hyaluronidase.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** HER2 receptor antagonist, monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Neoadjuvant treatment of adults with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early-stage breast cancer (either greater than 2 cm in diameter or node positive) as a part of a complete treatment regimen for early breast cancer. Adjuvant treatment of adults with HER2-positive early breast cancer at high risk of recurrence. Treatment of HER2-positive metastatic breast cancer (in combination with docetaxel) in adults who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to pertuzumab, trastuzumab, hyaluronidase. **Cautions:** Baseline cytopenias, hepatic impairment, cardiovascular disease, HF, pulmonary disease, pts at risk for interstitial lung disease (e.g., COPD, sarcoidosis, connective tissue disease); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); treatment after anthracycline therapy.

P

**ACTION**

Pertuzumab targets the extracellular HER2 protein dimerization domain, inhibiting HER2 dimerization and blocking HER downstream. Trastuzumab binds to the extracellular domain of HER2. Hyaluronidase increases distribution and absorption of injected medications. **Therapeutic Effect:** Inhibits proliferation of tumor cells overexpressing HER2 protein.

**PHARMACOKINETICS**

Widely distributed. Peak plasma concentration: 3 days. Eliminated by parallel and nonlinear saturable target-mediated clearance. **Half-life:** Not specified.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males of reproductive potential should use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of cardiac dysfunction.

**INTERACTIONS**

**DRUG:** May increase cardiotoxic effects of anthracyclines (e.g., daunorubicin, doxorubicin, epirubicin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatinine, potassium, sodium. May decrease serum albumin, glucose, potassium, sodium; absolute neutrophil count (ANC), Hgb, lymphocytes, neutrophils, platelets.

**AVAILABILITY (Rx)**

**Injection Solution:** (pertuzumab/trastuzumab/hyaluronidase-zzxf): 1,200 mg/600 mg/30,000 units/15 mL (80 mg, 40 mg/2,000 units/mL), 600 mg/600

mg/20,000 units per 10 mL (60 mg, 60 mg/2,000 units/mL).

**ADMINISTRATION/HANDLING****SQ**

**Note:** Must be administered only in the thigh. Do not give IV or IM. Combination regimen has different dosages and administration instructions than individual pertuzumab (IV), trastuzumab (IV or SQ). Do not substitute with ado-trastuzumab emtansine, fam-trastuzumab deruxtecan, pertuzumab, or trastuzumab. Pts may transition from IV pertuzumab and trastuzumab (see manufacturer guidelines). Must be administered by a healthcare professional. Consider premedication with analgesic, antipyretic, or antihistamine in pts with prior injection reactions.

**Treatment interruption/missed doses**

- If treatment is interrupted or a dose is missed by less than 6 wks between injections, administer maintenance dose; do not wait until next dose. If treatment is interrupted or a dose is missed by more than 6 wks between injections, readminister initial dose, followed by maintenance doses at the usual intervals.

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly brown. Do not use if solution is cloudy, discolored, or visible particles are observed. • Withdraw contents from vial into syringe. • To avoid clogging, immediately attach a 25- to 27-gauge hypodermic needle or subcutaneous infusion set to syringe.

**Administration** • Insert needle subcutaneously into thigh only, approx. 2.5 cm from previous injection sites. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites of right and left thigh.

**Rate of administration** • **Initial Dose:** Inject over approx. 8 min. **Maintenance Dose:** Inject over approx. 5

min. Slow or pause injection if injection reaction occurs.

**Storage** • Refrigerate vials in original carton until time of use. Protect from light. Do not shake or freeze. • After vial is removed from refrigerator, use within 4 hrs. • May refrigerate syringe that contains solution for up to 24 hrs or store at room temperature for up to 4 hrs.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Give after completion of anthracycline therapy. If given for treatment of early breast cancer with docetaxel or paclitaxel, give docetaxel or paclitaxel after pertuzumab/trastuzumab/hyaluronidase-zzxf. If given for treatment of metastatic breast cancer with docetaxel, give docetaxel after pertuzumab/trastuzumab/hyaluronidase-zzxf.

### Breast Cancer (HER2-Positive, Locally Advanced, Inflammatory, Early Stage) (Neoadjuvant Treatment)

**SO: ADULTS:** Initially, 1,200 mg/600 mg/30,000 units as a single dose, then 600 mg/600 mg/20,000 units q3wks. After surgery, continue pertuzumab/trastuzumab/hyaluronidase to complete 1 year of treatment (up to 18 cycles) or until disease progression or unacceptable toxicity.

### Breast Cancer (HER2-Positive, Early Stage) (Adjuvant Treatment)

**SO: ADULTS:** Initially, 1,200 mg/600 mg/30,000 units as a single dose, then 600 mg/600 mg/20,000 units q3wks for a total of 1 year (up to 18 cycles) or until disease progression or unacceptable toxicity as part of a complete regimen including anthracycline- and/or taxane-based chemotherapy. Start on day 1 of first taxane-containing cycle.

### Breast Cancer (HER2-Positive, Metastatic)

**SO: ADULTS:** Initially, 1,200 mg/600 mg/30,000 units as a single dose, then 600 mg/600 mg/20,000 units q3wks (in

combination with docetaxel 75–100 mg/m<sup>2</sup> IV q3wks based on tolerability) until disease progression or unacceptable toxicity.

## Dose Modification

### Cardiac Toxicity

**Early breast cancer with baseline LVEF 55% or greater:** Withhold treatment for at least 3 wks if a decrease in LVEF is less than 50% with a fall of greater than or equal to 10 percentage points below baseline. Resume if LVEF improves to either greater than or equal to 50% or less than 10 percentage points of baseline. **Metastatic breast cancer with baseline LVEF 50% or greater:** Withhold treatment for at least 3 wks for either a decrease in LVEF that is less than 40% or a decrease in LVEF of 40%–45% with a fall of greater than or equal to 10 percentage points below baseline. Resume if LVEF improves to either greater than 45% or 40%–45% with a fall of less than 10 percentage points below baseline.

### Permanent Discontinuation

Discontinue treatment if LVEF has not improved, worsened, or pt has become symptomatic after 3 wks; severe hypersensitivity reaction (e.g., anaphylaxis) occurs.

## Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

## Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (77%–29%):** Alopecia, nausea, diarrhea, asthenia, fatigue. **Occasional (25%–6%):** Stomatitis, myalgia, arthralgia, constipation, dysgeusia, decreased appetite, insomnia, headache, peripheral neuropathy, dry skin, rash, cough, mucosal

inflammation, injection site reaction, dyspepsia, pyrexia, dizziness, hot flush, decreased weight, back pain, paresthesia, dyspnea, nail discoloration, hemorrhoids, erythema, abdominal pain, peripheral edema, dermatitis, nail disorder, rhinorrhea, malaise, bone pain, extremity pain, muscle spasm, musculoskeletal pain. **Rare (5%):** Increased lacrimation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including bone marrow depression, febrile neutropenia, may be life-threatening. May exacerbate chemotherapy-induced neutropenia. May cause cardiomyopathy, cardiac failure, and death. Other cardiac disorders may include arrhythmias, hypertension, asymptomatic decrease of LVEF; disabling HF. May increase risk of cardiac dysfunction in pts who receive anthracycline after stopping treatment. Pulmonary toxicities (acute respiratory distress syndrome, dyspnea, hypoxia, ILD, pulmonary edema, pneumonitis, pleural effusions, pulmonary fibrosis, pulmonary infiltrates, pulmonary insufficiency) were reported. Infections (upper respiratory tract infections, nasopharyngitis, paronychia, UTI, viral infections) were reported. Epistaxis reported in 12% of pts. Immunogenicity (auto-drug antibodies) reported in up to 5% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with skin redness, swelling, numbness, sloughing of the hands and feet, reported in 6% of pts. Severe hypersensitivity reactions, including anaphylaxis, may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm

compliance with effective contraception. Verify presence of HER2 protein overexpression or HER2 gene amplification in tumor specimen. Administer in an environment equipped to monitor for and manage hypersensitivity reactions; verify emergency resuscitation equipment/medications are readily available. Assess LVEF by echocardiogram or MUGA scan. A baseline LVEF of 50% or greater is required in pts after completion of anthracycline therapy. Question history of cardiovascular disease, HF, pulmonary disease, prior hypersensitivity reactions. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) as clinically indicated. Diligently monitor for hypersensitivity reactions or injection reactions for at least 30 min after initial dose, then for at least 15 min after each maintenance dose. Severe reactions may require emergency resuscitation; early detection is vital. Consider ABG, radiologic test if pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if pneumonitis is confirmed. Assess LVEF by echocardiogram q3mos. If treatment is withheld due to change in LVEF, monitor LVEF at 3-wk intervals. After discontinuation, monitor LVEF q6mos for at least 2 yrs. Monitor for infections (cough, dysuria, fatigue, fever, urinary frequency). Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, erythema, toxicities.

### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue,

fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); heart failure (e.g., chest pain, difficulty breathing, palpitations, swelling of extremities); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), UTI (fever, urinary frequency, burning during urination, foul-smelling urine). • Severe allergic reactions, including anaphylaxis, may occur. Difficulty breathing, dizziness, hives, rapid heart rate, rash, swelling of the face or tongue requires immediate medical attention. • Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Report bleeding of any kind. • Maintain proper hydration and nutrition.

## PHENobarbital

fee-noe-bar-bi-tal

**Do not confuse PHENobarbital with Phenergan, or phenytoin.**

### FIXED-COMBINATION(S)

**Donnatal:** PHENobarbital/atropine (an anticholinergic)/hyoscyamine (an anticholinergic)/scopolamine (an anticholinergic): 16.2 mg/0.0194 mg/0.1037 mg/0.0065 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Barbiturate (Schedule IV). **CLINICAL:** Anticonvulsant.

### USES

Management of generalized tonic-clonic (grand mal) seizures, partial seizures, control of acute seizure episodes (status

epilepticus). **OFF-LABEL:** Treatment of alcohol withdrawal, sedative/hypnotic withdrawal.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to PHENobarbital, other barbiturates, porphyria, dyspnea or airway obstruction, use in nephritic pts (large doses), severe hepatic impairment. History of sedative/hypnotic addiction. Intra-arterial or SQ administration. **Cautions:** Renal/hepatic impairment, acute/chronic pain, depression, suicidal tendencies, history of drug abuse, elderly, debilitated, children, hemodynamically unstable pts, hypoadrenalism, respiratory disease.

### ACTION

Depresses sensory cortex, decreases motor activity, alters cerebellar function. **Therapeutic Effect:** Induces drowsiness, sedation, anticonvulsant activity.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	20–60 min	N/A	6–10 hrs
IV	5 min	30 min	4–10 hrs

Widely distributed. Protein binding: 20%–45%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 53–140 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Produces respiratory depression in neonates during labor. May cause postpartum hemorrhage, hemorrhagic disease in newborn. Withdrawal symptoms may appear in neonates born to women receiving barbiturates during last trimester of pregnancy. Lowers serum bilirubin in neonates. **Children:** May cause paradoxical excitement. **Elderly:** May exhibit excitement, confusion, mental depression. Use caution.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., **LOrazepam**, **morphine**) may increase CNS depression. May decrease effects of **warfarin**, **oral contraceptives**. **Valproic acid** may increase concentration, risk of toxicity. **Strong CYP2C19 inducers** (e.g., **carBA-Mazepine**, **rifAMPin**) may decrease concentration/effect. **Strong CYP2C19 inhibitors** (e.g., **FLUoxetine**, **fluvoxamine**) may increase concentration/effect. May decrease concentration/effect of **dolutegravir**, **tenofovir**, **voriconazole**. **HERBAL:** Herbals with sedative properties (e.g., **chamomile**, **kava kava**, **valerian**) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease serum bilirubin. **Therapeutic serum level:** 10–40 mcg/mL; **toxic serum level:** greater than 40 mcg/mL.

## AVAILABILITY (Rx)

**Elixir:** 20 mg/5 mL. **Oral Solution:** 20 mg/5 mL. **Injection Solution:** 65 mg/mL, 130 mg/mL. **Tablets:** 15 mg, 30 mg, 60 mg, 100 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • May give undiluted or may dilute with NaCl.

**Rate of administration** • Adequately hydrate before and immediately after drug therapy (decreases risk of adverse renal effects). • Do not inject IV faster than 30 mg/min for children and 60 mg/min for adults. Too-rapid IV may produce severe hypotension, marked respiratory depression. • Inadvertent intra-arterial injection may result in arterial spasm with severe pain, tissue necrosis. Extravasation in SQ tissue may produce redness, tenderness, tissue necrosis.

**Storage** • Store vials at room temperature.

## IM

• Do not inject more than 5 mL in any one IM injection site (produces tissue irritation). • Inject deep IM into large muscle mass.

## PO

• Give without regard to food. • Tablets may be crushed. • Elixir may be mixed with water, milk, fruit juice.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Calcium gluconate, enalapril (Vasotec), fosphenytoin (Cerebyx), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Status Epilepticus

**IV: ADULTS, ELDERLY, CHILDREN:** 15 mg/kg as a single dose. **CHILDREN:** 15–20 mg/kg (**Maximum:** 1,000 mg) over 10 min; may repeat with an additional 5–10 mg/kg dose 10 min after loading dose.

### Seizure Control (Maintenance)

**Note:** Maintenance dose usually starts 12 hrs after loading dose.

**PO, IV: ADULTS, ELDERLY:** 2 mg/kg/day in divided doses. **ADOLESCENTS, CHILDREN 6 YRS AND OLDER:** 2–3 mg/kg/day in 1–2 divided doses. **CHILDREN 5 YRS OR YOUNGER, INFANTS, NEONATES:** 3–5 mg/kg/day in 1–2 divided doses.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (3%–1%):** Drowsiness. **Rare (less than 1%):** Confusion, paradoxical CNS reactions (hyperactivity, anxiety in children; excitement, restlessness in elderly, generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain).

## ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal after prolonged therapy may produce increased dreaming, nightmares, insomnia, tremor, diaphoresis, vomiting, hallucinations, delirium, seizures, status epilepticus. Skin eruptions appear as hypersensitivity reaction. Blood dyscrasias, hepatic disease, hypocalcemia occur rarely. Overdose produces cold/clammy skin, hypothermia, severe CNS depression, cyanosis, tachycardia, Cheyne-Stokes respirations. Toxicity may result in severe renal impairment.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, heart rate, respirations immediately before administration. **Hypnotic:** Raise bed rails, provide environment conducive to sleep (back rub, quiet environment, low lighting). **Seizures:** Review history of seizure disorder (length, presence of auras, LOC). Observe for recurrence of seizure activity. Initiate seizure precautions.

### INTERVENTION/EVALUATION

Monitor CNS status, seizure activity, hepatic/renal function, respiratory rate, heart rate, B/P. Monitor for therapeutic serum level. Neurologic assessments may be inaccurate until drug has properly cleared the body. **Therapeutic serum level:** 10–40 mcg/mL; **toxic serum level:** greater than 40 mcg/mL.

### PATIENT/FAMILY TEACHING

- Avoid alcohol, limit caffeine.
- May be habit-forming.
- Do not discontinue abruptly.
- May cause dizziness/drowsiness; avoid tasks that require alertness, motor skills until response to drug is established.

## phenylephrine

**HIGH ALERT**

fen-il-ef-rin

(AK-Dilate, Mydfrin, Neo-Synephrine, Sudafed PE)

■ **BLACK BOX ALERT** ■ Intravenous use should be administered by adequately trained individuals familiar with its use.

**Do not confuse Mydfrin with Midrin, or Sudafed PE with Sudafed.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha-adrenergic agonist. **CLINICAL:** Nasal decongestant, mydriatic, vasopressor.

## USES

**Nasal:** Temporary relief of nasal congestion due to the common cold, hay fever (allergic rhinitis), or other upper respiratory allergies. **Parenteral:** Treatment of hypotension, vascular failure in shock.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to phenylephrine. **Injection:** Severe hypertension, ventricular tachycardia. **Oral:** Use within 14 days of MAOI therapy. **Cautions:** **Injection:** Elderly, hyperthyroidism, bradycardia, partial heart block, cardiac disease, HF, cardiogenic shock, hypertension. **Oral:** Asthma, bowel obstruction, cardiac disease, ischemic heart disease, hypertension, increased intraocular pressure, elderly, prostatic hyperplasia.

## ACTION

Acts on alpha-adrenergic receptors of vascular smooth muscle. Causes vasoconstriction of arterioles of nasal mucosa/conjunctiva; produces systemic arterial vasoconstriction. **Therapeutic Effect:** Decreases mucosal blood flow, relieves congestion. Increases B/P. Reduces heart rate due to decrease in cardiac output.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	Immediate	N/A	15–20 min
IM	10–15 min	N/A	0.5–2 hrs
SQ	10–15 min	N/A	1 hr

Minimal absorption after intranasal, ophthalmic administration. Metabolized in liver, GI tract. Primarily excreted in urine.

**Half-life:** 2.5 hrs.

 LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** May exhibit increased absorption, toxicity with nasal preparation. No age-related precautions noted with systemic use. **Elderly:** More likely to experience adverse effects.

## INTERACTIONS

**DRUG:** Linezolid, MAOIs (e.g., phenelzine, selegiline) may increase vasopressor effects. **Tricyclic antidepressants** (e.g., amitriptyline, doxepin) may increase vasopressor effect. **Ergot derivatives** (e.g., ergotamine) may increase hypertensive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (OTC)

**Injection, Solution:** 10 mg/mL. **Solution, Nasal:** 0.125%, 0.25%, 0.5%. **Solution, Nasal Spray:** 0.25%, 0.5%. **Solution, Oral:** 2.5 mg/5 mL. **Tablets:** 10 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • For IV push, dilute with NS to a concentration of 0.1–1 mg/mL. • For IV infusion, dilute 10–100 mg with 500 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • For IV push, give over 20–30 sec. • For IV infusion, titrate dose to maintain systolic B/P greater than 90 mm Hg.

**Storage** • Store vials at room temperature.

## Nasal

• Instruct pt to blow nose prior to administering medication. • With head tilted back, apply drops in 1 nostril. Wait 5 min before applying drops in other nostril. • Sprays should be administered into each nostril with head erect. • Pt should sniff briskly while squeezing container, then wait 3–5 min before blowing nose gently. • Rinse tip of spray bottle.

 IV INCOMPATIBILITIES

Furosemide (Lasix).

 IV COMPATIBILITIES

Amiodarone (Cordarone), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), lidocaine, potassium chloride, propofol (Diprivan), vasopressin.

## INDICATIONS/ROUTES/DOSAGE

## Nasal Decongestant

**⚠️ ALERT ⚠️** Do not use for more than 3 days.

**Intranasal: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 2–3 drops or 2–3 sprays of 0.25%–0.5% solution into each nostril q4h as needed. **CHILDREN 6–11 YRS:** 2–3 drops or 2–3 sprays of 0.25% solution into each nostril q4h as needed. **CHILDREN 2–5 YRS:** 1 drop of 0.125% solution (dilute 0.5% solution with 0.9% NaCl to achieve 0.125%) in each nostril. Repeat q2–4h as needed.

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 10 mg q4h as needed for up to 7 days. **Maximum:** 60 mg/day. **CHILDREN 6–11 YRS:** 5 mg q4h as needed for up to 7 days. **Maximum:** 30 mg/day. **CHILDREN 4–5 YRS:** 2.5 mg q4h as needed for up to 7 days. **Maximum:** 15 mg/day.

## Hypotension, Shock

**IV infusion: ADULTS, ELDERLY:** 0.5–6 mcg/kg/min. Titrate to desired response. **CHILDREN:** Initially, 0.1–0.5 mcg/kg/min. Titrate to desired effect.

## SIDE EFFECTS

**Frequent:** **Nasal:** Rebound nasal congestion due to overuse, esp. when used longer than 3 days. **Occasional:** Mild CNS stimulation (restlessness, nervousness, tremors, headache, insomnia, particularly in those hypersensitive to sympathomimetics, such as elderly pts). **Nasal:** Stinging, burning, drying of nasal mucosa.

## ADVERSE EFFECTS/TOXIC REACTIONS

Large doses may produce tachycardia, palpitations (particularly in pts with cardiac disease), dizziness, nausea, vomiting. Overdose in pts older than 60 yrs may result in hallucinations, CNS depression, seizures. Prolonged nasal use may produce chronic swelling of nasal mucosa, rhinitis. If phenylephrine 10% ophthalmic is instilled into denuded/damaged corneal epithelium, corneal clouding may result.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline symptomology, vital signs. Question history of hypertension, cardiac disease, asthma, recent use of MAOI therapy.

### INTERVENTION/EVALUATION

Monitor B/P, heart rate. For severe hypertension or shock states, monitor central venous pressure noninvasive hemodynamic monitoring systems.

### PATIENT/FAMILY TEACHING

- Discontinue if adverse reactions occur.
- Do not use for nasal decongestion for longer than 3 days (rebound congestion).
- Discontinue if insomnia, dizziness, weakness, tremor, palpitations occur.
- **Nasal:** Stinging/burning of nasal mucosa may occur.
- **Ophthalmic:** Blurring of vision with eye instillation generally subsides with continued therapy.
- Discontinue medication if redness/swelling of eyelids, itching occurs.

## phenytoin

fen-i-toyn  
(Dilantin, Phenytek)

■ **BLACK BOX ALERT** ■ Do not exceed IV rate of 50 mg/min in adults and 1–3 mg/kg/min in pediatric pts.

**Do not confuse Dilantin with Dilaudid or dilTIAzem, or phenytoin with phenelzine or fosphenytoin.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hydantoin. **CLINICAL:** Anticonvulsant.

## USES

Management of generalized tonic-clonic seizures (grand mal), complex partial seizures, status epilepticus. Prevention of seizures following head trauma/neurosurgery. **OFF-LABEL:** Prevention of early posttraumatic seizures following traumatic brain injury.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to phenytoin, other hydantoin. Concurrent use of delavirdine. History of acute phenytoin therapy-induced hepatotoxicity. **IV (additional):** Second- and third-degree AV block, sinoatrial block, sinus bradycardia, Adams-Stokes syndrome. **Cautions:** Porphyria, diabetes, renal/hepatic impairment, pts at increased risk of suicidal behavior/thoughts, elderly, debilitated, hypoalbuminemia, cardiac disease, hypothyroidism, pts of Asian descent.

## ACTION

Stabilizes neuronal membranes in motor cortex. Decreases influx of sodium during generation of nerve impulses. **Therapeutic Effect:** Decreases seizure activity.

## PHARMACOKINETICS

Widely distributed. Protein binding: 90%–95%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 7–42 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta; distributed in small amount in breast milk. Fetal hydantoin syndrome (craniofacial abnormalities, nail/digital hypoplasia, prenatal growth deficiency) has been reported. Increased frequency of seizures in pregnant women due to altered absorption of metabolism of phenytoin. May increase risk of hemorrhage in neonate, maternal bleeding during delivery. **Children:** More susceptible to gingival hyperplasia, coarsening of facial features; excess body hair. **Elderly:** No age-related precautions noted but lower dosages recommended.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Amiodarone, cimetidine, disulfiram, FLUoxetine, isoniazid, sulfonamides may increase concentration/effect, risk of toxicity. May decrease effects of glucocorticoids (e.g., dexamethasone, prednisONE), oral contraceptives. Lidocaine, propranolol may increase cardiac depressant effect. Valproic acid may decrease metabolism, increase concentration/effect. May decrease concentration/effects of apixaban, axitinib, dabigatran, dronedarone, itraconazole, ivabradine, niMODipine, rivaroxaban. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, GGT, alkaline phosphatase. **Therapeutic serum level:** 10–20 mcg/mL; **toxic serum level:** greater than 20 mcg/mL.

**AVAILABILITY (Rx)**

**Capsules:** 30 mg, 100 mg, 200 mg, 300 mg. **Injection Solution:** 50 mg/mL. **Suspension, Oral:** 125 mg/5 mL. **Tablets, Chewable:** 50 mg.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Give by IV push or IV piggyback. IV push can be painful (chemical irritation of vein due to alkalinity of solution). To minimize effect of irritation, flush IV with sterile saline after dose is administered.

**Reconstitution** • May give undiluted or may dilute with 0.9% NaCl to a concentration of 5 mg/mL or more.

**Rate of administration** • Administer at rate not exceeding 50 mg/min in adults, 20 mg/min in elderly, pts with preexisting cardiovascular conditions. In neonates, administer at rate not exceeding 1–3 mg/kg/min. • Infuse diluted solutions using an in-line filter. • Severe hypotension, cardiovascular collapse occur if rate of IV injection exceeds 50 mg/min for adults. • IV toxicity characterized by CNS depression, cardiovascular collapse.

**Storage** • Precipitate may form if parenteral form is refrigerated. • Slight yellow discoloration of parenteral form does not affect potency, but do not use if solution is cloudy or precipitate forms. Discard if not used within 4 hrs of preparation.

**PO**

• Give with food if GI distress occurs. • Tablets may be chewed. • Shake oral suspension well before using. • Separate administration of phenytoin with antacids or tube feeding by 2 hrs.

**IV INCOMPATIBILITIES**

DilTIAZem (Cardizem), DOBUTamine (Dobutrex), enalapril (Vasotec), heparin, HYDRomorphone (Dilaudid), insulin, lidocaine, morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Status Epilepticus**

**IV: ADULTS, ELDERLY, ADOLESCENTS:** **Loading dose:** 20 mg/kg at maximum

rate of 25–50 mg/min. May repeat in 10 min after loading dose with dose of 5–10 mg/kg. **Maintenance:** (IV, Oral): Initially, 4–7 mg/kg/day (usual 300–400 mg/day) in 2–4 divided doses. **INFANTS, CHILDREN: Loading dose:** 20 mg/kg in a single dose or divided doses. **Maximum:** 1,000 mg/dose. May give additional dose of 5–10 mg/kg after loading dose. **Maintenance:** Initially, 5 mg/kg/day in divided doses. Usual Range: 4–8 mg/kg/day. **Maximum daily dose:** 300 mg/day.

### Focal Partial-Onset Seizures, Generalized-Onset Seizures

**PO: ADULTS, ELDERLY: Loading Dose:** 1 g divided into 3 doses given at 2-hr intervals. **Maintenance** (begins 24 hrs after loading dose): Initially 100 mg 3 times/day; adjust at no less than 7–10-day intervals. Usual dose: 100 mg 3–4 times/day up to 200 mg 3 times/day (may consider 300 mg once daily in pts established on 100 mg 3 times/day). **CHILDREN: Loading dose: IV/PO:** 15–20 mg/kg divided into 3 doses and administered q2–4h. **Maintenance:** Initially, 5 mg/kg/day in 2–3 divided doses. Adjust dose at 7- to 10-day intervals. **Usual range:** 4–8 mg/kg/day. **Maximum:** 300 mg/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Drowsiness, lethargy, confusion, slurred speech, irritability, gingival hyperplasia, hypersensitivity reaction (fever, rash, lymphadenopathy), constipation, dizziness, nausea. **Occasional:** Headache, hirsutism, coarsening of facial features, insomnia, muscle twitching.

### ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal may precipitate status epilepticus. Blood dyscrasias, osteomalacia (due to interference of vitamin D metabolism) may occur. Toxic phenytoin blood concentration (25 mcg/mL or more) may produce ataxia, nystagmus,

diplopia. As level increases, extreme lethargy to comatose state occurs. May increase risk of suicidal thoughts and behavior. Severe cutaneous reactions including toxic epidermal necrolysis, Stevens-Johnson syndrome may occur. Life-threatening drug reaction with eosinophilia and systemic symptoms (DRESS) (multiorgan hypersensitivity) may present as lymphadenopathy, fever, facial swelling, hepatitis, nephritis, myocarditis, myositis. Hepatotoxicity, acute hepatic failure were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**Anticonvulsant:** Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. LFT, CBC should be performed before beginning therapy and periodically during therapy.

### INTERVENTION/EVALUATION

Repeat CBC 2 wks following initiation of therapy and 2 wks following administration of maintenance dose. Observe frequently for recurrence of seizure activity. Monitor ECG for cardiac arrhythmia. Assess for clinical improvement (decrease in intensity/frequency of seizures). Monitor for depression, suicidal tendencies, unusual behavior. Monitor CBC with differential, renal function, LFT, B/P (with IV use). Assist with ambulation if drowsiness, lethargy occurs. Monitor for therapeutic serum level (10–20 mcg/mL). **Therapeutic serum level:** 10–20 mcg/mL; **toxic serum level:** greater than 20 mcg/mL. **Free unbound levels: Therapeutic:** 1–2 mcg/mL; **toxic:** more than 2 mcg/mL.

### PATIENT/FAMILY TEACHING

- Pain may occur with IV injection.
- To prevent gingival hyperplasia (bleeding, tenderness, swelling of gums), maintain good oral hygiene, gum massage, regular dental visits.
- Report sore throat, fever, glandular swelling, skin reaction (hematologic toxicity).
- Drowsiness usually diminishes with continued therapy.

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly withdraw medication after long-term use (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control, arrhythmias.
- Avoid alcohol.
- Report changes in behavior, thoughts of suicide.

## phosphates potassium sodium

fos-fates

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Electrolyte supplement. **CLINICAL:** Mineral.

### USES

Prevention and treatment of hypophosphatemia.

### P

### PRECAUTIONS

**Contraindications:** **K-phosphate:** Hyperkalemia, hyperphosphatemia, hypocalcemia. **Na-phosphate:** Hypocalcemia, hypernatremia, hyperphosphatemia. **Cautions:** Renal impairment, concomitant use of potassium-sparing drugs, acid-base alteration, digitalized pts, cardiac disease, metabolic alkalosis.

### ACTION

Active in bone deposition, calcium metabolism, utilization of B complex vitamins. Act as buffers in maintaining acid-base balance. Exert osmotic effect in small intestine. **Therapeutic Effect:** Correct hypophosphatemia, acidify urine, prevent calcium deposits in urinary tract, promote peristalsis in GI tract.

### PHARMACOKINETICS

Poorly absorbed after PO administration. PO form excreted in feces; IV form excreted in urine.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use caution in pregnant women with other medical conditions (e.g., preeclampsia). **Children:** Increased risk of dehydration in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), eplerenone, iron salts, magnesium salts, potassium-containing medications, potassium-sparing diuretics (e.g., spironolactone), salt substitutes containing potassium phosphate may increase serum potassium. **Antacids, sucralfate** may decrease absorption. **Calcium-containing medications** may increase risk of calcium deposition in soft tissues, decrease phosphate absorption. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injection Solution (Potassium Phosphate):** 3 mmol phosphate and 4.4 mEq potassium per mL. **Injection Solution (Sodium Phosphate):** 3 mmol phosphate and 4 mEq sodium per mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • Must be diluted. Soluble in all commonly used IV solutions.

**Rate of administration** • Infuse over minimum of 4 hrs (usually over 6 hrs).

**Maximum rate:** 0.06 mmol/kg/hr.

**Storage** • Store at room temperature.

### ⚠️ IV INCOMPATIBILITIES

Amiodarone, DOBUTamine (Dobutrex), pantoprazole (Protonix).

### ⚠️ IV COMPATIBILITIES

DiTIAZem (Cardizem), enalapril (Vasotec), famotidine (Pepcid), metoclopramide (Reglan), niCARDipine (Cardene).

**INDICATIONS/ROUTES/DOSAGE**

**Note:** (*K-Phosphate*): For each mmol of phosphate, 1.5 mEq of K will be given.

(*Na-Phosphate*): For each mmol of phosphate, 1.3 mEq of Na will be given.

**Hypophosphatemia**

(*Potassium/Sodium Phosphate*):

**Phosphate level 2.3–3 mg/dL:** Initially, 0.08–0.16 mmol/kg over 4–6 hrs.

**Phosphate level 1.6–2.2 mg/dL:** Initially, 0.16–0.32 mmol/kg over 4–6 hrs.

**Phosphate level less than 1.5 mg/dL:** Initially, 0.32–0.64 mmol/kg over 4–6 hrs.

**SIDE EFFECTS**

**Frequent:** Mild laxative effect (in first few days of therapy). **Occasional:** Diarrhea, nausea, abdominal pain, vomiting.

**Rare:** Headache, dizziness, confusion, heaviness of lower extremities, fatigue, muscle cramps, paresthesia, peripheral edema, arrhythmias, weight gain, thirst.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hyperphosphatemia may produce extra-skeletal calcification.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain BMP, serum phosphate, ionized calcium. Question history of renal impairment, cardiac disease. Assess hydration status.

**INTERVENTION/EVALUATION**

Monitor serum phosphate, potassium, calcium.

**PATIENT/FAMILY TEACHING**

- Report diarrhea, nausea, vomiting.

**piperacillin/  
tazobactam**

pye-per-a-sil-in/tay-zoe-bak-tam  
(Zosyn)

**Do not confuse Zosyn with  
Zofran or Zyvox.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

**USES**

Treatment of moderate to severe bacterial infections, including community-acquired/nosocomial pneumonia, intra-abdominal, pelvic, skin, and skin structure infections. Tazobactam expands piperacillin activity to include beta-lactamase-producing strains of *S. aureus*, *H. influenzae*, *Bacteroides*, *PsAg*, *Acinetobacter*, *Klebsiella pneumoniae*, *E. coli*. **OFF-LABEL:** Surgical prophylaxis, complicated intra-abdominal infections.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to piperacillin/tazobactam, any penicillin.

**Cautions:** History of allergies (esp. cephalosporins, beta-lactamase inhibitors), renal impairment, seizure disorder.

**ACTION**

**Piperacillin:** Inhibits bacterial cell wall synthesis by binding to PCN-binding proteins, which inhibit the final step of peptidoglycan synthesis. **Therapeutic Effect:** Bactericidal. **Tazobactam:** Inactivates bacterial beta-lactamase. **Therapeutic Effect:** Protects piperacillin from enzymatic degradation, extends its spectrum of activity, prevents bacterial overgrowth.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 16%–30%. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 0.7–1.2 hrs (increased in hepatic cirrhosis, renal impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Dosage not

established for pts younger than 12 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** May decrease concentration/effects of **aminoglycosides** (e.g., **gentamicin**, **tobramycin**). May increase concentration, toxicity of **methotrexate**. **Probenecid** may increase concentration, risk of toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum sodium, alkaline phosphatase, bilirubin, LDH, ALT, AST, BUN, creatinine, PT, PTT. May decrease serum potassium. May cause positive Coombs' test.

## AVAILABILITY (Rx)

**◀ALERT▶** Piperacillin/tazobactam is a combination product in an 8:1 ratio of piperacillin to tazobactam. **Injection Powder:** 2.25 g, 3.375 g, 4.5 g. **Premix Ready to Use:** 2.25 g (50 mL), 3.375 g (50 mL), 4.5 g (100 mL).

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 1 g with 5 mL D<sub>5</sub>W or 0.9% NaCl. Shake vigorously to dissolve. • Further dilute with at least 50 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Infuse over 30 min. Expanded infusion over 3–4 hrs.

**Storage** • Reconstituted vial is stable for 24 hrs at room temperature or 48 hrs if refrigerated. • After further dilution, stable for 24 hrs at room temperature or 7 days if refrigerated.

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), famotidine (Pepcid), haloperidol (Haldol), hydrOXYzine (Vistaril), vancomycin (Vancocin).

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, dexmedetomidine (Precedex), di-

phenhydrAMINE (Benadryl), DOPamine (Intropin), enalapril (Vasotec), furosemide (Lasix), granisetron (Kytril), heparin, hydrocortisone (Solu-CORTEF), HYDROMORPHONE (Dilaudid), LORazepam (Ativan), magnesium sulfate, methyl-PREDNISolone (SOLU-Medrol), metoclopramide (Reglan), morphine, ondansetron (Zofran), potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

**Note: Extended Infusion: ADULTS, ELDERLY:** 3.375–4.5 g over 4 hrs q8h.

### Usual Dosage

**IV: ADULTS, ELDERLY:** (Mild to moderate infections): 3.375 g q6h. (Severe infections): 4.5 g q6–8h. (Coverage of *Pseudomonas aeruginosa*): 4.5 g q6h. **Maximum:** 18 g daily. **ADOLESCENTS, CHILDREN, INFANTS:** 240–300 mg piperacillin/kg/day divided in 3–4 doses. **Maximum daily dose:** 16 g/day. **NEONATES:** 80–100 mg piperacillin component/kg/dose q6–8h.

### Creatinine

#### Clearance Dosage

20–40 mL/min	2.25 g q6h (if usual dose is 3.375g q6h) or 4.5 g q8h or 3.375g q6h (if usual dose is 4.5 g q6h). Extended infusion over 4h (3.375g q8–12h).
Less than 20 mL/min	2.25 g q8h (if usual dose is 3.375g q6h) or 4.5 g q12h or 2.25 g q6h (if usual dose is 4.5 g q6h). Extended infusion over 4h (3.375g q12h).

### Dosage for Hemodialysis

**IV: ADULTS, ELDERLY:** 2.25 g q12 with additional dose of 0.75 g after each dialysis session.

### Dosage for CRRT

CVVH	2.25–3.375 g q6–8h
CVVHD	2.25–3.375 g q6h
CVVHDF	3.375 g q6h

### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Diarrhea, headache, constipation, nausea, insomnia, rash. **Occasional:** Vomiting, dyspepsia, pruritus, fever, agitation, candidiasis, dizziness, abdominal pain, edema, anxiety, dyspnea, rhinitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Overdose, more often with renal impairment, may produce seizures, neurologic reactions. Severe hypersensitivity reactions, including anaphylaxis, occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of allergies, esp. to penicillins, cephalosporins. Obtain CBC; LFT in pts with hepatic impairment.

**INTERVENTION/EVALUATION**

Monitor daily pattern of bowel activity, stool consistency; mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor I&O, urinalysis. Monitor serum electrolytes, esp. potassium, renal function tests.

**polatuzumab vedotin-piiq**

pol-a-too-zue-mab ve-doe-tin (Polivy)

**Do not confuse polatuzumab vedotin-piiq with brentuximab vedotin, panitumumab, pembrolizumab, pertuzumab, or ritUXimab.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** CD79b-directed antibody-drug conjugate (ADC), monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with relapsed or refractory diffuse large B-cell lymphoma (in combination with bendamustine and a ritUXimab product), not otherwise specified, after at least two prior therapies.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to polatuzumab vedotin-piiq. **Cautions:** Baseline cytopenias, hepatic impairment, pts at high risk for tumor lysis syndrome (high tumor burden); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); chronic opportunistic infections (e.g., herpesvirus infection, fungal infections).

**ACTION**

An antibody drug conjugate consisting of three components: a protease-cleavable linker, a microtubule-disrupting agent (monomethyl auristatin E [MMAE]), and humanized immunoglobulin G1 (IgG1) monoclonal antibody. Binds to CD79b (B-cell-specific cell surface protein) commonly expressed in B-cell lymphoma. Forms a complex that disrupts microtubule network. **Therapeutic Effect:** Induces cell cycle arrest and apoptosis.

**PHARMACOKINETICS**

Widely distributed. Metabolized via catabolism into small peptides, amino acids, unconjugated MMAE, catabolites. Protein binding: 71%–77%. Excretion not specified. **Half-life:** (antibody-conjugated MMAE): 12 days; (unconjugated MMAE): 4 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females

of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 mos after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 5 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions/toxic effects.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**. May decrease therapeutic effect; increase adverse effects of **live vaccines**. May increase adverse/toxic effects of **natalizumab**.

**Pimecrolimus, tacrolimus (topical)** may increase adverse/toxic effects.

**HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** **Grapefruit products** may increase concentration/

effect. **LAB VALUES:** May increase serum amylase, ALT, AST, creatinine, lipase. May decrease serum calcium, phosphate, potassium; Hgb, lymphocytes, neutrophils, platelets, RBCs.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 30 mg, 140 mg.

## ADMINISTRATION/HANDLING

**Premedication** • Premedicate with an antipyretic and an antihistamine 30–60 min prior to each dose.

**Infusion guidelines** • Infuse via dedicated IV line using a sterile, nonpyrogenic, low-protein-binding 0.2 or 0.22 micron in-line filter. • Do not administer as IV push or bolus. If a dose is missed, give as soon as possible and adjust schedule to maintain treatment interval.

**Reconstitution** • Must be prepared by personal trained in aseptic manipula-

tions and admixing of cytotoxic drugs. • Calculate the number of vials needed for reconstitution based on weight in kg. • While directing stream toward glass wall of vial, reconstitute each vial with 7.2 mL of Sterile Water for Injection to a final concentration of 20 mg/mL. • Swirl vial gently until powder is completely dissolved. Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear slightly opalescent and colorless to slightly brown in color. Do not use if solution is cloudy or discolored or if visible particles are observed. • Dilute in an infusion bag with a minimum of 50 mL containing 0.9% NaCl, 0.45% NaCl, or D<sub>5</sub>W to a final concentration of 0.72–2.7 mg/mL. • Mix by gentle inversion. • Do not shake or agitate. • Discard used portions of vial.

**Rate of administration • Initial infusion:** Infuse over 90 min.

• **Subsequent infusions:** Infuse over 30 min if previous infusion was tolerated.

**Infusion reactions** • If Grade 1–3 infusion-related reactions occur, interrupt infusion and treat symptoms. If symptoms resolve, resume infusion at 50% of the infusion rate prior to interruption. If symptoms do not recur, may increase infusion rate in increments of 50 mL/hr q30min. • For next cycle, may infuse over 90 min. If no infusion-related reactions occur, subsequent infusion may be infused over 30 min. If Grade 4 infusion-related reactions occur, discontinue infusion and treat symptoms.

**Storage** • Refrigerate unused vials in original carton. • May refrigerate reconstituted vials for up to 48 hrs or store at room temperature for up to 8 hrs. Diluted solutions containing 0.9% NaCl may be refrigerated for up to 24 hrs or stored at room temperature for up to 4 hrs. Diluted solutions containing 0.45% NaCl may be refrigerated for up to 18 hrs or stored at room temperature for up to 4 hrs. Diluted solutions containing D<sub>5</sub>W may be refrigerated for up to 36 hrs or stored at room

temperature for up to 6 hrs. Limit transportation of refrigerated, diluted solutions to 12 hrs or room temperature solutions to 30 min. The total storage time plus transportation of diluted solution should not exceed the storage duration.

## IV INCOMPATIBILITIES

Do not mix or infuse with other solutions or medications.

## INDICATIONS/ROUTES/DOSAGE

### Diffuse Large B-Cell Lymphoma (Relapsed or Refractory)

**IV; ADULTS:** 1.8 mg/kg q21days for 6 cycles (in combination with bendamustine 90 mg/m<sup>2</sup>/day on day 1 and 2 of each cycle, and rituximab 375 mg/m<sup>2</sup> on day 1 of each cycle).

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Peripheral Neuropathy

**Grade 2 or 3 peripheral neuropathy:** Withhold treatment until improved to Grade 1 or 0. If recovered to Grade 1 or 0 before day 14, resume at permanently reduced dose of 1.4 mg/kg. **Permanent discontinuation:** Permanently discontinue if unable to tolerate 1.4 mg/kg dose; if not recovered to Grade 1 or 0 by day 14; if Grade 4 peripheral neuropathy occurs.

### Neutropenia

**Grade 3 or 4 neutropenia:** Withhold treatment until absolute neutrophil count (ANC) greater than 1,000 cells/mm<sup>3</sup>. **ANC improved to greater than 1,000 cells/mm<sup>3</sup> on or before day 7:** Resume all treatments at same dose and consider granulocyte colony-stimulating factor prophylaxis for subsequent cycles (if not previously given). **ANC improved to greater than 1,000 cells/mm<sup>3</sup> after day 7:** Resume all treatments at same dose and consider granulocyte colony-stimulating factor prophylaxis for subsequent cycles (if not previously given). Consider dose reduction of bendamustine if

granulocyte colony-stimulating factor prophylaxis was given. If bendamustine dose was already reduced, then reduce polatuzumab vedotin-piiq dose to 1.4 mg/kg.

### Thrombocytopenia

**Grade 3 or 4 thrombocytopenia:** Withhold treatment until platelet count improves to greater than 75,000 cells/mm<sup>3</sup>. **Platelet count improved to greater than 75,000 cells/mm<sup>3</sup> on or before day 7:** Resume all treatments at same dose. **Platelet count improved to greater than 75,000 cells/mm<sup>3</sup> after day 7:** Resume all treatments and reduce dose of bendamustine. If bendamustine dose was already reduced, then reduce polatuzumab vedotin-piiq dose to 1.4 mg/kg.

### Infusion-Related Reactions

Permanently discontinue in pts with first occurrence of Grade 3 bronchospasm, generalized urticaria, wheezing; recurrent Grade 2 wheezing, urticaria; recurrence of any Grade 3 symptoms; any Grade 4 symptoms.

### Dosage in Renal Impairment.

**Mild to severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment.

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (38%–18%):** Diarrhea, pyrexia, decreased appetite, vomiting. **Occasional (16%–7%):** Decreased weight, dizziness, arthralgia. **Rare (1%):** Blurred vision.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy but more severe reactions including severe neutropenia, febrile neutropenia may be life threatening. Peripheral neuropathy including hypoesthesia, hyperesthesia,

gait disturbance, muscular weakness, paresthesia, peripheral motor/sensorimotor neuropathy, neuropathic pain reported in 40% of pts. Infusion reactions including chills, dyspnea, fever, flushing, hypotension, urticaria reported in 7% of pts. Fatal infections, including opportunistic infections, such as cytomegalovirus infection, herpes virus infection, pneumonia (*Pneumocystis jiroveci* and fungal pneumonia), sepsis have occurred. Grade 3 or higher infections reported in 32% of pts. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive, permanent disability and death. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Hepatotoxicity reported in 2% of pts. Pneumonitis reported in 4% of pts. Immunogenicity (auto-polatuzumab vedotin-piiq antibodies) reported in 6% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, LFT; pregnancy test in females of reproductive potential. Verify use of effective contraception. Recommend prophylactic treatment of *Pneumocystis jiroveci* pneumonia and herpes zoster throughout therapy. Question occurrence of infusion-related reactions prior to each treatment. Due to increased risk of tumor lysis syndrome, assess hydration status prior to each treatment. Screen for active infection. Question history of hepatic impairment, herpesvirus infection, chronic opportunistic infections. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC throughout treatment. Monitor LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) periodically. Monitor for infusion reactions during each infusion.

If infusion reactions occur, interrupt infusion and manage symptoms. Consider ABG, radiologic test if pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if pneumonitis is confirmed. Pts with altered mental status, seizures, visual disturbances, generalized or unilateral weakness should be evaluated for PML. Diligently monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Offer antiemetics if nausea occurs; antidiarrheal agent if diarrhea occurs. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), inflammation of the lung (excessive cough, difficulty breathing, chest pain), nervous system changes (gait disturbance, pain, numbness, trouble walking).
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities or death. Report symptoms of PML brain such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure, and can be fatal. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Allergic reactions

such as chills, difficulty breathing, fever, flushing, itching, low blood pressure can happen at any time during infusion. If allergic reaction occurs, seek immediate medical attention.

## polyethylene glycol

### polyethylene glycol–electrolyte solution

pol-ee-eth-il-een-glye-kol  
(CoLyte, GoLYTELY, Klean-Prep ,  
MiraLax, NuLytely, Peglyte ,  
TriLyte)

**Do not confuse MiraLax with Mirapex.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Osmotic.

**CLINICAL:** Bowel evacuant, laxative.

#### USES

**Polyethylene glycol–electrolyte solution:** Bowel cleansing before GI examination, colon surgery. **Polyethylene glycol:** Treatment of occasional constipation.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to polyethylene glycol. Bowel perforation, gastric retention, GI obstruction, megacolon, toxic colitis, toxic ileus. **Cautions:** **Propylene glycol:** Renal impairment. **Propylene glycol–electrolyte solution:** Ulcerative colitis, dehydration, medications altering electrolytes, hyponatremia, cardiac arrhythmias, impaired gag reflex, seizure disorder, elderly.

#### ACTION

Induces catharsis by osmotic effect. **Therapeutic Effect:** Alleviates constipation, cleanses bowel without depleting electrolytes.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (bowel cleansing)	1–2 hrs	N/A	N/A
PO (constipation)	2–4 days	N/A	N/A

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

#### AVAILABILITY (Rx)

**Powder for Oral Solution: Propylene glycol: (MiraLax):** 17 g/dose. **Propylene glycol–electrolyte solution: (CoLyte, GoLYTELY):** See individual product for specific ingredients.

#### ADMINISTRATION/HANDLING

##### PO

**Polyethylene glycol–electrolyte solution:** • Refrigerate reconstituted solutions; use within 48 hrs. • May use tap water to prepare solution. Shake vigorously for several min to ensure complete dissolution of powder. • Fasting should occur for more than 3 hrs prior to ingestion of solution (always avoid solid food less than 2 hrs prior to administration). • Only clear liquids permitted after administration. • May give via NG tube. • Rapid drinking preferred. Chilled solution is more palatable.

**Polyethylene glycol:** • Add to 4- to 8-oz beverage.

#### INDICATIONS/ROUTES/DOSAGE

##### Bowel Evacuant

**PO: ADULTS, ELDERLY:** Before GI examination: 240 mL (8 oz) q10min until 4 L consumed or rectal effluent clear. NG tube: 20–30 mL/min until 4 L given.

**Constipation**

**PO:** (*MiraLax*): **ADULTS:** 17 g or 1 heaping tbsp/day. **CHILDREN 6 MOS AND OLDER:** 0.2–0.8 g/kg/day. **Maximum:** 17 g/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (50%):** Some degree of abdominal fullness, nausea, bloating. **Occasional (10%–1%):** Abdominal cramping, vomiting, anal irritation. **Rare (less than 1%):** Urticaria, rhinorrhea, dermatitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

None known.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Do not give oral medication within 1 hr of start of therapy (may not adequately be absorbed before GI cleansing).

**INTERVENTION/EVALUATION**

Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Assess for abdominal disturbances.

**PATIENT/FAMILY TEACHING**

- May take 2–4 days to produce a bowel movement.
- Report unusual cramps, bloating, diarrhea.

**pomalidomide**

poe-ma-lid-oh-mide  
(Pomalyst)

**BLACK BOX ALERT** ■ May cause life-threatening birth defects. Pregnancy contraindicated. Exclude pregnancy before initiating treatment. Females of reproductive potential must use two reliable forms of contraception or continuously abstain during treatment and for 4 wks after treatment. Deep vein thrombosis and pulmonary embolism may occur. Consider venous thromboembolism (VTE) prophylaxis during treatment.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Angiogenesis inhibitor. **CLINICAL:** Anti-neoplastic.

**USES**

Treatment of multiple myeloma in pts who have received at least two prior therapies including lenalidomide and a proteasome inhibitor and who have demonstrated disease progression on or within 60 days of completion of the last therapy. Treatment of adults with AIDS-related Kaposi sarcoma (KS) after failure of highly active antiretroviral therapy (HAART) or in pts with KS who are HIV negative.

**PRECAUTIONS**

**ALERT** ▶ Do not donate blood products during therapy and for 1 month after therapy discontinuation; male pts must not donate sperm.

**Contraindications:** Hypersensitivity to pomalidomide. Pregnancy. **Cautions:** Anemia, HF, hepatic/renal impairment, smoking, breastfeeding, or prior history of CVA, MI, DVT, PE.

**ACTION**

Inhibits tumor cell proliferation and induces apoptosis (cell death) of hematopoietic cells. Enhances T-cell- and natural killer (NK) cell-mediated immunity. Inhibits proinflammatory cytokines. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 12%–44%. Peak plasma concentration: 2–3 hrs. Excreted in urine (73%), feces (15%). **Half-life:** 8–10 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Pregnancy/breastfeeding contraindicated. May cause fetal harm. Unknown if distributed in breast milk. Do not breastfeed.

Must verify negative pregnancy status before initiation. Must use two reliable forms of birth control (intrauterine device [IUD], tubal ligation) plus barrier methods. Avoid pregnancy for at least 4 wks after discontinuation. **Males:** Must use condoms during treatment and up to 1 mo after treatment, despite prior history of vasectomy. Do not donate sperm. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of serious adverse effects, renal failure, electrolyte imbalance.

## INTERACTIONS

**DRUG:** May decrease the therapeutic effect; increase adverse effects of vaccines (live). CNS depressants (e.g., alcohol, morphine, zolpidem) may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. Echinacea may decrease therapeutic effect. **FOOD:** None significant. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets, leukocytes, lymphocytes, serum calcium, potassium, sodium. May increase serum calcium, creatinine, glucose.

## AVAILABILITY (Rx)

**Capsules:** 1 mg, 2 mg, 3 mg, 4 mg.

## ADMINISTRATION/HANDLING

### PO

- Do not break, crush, or open capsule.
- Give on empty stomach; must administer at least 2 hrs before or 2 hrs after meal.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma

**Note:** Absolute neutrophil count (ANC) should be 500 cells/mm<sup>3</sup> or greater and platelet count 50,000 cells/mm<sup>3</sup> or greater prior to starting new cycles of therapy.

**PO: ADULTS/ELDERLY:** 4 mg once daily on days 1–21 of 28-day cycle (in combination with dexamethasone; or dexamethasone

and elotuzumab; or dexamethasone and daratumumab). Continue until disease progression or unacceptable toxicity.

### Kaposi Sarcoma

**PO: ADULTS/ELDERLY:** 5 mg once daily on days 1–21 of 28-day cycle. Continue until disease progression or unacceptable toxicity.

### Dose Modification

#### Neutropenia

**ANC less than 500 cells/mm<sup>3</sup> or febrile neutropenia:** Withhold treatment until ANC is greater than 500 cells/mm<sup>3</sup>, then reduce dose to 3 mg once daily. **Any subsequent drop of ANC less than 500 cells/mm<sup>3</sup> after prior reduction:** Withhold treatment until ANC is greater than 500 cells/mm<sup>3</sup>, then reduce dose by 1 mg less than previous dose. Discontinue if 1-mg dose is intolerable.

#### Thrombocytopenia

**Platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count greater than 50,000 cells/mm<sup>3</sup>, then reduce dose to 3 mg once daily. **Any subsequent platelet drop to less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count greater than 50,000 cells/mm<sup>3</sup>, then reduce dose by 1 mg less than previous dose. Discontinue if 1-mg dose is intolerable.

### Kaposi Sarcoma

**PO: ADULTS:** 5 mg once daily on days 1–21 of a 28-day cycle. Continue until disease progression or unacceptable toxicity. Continue HAART as HIV treatment in pts with AIDS-related Kaposi sarcoma.

### Dosage in Renal Impairment

Avoid use in pts with serum creatinine more than 3 mg/dL or CrCl less than 45 mL/min.

### Dosage in Hepatic Impairment

Avoid use in pts with serum bilirubin more than 2 mg/dL and ALT, AST more than 3 times upper limit of normal (ULN).

## SIDE EFFECTS

**Frequent (55%–22%):** Fatigue, constipation, nausea, diarrhea, dyspnea, back pain, peripheral edema, musculoskeletal chest pain, anorexia, rash. **Occasional (20%–7%):** Dizziness, pyrexia, muscle spasms, arthralgia, pruritus, vomiting, cough, weight loss, headache, bone pain, muscular weakness, anxiety, musculoskeletal pain, peripheral neuropathy, chills, dry skin, tremor, insomnia. **Rare (6%–1%):** Hyperhidrosis, extremity pain, back pain, night sweats, constipation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (neutropenia, leukopenia, thrombocytopenia) is an expected outcome of therapy; may increase risk of infection such as pneumonia, upper respiratory tract infection, UTI. Neurologic events such as acute confusion, dizziness reported. Peripheral neuropathy occurred in 18% of pts. Venous thromboembolism including DVT, PE occurred in 3% of pts. Epistaxis occurred in 15% of pts. Increased risk of secondary malignancies reported. Acute renal failure reported in 16% of pts. Additional adverse events may include interstitial lung disease (ILD), neutropenic sepsis, *Pneumocystis jiroveci* pneumonia, respiratory syncytial virus infection, urinary retention, vertigo.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP; pregnancy test in females of reproductive potential. Receive full medication history. Obtain baseline neurologic exam. Question history of diabetes mellitus, electrolyte imbalance, hepatic/renal impairment, pulmonary disease, thromboembolism, smoking.

### INTERVENTION/EVALUATION

Monitor CBC, BMP. Obtain ECG for palpitations, chest pain, hypokalemia,

hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias. Immediately report dyspnea, chest pain, hypoxia, unilateral peripheral edema/pain (may indicate thromboembolic event). Perform routine neurologic assessments to screen for confusion, delirium. Monitor urine output, frequency.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Do not donate blood.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Go from lying to standing slowly (prevents postural hypotension, dizziness). Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not smoke.
- Do not eat 2 hrs before or 2 hrs after dose.
- Avoid alcohol.
- Report difficulty breathing, chest pain, extremity pain or swelling, dizziness, confusion.

## ponatinib

poe-na-ti-nib  
(Iclusig)

**BLACK BOX ALERT** Arterial occlusions have occurred, including CVA, fatal MI, large arterial vessel stenosis of the brain, severe peripheral vascular disease requiring revascularization. Events may occur in pts with or without cardiovascular risks, including pts younger than 50 yrs of age. Venous thromboembolism, serious HF, or left ventricular dysfunction

were reported. Hepatotoxicity, including fatal hepatic failure, may occur.

**Do not confuse ponatinib with afatinib, alectinib, dasatinib, bosutinib, gefitinib, imatinib, lapatinib, lenvatinib, neratinib, or tofacitinib.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** BCR-ABL tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Treatment of pts with chronic, accelerated, or blast phase chronic myeloid leukemia (CML) or Philadelphia chromosome (Ph+) acute lymphoblastic leukemia (ALL) for whom no other kinase inhibitor therapy is indicated. Treatment of adults with T315I-positive CML (chronic, accelerated, or blast phase) or T315I-positive ALL (Ph+ ALL). Not indicated for treatment of newly diagnosed chronic phase CML.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to ponatinib. **Cautions:** Baseline hematologic cytopenias; conditions predisposing to infection (e.g., diabetes, immunocompromised pts, open wounds), history of arterial/venous thrombosis (e.g., CVA, DVT, MI, PE), cardiac disease, cardiac conduction disorders, HF, hypertension; diabetes, electrolyte imbalance, glaucoma, hepatic impairment, hyperlipidemia, GI perforation, neuropathy (peripheral or cranial), ocular disorders, pancreatitis or alcohol abuse, history of ischemia, vascular stenosis; pts with high tumor burden; pts at risk for hemorrhage (e.g., history of intracranial/GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelets, NSAIDs).

#### ACTION

Inhibits viability of cells expressing native or mutant BCR-ABL tyrosine kinase, including T315I mutation, created by the Philadelphia chromosome abnormality.

**Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 6 hrs or less. Excreted in feces (87%), urine (5%). **Half-life:** 24 hrs (Range: 12–66 hrs).

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 6 days after discontinuation. Females of reproductive potential and males with female partners of reproductive potential should use effective contraception during treatment and for at least 3 wks after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions/toxic effects. Use caution.

#### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease therapeutic effect of BCG (intravesical), vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, bilirubin, creatinine, lipase, triglycerides, uric acid. May decrease Hgb, Hct, leuko-

cytes, lymphocytes, neutrophils, platelets; serum albumin, bicarbonate, phosphate. May increase or decrease serum calcium, glucose, potassium, sodium.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 15 mg, 30 mg, 45 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer tablets whole; do not break, cut, crush, or divide.

## INDICATIONS/ROUTES/DOSAGE

**CML (Accelerated or Blast Phase), Ph+ ALL**

**PO: ADULTS, ELDERLY:** 45 mg once daily. Consider dose reduction in pts with chronic or accelerated phase CML who have achieved a major cytogenetic response. If an adequate response has been not achieved within 90 days, consider discontinuation.

**CML (Chronic Phase)**

**PO: ADULTS, ELDERLY:** Initially, 45 mg once daily. Reduce dose to 15 mg once daily upon achievement of 1% or less BCR-ABL IIS. Pts with a loss of response may re-escalate dose to 30–45 mg once daily. Continue until a loss of response at the re-escalated dose, unacceptable toxicity, or if hematologic response has not occurred by 3 mos.

### Dose Modification

Based on Common Terminology for Adverse Events (CTCAE).

### Hepatotoxicity

**Grade 2 or greater serum ALT/AST elevation:** Withhold treatment until improved to Grade 1 or 0, then resume dose based on occurrence. **Occurrence at 45-mg dose:** Resume treatment at 30-mg dose. **Occurrence at 30-mg dose:** Resume treatment at 15-mg dose. **Occurrence at 15-mg dose:** Permanently discontinue. **Serum ALT/AST elevation greater than or equal to 3 times ULN with concurrent serum bilirubin elevation greater than 2 times ULN and serum alkaline phosphatase less than 2 times ULN:** Permanently discontinue.

### Neutropenia/Thrombocytopenia

**ANC less than 1000 cells/mm<sup>3</sup>; platelet count less than 50,000 cells/mm<sup>3</sup>:** Withhold treatment until ANC greater than or equal to 1500 cells/mm<sup>3</sup>; or platelet count greater than or equal to 75,000 cells/mm<sup>3</sup>, then resume dose based on occurrence. **First occurrence:** Resume treatment at 45-mg dose. **Second occurrence:** Resume treatment at 30-mg dose. **Third occurrence:** Resume treatment at 15-mg dose.

### Pancreatitis/Elevated Lipase

**Asymptomatic Grade 1 or 2 serum lipase elevation:** Consider withholding treatment or reducing dose. **Asymptomatic Grade 3 or 4 serum lipase elevation; asymptomatic radiologic pancreatitis (Grade 2 pancreatitis):** Withhold treatment until improved to Grade 1 or 0, then resume dose based on occurrence. **Occurrence at 45-mg dose:** Resume treatment at 30-mg dose. **Occurrence at 30-mg dose:** Resume treatment at 15-mg dose. **Occurrence at 15-mg dose:** Permanently discontinue. **Grade 4 pancreatitis:** Permanently discontinue.

### Concomitant Use of Strong CYP3A4 Inhibitors

Reduce initial dose to 30 mg.

### Dosage in Renal Impairment

Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild, moderate, severe impairment:** Reduce initial dose to 30 mg.

## SIDE EFFECTS

**Note:** Percentages of side effects of chronic phase, accelerated phase, blast phase CML; Ph+ ALL may vary.

**Frequent (69%–18%):** Hypertension, abdominal pain, fatigue, asthenia, headache, dry skin, constipation, arthralgia, nausea, pyrexia, burning sensation, hyperesthesia, hypoesthesia, neuralgia, paresthesia, dysgeusia, muscular weakness, gait disturbance, areflexia, hypotonia, restless legs syndrome, myalgia, extremity pain,

back pain, diarrhea, vomiting. **Occasional (17%–2%):** Dyspnea, dizziness, peripheral edema, cough, bone pain, musculoskeletal pain, mucositis, aphthous stomatitis, lip blister, mouth ulceration, mucosal eruption, oral pain, oropharyngeal pain, stomatitis, tongue ulceration, muscle spasm, conjunctival irritation, corneal abrasion/erosion, dry eye, hyperemia, eye pain, pruritus, decreased appetite, insomnia, decreased weight, generalized pain, erythema, alopecia, chills, blurry vision, tachycardia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including bone marrow failure, febrile neutropenia may be life-threatening. Fatal arterial occlusions including CVA, MI, stenosis of large arterial vessel of the brain, severe peripheral vascular disease requiring revascularization reported in 35% of pts; may occur within 2 wks of initiation (even at reduced doses of 15 mg/day). Coronary artery occlusion, MI occurred in 21% of pts. Venous thromboembolism (DVT, PE, superficial thrombophlebitis) occurred in 5–9% of pts. Life-threatening events including cardiac bradyarrhythmias (requiring pacemaker implantation), complete heart block, sick sinus syndrome, atrial fibrillation with bradycardic pauses, atrial fibrillation, SVT, ventricular tachycardia; emergent hypertension (68% of pts), GI/intracranial hemorrhage (28% of pts), hepatotoxicity (54% of pts), pancreatitis (6%), HF, left ventricular dysfunction (6% of pts); infections including cellulitis, nasopharyngitis, pneumonia, sepsis, upper respiratory tract infection, UTI; ocular toxicities including blindness, conjunctival hemorrhage, cataracts, periorbital edema, ocular hyperemia, iritis, iridocyclitis, ulcerative keratitis; peripheral edema (31% of pts), pleural effusion (2% of pts), pericardial effusion (1% of pts); peripheral neuropathy, polyneuropathy,

nerve compression (20% of pts) may occur. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Reversible posterior leukoencephalopathy may include aphasia, cognition impairment, paralysis, vision loss, weakness. Pts with newly diagnosed CML have an increased risk of severe toxicities. Improper wound healing, GI perforation may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, serum ionized calcium, phosphate, uric acid; vital signs; weight. Obtain pregnancy test in females of reproductive potential. Receive full medication history including herbal products and screen for interactions. Question history as listed in Precautions. Screen for active infection. Conduct ophthalmologic, neurologic exam. Due to increased risk of tumor lysis syndrome, assess adequate hydration prior to initiation. Consider correcting electrolyte abnormalities prior to initiation. Obtain dietary consult. Screen for risk of bleeding; active infection. Assess skin for rash, lesions. Offer emotional support.

### INTERVENTION/EVALUATION

Obtain ANC, CBC for myelosuppression q2wks for 3 mos, then monthly thereafter. Monitor serum lipase monthly; BMP, LFT, serum ionized calcium, phosphate, uric acid as indicated. Monitor ECG for cardiac arrhythmias. Due to extremely high risk for arterial occlusions, be vigilant when screening for CVA (aphasia, confusion, paresthesia, hemiparesis, seizures), MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation), vascular compromise. Be alert for serious infection, opportunistic infection, sepsis. Monitor for GI perforation, hepatotoxicity, ocular disease, pancreatitis; symptoms of thromboembolism (arm/leg pain, swelling; chest pain, dyspnea, hypoxia, tachycardia), reversible

posterior leukoencephalopathy, tumor lysis syndrome; other toxicities as listed in Adverse Reactions/Toxic Effects. Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition. Monitor weight, I&O.

#### PATIENT/FAMILY TEACHING

• Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Life-threatening arterial blood clots may occur; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures). • Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); HF (difficulty breathing, extremity swelling, sudden loss of breath, palpitations); inflammation of the pancreas (abdominal bruising; persistent, severe abdominal pain that radiates to the back [with or without vomiting]); eye problems (blindness, blurred vision, eye inflammation or bleeding, severe eye or head pain); heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate); intestinal perforation (severe abdominal pain, fever, nausea). • Use effective contraception to avoid pregnancy. Do not breastfeed. • Report planned surgical/dental procedures. • Immediately report bleeding of any kind. • Do not ingest grapefruit products, herbal supplements. • Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## ponesimod

poe-nes-i-mod  
(Ponvory)

**Do not confuse ponesimod with fingolimod, siponimod, or ozanimod.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sphingosine 1-phosphate (S1P) receptor-1 modulator. **CLINICAL:** Multiple sclerosis agent.

#### USES

Treatment of relapsing forms of multiple sclerosis (MS) in adults, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to ponesimod. Myocardial infarction, unstable angina, stroke, transient ischemic attack, decompensated heart failure requiring hospitalization, or Class III or IV heart failure in the last 6 mos. Sick sinus syndrome, Mobitz type II second- or third-degree AV block (unless pt has a functioning pacemaker). **Cautions:** Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), baseline sinus bradycardia, hepatic impairment, hypertension, altered pulmonary function, pts at risk for developing AV block (e.g., congenital heart disease, ischemic heart disease, HF), pts at risk for macular edema (e.g., diabetes, history of uveitis). Concomitant use of antiarrhythmics, beta blockers, calcium channel blockers, immunosuppressants, immune modulators, antineoplastics, QT interval-prolonging medications. Not recommended in pts with severe active infection; history of cardiac arrest, cerebrovascular disease, uncontrolled hypertension; severe, untreated sleep apnea unless approved by a cardiologist.

## ACTION

Binds with high affinity to S1P receptor, blocking capacity of lymphocytes to move out from lymph nodes, reducing the number of lymphocytes available to the CNS. **Therapeutic Effect:** May involve reduction of lymphocyte migration into the CNS, reducing inflammation.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 4 hrs. Excreted in feces (57%–80%), urine (10%–18%). Not removed by hemodialysis. **Half-life:** 33 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for 1 wk after the last ponesimod dose. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Beta-blockers** (e.g., carvedilol, metoprolol), **bretylum**, **calcium channel blockers** (e.g., diltiazem, verapamil), **ceritinib**, **digoxin**, **lacosamide** may increase risk of AV block, bradycardia. **Class Ia antiarrhythmics** (e.g., procainamide, quinidine), **Class III antiarrhythmics** (e.g., amiodarone, sotalol) may increase risk of torsades de pointes in pts with baseline sinus bradycardia. May increase QT interval—prolonging effect of **amiodarone**, **azithromycin**, **ciprofloxacin**, **haloperidol**. May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase toxic effect of live vaccines. May increase toxic effects of **leflunomide**, **natalizumab**, **tacrolimus**. May increase immunosuppressive effect of

**alemtuzumab**, **baricitinib**,  **fingolimod**,  **tofacitinib**,  **upadacitinib**. **MAOIs** (e.g., **phenelzine**, **selegiline**, **tranylcypromine**) may increase risk of hypertensive crisis. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** **Foods or beverages with high amounts of tyramine** (e.g., **aged cheese**, **pickled herring**, **red wine**) may cause release of norepinephrine, resulting in hypertension. **LAB VALUES:** May increase serum ALT, AST, cholesterol, C-reactive protein. Expected to cause a dose-dependent reduction in peripheral lymphocyte count from baseline values.

## AVAILABILITY (Rx)

**Tablets:** 2 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7 mg, 8 mg, 9 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Starter pack must be used as a 14-day titration prior to maintenance doses.
- Interruption during titration is not recommended. If fewer than 4 consecutive doses are missed during titration, resume treatment with the first missed dose. If fewer than 4 consecutive doses are missed during maintenance, continue maintenance dose. If 4 or more consecutive doses are missed (titration or maintenance), restart titration with starter pack.
- Administer tablet whole.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis (Relapsing)

**PO: ADULTS:** Titrate as follows: **Days 1–2:** 2 mg once daily. **Days 3–4:** 3 mg once daily. **Days 5–6:** 4 mg once daily. **Day 7:** 5 mg (single dose). **Day 8:** 6 mg (single dose). **Day 9:** 7 mg (single dose). **Day 10:** 8 mg (single dose). **Day 11:** 9 mg (single dose). **Days 12–14:** 10 mg once daily. **Maintenance:** 20 mg once daily starting on day 15.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

**Dosage in Hepatic Impairment****Mild impairment:** No dose adjustment.**Moderate to severe impairment:** Not specified; use caution.**SIDE EFFECTS****Occasional (10%):** Hypertension. **Rare (5%–2%):** Dyspnea, dizziness, cough, extremity pain, somnolence, pyrexia, vertigo.**ADVERSE EFFECTS/TOXIC REACTIONS**

Life-threatening infections may occur. Fatal cases of cryptococcal meningitis, disseminated cryptococcal infections were reported. Herpes zoster infections reported in 5% of pts. Reactivation of herpes viral infection may cause herpes simplex encephalitis and varicella zoster meningitis. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Respiratory tract infections, including bronchitis, laryngitis, pharyngitis, pneumonia, nasopharyngitis, sinusitis, tracheitis, reported in 37% of pts. Urinary tract infection (UTI) reported in 6% of pts. Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may evolve into an ischemic CVA or cerebral hemorrhage, may occur. Macular edema reported in 2% of pts. Pts with diabetes or history of uveitis are at an increased risk for developing macular edema. AV conduction delays, bradycardia reported in 6% of pts. Dose-dependent reductions of pulmonary function (absolute forced expiratory volume over 1 second) reported in 4%–8% of pts. Hepatotoxicity reported in 5% of pts. Seizures reported in 2% of pts. May increase risk of hypertensive crisis. Cutaneous malignancies, including basal cell carcinoma, melanoma, squamous cell carcinoma, were reported. Rebound or severe exacerbation of MS symptoms may occur after discontinuation.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT, ECG. Assess baseline symptoms of MS (e.g., bladder/bowel

dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Consultation with a cardiologist is advised in pts with QT interval prolongation greater than 500 msec; arrhythmias requiring treatment with Class Ia or Class III antiarrhythmics; unstable ischemic heart disease, HF, uncontrolled hypertension, history of cardiac arrest, CVA or TIA (greater than 6 mos); history of Mobitz type II second- or third-degree AV block, sick sinus syndrome, sinoatrial heart block. First-dose monitoring is recommended in pts with preexisting cardiac conditions (baseline sinus bradycardia, first- or second-degree [Mobitz type I], history of MI [greater than 6 mos], HF) in a medical setting that can adequately treat symptomatic bradycardia. Pts without a documented history of vaccination against varicella zoster or a confirmed history of varicella infection (chickenpox) should be tested for antibodies prior to initiation. A full vaccination course for varicella in antibody-negative pts is recommended. Perform baseline ophthalmologic evaluation of the fundus (including the macula). Receive full medication history and screen for interaction (esp. antineoplastics, immunosuppressants; drugs known to cause bradycardia, AV conduction delay). Question history as listed in PRECAUTIONS. Screen for active infection.

**INTERVENTION/EVALUATION**

Monitor LFT if hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) is suspected. At initial treatment (within first 4–6 hrs after dose), therapy reduces heart rate, AV conduction. In pts with preexisting cardiac conditions, monitor for symptomatic bradycardia for at least 6 hrs after first dose with hourly pulse, B/P, then obtain ECG at the end of day 1. If heart rate is less than 45 beats/min, QTc interval is 500 msec or greater, or new-onset second-degree (or higher) AV block is present after first dose, continue monitoring until resolved. If intervention

is required, continue heart monitoring overnight and repeat 4-hr monitoring after second dose. Conduct ophthalmic examination with any change of vision. Pts with altered mental status, seizures, visual disturbances, unilateral weakness should be evaluated for cryptococcal meningitis, varicella zoster meningitis, posterior reversible encephalopathy syndrome, PML. Persistent immunosuppressive effects may occur after discontinuation. Closely monitor for adverse effects if other immunosuppressants are initiated after discontinuation. Monitor for infections (cough, fatigue, fever, urinary frequency), esp. herpetic infections, respiratory tract infections, sepsis. Monitor B/P for hypertension. Assess skin for malignancies, new lesions. Conduct neurological assessment. Assess for improvement of MS symptoms.

#### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system and reduce ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Any change of vision will require an immediate eye examination.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities or death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- Treatment may worsen high blood pressure or cause skin cancers.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), lung problems (reduced lung function, shortness of breath), heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or irregular heart rate).
- Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may cause a stroke or bleeding in the brain, may occur.
- Use effective contraception to avoid pregnancy.
- Due to high risk of interactions, do not take newly prescribed

medications unless approved by the prescriber who originally started treatment.

- Do not receive live vaccines within 4 wks of initiation.
- Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen, lip balm, clothing to protect against sunburn/skin irritation.
- Severe worsening of MS symptoms may occur after stopping treatment.

## potassium acetate

**HIGH ALERT**

## potassium bicarbonate/citrate

(Effer-K, Klor-Con EF)

## potassium chloride

(Kaon-Cl, Klor-Con, Klor-Con M10, Klor-Con M20, Micro-K)

**Do not confuse Micro-K with Macrobid or Micronase.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Electrolyte. **CLINICAL:** Potassium replenisher.

#### USES

**Potassium acetate, potassium bicarbonate/citrate:** Treatment, prevention of hypokalemia when necessary to avoid chloride or acid/base imbalance (requires bicarbonate). **Potassium chloride:** Treatment, prevention of hypokalemia.

#### PRECAUTIONS

**Contraindications:** **Acetate:** Severe renal impairment, adrenal insufficiency, hyperkalemia. **Chloride:** Renal failure, hyperkalemia, conditions in which potassium retention is present. Solid oral dosage form in pts in whom there is structural, pathologic cause for delay in passage through

GI tract. **Cautions:** Cardiac disease, acid-base disorders, potassium-altering disorders, digitalized pts, concomitant therapy that increases serum potassium (e.g., ACE inhibitors), renal impairment. Do not administer IV undiluted.

## ACTION

Necessary for multiple cellular metabolic processes. Primary action is intracellular. **Therapeutic Effect:** Required for nerve impulse conduction, contraction of cardiac, skeletal, smooth muscle; maintains normal renal function, acid-base balance.

## PHARMACOKINETICS

Well absorbed from GI tract. Enters cells by active transport from extracellular fluid. Primarily excreted in urine.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** May be at increased risk for hyperkalemia. Age-related ability to excrete potassium is reduced.

## INTERACTIONS

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), eplerenone, potassium-containing medications, potassium-sparing diuretics (e.g., spironolactone, triamterene), salt substitutes may increase serum potassium concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

## AVAILABILITY (Rx)

**Potassium Acetate**

**Injection Solution:** 2 mEq/mL.

**Potassium Bicarbonate and**

**Potassium Citrate**

**Tablets for Solution: (Effer-K):** 10 mEq, 20 mEq, 25 mEq. **(Klor-Con EF):** 25 mEq.

**Potassium Chloride**

**Injection Solution:** 2 mEq/mL. **Oral Solution:** 20 mEq/15 mL, 40 mEq/15 mL. **Powder for Oral Solution:** 20 mEq/packet, 25 mEq/packet.

**Capsules, Extended-Release: (Micro-K):** 8 mEq, 10 mEq. **Tablets, Extended-Release:** 8 mEq, 10 mEq, 15 mEq, 20 mEq.

## ADMINISTRATION/HANDLING

**Reconstitution** • For IV infusion only, must dilute before administration, mix well, infuse slowly. • Avoid adding potassium to hanging IV.

**Rate of administration** • Routinely, give at concentration of no more than 40 mEq/L, no faster than 10 mEq/hr for peripheral infusion, 20–40 mEq/hr for central infusion.

**Storage** • Store at room temperature. Use admixtures within 24 hrs.

## PO

• Take with or after meals, with full glass of water (decreases GI upset). • Liquids, powder, effervescent tablets: Mix, dissolve with juice, water before administering. • Do not break, crush, dissolve, or divide tablets; give whole.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), phenytoin (Dilantin).

## IV COMPATIBILITIES

Amiodarone (Cordarone), atropine, aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), ciprofloxacin (Cipro), clindamycin (Cleocin), dexamethasone (Decadron), dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), famotidine (Pepcid), fluconazole (Diflucan), furosemide (Lasix), granisetron (Kytril), heparin, hydrocortisone (Solu-CORTEF), insulin, lidocaine, LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (SOLU-Medrol), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, norepinephrine (Levophed), ondansetron (Zofran), oxytocin (Pitocin),

piperacillin and tazobactam (Zosyn), procainamide (Pronestyl), propofol (Diprivan), propranolol (Inderal).

## INDICATIONS/ROUTES/DOSAGE

### Treatment of Hypokalemia

#### Potassium Acetate

**IV: ADULTS, ELDERLY:** 5–10 mEq/dose (**Maximum:** 40 mEq/dose) to infuse over 2–3 hrs. **Usual Range:** 40–100 mEq/day.

#### Dose/Rate Guidelines

	Greater than 2.5–3.5 mEq/L	2.5 mEq/L or less
<b>Serum potassium</b>	3.5 mEq/L	or less
Maximum infusion rate	10 mEq/hr	40 mEq/hr
Maximum 24-hr dose	200 mEq	400 mEq

#### Potassium Chloride

**PO: ADULTS, ELDERLY: Mild to moderate:** Initially, 10–20 mEq given 2–4 times/day. **Severe:** Initially, 40 mEq given 3–4 times/day. (May also give 20 mEq q2–3h in conjunction with careful monitoring.) **CHILDREN:** Initially, 1–2 mEq/kg, then as needed based on lab values.

**IV: ADULTS, ELDERLY:** 10 mEq/hr (or less); repeat as needed based on lab values. **CHILDREN:** 0.5–1 mEq/kg/dose (**Maximum:** 40 mEq); repeat as needed based on lab values.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution with potassium acetate (may increase serum aluminum and/or potassium).

## SIDE EFFECTS

**Occasional:** Nausea, vomiting, diarrhea, flatulence, abdominal discomfort with distention, phlebitis with IV administration (particularly when potassium concentration of greater than 40 mEq/L is infused). **Rare:** Rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hyperkalemia (more common in elderly, pts with renal impairment) mani-

festes as paresthesia, motor weakness, cold skin, hypotension, confusion, irritability, paralysis, cardiac arrhythmias. Too-rapid infusion may cause cardiac arrhythmia, ventricular fibrillation, cardiac arrest.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess for hypokalemia (weakness, fatigue, polyuria, polydipsia). PO form should be given with food or after meals with full glass of water, fruit juice (minimizes GI irritation).

### INTERVENTION/EVALUATION

Monitor serum potassium, calcium, phosphate. If GI disturbance occurs, dilute preparation further or give with meals. Monitor for decreased urinary output (may be indication of renal insufficiency). Check IV site closely during infusion for evidence of phlebitis (heat, pain, red streaking of skin over vein, hardening of vein), extravasation (swelling, pain). Be alert to evidence of hyperkalemia (skin pallor/coldness, paresthesia, feeling of heaviness of lower extremities).

### PATIENT/FAMILY TEACHING

- Report symptoms of high potassium levels (irregular heartbeat, muscle weakness, nausea, numbness, tingling).

## PRALAtrexate

pral-a-trex-ate  
(Folotyn)

**Do not confuse Folotyn with Focalin, or PRALAtrexate with methotrexate or PEMAtrexed.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic.

## USES

Treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL). **OFF-LABEL:** Treatment of relapsed/refractory cutaneous T-cell lymphoma.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to PRALAtrexate. **Cautions:** Baseline cytopenias, mouth ulcers; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hepatic impairment, severe renal impairment, pts at risk for tumor lysis syndrome (high tumor burden). Avoid use in pts with end-stage renal disease (ESRD).

## ACTION

Folate analogue metabolic inhibitor that competes with enzymes necessary for tumor cell reproduction. Inhibits DNA, RNA, protein synthesis. **Therapeutic Effect:** Inhibits tumor growth.

## PHARMACOKINETICS

Widely distributed. Protein binding: 67%. Partially excreted in urine. **Half-life:** 12–18 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., diclofenac, meloxicam, naproxen), probenecid, salicylates (e.g., aspirin), trimethoprim/sulfamethoxazole may delay

clearance, increase concentration. May decrease the therapeutic effect; increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease RBC, WBC, Hgb, Hct, platelet count, serum potassium. May increase serum ALT, AST.

## AVAILABILITY (Rx)

**Injection Solution:** 20 mg/mL.

## ADMINISTRATION/HANDLING

**◀ALERT▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately, thoroughly with soap, water.

**Reconstitution** • Withdraw calculated dose into syringe for immediate use. • Intended for single use only. • Do not dilute.

**Rate of administration** • Administer as IV push over 3–5 min into IV infusion of 0.9% NaCl.

**Storage** • Refrigerate vials until use, protect from light. Stable at room temperature for 72 hrs. • Discard vial if solution is discolored (solution should appear clear to yellow) or particulate matter is present.

## IV INCOMPATIBILITIES

Do not mix with any other medication.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Prior to any dose, mucositis should be no higher than CTCAE Grade 1, platelets 100,000 cells/mm<sup>3</sup> or greater for first dose and 50,000 cells/mm<sup>3</sup> or greater for subsequent doses, and absolute neutrophil count (ANC) 1,000 cells/mm<sup>3</sup> or greater. Pt should begin taking oral folic acid (1 mg) daily starting 10 days prior to first IV PRALAtrexate dose and continue for 30 days after last dose.

Pt should also receive vitamin B<sub>12</sub> (1 mg) IM injection no more than 10 wks prior to first IV PRALatrexate dose and every 8–10 wks thereafter.

### Refractory/Relapsed Peripheral T-Cell Lymphoma

**IV: ADULTS, ELDERLY:** 30 mg/m<sup>2</sup> administered once wky for 6 wks in 7-wk cycles. Dose may be decreased to 20 mg/m<sup>2</sup> to manage adverse reactions. Continue until disease progression or unacceptable toxicity.

### Dosage in Renal Impairment

**Note:** Further dose modifications may be required based on tolerability and history of renal impairment.

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose to 15 mg/m<sup>2</sup>. **ESRD:** Avoid use.

### Dosage in Hepatic Impairment

**CTCAE Grade 3:** Withhold dose; decrease to 20 mg/m<sup>2</sup> when Grade 2 or less. **CTCAE Grade 4:** Discontinue.

## SIDE EFFECTS

**Common (70%–36%):** Mucositis, nausea, fatigue. **Frequent (34%–10%):** Constipation/diarrhea, pyrexia, edema, cough, epistaxis, vomiting, dyspnea, anorexia, rash, throat/abdominal/back pain, night sweats, asthenia, tachycardia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia) is an expected response to therapy, but more severe reactions including febrile neutropenia, sepsis may occur. Mucositis reported in 70% of pts. Mucositis is less severe when folic acid, vitamin B<sub>12</sub> therapy is ongoing. Cutaneous toxicities, including toxic epidermal necrolysis, may occur. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. May cause hepatotoxicity. Pts with renal impairment have an increased risk of toxicity. Epistaxis reported in 26% of pts. Up-

per respiratory tract infections reported in 10% of pts. Overdosage requires general supportive care. Prompt administration of leucovorin should be considered in case of overdose, based on mechanism of action of PRALatrexate.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function, LFT; pregnancy test in females of reproductive potential. Initiate folic acid, vitamin B<sub>12</sub> therapy prior to and throughout therapy. Assess risk of tumor lysis syndrome. Ensure adequate hydration. Screen for active infection. Ensure proper parameters prior to each dose: mucositis Grade 1 or 0; platelet count 100,000 cells/mm<sup>3</sup> or greater (first dose) or 50,000 cells/mm<sup>3</sup> or greater (subsequent doses); ANC 1000 cells/mm<sup>3</sup> or greater. Verify compliance of folic acid, vitamin B<sub>12</sub> therapy prior to initiation and during treatment. Receive full medication history and screen for interactions. Question history of hepatic/renal disease.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss); renal function. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Diligently monitor for infection (cough, fatigue, fever). Assess for mucositis (oropharyngeal ulcers, oral/throat pain, local infection). Monitor skin for cutaneous toxicities. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of

bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool. • Folic acid, vitamin B<sub>12</sub> therapy is essential to reduce adverse effects. • Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting. Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), toxic skin reactions (rash, redness, sloughing, swelling); symptoms of mucositis (oral/throat pain or ulcers, local infection). • Maintain strict oral hygiene. Use effective contraception to avoid pregnancy. Do not breastfeed.

## pralsetinib

pral-se-ti-nib  
(Gavreto)

**Do not confuse pralsetinib with pazopanib, pemigatinib, pexidartinib, ponatinib, pralatrexate, ripretinib, or selpercatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** *RET* kinase inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of adults with metastatic *RET* fusion-positive non–small-cell lung cancer (NSCLC). Treatment of adults and pediatric pts 12 yrs of age and older with advanced or metastatic *RET*-mutant medullary thyroid cancer (MTC) who require systemic therapy. Treatment of advanced or metastatic *RET* fusion-positive thyroid cancer in pediatric pts 12 yrs of age and older and adults who require systemic ther-

apy and who are radioactive iodine–refractory (if radioactive iodine is appropriate).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to pralsetinib. **Cautions:** Baseline cytopenias, hepatic impairment, hypertension, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); pts at risk for bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma), interstitial lung disease (e.g., COPD, sarcoidosis, connective disease disease), tumor lysis syndrome (high tumor burden), poor wound healing (e.g., recent or planned surgery, chronic open wounds). Withhold treatment for at least 5 days prior to elective surgery or for at least 2 wks after major surgery and until wound is fully healed. Do not initiate in pts with uncontrolled hypertension. Avoid concomitant use of strong CYP3A inducers; combined P-gp and strong CYP3A inhibitors.

## ACTION

Inhibits wild-type *RET*, oncogenic *RET* fusions, and *RET* mutations. Certain activating point mutations in *RET* or chromosomal rearrangements involving in-frame fusions of *RET* can result in constitutively activated chimeric *RET* fusion proteins, which may act as oncogenic drivers, promoting tumor cell line proliferation. **Therapeutic Effect:** Demonstrates anti-tumor activity in cells harboring oncogenic *RET* fusions or mutations.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 97%. Peak plasma concentration: 2–4 hrs. Steady state reached in 3–5 days. Excreted in feces (73%), urine (6%). **Half-life:** 15.7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of re-

productive potential must use effective, nonhormonal contraception during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 mos after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. May impair fertility. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), P-gp inhibitors (e.g., amiodarone, azithromycin, cyclosporine, diltiazem, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** Food, meals decrease absorption, concentration/effect. **Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, potassium. May decrease serum albumin, calcium, magnesium, phosphate, sodium; Hgb, lymphocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Capsules:** 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Give on empty stomach (no food for at least 2 hrs prior to or at least 1 hr after dose).
- Administer capsules whole; do not break, cut, or crush.
- Capsules cannot be chewed.
- If a dose is missed, give as soon as possible on the same day.
- If vomiting occurs after administration,

give the next dose at regularly scheduled time (do not give additional dose).

## INDICATIONS/ROUTES/DOSAGE

**NSCLC** (metastatic RET fusion-positive), **MTC** (advanced or metastatic RET-mutant), **Thyroid Cancer** (advanced, metastatic RET fusion-positive)

**PO: ADULTS, CHILDREN 12 YRS OR OLDER:** 400 once daily until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**First reduction:** 300 mg once daily.

**Second reduction:** 200 mg once daily.

**Third reduction:** 100 mg once daily.

**Unable to tolerate 100-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Hepatotoxicity

**Grade 3 or 4 hepatotoxicity:** Withhold treatment until improved to Grade 1 or baseline, then resume at a reduced dose. Permanently discontinue if Grade 3 or 4 hepatotoxicity recurs.

### Hemorrhagic Events

**Grade 3 or 4 hemorrhage:** Withhold treatment until improved to Grade 1 or 0. **Severe or life-threatening hemorrhage:** Permanently discontinue

### Hypertension

**Grade 3 hypertension (despite optimal hypertensive therapy):** Withhold treatment until adequately controlled, then resume at reduced dose level. **Grade 4 hypertension:** Permanently discontinue.

### Pulmonary Toxicity

**Grade 1 or 2 ILD/pneumonitis:** Withhold treatment until resolved, then resume at reduced dose. Permanently discontinue if ILD/pneumonitis recurs.

### Other Toxicities

**Any other Grade 3 or 4 toxicities:** Withhold treatment until improved to

Grade 2 or less, then resume at reduced dose level. Permanently discontinue if Grade 4 toxicity recurs.

#### **Concomitant Use of Combined P-gp and Strong CYP3A Inhibitors**

**Note:** If concomitant use of combined P-gp and strong CYP3A inhibitor is unavoidable, reduce pralsetinib dose as follows: **Current 400-mg dose:** Reduce dose to 200 mg once daily. **Current 300-mg dose:** Reduce dose to 200 mg once daily. **Current 200-mg dose:** Reduce dose to 100 mg once daily. If CYP3A inhibitor is discontinued for 3–5 half-lives, may resume dose prior to starting combined P-gp and strong CYP3A inhibitor.

#### **Concomitant Use of Strong CYP3A Inducers**

If concomitant use of strong CYP3A inducer is unavoidable, increase starting pralsetinib dose to double the current dose starting on day 7. If CYP3A inducer is discontinued for at least 14 days, may resume dose prior to starting strong CYP3A inducer.

#### **Dosage in Renal Impairment**

**Mild to severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment.  
**Moderate to severe impairment:** Not specified; use caution.

### **SIDE EFFECTS**

**Note:** Frequency and occurrence of side effects may vary based on treatment as monotherapy or in combination with other therapies.

**Frequent (42%–22%):** Musculoskeletal pain, constipation, hypertension, diarrhea, abdominal pain, dry mouth, stomatitis, mucosal inflammation, tongue ulceration, nausea, fatigue, asthenia, edema (eyelid, face, periorbital, peripheral), cough, headache, rash, eczema, migraine, pyrexia, dyspnea.

**Occasional (20%–15%):** Peripheral neu-

ropathy, dysesthesia, neuralgia, paresthesia, polyneuropathy, dizziness, vertigo, dysgeusia, decreased appetite.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Life-threatening ILD/pneumonitis reported in 10% of pts. Grade 3 hypertension reported in 14% of pts. Serum ALT, AST elevation reported in 69% and 46% of pts, respectively. Serious hepatotoxicity reported in 2% of pts. Grade 3 or 4 hemorrhagic events reported in 3% of pts. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. May cause impaired wound healing or wound dehiscence requiring medical intervention. Pneumonia reported in 17% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with skin redness, swelling, numbness, sloughing of the hands and feet, may occur.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT, B/P; pregnancy test in females of reproductive potential. Confirm compliance of effective nonhormonal contraception. Verify presence of a *RET* gene fusion (NSCLC, thyroid cancer) or specific *RET* gene mutation (MTC) in tumor specimens or plasma. Due to increased risk of tumor lysis syndrome, routinely assess hydration. Conduct dermatological exam; assess for open wounds, lesions, surgical incisions. Question history of hepatic impairment, hemorrhagic events, hypertension, recent surgery. Receive full medication history and screen for interactions. Screen for active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression periodically; LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) q2wks for 3 mos, then monthly thereafter. If Grade 3 or 4 hepatotoxicity occurs, monitor LFT wkly until improved. Obtain serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Monitor B/P 1 wk after initiation, then at least monthly thereafter. If indicated, consider antihypertensive therapy. Monitor for infections (cough, fatigue, fever). Consider ABG, radiologic test if pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if pneumonitis is confirmed. Monitor for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor, P-gp inhibitor is unavoidable. Assess skin for impaired wound healing, rash, PPES. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), inflammation of the lung (excessive cough, difficulty breathing, chest pain), toxic skin reactions (sloughing,

rash, poor healing of wounds).

- Life-threatening bleeding may occur; report bloody stool, urine; rectal bleeding, nosebleeds, vomiting blood.
- There is a high risk of interactions with other drugs. Do not take newly prescribed medications unless approved by prescriber who originally started treatment. Avoid grapefruit products, herbal supplements.
- Use effective, nonhormonal contraception to avoid pregnancy. Do not breastfeed. Fertility may be impaired.
- Notify physician before any planned surgeries/dental procedures.
- Dose must be taken on an empty stomach.

**pramipexole**

pram-i-pex-ole  
(Apo-Pramipexole , Mirapex, Mirapex ER)

**Do not confuse Mirapex with Mifeprex or MiraLax.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** DOPamine receptor agonist. **CLINICAL:** Antiparkinson agent.

**USES**

**Mirapex:** Treatment of Parkinson's disease, moderate to severe primary restless legs syndrome. **Mirapex ER:** Treatment of Parkinson's disease. **OFF-LABEL: Immediate-Release:** Depression (due to bipolar disorder), fibromyalgia.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to pramipexole. **Cautions:** History of orthostatic hypotension, pts at risk for hypotension, syncope, hallucinations, renal impairment (extended-release not recommended with CrCl less than 30 mL/min), concomitant use of CNS depressants, preexisting dyskinesia, elderly pts.

**ACTION**

Stimulates DOPamine receptors in striatum and substantia nigra. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson's disease. Improves motor function.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 15%. Steady-state concentrations achieved within 2 days. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 8 hrs (12 hrs in pts older than 65 yrs).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of hallucinations.

**INTERACTIONS**

**DRUG:** Antipsychotic agents (e.g., haloperidol) may decrease therapeutic effect. **Levodopa-containing products** may increase the hypotensive effect. **HERBAL:** Herbs with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase hypotensive effect. **FOOD:** All foods delay peak drug plasma levels by 1 hr (extent of absorption not affected). **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Tablets:** 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg.

**Tablets, Extended-Release:** (*Mirapex ER*): 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg.

**ADMINISTRATION/HANDLING****PO**

**Mirapex:** • Give without regard to food. **Mirapex ER:** • Give once daily, without regard to food. • Give whole; do not break, crush, dissolve, or divide tablets.

**INDICATIONS/ROUTES/DOSAGE****Parkinson's Disease**

**Note:** When discontinuing, reduce dose by 0.75 mg/day until daily dose is 0.75 mg once daily, then reduce by 0.375 mg/day thereafter.

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 0.125 mg 3 times/day. Increase no more frequently than every 5–7 days. **Maintenance:** 0.5–1.5 mg 3 times/day. **(Extended-Release):** Initially, 0.375 mg once daily. May increase to 0.75 mg, then by 0.75-mg increments no more frequently than 5–7 days. **Maximum:** 4.5 mg once daily. **Note:** May switch overnight from immediate-release to extended-release at same daily dose.

**Restless Legs Syndrome**

**Note:** When discontinuing, gradually reduce dose q4–7 days.

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 0.125 mg once daily 2–3 hrs before bedtime. May increase to 0.25 mg after 4–7 days, then to 0.5 mg after 4–7 days (interval is 14 days in pts with renal impairment). **Maximum:** 0.75 mg/day.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance.

**Parkinson's Disease****Immediate-Release**

Creatinine Clearance	Initial Dosage	Maximum Dosage
30–50 mL/min	0.125 mg twice daily	0.75 mg 3 times/day
15–29 mL/min	0.125 mg once daily	1.5 mg once daily

**Extended-Release**

**CrCl 30–50 mL/min:** Initially, 0.375 mg every other day. May increase by 0.375 mg/day in 7 days or longer. **Maximum:** 2.25 mg once daily. **CrCl less than 30 mL/min:** Not recommended.

**Restless Legs Syndrome**

No dose adjustment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent: Early Parkinson's disease (28%–10%):** Nausea, asthenia, dizziness, drowsiness, insomnia, constipation. **Advanced Parkinson's disease**

(53%–17%): Orthostatic hypotension, extrapyramidal reactions, insomnia, dizziness, hallucinations. **Occasional:** **Early Parkinson's disease (5%–2%):** Edema, malaise, confusion, amnesia, akathisia, anorexia, dysphagia, peripheral edema, vision changes, impotence. **Advanced Parkinson's disease (10%–7%):** Asthenia, drowsiness, confusion, constipation, abnormal gait, dry mouth. **Rare:** **Advanced Parkinson's disease (6%–2%):** General edema, malaise, angina, amnesia, tremor, urinary frequency/incontinence, dyspnea, rhinitis, vision changes. **Restless legs syndrome:** **Frequent (16%):** Headache, nausea. **Occasional (13%–9%):** Insomnia, fatigue. **Rare (6%–3%):** Drowsiness, constipation, diarrhea, dry mouth.

## ADVERSE EFFECTS/TOXIC REACTIONS

Vascular disease, atrial fibrillation, arrhythmias, pulmonary embolism, impulsive/compulsive behavior (pathological gambling, hypersexuality, binge eating) have been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**Parkinson's disease:** Assess for tremor, muscle weakness and rigidity, ataxia. **Restless legs syndrome:** Assess frequency of symptoms, sleep pattern.

### INTERVENTION/EVALUATION

Assess for clinical improvement. Assist with ambulation if dizziness occurs. Assess for constipation; encourage fiber, fluids, exercise.

### PATIENT/FAMILY TEACHING

- Hallucinations may occur, esp. in the elderly.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- If nausea occurs, take medication with food.
- Avoid abrupt withdrawal.
- Avoid alcohol.
- Report new or increased impulsive/compulsive behaviors (e.g., gambling, sexual urges, compulsive eating or buying).

## pravastatin

 TOP  
100

pra-va-sta-tin

**Do not confuse pravastatin with atorvastatin, lovastatin, nystatin, pitavastatin, or simvastatin.**

### FIXED-COMBINATION(S)

**Pravigard:** pravastatin/aspirin (anti-coagulant): 20 mg/81 mg, 40 mg/81 mg, 80 mg/81 mg, 20 mg/325 mg, 40 mg/325 mg, 80 mg/325 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hydroxymethylglutaryl CoA (HMG-CoA) reductase inhibitor. **CLINICAL:** Anti-hyperlipidemic.

### USES

To reduce elevated total cholesterol (total-C), LDL-C, apoB, and triglyceride levels and to increase HDL-C in pts with primary hypercholesterolemia. Adjunct to diet in children and adolescents aged 8 yrs of age and older with heterozygous familial hypercholesterolemia. Adjunct to other lipid-lowering treatments to reduce total-C and LDL-C in pts with homozygous familial hypercholesterolemia. To reduce the risk of myocardial infarction (MI), stroke, revascularization procedures, and angina in pts with a history of coronary heart disease (CHD) and in adults without a history of CHD, but who have multiple CHD risk factors.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to pravastatin. Active hepatic disease or unexplained, persistent elevations of LFT results. Pregnancy, breastfeeding. **Cautions:** Hepatic impairment, substantial alcohol consumption. Withholding/discontinuing pravastatin may be necessary when pt is at risk for renal failure secondary to rhabdomyolysis, elderly.

### ACTION

Interferes with cholesterol biosynthesis by preventing conversion of HMG-CoA

reductase to mevalonate, a precursor to cholesterol. **Therapeutic Effect:** Lowers LDL, VLDL cholesterol, plasma triglycerides; increases HDL.

## PHARMACOKINETICS

Widely distributed. Protein binding: 50%. Metabolized in liver. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 2–3 hrs. (Half-life including all metabolites: 77 hrs.)

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity) and lactation. Small amount is distributed in breast milk, but there is risk of serious adverse reactions in breastfeeding infants. Breastfeeding not recommended. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CycloSPORINE, clarithromycin, colchicine, erythromycin, gemfibrozil, niacin increase risk of myopathy, rhabdomyolysis. **Bile acid sequestrants** (e.g., cholestyramine) may decrease absorption. **HERBAL:** None significant. **FOOD:** Red yeast rice contains 2.4 mg lovastatin per 600 mg rice (may increase adverse effects). **LAB VALUES:** May increase serum creatine kinase (CK), transaminase.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 20 mg, 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Prior to initiating therapy, pt should be on standard cholesterol-lowering diet for 3–6 mos. Low-cholesterol diet should be continued throughout pravastatin therapy.

## Hyperlipidemia, Prevention of Coronary/ Cardiovascular Events

**PO: ADULTS, ELDERLY:** 40–80 mg once daily.

## Heterozygous Familial Hypercholesterolemia

**PO: CHILDREN 14–18 YRS:** 40 mg/day.  
**CHILDREN 8–13 YRS:** 20 mg/day. Range: 5–20 mg/day.

## Dose Modification

### Dosage with Clarithromycin

**Maximum:** 40 mg/day.

### Dosage with CycloSPORINE

**ADULTS, ELDERLY:** Initially, 10 mg/day.

**Maximum:** 20 mg/day.

### Dosage in Renal Impairment

For adults, give 10 mg/day initially. Titrate to desired response.

### Dosage in Hepatic Impairment

See contraindications.

## SIDE EFFECTS

**Occasional (7%–4%):** Nausea, vomiting, diarrhea, constipation, abdominal pain, headache, rhinitis, rash, pruritus. **Rare (3%–2%):** Heartburn, myalgia, dizziness, cough, fatigue, flu-like symptoms, depression, photosensitivity.

## ADVERSE EFFECTS/TOXIC REACTIONS

Potential for malignancy, cataracts. Hypersensitivity, myopathy occur rarely. Rhabdomyolysis has been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain lipid panel, LFT; pregnancy test in females of reproductive potential. Obtain dietary history, esp. fat consumption.

### INTERVENTION/EVALUATION

Monitor serum cholesterol, triglycerides for therapeutic response. Monitor LFT. Monitor daily pattern of bowel activity, stool consistency. Assess for rash, pruritus.

Be alert for malaise, muscle cramping/weakness; if accompanied by fever, may require discontinuation of medication.

#### PATIENT/FAMILY TEACHING

- Follow special diet (important part of treatment).
- Report promptly any muscle pain/weakness, esp. if accompanied by fever, malaise.
- Use non-hormonal contraception.
- Avoid direct exposure to sunlight.

## prednisoLONE

pred-niss-oh-lone  
(Millipred, Orapred ODT, Pred Forte, Pred Mild, Veripred)

**Do not confuse prednisoLONE with predniSONE or primidone.**

#### FIXED-COMBINATION(S)

**Blephamide:** prednisoLONE/sulfacetamide (an anti-infective): 0.2%/10%.

**Vasocidin:** prednisoLONE/sulfacetamide: 0.25%/10%.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenal corticosteroid. **CLINICAL:** Anti-inflammatory, immunosuppressant.

## USES

**Systemic:** Endocrine, rheumatic, hematologic disorders; collagen, respiratory, neoplastic, GI diseases; allergic states; acute or chronic solid organ rejection.

**Ophthalmic:** Treatment of conjunctivitis, corneal injury (from chemical/thermal burns, foreign body).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to prednisoLONE. Acute superficial herpes simplex keratitis, systemic fungal infections, varicella, live or attenuated virus vaccines. **Cautions:** Hyperthyroidism, cirrhosis, ocular herpes simplex, respiratory tuberculosis, untreated systemic

infections, renal/hepatic impairment, diabetes, cataracts, glaucoma, seizure disorder, peptic ulcer disease, osteoporosis, myasthenia gravis, hypertension, HF, ulcerative colitis, thromboembolic disorders, elderly.

## ACTION

Inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release/synthesis, release of mediators of inflammation.

**Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

## PHARMACOKINETICS

Protein binding: 65%–91%. Metabolized in liver. Excreted in urine. **Half-life:** 3.6 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Fetal cleft palate often occurs with chronic, first-trimester use. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

## INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease effects. Live virus vaccines increase vaccine side effects, potentiate virus replication, decrease pt's antibody response to vaccine. May increase effect of warfarin. May decrease therapeutic effect of aldesleukin. May increase hyponatremic effect of desmopressin. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, lipids, sodium, uric acid. May decrease serum calcium, WBC, hypothalamic pituitary adrenal (HPA) axis function, potassium.

**AVAILABILITY (Rx)**

**Solution, Ophthalmic:** 1%. **Solution, Oral:** 15 mg/5 mL, 5 mg/5 mL, 10 mg/5 mL, 20 mg/5 mL, 25 mg/5 mL. **Suspension, Ophthalmic:** 1%, 0.12%. **Tablets:** 5 mg.

 **Tablets, Orally Disintegrating:** 10 mg, 15 mg, 30 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with food or fluids to decrease GI side effects.

**Orally Disintegrating Tablets**

- Do not break, crush, or divide tablets.
- Remove from blister just prior to giving; place on tongue.
- Pt may swallow whole or allow to dissolve in mouth with/without water.

**Ophthalmic**

- For ophthalmic solution, shake well before using.
- Instill drops into conjunctival sac, as prescribed.
- Avoid touching applicator tip to conjunctiva to avoid contamination.

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**PO: ADULTS, ELDERLY:** 10–60 mg/day as a single daily dose or in 2–4 divided doses. (Low dose): 2.5–10 mg/day. (High dose): 1–1.5 mg/kg/day (usually not to exceed 80–100 mg/day). **CHILDREN:** 0.1–2 mg/kg/day in divided doses 1–4 times/day.

**Treatment of Conjunctivitis, Corneal Injury**

**Ophthalmic: ADULTS, ELDERLY, CHILDREN:** 1–2 drops every hr during day and q2h during night. After response, decrease dosage to 1 drop q4h, then 1 drop 3–4 times/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Insomnia, heartburn, nervousness, abdominal distention, diaphoresis, acne, mood swings, increased appetite,

facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. **Occasional:** Headache, edema, change in skin color, frequent urination. **Rare:** Tachycardia, allergic reaction (rash, urticaria), psychological changes, hallucinations, depression. **Ophthalmic:** Stinging/burning, posterior subcapsular cataracts.

**ADVERSE EFFECTS/TOXIC REACTIONS**

**Long-term therapy:** Hypocalcemia, hypokalemia, muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF, immunosuppression. **Abrupt withdrawal following long-term therapy:** Anorexia, nausea, fever, headache, severe/sudden joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension. Sudden discontinuance may be fatal.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question medical history as listed in Precautions. Obtain height, weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, ECG).

**INTERVENTION/EVALUATION**

Monitor B/P, weight, serum electrolytes, glucose, results of bone mineral density test, height, weight in children. Be alert to infection (sore throat, fever, vague symptoms); assess oral cavity daily for signs of *Candida* infection. Monitor for symptoms of adrenal insufficiency, immunosuppression.

**PATIENT/FAMILY TEACHING**

- Report fever, sore throat, muscle aches, sudden weight gain, swelling, loss of appetite, fatigue.
- Avoid alcohol, limit caffeine.
- Do not abruptly discontinue without physician's approval.
- Avoid exposure to chickenpox, measles.
- Long-term use may significantly increase risk of serious infections.

## predniSONE

pred-ni-sonē

(Apo-PredniSONE , PredniSONE Intensol, Rayos, Winpred )

**Do not confuse predniSONE with methylPREDNISolone, prazosin, prednisoLONE, PriLOSEC, primidone, or promethazine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenal corticosteroid. **CLINICAL:** Anti-inflammatory, immunosuppressant.

### USES

**Substitution therapy in deficiency states:** Acute or chronic adrenal insufficiency, congenital adrenal hyperplasia, adrenal insufficiency secondary to pituitary insufficiency. **Nonendocrine disorders:** Arthritis, rheumatic carditis; allergic, collagen, intestinal tract, multiple sclerosis exacerbations; liver, ocular, renal, skin diseases; bronchial asthma, cerebral edema, malignancies. **OFF-LABEL:** Prevention of postherpetic neuralgia, relief of acute pain in pts with herpes zoster, autoimmune hepatitis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to predniSONE. Acute superficial herpes simplex keratitis, systemic fungal infections, varicella, administration of live or attenuated virus vaccines. **Cautions:** Hyperthyroidism, cirrhosis, ocular herpes simplex, respiratory tuberculosis, untreated systemic infections, renal/hepatic impairment, following acute MI, cataracts, glaucoma, seizure disorder, peptic ulcer disease, osteoporosis, myasthenia gravis, hypertension, HF, ulcerative colitis, thromboembolic disorders, elderly, pts at risk for hyperglycemia (e.g., diabetes, recent surgery).

### ACTION

Inhibits accumulation of inflammatory cells at inflammation sites, phagocyto-

sis, lysosomal enzyme release/synthesis, release of mediators of inflammation. **Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 70%–90%. Widely distributed. Metabolized in liver, converted to prednisoLONE. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2.5–3.5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Fetal cleft palate often occurs with chronic, first trimester use. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

### INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease effects. **Live virus vaccines** may increase vaccine side effects, potentiate virus replication, decrease pt's antibody response to vaccine. May increase effect of warfarin. May decrease therapeutic effect of aldesleukin. May increase hyponatremic effect of desmopressin. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, lipids, sodium, uric acid. May decrease serum calcium, potassium, WBC, hypothalamic pituitary adrenal (HPA) axis function.

### AVAILABILITY (Rx)

**Solution, Oral:** 1 mg/mL. **Solution, Oral Concentrate:** (Prednisone Intensol): 5 mg/mL. **Tablets:** 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg.

 **Tablet, Delayed-Release: (Rayos):** 1 mg, 2 mg, 5 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food or fluids to decrease GI side effects.
- Give single doses before 9 AM, multiple doses at evenly spaced intervals.
- Give delayed-release tablet whole; do not break, crush, dissolve, or divide.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Dose dependent upon condition treated, pt response rather than by rigid adherence to age, weight, or body surface area.

### Usual Dosage

**PO: ADULTS, ELDERLY:** 10–60 mg/day as a single daily dose or in 2–4 divided doses. (Low dose): 2.5–10 mg/day. (High dose): 1–1.5 mg/kg/day (usually not to exceed 80–100 mg/day). **CHILDREN:** 0.05–2 mg/kg/day in 1–4 divided doses.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Insomnia, heartburn, nervousness, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea, constipation. **Occasional:** Headache, edema, change in skin color, frequent urination. **Rare:** Tachycardia, allergic reaction (rash, urticaria), psychological changes, hallucinations, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

**Long-term therapy:** Muscle wasting (esp. in arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF. **Abrupt withdrawal following long-term therapy:** Anorexia, nausea, fever, headache, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension. Sudden discontinuance may be fatal.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question medical history as listed in Precautions. Obtain height, weight, B/P, serum glucose, electrolytes. Check results of initial tests (tuberculosis [TB] skin test, X-rays, ECG).

### INTERVENTION/EVALUATION

Monitor B/P, serum electrolytes, glucose, results of bone mineral density test, height, weight in children. Be alert to infection (sore throat, fever, vague symptoms); assess oral cavity daily for signs of *Candida* infection. Monitor for symptoms of adrenal insufficiency, immunosuppression.

### PATIENT/FAMILY TEACHING

- Report fever, sore throat, muscle aches, sudden weight gain, swelling, loss of appetite, or fatigue.
- Avoid alcohol, minimize use of caffeine.
- Report symptoms of elevated blood sugar levels (blurred vision, headache, increased thirst, frequent urination).
- Do not abruptly discontinue without physician's approval.
- Avoid exposure to chickenpox, measles.
- Long-term use may significantly increase risk of serious infections.

## pregabalin

TOP  
100

pre-gab-a-lin  
(Lyrica, Lyrica CR)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** GABA analogue. **CLINICAL:** Anticonvulsant, antineuralgic, analgesic (Schedule V).

## USES

**Lyrica:** Adjunctive therapy in treatment of partial-onset seizures. Management of neuropathic pain associated with dia-

betic peripheral neuropathy or spinal cord injury. Management of postherpetic neuralgia. Management of fibromyalgia. **Lyrica CR:** Management of neuropathic pain associated with diabetic peripheral neuropathy, postherpetic neuralgia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to pregabalin. **Cautions:** HF, renal impairment, cardiovascular disease, diabetes, history of angioedema, history of suicidal ideation and behavior. Concurrent use of thiazolidine antidiabetics (e.g., Actos).

## ACTION

Binds to calcium channel sites in CNS tissue, inhibiting excitatory neurotransmitter release. Exerts antinociceptive, anticonvulsant activity. May affect descending noradrenergic and serotonergic pain transmission pathways from the brainstem to spinal cord. **Therapeutic Effect:** Decreases symptoms of painful peripheral neuropathy; decreases frequency of partial seizures.

## PHARMACOKINETICS

Widely distributed. Excreted in urine unchanged. **Half-life:** 6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Increased risk of fetal skeletal abnormalities. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase sedative effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase CPK. May cause mild PR interval prolongation. May decrease platelet count.

## AVAILABILITY (Rx)

**Solution, Oral:** 20 mg/mL.

 **Capsules:** 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg.

 **Tablet, Extended-Release:** 82.5 mg, 165 mg, 330 mg.

## ADMINISTRATION/HANDLING

- Give without regard to food.
- Administer whole; do not break, crush, or open capsule.
- **Lyrica CR:** Give once daily in evening.
- Discontinue pregabalin gradually over at least 1 wk.
- Administer whole; do not break, cut, crush, or divide. Tablet cannot be chewed.

## INDICATIONS/ROUTES/DOSAGE

### Partial-Onset Seizures

**PO: ADULTS, ELDERLY:** Initially, 75 mg twice daily or 50 mg 3 times/day. May increase dose based on tolerability/effect. **Maximum:** 600 mg/day. **ADOLESCENTS, CHILDREN, 4 YRS AND OLDER WEIGHING 30 KG OR MORE:** Initially, 2.5 mg/kg/day in 2 or 3 divided doses. May increase wkly based on clinical response and tolerability. **Maximum:** 10 mg/kg/day (not to exceed 600 mg/day). **LESS THAN 30 KG:** Initially, 3.5 mg/kg/day in 2 or 3 divided doses. May increase wkly based on clinical response and tolerability. **Maximum:** 14 mg/kg/day. **CHILDREN YOUNGER THAN 4 YRS, INFANTS WEIGHING LESS THAN 30 KG:** Initially, 3.5 mg/kg/day in 3 divided doses. May increase wkly based on response and tolerability. **Maximum:** 14 mg/kg/day.

### Neuropathic Pain (Diabetes-Associated)

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 25–75 mg/day once daily or in 2–3 divided doses. May increase within 1 wk based on response and tolerability. **Maximum:** 300–450 mg/day.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 165 mg once daily. May increase to 330 mg/day within 1 wk. **Maximum:** 330 mg/day.

### Postherpetic Neuralgia, Neuropathic Pain Associated With Spinal Cord Injury

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 75 mg twice daily or 50 mg 3 times/day. May increase to 300 mg/day

within 1 wk. May further increase to 600 mg/day after 2–4 wks. **Maximum:** 600 mg/day.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 165 mg once daily. May increase to 330 mg/day within 1 wk. May further increase to 660 mg once daily after 2–4 wks. **Maximum:** 660 mg/day.

### Fibromyalgia

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 75 mg twice daily. May increase to 150 mg twice daily within 1 wk. **Maximum:** 225 mg twice daily.

### Dosage in Renal Impairment

#### Creatinine Clearance Daily Dosage

30–60 mL/min	75–300 mg in 2–3 divided doses
15–29 mL/min	25–150 mg in 1 or 2 doses
Less than 15 mL/min	25–75 mg once daily

### Dosage for Hemodialysis

**◀ALERT▶** Take supplemental dose immediately following dialysis.

#### Daily Dosage Supplemental Dosage

25 mg	Single dose of 25 mg or 50 mg
25–50 mg	Single dose of 50 mg or 75 mg
75 mg	Single dose of 100 mg or 150 mg

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (32%–12%):** Dizziness, drowsiness, ataxia, peripheral edema. **Occasional (12%–5%):** Weight gain, blurred vision, diplopia, difficulty with concentration, attention, cognition; tremor, dry mouth, headache, constipation, asthenia. **Rare (4%–2%):** Abnormal gait, confusion, incoordination, twitching, flatulence, vomiting, edema, myopathy.

## ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal increases risk of seizure frequency in pts with seizure disorders; withdraw gradually over a

minimum of 1 wk. May increase risk of suicidal thoughts and behavior.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**Seizure:** Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC). **Pain:** Assess onset, type, location, and duration of pain. Question history of suicidal ideation and behavior.

### INTERVENTION/EVALUATION

Assess for seizure activity. Assess for clinical improvement; record onset of relief of pain. Assess for peripheral edema. Question for changes in visual acuity. Monitor weight.

### PATIENT/FAMILY TEACHING

- Do not abruptly stop taking drug; seizure frequency may be increased.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occur.

## primidone

prim-i-done  
(Mysoline)

**Do not confuse primidone with predniSONE or pyridoxine.**

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Barbiturate. **CLINICAL:** Anticonvulsant.

## USES

Management of psychomotor, generalized tonic-clonic (grand mal), and focal seizures. **OFF-LABEL:** Treatment of essential tremor (familial tremor).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to primidone, PHENobarbital; porphyria.

**Cautions:** Renal/hepatic impairment, pulmonary insufficiency, elderly, debilitated, children, hypoadrenalism, pts at risk for suicidal thoughts/behavior, depression, history of drug abuse.

## ACTION

Decreases neuron excitability. Raises seizure threshold. **Therapeutic Effect:** Reduces seizure activity.

## PHARMACOKINETICS

Widely distributed. Protein binding: 99%. Metabolized in liver to PHENobarbital. Minimal excretion in urine. **Half-life:** 3–6 hrs. (PHENobarbital: 2–5 days.)

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children/Elderly:** May produce paradoxical excitement, restlessness.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Valproic acid increases concentration, risk of toxicity. Strong CYP2C19 inducers (e.g., carbamazepine, rifampin) may decrease concentration/effect. Strong CYP2C19 inhibitors (e.g., fluoxetine, fluvoxamine) may increase concentration/effect. May decrease effect of dolutegravir, oral contraceptives, tenofovir, voriconazole, warfarin. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease serum bilirubin. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

## AVAILABILITY (Rx)

**Tablets:** 50 mg, 250 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food to minimize GI effects.

## INDICATIONS/ROUTES/DOSAGE

### Seizure Control

**PO: ADULTS, ELDERLY:** Initially, 100–125 mg/day at bedtime for days 1–3. **Days 4–6:** 100–125 mg twice daily. **Days 7–9:** 100–125 mg 3 times/day. **Usual dose:** 750–1,500 mg/day in 3–4 divided doses. **Maximum:** 2 g/day. **CHILDREN 8 YRS AND OLDER: Days 1–3:** 100–125 mg at bedtime. **Days 4–6:** 100–125 mg twice daily. **Days 7–9:** 100–125 mg 3 times daily. **Maintenance:** (starting day 10 of therapy): 250 mg 3 times daily. **Usual range:** 750–1,000 mg/day in divided doses 3–4 times daily. **Maximum:** 2,000 mg/day. **CHILDREN YOUNGER THAN 8 YRS:** Initially, 50 mg/day at bedtime for days 1–3. **Days 4–6:** 50 mg twice daily. **Days 7–9:** 100 mg twice daily. **Usual dose:** 125–250 mg 3 times/day. **NEONATES:** 12–20 mg/kg/day in divided doses 2–4 times/day.

### Dosage in Renal Impairment

Creatine Clearance	Interval
50 mL/min or greater	q12h
10–49 mL/min	q12–24h
Less than 10 mL/min	q24h
Hemodialysis (HD)	Administer dose post-HD

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Ataxia, dizziness. **Occasional:** Anorexia, drowsiness, altered mental status, nausea, vomiting, paradoxical excitement. **Rare:** Rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal after prolonged therapy may produce effects ranging from markedly increased dreaming, nightmares, insomnia, tremor, diaphoresis, vomiting to hallucinations, delirium, seizures, status epilepticus. Skin eruptions may appear as hypersensitivity reaction. Blood dyscrasias, hepatic disease, hypocalcemia occur rarely. Overdose produces cold/clammy skin, hypothermia, severe CNS depression,

followed by high fever, coma. May increase risk of suicidal thoughts and behavior.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Review history of seizure disorder (intensity, frequency, duration, LOC). Observe frequently for recurrence of seizure activity. Initiate seizure precautions. Question history of suicidal ideation and behavior.

### INTERVENTION/EVALUATION

Monitor for changes in behavior, depression, suicidal ideation. Monitor CBC, neurologic status (frequency, duration, severity of seizures). Monitor for **therapeutic serum level**: 4–12 mcg/mL; **toxic serum level**: more than 12 mcg/mL.

### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue medication after long-term use (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established; drowsiness usually disappears during continued therapy.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## propafenone

proe-paf-e-nown

(Apo-Propafenone , Rythmol SR)

**BLACK BOX ALERT** Mortality or nonfatal cardiac arrest rate (7.7% of pts) in asymptomatic non-life-threatening ventricular arrhythmia pts with recent MI (more than 6 days but less than 2 yrs prior) reported.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC**: Class 1c antiarrhythmic. **CLINICAL**: Antiarrhythmic.

## USES

**Immediate-Release**: Treatment of life-threatening ventricular arrhythmias (e.g., sustained ventricular tachycardias). To prolong time to recurrence of paroxysmal atrial fibrillation/flutter (PAF) or paroxysmal supraventricular tachycardia (PSVT) in pts with disabling symptoms and without structural heart disease.

**Extended-Release**: Prolong the time to recurrence of atrial fibrillation/flutter or paroxysmal supraventricular tachycardia in pts with disabling symptoms without structural heart disease. **OFF-LABEL**: Treatment following cardioversion of recent-onset atrial fibrillation; supraventricular tachycardia in pts with Wolff-Parkinson-White syndrome.

## PRECAUTIONS

**Contraindications**: Hypersensitivity to propafenone. Sinus bradycardia, bronchospastic disorders or severe obstructive pulmonary disease, cardiogenic shock, uncorrected electrolyte imbalance, sinoatrial, AV, intraventricular impulse generation or conduction disorders (e.g., sick sinus syndrome, AV block) without pacemaker, uncompensated HF, marked hypotension. **Cautions**: Renal/hepatic impairment, myasthenia gravis, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia).

## ACTION

Blocks fast inward sodium current. Slows the rate of increase of the action potential (prolongs conduction velocity, refractory period). **Therapeutic Effect**: Suppresses arrhythmias.

## PHARMACOKINETICS

Widely distributed. Protein binding: 85%–97%. Metabolized in liver. Primarily excreted in feces. **Half-life**: 2–10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta, distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Amiodarone may affect cardiac conduction, repolarization. May increase effects of warfarin. CYP3A4 inhibitors (e.g., ketoconazole, erythromycin) may increase concentration/toxicity. Strong CYP2D6 inhibitors (e.g., buPROPion, FLUoxetine) may increase concentration/effect. QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May cause ECG changes (e.g., QRS widening, PR interval prolongation), positive ANA titer.

## AVAILABILITY (Rx)

**Tablets:** 150 mg, 225 mg, 300 mg.

 **Capsules, Extended-Release:** 225 mg, 325 mg, 425 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Give whole; do not break, crush, divide, or open capsules.

## INDICATIONS/ROUTES/DOSAGE

**Ventricular Arrhythmias, PAT, PSVT**

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 150 mg q8h. May increase at 3- to 4-day intervals to 225 mg q8h, then to 300 mg q8h. **Maximum:** 900 mg/day.

**PO: (Extended-Release): (Ventricular arrhythmias):** 225–425 mg q12h. **(PAT):** Initially, 225 mg q12h. **Maximum:** 425 mg q12h

**Atrial Fibrillation (Prevention of Recurrence)**

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 150 mg q8h. May increase at 3- to 4-day intervals to 225 mg q8h, then to 300 mg q8h. **Maximum:** 900 mg/day. **(Extended-Release): ADULTS, ELDERLY:** Initially, 225 mg q12h. May increase at 5-day intervals to 325 mg q12h. **Maximum:** 425 mg q12h.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

## SIDE EFFECTS

**Frequent (13%–7%):** Dizziness, nausea, vomiting, altered taste, constipation. **Occasional (6%–3%):** Headache, dyspnea, blurred vision, dyspepsia. **Rare (less than 2%):** Rash, weakness, dry mouth, diarrhea, edema, hot flashes.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause or worsen arrhythmias, HF. Overdose may produce hypotension, drowsiness, bradycardia, atrioventricular conduction disturbances.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Correct electrolyte imbalance before administering medication. Obtain baseline ECG. Screen for cardiac contraindications.

### INTERVENTION/EVALUATION

Assess pulse for quality, rhythm, rate. Monitor ECG for cardiac performance or changes, particularly widening of QRS complex, prolongation of PR interval. Question for visual disturbances, headache, GI upset. Monitor LFT. Monitor for therapeutic serum level (0.06–1 mcg/mL).

### PATIENT/FAMILY TEACHING

- Compliance with therapy regimen is essential to control arrhythmias.

• Altered taste sensation may occur. • Report headache, blurred vision. • Avoid tasks that require alertness, motor skills until response to drug is established. • Report chest pain, difficulty breathing, palpitations.

## propofol

HIGH  
ALERT

**proc-poe-fof**  
(Diprivan, Fresenius Propoven)  
**Do not confuse Diprivan with Diflucan or Ditropan, or propofol with fospropofol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Rapid-acting general anesthetic. **CLINICAL:** Sedative-hypnotic.

### USES

Induction/maintenance of anesthesia. Continuous sedation in intubated and respiratory controlled adult pts in ICU. **OFF-LABEL:** Postop antiemetic, refractory status epilepticus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to propofol, eggs, egg products, soybean or soy products. **Cautions:** Hemodynamically unstable pts, hypovolemia, severe cardiac/respiratory disease, elevated ICP, impaired cerebral circulation, preexisting pancreatitis, hyperlipidemia, seizure disorder, elderly, debilitated; peanut allergy.

### ACTION

Causes CNS depression through agonist action of GABA receptors. **Therapeutic Effect:** Produces hypnosis rapidly.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	40 sec	N/A	3–10 min

Rapidly, extensively distributed. Protein binding: 97%–99%. Metabolized

in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. Rapid awakening can occur 10–15 min after discontinuation. **Half-life:** 3–12 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta. Distributed in breast milk. Not recommended for obstetrics, breastfeeding mothers. **Children:** Safety and efficacy not established. FDA-approved for use in pts 2 mos and older. **Elderly:** No age-related precautions noted; lower dosages recommended.

### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS, respiratory depression, hypotensive effects. **Antihypertensive medications (e.g., amlODIPine, lisinopril, valsartan)** may increase hypotensive effects. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. Herbs with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. **FOOD:** None known. **LAB VALUES:** May increase serum triglycerides.

### AVAILABILITY (Rx)

**Injection Emulsion:** 10 mg/mL.

### ADMINISTRATION/HANDLING

**◀ALERT▶** Do not give through same IV line with blood or plasma.

**Reconstitution** • May give undiluted, or dilute only with D<sub>5</sub>W. • Do not dilute to concentration less than 2 mg/mL (4 mL D<sub>5</sub>W to 1 mL propofol yields 2 mg/mL).

**Rate of administration** • Too-rapid IV administration may produce marked severe hypotension, respiratory depression, irregular muscular movements. • Observe for signs of extravasation (pain, discolored skin patches, white or blue color to peripheral IV site area, delayed onset of drug action).

**Storage** • Store at room temperature. • Discard unused portions. • Do not use if emulsion separates. • Shake well before using.

#### IV INCOMPATIBILITIES

Amikacin (Amikin), amphotericin B complex (Abelcet, AmBisome, Amphotec), bretylium (Bretylol), calcium chloride, ciprofloxacin (Cipro), diazepam (Valium), digoxin (Lanoxin), DOXOrubicin (Adriamycin), gentamicin (Garamycin), methylPREDNISolone (SOLU-Medrol), minocycline (Minocin), phenytoin (Dilantin), tobramycin (Nebcin), verapamil (Isoptin).

#### IV COMPATIBILITIES

Acyclovir (Zovirax), bumetanide (Bumex), calcium gluconate, ceftAZidime (Fortaz), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), fentaNYL, heparin, insulin, labetalol (Normodyne, Trandate), lidocaine, LORazepam (Ativan), magnesium, milrinone (Primacor), nitroglycerin, norepinephrine (Levophed), potassium chloride, vancomycin (Vancocin).

#### INDICATIONS/ROUTES/DOSAGE

##### Anesthesia

**IV infusion: ADULTS, ELDERLY:** Induction, 2–2.5 mg/kg (approximately 40 mg q10sec until onset of anesthesia). **Maintenance:** Initially, 100–200 mcg/kg/min or 6–12 mg/kg/hr for 10–15 min. Usual maintenance infusion: 50–100 mcg/kg/min or 3–6 mg/kg/hr. **CHILDREN 3–16 YRS:** Induction, 2.5–3.5 mg/kg over 20–30 sec, then infusion of 125–300 mcg/kg/min or 7.5–18 mg/kg/hr.

##### Sedation in ICU

**IV infusion: ADULTS, ELDERLY:** Initially, 5 mcg/kg/min (0.3 mg/kg/hr); increase by increments of 5–10 mcg/kg/min (0.3–0.6 mg/kg/hr) q5–10 min until desired sedation level achieved. **Usual maintenance:** 5–50 mcg/kg/min (0.3–3 mg/

kg/hr). Reduce dose after adequate sedation established, and adjust to response. Daily interruption with retitration (sedation vacation) recommended to minimize prolonged sedative effects.

##### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent:** Involuntary muscle movements, apnea (common during induction; often lasts longer than 60 sec), hypotension, nausea, vomiting, IV site burning/stinging. **Occasional:** Twitching, thrashing, headache, dizziness, bradycardia, hypertension, fever, abdominal cramps, paresthesia, coldness, cough, hiccups, facial flushing, green-tinted urine. **Rare:** Rash, dry mouth, agitation, confusion, myalgia, thrombophlebitis.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Continuous infusion or repeated intermittent infusions of propofol may result in extreme drowsiness, respiratory depression, circulatory depression, delirium. Too-rapid IV administration may produce severe hypotension, respiratory depression, involuntary muscle movements. Pt may experience acute allergic reaction, characterized by abdominal pain, anxiety, restlessness, dyspnea, erythema, hypotension, pruritus, rhinitis, urticaria. May cause propofol infusion syndrome, a collection of metabolic disorders and organ system failures including metabolic acidosis, hyperkalemia, rhabdomyolysis, hepatomegaly; cardiac, renal failure.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Resuscitative equipment, suction, O<sub>2</sub> must be available. Obtain vital signs before administration.

##### INTERVENTION/EVALUATION

Observe for signs of wakefulness, agitation. Monitor respiratory rate, B/P, heart rate, O<sub>2</sub> saturation, depth of sedation, serum lipid, triglycerides (if used longer

than 24 hrs). May change urine color to green. If continuous high-dose infusions do not properly induce sedation, consider additional sedatives (e.g., opioids, hypnotics, benzodiazepines) to achieve desired response.

## propranolol

**HIGH  
ALERT**

proe-pran-oh-lol  
(Hemangeol, Inderal LA, Inderal XL, InnoPran XL)

**BLACK BOX ALERT** Severe angina exacerbation, MI, ventricular arrhythmias may occur in angina pts after abrupt discontinuation; must taper gradually over 1–2 wks.

**Do not confuse Inderal LA with Adderall, Imdur, Isordil, or Toradol, or propranolol with Pravachol.**

### FIXED-COMBINATION(S)

**Inderide:** propranolol/hydroCHLOROthiazide (a diuretic): 40 mg/25 mg, 80 mg/25 mg. **Inderide LA:** propranolol/hydroCHLOROthiazide (a diuretic): 80 mg/50 mg, 120 mg/50 mg, 160 mg/50 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Non-selective beta-adrenergic blocker.

**CLINICAL:** Antihypertensive, antianginal, antiarrhythmic, antimigraine.

### USES

Treatment of angina pectoris, supraventricular arrhythmias, essential tremors, hypertension, ventricular tachycardia, symptomatic treatment of obstructive hypertrophic cardiomyopathy, treatment of proliferating infantile hemangioma requiring systemic therapy, migraine headache prophylaxis, pheochromocytoma, prevention of MI. **Hemangeol:** Treatment of proliferating infantile heman-

gioma needing systemic therapy. **OFF-LABEL:** Treatment adjunct for anxiety, tremor due to Parkinson's disease, alcohol withdrawal, aggressive behavior, schizophrenia, antipsychotic-induced akathisia, variceal hemorrhage, acute panic.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to propranolol. Bronchial asthma, severe sinus bradycardia, cardiogenic shock, sick sinus syndrome, heart block greater than first-degree (unless pt has functional pacemaker), uncompensated HF. **Hemangeol (Additional):** Premature infants with corrected age younger than 5 wks, infants weighing less than 2 kg; history of bronchospasm, bradycardia (less than 80 beats/min), B/P less than 50/30 mm Hg, pheochromocytoma. **Cautions:** Diabetes, renal/hepatic impairment, Raynaud's disease, hyperthyroidism, myasthenia gravis, psychiatric disease, bronchospastic disease, elderly pts, history of severe anaphylaxis to allergens.

### ACTION

Blocks beta<sub>1</sub>-, beta<sub>2</sub>-adrenergic receptors. **Therapeutic Effect:** Slows heart rate; decreases B/P, myocardial contractility, myocardial oxygen demand.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1–2 hrs	N/A	6 hrs

Widely distributed. Protein binding: 93%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis.

**Half-life:** 4–6 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Avoid use during first trimester. May produce low-birth-weight infants, bradycardia, apnea, hypoglycemia, hypothermia during delivery. **Children:** No age-related precautions noted. **Elderly:** Age-related peripheral vascular disease may increase

susceptibility to decreased peripheral circulation.

## INTERACTIONS

**DRUG:** Alpha<sub>2</sub> agonists (e.g., cloNIDine) may increase AV-blocking effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Dronedaron, fingolimod, rivastigmine** may increase bradycardic effect. May increase vasoconstriction of **ergot derivatives** (e.g., ergotamine). **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum antinuclear antibody (ANA) titer, serum BUN, LDH, lipoprotein, alkaline phosphatase, potassium, uric acid, ALT, AST, triglycerides.

## AVAILABILITY (Rx)

**Injection Solution:** 1 mg/mL. **Oral Solution:** 20 mg/5 mL, 40 mg/5 mL. **Oral Solution (Hemangeol):** 4.28 mg/mL. **Tablets:** 10 mg, 20 mg, 40 mg, 60 mg, 80 mg.

 **Capsules, Extended-Release (24-HR):** 60 mg, 80 mg, 120 mg, 160 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Give undiluted for IV push. • For IV infusion, may dilute each 1 mg in 10 mL D<sub>5</sub>W.

**Rate of administration** • Do not exceed 1 mg/min injection rate. • For IV infusion, give over 30 min.

**Storage** • Store at room temperature. • Once diluted, stable for 24 hrs at room temperature.

## PO

• May crush scored tablets. • Do not break, crush, or open extended- or sustained-release capsules. • Give immediate-release tablets on empty stomach. • Give extended-release, sustained-release without regard to food.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Alteplase (Activase), heparin, milrinone (Primacor), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY: (Immediate-Release or Extended-Release):** Initially, 80 mg/day. May increase at greater than or equal to 1-wk intervals prn based on patient response. Usual dosage range: 80–160 mg/day.

### Angina

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 80 mg/day. Increase dose at least 1 wk intervals as tolerated to desired effect. Range: 80–320 mg/day in 2–4 divided doses.

**PO: (Extended-Release [Inderal LA]):** Initially, 80 mg/day. Increase dose as tolerated to desired effect. Range: 80–320 mg/day.

### Arrhythmia

**IV: ADULTS, ELDERLY:** 1 mg over 1 min. May repeat q2min up to maximum of 3 doses. **CHILDREN:** 0.01–0.15 mg/kg over 10 min. May repeat q6–8h. **Maximum:** Infants, 1 mg/dose; children, 3 mg/dose.

**PO: ADULTS, ELDERLY: (Immediate-Release):** 10–40 mg 3–4 times/day. **CHILDREN:** Initially, 0.5–1 mg/kg/day in divided doses q6–8h. May increase q3–5days. Usual dosage: 2–4 mg/kg/day. **Maximum:** 16 mg/kg/day or 60 mg/day.

### Adjunct to Alpha-Blocking Agents to Treat Pheochromocytoma

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 10 mg q6h or 20 mg 3 times daily. Begin 3–4 days after initiation of an alpha-1 blocker and adjust to goal heart rate up to 120 mg/day in divided doses.

**Migraine Headache**

**PO: ADULTS, ELDERLY:** (*Immediate-Release or Extended-Release*): Initially, 40–80 mg/day. May increase gradually based on response and tolerability. Usual effective range: 40–160 mg/day. **CHILDREN 7 YRS AND OLDER:** (*Immediate-Release*): Initially, 10 mg daily. May increase at wkly intervals in 10 mg increments. Usual dose range: 10–20 mg 3 times/day.

**Reduction of Cardiovascular Mortality, Reinfarction in Pts With Previous MI**

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): Initially, 60–120 mg/day in 2–3 divided doses. May increase dose based on heart rate and BP up to 240 mg/day.

**Essential Tremor**

**PO: ADULTS, ELDERLY:** (*Immediate-Release or Extended-Release*): Initially, 60–80 mg/day. May increase based on response and tolerability. Usual dosage range: 60–320 mg/day.

**Infantile Hemangioma**

**Note:** Separate doses by at least 9 hrs during or after feeding.

**PO: INFANTS 5 WKS TO 5 MOS:** Initially, 0.15 mL/kg (0.6 mg/kg) twice daily for 1 wk. Beginning with wk 2, increase to 0.3 mL/kg (1.1 mg/kg) twice daily. For wk 3, increase to maintenance dose of 0.4 mL/kg (1.7 mg/kg) twice daily. Maintain dose for 6 months. Readjust dose as weight increases.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent:** Diminished sexual function, drowsiness, difficulty sleeping, unusual fatigue/weakness. **Occasional:** Bradycardia, depression, sensation of coldness in extremities, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting. **Rare:** Altered taste, dry eyes, pruritus, paresthesia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal

may result in diaphoresis, palpitations, headache, tremulousness. May precipitate HF, MI in pts with cardiac disease, thyroid storm in pts with thyrotoxicosis, peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes. **Antidote:** Glucagon (see Appendix J for dosage).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess renal function, LFT. Assess B/P, heart rate, immediately before administering drug (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Angina:** Record onset, quality, radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**INTERVENTION/EVALUATION**

Assess pulse for quality, regularity, bradycardia. Monitor ECG for cardiac arrhythmias. Assess fingers for color, numbness (Raynaud's). Assess for evidence of HF (dyspnea [particularly on exertion or lying down], night cough, peripheral edema, distended neck veins). Monitor I&O (increase in weight, decrease in urinary output may indicate HF). Assess for rash, fatigue, behavioral changes. Therapeutic response time ranges from a few days to several wks. Measure B/P near end of dosing interval (determines if B/P is controlled throughout day).

**PATIENT/FAMILY TEACHING**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension, arrhythmia, anginal pain.
- To avoid hypotensive effect, slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report excessively slow pulse rate (less than 50 beats/min), peripheral numbness, dizziness.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician approval.
- Restrict salt, alcohol intake.

## pyridostigmine

peer-id-oh-stig-meen  
(Mestinon, Mestinon SR , Regonol)

**Do not confuse pyridostigmine with physostigmine, or Regonol with Reglan or Renagel.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinesterase inhibitor. **CLINICAL:** Cholinergic muscle stimulant.

### USES

Treatment of myasthenia gravis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to pyridostigmine. Mechanical, intestinal or urinary obstruction. **Cautions:** Bronchial asthma, COPD, bradycardia, seizure disorder, hyperthyroidism, cardiac arrhythmias, peptic ulcer, renal impairment.

### ACTION

Prevents destruction of acetylcholine by inhibiting the enzyme acetylcholinesterase, enhancing impulse transmission across neuromuscular junction. **Therapeutic Effect:** Produces miosis; increases intestinal, skeletal muscle tone; stimulates salivary, sweat gland secretions.

### PHARMACOKINETICS

Poorly absorbed from GI tract. Metabolized in liver. Excreted primarily unchanged in urine. **Half-life:** 1–2 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase bradycardic effect of  **fingolimid**,  **ponesimod**,

**siponimod**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injection Solution: (Regonol):** 5 mg/mL. **Solution, Oral:** 60 mg/5 mL. **Tablets:** 30 mg, 60 mg.

 **Tablets: Extended-Release:** 180 mg.

### ADMINISTRATION/HANDLING

#### IV, IM

- Give large parenteral doses concurrently with 0.6–1.2 mg atropine sulfate IV to minimize side effects.

#### PO

- Give with food, milk.
- Tablets may be crushed. Do not chew, crush extended-release tablets (may be broken).
- Give larger dose at times of increased fatigue (e.g., for those with difficulty in chewing, 30–45 min before meals).

### IV INCOMPATIBILITIES

Do not mix with any other medications.

### INDICATIONS/ROUTES/DOSAGE

**Note:** The following dosage ranges are for guidance only. Dosing is highly individualized.

#### Myasthenia Gravis

**PO: ADULTS, ELDERLY: (Immediate-Release):** 60–1,500 mg/day (usually 600 mg/day) in 5–6 divided doses, spaced to provide maximum relief.

**PO: (Sustained-Release):** 180–540 mg once or twice daily; separate by at least 6 hrs. Immediate-release therapy may need to be used concomitantly with sustained-release therapy. **ADOLESCENTS, CHILDREN, INFANTS: (Immediate-Release):** 1 mg/kg/dose q4h. **Usual range:** 4–5 mg/kg/day in 4–6 divided doses. **Maximum:** 7 mg/kg/day divided in 5–6 doses.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Miosis, increased GI/skeletal muscle tone, bradycardia, constriction of bronchi/ureters, diaphoresis, increased salivation. **Occasional:** Headache, rash, temporary decrease in diastolic B/P with mild reflex tachycardia, short periods of atrial fibrillation (in hyperthyroid pts), marked drop in B/P (in hypertensive pts).

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce cholinergic crisis, manifested as increasingly severe descending muscle weakness (appears first in muscles involving chewing, swallowing, followed by muscle weakness of shoulder girdle, upper extremities), respiratory muscle paralysis, followed by pelvis girdle/leg muscle paralysis. Requires withdrawal of all cholinergic drugs and immediate use of 1–4 mg atropine sulfate IV for adults, 0.01 mg/kg for infants and children younger than 12 yrs.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Larger doses should be given at time of greatest fatigue. Assess muscle strength before testing for diagnosis of myasthenia gravis and following drug administration. Avoid large doses in pts with megacolon, reduced GI motility.

### INTERVENTION/EVALUATION

Have facial tissues readily available at pt's bedside. Monitor respirations closely during myasthenia gravis testing or if dosage is increased. Assess diligently for cholinergic reaction, bradycardia in myasthenic pt in crisis. Coordinate dosage time with periods of fatigue and increased/decreased muscle strength. Monitor for therapeutic response to medication (increased muscle strength, decreased fatigue, improved chewing/swallowing functions).

### PATIENT/FAMILY TEACHING

- Report nausea, vomiting, diarrhea, diaphoresis, profuse salivary secretions, palpitations, muscle weakness, severe abdominal pain, difficulty breathing.

# QUetiapine

TOP  
100

kwet-eye-a-peen  
(SEROquel, SEROquel XR)

**■ BLACK BOX ALERT ■** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Elderly with dementia-related psychosis are at increased risk for death.

**Do not confuse QUetiapine with OLANzapine, or SEROquel with SEROquel XR or SINEquan.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Dibenzodiazepine derivative. **CLINICAL:** Second-generation (atypical) antipsychotic.

## USES

**Bipolar disorder:** Acute treatment of mania (immediate-release and extended-release) or episodes with mixed features (extended-release). Maintenance treatment of bipolar I disorder, as an adjunct to antimanic therapy. Acute treatment of bipolar major depression (as monotherapy). **Major depressive disorder: (Extended-Release only):** Adjunctive therapy in pts with an inadequate response to antidepressants for the treatment of major depressive disorder. **Schizophrenia:** Treatment of schizophrenia (immediate-release and extended-release).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to QUetiapine. **Cautions:** Renal/hepatic impairment, hyperlipidemia, pts at risk for aspiration pneumonia, cardiovascular disease (e.g., HF, history of MI), cerebrovascular disease, dehydration, hypovolemia, history of drug abuse/dependence, seizure disorder, hypothyroidism, pts at risk for suicide, Parkinson's disease, decreased GI motility, urinary retention, narrow-angle glaucoma, diabetes, visual problems, elderly, pts at risk for orthostatic hypotension. Avoid use in pts

at risk for torsades de pointes (hypokalemia, hypomagnesemia, history of cardiac arrhythmias, congenital long QT syndrome, concurrent medications that prolong QT interval).

## ACTION

Antagonizes DOPamine and serotonin (antipsychotic activity), histamine (somnolence), alpha<sub>1</sub>-adrenergic (orthostatic hypotension) receptors. **Therapeutic Effect:** Diminishes symptoms associated with schizophrenia/bipolar disorders.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 83%. Primarily excreted in urine. **Half-life:** 6 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in children less than 10 yrs of age (bipolar mania) or less than 13 yrs of age (schizophrenia). **Elderly:** No age-related precautions noted, but lower initial and target dosages may be necessary.

## INTERACTIONS

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem)** may increase CNS depression. May increase hypotensive effects of antihypertensives. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole)** may increase concentration/effect. **Anticholinergic agents (e.g., acclidinium, ipratropium, tiotropium, umeclidinium)** may increase anticholinergic effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease concen-

Q

tration/effect. **FOOD:** None known. **LAB VALUES:** May decrease total free thyroxine ( $T_4$ ) serum levels. May increase serum cholesterol, triglycerides, ALT, AST, WBC, GGT. May produce false-positive pregnancy test result.

### AVAILABILITY (Rx)

**Tablets:** 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg. **Tablets, Extended-Release:** 50 mg, 150 mg, 200 mg, 300 mg, 400 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give immediate-release tablets without regard to food.
- Do not break, crush, dissolve, or divide extended-release tablets.
- Extended-release tablets should be given without regard to food or with a light meal in evening.

### INDICATIONS/ROUTES/DOSAGE

- When restarting pts who have been off QUetiapine for less than 1 wk, titration is not required, and maintenance dose can be reinstated.
- When restarting pts who have been off QUetiapine for longer than 1 wk, follow initial titration schedule.
- When discontinuing, gradual tapering recommended to avoid withdrawal symptoms and minimize risk of relapse.

#### Schizophrenia

**PO:** (**Immediate-Release**): **ADULTS, ELDERLY:** Initially, 25 mg twice daily, then increase in 25–50-mg increments divided 2–3 times/day on the second and third days; may further increase up to target dose of 300–400 mg/day in 2–3 divided doses by the fourth day. Further adjustments of 25–50 mg twice daily may be made at intervals of 2 days or longer. **Maintenance:** 400–800 mg/day. **Maximum:** 800 mg/day. (**Extended-Release**): Initially, 300 mg/day. May increase in increments of up to 300 mg/day at intervals as short as 1 day. Range: 400–800 mg/day. **Maximum:** 800 mg/day. (**Immediate-Release**): **ADOLESCENTS:** Initially, 25 mg twice daily on day 1,

50 mg twice daily on day 2, then increase by 100 mg/day to target dose of 400 mg twice daily on day 5. May further increase to 800 mg/day in increments of 100 mg or less daily. Range: 400–800 mg/day. **Maximum:** 800 mg. Total dose may be divided in 3 doses/day. (**Extended-Release**): Initially, 50 mg once daily on day 1, 100 mg on day 2, until 400 mg once daily is reached on day 5. Range: 400–800 mg/day. **Maximum:** 800 mg/day.

#### Mania in Bipolar Disorder

**PO:** (**Immediate-Release**): **ADULTS, ELDERLY:** Initially, 100–200 mg once daily at bedtime or in 2 divided doses on day 1. May increase in increments of 100 mg/day to 200 mg twice daily on day 4. May further increase in increments of 200 mg/day to 800 mg/day. **Maximum:** 800 mg/day. (**Extended-Release**): Initially, 300 mg on day 1 in the evening; increase to 600 mg on day 2. Adjust dose base on response/tolerability. **Maximum:** 1,200 mg/day. (**Immediate-Release**): **CHILDREN 10 YRS AND OLDER:** 25 mg twice daily on day 1, 50 mg twice daily on day 2, then 100 mg twice daily on day 3, 150 mg twice daily on day 4, then continue at target dose of 200 mg twice daily on day 5. Usual range: 200–300 mg twice daily. **Maximum:** 600 mg/day. (**Extended-Release**): 50 mg on day 1; 100 mg on day 2; then increase by 100 mg/day until target dose of 400 mg once daily on day 5. Usual range: 400–600 mg once daily.

#### Depression in Bipolar Disorder

**PO:** (**Immediate-Release**): **ADULTS, ELDERLY:** Initially, 50 mg/day on day 1, increase to 100 mg/day on day 2, then increase by 50–100 mg/day up to target dose of 300 mg/day. (**Extended-Release**): Initially, 50 mg on day 1 in the evening, 100 mg on day 2, 200 mg on day 3, 300 mg on day 4 and thereafter.

#### Adjunctive Therapy in MDD

**PO:** **ADULTS, ELDERLY:** (**Extended-Release**): Initially, 50 mg on days 1 and 2; then 150 mg on days 3 and 4; then 150–300 mg/day thereafter.

**Dosage in Hepatic Impairment**

**(Immediate-Release):** Initially, 25 mg/day. Increase by 25–50 mg/day to effective dose. **(Extended-Release):** Initially, 50 mg/day, increase by 50 mg/day until effective dose.

**Dosage in Renal Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (19%–10%):** Headache, drowsiness, dizziness. **Occasional (9%–3%):** Constipation, orthostatic hypotension, tachycardia, dry mouth, dyspepsia, rash, asthenia, abdominal pain, rhinitis. **Rare (2%):** Back pain, fever, weight gain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of death in elderly pts with dementia-related psychosis. Most deaths appeared to be cardiovascular (e.g., HF, sudden death) or infectious (e.g., pneumonia) in nature. May increase risk of life-threatening neuroleptic malignant syndrome (NMS). Symptoms of NMS may include hyperpyrexia, muscle rigidity, altered mental status, autonomic instability (irregular pulse/blood pressure, tachycardia, diaphoresis, cardiac arrhythmias); elevated CPK, rhabdomyolysis, acute renal failure. Tardive dyskinesia (potentially irreversible, involuntary, dyskinetic movements) has occurred. Metabolic changes including hyperglycemia, ketoacidosis, hyperosmolar coma, diabetes, dyslipidemia may occur. Agranulocytosis, leukopenia, neutropenia was reported. Cognitive and motor impairment reported in 24% of pts. Other effects may include body temperature dysregulation, cataracts, dysphagia, dystonia, extrapyramidal symptoms, orthostatic hypotension, falls, syncope, seizures. Overdose may cause heart block, hypotension, hypokalemia, tachycardia.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain lipid profile, vital signs; CBC in pts with baseline leukopenia, neutropenia; pregnancy test in females of reproductive potential. Screen for active infection. Receive full medication history and screen for interactions. Question history as listed in Precautions. Assess risk of dysphagia, aspiration. Initiate fall precautions. Assess appearance, behavior, speech pattern, levels of interest. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor blood glucose in pts with diabetes; lipid profile after initiation and periodically thereafter. Monitor CBC, orthostatic vital signs frequently during the first mos of therapy. Monitor for hyperglycemia (blurred vision, confusion, excessive thirst, Kussmaul respirations, polyuria), infections (cough, fatigue, fever), body temperature dysregulation, dysphagia, dystonia, tardive dyskinesia, symptoms of NMS. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

**PATIENT/ FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection until response to drug is established.
- Report symptoms of high blood sugar levels (e.g., blurred vision, excessive thirst/hunger, headache, frequent urination); nervous system changes (e.g., abnormal, involuntary movements (e.g., lip smacking, puckering, tongue protrusion or chewing, jaw movement, rapid blinking of the eye), difficulty swallowing, seizures, tremor; spasms of the neck, tongue, face).
- Treatment may cause NMS (confusion, high fever, muscle

Q

rigidity, high or irregular B/P, heart arrhythmias), a life-threatening condition that can be confused with symptoms of severe infection. • Avoid tasks that require alertness, motor skills until response to drug is established. • Go slowly from lying to standing. • Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Avoid overheating, dehydration. • Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## quinapril

kwin-a-pril  
(Accupril)

**BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy detected.

**Do not confuse Accupril with Accolate, Accutane, Aciphex, or Monopril.**

### FIXED-COMBINATION(S)

**Accuretic:** quinapril/hydroCHLOROTHIAZIDE (a diuretic): 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-converting enzyme (ACE) inhibitor. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension. Used alone or in combination with other antihypertensives. Adjunctive therapy in management of HF. **OFF-LABEL:** Treatment of pediatric hypertension.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to quinapril. History of angioedema from previous treatment with ACE inhibitors, concomitant use with aliskiren in pts with diabetes.

Concomitant use with neprilysin inhibitor (e.g., sacubitril) or within 36 hrs of switching to or from neprilysin inhibitor. **Cautions:** Renal impairment, hypertrophic cardiomyopathy with outflow tract obstruction, major surgery, HF, hypovolemia, unstented bilateral renal artery stenosis, hyperkalemia, concurrent potassium supplements, severe aortic stenosis, ischemic heart disease, cerebrovascular disease.

### ACTION

Suppresses renin-angiotensin-aldosterone system, preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Lower angiotensin II causes an increase in plasma renin activity and decreased aldosterone secretion. **Therapeutic Effect:** Reduces peripheral arterial resistance, B/P.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	N/A	24 hrs

Widely distributed. Protein binding: 97%. Rapidly hydrolyzed to active metabolite. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 1–2 hrs; metabolite, 3 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. May cause fetal, neonatal mortality or morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

### INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase potential for allergic reactions to allopurinol. **Angiotensin receptor blockers (e.g., losartan, valsartan)** may increase adverse effects. May increase adverse effects of lithium, sacubitril. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, gin-

ger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody (ANA) titer.

### AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS:** Initially, 10–20 mg/day. May adjust dosage at intervals of at least 2 wks or longer up to 80 mg/day in one or two divided doses. **ELDERLY:** Initially, 10 mg once daily. Titrate to optimal response.

#### Adjunct to Manage HF

**PO: ADULTS, ELDERLY:** Initially, 5 mg twice daily. Titrate at wkly intervals to 20–40 mg/day in 2 divided doses. Target dose: 20 mg twice daily.

#### Dosage in Renal Impairment

##### Hypertension

Creatinine Clearance	Initial Dose
More than 60 mL/min	10 mg
30–60 mL/min	5 mg
10–29 mL/min	2.5 mg

##### HF

Creatinine Clearance	Initial Dose
Greater than 30 mL/min	5 mg
10–30 mL/min	2.5 mg

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (7%–5%):** Headache, dizziness.

**Occasional (4%–2%):** Fatigue, vomiting,

nausea, hypotension, chest pain, cough, syncope. **Rare (less than 2%):** Diarrhea, cough, dyspnea, rash, palpitations, impotence, insomnia, drowsiness, malaise.

### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (“first-dose syncope”) may occur in pts with HF, those who are severely salt/volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may occur in pts with collagen vascular disease (scleroderma, systemic lupus erythematosus), renal impairment. Nephrotic syndrome may occur in pts with history of renal disease.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain renal function test. Obtain B/P immediately before each dose in addition to regular monitoring (be alert to fluctuations). In pts with prior renal disease, urine test for protein by dipstick method should be made with first urine of day before beginning therapy and periodically thereafter. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before beginning therapy and q2wks for 3 mos, then periodically thereafter.

#### INTERVENTION/EVALUATION

Monitor B/P for hypotension; renal function, serum potassium, WBC. Assist with ambulation if dizziness occurs.

#### PATIENT/ FAMILY TEACHING

- Go slowly from lying to standing.
- Full therapeutic effect may take 1–2 wks.
- Report any sign of infection (sore throat, fever).
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.

# RABEprazole

 TOP  
100

ra-bep-ra-zole

 (Aciphex, Aciphex Sprinkle, Pariet )

**Do not confuse Aciphex with Accupril or Aricept, or RABEprazole with ARIpizazole, donepezil, lansoprazole, omeprazole, or raloxifene.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Proton pump inhibitor. **CLINICAL:** Gastric acid inhibitor.

## USES

Short-term treatment for healing and symptomatic relief of erosive or ulcerative esophagitis in adults. Maintenance treatment for healing of erosive or ulcerative esophagitis and reduction in relapse rates of heartburn symptoms of adults. Treatment of heartburn, other symptoms associated with GERD in adults and children 12 yrs of age and older (tablets only) and children 1–11 yrs of age (capsules only). Treatment of *H. pylori* infection and duodenal ulcer disease (active or history of within the past 5 yrs) as part of combination with antibiotics in adults (tablets only). Long-term treatment of pathological hypersecretory conditions, including Zollinger-Ellison syndrome in adults. Short-term (4 wks or less) treatment for healing and symptomatic relief of duodenal ulcers in adults (tablets only).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to RABEprazole, other proton pump inhibitors (e.g., omeprazole). Concomitant use with rilpivirine-containing products. **Cautions:** Severe hepatic impairment, osteoporosis.

## ACTION

Suppresses gastric acid secretion by inhibiting  $H^+/K^+-ATP$  pump. **Therapeutic Effect:** Increases gastric pH, reducing gastric acid production.

## PHARMACOKINETICS

Rapidly absorbed after passing through stomach relatively intact as delayed-release tablet. Protein binding: 96%. Metabolized in liver. Excreted in urine (90%), feces. **Half-life:** 1–2 hrs (increased with hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease concentration/effects of **acalabrutinib, cefuroxime, erlotinib, neratinib, pazopanib. Strong CYP2C19 inducers (e.g., FLUoxetine), strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. May decrease concentration of **ketoconazole, clopidogrel, atazanavir. HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, thyroid-stimulating hormone (TSH).

## AVAILABILITY (Rx)

 **Tablets, Delayed-Release:** 20 mg. **Capsule, Sprinkle:** 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

• May give without regard to food; best taken after breakfast. • Do not break, crush, dissolve, or divide tablet; give whole.

### Sprinkle

• May give with antacid. • Administer 30 min before a meal. • Open capsule, sprinkle on soft food. Take within 15 min of preparation. • Do not chew, crush.

## INDICATIONS/ROUTES/DOSAGE

**GERD (Mild/Intermittent Disease [Fewer than 2 Episodes/wk] With No Evidence of Erosive Esophagitis)**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 20 mg/day for 4–8 wks.

Discontinue once asymptomatic for 8 wks. **CHILDREN, 1–11 YRS, WEIGHING 15 KG OR GREATER:** 10 mg once daily. **WEIGHING LESS THAN 15 KG:** 5 mg once daily; may increase to 10 mg once daily.

**Erosive Esophagitis, GERD (Severe and/or Frequent Symptoms [2 or More Episodes/wk])**

**PO: ADULTS, ELDERLY** 20 mg once daily. Once symptoms are controlled, continue for at least 8 wks.

**Duodenal Ulcer**

**PO: ADULTS, ELDERLY:** 20 mg/day after morning meal for 4 wks. Range: 4–8 wks.

**Pathologic Hypersecretory Conditions**

**PO: ADULTS, ELDERLY:** Initially, 60 mg once daily. May increase to 60 mg twice daily.

***H. pylori* Infection**

**PO: ADULTS, ELDERLY:** 20 mg or 40 mg twice daily for 10–14 days (given with various antibiotic regimens).

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**SIDE EFFECTS**

**Rare (less than 2%):** Headache, nausea, dizziness, rash, diarrhea, malaise.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hyperglycemia, hypokalemia, hyponatremia, hyperlipemia occur rarely. May increase risk of bone fractures, *C. difficile*-associated colitis, fundic gland polyps, interstitial nephritis, vitamin B<sub>12</sub> deficiency.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Question history of GI disease, ulcers, GERD.

**INTERVENTION/EVALUATION**

Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea, diarrhea, headache occurs. Assess skin for evidence of rash. Observe for evidence of dizziness; utilize appropriate safety precautions.

**PATIENT/FAMILY TEACHING**

- Swallow tablets whole; do not break, chew, dissolve, or divide tablets.
- Report headache.

**raloxifene**

TOP 100

ra-lox-i-feen  
(Evista)

**BLACK BOX ALERT** Increases risk of deep vein thrombosis, pulmonary embolism. Women with coronary heart disease or pts at risk for coronary events are at increased risk for death due to stroke.

**Do not confuse Evista with AVINza.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective estrogen receptor modulator (SERM).

**CLINICAL:** Osteoporosis preventive.

**USES**

Prevention/treatment of osteoporosis in postmenopausal women. Reduces risk of invasive breast cancer in postmenopausal women with osteoporosis and postmenopausal women at high risk for invasive breast cancer.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to raloxifene. Active or history of venous thromboembolic events, such as deep vein thrombosis (DVT), pulmonary embolism, retinal vein thrombosis; women who are or may become pregnant, breastfeeding. **Cautions:** Cardiovascular disease, renal/hepatic impairment, pts at risk for thrombosis (immobility, indwelling venous catheter/access device,

morbid obesity, genetic hypercoagulable conditions), unexplained uterine bleeding, elevated triglycerides in response to oral estrogen therapy.

## ACTION

Selective estrogen receptor modulator (SERM) that binds to estrogen receptors, increasing bone mineral density. Blocks estrogen effects in breast/uterus. **Therapeutic Effect:** Reduces bone resorption, increases bone mineral density, reduces incidence of fractures.

## PHARMACOKINETICS

Rapidly absorbed. Protein binding: 95%. Metabolized in liver. Excreted primarily in feces. Unknown if removed by hemodialysis. **Half-life:** 27.7–32.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Contraindicated in pregnancy, breastfeeding. **Children:** Not used in this pt population. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Bile acid sequestrants (e.g., cholestyramine) may decrease absorption/effect. May decrease absorption of levothyroxine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May lower serum total cholesterol, LDL. May decrease platelet count, serum inorganic phosphate, albumin, calcium, protein.

## AVAILABILITY (Rx)

**Tablets:** 60 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Discontinue at least 72 hrs prior to and during prolonged immobilization (may increase risk for DVT/PE).

## Prophylaxis/Treatment of Osteoporosis, Breast Cancer Risk Reduction

**PO: ADULTS, ELDERLY:** 60 mg/day.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (25%–10%):** Hot flashes, flu-like symptoms, arthralgia, sinusitis. **Occasional (9%–5%):** Weight gain, nausea, myalgia, pharyngitis, cough, dyspepsia, leg cramps, rash, depression. **Rare (4%–3%):** Vaginitis, UTI, peripheral edema, flatulence, vomiting, fever, migraine, diaphoresis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Thromboembolic events (DVT, pulmonary embolism, superficial thrombophlebitis) may occur, esp. in pts with immobility. May increase risk of uterine bleeding, hypertriglyceridemia; death due to stroke.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain lipid panel. Question history of thrombosis (CVA, DVT, PE). Question for possibility of pregnancy. Drug should be discontinued 72 hrs before and during prolonged immobilization (postop recovery, prolonged bed rest). Therapy may be resumed only after pt is fully ambulatory.

### INTERVENTION/EVALUATION

Monitor serum total cholesterol, total calcium, phosphate, total protein, albumin, bone mineral density, platelet count. Diligently monitor for CVA (aphasia, blindness, confusion, paresthesia, hemiparesis, syncope), DVT (arm/leg pain, swelling), pulmonary embolism (chest pain, dyspnea, hypoxia, tachycardia).

### PATIENT/FAMILY TEACHING

- Avoid prolonged restriction of movement during travel (increased risk of venous thromboembolic events).
- Take supplemental calcium, vitamin D if daily dietary intake is inadequate.
- Engage in regular weight-bearing exercise.
- Modify, discon-

tinue habits of cigarette smoking, alcohol consumption. • Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (blindness, confusion, difficulty speaking, one-sided weakness, passing out).

## ramelteon

ra-mel-tee-on  
(Rozerem)

**Do not confuse ramelteon with Remeron, or Rozerem with Razadyne or Remeron.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Melatonin receptor agonist. **CLINICAL:** Hypnotic.

### USES

Treatment of insomnia in pts who experience difficulty with sleep onset.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ramelteon. Concurrent fluvoxamine therapy, history of angioedema with previous ramelteon therapy. **Cautions:** Depression, other psychiatric conditions, alcohol consumption, other CNS depressants, moderate hepatic impairment, severe sleep apnea, COPD; concomitant strong CYP1A2 inhibitors (e.g., fluvoxamine).

### ACTION

Selectively targets melatonin receptors thought to be involved in maintenance of circadian rhythm underlying normal sleep-wake cycle. **Therapeutic Effect:** Prevents insomnia characterized by difficulty with sleep onset.

### PHARMACOKINETICS

Widely distributed. Protein binding: 82%. Metabolized in liver. Excreted in urine (84%), feces (4%). **Half-life:** 2–5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depression. **Strong CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration/effect. **Fluvoxamine** may increase concentration/effect; increase risk of toxicity. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Onset of action may be reduced if taken with or immediately after a high-fat meal. **LAB VALUES:** May decrease serum cortisol.

### AVAILABILITY (Rx)

 **Tablets, Film-Coated:** 8 mg.

### ADMINISTRATION/HANDLING

#### PO

• Administer within 30 min before bedtime. • Do not give with, or immediately following, a high-fat meal. • Do not break, crush, dissolve, or divide tablet.

### INDICATIONS/ROUTES/DOSAGE

#### Insomnia

**PO:** **ADULTS, ELDERLY:** 8 mg within 30 min before bedtime. **Maximum:** 8 mg.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (7%–5%):** Headache, dizziness, drowsiness (expected effect). **Occasional (4%–3%):** Fatigue, nausea, exacerbated

insomnia. **Rare (2%):** Diarrhea, myalgia, depression, altered taste, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe hypersensitivity reactions including anaphylaxis, angioedema, dyspnea, throat constriction may occur. Angioedema involving larynx, glottis, tongue can be fatal. Worsening of insomnia may indicate underlying psychiatric illness. May cause amnesic events including cooking, sleepwalking, sexual activity, sleep-driving. May increase risk of suicidal ideation and behavior. May affect reproductive hormones in adults (decreased testosterone levels, increased prolactin levels), resulting in unexplained amenorrhea, galactorrhea, decreased libido, impaired fertility.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, pulse, respirations. Raise bed rails, provide call light. Provide environment conducive to sleep (quiet environment, low/no lighting, TV off). Do not give unless a full night of sleep is planned.

### INTERVENTION/EVALUATION

Assess sleep pattern of pt. Evaluate for therapeutic response: rapid induction of sleep onset, decrease in number of nocturnal awakenings.

### PATIENT/FAMILY TEACHING

- Take within 30 min before going to bed; confine activities to those necessary to prepare for bed.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Therapy may need to be discontinued if cooking, driving, sleepwalking, sexual activity occurs without recollection.
- Do not take unless a full night of sleep is planned.
- Avoid alcohol.
- Do not take medication with or immediately after a high-fat meal.

## ramipril

ram-i-pril  
(Altace)

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Altace with alteplase, Amaryl, or Artane, or ramipril with enalapril or Monopril.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-converting enzyme (ACE) inhibitor. **CLINICAL:** Antihypertensive.

## USES

Treatment of hypertension. Used alone or in combination with other antihypertensives. Treatment of HF following MI. Reduce risk of heart attack, stroke in pts 55 yrs and older at increased risk of developing major cardiovascular events. **OFF-LABEL:** HF Delay progression of nephropathy, reduce risks of cardiovascular events in hypertensive pts with type 1 or type 2 diabetes.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ramipril, other ACE inhibitors. History of ACE inhibitor–induced angioedema, concomitant use with aliskiren in pts with diabetes. Concomitant use or within 36 hrs of switching to or from a neprilysin inhibitor (e.g., sacubitril). **Cautions:** Renal impairment, elderly, collagen vascular disease, hyperkalemia, hypertrophic cardiomyopathy with outflow tract obstruction; unstented unilateral, bilateral renal artery stenosis; severe aortic stenosis; before, during, or immediately after major surgery; concomitant potassium supplements.

## ACTION

Suppresses renin-angiotensin-aldosterone system. Blocks conversion of angiotensin

I to angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Reduces peripheral arterial resistance, decreasing B/P.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1–2 hrs	3–6 hrs	24 hrs

Widely distributed. Protein binding: 73%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5.1 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause fetal or neonatal mortality or morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

## INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase potential for allergic reactions to allopurinol. Angiotensin receptor blockers (e.g., losartan, valsartan) may increase adverse effects. May increase adverse effects of lithium, sacubitril. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody (ANA) titer.

## AVAILABILITY (Rx)

**Capsules:** 1.25 mg, 2.5 mg, 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- May mix with water, apple juice/sauce.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 2.5 mg/day. Titrate to desired effect after

2–4 wks up to 20 mg daily in 1 or 2 divided doses. **Pts with volume depletion:** Initially, 1.25 mg daily. Titrate to desired response.

### HF Following MI

**PO: ADULTS, ELDERLY:** Initially, 1.25–2.5 mg once daily. May increase q1–2wks to a target dose of 10 mg once daily.

### Risk Reduction for MI/Stroke

**PO: ADULTS, ELDERLY:** Initially, 2.5 mg/day for 7 days, then 5 mg/day for 21 day, then increase as tolerated to maintenance dose of 10 mg/day in 1–2 divided doses.

### Dosage in Renal Impairment

**CrCl equal to or less than 40 mL/min:** 25% of normal dose.

### Renal Failure and Hypertension

Initially, 1.25 mg/day titrated upward. **Maximum:** 5 mg/day. **Renal failure and HF:** Initially, 1.25 mg/day, titrated up to 2.5 mg twice daily.

### Dosage in Hepatic Impairment

No dose adjustment. Discontinue for jaundice or marked elevation of hepatic enzymes.

## SIDE EFFECTS

**Frequent (12%–5%):** Cough, headache. **Occasional (4%–2%):** Dizziness, fatigue, nausea, asthenia. **Rare (less than 2%):** Palpitations, insomnia, nervousness, malaise, abdominal pain, myalgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (“first-dose syncope”) may occur in pts with HF, severely salt or volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may occur in pts with collagen vascular disease (scleroderma, systemic lupus erythematosus), renal impairment. Nephrotic syndrome may occur in pts with history of renal disease. May cause angioedema of the face, neck, throat, tongue. Cholestatic jaundice, fulminant hepatic necrosis may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Renal function tests should be performed before beginning therapy. Question history of hypersensitivity reaction, angioedema.

### INTERVENTION/EVALUATION

In pts with prior renal disease, urine test for protein (by dipstick method) should be made with first urine of day before beginning therapy and periodically thereafter. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before beginning therapy and q2wks for 3 mos periodically thereafter. Monitor B/P, renal function, serum potassium. Assess for cough (frequent effect). Assist with ambulation if dizziness occurs. Assess lung sounds for rales, wheezing in pts with HF. Monitor urinalysis for proteinuria. Monitor serum potassium in pts on concurrent diuretic therapy.

### PATIENT/FAMILY TEACHING

• Do not discontinue medication without physician's approval. • Slowly go from lying to standing to minimize hypotensive effect. • Report palpitations, cough, chest pain. • Dizziness may occur in first few days. • Avoid alcohol. • Report swelling of the face, lips, or tongue.

## ramucirumab

ra-mue-sir-ue-mab  
(Cyramza)

**Do not confuse ramucirumab with ranibizumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhib-

itor. Monoclonal antibody. **CLINICAL:** Antineoplastic.

## USES

As a single agent or in combination with PACLitaxel, for treatment of advanced or metastatic gastric or gastroesophageal junction adenocarcinoma with disease progression on or after prior fluoropyrimidine- or platinum-containing chemotherapy. In combination with DOCETaxel, for treatment of metastatic non-small-cell lung cancer (NSCLC) with disease progression on or after platinum-based chemotherapy. In combination with FOLFIRI, for treatment of metastatic colorectal cancer with disease progression on or after therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine. Treatment of advanced or relapsed/refractory hepatocellular carcinoma (as a single agent).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ramucirumab. **Cautions:** History of arterial/venous thromboembolism (e.g., MI, cardiac arrest, CVA, cerebral ischemia), hepatic cirrhosis, electrolyte imbalance, hypertension, GI bleeding/perforation, chronic/unhealed wounds; baseline neutropenia, thrombocytopenia.

## ACTION

Binds vascular endothelial growth factor (VEGF) receptor 2 and blocks binding of VEGF ligands, VEGF-A, VEGF-C, and VEGF-D. **Therapeutic Effect:** Inhibits/reduces tumor vascularity and growth.

## PHARMACOKINETICS

Metabolism not specified. Elimination not specified.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Females of reproductive potential should use effective contraception during treatment and up to 3 mos after

discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase urine protein. May decrease neutrophils, serum sodium.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mg/10 mL, 500 mg/50 mL.

## ADMINISTRATION/HANDLING

• Do not administer IV push or bolus. • Recommend premedication with IV histamine H<sub>1</sub> antagonist (e.g., diphenhydramine) prior to each infusion. Pts with prior Grade 1 or Grade 2 infusion reaction should also be premedicated with dexamethasone (or equivalent) and acetaminophen prior to each infusion. • Flush IV line with 0.9% NaCl upon infusion completion.

**Reconstitution** • Calculate dose, required solution volume, and number of vials needed using weight in kg. • Vials contain either 100 mg/10 mL or 500 mL/50 mL at concentration of 10 mg/mL. • Visually inspect for particulate matter. Discard if particulate matter or discoloration observed. • Using 250 mL 0.9% NaCl bag, withdraw and discard a volume equal to the total calculated volume of solution. • Slowly add required dose to diluent bag for final volume of 250 mL. Gently invert bag to mix; do not shake.

**Rate of administration** • Infuse over 60 min using 0.22-micron in-line filter via dedicated line.

**Storage** • Refrigerate vials in original carton until time of use. • Do not freeze. • Diluted solution may be refrigerated up to 24 hrs or stored at room temperature for up to 4 hrs. • Protect from light.

## IV INCOMPATIBILITIES

Do not dilute in dextrose-containing fluids or infuse concomitantly with other electrolytes or medications.

## INDICATIONS/ROUTES/DOSAGE

### Gastric Cancer (Advanced or Metastatic)

**IV: ADULTS, ELDERLY:** 8 mg/kg every 14 days, either as a single agent or in combination with wkly PACLitaxel. Continue until disease progression or unacceptable toxicity.

### NSCLC

**IV: ADULTS, ELDERLY: (Disease progression on or after platinum-based chemotherapy):** 10 mg/kg on day 1 of a 21-day cycle in combination with DOCetaxel. Continue until disease progression or unacceptable toxicity. **(First-line treatment):** 10 mg/kg once q2wks (in combination with erlotinib). Continue until disease progression or unacceptable toxicity.

### Colorectal Cancer

**IV: ADULTS, ELDERLY:** 8 mg/kg q2wks, in combination with FOLFIRI (irinotecan, leucovorin, 5-fluorouracil). Continue until disease progression or unacceptable toxicity.

### Hepatocellular Carcinoma

**IV: ADULTS, ELDERLY:** 8 mg/kg q2wks (as single agent). Continue until disease progression or unacceptable toxicity

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Infusion-related reaction:** Reduce infusion rate by 50% for Grade 1 or Grade 2 reaction. Permanently discontinue for Grade 3 or Grade 4 reaction.

**Severe hypertension:** Interrupt treatment until controlled with medical management. Permanently discontinue for severe hypertension that is not controlled with antihypertensive therapy. **Proteinuria:** Interrupt treatment for urine protein level greater than or equal to 2 g/24 hrs. Restart treatment at reduced dose of 6 mg/kg every 14 days once urine protein

level returns to less than 2 g/24 hrs. If level greater than or equal 2 g/24 hrs recurs, interrupt treatment and reduce dose to 5 mg/kg every 14 days once level returns to less than 2 g/24 hrs. Permanently discontinue for urine protein level greater than 3 g/24 hrs or in the setting of nephrotic syndrome. **Wound healing complications:** Interrupt treatment prior to scheduled surgery until wound is fully healed. **Arterial thromboembolic events, GI perforation, or Grade 3 or Grade 4 bleeding:** Permanently discontinue.

#### **Dosage in Renal Impairment**

No dose adjustment.

#### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

### **SIDE EFFECTS**

**Occasional (16%–9%):** Hypertension, diarrhea, headache. **Ramucirumab plus paclitaxel: Frequent (57%–20%):** Fatigue, diarrhea, peripheral edema, hypertension, stomatitis.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Fatal hemorrhagic events including GI bleeding occurred in 3.4% of pts receiving single agent and in 4.3% of pts receiving combo therapy. GI perforations occurred in 0.7% of pts receiving single agent and in 1.2% of pts receiving combo therapy. Thromboembolic events including arterial thromboembolism, CVA, MI reported in 1.7% of pts. Severe hypertension occurred in 8% of pts receiving single agent and in 15% of pts receiving combo therapy despite medical management. Severe infusion-related reactions such as back pain/spasms, bronchospasm, chest pain, chills, dyspnea, flushing, hypotension, hypoxia, paresthesia, rigors/tremors, supraventricular tachycardia, wheezing occurred in 16% of pts. May cause ineffective wound healing or wound dehiscence requiring medical intervention. Reversible posterior

leukoencephalopathy syndrome (RPLS) reported in less than 1% of pts. Proteinuria may indicate nephrotic syndrome. Clinical deterioration of hepatic cirrhosis, manifested by new-onset or worsening encephalopathy, ascites, or hepatorenal syndrome, was reported in pts receiving single agent. Other adverse reactions include epistaxis, intestinal obstruction, neutropenia, severe rash, thrombocytopenia. Immunogenicity (anti-ramucirumab antibodies) occurred in 6% of pts.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain CBC, BMP, vital signs; pregnancy test in females of reproductive potential. Question history of CVA, hepatic impairment/cirrhosis, hypertension, MI, prior hypersensitivity reaction. Offer emotional support.

### **INTERVENTION/EVALUATION**

Monitor CBC, serum electrolytes, vital signs. Persistent diastolic hypertension may indicate hypertensive emergency. Obtain ECG for arrhythmia, chest pain, palpitation. Consider RPLS in pts with altered mental status, confusion, headache, seizure, visual disturbances. Screen for GI bleeding, GI perforation. Notify physician if any CTCAE toxicities occur (see Appendix M). Monitor for hypersensitivity reaction. Once infusion is completed, IV access must be flushed with NS.

### **PATIENT/FAMILY TEACHING**

- Treatment may cause severe allergic reaction or infusion-related reaction.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Neurologic changes, including altered mental status, headache, seizures, trouble speaking, may indicate high blood pressure crisis or life-threatening brain swelling.
- Immediately report abdominal pain, GI bleeding, vomiting blood.
- Therapy may cause severe blood-clotting events such as heart attack or stroke.

## rasagiline

ra-sa-ji-leen

(Azilect, Apo-Rasagiline )

**Do not confuse Azilect with Aricept.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** MAO type B inhibitor. **CLINICAL:** Antiparkinson agent.

### USES

Treatment of signs/symptoms of Parkinson's disease as initial monotherapy or as adjunct therapy with or without levodopa.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to rasagiline. Concurrent use with methadone, tramadol, meperidine, MAOIs within 14 days of rasagiline, cycloenzaprine, dextromethorphan, or St. John's wort. **Cautions:** Hepatic impairment (avoid use in moderate to severe impairment); cardiovascular, cerebrovascular disease, baseline hypotension. Avoid foods high in tyramine. Do not use within 5 wks of stopping FLUoxetine; do not start tricyclic, SSRI, or SNRI within 2 wks of stopping rasagiline. History of major psychotic disorder.

### ACTION

Irreversibly and selectively inhibits monoamine oxidase type B, an enzyme that plays a major role in catabolism of DOPamine. Inhibition of DOPamine depletion reduces symptomatic motor deficits of Parkinson's disease. **Therapeutic Effect:** Reduces symptoms of Parkinson's disease; appears to delay disease progression.

### PHARMACOKINETICS

Widely distributed. Protein binding: 88%–94%. Metabolized in liver. Excreted in urine (62%), feces (7%). **Half-life:** 1.3–3 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Alcohol may increase adverse effects. Amphetamines, MAOIs (e.g., phenelzine, selegiline), sympathomimetics (e.g., DOPamine) may cause hypertensive crisis. Anorexiant (e.g., dexfenfluramine, fenfluramine, sibutramine), CNS stimulants (e.g., methylphenidate), cycloenzaprine, dextromethorphan, meperidine, methadone, mirtazapine, serotonin or norepinephrine reuptake inhibitors (e.g., citalopram, sertraline, venlafaxine), tricyclic antidepressants (e.g., amitriptyline), venlafaxine may cause serotonin syndrome. May increase risk of atomoxetine, buPROPion toxicity. Levodopa may cause hypertensive/hypotensive reaction. **HERBAL:** Herbals with hypotensive properties (e.g., black cohosh, garlic) may increase effect. **FOOD:** Caffeine, foods/beverages containing tyramine may result in hypertensive reaction, hypertensive crisis. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. May cause leukopenia.

### AVAILABILITY (Rx)

**Tablets:** 0.5 mg, 1 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Avoid food, beverages containing tyramine (e.g., cheese, sour cream, yogurt, pickled herring, liver, figs, raisins, bananas, avocados, soy sauce, broad beans, yeast extracts, meat tenderizers, red wine, beer), excessive amounts of caffeine (e.g., coffee, tea).

### INDICATIONS/ROUTES/DOSAGE

**◀ ALERT ▶** When used in combination with levodopa, dosage reduction of levodopa should be considered.

**Parkinson's Disease**

**PO: ADULTS, ELDERLY, MONOTHERAPY, ADJUNCTIVE THERAPY WITHOUT LEVODOPA:** 1 mg once daily. **ADULTS, ELDERLY, ADJUNCTIVE THERAPY WITH LEVODOPA:** Initially, 0.5 mg once daily. If therapeutic response is not achieved, dose may be increased to 1 mg once daily. **ADJUNCTIVE THERAPY WITHOUT LEVODOPA:** 1 mg once daily.

**Dose Modification**

**Concomitant use of CYP1A2 inhibitors, ciprofloxacin:** 0.5 mg once daily.

**Dosage in Hepatic Impairment**

**Mild impairment:** 0.5 mg once daily.  
**Moderate to severe impairment:** Not recommended.

**Dosage in Renal Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (14%–12%):** Headache, nausea.  
**Occasional (9%–5%):** Orthostatic hypotension, weight loss, dyspepsia, dry mouth, arthralgia, depression, hallucinations, constipation. **Rare (4%–2%):** Fever, vertigo, ecchymosis, rhinitis, neck pain, arthritis, paresthesia.

**R****ADVERSE EFFECTS/TOXIC REACTIONS**

Increase in dyskinesia (impaired voluntary movement), dystonia (impaired muscular tone) occurs in 18% of pts, angina occurs in 9%. Gastroenteritis, conjunctivitis occur rarely (3% of pts).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT, B/P. Receive full medication history and screen for interactions. Question history of severe hepatic impairment, cardiovascular disease.

**INTERVENTION/EVALUATION**

Monitor B/P. Assess for clinical reversal of symptoms (improvement of tremor of head/hands at rest, mask-like facial expres-

sion, shuffling gait, muscular rigidity). If hallucinations or dyskinesia occurs, symptoms may be eliminated if levodopa dosage is reduced. Hallucinations generally are accompanied by confusion and, to a lesser extent, insomnia.

**PATIENT/FAMILY TEACHING**

- Orthostatic hypotension may occur more frequently during initial therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Hallucinations may occur (more so in the elderly with Parkinson's disease), typically within first 2 wks of therapy.
- Avoid foods that contain tyramine (cheese, sour cream, beer, wine, pickled herring, liver, figs, raisins, bananas, avocados, soy sauce, yeast extracts, yogurt, papaya, broad beans, meat tenderizers), excessive amounts of caffeine (coffee, tea, chocolate), OTC preparations for hay fever, colds, weight reduction (may produce significant rise in B/P).
- Do not take any newly prescribed medications unless approved by prescriber who originally started therapy.

**rasburicase**

ras-bure-i-kase  
(Elitek, Fasturtec )

**BLACK BOX ALERT** ■ Severe hypersensitivity reactions including anaphylaxis reported. May cause severe hemolysis in pts with glucose-6-phosphate dehydrogenase (G6PD) deficiency. Screen pts at high risk for G6PD (African or Mediterranean descent) prior to therapy. Methemoglobinemia has been reported. Blood samples left at room temperature may interfere with uric acid measurements. Must collect blood samples in prechilled tubes containing heparin and immediately immerse in ice water bath. Assay plasma samples within 4 hrs of collection. Elitek enzymatically degrades uric acid in blood samples left at room temperature.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Urate-oxidase enzyme. **CLINICAL:** Antihyperuricemic.

## USES

Initial management of uric acid levels in pts with leukemia, lymphoma, and solid tumor malignancies who are receiving chemotherapy expected to result in tumor lysis and subsequent elevation of plasma uric acid.

## PRECAUTIONS

**Contraindications:** History of anaphylaxis or severe hypersensitivity to rasburicase. Prior rasburicase-associated drug reactions including hemolysis, methemoglobinemia. History of G6PD deficiency.

**Cautions:** Pts at high risk for G6PD deficiency (e.g., African, Mediterranean, or Southeast Asian descent).

## ACTION

A urate-oxidase enzyme that converts uric acid into allantoin (an inactive metabolite of uric acid). Does not inhibit formation of uric acid. **Therapeutic Effect:** Decreases uric acid levels.

## PHARMACOKINETICS

**Half-life:** 16–23 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Unknown if crosses placenta. May cause fetal harm. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT. May decrease serum phosphate.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1.5 mg/vial, 7.5 mg/vial.

## ADMINISTRATION/HANDLING

**Reconstitution** • Must use diluent provided in carton. • Reconstitute 1.5-mg vial with 1 mL of diluent or 7.5-mg vial with 5 mL of diluent to provide concentration of 1.5 mg/mL. • Gently swirl to mix. Do not shake. • Inspect for particulate matter or discoloration. • Inject calculated dose into appropriate volume of 0.9% NaCl to achieve a final volume of 50 mL.

**Rate of administration** • Infuse over 30 min. • Do not use filter during reconstitution or infusion.

**Storage** • Refrigerate solution until time of use. • Discard after 24 hrs following reconstitution.

## ⚠️ IV INCOMPATIBILITIES

Do not mix with other IV medications.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Indicated only for a single course of treatment.

### Management of Hyperuricemia

**IV; ADULTS, ELDERLY, CHILDREN: (High risk):** 0.2 mg/kg once daily (duration based on plasma uric acid levels). **(Intermediate risk):** 0.15 mg/kg (duration based on plasma uric acid levels). **(Low risk):** 0.1 mg/kg (duration based on clinical judgment).

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (50%–46%):** Vomiting, fever. **Occasional (27%–13%):** Nausea, headache, abdominal pain, constipation, diarrhea, mucositis, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions occurred in 4.3% of pts including injection irritation, peripheral edema, urticaria, pruritus.

Anaphylaxis, hemolysis, methemoglobinemia occurred in less than 1%. Pulmonary hemorrhage, respiratory failure, supraventricular arrhythmias, ischemic coronary artery disorders, sepsis, abdominal, gastrointestinal infections occurred in greater than 2% of pts. Anti-rasburicase antibodies reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain uric acid level; pregnancy test in females of reproductive potential. Question for history of prior hypersensitivity reactions. Assess G6PD deficiency risk in potential candidates.

### INTERVENTION/EVALUATION

Monitor uric acid levels. If hypersensitivity reaction occurs, stop infusion and immediately notify physician. Screen for clinical tumor lysis syndrome, hemolysis, methemoglobinemia. Follow strict procedure when collecting uric acid levels. Obtain ECG for chest pain/tightness, hyperkalemia, dyspnea. Assess skin for rash.

### PATIENT/FAMILY TEACHING

- Report any allergic reaction, bronchospasm, chest pain or tightness, cough, difficulty breathing, dizziness, fainting, rash, or itching.

## regorafenib

re-goe-raf-e-nib  
(Stivarga)

**BLACK BOX ALERT** Severe, sometimes fatal, hepatotoxicity reported. Monitor hepatic function prior to and during treatment. Interrupt, reduce, or discontinue therapy if hepatotoxicity or hepatocellular necrosis occurs.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.  
**CLINICAL:** Antineoplastic.

## USES

Treatment of metastatic colorectal cancer in pts who have been previously treated with fluoropyrimidine/oxaliplatin/irinotecan-based chemotherapy, anti-VEGF or anti-EGFR therapy. Locally advanced, unresectable, or metastatic GI stromal tumor previously treated with imatinib and SUNTininib. Treatment of hepatocellular carcinoma (HCC) previously treated with sorafenib.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to regorafenib. **Cautions:** Mild to moderate hepatic impairment (not recommended with severe hepatic impairment), hypertension (not recommended with severe or uncontrolled hypertension), recent surgical/dental procedures, chronic open wounds/ulcers, hemoptysis, concomitant warfarin therapy, cardiovascular disease, recent MI.

## ACTION

Inhibits tyrosine kinase activity involved with tumor angiogenesis, oncogenesis, and maintenance of tumor microenvironment. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99.5%. Peak plasma concentration: 4 hrs. Excreted in feces (71%), urine (19%). **Half-life:** 28 hrs (Range: 14–58 hrs).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin) may decrease concentration/effects. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effects. **HERBAL:** St. John's wort may decrease concentration/effects. **FOOD:** Grapefruit products may increase concentration/effects. High-fat meal may increase absorption/concentration. **LAB VALUES:** May decrease lymphocytes, neutrophils, platelets, serum calcium, phosphorus, potassium, sodium. May increase serum bilirubin, ALT, AST, lipase, amylase, INR, urine protein.

## AVAILABILITY (Rx)

 **Tablets:** 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Take at same time each day with low-fat (less than 30%) breakfast.
- Give whole; do not break, crush, dissolve, or divide tablet.

## INDICATIONS/ROUTES/DOSAGE

**Metastatic Colorectal Cancer, GI Stromal Tumor, Hepatocellular Carcinoma**

**PO: ADULTS/ELDERLY:** 160 mg once daily for first 21 days of each 28-day cycle. Continue until disease progression or unacceptable toxicity.

### Dosage Modification

**Symptomatic Hypertension, Toxic Skin Reactions, Severe Side Effects (Grades 3–4)**

**PO: ADULTS/ELDERLY:** Reduce dose to 120 mg once daily. If recovery does not occur within 7 days (despite dose reduction), interrupt treatment for minimum of 7 days and reassess. If recovery does not occur after interruption, reduce dose to 80 mg once daily. Discontinue for any of the following: intolerance of 80-mg dose; serum ALT or AST greater than 20 times upper limit of normal (ULN); serum ALT/AST greater than 3 times ULN and bilirubin greater than 2 times ULN; recurrent serum ALT/AST greater than 5

times ULN despite dose of 120 mg; recovery failure of Grade 3 or 4 side effects, toxic skin reaction.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (64%–26%):** Asthenia/fatigue, anorexia, diarrhea, mucositis, weight loss, hypertension, dysphonia, generalized pain, fever, rash. **Occasional (10%–5%):** Headache, alopecia, dysgeusia, musculoskeletal stiffness, dry mouth. **Rare (2% or less):** Tremor, gastric reflux.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy. May cause GI perforation, GI fistula formation. Hemorrhaging of respiratory, GI, genitourinary tracts reported in 21% of pts. Hypertension (30% of pts) may lead to hypertensive crisis. May cause ineffective wound healing or wound dehiscence requiring medical intervention. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of hands, feet (45% of pts). Reversible posterior leukoencephalopathy syndrome (RPLS) reported in less than 1% of pts. May induce cardiac ischemia and/or MI. Severe, sometimes fatal, hepatotoxicity including hepatocellular necrosis reported in less than 1%. Infections including mucocutaneous and systemic infections, nasopharyngitis, pneumonia, UTI reported in 31% of pts (most likely due to neutropenia).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Assess

recent surgical/dental procedures. Obtain full medication history including herbal products. Question for history of hypertension, hepatic impairment, cardiovascular disease. Assess skin for open/unhealed wounds. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor B/P, CBC, serum electrolytes, urinalysis. Monitor LFT q2wks for 2 mos, then monthly; or every wk if elevated. Persistent diastolic hypertension may indicate hypertensive emergency. Obtain ECG for palpitation, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias. Reverse posterior leukoencephalopathy syndrome (RPLS) should be considered in pts with seizure, headache, visual disturbances, altered mental status, malignant hypertension. Assess hydration status. Encourage PO intake. Immediately report any hemorrhaging, bloody stools, hematuria, abdominal pain, hemoptysis (may indicate GI perforation/fistula formation).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), symptoms of hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision, seizures).
- Report neurologic changes including confusion, seizures, vision loss, high blood pressure crisis (may indicate RPLS).
- Do not take herbal products.
- Notify physician before any planned surgical/dental procedures.
- Do not ingest grapefruit products.
- Take with low-fat food only.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Immediately report bleeding of any kind.

## relugolix

rel-ue-goe-lix  
(Orgovyx)

**Do not confuse relugolix with cetrorelix, degarelix, or elagolix.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Gonadotropin-releasing hormone (GnRH) receptor antagonist. **CLINICAL:** Antineoplastic.

#### USES

Treatment of adults with advanced prostate cancer.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to relugolix. **Cautions:** Pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia). Avoid concomitant use of P-gp inhibitors; combined P-gp and strong CYP3A inducers.

#### ACTION

Competitively binds to GnRH receptor, suppressing release of luteinizing hormone (LH) and follicle-stimulating hormone from pituitary gland. **Therapeutic Effect:** Suppresses release of testosterone, reducing tumor growth.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 68%–71%. Peak plasma concentration: 2.25 hrs. Excreted in feces (81%), urine (4%). **Half-life:** 25 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not indicated in females. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and up to 2 wks after discontinuation. May impair fertility. **Children:** Safety and efficacy not

established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** P-gp inhibitors (e.g., amiodarone, azithromycin, cyclosporine, ketoconazole, ritonavir, verapamil) may increase concentration/effect. **Combined P-gp and strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QT interval prolongation. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, glucose, triglycerides. May decrease Hgb.

## AVAILABILITY (Rx)

**Tablets:** 120 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer tablet whole; do not break or crush. Tablets cannot be chewed.
- If a dose is missed, give as soon as possible on the same day. If a dose is missed by more than 12 hrs, give dose at the next regularly scheduled time.
- If treatment is withheld for more than 7 days, readminister loading dose, followed by usual maintenance doses.

## INDICATIONS/ROUTES/DOSAGE

### Prostate Cancer (Advanced)

**PO: ADULTS, ELDERLY:** 360 mg as loading dose, then 120 mg once daily thereafter. If treated with GnRH receptor agonists and antagonist, treatment is usually continued until development of nonmetastatic or metastatic castration-resistant prostate cancer.

### Dose Modification

#### Concomitant Use of P-gp Inhibitors

If concomitant use of P-gp inhibitor is unavoidable, give relugolix first, then separate dosing by at least 6 hrs. May interrupt treatment for up to 2 wks if

short-course therapy with a P-gp inhibitor is needed.

#### Concomitant Use of Combined P-gp and Strong CYP3A Inducers

Increase to 240 mg once daily if concomitant use of combined P-gp and strong CYP3A inducer is unavoidable. If combined P-gp and strong CYP3A inducer is discontinued, resume 120-mg dose.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (54%–26%):** Hot flushes, arthralgia, arthritis, musculoskeletal pain (back, bone, chest, extremity, neck, spinal), fatigue, asthenia. **Occasional (12%–10%):** Diarrhea, constipation, increased weight, insomnia, gynecomastia, hyperhidrosis, decreased libido.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including anaphylaxis, angioedema, bradycardia, diaphoresis, dyspnea, fever, hypertension, hypotension, hypoxia, nausea, rash, shivering, tachycardia wheezing have occurred. Grade 1 or 2 transaminase elevations were reported. Seizure activity, acute kidney occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT; prostate-specific antigen (PSA), testosterone level; ECG. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor PSA level periodically. If PSA level increases, obtain serum testosterone level. Monitor for symptoms of QT interval prolongation (chest pain, dizziness, dyspnea, palpitations, syncope). If concomitant use of QT interval-prolonging medications is unavoidable, monitor ECG for QT interval prolongation, cardiac arrhythmias. Monitor for drug toxicities if discontinuation or dose reduction of concomitant P-gp inhibitor is unavoidable.

**PATIENT/FAMILY TEACHING**

- Treatment may affect the electrical conduction of the heart, which may lead to arrhythmias; report chest pain, dizziness, fainting, palpitations.
- Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Use effective contraception to avoid pregnancy.
- Seek medical attention if new-onset or worsening of depression occurs.

**remdesivir**

rem-de-si-vir  
(Veklury)

**Do not confuse remdesivir with oseltamivir, peramivir, or zanamivir.**

**◆ Classification**

**PHARMACOTHERAPEUTIC:** Nucleotide analog ribonucleic acid (RNA) polymerase inhibitor. **CLINICAL:** Antiviral.

**USES**

Treatment of coronavirus disease 2019 (COVID-19) in adults and pediatric pts (12 yrs and older and weighing at least 40 kg) who require hospitalization.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to remdesivir. **Cautions:** Renal impairment, hepatic disease. Avoid concomitant use of chloroquine phosphate, hydroxychloroquine.

**ACTION**

Inhibits SARS-CoV-2 RNA-dependent RNA polymerase, essential for viral replication. Distributes into cells and metabolizes into active nucleoside triphosphate metabolite, which competes for incorporation into RNA chains, resulting in chain termination. **Therapeutic Effect:** Inhibits viral replication of coronavirus associated with COVID-19.

**PHARMACOKINETICS**

Widely distributed. Primarily metabolized by enzymatic activity into active metabolite (minimal hepatic metabolism). Protein binding: 88%–94%. Peak plasma concentration: less than 1 hr. Excreted in urine (49%), feces (less than 1%). **Half-life:** 1 hr.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs or weighing less than 40 kg. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Chloroquine, hydroxychloroquine may decrease antiviral/therapeutic effect. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatinine, glucose; prothrombin time. May decrease CrCl, estimated glomerular filtration rate (eGFR), Hgb, lymphocytes.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 100 mg. **Injection Solution:** 100 mg/20 mL (5 mg/mL).

**ADMINISTRATION/HANDLING**

**Note:** Must be prepared and administered in the healthcare setting by a healthcare provider.

**Reconstitution/Preparation** • Reconstitute lyophilized powder with 19 mL Sterile Water for Injection. Discard vial if vacuum does not pull Sterile Water for Injection into vial. • Shake for 30 sec, then allow contents to settle for 2–3 min. Repeat until contents are completely dissolved (discard if not completely dissolved). • Reconstituted solution must be diluted in either 100 mL or 250 mL 0.9% NaCl infusion bag. Concentrated injection solution must be diluted in 250 mL 0.9% NaCl infusion bag only. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow. Do not use if solution is cloudy or discolored or if visible particles are observed. • Withdraw and discard a volume from the infusion bag that is equal to the required volume of dose (40 mL for loading dose; 20 mL for maintenance dose). • Transfer required volume of dose to infusion bag. • Invert 20 times to mix. Do not shake.

**Rate of administration** • Infuse over 30–120 min based on tolerability.

**Storage** • Store unused vials containing lyophilized powder at controlled room temperature. Refrigerate unused vials containing concentrated injection solution or store at room temperature for up to 12 hrs. • May refrigerate diluted solution for up to 48 hrs or store at room temperature for up to 24 hrs. • Do not shake or freeze.

## IV INCOMPATIBILITIES

Do not mix or infuse with other medications or solutions.

## INDICATIONS/ROUTES/DOSAGE

### COVID-19 Infection

**IV: ADULTS, CHILDREN 12 YRS AND OLDER WEIGHING AT LEAST 40 KG:** 200 mg (as a single loading dose) on day 1, then 100 mg daily for 4 days or until hospital discharge. May continue for up to 10 days in pts without substantial clinical improvement at day 5. **Permanent discontinuation:** Discontinue in pts with hypersensitivity reactions, serum ALT

greater than 10 times ULN, or serum ALT elevation associated with signs and symptoms of hepatic inflammation.

### Dosage in Renal Impairment

**eGFR 30 mL/min or greater:** No dose adjustment. **eGFR less than 30 mL/min:** Not recommended.

### Dosage in Hepatic Impairment.

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Rare (5% to less than 1%):** Nausea, injection site erythema.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including anaphylaxis, angioedema, bradycardia, diaphoresis, dyspnea, fever, hypertension, hypotension, hypoxia, nausea, rash, shivering, tachycardia wheezing have occurred. Grade 1 or 2 transaminase elevations were reported. Seizure activity, acute kidney occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain vital signs, renal function test (BUN, serum creatinine; CrCl, eGFR), LFT, prothrombin time. Confirm positive test for SARS-CoV-2. Question history of renal impairment, hepatic disease. Auscultate lung sounds. Assess for symptoms of COVID-19 (anosmia, cough, dysgeusia, dyspnea, fever, headache, muscle aches, respiratory failure, sepsis). Initiate isolation precautions.

### INTERVENTION/EVALUATION

Monitor vital signs, eGFR, LFT, prothrombin time. Assess for hypersensitivity reactions, esp. during initial doses. Monitor I&Os. Assess for acute kidney injury, esp. in critically ill pts (decreased urinary output, edema, flank pain, seizures); hepatic injury (abdominal pain, encephalopathy, fatigue, jaundice, nausea, vomiting). Monitor for worsening of COVID-19–related symptoms.

**PATIENT/FAMILY TEACHING**

- Treatment is not a cure, but it may shorten recovery time and reduce symptoms associated with COVID-19.
- Severe allergic reactions, including anaphylaxis, can occur. If allergic reaction occurs, seek immediate medical attention.
- Report symptoms of liver inflammation (abdominal pain, confusion, nausea, vomiting, yellowing of skin or eyes); kidney inflammation (decreased urine output, flank pain, darkened urine).

**reslizumab**

res-li-zoo-mab  
(Cinqair)

**BLACK BOX ALERT**

Anaphylaxis reported in less than 1% asthmatic pts, which usually occurred during or within 20 min of completion of infusion. Observe for appropriate period of time after administration.

**Do not confuse reslizumab with certolizumab, daclizumab, eculizumab, efalizumab, mepolizumab, natalizumab, omalizumab, pembrolizumab, tocilizumab, or vedolizumab, or Cinqair with Cinryze, Cinolar, Cinobac, Sinemet, Singulair, or SINEquan.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Interleukin-5 receptor antagonist. Monoclonal antibody. **CLINICAL:** Antiasthmatic.

**USES**

Add-on maintenance treatment of pts with severe asthma, aged 18 yrs and older, and with an eosinophil phenotype.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to reslizumab. **Cautions:** History of helminth (parasite) infection; long-term use of corticosteroids. Not indicated for

treatment of other eosinophilic conditions; relief of acute bronchospasm, status asthmaticus, exercise-induced bronchospasm. History of anaphylaxis.

**ACTION**

Exact mechanism unknown. Inhibits signaling of interleukin-5 cytokine, reducing production and survival of eosinophils responsible for asthmatic inflammation and pathogenesis. **Therapeutic Effect:** Prevents inflammatory process. Decreases number of asthma exacerbations.

**PHARMACOKINETICS**

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. Peak plasma concentration: reached by end of infusion. Excretion not specified. **Half-life:** 24 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase creatine phosphokinase (CPK).

**AVAILABILITY (Rx)**

**Injection Solution:** 100 mg/10 mL (10 mg/mL).

**ADMINISTRATION/HANDLING**

**Preparation**

- Allow vial to warm to room temperature.
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale yellow.
- Proteinaceous particles may be present.
- Air bubbles are expected and allowed.
- Do not use if solution is cloudy or discolored or if foreign parti-

cles are observed. • Do not shake. • Withdraw proper dose volume from vial and dilute in 50 mL 0.9% NaCl bag. • Gently invert to mix. Do not shake (may cause foaming/precipitate formation). • Infuse via dedicated line. • After infusion is complete, flush IV line with 0.9% NaCl.

**Rate of administration** • Infuse over 20–50 min (depending on total volume of infusion), using an in-line, low protein-binding filter (pore size: 0.2 micron).

**Storage** • Refrigerate unused vials. • Do not freeze. • Diluted solution may be refrigerated or stored at room temperature for up to 16 hrs. • If refrigerated, allow diluted solution to warm to room temperature before use. • Protect from light.

#### IV INCOMPATIBILITIES

Do not mix or infuse with other medications.

#### INDICATIONS/ROUTES/DOSAGE

##### Asthma (Severe)

**IV; ADULTS, ELDERLY:** 3 mg/kg once q4wks.

##### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

#### SIDE EFFECTS

**Rare (3%–1%):** Oropharyngeal pain, myalgia.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening anaphylaxis reported in less than 1% of pts. Hypersensitivity reactions including bronchospasm, dyspnea, hypoxia, rash, urticaria, vomiting usually occurred during infusion or within 20 min after completion. Less than 1% of pts reported at least one malignant neoplasm within 6 mos of initiation. Unknown if treatment will influence the immunologic response to helminth (parasite) infection. Immunogenicity (auto-reslizumab antibodies) reported in 5% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum CPK. Verify presence of eosinophil phenotype. Question history of hypersensitivity reaction. Therapy should be administered in a healthcare setting by medical professionals who are trained and prepared to readily manage anaphylaxis. Have anaphylactic medications (e.g., antihistamine, bronchodilator, corticosteroid, EPINEPHrine, H<sub>2</sub> receptor antagonist), intubation kit, supplemental oxygen readily available before initiation. Inhaled or systemic corticosteroids should not be suddenly discontinued upon initiation. Corticosteroids that are not gradually reduced may cause withdrawal symptoms or unmask conditions that were originally suppressed with corticosteroid therapy. Pts with preexisting helminth infection should be treated prior to initiation.

### INTERVENTION/EVALUATION

Obtain serum CPK in pts complaining of myalgia. Diligently observe for hypersensitivity/anaphylactic reaction during infusion and directly after completion. If anaphylaxis occurs, discontinue infusion and provide immediate resuscitation support. Early detection is vital. Assess rate, depth, rhythm of respirations, oxygen saturation for therapeutic effectiveness. Assess lungs for wheezing, rales. Obtain pulmonary function test to assess disease improvement. Interrupt or discontinue therapy if helminth infection occurs, if worsening of asthma-related symptoms occurs (esp. in pts tapering off corticosteroids). Monitor for increased use of rescue inhalers; may indicate deterioration of asthma. Monitor for primary malignancies.

### PATIENT/FAMILY TEACHING

- Treatment may cause life-threatening anaphylaxis. Immediately report allergic reactions such as difficulty breathing, hives, itching, low blood pressure, rash, swelling of the face or tongue, sudden coughing, vomiting, wheezing during infu-

sion or immediately after infusion.

- Therapy not indicated for relief of acute asthma or bronchospasm.
- Have a rescue inhaler readily available.
- Increased use of rescue inhalers may indicate worsening of asthma.
- Seek medical attention if asthma symptoms worsen or remain uncontrolled.
- Do not stop corticosteroid therapy unless directed by prescriber.
- Treatment may increase risk of new cancers or alter the body's immune response to parasite infections.

## ribavirin

rye-ba-vye-rin  
(Virazole)

### ■ BLACK BOX ALERT ■

Significant teratogenic/embryocidal effects. Hemolytic anemia is significant toxicity, usually occurring within 1–2 wks. May worsen cardiac disease and lead to fatal or nonfatal MI. Inhalation may interfere with safe and effective assisted ventilation. Monotherapy not effective for chronic hepatitis C virus infection.

**Do not confuse ribavirin with riboflavin, rifAMPin, or Robaxin.**

### FIXED-COMBINATION(S)

With interferon alfa-2b (**Rebtron**). Individually packaged.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic nucleoside. **CLINICAL:** Antihepaciviral.

### USES

**Inhalation:** Treatment of respiratory syncytial virus (RSV) infections (esp. in pts with underlying compromising conditions such as chronic lung disorders, congenital heart disease, recent transplant recipients).

**Capsule/tablet/oral solution:** Treatment of chronic hepatitis C virus infection in pts with compensated hepatic disease in combination with other medications.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ribavirin. **Inhalation:** Women who are pregnant or may become pregnant. **Oral formulations:** Hemoglobinopathies (e.g., sickle cell anemia), men whose female partner is pregnant, women of childbearing age who are pregnant or may become pregnant. Concomitant use of didanosine. **RibaspHERE, RebetoL Only:** CrCl less than 50 mL/min. **Cautions: Inhalation:** Pts requiring assisted ventilation, COPD, asthma. **PO:** Baseline anemia, cardiac/pulmonary disease, elderly, renal impairment, history of sarcoidosis, psychiatric illness.

### ACTION

Inhibits replication of viral RNA, DNA, influenza virus RNA polymerase activity; interferes with expression of messenger RNA. **Therapeutic Effect:** Inhibits viral protein synthesis.

### PHARMACOKINETICS

Readily absorbed. Peak concentrations: **Inhalation:** At end of inhalation period. **Capsules:** 3 hrs. **Tablets:** 2 hrs. Protein binding: None. Metabolized in liver and intracellularly. Primarily excreted in urine. **Half-life: Inhalation:** 6.5–11 hrs. **Capsules:** 298 hr at steady state. **Tablets:** 120–170 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy. Females and males with female partners of reproductive potential must use 2 forms of effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if excreted in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase adverse effects of **didanosine**. **Zidovudine** may increase adverse effects. May decrease therapeutic effect of **cladribine**. **HERBAL:** None

significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Capsules:** 200 mg. **Powder for Solution, Nebulization: (Virazole):** 6 g. **Solution, Oral:** 40 mg/mL. **Tablet:** 200 mg, 400 mg, 600 mg.

### ADMINISTRATION/HANDLING

#### PO

- Capsules may be taken without regard to food.
- Do not break, crush, or open capsules.
- Use oral solution in children 5 yrs or younger, those 47 kg or less, or those unable to swallow.
- Give capsules with food when combined with peginterferon alfa-2b.
- Tablets should be given with food.

#### Inhalation

**◀ALERT▶** May be given via nasal or oral inhalation.

- Solution appears clear, colorless; is stable for 24 hrs at room temperature.
- Discard solution for nebulization after 24 hrs.
- Discard if discolored or cloudy.
- Add 50–100 mL Sterile Water for Injection or Inhalation to 6-g vial.
- Transfer to a flask, serving as reservoir for aerosol generator.
- Further dilute to final volume of 300 mL, giving solution concentration of 20 mg/mL.
- Use only aerosol generator available from manufacturer of drug.
- Do not give concomitantly with other drug solutions for nebulization.
- Discard reservoir solution when fluid levels are low and at least q24h.
- Only experienced personnel should administer drug.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Combination therapy with peginterferon alone is not recommended in HCV guidelines.

#### Chronic Hepatitis C Virus Infection

**PO: ADULTS, ELDERLY WEIGHING MORE THAN 75 KG:** 1,200 mg daily in 2 divided doses. **WEIGHING 74 KG OR LESS:** 1,000 mg daily in 2 divided doses. **LOW**

**INITIAL DOSE:** 600 mg/day. May increase as tolerated.

#### Dosage in Renal Impairment

##### Capsules/Oral Solution

**ADULTS: CrCl less than 50 mL/min:** Contraindicated. **CHILDREN: Serum creatinine more than 2 mg/dL:** Discontinue treatment.

##### Ribasphere Tablets

**ADULTS: CrCl less than 50 mL/min:** Not recommended.

#### Dosage in Hepatic Impairment

Contraindicated.

#### Severe Lower Respiratory Tract Infection Caused by Respiratory Syncytial Virus (RSV)

**Inhalation: CHILDREN, INFANTS:** Use with Viratek small-particle aerosol generator at concentration of 20 mg/mL (6 g reconstituted with 300 mL Sterile Water for Injection) over 12–18 hrs/day for 3–7 days.

### SIDE EFFECTS

**Frequent (greater than 10%):** Hemolytic anemia, dizziness, headache, fatigue, fever, insomnia, irritability, depression, emotional lability, impaired concentration, alopecia, rash, pruritus, nausea, anorexia, dyspepsia, vomiting, decreased hemoglobin, hemolysis, arthralgia, musculoskeletal pain, dyspnea, sinusitis, flu-like symptoms. **Occasional (10%–1%):** Nervousness, altered taste, weakness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Cardiac arrest, apnea, ventilator dependence, bacterial pneumonia, pneumonia, pneumothorax occur rarely. If treatment exceeds 7 days, anemia may occur.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain sputum specimens before giving first dose or at least during first 24 hrs of therapy. Assess respiratory status for baseline. **PO:** Obtain CBC with differential, pretreatment and monthly pregnancy test for women of childbearing age.

**INTERVENTION/EVALUATION**

Monitor Hgb, Hct, platelets, LFT, I&O, fluid balance carefully. Check hematology reports for anemia due to reticulocytosis when therapy exceeds 7 days. For ventilator-assisted pts, watch for “rainout” in tubing and empty frequently; be alert to impaired ventilation/gas exchange due to drug precipitate. Assess skin for rash. Monitor B/P, respirations; assess lung sounds.

**PATIENT/FAMILY TEACHING**

- Report immediately any difficulty breathing, itching/swelling/redness of eyes, severe abdominal pain, bloody diarrhea, unusual bleeding/bruising.
- Female pts should take measures to avoid pregnancy.
- Male pts must use condoms during sexual activity.

## ribociclib

rye-boe-sye-klib  
(Kisqali)

**Do not confuse ribociclib with palbociclib or riboflavin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cyclin-dependent kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Used in combination with an aromatase inhibitor as initial endocrine-based therapy for treatment of postmenopausal women with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer. Treatment of HR-positive, HER2-negative advanced or metastatic breast cancer (in combination with fulvestrant) in pre-/perimenopausal or postmenopausal women as initial endocrine-based therapy.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ribociclib. **Cautions:** Baseline cytopenias,

hepatic impairment. Avoid concomitant use of strong CYP3A inhibitors, strong CYP3A inducers, QTc interval-prolonging medications. Avoid use in pts with or at risk for QTc prolongation (e.g., congenital long QT syndrome, hypokalemia, hypomagnesemia; uncontrolled, significant cardiac disease including MI, HF, unstable angina, bradyarrhythmias).

**ACTION**

Blocks retinoblastoma protein phosphorylation and prevents progression through cell cycle, resulting in arrest of G<sub>1</sub> phase. **Therapeutic Effect:** Inhibits tumor growth.

**PHARMACOKINETICS**

Widely distributed. Metabolized extensively in liver. Protein binding: 70%. Peak plasma concentration: 1–4 hrs. Excreted in feces (69%), urine (23%). **Half-life:** 30–55 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Indicated for postmenopausal women; however, may cause fetal harm/malformations when used during pregnancy. Females of reproductive potential should use effective contraception during treatment and for at least 3 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 3 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. QT interval-prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, torsades de pointes. May increase concentration/effect of **aprepitant**,

bosutinib, budesonide, naloxegol, neratinib, olaparib, pimeozide. May decrease effect of BCG (intravesical). May increase adverse effects/toxicity of natalizumab, pimecrolimus, tacrolimus. **HERBAL:** Echinacea, St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease ANC, Hgb, lymphocytes, leukocytes, neutrophils, platelets; serum potassium, phosphate.

### AVAILABILITY (Rx)

**Tablets:** 200 mg. **Blister Pack:** (21 tablets, 42 tablets, 63 tablets).

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. Administer tablet whole; do not break, cut, or crush.
- Do not give if tablet is cracked, broken, or not intact.
- Tablets cannot be chewed. If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

### INDICATIONS/ROUTES/DOSAGE

#### Breast Cancer (Advanced or Metastatic)

**Note:** A luteinizing hormone–releasing hormone (LHRH) agonist should be administered to premenopausal and perimenopausal women.

**PO: ADULTS, ELDERLY:** 600 mg once daily for 21 days, followed by 7 days off treatment of 28-day cycle. Use in combination with an aromatase inhibitor or fulvestrant. Continue until disease progression or unacceptable toxicity.

#### Dose Reduction Schedule

**First reduction:** 400 mg/day. **Second reduction:** 200 mg/day. **Unable to tolerate 200 mg/day:** Permanently discontinue.

#### Dose Modification

Based on Common Terminology Criteria for Adverse Events.

#### Hepatotoxicity

**Note:** Defined as hepatotoxicity without total bilirubin greater than 2 times upper limit of normal (ULN). If serum ALT, AST elevation greater than 3 times ULN with total bilirubin greater than 2 times ULN, permanently discontinue.

**Grade 1 serum ALT, AST elevation (up to 3 times ULN):** No dose adjustment.

**Grade 2 serum ALT, AST elevation (greater than 3–5 times ULN) with baseline at less than Grade 2:** Withhold treatment until improved to baseline, then resume at same dose level. If baseline at less than Grade 2, do not withhold treatment. If Grade 2 serum ALT, AST elevation recurs, then resume at reduced dose level.

**Grade 3 serum ALT, AST elevation (greater than 5–20 times ULN):** Withhold treatment until improved to baseline, then resume at reduced dose level. If Grade 3 serum ALT, AST elevation recurs, permanently discontinue. **Grade 4 serum ALT, AST elevation (greater than 20 times ULN):** Permanently discontinue.

#### Hematologic

**Grade 1 or 2 neutropenia (ANC 1000 cells/mm<sup>3</sup> to less than the lower limit of normal):** No dose adjustment. **Grade 3 neutropenia (ANC 500 to less than 1000 cells/mm<sup>3</sup>):** Withhold treatment until recovery to Grade 2 or less, then resume at same dose level. If Grade 3 neutropenia recurs, withhold treatment until recovery to Grade 2 or less, then resume at reduced dose level.

**Grade 3 febrile neutropenia:** Withhold treatment until recovery to Grade 2 or less, then resume at reduced dose level. **Grade 4 neutropenia (ANC less than 500 cells/mm<sup>3</sup>):** Withhold treatment until recovery to Grade 2 or less, then resume at reduced dose level.

#### QTc Interval Prolongation

**QTc interval prolongation greater than 480 msec:** Withhold treatment until resolved to less than 481 msec, then resume at same dose level. If QTc interval prolongation greater than 480 msec recurs,

withhold treatment until resolved to less than 481 msec, then resume at reduced dose level. **QTc interval prolongation greater than 500 msec:** Withhold treatment if QTc interval prolongation greater than 500 msec on at least two separate ECGs (within same visit). If QTc interval prolongation resolves to less than 481 msec after withholding treatment, resume at reduced dose level. **QTc interval prolongation greater than 500 msec (or greater than 60 msec from baseline) with torsades de pointes, polymorphic ventricular tachycardia, unexplained syncope, symptoms of serious arrhythmia:** Permanently discontinue.

#### **Other Toxicities**

**Any other Grade 1 or 2 toxicities:** No dose adjustment. **Any other Grade 3 toxicities:** Withhold treatment until resolved to Grade 1 or 0, then resume at same dose level. If Grade 3 toxicities recur, resume at reduced dose level. **Any other CTCAE Grade 4 toxicities:** Permanently discontinue.

#### **Concomitant Use of Strong CYP3A Inhibitors**

Reduce initial dose to 400 mg once daily if strong CYP3A inhibitor cannot be discontinued. If CYP3A inhibitor is discontinued, increase ribociclib dose (after at least 5 half-lives of CYP3A inhibitor have elapsed) to the dose used prior to initiating strong CYP3A inhibitor.

#### **Dosage in Renal Impairment**

Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Reduce starting dose to 400 mg once daily.

### **SIDE EFFECTS**

**Frequent (52%–17%):** Nausea, fatigue, diarrhea, alopecia, vomiting, constipation,

headache, back pain, decreased appetite, rash. **Occasional (14%–11%):** Pruritus, pyrexia, insomnia, dyspnea, stomatitis, peripheral edema, abdominal pain.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including febrile neutropenia, may be life-threatening. CTCAE Grade 3 or 4 neutropenia reported in 60% of pts. Severe hepatotoxicity reported in 10% of pts. QTc interval prolongation, infections including UTI may occur.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, LFT, vital signs, weight; pregnancy test in females of reproductive potential. Obtain ECG (note QTc interval). Initiate treatment only in pts with QTc interval less than 450 msec. Question history of cardiac disease, cardiac conduction disorders, hepatic impairment. Receive full medication history including herbal products and screen for interactions. Screen for risk of bleeding, QTc interval prolongation, active infection. Obtain dietary consult. Offer emotional support.

#### **INTERVENTION/EVALUATION**

Monitor ANC, CBC for myelosuppression; LFT for hepatotoxicity q2wks for the first 2 cycles, then prior to each subsequent cycle, then as clinically indicated. Monitor BMP, serum phosphate for electrolyte imbalance; consider correcting imbalances, esp. hypokalemia, hypomagnesemia (due to increased risk of cardiac arrhythmias, torsades de pointes). Obtain repeat ECG on day 14 of the first cycle and at the beginning of the second cycle, or more frequently if QTc interval prolongation occurs. Monitor daily pat-

tern of bowel activity, stool consistency. Assess skin for rash, lesions. Monitor weight, I&O.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Report liver problems such as bruising, confusion, amber or dark-colored urine; right upper abdominal pain, yellowing of the skin or eyes; heart arrhythmias (chest pain, difficulty breathing, palpitations, passing out).
- Therapy indicated for postmenopausal women; however, birth defects may occur when used during pregnancy. Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not ingest grapefruit products, Seville oranges, starfruit, pomegranate, herbal supplements.
- Report planned surgical/dental procedures.
- Immediately report bleeding of any kind.

## rifAMPin

rif-am-pin  
(Rifadin, Rofact )

**Do not confuse Rifadin with Rifater or Ritalin, or rifAMPin with ribavirin, rifabutin, Rifamate, rifapentine, rifAXIMin, or Ritalin.**

#### FIXED-COMBINATION(S)

**Rifamate:** rifAMPin/isoniazid (an antitubercular): 300 mg/150 mg. **Rifater:** rifAMPin/isoniazid/pyrazinamide (an antitubercular): 120 mg/50 mg/300 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Rifamycin derivative. **CLINICAL:** Antitubercular.

#### USES

In combination with other antitubercular agents for initial treatment, retreatment of active tuberculosis. Eliminates meningococci from nasopharynx of asymptomatic carriers. **OFF-LABEL:** Prophylaxis of *H. influenzae* type B infection, *Legionella* pneumonia, serious infections caused by *Staphylococcus* spp. (in combination with other agents). Treatment of prosthetic joint infection.

#### PRECAUTIONS

**Contraindications:** Concomitant therapy with atazanavir, darunavir, fosamprenavir, saquinavir, ritonavir, tipranavir; hypersensitivity to rifAMPin, other rifamycins.

**Cautions:** Hepatic impairment, active or treated alcoholism, porphyria. Concurrent medications associated with hepatotoxicity.

#### ACTION

Interferes with bacterial RNA synthesis by binding to DNA-dependent RNA polymerase, preventing attachment to DNA, thereby blocking RNA transcription. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 80%. Metabolized in liver. Primarily eliminated by biliary system. Not removed by hemodialysis. **Half-life:** 3–5 hrs (increased in hepatic impairment).

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease concentration/effects of **atovaquone, diltiazem, disopyramide, edoxaban,**

esomeprazole, methadone, mycophenolate, omeprazole, oral anticoagulants (e.g., apixaban, warfarin), oral contraceptives, phenytoin, ranolazine, tacrolimus, tenofovir, zolpidem. **HERBAL:** None significant.

**FOOD:** Food decreases extent of absorption. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, ALT, AST.

## AVAILABILITY (Rx)

**Capsules:** 150 mg, 300 mg. **Injection, Powder for Reconstitution:** 600 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 600-mg vial with 10 mL Sterile Water for Injection to provide concentration of 60 mg/mL. • Withdraw desired dose and further dilute with 0.9% NaCl or D<sub>5</sub>W to concentration not to exceed 6 mg/mL.

**Rate of administration** • For IV infusion only. Avoid IM, SQ administration. • Avoid extravasation (local irritation, inflammation). • Infuse over 30 min to 3 hrs.

**Storage** • Reconstituted vial is stable for 24 hrs. • Diluted solution is stable for 4 hrs in D<sub>5</sub>W or 24 hrs in 0.9% NaCl.

### PO

• Preferably give 1 hr before or 2 hrs following meals with 8 oz of water (may give with food to decrease GI upset; will delay absorption). • For pts unable to swallow capsules, contents may be mixed with applesauce, jelly. • Administer at least 1 hr before antacids, esp. those containing aluminum.

## IV INCOMPATIBILITIES

DilTIAZem (Cardizem).

## IV COMPATIBILITIES

D<sub>5</sub>W if infused within 4 hrs (risk of precipitation beyond this time period).

## INDICATIONS/ROUTES/DOSAGE

### Tuberculosis

**Note:** A four-drug regimen (ethambutol, isoniazid, pyrazinamide, rifAMPin) is preferred for initial, empiric treatment.

**PO, IV; ADULTS, ELDERLY:** 10 mg/kg/day.

**Maximum:** 600 mg/day. **CHILDREN:** 10–20 mg/kg/day usually as a single daily dose. **Maximum:** 600 mg/day.

### Meningococcal Carrier

**PO, IV; ADULTS, ELDERLY:** 600 mg twice daily for 2 days. **PO only; CHILDREN 1 MO AND OLDER:** 10 mg/kg/dose q12h for 2 days. **Maximum:** 600 mg/dose. **CHILDREN YOUNGER THAN 1 MO:** 5 mg/kg/dose q12h for 2 days.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, tears. **Occasional (5%–3%):** Hypersensitivity reaction (flushing, pruritus, rash). **Rare (2%–1%):** Diarrhea, dyspepsia, nausea, oral candida (sore mouth, tongue).

## ADVERSE EFFECTS/TOXIC REACTIONS

Hepatotoxicity (risk is increased when rifAMPin is taken with isoniazid), hepatitis, blood dyscrasias, Stevens-Johnson syndrome, antibiotic-associated colitis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test, LFT. Screen for concomitant medications known to cause hepatotoxicity. Question for hypersensitivity to rifAMPin, rifamycins. Ensure collection of diagnostic specimens.

### INTERVENTION/EVALUATION

Assess IV site at least hourly during infusion; restart at another site at the first sign

of irritation or inflammation. Monitor LFT, assess for hepatitis: jaundice, anorexia, nausea, vomiting, fatigue, weakness (hold rifAMPin, inform physician at once). Report hypersensitivity reactions promptly: any type of skin eruption, pruritus, flu-like syndrome with high dosage. Monitor daily pattern of bowel activity, stool consistency (potential for antibiotic-associated colitis). Monitor CBC results for blood dyscrasias; be alert for infection (fever, sore throat), unusual bruising/bleeding, unusual fatigue/weakness.

#### PATIENT/FAMILY TEACHING

- Preferably take on empty stomach with 8 oz of water 1 hr before or 2 hrs after meal (with food if GI upset).
- Avoid alcohol.
- Do not take any other medications without consulting physician, including antacids; must take rifAMPin at least 1 hr before antacid.
- Urine, feces, sputum, sweat, tears may become red-orange; soft contact lenses may be permanently stained.
- Report any new symptom immediately such as yellow eyes/skin, fatigue, weakness, nausea/vomiting, sore throat, fever, flu, unusual bruising/bleeding.
- If taking oral contraceptives, check with physician (reliability may be affected).

## rifAXIMin

rif-ax-i-min  
(Xifaxan, Zaxine )

**Do not confuse rifAXIMin with rifAMPin.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-infective. **CLINICAL:** Site-specific antibiotic.

#### USES

Treatment of traveler's diarrhea caused by noninvasive strains of *E. coli*. Reduction of risk for recurrence of overt hepatic encephalopathy. Treatment of irritable bowel syndrome with diarrhea

(IBS-D) in adults. **OFF-LABEL:** Treatment of hepatic encephalopathy. Treatment of *C. difficile*-associated diarrhea.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to rifAXIMin, other rifamycin antibiotics.

**Cautions:** Severe hepatic impairment.

#### ACTION

Inhibits bacterial RNA synthesis by binding to bacterial DNA-dependent RNA polymerase.

**Therapeutic Effect:** Bactericidal.

#### PHARMACOKINETICS

Less than 0.4% absorbed after PO administration. Primarily excreted in feces.

**Half-life:** 5.85 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs for traveler's diarrhea; younger than 18 yrs for IBS-D. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease effect of BCG (intravesical). Lasmiditan may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

#### AVAILABILITY (Rx)

 **Tablets:** 200 mg, 550 mg.

#### ADMINISTRATION/HANDLING

##### PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

#### INDICATIONS/ROUTES/DOSAGE

##### Traveler's Diarrhea

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 200 mg 3 times/day for 3 days.

##### Hepatic Encephalopathy

**PO: ADULTS, ELDERLY:** 550 mg 2 times/day or 400 mg 3 times/day.

**IBS-D**

**PO: ADULTS, ELDERLY:** 550 mg 3 times/day for 14 days. May repeat up to 2 times if symptoms recur.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (11%–5%):** Flatulence, headache, abdominal discomfort, rectal tenesmus, defecation urgency, nausea. **Rare (4%–2%):** Constipation, fever, vomiting.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reaction, superinfection occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Check baseline hydration status: skin turgor, mucous membranes for dryness, urinary status. Assess stool frequency, consistency.

**INTERVENTION/EVALUATION**

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Assess for GI disturbances, blood in stool.

**PATIENT/FAMILY TEACHING**

- Report if diarrhea worsens or if blood occurs in stool, fever develops within 48 hrs.

**rimegepant**

ri-me-je-pant  
(Nurtec ODT)

**Do not confuse rimegepant with ubrogepant.**

◆ **Classification**

**PHARMACOTHERAPEUTIC:** Calcitonin gene-related peptide (CGRP) receptor antagonist. **CLINICAL:** Antimigraine.

**USES**

Treatment of migraines with or without aura in adults. Preventive treatment of episodic migraine in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to rimegepant. **Cautions:** Not indicated for prevention of migraine.

**ACTION**

Exact mechanism of action unknown. Binds to and inhibits calcitonin gene-related peptide (CGRP) receptor. **Therapeutic Effect:** Relieves migraine headache.

**PHARMACOKINETICS**

Rapidly absorbed. Metabolized in liver. Protein binding: 96%. Peak plasma concentration: 1.5 hrs. Excreted in urine (51%), feces (42%). **Half-life:** 11 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil), P-gp inhibitors (e.g., amiodarone, carvedilol, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

**AVAILABILITY (Rx)**

**Tablets, Orally Disintegrating:** 75 mg.

**ADMINISTRATION/HANDLING****Orally Disintegrating Tablets**

• Do not remove from blister pack until needed. • Peel backing off; do not push tablet through blister pack. • Place tablet on or under tongue; allow to dissolve. Swallow with saliva.

**INDICATIONS/ROUTES/DOSAGE****Migraine Treatment (With or Without Aura)**

**PO: ADULTS:** 75 mg once prn. Do not exceed 75 mg in a 24-hr period.

**Migraine Prevention**

**PO: ADULTS, ELDERLY:** 75 mg every other day.

**Dose Modification**

**Concomitant use of strong/moderate CYP3A4 inhibitors:** Avoid concomitant use of strong CYP3A4 inhibitors. Avoid second dose of rimegepant within 48 hrs of concomitant moderate CYP3A4 inhibitors.

**Concomitant use of strong/moderate CYP3A4 inducers:** Due to loss of efficacy, avoid concomitant use of strong or moderate CYP3A4 inducers.

**Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Avoid use.

**SIDE EFFECTS**

**Rare (2%):** Nausea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reactions including dyspnea, severe rash reported in less than 1% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms).

**INTERVENTION/EVALUATION**

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, foggiess). Monitor for hypersensitivity reactions.

**PATIENT/FAMILY TEACHING**

• Allergic reactions such as difficulty breathing, severe rash may occur. If allergic reaction occurs, seek immediate medical attention. • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy.

**ripretinib**

ri-**pre**-tin-ib  
(Qinlock)

**Do not confuse ripretinib with avapritinib, ceritinib, imatinib, regorafenib, rucaparib, ruxolitinib, sunitinib.**

**◆ Classification**

**PHARMACOTHERAPEUTIC:** KIT inhibitor, PDGFR-alpha blocker. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with advanced gastrointestinal stromal tumor (GIST) who have received prior treatment with three or more kinase inhibitors (including imatinib).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ripretinib. **Cautions:** Baseline hematologic cytopenias, hepatic impairment, dermatologic disease, cardiovascular disease, hypertension, HF; conditions predisposing to infection (e.g., diabetes, immunocompromised, open wounds); recent surgical incision, poorly healed wounds. Do not initiate in pts with uncontrolled hypertension.

**ACTION**

Inhibits KIT proto-oncogene receptor tyrosine kinase and platelet-derived growth factor receptor A (PDGFRA) kinase signaling, including wild-type, primary, secondary mutations of KIT and PDGFRA. **Therapeutic Effect:** Inhibits tumor growth.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Steady state reached in 14 days. Excreted in feces (34%), urine (less than 1%). **Half-life:** 14.8.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 7 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. **Males:** May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase activated partial thromboplastin time (aPTT), INR; serum amylase, ALT, bilirubin, CPK, creatinine, lipase, triglycerides. May decrease serum phosphate, sodium; Hgb, neutrophils, RBCs.

**AVAILABILITY (Rx)**

 **Tablets:** 50 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Administer tablets whole; do not break, crush, or divide. Tablet cannot be chewed.
- If

vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose). • If a dose is missed, do not give if more than 8 hrs have passed since the missed scheduled dose.

**INDICATIONS/ROUTES/DOSAGE****GI Stromal Tumor**

**PO: ADULTS:** 150 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule for Adverse Events.**

**First dose reduction:** 100 mg once daily. **Unable to tolerate 100-mg dose:** Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Arthralgia/Myalgia**

**Grade 2 arthralgia/myalgia:** Withhold treatment until improved to Grade 1 or baseline. If improved within 7 days, resume at same dose or consider reduced dose. Consider re-escalating if maintained at Grade 1 or baseline for at least 28 days. If recurs, withhold treatment until improved to Grade 1 or baseline, then resume at reduced dose regardless of the time symptoms improved.

**Grade 3 arthralgia/myalgia:** Withhold treatment for at least 7 days (or until improved to Grade 1 or baseline), then resume at reduced dose. Consider re-escalating if maintained at Grade 1 or baseline for at least 28 days.

**Hypertension Grade 3 hypertension:**

If symptomatic, withhold until symptoms resolve and B/P has improved. If B/P has improved to Grade 1 or baseline, resume at same dose or consider reduced dose. If recurs, withhold treatment until symptoms resolve and B/P has improved, then resume at reduced dose.

**Grade 4 hypertension:** Permanently discontinue.

**Left Ventricular Dysfunction**

**Grade 3 or 4 left ventricular dysfunction:** Permanently discontinue.

**Palmar-Plantar Erythrodysesthesia Syndrome (PPES) Grade 2 PPES:** Withhold treatment until improved to Grade 1 or baseline. If improved within 7 days, resume at same dose or consider reduced dose. Consider re-escalating if maintained at Grade 1 or baseline for at least 28 days. If recurs, withhold treatment until improved to Grade 1 or baseline, then resume at reduced dose regardless of the time symptoms improved. **Grade 3 PPES:** Withhold treatment for at least 7 days (or until improved to Grade 1 or baseline), then resume at reduced dose. Consider re-escalating if maintained at Grade 1 or baseline for at least 28 days.

**Other Toxicities**

**Other Grade 3 or 4 toxicities:** Withhold treatment up to a maximum of 28 days until improved to Grade 1 or baseline, then resume at same dose or consider reduced dose. Consider re-escalating if maintained at Grade 1 or baseline for at least 28 days. If recurs, permanently discontinue.

**Dosage in Renal Impairment Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (52%–19%):** Alopecia, fatigue, nausea, abdominal pain, constipation, myalgia, diarrhea, decreased appetite, vomiting, headache, arthralgia, decreased weight. **Occasional (17%–7%):** Peripheral edema, muscle spasm, asthenia, dyspnea, dry skin, pruritus, stomatitis, agitation, hyperesthesia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia) is an expected response to therapy. PPES, a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, reported in 21% of pts. New primary malignancies including cutaneous squamous cell carcinoma, keratoacanthoma were reported. Grade 1–3 hypertension reported in 14% of pts. Cardiac dysfunction (cardiac failure, acute left ventricular failure, diastolic dysfunction, ventricular hypertrophy) reported in 2% of pts. Other cardiac events may include cardiac arrest, acute coronary syndrome, MI. Impaired wound healing may occur.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC; B/P; pregnancy test in females of reproductive potential. Verify use of effective contraception. Question history of cardiovascular disease, hypertension, HF, dermatologic disease, hepatic impairment. Assess LVEF by echocardiogram. Conduct dermatologic exam; assess for open wounds, lesions, surgical incisions. Question for recent surgeries, invasive dental procedures. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, B/P throughout therapy. Assess for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor is unavoidable. Monitor for infection (cough, fatigue, fever). If serious infection, sepsis occurs, initiate appropriate antimicrobial therapy. Assess skin for dermal toxicities, PPES. Monitor skin for impaired wound healing, new skin lesions, rash, sloughing. Assess LVEF by echocardiogram at regular intervals. Monitor for symptoms of HF (dyspnea, edema, palpi-

tations, syncope). Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), toxic skin reactions (e.g., itching, peeling, rash, redness, swelling).
- Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms. Report difficulty breathing, palpitations, swelling of extremities.
- High blood pressure may occur; expect frequent blood pressure monitoring.
- Notify physician before any planned surgeries/invasive dental procedures.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Treatment may cause new cancers.

## risankizumab-rzaa

ris-an-kiz-ue-mab-rzaa  
(Skyrizi)

**Do not confuse risankizumab with ixekizumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-23 antagonist. Monoclonal antibody. **CLINICAL:** Antipsoriatic agent.

#### USES

Treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy or phototherapy.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to risankizumab. **Cautions:** Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), prior exposure to tuberculosis or use in pts who reside or travel to areas where TB is endemic. Avoid use during active infection. Concomitant use of live vaccines not recommended.

#### ACTION

Selectively binds to p19 subunit of interleukin-23 (IL-23) and inhibits interaction with IL-23 receptor. IL-23 is a cytokine that is involved in inflammatory and immune response. **Therapeutic Effect:** Alters biologic immune response; reduces inflammation of psoriatic lesions.

#### PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 3–14 days. Steady state reached in 16 wks. **Half-life:** 28 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May increase immunosuppressive effect of **baricitinib**,  **fingolimod**. May decrease therapeutic effect of **BCG (intravesical)**. May increase adverse/toxic effects of **leflunomide**, **natalizumab**. May decrease therapeutic effects/increase adverse effects of **live vaccines**. **Belimumab**, **infliximab** may increase immunosuppressive effect. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** None known.

**AVAILABILITY (Rx)**

**Injection Solution, Prefilled Syringe:** 75 mg/0.83 mL, 150 mg/mL. **Solution, Auto-Injector (Skyrizi Pen):** 150 mg/mL.

**ADMINISTRATION/HANDLING****SQ**

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 15–30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy or discolored or if visible particles are observed.

**Administration** • Insert needle subcutaneously into outer thigh or abdomen and inject solution. Injections to the outer arms may only be performed by a healthcare professional. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly. • If a dose is missed, administer as soon as possible, then give next dose at regularly scheduled time.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from light. • Do not shake. • Do not freeze or expose to heating sources.

**INDICATIONS/ROUTES/DOSAGE****Plaque Psoriasis**

**SQ: ADULTS, ELDERLY:** 150 mg (two 75-mg injections) at wk 0 and wk 4, then q12wks thereafter.

**Dosage in Renal Impairment**

**Mild to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Rare (4%–2%):** Headache, tension headache, sinus headache, fatigue, asthenia,

injection site reactions (bruising, erythema, extravasation, hematoma, hemorrhage, infection, inflammation, irritation, pain, pruritus, swelling, warmth).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Upper respiratory tract infections (bacterial, viral, unspecified) including nasopharyngitis, pharyngitis, rhinitis, sinusitis, tonsillitis reported in 13% of pts. Tinea infections reported in 1% of pts. Serious infections including cellulitis, herpes zoster, osteomyelitis, sepsis occurred in less than 1% of pts. Immunogenicity (auto-risankizumab antibodies) reported in 24% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Consider completion of age-appropriate immunizations prior to initiation. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiation and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Screen for active infection or chronic infections. Conduct dermatologic exam; record characteristics of psoriatic lesions. Assess pt's willingness to self-inject medication. Teach proper injection techniques.

**INTERVENTION/EVALUATION**

Assess skin for improvement of lesions. Monitor for symptoms of tuberculosis (cough, fatigue, hemoptysis, nocturnal sweating, weight loss), including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs.

**PATIENT/FAMILY TEACHING**

• Treatment may depress your immune system and reduce your ability to fight infec-

tion. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever; fungal infections. Avoid those with active infection. • Do not receive live vaccines. • Expect frequent tuberculosis screening. Report symptoms of tuberculosis such as cough, fatigue, night sweats, weight loss, or coughing up blood. • Report travel plans to possible endemic areas.

## risedronate

ris-ed-roe-nate  
(Actonel, Atelvia)

**Do not confuse Actonel with Actos, or risedronate with alendronate.**

### FIXED-COMBINATION(S)

**Actonel with Calcium:** risedronate/calcium: 35 mg/6 × 500 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Bisphosphonate. **CLINICAL:** Calcium regulator.

### USES

**Actonel:** Treatment of Paget's disease of bone. Treatment/prevention of osteoporosis in postmenopausal women, glucocorticoid-induced osteoporosis (daily dose 7.5 mg prednisone or greater). Treatment of osteoporosis in men. **Atelvia:** Treatment of osteoporosis in postmenopausal women.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to risedronate, other bisphosphonates (e.g., alendronate); inability to stand or sit upright for at least 30 min; abnormalities of esophagus that delay esophageal emptying; hypocalcemia. **Cautions:** GI diseases (duodenitis, dysphagia, esophagitis, gastritis, ulcers [drug may exacerbate these conditions]), severe renal impairment (CrCl less than 30 mL/min).

### ACTION

Inhibits bone resorption by action on osteoclasts or osteoclast precursors. **Therapeutic Effect:** **Osteoporosis:** Decreases bone resorption (indirectly increases bone mineral density). **Paget's Disease:** Inhibition of bone resorption causes a decrease (but more normal architecture) in bone formation.

### PHARMACOKINETICS

Rapidly absorbed. Bioavailability decreased when administered with food. Protein binding: 24%. Not metabolized. Excreted unchanged in urine, feces. Not removed by hemodialysis. **Half-life:** 1.5 hrs (initial); 480 hrs (terminal).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not indicated for use in this pt population. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Antacids containing aluminum, calcium, magnesium; vitamin D may decrease absorption (avoid administration within 30 min of risedronate). **Histamine H<sub>2</sub> receptor antagonists** (e.g., famotidine, ranitidine), **proton pump inhibitors** (e.g., omeprazole, pantoprazole) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

 **Tablets:** 5 mg, 30 mg, 35 mg, 150 mg. **Tablets, Delayed-Release:** 35 mg.

### ADMINISTRATION/HANDLING

#### PO

**Actonel:** • Administer 30–60 min before any food, drink, other oral medications to avoid interference with absorption. • Give on empty stomach with full glass of plain water (not mineral water). • Pt must avoid lying down for at least 30 min after swallowing tablet

(assists with delivery to stomach, reduces risk of esophageal irritation). • Give whole; do not break, crush, dissolve, or divide tablet. • **Atelvia:** Take in morning immediately following breakfast with at least 4 oz water. • Remain upright for 30 min after taking dose.

## INDICATIONS/ROUTES/DOSAGE

### Paget's Disease

**PO: ADULTS, ELDERLY:** 30 mg/day for 2 mos. Retreatment may occur after 2-mo post-treatment observation period.

### Prophylaxis, Treatment of Postmenopausal Osteoporosis

**PO: ADULTS, ELDERLY:** 5 mg/day or 35 mg once wkly or 150 mg once monthly.

### Treatment of Postmenopausal Osteoporosis

**PO: ADULTS, ELDERLY:** 35 mg once wkly.

### Treatment of Male Osteoporosis

**PO: ADULTS, ELDERLY:** 35 mg once wkly.

### Treatment and Prevention of Glucocorticoid-Induced Osteoporosis

**PO: ADULTS, ELDERLY:** 5 mg/day.

### Dosage in Renal Impairment

Not recommended with CrCl less than 30 mL/min.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (30%):** Arthralgia. **Occasional (12%–8%):** Rash, diarrhea, constipation, nausea, abdominal pain, dyspepsia, flu-like symptoms, peripheral edema. **Rare (5%–3%):** Bone pain, sinusitis, asthenia, dry eye, tinnitus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces hypocalcemia, hypophosphatemia, significant GI disturbances, osteonecrosis of jaw.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess symptoms of Paget's disease (bone pain, bone deformities). Hypocalcemia, vitamin D deficiency must be corrected before therapy begins. Obtain baseline laboratory studies, esp. serum electrolytes, renal function. Verify pt is able to stand or sit upright for at least 30 min.

### INTERVENTION/EVALUATION

Check serum electrolytes (esp. calcium, ionized calcium, phosphorus, alkaline phosphatase levels). Monitor I&O, BUN, creatinine in pts with renal impairment.

### PATIENT/FAMILY TEACHING

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water first thing in the morning and at least 30 min before first food, beverage, medication of the day. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication. • Do not lie down for at least 30 min after taking medication (potentiates delivery to stomach, reduces risk of esophageal irritation).
- Report swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises; modify behavioral factors (cigarette smoking, alcohol consumption).
- Report jaw pain, incapacitating bone, joint, or muscle pain.

## risperiDONE

ris-per-i-done  
(Perseris, RisperDAL, RisperDAL Consta)

**BLACK BOX ALERT** Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF.

**Do not confuse RisperDAL with Restoril.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzisoxazole derivative. **CLINICAL:** Second-generation (atypical) antipsychotic. Antimanic agent.

**USES**

**Oral:** Treatment of schizophrenia, irritability/aggression associated with autistic disease in children. Treatment of acute mania associated with bipolar disorder (monotherapy in children and adults; in combination with lithium or valproate in adults). **IM:** Management of schizophrenia, maintenance treatment of bipolar I disorder (monotherapy or in combination with lithium or valproate in adults). **SQ:** Treatment of schizophrenia in adults. **OFF-LABEL:** Tourette's syndrome. Posttraumatic stress syndrome. Major depressive disorder.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to risperiDONE. **Cautions:** Renal/hepatic impairment, seizure disorder, cardiac disease, recent MI, breast cancer or other prolactin-dependent tumors, Parkinson's disease, elderly; pts at risk for aspiration, orthostatic hypotension; diabetes, decreased GI motility, urinary retention, BPH, xerostomia, visual problems, pts exposed to temperature extremes, pre-existing myelosuppression, narrow-angle glaucoma; history of suicidal ideation and behavior.

**ACTION**

Antagonizes DOPamine, serotonin receptors in both CNS and periphery. **Therapeutic Effect:** Suppresses psychotic behavior.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3–20 hrs; metabolite, 21–30 hrs (increased in elderly). **Injection:** 3–6 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in children younger than 13 yrs for schizophrenia, 10 yrs for bipolar mania, and 5 yrs for autistic disorder. **Elderly:** More susceptible to postural hypotension. Age-related renal/hepatic impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **Strong CYP3A4 inducers** (e.g., carbAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Anticholinergics** (e.g., acclidinium, ipratropium, tiotropium, umeclidinium) may increase anticholinergic effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum prolactin, glucose, AST, ALT. May cause ECG changes.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** (*RisperDAL Consta*): 12.5 mg, 25 mg, 37.5 mg, 50 mg. **Oral Solution:** 1 mg/mL. **Syringe, Prefilled:** 90 mg, 120 mg. **Tablets:** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

**Tablets, Orally Disintegrating:** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Do not administer via IV route.

**IM**

**Reconstitution** • Use only diluent and needle supplied in dose pack. • Prepare suspension according to manufacturer's directions. • May be given up to 6 hrs after reconstitution, but immediate administration is recommended. • If 2 min pass between

reconstitution and injection, shake upright vial vigorously back and forth to resuspend solution.

**Rate of administration** • Inject IM into upper outer quadrant of gluteus maximus or into deltoid muscle in upper arm.

**Storage** • Store at room temperature.

#### PO

• Give without regard to food. • May mix oral solution with water, coffee, orange juice, low-fat milk. Do not mix with cola, tea.

#### Orally Disintegrating Tablet

• Remove from blister pack immediately before administration. • Using gloves, place immediately on tongue. • Tablet dissolves in seconds. • Pt may swallow with or without liquid. • Do not split or chew.

#### SQ

Insert needle subcutaneously into abdomen only and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not rub injection site.

## INDICATIONS/ROUTES/DOSAGE

### Schizophrenia

**PO: ADULTS:** Initially, 1–2 mg/day as single or 2 divided doses. May increase gradually (1–2 mg/day at intervals of at least 24 hrs). Usual dosage range: 2–6 mg/day. **Usual maximum:** 6–8 mg/day. **ELDERLY:** Initially, 0.5 mg twice daily. May increase slowly at increments of no more than 0.5 mg twice daily. **CHILDREN 13–17 YRS:** Initially, 0.5 mg/day (as single daily dose). May increase by 0.5–1 mg/day at intervals of greater than 24 hrs to recommended dose of 3 mg/day. **IM: ADULTS, ELDERLY:** Initially, 25 mg q2wks. May increase based on response and tolerability in increments of 12.5–25 mg q4wks. **Maximum:** 50 mg q2wks. Dosage adjustments should not be made more frequently than every 4 wks.

**SQ: ADULTS, ELDERLY:** 90–120 mg once monthly.

### Bipolar Mania

**PO: ADULTS:** Initially, 1–3 mg in 1 or 2 divided doses. May increase by 1 mg/day at 24-hr intervals. Usual dose: 4–6 mg/day. **ELDERLY:** Initially, 0.5 mg twice daily. Titrate slowly.

**PO: CHILDREN 10–17 YRS:** Initially, 0.5 mg/day. May increase by 0.5–1 mg/day at intervals of greater than 24 hrs to recommended dose of 2.5 mg/day. **IM: ADULTS, ELDERLY:** 25 mg q2wks. May increase dose in increments of 12.5 mg no sooner than 4 wks. **Maximum:** 50 mg q2wks.

### Autism

**CHILDREN 5 YRS AND OLDER WEIGHING MORE THAN 19 KG:** Initially, 0.5 mg/day. May increase to 1 mg after 4 days. May further increase dose by 0.5 mg/day in greater than 2-wk intervals. Range: 0.5–3 mg/day.

**CHILDREN 5 YRS AND OLDER WEIGHING 15–19 KG:** Initially, 0.25 mg/day. May increase to 0.5 mg/day after 4 days. May further increase dose by 0.25 mg/day in greater than 2-wk intervals. Range: 0.5–3 mg/day.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Initial dosage for adults, elderly pts is 0.5 mg twice daily. Dosage is titrated slowly to desired effect.

## SIDE EFFECTS

**Frequent (26%–13%):** Agitation, anxiety, insomnia, headache, constipation. **Occasional (10%–4%):** Dyspepsia, rhinitis, drowsiness, dizziness, nausea, vomiting, rash, abdominal pain, dry skin, tachycardia. **Rare (3%–2%):** Visual disturbances, fever, back pain, pharyngitis, cough, arthralgia, angina, aggressive behavior, orthostatic hypotension, breast swelling.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause tardive dyskinesia (characterized by tongue protrusion, puffing of the cheeks, chewing or puckering of mouth), neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental

status, irregular pulse or B/P, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, acute renal failure). Hyperglycemia, life-threatening events such as ketoacidosis and hyperosmolar coma, death have been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Renal function test, LFT should be performed before therapy begins. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content, baseline weight. Obtain fasting serum glucose, CBC. Question history of suicidal ideation and behavior.

### INTERVENTION/EVALUATION

Monitor B/P, heart rate, weight, LFT, ECG. Monitor for fine tongue movement (may be first sign of tardive dyskinesia, which may be irreversible). Monitor for suicidal ideation. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor for potential neuroleptic malignant syndrome: fever, muscle rigidity, irregular B/P or pulse, altered mental status. Monitor fasting serum glucose periodically during therapy. Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder.

### PATIENT/FAMILY TEACHING

- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.
- Avoid tasks that may require alertness, motor skills until response to drug is established (may cause dizziness/drowsiness).
- Avoid alcohol.
- Go from lying to standing slowly.
- Report trembling in fingers, altered gait, unusual muscular/skeletal movements, palpitations, severe dizziness/fainting, swelling/pain in breasts, visual changes, rash, difficulty breathing.

## riTUXimab

TOP  
100 HIGH  
ALERT

### ri-tux-i-mab

(Rituxan, Rituxan Hycela, Ruxience, Truxima)

**BLACK BOX ALERT** Profound, occasionally fatal infusion-related reactions reported during first 30–120 min of first infusion. Tumor lysis syndrome leading to acute renal failure may occur 12–24 hrs following first dose. Severe, sometimes fatal, mucocutaneous reactions resulting in progressive multifocal leukoencephalopathy (PML) and death reported. Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death.

**Do not confuse Rituxan with Remicade, or riTUXimab with bevacizumab, inFLIXimab, brentuximab, obinutuzumab, ofatumumab, ramucirumab, ruxolitinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD20 monoclonal antibody. **CLINICAL:** Disease-modifying antirheumatic drug (DMARD), antineoplastic, immunosuppressant.

### USES

**riTUXimab:** Treatment of CD20-positive non-Hodgkin's lymphomas (NHL): relapsed or refractory, low-grade, or follicular B-cell NHL; follicular B-cell NHL (previously untreated); nonprogressive, low-grade B-cell NHL; diffuse large B-cell NHL, previously untreated. Treatment of CD20-positive chronic lymphocytic leukemia (CLL), in combination with fludarabine and cyclophosphamide (FC). Treatment of adults with moderate to severe active rheumatoid arthritis (RA), in combination with methotrexate, who have had an inadequate response to one or more TNF antagonists. Treatment of granulomatosis with polyangiitis (GPA)

(Wegener's granulomatosis) and microscopic polyangiitis (MPA). Treatment of moderate to severe pemphigus vulgaris. **OFF-LABEL:** Treatment of autoimmune hemolytic anemia, chronic immune thrombocytopenic purpura (ITP), systemic autoimmune disease (other than rheumatoid arthritis), Burkitt's lymphoma, CNS lymphoma, Hodgkin's lymphoma. **Rituxan Hycela:** Treatment of adults with relapsed or refractory follicular lymphoma as a single agent; previously untreated follicular lymphoma, in combination with first-line chemotherapy and, in pts achieving a complete or partial response to rituximab in combination with chemotherapy, as a single agent; nonprogressing (including stable disease) follicular lymphoma as a single agent after first-line cyclophosphamide, vincristine and predniSONE chemotherapy. Treatment of adults with diffuse large B-cell lymphoma in adults (previous untreated) in combination with cyclophosphamide, doxorubicin, vincristine, predniSONE, or other anthracycline-based chemotherapy regimens. Treatment of CLL, in combination with fludarabine and cyclophosphamide (previously untreated and previously treated CLL). Limitations: Only indicated in pts who have had at least one full dose of intravenous rituximab. Not indicated for treatment of nonmalignant conditions.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to riTUXimab. **Cautions:** Baseline cytopenias, active infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for tumor lysis syndrome (high tumor burden), cardiac disease, elderly, pulmonary disease, renal impairment, hepatitis B virus (HBV) infection, hepatitis C virus (HCV) infection; pts at risk for GI perforation (Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies). Avoid administration of live or live attenuated vaccines

during treatment and after discontinuation until B cells are no longer depleted.

## ACTION

Binds to CD20, the antigen found on surface of B lymphocytes. Activates B-cell cytotoxicity. B cells may also play a role in development/progression of RA. Hyaluronidase increases the absorption rate of rituximab by increasing permeability of SQ tissue. **Therapeutic Effect:** Produces cytotoxicity, reduces tumor size. Signs/symptoms of rheumatoid arthritis are reduced; structural damage delayed.

## PHARMACOKINETICS

Rapidly depletes B cells. **Half-life:** 59.8 hrs after first infusion, 174 hrs after fourth infusion.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm due to fetal B-cell depletion and lymphocytopenia in neonates. Unknown if distributed in breast milk. Females of reproductive potential should use effective contraception during treatment and for at least 12 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 6 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of cardiac/pulmonary adverse reactions.

## INTERACTIONS

**DRUG:** Denosumab, pimecrolimus, tacrolimus may increase risk of adverse effects. May increase toxic effects of belimumab, clozapine, leflunomide, natalizumab. Roflumilast may increase immunosuppressive effect. May increase immunosuppressive effect of fingolimod. May decrease concentration/effect of nivolumab, sipuleucel-T. Trastuzumab may increase neutropenic effect. May decrease therapeutic effect; increase risk of adverse effect of live vaccines. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum

creatinine, glucose; LDH. May decrease Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets, RBCs; B-cell counts, immunoglobulin concentrations. May diminish diagnostic effect of *Coccidioides immitis* skin test.

### AVAILABILITY (Rx)

**Injection Solution, IV:** 10 mg/mL (10 mL, 50 mL). **Injection Solution, SQ: (Rituxan Hycela):** 1,400 mg/23,400 units, 1,600 mg/26,800 units.

### ADMINISTRATION/HANDLING

**⚠️ ALERT** Do not give by IV push or bolus. Must be administered by a health-care professional who is experienced in management of severe infusion reactions.

**Reconstitution** • Dilute with 0.9% NaCl or D<sub>5</sub>W to provide final concentration of 1–4 mg/mL in infusion bag.

**Rate of administration** • Initially infuse at rate of 50 mg/hr. If no hypersensitivity or infusion-related reaction, may increase infusion rate in 50 mg/hr increments q30min to maximum 400 mg/hr. • Subsequent infusion can be given at 100 mg/hr and increased by 100 mg/hr increments q30min to maximum 400 mg/hr.

**Storage** • Refrigerate vials. • Diluted solution is stable for 24 hrs if refrigerated or at room temperature.

### SQ

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Administration** • For 1,400 mg/23,400 unit dose (11.7 mL), insert needle subcutaneously into abdomen and inject solution over 5 min. • For 1,600 mg/26,800 unit dose (13.4 mL), insert needle subcutaneously into abdomen and inject solution over 7 min. • Do not inject into areas of active skin disease

or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • If administration is interrupted, continue administering at the same site (or at different site) but only in the SQ abdomen. • Do not administer IV or intramuscular. • Rotate injection sites.

**Storage** • Refrigerate unused vials until time of use. • Protect from light. • Do not freeze or expose to heating sources. • Once transferred to syringe, may refrigerate for up to 48 hrs or store at room temperature for up to 8 hrs.

### IV INCOMPATIBILITIES

Do not mix with any other medications.

### INDICATIONS/ROUTES/DOSAGE

**NHL (Relapsed/Refractory, Low-Grade or Follicular CD20-Positive B-Cell)**

**IV: ADULTS:** 375 mg/m<sup>2</sup> wkly for 4 or 8 doses.

**SQ: ADULTS:** 1,400 mg/23,400 units once wkly for 3 or 7 wks following full dose of IV rituximab at wk 1 (e.g., 4 or 8 wks total). **ADULTS (RETREATMENT):** 1,400 mg/23,400 units once wkly for 3 wks following full dose of IV rituximab at wk 1 (e.g., 4 wks total).

**NHL (Diffuse Large B-Cell)**

**IV: ADULTS:** 375 mg/m<sup>2</sup> on day 1 of each cycle up to 8 doses.

**SQ: ADULTS:** 1,400 mg/23,400 units on day 1 of cycles 2–8 of CHOP chemotherapy for up to 7 cycles following full dose of IV rituximab at day 1, cycle 1 of CHOP therapy.

**NHL (Follicular, CD20-Positive, B-Cell, Previously Untreated)**

**IV: ADULTS:** 375 mg/m<sup>2</sup> on day 1 of each cycle up to 8 doses. **Maintenance (single agent):** 375 mg/m<sup>2</sup> q8wks for 12 doses. **SQ: ADULTS:** 1,400 mg/23,400 units on day 1 of cycles 2–8 (q21 days), for up to 7 cycles following full dose of IV rituximab on day 1 of cycle 1 (e.g., up to 8 cycles total). In pts with partial or complete response,

start maintenance therapy 8 wks after completion. Administer as single agent q8wks for 12 doses.

**NHL (Nonprogressive, CD20-Positive, B-Cell Following 6–8 Cycles of Cyclophosphamide, vinCRIStine, and prednisolONE [CVP therapy])**

**IV: ADULTS:** 375 mg/m<sup>2</sup> once wkly for 4 doses q6mos. **Maximum:** 16 doses. **SQ: ADULTS:** 1,400 mg/23,400 units once wkly for 3 wks (e.g., 4 wks total) at 6-mo intervals following completion of CVP therapy and a full dose of IV rituximab at wk 1. **Maximum:** 16 doses.

**NHL (Combination With Ibritumomab)**

**IV: ADULTS:** 250 mg/m<sup>2</sup> day 1; repeat in 7–9 days with ibritumomab.

**Rheumatoid Arthritis**

**IV: ADULTS:** 1,000 mg every 2 wks times 2 doses in combination with methotrexate. May repeat course q24wks (if needed, no sooner than 16 wks).

**CLL**

**IV: ADULTS, CHILDREN: (Induction):** 375 mg/m<sup>2</sup> in first cycle (on day prior to fludarabine/cyclophosphamide) and 500 mg/m<sup>2</sup> on day 1 in cycles 2–6, administered every 28 days. **SQ: ADULTS:** 1,600 mg/26,800 units on day 1 of cycles 2–6 (q28 days) (in combination with fludarabine and cyclophosphamide) for a total of 5 cycles following full dose of IV rituximab on day 1 of cycle 1 (e.g., 6 cycles total).

**GPA, MPA**

**IV: (Induction): ADULTS, CHILDREN:** 375 mg/m<sup>2</sup> once wkly for 4 wks (in combination with methylPREDNISolone IV for 1–3 days, then daily predniSONE). **(Follow-up therapy): ADULTS:** 500 mg as 2 infusions separated by 2 wks, then 500 mg q6mos thereafter. **CHILDREN:** 250 mg/m<sup>2</sup> q2wks for 2 doses, then 250 mg/m<sup>2</sup> q6mos thereafter.

**Pemphigus Vulgaris**

**IV: ADULTS, ELDERLY:** 1,000 mg q2wks for 2 doses (in combination with a tapering course of glucocorticoids), then 500

mg at months 12 and 18 and q6mos thereafter.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Note:** Side effects may vary depending on dose and indicated treatment. **Frequent (53%–14%):** Fever, chills, asthenia, constipation, nausea, headache, paresthesia, night sweats, pyrexia, rash, pruritus, abdominal pain, alopecia. **Occasional (13%–5%):** Cough, pain, rhinitis, peripheral neuropathy, back pain, bone pain, diarrhea, vomiting, dizziness, myalgia, arthralgia, hypotension, insomnia, erythema, throat irritation, urticaria, muscle spasm, dyspnea, hypertension, chest pain, flushing, anxiety, peripheral edema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Severe infusion reactions including anaphylaxis, angioedema, ARDS, bronchospasm, hypotension, hypoxia, pulmonary infiltrates were reported. Cardiac events including cardiogenic shock, MI, ventricular fibrillation may occur, particularly in pts with history of preexisting cardiac conditions. Severe, and sometimes fatal, mucocutaneous reactions including paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis may occur. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Infections including upper respiratory tract infection, pneumonia, pharyngitis, nasopharyngitis, bronchitis, UTI, sinusitis, conjunctivitis, influenza occurred in 15%–4% of pts. May cause HBV reactivation, resulting in fulminant hepatitis, hepatic failure, and death. Tumor lysis syndrome may present as

R

acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Fatal cases of bowel perforation/obstruction were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; pregnancy test in females of reproductive potential; LFT in pts with history of HCV, HBV infection. Test all pts for hepatitis B virus infection. Initiate anti-HBV therapy if warranted. Recommend continuous ECG monitoring during initial infusions. Screen for active infection. Pretreatment with acetaminophen and diphenhydramine before each infusion may prevent infusion-related effects. Confirm compliance of effective contraception. Conduct baseline dermatological exam and assess skin for open/unhealed wounds, lesions, moles. Receive full medication history and screen for interactions. Question history of cardiac disease, GI perforation, chronic infections, renal impairment. All pts planning to receive SQ dose must complete at least one full intravenous dose. Recommend prophylactic treatment for *Pneumocystis jiroveci* (PCP) and herpes virus infection in pts with CLL during treatment and for up to 12 mos after discontinuation. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC at regular intervals. Monitor serum calcium, phosphate, uric acid if tumor lysis syndrome is suspected (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Monitor for infections of any kind. Monitor for an infusion-related reaction; generally occurs within 30 min–2 hrs of beginning first infusion. Slowing infusion resolves symptoms. If given SQ, monitor pt at least 15 min following administration. Pts who present with abdominal pain, fever, nausea, vomiting should be evaluated for bowel perforation/obstruction. Assess mouth for ulcerations; skin for cutaneous reactions. Closely monitor for exacerbation of hepatitis or HBV reactivation (amber- to orange-colored

urine, fatigue, jaundice, nausea, vomiting). Due to risk of cardiovascular events, have emergency resuscitation equipment ready available. Offer antiemetic if nausea occurs, antidiarrheal if diarrhea occurs. Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition. Monitor weight, I&Os

### PATIENT/FAMILY TEACHING

- Treatment may depress the immune system and reduce the ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine, confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities and death. Report symptoms of PML, brain hemorrhage such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- Immediately report symptoms of infusion reactions (difficulty breathing, itching, hives, palpitations, rash, swelling of the face or tongue); severe mucocutaneous reactions (blisters, peeling of skin, ulceration of the mouth); HBV reactivation (fatigue, yellowing of the skin or eyes); bowel obstruction or perforation (abdominal pain, fever, nausea, vomiting); cardiovascular events (chest pain, cold/clammy skin, difficulty breathing, fainting, irregular heartbeat, palpitations, sweating).
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## rivaroxaban

TOP  
100

rye-va-rox-a-ban  
(Xarelto)

**BLACK BOX ALERT** Epidural/spinal hematomas may occur in pts receiving neuraxial anesthesia or spinal puncture, resulting in long-term or permanent paralysis. Factors increasing risk of epidural/spinal hematoma include indwelling epidural catheters, concomitant drugs such as NSAIDs, platelet inhibitors, other anticoagulants; history of traumatic or repeated spinal or epidural punctures, history of spinal deformity or spinal surgery. Monitor for signs and symptoms of neurologic impairment. Consider benefits and risks before neuraxial intervention in anticoagulated pts or planned thromboprophylaxis. Increased risk of stroke may occur in pts with atrial fibrillation when discontinuing for reasons other than bleeding.

**Do not confuse rivaroxaban with argatroban.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Factor Xa inhibitor. Direct oral anticoagulant.

**CLINICAL:** Anticoagulant.

### USES

Prophylaxis of deep vein thrombosis (DVT) in pts undergoing knee or hip replacement surgery and in acutely ill medical pts. Prevents stroke/systemic embolism in pts with nonvalvular atrial fibrillation. Treatment of DVT/PE. Reduces risk of recurrent DVT/PE following 6 mos of treatment. In combination with aspirin, reduces risk of major CV events (e.g., MI, stroke) in pts with chronic coronary artery disease (CAD) or peripheral artery disease (PAD).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to rivaroxaban. Active major bleeding. **Cautions:** Renal/hepatic impairment, pts at increased risk of bleeding (e.g., thrombocytopenia, stroke, severe uncontrolled

hypertension), elderly pts; avoid use with heparin, low molecular weight heparin (LMWH), aspirin, warfarin, NSAIDs. Pts with prosthetic heart valves or significant rheumatic heart disease.

### ACTION

Selectively and reversibly blocks active site of factor Xa, a key factor in the intrinsic and extrinsic pathway of blood coagulation cascade. Inhibits platelet activation and fibrin clot formation. **Therapeutic Effect:** Inhibits blood coagulation.

### PHARMACOKINETICS

Rapidly absorbed after PO administration. Peak plasma concentration: 2–4 hrs. Absorption dependent on site of drug release within GI tract. Avoid administration into small intestine due to reduced absorption. Protein binding: 92%–95%. Metabolized in liver. Excreted in urine (66%), feces (28%). **Half-life:** 5–9 hrs, 11–13 hrs (elderly pts).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Use during pregnancy should be avoided. Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be at increased risk for bleeding due to age-related renal impairment. Use caution.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin, ritonavir) may increase concentration, risk of bleeding. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase bleeding risk. Apixaban, dabigatran, edoxaban may increase anticoagulant effect. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** Grapefruit products may increase risk of

bleeding. **LAB VALUES:** May decrease platelets. May increase serum ALT, AST, bilirubin.

## AVAILABILITY (Rx)

**Tablets:** 2.5 mg, 10 mg, 15 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer doses of 15 mg or greater with food; doses of 10 mg/day may be given without regard to food.
- **DVT prophylaxis (knee, hip):** Give without regard to food.
- **Nonvalvular atrial fibrillation:** Give with evening meal.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Avoid in pts with BMI greater than 40 kg/m<sup>2</sup> or weight greater than 120 kg due to lack of clinical data in this population.

### DVT Prophylaxis, Knee Replacement

**PO: ADULTS, ELDERLY:** 10 mg daily for minimum 10–14 days up to 35 days. Initiate at least 6–10 hrs after surgery once hemostasis established. **CrCl less than 30 mL/min:** Avoid use.

### DVT Prophylaxis, Hip Replacement

**PO: ADULTS, ELDERLY:** 10 mg daily for 10–14 days (minimum) up to 35 days. Initiate at least 6–10 hrs after surgery once hemostasis established. **CrCl less than 30 mL/min:** Avoid use.

### DVT Prophylaxis, Acutely Ill

**PO: ADULTS, ELDERLY:** 10 mg once daily for a total duration of 31–39 days (including hospitalization and postdischarge).

### Nonvalvular Atrial Fibrillation

**PO: ADULTS, ELDERLY:** **CrCl greater than 50 mL/min:** 20 mg daily. **CrCl 15–50 mL/min:** 15 mg daily. **CrCl less than 15 mL/min:** Avoid use.

### Treatment of DVT/PE

**PO: ADULTS, ELDERLY:** 15 mg twice daily for 3 wks, then 20 mg once daily.

### Reduce Risk of DVT/PE (After 6 mos Treatment)

**PO: ADULTS, ELDERLY:** (For pts at increased risk of recurrent VTE after 6 or more mos of therapeutic anticoagulation) 10 mg once daily.

### Reduce Risk of CV Events

**PO: ADULTS, ELDERLY:** 2.5 mg twice daily (in combination with daily low-dose aspirin).

### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** Avoid use in DVT/PE, postoperative thromboprophylaxis. (**Nonvalvular atrial fibrillation**): **CrCl 15–50 mL/min:** 15 mg once daily with evening meal. **CrCl less than 15 mL/min:** Avoid use.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Avoid use.

## SIDE EFFECTS

**Rare (3%–1%):** Wound secretion/oozing, extremity pain, muscle spasm, syncope, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Increased risk of bleeding/hemorrhagic events including retroperitoneal hemorrhage, cerebral hemorrhage, subdural hematoma, epidural/spinal hematoma (esp. with epidural catheters, spinal trauma). Serious reactions including jaundice, cholestasis, cytolytic hepatitis, Stevens-Johnson syndrome, hypersensitivity reaction, anaphylaxis reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ECG for pts with a history of atrial fibrillation. Question for history of bleeding disorders, recent surgery, spinal punctures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, renal/he-

patric impairment. Receive full medication history including herbal products.

**INTERVENTION/EVALUATION**

Be alert for complaints of abdominal/back pain, headache, confusion, weakness, vision change (may indicate hemorrhage). Question for increased menstrual bleeding/discharge. Assess peripheral pulses; skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess urine output for hematuria. Immediately report suspected pregnancy.

**PATIENT/FAMILY TEACHING**

- Do not take/discontinue any medication except on advice of physician.
- Avoid alcohol, aspirin, NSAIDs.
- Consult physician before surgery, dental work.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report any unusual bleeding/bruising, spinal/epidural hematomas (e.g., tingling, numbness, muscular weakness).
- Report if pregnant or planning to become pregnant.
- Avoid grapefruit products.

rivastigmine

---

riv-a-stig-meen  
(Exelon)

◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Acetylcholinesterase inhibitor. **CLINICAL:** Anti-Alzheimer's dementia agent.

**USES**

**Oral:** Treatment of mild to moderate dementia of Alzheimer's or mild to moderate dementia of Parkinson's disease. **Transdermal:** Treatment of mild, moderate, or severe dementia of the Alzheimer type. Treatment of mild to moderate dementia associated with Parkinson's disease. **OFF-LABEL:** Lewy body dementia.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to rivastigmine, other carbamate derivatives (e.g., neostigmine), history of application site reactions with rivastigmine patch. **Cautions:** Peptic ulcer disease, concurrent use of NSAIDs, sick sinus syndrome, bradycardia or supraventricular conduction defects, urinary obstruction, seizure disorders, asthma, COPD, body weight less than 50 kg.

**ACTION**

Increases acetylcholine in CNS by reversibly inhibiting hydrolysis by cholinesterase. **Therapeutic Effect:** Slows progression of symptoms of Alzheimer's disease, dementia of Parkinson's disease.

**PHARMACOKINETICS**

Widely distributed. Penetrates blood-brain barrier. Metabolized via cholinesterase-mediated hydrolysis. Excreted in urine (97%), feces (0.4%). **Half-life:** 1 hr (oral); 8–16 hrs (transdermal patch).

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not indicated in this pt population. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May interfere with anticholinergics (e.g., dicyclomine, glycopyrrolate, scopolamine) effects. May increase the bradycardic effect of beta blockers (e.g., atenolol, carvedilol, metoprolol). May increase the adverse effects of metoclopramide. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

- Transdermal Patch:** 4.6 mg/24 hrs, 9.5 mg/24 hrs, 13.3 mg/24 hrs.
-  **Capsules:** 1.5 mg, 3 mg, 4.5 mg, 6 mg.

R

**ADMINISTRATION/HANDLING****PO**

• Give morning and evening doses with food. • Give capsule whole; do not break, cut, or open.

**Transdermal Patch**

• May apply the day following the last oral dose. • Apply to upper or lower back, upper arm, or chest. • Avoid reapplication to same spot of skin for 14 days. • Do not apply to red, irritated, or broken skin. • Avoid eye contact. • After removal, fold patch to press adhesive together and discard.

**INDICATIONS/ROUTES/DOSAGE****Alzheimer's Dementia (Mild to Moderate)**

**PO: ADULTS, ELDERLY:** Initially, 1.5 mg twice daily. May increase at intervals of at least 2 wks to 3 mg twice daily, then 4.5 mg twice daily, and finally 6 mg twice daily.

**Maximum:** 6 mg twice daily. **Transdermal:** Initially, 4.6 mg/24 hrs. May increase at intervals of at least 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.

**Alzheimer's Dementia (Severe)**

**Transdermal: ADULTS, ELDERLY:** Initially, 4.6 mg/24 hrs. May increase at intervals of at least 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.

**Parkinson's Dementia**

**PO: ADULTS, ELDERLY:** Initially, 1.5 mg twice daily. May increase at intervals of at least 4 wks to 3 mg twice daily, then 4.5 mg twice daily, and finally 6 mg twice daily. **Maximum:** 6 mg twice daily. **Transdermal:** Initially, 4.6 mg/24 hrs. May increase after 4 wks to 9.5 mg/24 hrs and then to 13.3 mg/24 hrs.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Oral:** No dose adjustment. **Transdermal:** **Maximum:** 4.6 mg/24 hrs.

**SIDE EFFECTS**

**Frequent (47%–17%):** Nausea, vomiting, dizziness, diarrhea, headache, anorexia.

**Occasional (13%–6%):** Abdominal pain, insomnia, dyspepsia (heartburn, indigestion, epigastric pain), confusion, UTI, depression. **Rare (5%–3%):** Anxiety, drowsiness, constipation, malaise, hallucinations, tremor, flatulence, rhinitis, hypertension, flu-like symptoms, weight loss, syncope.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose can produce cholinergic crisis, characterized by severe nausea/vomiting, increased salivation, diaphoresis, bradycardia, hypotension, respiratory depression, seizures.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain vital signs. Assess history for peptic ulcer, urinary obstruction, asthma, COPD, cardiac disease. Assess cognitive, behavioral, functional deficits.

**INTERVENTION/EVALUATION**

Monitor for cholinergic reaction: GI discomfort/cramping, feeling of facial warmth, excessive salivation, diaphoresis, lacrimation, pallor, urinary urgency, dizziness. Monitor for nausea, diarrhea, headache, insomnia.

**PATIENT/ FAMILY TEACHING**

• Take with meals (at breakfast, dinner). • Swallow capsule whole. Do not break, chew, or divide capsules. • Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, severe abdominal pain, dizziness.

**rizatriptan**

rye-za-trip-tan  
(Maxalt, Maxalt-MLT, Maxalt RPD )

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin 5-HT<sub>1</sub> receptor agonist. **CLINICAL:** Antimigraine.

**USES**

Treatment of acute migraine headache with or without aura.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to rizatriptan. Basilar or hemiplegic migraine, history of stroke or transient ischemic attack; severe cardiovascular disease, coronary artery vasospasm, peripheral vascular disease, ischemic bowel disease, uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, MAOI use within 14 days. **Cautions:** Mild to moderate renal/hepatic impairment, end-stage renal disease requiring dialysis, elderly, cardiovascular risks (e.g., hypertension, diabetes, hypercholesterolemia).

**ACTION**

Binds selectively to serotonin 5-HT<sub>1</sub> receptors in cranial arteries producing vasoconstriction. **Therapeutic Effect:** Relieves migraine headache.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 14%. Crosses blood-brain barrier. Metabolized by liver. Excreted primarily in urine (82%), feces (12%). **Half-life:** 2–3 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Ergot derivatives (e.g., ergotamine) may increase vasoconstrictive effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) may increase concentration/effect. **MAOIs** (e.g., phenelzine, selegiline), **propranolol** may dramatically increase concentration (avoid concurrent use).

**HERBAL:** None significant. **FOOD:** All foods delay peak drug concentration by 1 hr. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Tablets:** 5 mg, 10 mg. **Tablets, Orally Disintegrating:** 5 mg, 10 mg.

**ADMINISTRATION/HANDLING****PO**

- Orally disintegrating tablet is packaged in individual aluminum pouch.
- Open packet with dry hands.
- Place tablet onto tongue, allow to dissolve, swallow with saliva.

Administration with water is not necessary.

**INDICATIONS/ROUTES/DOSAGE****Acute Migraine Headache**

**PO: ADULTS OLDER THAN 18 YRS, ELDERLY:** 5–10 mg. If significant improvement is not attained, dose may be repeated after 2 hrs. **Maximum:** 30 mg/24 hrs. (Use 5 mg/dose in pts taking propranolol with maximum of 15 mg/24 hrs.) **CHILDREN 6–17 YRS WEIGHING 40 KG OR MORE:** 10 mg as single dose. (Maximum 5 mg as single dose with propranolol.) **WEIGHING LESS THAN 40 KG:** 5 mg as a single dose. (Not recommended if taking propranolol.)

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (9%–7%):** Dizziness, drowsiness, paresthesia, fatigue. **Occasional (6%–3%):** Nausea, chest pressure, dry mouth. **Rare (2%):** Headache; neck, throat, jaw pressure; photosensitivity.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, CVA) may occur, esp. in pts with hypertension, diabetes, strong family history of coronary artery disease, obesity, smokers, males older than 40 yrs, postmenopausal women.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of peripheral vascular disease, renal/hepatic impairment. Question pt regarding onset, location, duration of migraine, possible precipitating symptoms.

### INTERVENTION/EVALUATION

Monitor for evidence of dizziness. Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, foginess).

### PATIENT/FAMILY TEACHING

- Take single dose as soon as symptoms of an actual migraine headache appear.
- Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report immediately if palpitations, pain/tightness in chest/throat, pain/weakness of extremities occurs.
- Do not remove orally disintegrating tablet from blister pack until just before dosing.

R

## romiDEPsin

roe-mi-dep-sin  
(Istodax)

**Do not confuse romiDEPsin with romiPLOstim.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histone deacetylase (HDAC) inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of cutaneous T-cell lymphoma (CTCL) or peripheral T-cell lymphoma (PTCL).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to romiDEPsin. **Cautions:** Moderate or severe hepatic impairment, end-stage renal impairment, preexisting cardiac disease, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), pts at risk for tumor lysis syndrome (high tumor burden), chronic viral infections (hepatitis B virus, herpesvirus). Avoid concomitant strong CYP3A4 inhibitors/inducers; caution with moderate CYP3A4 inhibitors or P-glycoprotein inhibitors.

## ACTION

Catalyzes acetyl group removal from protein lysine residues, resulting in acetyl group accumulation, which alters chromatin structure and transcription factor activation, terminating cell growth. **Therapeutic Effect:** Induces cell-cycle arrest, cell death.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 92%–94%. Excretion not specified. **Half-life:** 3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Consider nonhormonal contraception (condoms, intrauterine device). Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ritonavir) may increase concentration. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration. QT interval-prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. May increase adverse effects; decrease therapeutic effect of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** May decrease serum albumin, phosphate, potassium, sodium; Hgb, leukocytes, lymphocytes, platelets, neutrophils, RBCs. May increase serum ALT, AST, glucose, uric acid. May increase or decrease serum magnesium.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution, 2-Vial Kit:** 10 mg. **Injection Solution:** 27.5 mg/5.5 mL.

## ADMINISTRATION/HANDLING

**Reconstitution (powder for injection)** • Reconstitute with 2 mL of supplied diluent (80% propylene glycol, 20% dehydrated alcohol) to a final concentration of 5 mg/mL. • Swirl vial gently until powder is completely dissolved. • Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 500 mL 0.9% NaCl.

**Preparation (solution for injection):** • Dilute in 500 mL 0.9% NaCl. Compatible with PVC, EVA, PE infusion bags and glass infusion containers.

**Rate of administration** • Infuse over 4 hrs.

**Storage** • Store unused vials in original carton at controlled room temperature. Protect from light. • Diluted solution is stable for at least 24 hrs at room temperature • Diluted solution is

stable for at least 24 hrs at room temperature.

## INDICATIONS/ROUTES/DOSAGE

### CTCL, PTCL

**IV: ADULTS, ELDERLY:** 14 mg/m<sup>2</sup> administered over 4 hrs on days 1, 8, and 15 of a 28-day cycle. Repeat cycles every 28 days based on benefit and tolerability.

### Dose Modification

#### Hematologic Toxicity

**Grade 3 or 4 neutropenia or thrombocytopenia:** Delay treatment until ANC 1,500 cells/mm<sup>3</sup> or more and/or platelets 75,000 cells/mm<sup>3</sup> or more (or baseline), then resume at 14 mg/m<sup>2</sup>.

**Grade 4 neutropenia or thrombocytopenia requiring platelet transfusion:** Delay treatment until recovered to Grade 1 or 0 (or baseline), then permanently reduce dose to 10 mg/m<sup>2</sup>.

#### Nonhematologic Toxicity (Excluding Alopecia)

**Grade 2 or 3 toxicity:** Delay treatment until recovered to Grade 1 or 0 (or baseline), then restart at 14 mg/m<sup>2</sup>. **Grade 4, recurrent Grade 3 toxicity:** Delay treatment until recovered to Grade 1 or 0 (or baseline), then permanently reduce dose to 10 mg/m<sup>2</sup>. **Recurrent Grade 3 or 4 toxicity (with dose reduction):** Permanently discontinue.

#### Dosage in Renal Impairment

No dose adjustment. Use caution in end-stage-renal disease.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Reduce starting dose to 7 mg/m<sup>2</sup>. **Severe impairment:** Reduce starting dose to 5 mg/m<sup>2</sup>.

## SIDE EFFECTS

**Frequent (57%–23%):** Nausea, fatigue, vomiting, anorexia. **Occasional (20%–7%):** Diarrhea, fever, distorted sense of taste, constipation, hypotension, pruritus. **Rare (4%–2%):** Dermatitis, T-wave and ST-wave changes on ECG.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including febrile neutropenia may occur. Fatal infections including pneumonia, sepsis were reported. Increased risk of life-threatening infections are greater in pts treated with monoclonal antibodies directed at lymphocyte antigens and in pts with disease involvement of the bone marrow. Reactivation of hepatitis B virus, Epstein-Barr virus infection may occur. May cause cardiac conduction abnormalities (cardiac arrhythmias, T-wave, ST-segment changes, QT interval prolongation). Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Screen for active infection. Question history of hepatic/renal impairment, cardiac disease. Receive full medication history and screen for interactions. Assess risk for QT interval prolongation, tumor lysis syndrome. Ensure adequate hydration. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT. Monitor ECG for cardiac conduction abnormalities. Diligently monitor for infection (cough, fatigue, fever); reactivation of chronic viral infections. Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow

depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool. • Report palpitations, chest pain, shortness of breath, dizziness, fainting; may indicate arrhythmia. • Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting. • Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine). • Treatment may alter the electrical properties of the heart; report chest pain, difficulty breathing, palpitations. • Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Use effective contraception to avoid pregnancy. Do not breast-feed.

## romosozumab-aqqg

roe-moe-soz-ue-mab  
(Evenity)

**BLACK BOX ALERT** May increase risk of myocardial infarction (MI), cerebrovascular accident (CVA), cardiovascular death. Do not initiate in pts with recent (within 1 yr) MI, CVA. In pts with other cardiovascular risks, consider whether the benefits of treatment outweigh the risks. Discontinue treatment in pts who develop MI, CVA.

**Do not confuse romosozumab with atezolizumab, mepolizumab, pembrolizumab, trastuzumab, or vedolizumab, or Evenity with Emgality.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sclerostin inhibitor. Monoclonal antibody.  
**CLINICAL:** Osteoporosis agent.

## USES

Treatment of postmenopausal women with osteoporosis at high risk for fracture, defined as history of osteoporotic fracture, multiple risk factors for fracture, or pts who have failed or intolerant to other osteoporosis therapy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to romosozumab-aqqg. Hypocalcemia prior to initiation. **Cautions:** Severe renal impairment (eGFR 15–29 mL/min) or receiving dialysis; pts at risk for osteonecrosis of the jaw (cancer, radiotherapy, poor oral hygiene, pre-existing dental disease or infection, anemia, coagulopathy, recent dental procedures, tooth extraction). History of MI, CVA, cardiovascular disease. Avoid use in pts with recent (within 1 yr) MI, CVA.

## ACTION

Stimulates osteoblastic activity by inhibiting sclerostin, a regulatory factor in bone metabolism. **Therapeutic Effect:** Increases bone mass, improves bone structure and strength, decreases bone reabsorption.

## PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 5 days. Steady state reached in 3 mos. **Half-life:** 12.8 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not indicated in female pts of reproductive potential. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease calcium.

## AVAILABILITY (Rx)

**Injection Solution, Prefilled Syringe:** 105 mg/1.17 mL.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (at least 30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy or discolored or if visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly. • If a dose is missed, administer as soon as possible, then give next dose at the date of last dose.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from light. • Do not shake. • Do not freeze or expose to heating sources. • If not refrigerated, may store at room temperature (up to 77°F) for no more than 30 days. Discard if not used within 30 days.

## INDICATIONS/ROUTES/DOSAGE

### Postmenopausal Osteoporosis

**SQ: ADULTS, ELDERLY:** 210 mg (two 105-mg injections) once monthly for 12 mos. Give with supplemental calcium and vitamin D.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Occasional (13%–6%):** Arthralgia, headache. **Rare (4%–2%):** Injection site

reactions (pain, erythema), muscle spasms, peripheral edema, asthenia, neck pain, insomnia, paresthesia.

### ADVERSE EFFECTS/TOXIC REACTIONS

MI, CVA, cardiovascular death reported in less than 1% of pts. Hypocalcemia reported in less than 1% of pts. Pts with severe renal impairment (eGFR 15–29 mL/min) or receiving dialysis have an increased risk of hypocalcemia. Hypersensitivity reactions including angioedema, erythema multiforme, dermatitis, rash, urticaria may occur. Symptomatic hypocalcemia reported in 7% of pts. Osteonecrosis of the jaw may present as mandibular pain, jaw bone erosion, periodontal/gingival infection or ulceration, osteomyelitis, slow healing of the mouth after dental procedures. Pts with cancer, radiotherapy, poor oral hygiene, preexisting dental disease or infection, anemia, coagulopathy may be at increased risk of developing osteonecrosis of the jaw. Atypical subtrochanteric and diaphyseal femoral fractures may occur with little or no trauma. Immunogenicity (auto-romosozumab antibodies) reported in 18% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain serum calcium level. Hypocalcemia must be corrected prior to initiation. Calcium and vitamin D supplementation is recommended during treatment. Question history of MI, CVA, cardiovascular disease, renal impairment. Do not initiate in pts with recent (within 1 yr) MI, CVA. To assess the risk of osteonecrosis of the jaw, the prescriber should perform an oral examination prior to initiation. Question recent dental procedures or tooth extraction.

#### INTERVENTION/EVALUATION

Monitor serum calcium levels periodically, esp. in pts with severe renal impairment or receiving dialysis. Monitor for symptoms of CVA (aphasia, altered mental status, headache, hemiplegia, vi-

sion loss); MI (chest pain, dyspnea, syncope, diaphoresis, arm/jaw pain), osteonecrosis of the jaw (jaw pain/numbness, loosening of teeth, poor healing of the gums); hypocalcemia (muscle spasm, myalgia, paresthesia, seizures, QT interval prolongation, ventricular arrhythmias; Chvostek's sign, Trousseau's sign). A dull, aching thigh or groin pain should be evaluated for possible femoral fractures. Monitor for hypersensitivity reactions.

#### PATIENT/FAMILY TEACHING

- Report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm or jaw, sweating), stroke (confusion, one-sided weakness, loss of consciousness, trouble speaking, vision loss); atypical leg fractures (dull, aching thigh or groin pain).
- Treatment may cause low blood calcium levels; report difficulty swallowing, fatigue, muscle cramps, muscle weakness, palpitations, paralysis, numbness, tingling, seizures.
- Treatment may cause lack of blood supply to the jaw bone when the bone is exposed, which may lead to jaw necrosis. Report jaw pain or numbness, loosening of teeth, poor healing of the gums. Maintain proper oral hygiene.
- Allergic reactions such as swelling of the face or tongue, rash, itching may occur.

### rOPINIRole

roe-pin-i-role

**Do not confuse rOPINIRole with RisperDAL.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DOPamine agonist. **CLINICAL:** Antiparkinson agent.

#### USES

Treatment of signs/symptoms of idiopathic Parkinson's disease. **Immediate-Release Only:** Treatment of moderate to severe primary restless legs syndrome (RLS).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to rOPINIRole. **Cautions:** History of orthostatic hypotension, cardiovascular or cerebrovascular disease, syncope, concurrent use of CNS depressants, preexisting dyskinesia, hepatic or severe renal dysfunction (end-stage renal disease [ESRD]), major psychotic disorder, elderly.

## ACTION

Stimulates postsynaptic DOPamine receptors in caudate putamen in the brain. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson's disease.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 40%. Steady state reached in 2 days. Excreted in urine. **Half-life:** 6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. Drug activity possible in breastfeeding infant. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted, but hallucinations may occur more frequently.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Antipsychotic agents** (e.g., haloperidol) may decrease therapeutic effect. **HERBAL:** Herbals with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase hypotensive effect. **FOOD:** All foods delay peak plasma levels by 1 hr but do not affect drug absorption. **LAB VALUES:** May increase serum alkaline phosphatase.

## AVAILABILITY (Rx)

**Tablets:** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg.

 **Tablets, Extended-Release:** 2 mg, 4 mg, 6 mg, 8 mg, 12 mg.

## ADMINISTRATION/HANDLING

### PO

• May give without regard to food. • Do not break, crush, dissolve, or divide extended-release tablets.

## INDICATIONS/ROUTES/DOSAGE

### Parkinson's Disease

**PO: (Immediate-Release):** ADULTS, ELDERLY: Initially, 0.25 mg 3 times daily. May increase daily dose based on response and tolerability. **Doses up to 3 mg/day:** May increase daily dose by 0.75 mg q7 days. **Doses from 3–9 mg/day:** May increase daily dose by 1.5 mg q7 days. **Doses 9 mg/day or more:** May increase daily dose by 3 mg q7 days. (Usual dose): 12–16 mg/day. **Maximum:** 24 mg/day in 3 divided doses. **(Extended-Release):** Initially, 2 mg once daily for 1–2 wks. May increase by 2 mg/day at 1 wk or longer interval. (Usual dose): 12–16 mg/day. **Maximum:** 24 mg/day.

### Discontinuation Taper

Gradually taper over 7 days as follows: Decrease frequency from 3 times/day to twice daily for 4 days, then decrease from twice daily to once daily for remaining 3 days.

### Restless Legs Syndrome

**PO: (Immediate-Release):** ADULTS, ELDERLY: 0.25 mg once daily for days 1 and 2. May increase to 0.5 mg daily for days 3–7 and after 7 days to 1 mg daily. May further titrate upward in 0.5-mg increments q7days until reaching daily dose of 3 mg during wk 6. Daily dose may be increased to maximum of 4 mg beginning wk 7. Give all doses 1–3 hrs before bedtime. ESRD: 3 mg maximum.

### Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution with severe renal impairment. Titrate cautiously in pts with hepatic impairment.

## SIDE EFFECTS

**Frequent (60%–40%):** Nausea, dizziness, extreme drowsiness. **Occasional (12%–5%):** Syncope, vomiting, fatigue, viral infection, dyspepsia, diaphoresis, asthenia, orthostatic hypotension, abdominal discomfort, pharyngitis, abnormal vision, dry mouth, hypertension, hallucinations,

confusion. **Rare (less than 4%):** Anorexia, peripheral edema, memory loss, rhinitis, sinusitis, palpitations, impotence.

## ADVERSE EFFECTS/TOXIC REACTIONS

Dyskinesia, impulsive/compulsive behavior (pathologic gambling, hypersexuality, binge-eating) occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

**Parkinson's disease:** Assess signs/symptoms (e.g., tremor, gait). **Restless legs syndrome:** Assess frequency of symptoms, sleep pattern.

### INTERVENTION/EVALUATION

Assess for clinical improvement, clinical reversal of symptoms (improvement of tremors of head/hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Assist with ambulation if dizziness occurs. Monitor B/P, daytime alertness.

### PATIENT/FAMILY TEACHING

- Drowsiness, dizziness may be an initial response.
- Postural hypotension may occur more frequently during initial therapy. Slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- If nausea occurs, take medication with food.
- Hallucinations may occur, more so in the elderly than in younger pts with Parkinson's disease.
- Report occurrence of falling asleep during activities of daily living, new or worsening symptoms, changes in B/P, fainting, unusual urges.
- Avoid alcohol.

## rosuvastatin

TOP  
100

roe-soo-va-sta-tin  
(Apo-Rosuvastatin , Crestor, Ezalor Sprinkle)

**Do not confuse rosuvastatin with atorvastatin, lovastatin, nystatin, pitavastatin, or simvastatin.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** HMG-CoA reductase inhibitor. **CLINICAL:** Anti-hyperlipidemic.

## USES

To reduce LDL-C, total cholesterol, and apoB in adults with familial hypercholesterolemia as an adjunct to other lipid-lowering treatments. Adjunct to diet to reduce total cholesterol, LDL-C, and apoB levels in children and adolescents 8–17 yrs of age with heterozygous familial hypercholesterolemia (*excluding Ezalor*). To reduce the risk of myocardial infarction (MI), stroke, revascularization procedures, and angina in adults without a history of coronary heart disease (CHD), but who have multiple CHD risk factors. To reduce the risk of MI, stroke, revascularization procedures, and angina in adults with a history of CHD.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to rosuvastatin. Active hepatic disease, breastfeeding, pregnancy, unexplained, persistent elevations of hepatic enzymes. **Cautions:** Anticoagulant therapy, hepatic impairment, substantial alcohol consumption, elective major surgery, renal impairment, acute renal failure, uncontrolled hypothyroidism, elderly.

## ACTION

Interferes with cholesterol biosynthesis by inhibiting conversion of the enzyme HMG-CoA to mevalonate, a precursor to cholesterol. **Therapeutic Effect:** Decreases LDL, VLDL, plasma triglyceride levels; increases HDL concentration.

## PHARMACOKINETICS

Protein binding: 88%. Minimal hepatic metabolism. Primarily excreted in feces. **Half-life:** 19 hrs (increased in severe renal dysfunction).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol

biosynthesis may cause fetal toxicity), lactation. Risk of serious adverse reactions in breastfeeding infants. **Children:** Safety and efficacy not established in children younger than 7 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Aluminum- and magnesium-containing antacids may decrease concentration/effects. Increased risk of myopathy with colchicine, cycloSPORINE, fenofibrate, fenofibrate derivatives, gemfibrozil, niacin. May increase anticoagulant effect of warfarin. **HERBAL:** None significant. **FOOD:** Red yeast rice contains 2.4 mg lovastatin per 600 mg rice. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatinine phosphokinase, glucose, transaminases. May produce hematuria, proteinuria.

## AVAILABILITY (Rx)

**Capsule, Sprinkle:** 5 mg, 10 mg, 20 mg, 40 mg. **Tablets:** 5 mg, 10 mg, 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. May give at any time of day.

## INDICATIONS/ROUTES/DOSAGE

### Heterozygous Familial Hypercholesterolemia

**PO: ADULTS, ELDERLY:** Initially, 20–40 mg once daily. **CHILDREN 10 YRS AND OLDER, ADOLESCENTS:** (females greater than 1 yr postmenarche): 5–20 mg once daily. **Maximum:** 20 mg/day.

### Homozygous Familial Hypercholesterolemia

**PO: ADULTS, ELDERLY:** 40 mg once daily. **CHILDREN 7 YRS AND OLDER, ADOLESCENTS:** Initially, 20 mg once daily.

### Prevention of Atherosclerotic Cardiovascular Disease

**PO: ADULTS, ELDERLY: (Primary):** 5–40 mg once daily. **(Secondary):** 20–40 mg once daily.

### Concurrent CycloSPORINE Use

**PO: ADULTS, ELDERLY:** 5 mg/day maximum.

### Concurrent Gemfibrozil, Atazanavir/Ritonavir, Lopinavir/Ritonavir or Simeprevir Therapy

**PO: ADULTS, ELDERLY:** Initially, 5 mg/day. 10 mg/day maximum.

### Dosage in Renal Impairment (CrCl less than 30 mL/min)

**PO: ADULTS, ELDERLY:** 5 mg/day; do not exceed 10 mg/day.

### Dosage in Hepatic Impairment

Contraindicated in active in liver disease.

## SIDE EFFECTS

Generally well tolerated. Side effects are usually mild, transient. **Occasional (9%–3%):** Pharyngitis, headache, diarrhea, dyspepsia, nausea, depression. **Rare (less than 3%):** Myalgia, asthenia, back pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Potential for ocular lens opacities. Hypersensitivity reaction, hepatitis, rhabdomyolysis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain lipid panel, LFT; pregnancy test in females of reproductive potential. Obtain dietary history, esp. fat consumption.

### INTERVENTION/EVALUATION

Monitor serum cholesterol, HDL, LDL, triglycerides for therapeutic response. Lipid levels should be monitored within 2–4 wks of initiation of therapy or change in dosage. Monitor LFT at 12 wks following initiation of therapy, at any elevation of dose, and periodically (e.g., semiannually) thereafter. Monitor CPK if myopathy is suspected. Assess for headache, sore throat. Be alert for myalgia, weakness.

### PATIENT/FAMILY TEACHING

- Use appropriate contraceptive measures.
- Periodic lab tests are essential part

of therapy. • Maintain appropriate diet (important part of treatment). • Report unexplained muscle pain, tenderness, weakness, esp. if associated with fever, malaise.

## rucaparib

roo-kap-a-rib  
(Rubraca)

**Do not confuse rucaparib with neratinib, niraparib, olaparib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Poly (ADP-ribose) polymerase (PARP) inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of deleterious germline and/or somatic BRCA mutation–associated (detected by FDA-approved test) advanced ovarian cancer in pts who have been treated with two or more lines of chemotherapy. Maintenance treatment of recurrent ovarian cancer in pts who are in complete or partial response to platinum-based chemotherapy. Treatment of deleterious BRCA mutation (germline and/or somatic)–associated metastatic castration-resistant prostate cancer in adults treated with androgen receptor–directed therapy and a taxane-based chemotherapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to rucaparib. **Cautions:** Baseline cytopenias, hepatic impairment.

### ACTION

Inhibits poly (ADP-ribose) polymerase (PARP) enzymes (involved in DNA transcription, cell-cycle regulation, and DNA repair). By inhibiting PARP, may cause PARP DNA complexes resulting in DNA damage and cancer cellular death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 70%. Peak plasma concentration: 1.9 hrs. Excretion not specified. **Half-life:** 17–19 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease effect of **BCG (intravesical)**. May increase concentration/effect of **cilostazol, lomitapide, pimozone, rasagiline, tiZANidine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, cholesterol, creatinine. May decrease ANC, Hgb, absolute lymphocyte count, platelets.

### AVAILABILITY (Rx)

**Tablets:** 200 mg, 250 mg, 300 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Administer only to pts with deleterious germline and/or somatic BRCA mutation.

**Ovarian Cancer (Advanced or Maintenance of Recurrent)**

**PO: ADULTS, ELDERLY:** 600 mg twice daily about 12 hrs apart. Continue until disease progression or unacceptable toxicity.

**Prostate Cancer**

**PO: ADULTS, ELDERLY:** 600 mg twice daily. Continue until disease progression or unacceptable toxicity. Pts should also receive a gonadotropin-releasing hormone analog or have had bilateral orchiectomy.

**Dose Reduction Schedule**

**Starting dose:** 600 mg twice daily. **First dose reduction:** 500 mg twice daily. **Second dose reduction:** 400 mg twice daily. **Third dose reduction:** 300 mg twice daily.

**Dose Modification****Adverse Events, Nonhematologic Toxicity**

Either withhold treatment or reduce dosage per dose reduction schedule.

**Hematologic Toxicity**

Withhold treatment until improved to Grade 1 or 0 and investigate cause. If myelodysplastic syndrome or acute myeloid leukemia confirmed, permanently discontinue.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (77%–21%):** Nausea, asthenia, fatigue, vomiting, constipation, dysgeusia, decreased appetite, diarrhea, abdominal pain, dyspnea. **Occasional (17%–9%):** Dizziness, rash, pyrexia, photosensitivity reaction, pruritus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Myelodysplastic syndrome/acute myeloid leukemia reported in less than 1% of pts. Infections including nasopharyngitis, pharyngitis, upper respiratory tract infection occurred in 43% of pts. Febrile neutropenia

reported in less than 1% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition, that presents with redness, swelling, numbness, skin sloughing of the hands and feet, was reported in 2% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, vital signs, weight. Do not initiate therapy until hematologic toxicities have recovered from previous chemotherapy. Obtain pregnancy test in females of reproductive potential. Question plans of breastfeeding. Question history of hepatic/renal impairment, hypercholesterolemia. Screen for risk of bleeding, active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC monthly; creatinine periodically. For prolonged hematologic toxicities caused by other chemotherapies, monitor CBC w/ky until recovery. If hematologic levels have not recovered to CTCAE Grade 1 or 0 after 4 wks, consider hematology consultation for further investigations including bone marrow analysis, blood sample for cytogenetics. Diligently monitor for infection (cough, fatigue, fever). Monitor for myelodysplastic syndrome, acute myeloid leukemia. Assess skin for rash, lesions, sloughing. Monitor for decreased urine output, renal dysfunction.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report bleeding or easy bruising, bloody urine or stool, frequent infections, fatigue, shortness of breath, weakness, weight loss; may indicate acute bone marrow depression or acute leukemia.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take herbal supplements.
- Report planned surgical/dental procedures.

## rufinamide

rue-**fin**-a-myde  
(Banzel)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Triazole derivative. **CLINICAL:** Anticonvulsant.

### USES

Adjunctive therapy in treatment of seizures associated with Lennox-Gastaut syndrome in adults and children 1 yr and older.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to rufinamide. Familial short QT syndrome. **Cautions:** Concomitant use of QT interval-shortening drugs, depression, pts at high risk for suicide, mild to moderate hepatic impairment (not recommended in pts with severe hepatic impairment), concurrent use with hormonal contraceptives.

### ACTION

Modulates activity of sodium channels. Prolongs inactive state of the sodium channel in cortical neurons, limits sustained repetitive firing of sodium-dependent action potential, inhibiting excitatory neurotransmitter release. **Therapeutic Effect:** Decreases frequency/severity of seizure activity.

### PHARMACOKINETICS

Widely distributed. Protein binding: 34%. Extensively metabolized via hydrolysis. Excreted primarily in urine. **Half-life:** 6–10 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May produce fetal skeletal abnormalities. May be distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 4 yrs. **Elderly:** Age-related renal, hepatic, or cardiac impairment may require initiation of therapy at low end of dosing range.

### INTERACTIONS

**DRUG:** May increase concentration/effect of **PHENobarbital**, **phenytoin**. May decrease concentration/effect of **carbamazepine**. **Valproate** may increase concentration/effect. **Alcohol, CNS depressants** (e.g., **LORazepam**, **morphine**, **zolpidem**) may increase CNS depressant effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease WBCs.

### AVAILABILITY (Rx)

**Oral Suspension:** 40 mg/mL. **Tablets, Film-Coated:** 200 mg, 400 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give with food.
- Film-coated tablets may be cut or crushed for dosing flexibility.
- Shake oral suspension well before each dose; use bottle adapter and dosing syringes provided.

### INDICATIONS/ROUTES/DOSAGE

#### Lennox-Gastaut Seizures

**Note:** Discontinue therapy gradually to minimize potential of increased seizure frequency (e.g., decrease by 25% q2days).

**PO: ADULTS, ELDERLY:** Initially, 400–800 mg/day, given in 2 equally divided doses. Dose should be increased by 400–800 mg/day every 2 days. **Maximum:** 3,200 mg/day, administered in 2 equally divided doses. **CHILDREN 1 YR AND OLDER:** Treatment should be initiated at a daily dose of 10 mg/kg/day, given in 2 equally divided doses. Increase by 10-mg/kg increments every other day to a target dose of 45 mg/kg/day or 3,200 mg/day, whichever is less, administered in 2 equally divided doses.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Use caution. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Children:** **Frequent (27%–11%):** Headache, dizziness, fatigue, nausea, drowsiness, diplopia. **Occasional (6%–4%):** Tremor, nystagmus, blurred vision, vomiting. **Rare (3%):** Ataxia, upper abdominal pain, anxiety, constipation, dyspepsia, back pain, gait disturbance, vertigo. **Adults:** **Frequent (17%–7%):** Lethargy, vomiting, headache, fatigue, dizziness, nausea. **Occasional (5%–4%):** Influenza, nasopharyngitis, anorexia, rash, ataxia, diplopia. **Rare (3%):** Bronchitis, sinusitis, psychomotor hyperactivity, upper abdominal pain, aggression, ear infection, inattention, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Suicidal ideation or behavior occurs rarely, noted as early as 1 wk after initiation of therapy and persisting for at least 24 wks. Shortening of the QT interval (up to 20 msec), hypersensitivity reaction (rash, fever, urticaria) have been noted. Abrupt withdrawal may precipitate seizure, status epilepticus.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ECG. Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate seizure precautions. Question history of suicidal ideation and behavior.

### INTERVENTION/EVALUATION

Provide safety measures as needed. Observe frequently for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity, frequency of seizures). Assist with ambulation if drowsiness, lethargy occur. Question for evidence of headache. Monitor for suicidal ideation and behavior.

### PATIENT/FAMILY TEACHING

- Do not abruptly withdraw medication (may precipitate seizures).
- Avoid tasks that require alertness, motor skills

until response to drug is established. • Strict maintenance of drug therapy is essential for seizure control. • Avoid alcohol. • Use effective nonhormonal contraception to avoid pregnancy. • Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## ruxolitinib

rux-oh-lee-ti-nib  
(Jakafi)

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Janus-associated tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of intermediate or high-risk myelofibrosis, including primary myelofibrosis, post-polycythemia vera myelofibrosis, post-essential thrombocythemia myelofibrosis. Treatment of polycythemia vera. Treatment of steroid-refractory acute graft-versus-host disease (GVHD) in adults and children 12 yrs and older. Treatment of chronic graft-versus-host disease after failure of one or two lines of systemic therapy in adults and children 12 yrs and older.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ruxolitinib. **Cautions:** Conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic opportunistic infections (e.g., herpesvirus infection, hepatitis B virus [HBV] infection, fungal infections), renal/hepatic impairment, concomitant use of strong CYP3A4 inhibitors, history of bradycardia, conduction disturbances, ischemic heart disease, HF.

## ACTION

Inhibits Janus-associated kinases (JAKs) JAK1 and JAK2, which mediates the signaling of cytokines and growth factor important for hematopoiesis and immune function. In myelofibrosis and

polycythemia vera JAK1/2 activity is dysregulated. **Therapeutic Effect:** Modulates the affected JAK1/2 activity.

## PHARMACOKINETICS

Widely distributed. Protein binding: 97%. Metabolized in liver. Excreted in urine (74%), feces (22%). **Half-life:** 3–5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Not recommended in nursing mothers. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. May increase adverse effects; decrease therapeutic effect of vaccines (live). May decrease therapeutic effect of BCG (intravesical).

**HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May decrease platelets, RBC, Hgb, Hct, WBC. May increase serum bilirubin, ALT, AST, cholesterol.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 15 mg, 20 mg, 25 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

### Feeding Tube

- Suspend tablet in 40 mL water and stir for 10 min.
- May administer suspension within 6 hrs after tablet has dispersed.
- Flush with 75 mL water after administration.

## INDICATIONS/ROUTES/DOSAGE

### Myelofibrosis

**PO: ADULTS:** 20 mg twice daily if platelets greater than 200,000 cells/mm<sup>3</sup>, or

15 mg twice daily if platelets 100,000–200,000 cells/mm<sup>3</sup>, or 5 mg twice daily if platelets 50,000 to less than 100,000 cells/mm<sup>3</sup>. Dose reduction based on platelet response. **Maximum:** 25 mg twice daily.

### Polycythemia Vera

**PO: ADULTS, ELDERLY:** Initially, 10 mg bid. Doses titrated based on safety/efficacy.

### GVHD

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 5 mg twice daily. May increase to 10 mg twice daily after at least 3 days (if ANC and platelets have not decreased by 50% or greater from baseline).

### GVHD (chronic)

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 10 mg twice daily.

## Dosage in Renal Impairment

### Myelofibrosis

CrCl 15–59 mL/min	Platelets 100,000–150,000/mm <sup>3</sup>	10 mg twice daily
CrCl 15–59 mL/min	Platelets 50,000 to less than 100,000/mm <sup>3</sup>	5 mg once daily
CrCl 15–59 mL/min	Platelets less than 50,000/mm <sup>3</sup>	Avoid use
End-stage renal disease (ESRD) on dialysis	Platelets 100,000–200,000/mm <sup>3</sup>	15 mg after dialysis on days of dialysis
ESRD on dialysis	Platelets more than 200,000/mm <sup>3</sup>	20 mg after dialysis on days of dialysis
ESRD not requiring dialysis		Avoid use

### Polycythemia

**CrCl 5–59 mL/min and any platelet count:** 5 mg twice daily.

**GVHD**

**CrCl 5–59 mL/min and any platelet count:** 5 mg once daily. **ESRD on dialysis:** 5 mg once after dialysis. **ESRD not on dialysis:** Avoid use.

**Dosage in Hepatic Impairment**

**Myelofibrosis**

Hepatic impairment	Platelets 100,000–150,000/mm <sup>3</sup>	10 mg twice daily
Hepatic impairment	Platelets 50,000 to less than 100,000/mm <sup>3</sup>	5 mg once daily
Hepatic impairment	Platelets less than 50,000/mm <sup>3</sup>	Avoid use

**Polycythemia**

**Mild to severe and any platelet count:** 5 mg twice daily.

**GVHD**

**Stage 3 or 4 liver GVHD and any platelet count:** 5 mg once daily.

**SIDE EFFECTS**

**Frequent (23%–14%):** Bruising, dizziness, vertigo, labyrinthitis, headache.

**Occasional (9%–7%):** Weight gain, flatulence.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May cause severe thrombocytopenia (70% of pts), anemia (96% of pts), neutropenia (18% of pts), which may improve with reduced dose or by temporarily withholding regimen. Anemic pts may require blood transfusions. Increased risk of developing opportunistic bacterial, mycobacterial,

fungal, viral infections including herpes zoster, urinary tract infection, urosepsis, renal infection, pyuria. Increased risk of bleeding disorders including ecchymosis, hematoma, injection site hematoma, peri-orbital hematoma, petechiae, purpura.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC, serum chemistries, renal function, LFT, urinalysis, cholesterol level. Assess recent vaccinations status. Receive full medication history including herbal products. Question for possibility of pregnancy, renal/hepatic impairment, HIV.

**INTERVENTION/EVALUATION**

Monitor CBC (every 2–4 wks until doses stabilized), serum chemistries, renal function, LFT, cholesterol. Obtain urinalysis with reflex culture for suspected UTI. Routinely assess vital signs, I&O, breath sounds, gait. Monitor temperature; be alert for fever, infectious process. Avoid IM injections, rectal temperatures, other traumas that induce bleeding. Assess skin for petechiae, hematoma, purpura.

**PATIENT/FAMILY TEACHING**

- Report any new bruising/bleeding, bloody stools or urine, fever, chills, rash, painful urination, suspected infection, fatigue, shortness of breath.
- Do not breastfeed.
- Avoid grapefruit products.
- Open skin lesions, blisters may signal herpes infection.
- Blood work will be routinely monitored; if on dialysis, take only following dialysis.

**sacituzumab govitecan-hziy****sak-i-tooz-ue-mab goe-vi-tee-kan** (Trodelvy)

**BLACK BOX ALERT** Severe neutropenia may occur. Withhold treatment for absolute neutrophil count (ANC) less than 1,500 cells/mm<sup>3</sup> or febrile neutropenia. Initiate antimicrobial therapy in pts with febrile neutropenia. Consider granulocyte colony-stimulating factor prophylaxis. Severe diarrhea may occur. If not contraindicated, administer atropine for early diarrhea of any severity. For onset of late diarrhea, evaluate for infectious processes.

**Do not confuse sacituzumab govitecan with fam-trastuzumab deruxtecan, sarilumab, secukinumab.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-Trop-2, antibody drug conjugate, topoisomerase I inhibitor. Monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with metastatic triple-negative breast cancer (mTNBC) who have received two or more prior therapies for metastatic disease. Treatment of locally advanced or metastatic urothelial cancer in adults who have previously received platinum-containing chemotherapy and either programmed death receptor-1 or programmed death-ligand 1 inhibitor.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to sacituzumab govitecan-hziy. **Cautions:** Baseline hematologic cytopenias, hepatic impairment, dehydration; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic opportunistic infections (e.g., herpesvirus infection, fungal infections). Do not substitute with other drugs containing irinotecan or its

active metabolites. Pts who are homozygous for the UGT1A1\*28 allele are at increased risk for neutropenia.

**ACTION**

An antibody drug conjugate consisting of a humanized antitrophoblast cell-surface antigen 2 (Trop-2) monoclonal antibody coupled to the topoisomerase I inhibitor SN-38. Trop-2 is overexpressed and is associated with cancer cell growth. Binds to Trop-2 and is internalized; SN-38 is released in tumors. **Therapeutic Effect:** Causes DNA damage, apoptosis, and cell death.

**PHARMACOKINETICS**

Widely distributed. Metabolized by UGT1A1 enzymes. Excretion not specified. **Half-life:** 16 hrs; (SN-38): 18 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

**INTERACTIONS**

**DRUG:** UGT1A1 inhibitors (e.g., atazanavir, ketoconazole) may increase adverse effects. UGT1A1 inducers (e.g., carbamazepine, phenytoin, ritonavir) decrease concentration/effect. May decrease therapeutic effect of BCG (intravesical), vaccines (live). Irinotecan, pimecrolimus, tacrolimus (topical) may enhance the adverse/toxic effects. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase activated partial thromboplastin

time (aPTT), serum alkaline phosphatase, AST, ALT, magnesium. May decrease serum albumin, calcium, magnesium, potassium, phosphate, sodium; Hgb, leukocytes, neutrophils, platelets, RBCs. May increase or decrease serum glucose. May diminish diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 180 mg.

## ADMINISTRATION/HANDLING

**Premedication** • Give antipyretic, H<sub>1</sub> and H<sub>2</sub> blocker, antiemetic (either two- or three-drug combination) prior to each infusion. May give a corticosteroid in pts with prior infusion reaction.

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for reconstitution based on weight in kg at the beginning of each treatment cycle (or more frequently if body weight has changed by more than 10%). • Allow vial to warm to room temperature. • Reconstitute each vial with 20 mL of 0.9% NaCl to a final concentration of 10 mg/mL. • Swirl vial gently for up to 15 min until powder is completely dissolved. Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear clear and yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in an infusion bag containing 0.9% NaCl to a final concentration of 1.1–3.4 mg/mL (do not exceed 500 mL). Infusion bag must be made of polypropylene to minimize foaming.

**Infusion guidelines** • Do not administer as IV push or bolus. • Flush IV line with 20 mL of 0.9% NaCl after infusion is complete.

**Rate of administration** • **First Infusion:** Infuse over 3 hrs. • **Subsequent Infusions:** Infuse over 1–2

hrs if previously tolerated. May slow or interrupt infusion if infusion reactions occur.

**Storage** • Refrigerate unused vials in original carton. • May refrigerate diluted solution for up to 4 hrs. After refrigeration, diluted solution must be infused within 4 hrs (includes infusion time). • Protect from light. • Do not shake, agitate, or freeze.

## IV INCOMPATIBILITIES

Do not mix or infuse with other solutions or medications.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Withhold dose on day 1 of any cycle for ANC less than 1,500/mm<sup>3</sup>; withhold on day 8 of any cycle for ANC less than 1,000/mm<sup>3</sup>.

### Breast Cancer (Triple-Negative)

**IV Infusion: ADULTS:** 10 mg/kg on days 1 and 8 of 21-day cycle. Continue until disease progression or unacceptable toxicity. **Maximum:** 10 mg/kg/dose.

### Urothelial Cancer (Locally Advanced or Metastatic)

**IV Infusion: ADULTS, ELDERLY:** 10 mg/kg on days 1 and 8 of a 21-day treatment cycle. Continue until disease progression or unacceptable toxicity. **Maximum:** 10 mg/kg/dose.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Note:** Do not re-escalate if a dose reduction is made.

### Neutropenia

**Grade 3 febrile neutropenia; Grade 4 neutropenia for 7 days or greater; Grade 3 or 4 neutropenia that delays dosing by 2 or 3 wks for recovery to less than or equal to Grade 1:** For first occurrence, reduce dose by 25% and give granulocyte colony-stimulating factor. For second occurrence, reduce dose by 50%. For third occurrence, permanently discontinue. **Grade 3 or 4 neutropenia**

that delays dosing beyond 3 wks for recovery to less than or equal to Grade 1: Permanently discontinue. Severe Non-Neutropenic Toxicity. **Grade 4 nonhematologic toxicity of any duration; any Grade 3 or 4 treatment-induced nausea, vomiting, diarrhea (not controlled by antiemetics/antidiarrheal agents); other Grade 3 or 4 nonhematologic toxicity lasting greater than 48 hrs (despite medical management); Grade 3 or 4 non-neutropenic toxicity that delays dosing by 2 or 3 wks for recovery to less than or equal to Grade 1:** For first occurrence, reduce dose by 25%. For second occurrence, reduce dose by 50%. For third occurrence, permanently discontinue. **Grade 3 or 4 non-neutropenia hematologic toxicity that does not improve to less than or equal Grade 1 within 3 wks:** Permanently discontinue.

#### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (69–21%):** Nausea, diarrhea, fatigue, vomiting, alopecia, constipation, rash, skin irritation/exfoliation, decreased appetite, abdominal pain/distension, headache, back pain, cough, dizziness, dyspnea. **Occasional (19%–11%):** Edema, pruritus, arthralgia, dry skin, mucositis, stomatitis, esophagitis, mucosal inflammation, pyrexia, insomnia, dehydration, dysgeusia, extremity pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including severe neutropenia, febrile neutropenia may be

life-threatening. Pts with uridine diphosphate-glucuronosyl transferase 1A1 (UGT1A1)\*28 allele are at an increased risk of neutropenia, other adverse reactions. Diarrhea occurred in 63% of pts. Grade 3 or 4 diarrhea reported in 9% of pts. Life-threatening hypersensitivity reactions, including anaphylaxis, may occur. Grade 3 or 4 nausea and vomiting was reported. Pleural effusion reported in 2% of pts. Infections including bronchitis, influenza, pneumonia, respiratory syncytial virus infection, upper respiratory tract infection, UTI, viral infection were reported. Neuropathies including hypoesthesia, gait disturbance, muscular weakness, paresthesia, peripheral motor/sensorimotor neuropathy reported in 24% of pts. Immunogenicity (auto-sacituzumab govitecan-hziy antibodies) reported in 2% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Confirm triple-negative breast cancer status. Obtain weight in kilograms. Verify status of UGT1A1\*28 allele. Question occurrence of infusion reactions prior to each dose. Question history of hepatic impairment. Screen for active infection. Assess usual bowel movement patterns, stool characteristics. Assess and correct hydration status prior to each dose. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression. Monitor for severe neutropenia, febrile neutropenia (esp. in pts with reduced UGT1A1 activity); infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor for hypersensitivity reactions, infusion reactions during infusion and for at least 30 min after completion. If infusion-related reaction occurs, in-

interrupt infusion and manage symptoms. Permanently discontinue if life-threatening infusion reaction, hypersensitivity reaction occurs. Diarrhea must be treated promptly. If diarrhea occurs, evaluate for infectious processes. If negative for infectious processes, recommend loperamide (antidiarrheal agent) 4 mg initially, then 2 mg with every episode of diarrhea up to a maximum of 16 mg/day. Discontinue antidiarrheal agent 12 hrs after diarrhea subsides. May give atropine for subsequent treatments in pts who exhibit excessive cholinergic response (e.g., abdominal cramping, diarrhea, salivation). Adequate fluid and electrolyte resuscitation should be considered. Offer antiemetics if nausea or vomiting occurs. Monitor I&Os, hydration status. Monitor for neuropathies.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Severe allergic reactions, including anaphylaxis, can occur. If allergic reaction occurs, seek immediate medical attention.
- Severe diarrhea may cause dehydration, electrolyte imbalance. Drink plenty of fluids. Report diarrhea that does not improve with medical management. Maintain proper hydration and nutrition.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Nausea and vomiting is a common side effect.
- Report nervous system changes (gait disturbance, pain, numbness, trouble walking); UTI (fever, urinary frequency, burning during urination, foul-smelling urine).
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## sacubitril-valsartan

sak-ue-bi-tril  
(Entresto)

■ **BLACK BOX ALERT** ■ May cause fetal harm, mortality. Discontinue as soon as pregnancy detected.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Combination of sacubitril, a neprilysin inhibitor, and valsartan, an angiotensin II receptor blocker. **CLINICAL:** Reduces risk of complications in HF.

#### USES

To reduce the risk of cardiovascular death and hospitalization in pts with chronic HF (NYHA class II-IV) and reduced ejection fraction. Treatment of symptomatic HF with systemic left ventricular systolic dysfunction in pediatric pts 1 yr and older.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to sacubitril or valsartan; history of angioedema related to angiotensin-converting enzyme (ACE) inhibitor or angiotensin receptor blockers (ARB); concomitant use or within 36 hrs of ACE inhibitors; concomitant use of aliskiren in pts with diabetes. **Cautions:** Baseline anemia, dehydration, hypovolemia, sodium depletion; concomitant use of potassium-sparing diuretics or potassium supplements; hepatic/renal impairment; unstented bilateral/unilateral renal artery stenosis; significant aortic/mitral stenosis. Pts with orthostatic hypotension.

#### ACTION

Sacubitril inhibits neprilysin, increasing peptide levels that are degraded by neprilysin (e.g., natriuretic peptides). Valsartan directly antagonizes angiotensin II receptors; blocks vasoconstrictor, aldosterone secreting effects

of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Decreases risk of mortality in pts with chronic HF; produces vasodilation; decreases peripheral resistance; decreases B/P.

## PHARMACOKINETICS

Widely distributed. Sacubitril is converted by esterases; not significantly metabolized after conversion. Valsartan is minimally metabolized in liver. Protein binding (both): 94%–97%. Peak plasma concentration: sacubitril: 30 min, valsartan: 1.5 hrs. Steady-state concentration: 3 days. Excretion: sacubitril: urine (52%–68%), feces (37%–48%); valsartan: feces (86%), urine (13%). **Half-life:** sacubitril: 1.4 hrs; valsartan: 9.9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/mortality. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** ACE inhibitors (e.g., enalapril, ramipril) may increase risk of angioedema (contraindicated). **Potassium-sparing diuretics** (e.g., spironolactone) may increase risk of hyperkalemia. **NSAIDs** (e.g., ibuprofen, naproxen) may worsen renal function. May increase concentration/effect of lithium. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, potassium. May decrease Hct, Hgb.

## AVAILABILITY (Rx)

**Fixed-Dose Combination Tablets:** (*Sacubitril/valsartan*): 24 mg/26 mg, 49 mg/51 mg, 97 mg/103 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### HF

**Note:** Allow a 36-hr washout period when switching from or to an ACE inhibitor.

**PO: ADULTS, ELDERLY:** (*Previously taking a moderate to high dose of ACE inhibitor [greater than 10 mg enalapril or equivalent] or ARB [greater than 160 mg valsartan or equivalent]*): Initially, 49 mg/51 mg twice daily. After approx. 2 wks, double the dose as tolerated to a maintenance dose of 97 mg/103 mg twice daily. (*Previously taking low-dose ACE inhibitor [e.g., enalapril 10 mg/day or more [or equivalent] or ARB [e.g., valsartan 160 mg/day or less [or equivalent]]*): Initially, 24 mg/26 mg twice daily. Double the dose as tolerated in approx. 2-wk intervals to a maintenance dose of 97 mg/103 mg twice daily.

**ADOLESCENTS, CHILDREN WEIGHING 50 KG OR GREATER:** (*Previously taking moderate- to high-dose ACE inhibitor [e.g., enalapril  $\geq 0.2$  mg/kg/day or 10 mg/day [or equivalent] or ARB]*): Initially, 49 mg/51 mg twice daily for 2 wks, then increase to 72 mg/78 mg twice daily for 2 wks, then to 97 mg/103 mg twice daily. **WEIGHING 40–49 KG:** Initially, 24 mg/26 mg twice daily for 2 wks, then increase to 49 mg/51 mg twice daily for 2 wks, then to 72 mg/78 mg twice daily. **WEIGHING 40 KG or LESS:** Initially 1.6 mg/kg/dose twice daily for 2 wks, then increase to 2.3 mg/kg/dose twice daily for 2 wks, then to 3.1 mg/kg/dose twice daily.

**ADOLESCENTS, CHILDREN WEIGHING 50 KG OR GREATER:** (*Not currently taking an ACE inhibitor, or an ARB; previously taking low-dose ACE inhibitor [e.g., enalapril 0.1 mg/kg/day or 5 mg/day [or equivalent]] or ARB*): Initially, 24 mg/26 mg twice daily for 2 wks, then increase to 49 mg/51 mg twice daily for 2 wks, then to 72 mg/78 mg twice daily for 2 wks, then to 97 mg/103 mg twice daily. **49 KG OR LESS:** Initially, 0.8 mg/kg/dose twice daily for 2 wks, then increase to 1.6 mg/kg/dose twice daily for 2

wks, then to 2.3 mg/kg/dose twice daily for 2 wks, then to 3.1 mg/kg/dose twice daily.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Initially, 24 mg/26 mg twice daily. **Maintenance:** May double each dose every 2–4 wks up to 97 mg/103 mg twice daily based on tolerability.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Initially, 24 mg/26 mg twice daily. **Maintenance:** May double each dose every 2–4 wks up to 97 mg/103 mg twice daily based on tolerability. **Severe impairment:** Treatment not recommended.

#### SIDE EFFECTS

**Occasional (9%):** Cough, dizziness.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Angioedema (less than 1% of pts), hypotension (18% of pts), orthostatic hypotension (2% of pts), impairment/decrease in renal function due to inhibition of renin-angiotensin-aldosterone system (5% of pts), elevation of serum creatinine greater than 50% from baseline (1.4% of pts), renal impairment including oliguria, azotemia, acute renal failure (5% of pts), hyperkalemia (12% of pts), serum potassium elevation greater than 5.5 mEq/L (4% of pts) have occurred.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain BMP; CBC in pts with baseline anemia. Obtain B/P, heart rate immediately before each dose, in addition to regular monitoring (be alert for fluctuations). Assess hydration status. Correct hydration/sodium depletion prior to initiation. Receive medication history and screen for interactions, esp. concomitant use of aliskiren, ACE inhibitors, ARBs, potassium-sparing diuretics, potassium supplements. Verify negative pregnancy

status. Question history of hepatic/renal impairment, renal artery stenosis; angioedema, hypersensitivity reaction.

#### INTERVENTION/EVALUATION

Monitor renal function, serum potassium. Monitor for hyperkalemia, hypotension. If hypotension occurs, consider interrupting treatment or altering dose of diuretic, anti-hypertensive drugs and screen for dehydration/serum sodium depletion. If pt positive for dehydration, be cautious with PO/IV administration. Overhydration may exacerbate HF. Assist with ambulation if dizziness occurs. Monitor for hypersensitivity reaction, including angioedema. If angioedema occurs, interrupt treatment and institute therapy to protect airway patency.

#### PATIENT/FAMILY TEACHING

- Be cautious of fluid intake. Overhydration may lead to worsening of HF, while underhydration may lead to low blood pressure.
- Report urine changes such as darkened urine, decreased output.
- Immediately report allergic reactions such as difficulty breathing, itching, rash, tongue swelling; symptoms of high potassium levels such as extreme fatigue, muscle weakness, palpitations; suspected pregnancy.
- Do not breastfeed.
- Diuretics (water pills) may increase risk of low pressure or low potassium levels.

## salmeterol

TOP  
100

sal-met-er-all  
(Serevent Diskus)

■ **BLACK BOX ALERT** ■ Long-acting beta<sub>2</sub>-adrenergic agonists may increase risk of asthma-related deaths and asthma-related hospitalizations in pediatric and adolescent pts. Use only as adjuvant therapy in pts who are currently receiving but not adequately controlled on long-term asthma control medication.

**Do not confuse salmeterol with Solu-Medrol, or Serevent with Atrovent, Combivent, Serentil, or Sinemet.**

**FIXED-COMBINATION(S)**

**Advair Diskus:** salmeterol/fluticasone (a corticosteroid): 50 mcg/100 mcg, 50 mcg/250 mcg, 50 mcg/500 mcg. **Advair HFA:** salmeterol/fluticasone (a corticosteroid): 21 mcg/45 mcg, 21 mcg/115 mcg, 21 mcg/230 mcg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Beta<sub>2</sub>-adrenergic agonist (long-acting).

**CLINICAL:** Bronchodilator.

**USES**

Prevention of exercise-induced bronchospasm, bronchospasm in pts 4 yrs of age and older; maintenance treatment of asthma and prevention of bronchospasm in pts with reversible obstructive airway disease, including those with symptoms of nocturnal asthma in pts 4 yrs of age and older. Long-term maintenance treatment of bronchospasm associated with COPD (including emphysema and chronic bronchitis).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to salmeterol. Treatment of status asthmaticus, acute episodes of asthma or COPD. Use as monotherapy in treatment of asthma without concomitant long-term asthma control medication (e.g., inhaled corticosteroids). **Cautions:** Not for acute symptoms; may cause paradoxical bronchospasm, severe asthma. Cardiovascular disorders (coronary insufficiency, arrhythmias, hypertension), seizure disorders, diabetes, hyperthyroidism, hepatic impairment, hypokalemia.

**ACTION**

Stimulates beta<sub>2</sub>-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reducing airway resistance.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
Inhalation (asthma)	30–45 min	2–4 hrs	12 hrs
Inhalation (COPD)	2 hrs	3.25–4.75 hrs	12 hrs

Low systemic absorption; acts primarily in lungs. Protein binding: 95%. Metabolized in liver. Excreted in urine (25%), feces (60%). **Half-life:** 5.5 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** No age-related precautions in pts older than 4 yrs. **Elderly:** Lower dosages may be needed (may be more susceptible to tachycardia, tremors).

**INTERACTIONS**

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol) may reduce effect; may produce bronchospasm. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), **MAOIs** (e.g., phenelzine, selegiline), **tricyclic antidepressants** (e.g., amitriptyline, doxepin) may increase concentration/effects (wait 14 days after stopping MAOIs, tricyclic antidepressants before starting salmeterol). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium. May increase serum glucose.

**AVAILABILITY (Rx)**

**Aerosol Powder Breath Activated, Inhalation:** 50 mcg/inhalation.

**ADMINISTRATION/HANDLING****Inhalation**

- Do not shake or prime. Before inhaling the dose, breathe out fully (do not exhale into Diskus device). Activate and use only in level horizontal position.
- Inhale quickly and deeply through Diskus.
- Hold breath as long as possible before exhaling slowly.
- Do not use a spacer or wash mouthpiece.

## INDICATIONS/ROUTES/DOSAGE

### Maintenance and Prevention Therapy for Asthma, Bronchospasm

**Inhalation:** ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 1 inhalation (50 mcg) q12h (used in combination with inhaled corticosteroids not as monotherapy).

### Prevention of Exercise-Induced Bronchospasm

**Inhalation:** ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 1 inhalation at least 30 min before exercise. Additional doses should not be given for 12 hrs. Do not administer if already giving salmeterol twice daily.

### Maintenance Therapy for COPD

**Inhalation:** ADULTS, ELDERLY: 1 inhalation (50 mcg) q12h.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (28%):** Headache. **Occasional (7%–3%):** Cough, tremor, dizziness, vertigo, throat dryness/irritation, pharyngitis. **Rare (less than 3%):** Palpitations, tachycardia, nausea, heartburn, GI distress, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

May prolong QT interval (can precipitate ventricular arrhythmias). Hypokalemia, hyperglycemia may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of cardiac disease, hepatic impairment, seizure disorder. Screen for concomitant medications known to prolong QT interval. Assess lung sounds, vital signs.

### INTERVENTION/EVALUATION

Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse, B/P. Assess lungs for wheezing, rales, rhonchi. Periodically evaluate serum potassium levels.

## PATIENT/FAMILY TEACHING

- Not for relief of acute episodes.
- Keep canister at room temperature (cold decreases effects).
- Do not stop medication or exceed recommended dosage.
- Report chest pain, dizziness.
- Wait at least 1 full min before second inhalation.
- Administer dose 30–60 min before exercise when used to prevent exercise-induced bronchospasm.
- Avoid excessive use of caffeine derivatives (coffee, tea, colas, chocolate).

## sargramostim

sar-gra-moe-stim  
(Leukine)

**Do not confuse Leukine with leucovorin or Leukeran.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Colony-stimulating factor. **CLINICAL:** Hematopoietic agent.

## USES

**Acute myelogenous leukemia (AML: following induction chemotherapy):** Shortens time to neutrophil recovery; reduces incidence of severe infections. **Bone marrow transplant (allogeneic or autologous):** For graft failure, engraftment delay. **Myeloid reconstitution** following allogeneic or autologous bone marrow transplant. **Peripheral stem cell transplant (allogeneic or autologous):** Mobilizes hematopoietic progenitor cells. **Hematopoietic radiation injury syndrome (acute):** Treatment to increase survival due to acute exposure to myelosuppressive radiation doses. **OFF-LABEL:** Primary prophylaxis of neutropenia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to sargramostim. Concurrent (24 hrs preceding or following) myelosuppressive chemotherapy or radiation, pts with excessive leukemic myeloid blasts in bone marrow

or peripheral blood (greater than 10%), known hypersensitivity to yeast-derived products. **Cautions:** Preexisting HF, fluid retention, cardiovascular disease, pulmonary disease (hypoxia, pulmonary infiltrates), renal/hepatic impairment.

## ACTION

Stimulates proliferation/differentiation and functional activity of eosinophils, monocytes, neutrophils, and macrophages.

**Therapeutic Effect:** Assists bone marrow in making new WBCs, increases their chemotactic, antifungal, antiparasitic activity. Increases cytoneoplastic cells, activates neutrophils to inhibit tumor cell growth.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV (increase WBCs)	7–14 days	N/A	1 wk

Detected in serum within 5 min after SQ administration. **Peak serum levels:** 1–3 hrs. **Half-life: IV:** 1 hr; **SQ:** 3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## S

## INTERACTIONS

**DRUG:** May increase adverse effects of **tisagenlecleucel**. May decrease therapeutic effect of **vaccines (live)**. **Corticosteroids (e.g., dexamethasone, prednisONE)** may increase myeloproliferative effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatinine. May decrease serum albumin.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 250 mcg.

## ADMINISTRATION/HANDLING

### SQ

May be given without further dilution.

**Reconstitution** • To 250-mcg vial, add 1 mL Sterile Water for Injection (preservative free) or Bacteriostatic Water for Injection. Direct diluent to side of vial, gently swirl contents to avoid foaming; do not shake or vigorously agitate. • After reconstitution, further dilute in 25–50 mL 0.9% NaCl to a concentration of 10 mcg/mL or greater. If final concentration less than 10 mcg/mL, 1 mg of human albumin per 1 mL of 0.9% NaCl should be added to provide a final albumin concentration of 0.1% (e.g., 1 mL 5% albumin per 50 mL 0.9% NaCl).

**◀ALERT▶** Albumin is added before addition of sargramostim (prevents drug adsorption to components of drug delivery system).

**Rate of administration** • Give each single dose over 30 min, 2 hr, 6 hr, or continuous infusion.

**Storage** • Refrigerate powder, reconstituted solution, diluted solution for injection. • Do not shake. • Reconstituted solutions are clear, colorless. • Use within 6 hrs; discard unused portions. • Use 1 dose per vial; do not reenter vial.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ondansetron (Zofran).

## IV COMPATIBILITIES

Dexamethasone (Decadron), diphenhydramine (Benadryl), famotidine (Pepcid), granisetron (Kytril), heparin, metoclopramide (Reglan), promethazine (Phenergan).

## INDICATIONS/ROUTES/DOSAGE

### Neutrophil Recovery Following Chemotherapy in AML

**IV: ADULTS 55 YRS OR OLDER:** 250 mcg/m<sup>2</sup>/day (as 4-hr infusion) starting approximately 4 days following completion of induction chemotherapy (if day 10 bone marrow is hypoplastic with less than 5% blasts). Continue until ANC is greater than 1,500 cells/mm<sup>3</sup> for 3 consecutive days or

a maximum of 42 days. If WBC greater than 50,000 cells/mm<sup>3</sup> and/or ANC greater than 20,000 cells/mm<sup>3</sup>, interrupt treatment or reduce dose by 50%.

### Myeloid Recovery Following Bone Marrow Transplant (BMT)

**IV; ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER:** Usual parenteral dosage: 250 mcg/m<sup>2</sup>/day (as 2-hr infusion). Begin 2–4 hrs after autologous bone marrow infusion and not less than 24 hrs after last dose of chemotherapy or last radiation treatment, when post marrow infusion ANC is less than 500 cells/mm<sup>3</sup>. Continue until ANC greater than 1,500 cells/mm<sup>3</sup> for 3 consecutive days. If WBC greater than 50,000 cells/mm<sup>3</sup> and/or ANC greater than 20,000 cells/mm<sup>3</sup>, interrupt treatment or reduce dose by 50%. Discontinue if blast cells appear or underlying disease progresses.

### Bone Marrow Transplant Failure, Engraftment Delay

**IV; ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER:** 250 mcg/m<sup>2</sup>/day for 14 days. Infuse over 2 hrs. May repeat after 7 days off therapy if engraftment has not occurred. A third course with 500 mcg/m<sup>2</sup>/day for 14 days may be tried if engraftment still has not occurred.

### Stem Cell Transplant, Mobilization

**IV, SQ; ADULTS:** 250 mcg/m<sup>2</sup>/day IV (as 24-hr infusion) or SQ once daily. Continue same dose throughout peripheral blood progenitor cell collection. If WBC greater than 50,000 cells/mm<sup>3</sup>, reduce dose by 50%.

### Stem Cell Transplant, Posttransplant

**IV, SQ; ADULTS, ELDERLY:** 250 mcg/m<sup>2</sup>/day IV (as 24-hr infusion) or SQ once daily beginning immediately following infusion of progenitor cells. Continue until ANC greater than 1,500 cells/mm<sup>3</sup> for 3 consecutive days.

### Hematopoietic Radiation Injury Syndrome (Acute)

**SQ; ADULTS, ELDERLY WEIGHING MORE THAN 40 KG:** 7 mcg/kg once daily. Begin

treatment as soon as possible after suspected or confirmed exposure to radiation doses greater than 2 Gy(gray). Do not delay if CBC not available. Continue until ANC remains greater than 1,000/cells mm<sup>3</sup> for 3 consecutive CBCs (obtain q3days) or ANC exceeds 10,000/cells mm<sup>3</sup> after radiation-induced nadir. **INFANTS, CHILDREN, ADOLESCENTS WEIGHING 40 KG OR GREATER:** (*Weight-directed dosing*): 7 mcg/kg once daily. **WEIGHING 15–39 KG:** 10 mcg/kg once daily. **WEIGHING LESS THAN 15 KG:** 12 mcg/kg once daily.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** GI disturbances (nausea, diarrhea, vomiting, stomatitis, anorexia, abdominal pain), arthralgia or myalgia, headache, malaise, rash, pruritus. **Occasional:** Peripheral edema, weight gain, dyspnea, asthenia, fever, leukocytosis, capillary leak syndrome (fluid retention, irritation at local injection site, peripheral edema). **Rare:** Tachycardia, arrhythmias, thrombophlebitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Pleural/pericardial effusion occurs rarely after infusion.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, vital signs. Question history of cardiac/pulmonary disease, renal/hepatic impairment.

### INTERVENTION/EVALUATION

Monitor CBC with differential, serum renal/hepatic function, pulmonary function, vital signs, weight. Monitor for supraventricular arrhythmias during administration (particularly in pts with history of cardiac arrhythmias). Assess closely for dyspnea during and immediately following infusion (particularly in pts with history of lung disease). If dyspnea occurs during infusion, cut infusion rate by half. If dyspnea

continues, stop infusion immediately. If neutrophil count exceeds 20,000 cells/mm<sup>3</sup> or platelet count exceeds 500,000 cells/mm<sup>3</sup>, reduce dose by half, based on clinical condition of pt. Blood counts return to normal or baseline 3–7 days after discontinuation of therapy.

#### PATIENT/FAMILY TEACHING

- Report difficulty breathing, esp. during or immediately after infusion.
- May increase risk of cardiac arrhythmias; report dizziness, fainting, palpitations.
- Treatment may cause edema, fluid collection in the lungs or around the heart.

## sarilumab

sar-il-ue-mab  
(Kevzara)

**BLACK BOX ALERT** Tuberculosis (TB), invasive fungal infections, other opportunistic infections leading to hospitalization and death were reported. Avoid use in pts with active infection. Withhold treatment until serious infection is controlled. Test for TB prior to and during treatment, regardless of initial result; if positive, start treatment for TB prior to initiation.

**Do not confuse sarilumab with adalimumab, avelumab, belimumab, brodalumab, dupilumab, ipilimumab, nivolumab, or panitumumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-6 receptor antagonist. Monoclonal antibody. **CLINICAL:** Antirheumatic, disease modifying.

#### USES

Treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response or intolerance to one or more DMARDs. May use as monotherapy or in combination with nonbiologic DMARDs (do not use in combination with biologic DMARDs).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to sarilumab. **Cautions:** Hyperlipidemia, hypertriglyceridemia, active hepatic disease or hepatic impairment; recent travel or residence in endemic TB or mycosis areas; history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); history of HIV, herpes zoster, hepatitis B virus (HBV) infection, malignancies; baseline neutropenia, thrombocytopenia; pts at risk for GI perforation (Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies). Not recommended in pts with active infection, concomitant use of biological DMARDs; baseline ANC less than 2000 cells/mm<sup>3</sup>, platelet count less than 150,000 cells/mm<sup>3</sup>, serum ALT, AST above 1.5 times upper limit of normal (ULN).

#### ACTION

Binds to interleukin-6 (IL-6) receptor, inhibiting signaling of IL-6, a cytokine involved in inflammatory and immune responses. **Therapeutic Effect:** Reduces inflammation of RA.

#### PHARMACOKINETICS

Widely distributed. Peak plasma concentration: 2–4 days. Excretion (200 mg dose): linear, nonsaturable proteolytic pathway. (150 mg dose): nonlinear, saturable target mediated pathway. **Half-life:** Concentration dependent: 200 mg q2wks (up to 10 days); 150 mg q2wks (up to 8 days).

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses the placental barrier, esp. during the third trimester. Unknown if distributed in breast milk; however, maternal immunoglobulin G (IgG) is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution (increased incidence of infections).

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of belimumab, natalizumab, vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, cholesterol, LDL, HDL, triglycerides. May decrease leukocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection Solution:** 150 mg/1.14 mL, 200 mg/1.14 mL.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min). • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscularly. • Rotate injection sites.

**Storage** • Refrigerate in original carton until time of use. • Protect from light. • May store at room temperature for up to 14 days. Once warmed to room temperature, do not place back into refrigerator. • Do not freeze or expose to heating sources. • Do not shake.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Do not initiate if ANC is less than 2,000 cells/mm<sup>3</sup>; platelets less than 150,000 cells/mm<sup>3</sup>; or serum ALT or AST greater than 1.5 times ULN.

### Rheumatoid Arthritis

**SQ: ADULTS, ELDERLY:** 200 mg once q2wks.

## Dose Modification

### Neutropenia

**ANC greater than 1000 cells/mm<sup>3</sup>:** No dose adjustment. **ANC 500–1000 cells/mm<sup>3</sup>:** Withhold treatment until ANC greater than 1000 cells/mm<sup>3</sup>, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. **ANC less than 500 cells/mm<sup>3</sup>:** Permanently discontinue.

### Hepatotoxicity

**Serum ALT elevation up to 3 times ULN:** Consider modifying dose of concomitant DMARDs. **Serum ALT elevation greater than 3–5 times ULN:** Withhold treatment until serum ALT less than 3 times ULN, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. **Serum ALT elevation greater than 5 times ULN:** Permanently discontinue.

### Serious Infection

Withhold treatment until serious infection is controlled, then resume as clinically indicated.

### Thrombocytopenia

**Platelet count 50,000–100,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count greater than 100,000 cells/mm<sup>3</sup>, then resume at 150 mg once q2wks. May increase to 200 mg once q2wks as clinically indicated. **Platelet count less than 50,000 cells/mm<sup>3</sup>:** Permanently discontinue if confirmed by repeat testing.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Rare (4%–2%):** Injection site reactions (pain, erythema, pruritus).

## ADVERSE EFFECTS/TOXIC REACTIONS

Serious, sometimes fatal, infections including aspergillosis, candidiasis, cellulitis, *Cryptococcus*, histoplasmosis, pneumonia,

sepsis, tuberculosis; bacterial, mycobacterial, invasive fungal, opportunistic, viral infections were reported. Nasopharyngitis, upper respiratory tract infections, urinary tract infections occurred in 2–4% of pts. Neutropenia may increase risk of serious infection. GI perforation may occur, esp. in pts with history of diverticulitis or concomitant use of NSAIDs, corticosteroids. May increase risk for new malignancies. Hypersensitivity reactions including rash, urticaria reported in less than 1% of pts. May increase risk of HBV reactivation, which may result in fulminant hepatitis, hepatic failure, death. Immunogenicity (auto-sarilumab antibodies) was reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, lipid panel. Assess onset, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiation and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Question history of chronic infections, opportunistic infections, herpes infection. Screen for active infection. Assess skin for open wounds. Question history of active hepatic disease, GI perforation, malignancies, HIV, HBV, hypersensitivity reactions. Receive full medication history and screen for interactions. Assess pt's willingness to self-inject medication.

### INTERVENTION/EVALUATION

Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor neutrophil count, platelet count, LFT 4–6 wks after initiation, then q3mos thereafter. Monitor lipid panel 4–6 wks after initiation, then q6mos thereafter. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection

prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs and initiate appropriate antimicrobial therapy. Closely monitor for HBV reactivation.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening. Report travel plans to possible endemic areas.
- A healthcare provider will show you how to properly prepare and inject medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Report allergic reactions such as itching, hives, rash.
- Immediately report severe or persistent abdominal pain, bloody stool, fever; may indicate rupture in GI tract.
- Treatment may cause reactivation of HBV, new cancers.
- Therapy may decrease platelet count, which may increase risk of bleeding.
- Report liver problems such as bruising, confusion, amber or dark-colored urine; right upper abdominal pain; yellowing of the skin or eyes.

## sAXagliptin

sax-a-glip-tin  
(Onglyza)

**Do not confuse SAXagliptin with SITagliptin or SUMAtriptan.**

### FIXED-COMBINATION(S)

**Kombiglyze XR:** SAXagliptin/metFORMIN (an antidiabetic): 2.5 mg/1,000 mg, 5 mg/500 mg, 5 mg/1,000 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DDP-4 inhibitor (gliptins). **CLINICAL:** Antidiabetic agent.

## USES

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes as monotherapy or in combination with other antidiabetic agents.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to SAXagliptin. Type 1 diabetes, ketoacidosis. **Cautions:** Concurrent use of other glucose-lowering agents, moderate to severe renal impairment, end-stage renal disease requiring hemodialysis, concurrent use of strong CYP3A4 inhibitors (e.g., clarithromycin); history of pancreatitis.

## ACTION

Slows the inactivation of incretin hormones by inhibiting DDP-4 enzyme. Incretin hormones increase insulin synthesis/release from pancreas and decrease glucagon secretion. **Therapeutic Effect:** Regulates glucose homeostasis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Peak plasma concentration: 2 hrs. Excreted in urine (75%), feces (22%). **Half-life:** 2.5 hrs; metabolite, 3.1 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** May increase hypoglycemic effects of insulin, sulfonylureas (e.g., glipiZIDE, glyBURIDE). Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **HERBAL:** Herbals

with hypoglycemic properties (e.g., fenugreek) may increase effect.

**FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May slightly decrease WBCs, lymphocytes. May increase serum creatinine.

## AVAILABILITY (Rx)

 **Tablets, Film-Coated:** 2.5 mg, 5 mg.

## ADMINISTRATION/HANDLING

### PO

• May give without regard to food. • Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes

**PO: ADULTS, ELDERLY:** 2.5 or 5 mg once daily. **Concurrent strong CYP3A4 inhibitors (e.g., ketoconazole):** 2.5 mg once daily. **Hemodialysis:** Give dose after dialysis.

### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment: CrCl less than 50 mL/min:** 2.5 mg once daily.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (7%):** Headache. **Rare (3%–1%):** Peripheral edema, sinusitis, abdominal pain, gastroenteritis, vomiting, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause HF, esp. in pts with cardiovascular disease. Concomitant use of hypoglycemic agents may increase risk of hypoglycemia. Pancreatitis reported in less than 1%. Hypersensitivity reactions including anaphylaxis, angioedema (tongue/lip swelling), exfoliative skin conditions. Other reactions include bullous pemphigoid, severe/disabling arthralgia. Infections including upper respiratory tract infection (8% of pts), UTI (7% of pts) may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain blood glucose, hemoglobin A1c, renal function. Assess pt's understanding of diabetes management, routine home glucose monitoring. Receive full medication history and screen for interactions. Question history renal impairment, cardiovascular disease, pancreatitis.

**INTERVENTION/EVALUATION**

Monitor blood glucose, hemoglobin A1c level, renal function. Assess for hypoglycemia (diaphoresis, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia, difficulty concentrating), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, fatigue, Kussmaul breathing), hypersensitivity reactions. Concomitant use of beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Obtain dietary consult for nutritional education. Severe abdominal pain, nausea may indicate pancreatitis.

**PATIENT/FAMILY TEACHING**

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose).
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Report joint pain; allergic reactions of any kind.

**scopolamine**

sko-e-pol-a-meen  
(Trans-Derm Scop, Buscopan )

**FIXED-COMBINATION(S)**

**Donnatal:** scopolamine/atropine (anticholinergic)/hyoscyamine (anticholinergic)/PHENobarbital (sedative): 0.0065 mg/0.0194 mg/0.1037 mg/16.2 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anticholinergic. **CLINICAL:** Antinausea, antiemetic.

**USES**

Prevention of motion sickness, postop nausea/vomiting. **OFF-LABEL:** Breakthrough treatment of nausea/vomiting associated with chemotherapy.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to scopolamine. Narrow-angle glaucoma. **Cautions:** Hepatic/renal impairment, cardiac disease (hypertension, HF), seizure disorder, psychoses, coronary artery disease, prostatic hyperplasia, urinary retention, reflux esophagitis, ulcerative colitis, hyperthyroidism, GI obstruction, hiatal hernia, elderly.

**ACTION**

Competitively inhibits action of acetylcholine in smooth muscle, secretory glands, and CNS. **Therapeutic Effect:** Prevents motion-induced nausea/vomiting.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta; unknown if distributed in breast milk. **Children:** May be more susceptible to adverse effects. **Elderly:** Dizziness, hallucinations, confusion may require dosage adjustment. Use caution.

**INTERACTIONS**

**Transdermal:** **DRUG:** None significant. **HERBAL:** None significant. **FOOD:** **Grapefruit products** may increase concentration/effect. **LAB VALUES:** May interfere with gastric secretion test.

**AVAILABILITY (Rx)**

**Transdermal System: (Trans-Derm Scop):** 1.5 mg.

**ADMINISTRATION/HANDLING****Transdermal**

- Apply patch to hairless area behind one ear.
- If dislodged or on for more than 72 hrs, replace with fresh patch.
- Do not cut/trim.
- Limit contact with water.

**INDICATIONS/ROUTES/DOSAGE****Prevention of Motion Sickness**

**Transdermal: ADULTS:** One system at least 4 hrs prior to exposure and q72h as needed.

**Postop Nausea/Vomiting**

**Transdermal: ADULTS, ELDERLY:** 1 system no sooner than 1 hr before surgery and removed 24 hrs after surgery.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (greater than 15%):** Dry mouth, drowsiness, blurred vision. **Rare (5%–1%):** Dizziness, restlessness, hallucinations, confusion, difficulty urinating, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

None known.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess for use of CNS depressants, anticholinergics. Question medical history as listed in Precautions.

**INTERVENTION/EVALUATION**

Monitor for dehydration. Observe for improvement of symptoms.

**PATIENT/FAMILY TEACHING**

- Avoid tasks requiring alertness, motor skills until response to drug is established (may cause drowsiness, disorientation, confusion).
- Use only 1 patch at a time; do not cut.
- Wash hands after administration.

**secukinumab**

sek-ue-kin-ue-mab

(Cosentyx, Cosentyx Sensor Pen)

**Do not confuse secukinumab with canakinumab, ranibizumab, trastuzumab, ustekinumab**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Monoclonal antibody. Human interleukin-17A antagonist. **CLINICAL:** Antipsoriasis agent.

**USES**

Treatment of moderate to severe plaque psoriasis in pts 6 yrs of age and older and in adults who are candidates for systemic therapy or phototherapy, active psoriatic arthritis (PsA), active ankylosing spondylitis (AS). Treatment of active nonradiographic axial spondyloarthritis in adults with objective signs of inflammation.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to secukinumab. **Cautions:** Elderly, active Crohn's disease, HIV infection, concomitant use of immunosuppressants; conditions predisposing to infections (e.g., diabetes, renal failure, immunocompromised pts, open wounds); hypersensitivity to latex (injector pen/prefilled syringe), preexisting or recent-onset CNS demyelinating disorders (e.g., multiple sclerosis, polyneuropathy); exposure to tuberculosis. Administration of live vaccines not recommended.

**ACTION**

Selectively binds to the interleukin-17A (IL-17A) cytokine, inhibiting its interaction with the IL-17 receptor. IL-17A is involved in inflammatory and immune responses. **Therapeutic Effect:** Inhibits release of proinflammatory cytokines.

**PHARMACOKINETICS**

Widely distributed. Degraded into small peptides and amino acids via catabolic

pathway. Peak plasma concentration: 6 days. Steady state reached in 24 wks. Excretion not defined. **Half-life:** 22–31 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase immunosuppressive effect of **baricitinib**, **belimumab**. May decrease efficacy/immune response of **BCG (intravesical)**, **live vaccines**; may increase risk of toxic effects of **live vaccines**. **InFLIXimab** may increase immunosuppressive effect. May increase adverse/toxic effect of **natalizumab**. **HERBAL:** **Echinacea** may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Injector Pen:** 150 mg/mL solution. **Pre-filled Syringe:** 150 mg/mL solution.

### ADMINISTRATION/HANDLING

#### SQ

- Follow instructions for preparation according to manufacturer guidelines.

**Administration** • Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Refrigerate until time of use. • Allow injector pen/pre-filled syringe/vial to warm to room temperature before use (15–30 min). Do not freeze.

### INDICATIONS/ROUTES/DOSAGE

#### Ankylosing Spondylitis

**SQ: ADULTS, ELDERLY** (With a loading dose): 150 mg at wks 0, 1, 2, 3, and 4, then 150 mg q4wks. May increase to 300

mg q4wks. (Without a loading dose): 150 mg q4wks. May increase to 300 mg q4 wks.

#### Axial Spondyloarthritis (Nonradiographic)

**SQ: ADULTS, ELDERLY:** (With a loading dose): 150 mg at wks 0, 1, 2, 3, and 4, then 150 mg q4wks. (Without a loading dose): 150 mg q4 wks.

#### Plaque Psoriasis

**SQ: ADULTS, ELDERLY:** 300 mg every wk for 5 doses, then 300 mg q4wks. (Some pts may only require 150 mg.) **CHILDREN 6 YRS AND OLDER WEIGHING 50 KG OR GREATER:** 150 mg once wkly at wks 0, 1, 2, 3, and 4, followed by 150 mg q4wks. May increase to 300 mg q4wks. **WEIGHING LESS THAN 50 KG:** 75 mg once wkly at wks 0, 1, 2, 3, and 4, then 75 mg q4wks.

#### Psoriatic Arthritis

**Note:** With coexistent plaque psoriasis, use dose for plaque psoriasis.

**SQ: ADULTS, ELDERLY:** (With a loading dose): 150 mg at weeks 0, 1, 2, 3, and 4, followed by 150 mg q4wks. May increase to 300 mg q4wks. (Without a loading dose): 150 mg q4wks. May increase to 300 mg q4wks.

#### Dosage in Renal/Hepatic Impairment

Not studied; use caution.

### SIDE EFFECTS

**Rare (4%–1%):** Diarrhea, urticaria, rhinorrhea.

### ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk tuberculosis. Infections including nasopharyngitis (11% of pts), upper respiratory tract infection (2.5% of pts), mucocutaneous infection with *Candida* (1.2% of pts), rhinitis, pharyngitis, oral herpes (1% of pts) have occurred. May cause exacerbation of Crohn's disease. Hypersensitivity reactions including anaphylaxis

were reported. Immunogenicity (auto-secukinumab antibodies) occurred in less than 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Antifungal therapy should be considered for those who reside or travel to regions where mycoses are endemic. Do not initiate therapy during active infection. Question history of active Crohn's disease, hepatitis B or C virus infection, HIV infection, demyelinating disorders, cardiovascular disease; concomitant use of immunosuppressive agents.

### INTERVENTION/EVALUATION

Monitor skin for disease improvement. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs. Monitor for hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.
- Injector pen/prefilled syringe should not be used by pts with latex allergy.
- Immediately report itching, hives, rash, swelling of the face or tongue; may indicate allergic reaction.
- Treatment may cause worsening of Crohn's disease.

## selegiline

se-le-ji-leen

(Emsam, Zelapar)

**■ BLACK BOX ALERT ■** Antidepressants increase risk of suicidal thoughts and behavior in pediatrics and young adults. Monitor closely for changes in behavior, suicidal ideation.

**Do not confuse Eldepryl with Elavil or enalapril, selegiline with Salagen, sertraline, or Stelazine, or Zelapar with Zaleplon, Zemplar, or ZyPREXA.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** MAOI type B. **CLINICAL:** Antiparkinson agent, antidepressant.

## USES

**Oral:** Adjunct to levodopa/carbidopa in treatment of Parkinson's disease. **Transdermal:** Treatment of major depressive disorder (MDD). **OFF-LABEL:** Treatment of ADHD, early Parkinson's disease.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to selegiline. Concurrent use of meperidine. **Orally Disintegrating Tablet (additional):** Concomitant use or within 14 days of other MAOI, other drugs that are potent inhibitors of monoamine oxidase (e.g., linezolid), or opioids (e.g., meperidine, methadone, tramadol); concomitant use with cyclobenzaprine, dextromethorphan, or St. John's wort. **Transdermal (additional):** Pheochromocytoma; pts younger than 12 yrs of age; use of carbamazepine, clomipramine, dextromethorphan, imipramine, meperidine, methadone, pentazocine, propoxyphene, serotonin reuptake inhibitors (SSRIs), tramadol (concomitantly or within 2 wks of selegiline discontinuation, or selegiline use within 4–5 half-lives [approximately 1 wk for most medications; 5 wks for fluoxetine])

of discontinuation of contraindicated drug). **Cautions:** Renal/hepatic impairment, depression, elderly pts, major psychiatric disorder; pts at high risk of suicide; pts at high risk of hypotension (cerebrovascular disease, cardiovascular disease, hypovolemia).

## ACTION

May increase dopaminergic activity by interfering with dopamine reuptake at the synapse. **Therapeutic Effect:** Relieves signs/symptoms of Parkinson's disease (tremor, akinesia, posture/equilibrium disorders, rigidity). Improves mood with MDD.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	—	24–72 hrs

Rapidly absorbed from GI tract. Crosses blood-brain barrier. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life: PO:** 10 hrs. **Transdermal:** 18–25 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Cyclobenzaprine, dextromethorphan, opioids (e.g., meperidine, methadone, tramadol), SSRIs (e.g., escitalopram, sertraline), SNRIs (e.g., duloxetine, venlafaxine) may increase serotonergic effect, increasing risk of serotonin syndrome; avoid use. **Alcohol** may increase adverse effects. **HERBAL:** St. John's wort may increase serotonergic effect. **Herbals with hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may increase hypotensive effect. **FOOD:** Tyramine-rich foods may produce hypertensive reactions. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Capsules:** 5 mg. **Tablets:** 5 mg. **Tablets, Orally Disintegrating: (Zelapar):** 1.25 mg. **Transdermal: (Emsam):** 6 mg/24 hrs, 9 mg/24 hrs, 12 mg/24 hrs.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Avoid tyramine-containing foods, large quantities of caffeine-containing beverages.

### PO (Orally Disintegrating Tablets)

- Give in morning before breakfast and without liquid.
- Peel off backing with dry hands (do not push tablets through foil).
- Immediately place on top of tongue, allow to disintegrate.
- Avoid food, liquids for 5 min before and after taking selegiline.

### Transdermal

- Apply to dry, intact skin on upper torso or thigh, outer surface of upper arm.
- Avoid exposure to external heat source.
- Normal exposure to water unlikely to affect adhesion.
- If patch becomes loose, press back into place. If patch falls off again, apply a new patch; follow same dose schedule.
- Rotate application sites.

## INDICATIONS/ROUTES/DOSAGE

### Adjunctive Treatment of Parkinson's Disease

**PO: ADULTS: (Capsule, Tablet):** 5 mg at breakfast and lunch, given concomitantly with each dose of carbidopa and levodopa. **ELDERLY:** Initially, 5 mg in the morning. May increase up to 10 mg/day. **ADULTS, ELDERLY: (Orally Disintegrating Tablet):** Initially, 1.25 mg daily for at least 6 wks. May increase to maximum of 2.5 mg/day.

### Major Depressive Disorder

**Transdermal: ADULTS:** Initially, 6 mg/24 hrs. May increase in 3 mg/24 hrs increments at minimum of 2 wks. **Maximum:** 12 mg/24 hrs. **ELDERLY: Maximum:** 6 mg/24 hrs.

### Dosage in Renal/Hepatic Impairment

**Orally disintegrating tablet:** Not recommended in severe impairment.

**Oral:** Use caution. **Transdermal:** No dose adjustment.

## SIDE EFFECTS

**Frequent (10%–4%):** Nausea, dizziness, light-headedness, syncope, abdominal discomfort. **Occasional (3%–2%):** Confusion, hallucinations, dry mouth, vivid dreams, dyskinesia. **Rare (1%):** Headache, myalgia, anxiety, diarrhea, insomnia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Symptoms of overdose may vary from CNS depression (sedation, apnea, cardiovascular collapse, death) to severe paradoxical reactions (hallucinations, tremor, seizures). Impaired motor coordination, (loss of balance, blepharospasm, facial grimaces, feeling of heaviness in lower extremities), depression, nightmares, delusions, overstimulation, sleep disturbance, anger, hallucinations, confusion may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Receive full medication history and screen for contraindications/interactions. Question medical history as listed in Precautions. Assess current state of mental health.

### INTERVENTION/EVALUATION

Be alert to neurologic effects (headache, lethargy, mental confusion, agitation). Monitor for evidence of dyskinesia (difficulty with movement). Assess for clinical reversal of symptoms (improvement of tremors of head/hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Monitor for unusual behavior, worsening depression, suicidal ideation, especially at initiation of therapy or with changes in dosage.

### PATIENT/FAMILY TEACHING

- Tolerance to dizziness, light-headedness develops during therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Dry mouth, drowsiness, dizziness may be an expected response to drug.
- Avoid

alcohol. • Report worsening depression, unusual behavior, thoughts of suicide. • Avoid tyramine-rich foods. • Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Do not take herbal supplements.

## selinexor

sel-i-nex-or  
(Xpovio)

**Do not confuse selinexor with Effxor or selegiline. Xpovio with Xeloda, Xgeva, Xtandi.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nuclear export inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of adults with relapsed or refractory multiple myeloma (in combination with dexamethasone) who have received at least four prior therapies and whose disease is refractory to at least two proteasome inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody. Treatment of multiple myeloma (in combination with bortezomib and dexamethasone) in adults who have received at least 1 prior therapy. Treatment of adults with relapsed or refractory diffuse large B-cell lymphoma (DLBCL), not otherwise specified, including DLBCL arising from follicular lymphoma, after at least two lines of systemic therapy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to selinexor. **Cautions:** Baseline cytopenias, hepatic impairment, optic disorders, uncorrected hyponatremia, fall risk, elderly, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic opportunistic infections (e.g.,

herpesvirus infection, fungal infections), pts at risk for bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma, concomitant use of anticoagulants, NSAIDs, antiplatelets).

## ACTION

Reversibly inhibits nuclear export of tumor suppressor proteins, growth regulators, messenger RNA of oncogenic proteins by blocking protein exportin 1 (XPO1), leading to blockage of exportin 1. **Therapeutic Effect:** Reduces oncogenic proteins, causes cell cycle arrest and cancer cell apoptosis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95%. Peak plasma concentration: 4 hrs. Excretion not specified. **Half-life:** 6–8 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of serious or fatal adverse reactions.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (Intravesical)**, **vaccines (live)**. **Pimecrolimus**, **tacrolimus (topical)** may enhance the adverse/toxic effects. May increase adverse effects of **natalizumab**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatine kinase, glucose, creatinine. May decrease serum albumin, calcium, sodium, magnesium, phosphate; absolute neutrophil count

(ANC), Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets, RBCs. May increase or decrease serum potassium.

## AVAILABILITY (Rx)

**Tablets:** 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer tablets whole with water; do not break, crush, or divide. Tablets cannot be chewed.
- If a dose is missed or vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma (Relapsed or Refractory)

**PO; ADULTS:** (Pts who have received at least 4 prior therapies): 80 mg on days 1 and 3 of each wk (in combination with dexamethasone). Continue until disease progression or unacceptable toxicity. (Pts who have received at least 1 prior therapy): 100 mg once wkly on day 1 of each wk (in combination with bortezomib and dexamethasone). Continue until disease progression or unacceptable toxicity.

### DLBCL (Relapsed or Refractory)

**PO; ADULTS:** 60 mg on days 1 and 3 of each wk. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**(Multiple myeloma): First dose reduction:** 100 mg once wkly. **Second dose reduction:** 80 once wkly. **Third dose reduction:** 60 mg once wkly. **Unable to tolerate 60-mg dose:** Permanently discontinue.

**(DLBCL): First dose reduction:** 40 mg on day 1 and 3 each of wk (80 mg total). **Second dose reduction:** 60 once wkly. **Third dose reduction:** 40 mg once wkly. **Unable to tolerate 40-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Anemia**

**(Multiple myeloma/DLBCL): Hgb less than 8 mg/dL:** Reduce one dose level. **Life-threatening anemia:** Withhold treatment until Hgb improves to 8 g/dL, then resume at reduced dose level.

**Neutropenia**

**(Multiple myeloma): ANC 500–1,000 cells/mm<sup>3</sup> without fever:** Reduce one dose level. **ANC less than 500 cells/mm<sup>3</sup> or febrile neutropenia:** Withhold treatment until ANC improves to 1,000 cells/mm<sup>3</sup>, then resume at reduced dose level.

**(DLBCL): ANC 500–1,000 cells/mm<sup>3</sup> without fever:** For first occurrence, withhold treatment until ANC improves to 1,000 cells/mm<sup>3</sup>, then resume at same dose. If recurs, reduce one dose level.

**ANC less than 500 cells/mm<sup>3</sup> or febrile neutropenia:** Withhold treatment until ANC improves to 1,000 cells/mm<sup>3</sup>, then resume at reduced dose level.

**Thrombocytopenia**

**(Multiple myeloma): Platelet count 25,000–74,999 cells/mm<sup>3</sup>:** Reduce one dose level. **Platelet count 25,000–74,999 cells/mm<sup>3</sup> with bleeding:** Withhold treatment until bleeding resolves, then resume at reduced dose level. **Platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count improves to 50,000 cells/mm<sup>3</sup>, then resume at one reduced dose level.

**(DLBCL): Platelet count 50,000–74,999 cells/mm<sup>3</sup>:** Interrupt one dose, then resume at same dose. **Platelet count 25,000–49,999 cells/mm<sup>3</sup> without bleeding:** For first occurrence, withhold treatment until platelet count improves to greater than or equal to 50,000 cells/mm<sup>3</sup>, then resume at reduced dose level. **Platelet count 25,000–49,999 cells/mm<sup>3</sup> with bleeding:** Withhold treatment until bleeding resolves and platelet count improves to 50,000 cells/mm<sup>3</sup>, then resume at reduced dose level. **Platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet

count improves to 50,000 cells/mm<sup>3</sup>, then resume at reduced dose level.

**Diarrhea**

**Grade 2 diarrhea:** For first occurrence, maintain dose. If recurs, reduce one dose level. **Grade 3 or 4 diarrhea:** Withhold treatment until improved to Grade 2 or less, then resume at reduced dose level.

**Fatigue**

**Grade 2 fatigue (lasting longer than 7 days); Grade 3 fatigue:** Withhold treatment until improved to Grade 1 or baseline, then resume at reduced dose level.

**Hyponatremia**

**Serum sodium level 130 mmol/L or less:** Withhold treatment until improved to greater than 130 mmol/L, then resume at reduced dose level.

**Nausea/Vomiting**

**Grade 1 or 2 nausea/vomiting:** Maintain dose. **Grade 3 nausea; Grade 3 or 4 vomiting:** Withhold treatment until improved to Grade 2 or less, then resume at one reduced dose level.

**Ocular Toxicity**

**Grade 2 ocular toxicity (excluding cataract):** Withhold treatment until improved to Grade 1 or baseline, then resume at one reduced dose level. **Grade 3 or 4 ocular toxicity:** Permanently discontinue. **Grade 2 (or higher) cataract:** Reduce one dose level.

**Weight Loss/Anorexia**

**Weight loss of 10% to less than 20%; anorexia associated with significant weight loss or malnutrition:** Withhold treatment until improved to more than 90% of baseline weight, then resume at one reduced dose level.

**Other Nonhematologic Toxicity**

**Any other Grade 3 or 4 toxicity:** Withhold treatment until improved to Grade 2 or lower, then resume at one reduced dose level.

**Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment. **ESRD, dialysis:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Note:** Frequency and occurrence of side effects may vary based on indicated treatment. **Frequent (73–24%):** Fatigue, asthenia, nausea, decreased appetite, decreased weight, diarrhea, vomiting, constipation, dyspnea. **Occasional (17%–10%):** Edema, cough, pyrexia, musculoskeletal pain, dizziness, insomnia, dehydration, dysgeusia, ageusia, vision blurred, reduced visual acuity, hypotension, headache, abdominal pain, peripheral neuropathy.

**ADVERSE EFFECTS/TOXIC REACTIONS**

**Note:** Frequency and occurrence of adverse reactions may vary based on indicated treatment.

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including febrile neutropenia, hemorrhagic thrombocytopenia may occur. Hemorrhagic events (corneal bleeding, epistaxis, GI/rectal bleeding, hematoma, hematuria, subdural hematoma) reported in 10% of pts. GI toxicities (anorexia, diarrhea, nausea, vomiting, weight loss) reported in 80% of pts. Life-threatening hyponatremia reported in 39%–62% of pts. Serious and fatal infections (adenovirus, bronchitis, bronchiolitis, herpesvirus infection, pharyngitis, nasopharyngitis, parainfluenza, pneumonia, respiratory syncytial virus infection, rhinitis, rhinovirus, sepsis, UTI) were reported. Life-threatening neurologic toxicities (amnesia, decreased level of consciousness, confusion, delirium, hallucinations) reported in 30% of pts. Falls reported in 8% of pts. Cardiac failure, cataracts reported in 3% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, body weight; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Administer prophylactic antiemetic prior to each dose. Question history of hepatic impairment, herpesvirus infection, chronic opportunistic infections, optic disorders. Assess nutritional/hydration status. Obtain dietary consultation. Assess risk for bleeding. Screen for active infection. Initiate fall precautions. Assess usual bowel movement patterns, stool characteristics. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor ANC, CBC, BMP, body weight frequently during the first 3 mos of treatment, then as indicated. Diligently monitor for infections (cough, fever, fatigue), esp. respiratory tract infections, herpesvirus infection, sepsis. If serious infection or sepsis occurs, initiate appropriate antimicrobial therapy. Assess for symptoms of hyponatremia (coma, confusion, headache, lethargy, nausea, seizures, vomiting). Administer RBC transfusion per clinical guidelines if anemia occurs. Administer platelet transfusion per clinical guidelines if bleeding occurs in pts with thrombocytopenia. Consider growth colony-stimulating factor in pts with neutropenia. Withhold treatment 24 hrs before and 72 hrs after cataract surgery. Assess proper hydration/nutritional intake, I&Os. Offer antiemetics if nausea/vomiting occurs; antidiarrheal agent if diarrhea occurs. Monitor daily pattern of bowel activity, stool consistency. Monitor for neurologic toxicities (confusion, hallucinations, lethargy). Assess for visual changes at each office visit. If change of vision occurs, consider referral to ophthalmologist. Monitor for GI/genitourinary bleeding, bloody stool; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures).

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), nervous system changes (confusion, delirium, difficulty speaking, dizziness, hallucinations, pain, paralysis, numbness), change of vision, fatigue, weight loss, bleeding of any kind.
- Diarrhea, nausea, vomiting are common side effects that may cause dehydration, electrolyte imbalance, malnutrition. Drink plenty of fluids. Maintain proper caloric and nutritional intake.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Avoid tasks that require alertness, motor skills until response to drug is established.

**selpercatinib**

sel-per-ka-tih-nib  
(Retevmo)

**Do not confuse selpercatinib with selinexor, selumetinib, or tucatinib.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** RET kinase inhibitor, tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with metastatic RET fusion-positive non-small cell lung cancer (NSCLC). Treatment of adults and pediatric pts 12 yrs and older with advanced or metastatic RET-mutant medullary thyroid cancer (MTC) who require systemic therapy; or advanced, metastatic RET fusion-positive thyroid cancer who require

systemic therapy and who are radioactive iodine refractory (if radioactive iodine is appropriate).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to selpercatinib. **Cautions:** Baseline cytopenias, hepatic impairment, hypertension, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); pts at risk for QTc interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HE, QT interval—prolonging medications, hypokalemia, hypomagnesemia); pts at risk for bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma, concomitant use of anticoagulants, NSAIDs, antiplatelets). Do not initiate in pts with uncontrolled hypertension.

**ACTION**

Inhibits wild-type RET, multiple mutated RET fusion proteins, vascular endothelial growth factor (VEGFR) 1 and VEGFR3 receptors, and fibroblast growth factor receptor (FGFR). Mutations in RET can result in activated RET fusion proteins, which can act as oncogenic drivers, promoting tumor cell line proliferation. **Therapeutic Effect:** Exhibits antitumor activity in cells with activation of RET proteins.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 97%. Peak plasma concentration: 2 hrs. Excreted in feces (69%), urine (24%). **Half-life:** 32 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established

◆ Canadian trade name

 Non-Crushable Drug

 High Alert drug

in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A4 inhibitors (e.g., erythromycin, diltiazem, fluconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A4 inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. Histamine-2 receptor antagonists (e.g., famotidine); antacids containing magnesium, calcium, aluminum, bicarbonate; proton pump inhibitors (e.g., omeprazole, pantoprazole) may reduce concentration/effect. QT interval-prolonging medications (e.g., amiodarone, azithromycin, entrectinib, haloperidol, methadone, quetiapine, ribociclib) may increase risk of QTc interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, cholesterol (total), potassium. May decrease serum albumin, calcium, creatinine, magnesium, sodium; leukocytes, platelets. May increase or decrease serum glucose.

## AVAILABILITY (Rx)

**Capsules:** 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO.

- If concomitant use of proton pump inhibitor (e.g., pantoprazole) is unavoidable, give selpercatinib with food; otherwise, may give without regard to food.
- Give 2 hrs before or 10 hrs after histamine-2 receptor antagonist (e.g., famotidine).
- Give 2 hrs before or 2 hrs after locally acting antacid (e.g., magnesium-, calcium-, aluminum-, bicarbonate-containing antacids).
- Administer capsules

whole; do not break, cut, or open.

- Capsules cannot be chewed.
- Do not give a missed dose within 6 hrs of next dose.
- If vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).

## INDICATIONS/ROUTES/DOSAGE

**NSCLC (Metastatic RET Fusion-Positive), MTC (Advanced or Metastatic RET-Mutant), Thyroid Cancer (Advanced, Metastatic RET Fusion-Positive)**

**PO: ADULTS, CHILDREN 12 YRS AND OLDER: (LESS THAN 50KG):** 120 mg twice daily. **(50 KG OR GREATER):** 160 mg twice daily. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

Dose Reduction for Adverse Reactions	Weighing less than 50 kg	Weighing 50 kg or greater
First reduction	80 mg twice daily	120 mg twice daily
Second reduction	40 mg twice daily	80 mg twice daily
Third reduction	40 mg once daily	40 mg twice daily

Permanently discontinue in pts unable to tolerate 3 dose reductions.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Hepatotoxicity

**Grade 3 or 4 hepatotoxicity:** Withhold treatment and monitor serum ALI/AST w/ky until improved to Grade 1 or baseline, then resume at a reduced dose by 2 dose levels. Continue to monitor serum ALI/AST w/ky until 4 wks after reaching the dose prior to Grade 3 or 4 hepatotoxicity, then increase dose by 1 dose level (after at least 2 wks without recurrence), then increase to dose taken prior to Grade 3 or 4 hepatotoxicity (after at least 4 wks without recurrence).

### Hemorrhagic Events

**Grade 3 or 4 hemorrhage:** Withhold treatment until improved to Grade 1 or 0.

**Severe or life-threatening hemorrhage:** Permanently discontinue

#### **Hypersensitivity Reactions**

**Any grade hypersensitivity reaction:** Withhold treatment until resolved with corticosteroids, then resume at a reduced dose by 3 dose levels (while continuing corticosteroids). May increase dose by 1 dose level each wk until reaching the dose prior to hypersensitivity reaction, then taper corticosteroids.

#### **Hypertension**

**Grade 3 hypertension (despite optimal hypertensive therapy):** Withhold treatment until adequately controlled, then resume at reduced dose level.

**Grade 4 hypertension:** Permanently discontinue.

#### **QT Interval Prolongation**

**Grade 3 QT interval prolongation:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose level. **Grade 4 QT interval prolongation:** Permanently discontinue.

#### **Other Toxicities**

**Any Grade 3 or 4 toxicities:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level.

#### **Concomitant Use of Strong CYP3A Inhibitor**

**WEIGHING 50 KG OR GREATER:** Reduce dose to 80 mg twice daily. **WEIGHING LESS THAN 50 KG:** Reduce dose to 40 mg twice daily.

#### **Concomitant Use of Moderate CYP3A Inhibitor**

**WEIGHING 50 KG OR GREATER:** Reduce dose to 120 mg twice daily. **WEIGHING LESS THAN 50 KG:** Reduce dose to 80 mg twice daily.

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose to 80 mg twice daily.

## **SIDE EFFECTS**

**Frequent (39%–23%):** Dry mouth, diarrhea, hypertension, fatigue, asthenia, malaise, edema (eye, eyelid, face, localized, lymph, peripheral, scrotal), rash, constipation, nausea, headache, abdominal pain. **Occasional (18%–16%):** Cough, dyspnea, vomiting.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Leukopenia, thrombocytopenia is an expected response to therapy. Serious hepatotoxicity reported in 3% of pts. Serum ALT/AST elevation reported in 45% and 51% of pts, respectively. Grade 3 hypertension (17% of pts), Grade 4 hypertension (less than 1% of pts) has occurred. Concentration-dependent QT interval prolongation may occur, increasing risk of cardiac arrhythmias. Life-threatening hemorrhagic events (intraabdominal, GI, facial, genitourinary, intracranial, pulmonary, rectal, vaginal hemorrhage), ecchymosis, epistaxis, hematoma, hemoptysis, tracheal site hemorrhage may occur. Symptoms of hypersensitivity reactions including arthralgia, fever, myalgia, rash may occur with concurrent thrombocytopenia, transaminitis. May cause impaired wound healing.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain CBC, serum electrolytes, LFT, TSH, ECG, B/P; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Verify presence of a RET gene fusion (NSCLC, thyroid cancer) or specific RET gene mutation (MTC) in tumor specimens or plasma. Withhold treatment at least 7 days prior to elective surgery. Do not administer for at least 2 wks after major surgery. Assess skin for open wounds, surgical incisions. Question history of hypertension, hepatic impairment, recent surgery. Assess risk for bleeding. Screen for active infection. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor CBC, serum electrolytes, LFT, TSH, ECG periodically; LFT q2wks for the first 3 mos, then monthly thereafter (or wkly in pts with hepatotoxicity); B/P after 1 wk, then at least monthly thereafter. Manage hypersensitivity reactions with corticosteroids therapy. Assess for toxicities if concomitant use of CYP3A4 inhibitor is unavoidable. If concomitant use QT interval–prolonging medications is unavoidable, monitor ECG for QT interval prolongation, cardiac arrhythmias. Assess wounds/incisions for adequate healing following any surgery. Monitor daily pattern of bowel activity, stool consistency, I&Os. Monitor for bleeding of any kind; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures).

**PATIENT/FAMILY TEACHING**

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection. • Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), allergic reactions (rash, fever, muscle or joint pain), hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision), bleeding of any kind. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Treatment may cause or worsen high blood pressure. • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment. Do not ingest grapefruit products or herbal supplements. Avoid use of acid-reducing medications. • Treatment may affect the electrical conduction of the heart, which may lead to arrhythmias; report chest pain, dizziness, fainting, palpitations. • Notify physician before any planned surgeries/dental procedures.

**semaglutide**

sem-a-gloo-tide

(Ozempic, Rybelsus, Wegovy)

■ **BLACK BOX ALERT** ■ Thyroid C-cell tumors have occurred in rodent studies with glucagon-like peptide-1 (GLP-1) receptor agonists; unknown if relevant in humans. Contraindicated in pts with a personal/family history of medullary thyroid carcinoma or in pts with multiple endocrine neoplasia syndrome type 2.

**Do not confuse semaglutide with albiglutide, dulaglutide, liraglutide, or teduglutide.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Glucagon-like peptide-1 (GLP-1) receptor agonist. **CLINICAL:** Antidiabetic.

**USES**

**(Ozempic, Rybelsus):** Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus. Risk reduction of major cardiovascular (CV) events in adults with type 2 diabetes mellitus and established cardiovascular disease. **(Wegovy):** Adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in adults with an initial BMI of 30 kg/m<sup>2</sup> or greater (obesity), or 27 kg/m<sup>2</sup> or greater (overweight) in the presence of at least one weight-related comorbid condition.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to semaglutide. Personal/family history of medullary thyroid carcinoma (MTC). Pts with multiple endocrine neoplasia syndrome type 2 (MEN2). **Cautions:** Mild to moderate gastroparesis, renal impairment. History of pancreatitis. Not recommended in pts with severe GI disease, diabetic ketoacidosis, type 1 diabetes mellitus, or pancreatitis, or for use as first-line treatment regimen.

**ACTION**

Agonist of human glucagon-like peptide-1 (GLP-1). Increases glucose-dependent insulin secretion. Decreases inappropriate glucagon secretion. Slows gastric emptying. **Therapeutic Effect:** Augments glucose-dependent insulin secretion.

**PHARMACOKINETICS**

Widely distributed. Metabolized by proteolytic enzymes via protein degradation into small peptides, amino acids. Protein binding: greater than 99%. Peak plasma concentration: 1–3 days. Steady state reached in 4–5 wks. Excreted in urine (3% unchanged), feces. **Half-life:** 7 days.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Due to extended clearance period, recommend discontinuation of therapy at least 2 mos before planned pregnancy. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase hypoglycemic effect of **insulins, sulfonylureas (e.g., glipizide, glyBURIDE)**. **HERBAL:** **Herbals with hypoglycemic properties (e.g., fenugreek, maitake)** may increase effect. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum glucose, Hgb A1c. May increase serum amylase, lipase.

**AVAILABILITY (Rx)**

**Injection Solution, Prefilled Injector Pen:** (*Ozempic*): 1 mg/dose or 0.25 mg or 0.5 mg per dose (2 mg/1.5 mL). **Solution, Auto-Injector:** (*Wegovy*): 0.25 mg/0.5 mL, 0.5 mg/0.5 mL, 1 mg/0.5 mL, 1.7 mg/0.75 mL, 2.4 mg/0.75 mL. **Tablets:** 3 mg, 7 mg, 14 mg.

**ADMINISTRATION/HANDLING****PO**

• Administer on an empty stomach, at least 30 min before the first food intake,

beverage, or other oral medications of the day. • Take with 4 oz of plain water only. Eat 30–60 min after dose. • Administer whole; do not break, cut, or crush. Tablets cannot be chewed.

**SQ**

**Guidelines** • Administer any time of the day, without regard to food, on the same day of each wk. May change administration day if the time between two doses is at least 2 days. • If dose is missed, administer within 5 days of missed dose. If more than 5 days pass after missed dose, wait until next regularly scheduled dose.

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless, and free of particles. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously into abdomen, outer thigh, or upper arm, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscular. • Rotate injection sites.

**Storage** • Refrigerate unused injector pens. • Once used, may refrigerate or store at room temperature for up to 56 days. • Do not freeze. • Protect from sunlight.

**INDICATIONS/ROUTES/DOSAGE****Type 2 Diabetes Mellitus, Risk Reduction of Major CV Events**

**Note:** The lower initial dose (0.25 mg wkly) is intended to reduce GI symptoms.

**SQ: ADULTS, ELDERLY:** Initially, 0.25 mg once wkly for 4 wks, then increase to 0.5 mg once wkly for at least 4 wks. If glycemic response is inadequate, may further increase to a maximum of 1 mg once wkly.

**PO: ADULTS, ELDERLY:** Initially, 3 mg once daily for 30 days, then increase to 7 mg once daily for at least 30 days. May further increase to 14 mg once daily. **Note:** The 3 mg dose is intended only for therapy initiation.

**Weight Management (Chronic)**

**SQ: ADULTS: Wks 1–4:** 0.25 mg once wkly. **Wks 5–8:** 0.5 mg once wkly. **Wks 9–12:** 1 mg once wkly. **Wks 13–16:** 1.7 mg once wkly. **Wk 17 and thereafter (maintenance dose):** 2.4 mg once wkly. May decrease dose to 1.7 mg once wkly for up to 4 additional wks, then increase to 2.4 mg once wkly.

**Dosage in Renal/Hepatic Impairment**

**Mild to severe impairment:** No dose adjustment.

**SIDE EFFECTS**

**Occasional (15%–5%):** Nausea, vomiting, diarrhea, abdominal pain, constipation.

**Rare (less than 1%):** Injection site reactions (pain, erythema), fatigue, dysgeusia, dizziness.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. with dehydration), severe gastroparesis, pancreatitis, thyroid C-cell tumors. Hypersensitivity reactions including anaphylaxis, angioedema were reported. May increase risk of hypoglycemia when used with other hypoglycemic agents, insulin. Diabetic retinopathy complications reported in 1% of pts. Worsening of diabetic retinopathy has been associated with rapid improvement of glucose control. Cholelithiasis reported in 2% of pts. Immunogenicity (anti-semaglutide antibody formation) reported in 1% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain glucose level, Hgb A1c. Obtain BUN, serum creatinine, eGFR, CrCl in pts with renal impairment. Question history of medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2, hypersensitivity reaction, pancreatitis. Screen for use of other hypoglycemic agents, insulin. Assess pt's understanding of diabetes management, routine home glucose monitoring.

Assess hydration status. Obtain dietary consult for nutritional education. Assess pt's willingness to self-inject medication.

**INTERVENTION/EVALUATION**

Monitor capillary blood glucose levels, Hgb A1c; renal function in pts with renal impairment reporting severe GI symptoms such as diarrhea, gastroparesis, vomiting. Monitor for hypersensitivity reaction. Screen for thyroid tumors (dysphagia, dyspnea, persistent hoarseness, neck mass). If tumor is suspected, consider endocrinologist consultation. Assess for hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (confusion, fatigue, Kussmaul breathing, nausea, polyuria, vomiting). Screen for glucose-altering conditions: fever, stress, surgical procedures, trauma. Monitor for pancreatitis (severe, steady abdominal pain often radiating to the back [with or without vomiting]). Encourage fluid intake. Monitor I&Os.

**PATIENT/FAMILY TEACHING**

- A healthcare provider will show you how to properly prepare and inject medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood sugar regularly.
- Monitor daily calorie intake.
- When taking additional medications to lower blood sugar or when glucose demands are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have low blood sugar treatment available (glucagon, oral dextrose).
- Therapy may increase risk of thyroid cancer; report lumps or swelling of the neck, hoarseness, shortness of breath, trouble swallowing.
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Report allergic reactions of any kind, esp. difficulty

breathing, itching, rash, swelling of the face or throat. • Kidney injury or kidney failure may occur; report decreased urine output, amber-colored urine, flank pain.

## serdexmethylphenidate/dexmethylphenidate

ser-dex-meth-il-fen-i-date/dex-meth-il-fen-i-date  
(Azstarys)

■ **BLACK BOX ALERT** ■ CNS stimulants, other methylphenidate-containing products, amphetamines have high potential for drug abuse and dependency. Due to high risk of abuse, monitor for symptoms of drug abuse and misuse (drug-seeking behavior, dependency).

**Do not confuse serdexmethylphenidate/dexmethylphenidate with dexmethylphenidate, methylphenidate, or dexmethylphenidate.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** CNS stimulant (Schedule II). **CLINICAL:** CNS stimulant.

### USES

Treatment of attention deficit hyperactivity disorder (ADHD) in pts 6 yrs of age and older.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to serdexmethylphenidate, dexmethylphenidate, methylphenidate. Concomitant use with or within 14 days of monoamine oxidase inhibitors (MAOIs). **Cautions:** Family history of sudden cardiac death, ventricular arrhythmias, suicide, psychiatric disorders. Personal history of hypertension, seizure disorder, hyperthyroidism, bipolar disorder,

depression, psychosis, mania, other psychiatric diseases; substance abuse (e.g., history of depression, mood disorder, psychiatric disorder; history of drug abuse); pts at high risk for suicide ideation and behavior. Adults with history of arterial thrombosis (CVA, MI). Avoid use in pts with structural cardiac abnormalities, coronary artery disease, cardiomyopathy, cardiac conduction disturbances.

### ACTION

The exact mechanism of action in ADHD is unknown. Blocks reuptake of norepinephrine, dopamine and increases their release into the extraneuronal space. **Therapeutic Effect:** Decreases motor restlessness, fatigue. Increases motor acuity, attention span, mental alertness. Produces mild euphoria.

### PHARMACOKINETICS

Widely distributed. Metabolized via enzymatic activity to metabolite ritalinic acid. Protein binding: 47%–56%. Peak plasma concentration: 2 hrs. Steady state reached after third dose. Excreted in urine (62%), feces (37%). **Half-life:** 5.7 hrs (serdexmethylphenidate)/11.7 hrs (dexmethylphenidate).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. **Children:** May have increased risk of developing anorexia, insomnia, abdominal pain, decreased weight, inhibited growth. Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline, tranylcypromine) may increase risk of hypertensive crisis; use contraindicated. May decrease therapeutic effect of antihypertensives (e.g., amlodipine, HCTZ, hydralazine, lisinopril,

S

**losartan**). May increase the hypertensive effect of **inhalational anesthetics**. **Other CNS stimulants (e.g., caffeine, dextroamphetamine, phentermine)** may have additive effect. **Alcohol** may increase adverse effects. **HERBAL: Ephedra** may cause hypertension, arrhythmias. **Yohimbe** may increase CNS stimulation. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (RX)

**Capsules:** (serdexmethylphenidate/dexmethylphenidate): 26.1 mg/5.2 mg, 39.2 mg/7.8 mg, 52.3 mg/10.4 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer whole or sprinkle contents into 50 mL of water or on 2 tablespoons of applesauce. Consume within 10 min. Do not store for later administration time.

## INDICATIONS/ROUTES/DOSAGE

### ADHD

**PO: ADULTS, ADOLESCENTS:** Initially, 39.2 mg/7.8 mg once daily in AM for 7 days, then increase to 52.3 mg/10.4 mg once daily in AM. **Maximum:** 52.3 mg/10.4 mg/day. **CHILDREN 6 YRS OF AGE OR OLDER:** Initially, 39.2 mg/7.8 mg once daily in AM for 7 days. May either increase to 52.3 mg/10.4 mg once daily in AM or decrease to 26.1 mg/5.2 mg once daily in AM. **Maximum:** 52.3 mg/10.4 mg/day.

### Transition From Other Methylphenidate Products

May begin titration of serdexmethylphenidate/dexmethylphenidate after methylphenidate product is discontinued. Do not substitute a mg-per-mg equivalency with other methylphenidate products.

### Discontinuation/Dose Reduction

Either reduce dose or discontinue treatment if paradoxical aggravation or adverse reaction occurs. Periodical

discontinuation is recommended to assess pt's condition. Discontinue treatment if symptoms do not improve after 4 wks.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent:** Anxiety, insomnia, decreased appetite, dizziness. **Occasional:** Drowsiness, headache, nausea, abdominal pain, pyrexia, rash, arthralgia, vomiting, blurred vision, palpitations, affect lability, irritability, hypertension.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce skin pallor/flushing, cardiac arrhythmias, psychosis. Cardiovascular events, including sudden cardiac death, CVA, MI, were reported in adults taking CNS stimulants. Sudden cardiac death was reported in adolescents with structural cardiac abnormalities, other cardiac problems who take CNS stimulants. May increase heart rate, B/P. Psychiatric events, including exacerbation of preexisting psychosis, induction of manic episodes (in pts with bipolar disorder), psychotic or manic symptoms, have occurred. Priapism (a prolonged and painful erection) was reported, which may require medical intervention. Prolonged use in children with ADHD may temporarily suppress normal weight/height pattern. May cause peripheral vasculopathy (including Raynaud's phenomenon).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P, heart rate. Assess attention span, impulsivity, interaction with others, distractibility. Assess for potential of abuse/misuse (e.g., drug-seeking

behavior, mental health conditions, history of substance abuse). Question history of cardiac disease, cardiac conduction abnormalities; anxiety, depression, mood disorder, suicidal ideation and behavior; arterial thrombosis (CVA, MI) in adults. Receive full medication history and screen for interactions (esp. use of MAOIs).

#### INTERVENTION/EVALUATION

Monitor B/P, heart rate. Assess for clinical improvement of ADHD. If paradoxical return of attention deficit occurs, dose should be decreased or discontinued. Monitor weight/growth in children and adolescents. Monitor for drug abuse and misuse, drug-seeking behavior. Diligently assess for new-onset or worsening of anxiety, depression, mood disorder; manic behavior in pts with bipolar disorder. Consult mental health professional if mood disorder is suspected. Monitor for symptoms of CVA (aphasia, altered mental status, hemiplegia, vision loss, seizures); MI (arm/jaw pain, chest pain, diaphoresis, dyspnea) in adults.

#### PATIENT/FAMILY TEACHING

- Take dose in early in morning to avoid insomnia.
- Report anxiety, chest pain, difficulty breathing, palpitations.
- Seek medical attention if a prolonged and painful erection occurs.
- Treatment may cause high blood pressure; rapid heart rate.
- Seek immediate medical attention if new onset or worsening of anxiety, depression, or changes in mood occur.
- Sudden cardiac death, heart attack, stroke have occurred in adults. Report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm, sweating), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision).
- Sudden cardiac death has occurred in children with history of heart defects or heart problems.
- Stimulants have a high risk of drug abuse and physical dependency.

## sertraline

ser-tra-leen  
(Zoloft)

**BLACK BOX ALERT** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse sertraline with cetirizine, selegiline, Serentil, or Serevent, or Zoloft with Zocor.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor. **CLINICAL:** Antidepressant, anxiolytic, obsessive-compulsive disorder adjunct.

#### USES

Treatment of major depressive disorders, panic disorder, obsessive-compulsive disorder (OCD), posttraumatic stress disorder (PTSD), premenstrual dysphoric disorder (PMDD), social anxiety disorder. **OFF-LABEL:** Eating disorders, bulimia nervosa, generalized anxiety disorder (GAD).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to sertraline. MAOI use within 14 days (concurrently or within 14 days of stopping an MAOI or sertraline). Concurrent use of oral concentrate (contains alcohol) with disulfiram. Concurrent use with pimozide; initiation in pts treated with linezolid or methylene blue.

**Cautions:** Seizure disorder, hepatic impairment, pts at risk for uric acid nephropathy, elderly, pts in third trimester of pregnancy, pts at high risk for suicide, family history of bipolar disorder or mania, pts with risk factors for QT prolongation (e.g., hypokalemia, hypomagnesemia), alcoholism. Pts in whom weight loss is undesirable.

S

**ACTION**

Blocks reuptake of the neurotransmitter serotonin at CNS neuronal presynaptic membranes, increasing availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression, reduces obsessive-compulsive behavior, decreases anxiety.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 98%. Metabolized in liver. Excreted in urine (45%), feces (45%). Not removed by hemodialysis. **Half-life:** 26 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Children and adolescents are at increased risk for suicidal ideation and behavior or worsening of depression, esp. during the first few mos of therapy. **Elderly:** No age-related precautions noted, but lower initial dosages recommended.

**INTERACTIONS**

**DRUG:** Alcohol, disulfiram may increase adverse effects. **Anticoagulants** (e.g., heparin, rivaroxaban, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., diclofenac, meloxicam, naproxen) may increase risk of bleeding. **MAOIs** (e.g., phenelzine, selegiline) may cause neuroleptic malignant syndrome, serotonin syndrome. **Serotonergic drugs** (e.g., buspirone, carbamazepine, fentanyl, linezolid, lithium, SNRIs [e.g., duloxetine, venlafaxine]) may cause serotonin syndrome. May increase concentration, toxicity of tricyclic antidepressants (e.g., amitriptyline, doxepin). **HERBAL:** Glucosamine, herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba, ginseng) may increase concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase total serum cholesterol, triglycerides, ALT, AST. May decrease serum uric acid.

**AVAILABILITY (Rx)**

**Oral Concentrate:** 20 mg/mL. **Tablets:** 25 mg, 50 mg, 100 mg.

**ADMINISTRATION/HANDLING****PO**

• Give with food, milk if GI distress occurs. • Oral concentrate must be diluted before administration. Mix with 4 oz water, ginger ale, lemon/lime soda, or orange juice only. Give immediately after mixing.

**INDICATIONS/ROUTES/DOSAGE****Depression**

**PO: ADULTS:** Initially, 50 mg/day. May increase by 25–50 mg/day at 7-day intervals up to 300 mg/day. **ELDERLY:** Initially, 25 mg/day. May increase by 25–50 mg/day at 7-day intervals up to 300 mg/day.

**Obsessive-Compulsive Disorder (OCD)**

**PO: ADULTS, CHILDREN 13–17 YRS:** Initially, 50 mg/day with morning or evening meal. May increase by 25–50 mg/day at 7-day intervals up to 200 mg/day. **ELDERLY, CHILDREN 6–12 YRS:** Initially, 25 mg/day. May increase by 25–50 mg/day at 7-day intervals. **Maximum:** 200 mg/day.

**Panic Disorder**

**PO: ADULTS, ELDERLY:** Initially, 25 mg once daily for 3–7 days. May increase to 50 mg/day. May further increase dose based on response and tolerability in increments of 25–50 mg at intervals of at least 1 wk. **Maximum:** 200 mg/day.

**Posttraumatic Stress Disorder (PTSD), Social Anxiety Disorder (SAD)**

**PO: ADULTS, ELDERLY:** Initially, 25–50 mg/day. May increase by 25–50 mg/day at 7-day intervals. Range: 50–200 mg/day. **Maximum:** 200 mg/day.

**Premenstrual Dysphoric Disorder (PMDD)**

**PO: ADULTS: (Continuous daily dosing):** Initially, 25 mg once daily. Over first month, increase to 50 mg once daily. In subsequent menstrual cycles, an increase up to 200 mg/day may be necessary. **(Luteal phase dosing):** Initially, 25 mg

once daily during luteal phase. Over first month, increase to 50 mg once daily. In subsequent menstrual cycles, an increase up to 150 mg/day may be necessary.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (26%–12%):** Headache, nausea, diarrhea, insomnia, drowsiness, dizziness, fatigue, rash, dry mouth. **Occasional (6%–4%):** Anxiety, nervousness, agitation, tremor, dyspepsia, diaphoresis, vomiting, constipation, sexual dysfunction, visual disturbances, altered taste. **Rare (less than 3%):** Flatulence, urinary frequency, paresthesia, hot flashes, chills.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Serotonin syndrome (seizures, arrhythmias, high fever), neuroleptic malignant syndrome (muscle rigidity, cognitive changes), suicidal ideation have occurred.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Assess appearance, behavior, speech patterns, level of interest, mood. For pts on long-term therapy, CBC, renal function, LFT should be performed periodically. Question history of suicidal ideation and behavior.

**INTERVENTION/EVALUATION**

Assess mental status for depression, suicidal ideation (esp. at beginning of therapy or change in dosage), anxiety, social function, panic attack. Monitor daily pattern of bowel activity, stool consistency. Assist with ambulation if dizziness occurs.

**PATIENT/FAMILY TEACHING**

- Report headache, fatigue, tremor, sexual dysfunction.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, drowsiness).
- Take with food if nausea

occurs. • Avoid alcohol. • Do not take OTC medications without consulting physician. • Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

**sevelamer**

TOP 100

se-vel-a-mer  
(Renagel, Renvela)

**Do not confuse Renagel with Reglan, Regonol, or Renvela, or sevelamer with Savella.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Polymeric phosphate binder. **CLINICAL:** Electrolyte modifier, antihyperphosphatemia agent.

**USES**

Control of serum phosphorus in pts with chronic renal disease on hemodialysis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to sevelamer. Bowel obstruction. **Cautions:** Dysphagia, severe GI tract motility disorders, major GI tract surgery.

**ACTION**

Binds with phosphate within the intestinal lumen without altering calcium, aluminum, or bicarbonate concentration. **Therapeutic Effect:** Inhibits phosphate absorption. Decreases serum phosphate concentration.

**PHARMACOKINETICS**

Not absorbed systemically. Unknown if removed by hemodialysis.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Not distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May decrease concentration/effect of **fluoroquinolones** (e.g., **levoFLOxacin**), **levothyroxine**, **mycophenolate**.

**HERBAL:** None significant. **FOOD:** May cause reduced absorption of **vitamins D, E, K, folic acid**. **LAB VALUES:** Expected to decrease serum phosphate.

**AVAILABILITY (Rx)**

**Powder for Oral Suspension:** (*Renvela*): 0.8 g/pack, 2.4 g/pack.

 **Tablets:** 800 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with meals.
- Space other medication by at least 1 hr before or 3 hrs after sevelamer.
- Give tablets whole; do not break, crush, dissolve, or divide.
- **Oral Suspension:** Mix 0.8 g with 30 mL water (2.4 g with 60 mL water). Stir vigorously to suspend (does not dissolve) just prior to drinking.

**INDICATIONS/ROUTES/DOSAGE****Hyperphosphatemia**

**PO: ADULTS, ELDERLY:** 800–1,600 mg with each meal, depending on severity of hyperphosphatemia (5.5–7.4 mg/dL: 800 mg 3 times/day; 7.5–8.9 mg/dL: 1,200–1,600 mg 3 times/day; 9 mg/dL or greater: 1,600 mg 3 times/day). (*Renvela*): **CHILDREN 6 YRS AND OLDER:** (Pts not taking a phosphate binder): **BSA 0.75–1.1 m<sup>2</sup>:** Initially, 800 mg 3 times daily. Titrate as needed by 400 mg/dose at 2-wk intervals. **BSA greater than 1.1 m<sup>2</sup>:** 1,600 mg 3 times daily. Titrate as needed by 800 mg/dose at 2-wk intervals. **Maintenance:** Based on serum phosphorus concentrations. Goal range: 3.5–5.5 mg/dL.

**Serum Phosphorus**

Concentration	Dosage
Greater than 5.5 mg/dL	Increase by 400–800 mg per meal at 2-wk intervals
3.5–5.5 mg/dL	Maintain current dosage
Less than 3.5 mg/dL	Decrease by 400–800 mg per meal

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (20%–11%):** Infection, pain, hypotension, diarrhea, dyspepsia, nausea, vomiting. **Occasional (10%–1%):** Headache, constipation, hypertension, increased cough.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Thrombosis occurs rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum calcium, phosphate. Question history of bowel obstruction, GI motility disorders.

**INTERVENTION/EVALUATION**

Monitor serum phosphate, calcium.

**PATIENT/FAMILY TEACHING**

- Take with meals, swallow tablets whole; do not chew, crush, dissolve, or divide tablets.
- Report persistent headache, nausea, vomiting, diarrhea, hypotension.

**simvastatin**TOP  
100

**sim**-va-sta-tin  
(FloLipid, Zocor)

**Do not confuse simvastatin with atorvastatin, lovastatin, nystatin, pitavastatin, or pravastatin, or Zocor with Cozaar, Lipitor, Zolof, or Zyrtec.**

**FIXED-COMBINATION(S)**

**Juvisync:** simvastatin/SITagliptin (an antidiabetic agent): 10 mg/100 mg, 20 mg/100 mg, 40 mg/100 mg. **Simcor:** simvastatin/niacin (an antilipemic agent): 20 mg/500 mg, 40 mg/500 mg, 20 mg/750 mg, 20 mg/1000 mg, 40 mg/1000 mg. **Vytorin:** simvastatin/

ezetimibe (a cholesterol absorption inhibitor): 10 mg/10 mg, 20 mg/10 mg, 40 mg/10 mg, 80 mg/10 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hydroxymethylglutaryl-CoA (HMG-CoA) reductase inhibitor. **CLINICAL:** Anti-hyperlipidemic.

### USES

To reduce elevated total cholesterol (total-C), LDL-C, apoB, and triglyceride levels and to increase HDL-C in pts with primary hypercholesterolemia. To reduce total-C, LDL-C, and apoB levels in males and postmenarche females 10–17 yrs of age with heterozygous familial hypercholesterolemia. To reduce total-C and LDL-C in pts with homozygous familial hypercholesterolemia as an adjunct to other lipid-lowering treatments. To reduce the risk of myocardial infarction (MI), stroke, revascularization procedures, and angina in adults without a history of coronary heart disease (CHD), but who have multiple CHD risk factors and in pts with a history of CHD.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to simvastatin. Active hepatic disease or unexplained, persistent elevations of hepatic transaminases, pregnancy, breastfeeding, concurrent use of strong CYP3A4 inhibitors (e.g., clarithromycin, cycloSPORINE, gemfibrozil). **Cautions:** Hepatic disease, diabetes, severe renal impairment, substantial alcohol consumption. Withholding or discontinuing simvastatin may be necessary when pt is at risk for renal failure secondary to rhabdomyolysis. Concomitant use of other medications associated with myopathy.

### ACTION

Interferes with cholesterol biosynthesis by inhibiting conversion of the enzyme HMG-CoA to mevalonate. **Therapeutic Effect:** Decreases LDL, cholesterol,

VLDL, triglyceride levels; increase in HDL concentration.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Excreted in feces (60%), urine (13%). Unknown if removed by hemodialysis.

Route	Onset	Peak	Duration
PO (to reduce cholesterol)	3 days	14 days	N/A

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy (suppression of cholesterol biosynthesis may cause fetal toxicity), lactation. Risk of serious adverse reactions in breastfeeding infants. **Children:** Safety and efficacy not established in children less than 10 yrs of age or in premenarchal girls. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** CycloSPORINE, Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole), amiodarone, calcium channel blockers (e.g., diltiazem, verapamil), colchicine, fibrates, gemfibrozil, niacin, ranolazine may increase risk of acute renal failure, rhabdomyolysis. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration, toxicity. **Red yeast rice** contains 2.4 mg lovastatin per 600 mg rice. **LAB VALUES:** May increase serum creatine kinase (CK), transaminase.

### AVAILABILITY (Rx)

**Oral Suspension:** 20 mg/5 mL, 40 mg/5 mL.  
**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg, 80 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Administer in evening for maximum efficacy. Shake suspension well for 20 sec before administering.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Limit 80-mg dose to pts taking simvastatin longer than 12 mos without evidence of myopathy.

**Heterozygous Familial Hypercholesterolemia**

**PO: ADULTS, ELDERLY:** 20–40 mg once daily in the evening.

**Homozygous Familial Hypercholesterolemia**

**PO: ADULTS, ELDERLY:** 20–40 mg once daily in the evening.

**Prevention of Atherosclerotic Cardiovascular Disease**

**PO: ADULTS, ELDERLY:** 20–40 mg once daily in the evening.

**Heterozygous Familial Hypercholesterolemia (HeFH)**

**PO: CHILDREN 10–17 YRS:** 10 mg once daily in evening. May increase to 20 mg once daily after 6 wks. May further increase to 40 mg once daily after additional 6 wks. **Maximum dose:** 40 mg/day.

**Dosing Adjustment With Medications**

**(CycloSPORINE, gemfibrozil):** Do not exceed 10 mg/day. **(Amiodarone, amLODIPine, ranolazine):** Do not exceed 20 mg/day. **(DiITIAZem, dronedarone, verapamil):** Do not exceed 10 mg/day. **(Lomitapide):** Reduce simvastatin dose by 50% when initiating lomitapide. Do not exceed 20 mg/day.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** Initially, 5 mg/day.

**Dosage in Hepatic Impairment**

Contraindicated with active hepatic disease.

**SIDE EFFECTS**

Generally well tolerated. Side effects are usually mild and transient. **Occasional (3%–2%):** Headache, abdominal pain/cramps, constipation, upper respiratory tract infection. **Rare (less than 2%):** Diarrhea, flatulence, asthenia, nausea/vomiting, depression.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May cause ocular lens opacities. Hypersensitivity reaction, hepatitis occur rarely. Myopathy (muscle pain, tenderness, weakness with elevated serum creatine kinase [CK], sometimes taking the form of rhabdomyolysis) has occurred.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain lipid panel, LFT; urine pregnancy test in females of reproductive potential.

**INTERVENTION/EVALUATION**

Monitor serum cholesterol, triglyceride lab results for therapeutic response. Monitor LFT. Assess for headache, myopathy.

**PATIENT/FAMILY TEACHING**

- Use appropriate contraceptive measures.
- Periodic lab tests are essential part of therapy.
- Maintain appropriate diet. Avoid grapefruit products.
- Report unexplained muscle pain, tenderness, weakness.

**siponimod**

si-pon-i-mod  
(Mayzent)

**Do not confuse siponimod with fingolimod or ozanimod.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sphingosine-1-phosphate receptor modulator.  
**CLINICAL:** Multiple sclerosis agent.

**USES**

Treatment of relapsing forms of multiple sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to siponimod. Pts with CYP2C9\*3/\*3 genotype. Recent (within 6 mos) MI, unstable angina,

CVA, TIA, decompensated HF requiring hospitalization, NYHA class III/IV HF, sick sinus syndrome, Mobitz type II second- or third-degree AV block (unless pt has functioning pacemaker). **Cautions:** Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), baseline sinus bradycardia, severe hepatic impairment, hypertension, altered pulmonary function, pts at risk for developing AV block (congenital heart disease, ischemic heart disease, HF), pts at risk for macular edema (e.g., diabetes, history of uveitis); history of syncope, thromboembolic events (CVA, pulmonary embolism, MI [more than 6 mos prior]). Concomitant use of antiarrhythmics, beta blockers, calcium channel blockers, immunosuppressants, immune modulators, antineoplastics, QT interval-prolonging medications. Not recommended in pts with severe active infection; history of cardiac arrest, cerebrovascular disease, uncontrolled hypertension, or severe, untreated sleep apnea unless approved by a cardiologist.

## ACTION

Blocks capacity of lymphocytes to move out from lymph nodes, reducing the number of lymphocytes available to the CNS. **Therapeutic Effect:** May involve reduction of lymphocyte migration into the CNS, reducing inflammation.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 68%. Peak plasma concentration: 4 hrs. Steady state reached in 6 days. Excreted primarily in feces. **Half-life:** 30 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and up to 10 days after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related hepatic impairment may increase risk of adverse effects/hepatic injury.

## INTERACTIONS

**DRUG:** Beta blockers (e.g., carvedilol, metoprolol), bretylium, calcium channel blockers (e.g., diltiazem, verapamil), ceritinib, digoxin, lacosamide may increase risk of AV block, bradycardia. May increase QT interval—prolonging effect of amiodarone, azithromycin, haloperidol. May decrease therapeutic effect of BCG (intravesical), live vaccines. May increase toxic effect of live vaccines. Fluconazole may increase concentration/effect. Rifampin may decrease concentration/effect. May increase toxic effects of denosumab, leflunomide, natalizumab, tacrolimus. May decrease therapeutic effect of nivolumab, sipuleucel-T, tantomotide. May increase immunosuppressive effect of baricitinib, upadacitinib, tofacitinib, other immunosuppressants. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, GGT. Expected to cause a dose-dependent reduction in peripheral lymphocyte count to 20%–30% of baseline values.

## AVAILABILITY (Rx)

**Tablets:** 0.25 mg, 2 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to meals.
- Starter pack should be used in pts who titrate to 2 mg maintenance dose. Do not use starter pack in pts who titrate to 1 mg maintenance dose.
- If one dose titration is missed for more than 24 hrs, reinstate treatment starting with day 1 of titration regimen.
- If treatment is interrupted for more than 4 consecutive days after initial titration is completed, reinstate treatment starting with day 1 of titration regimen.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis (Relapsing)

**PO: ADULTS, ELDERLY:** (Pts with CYP2C9 genotypes \*1/\*1, \*1/\*2, or \*2/\*2):

## 1076 siponimod

0.25 mg on day 1, then 0.25 mg on day 2, then 0.5 mg on day 3, then 0.75 mg on day 4, then 1.25 mg on day 5. **Maintenance:** 2 mg once daily starting on day 6. **(Pts with CYP2C9 genotypes \*1/\*3 or \*2/\*3):** 0.25 mg on day 1, then 0.25 mg on day 2, then 0.5 mg on day 3, then 0.75 mg on day 4. **Maintenance:** 1 mg once daily starting on day 5.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Occasional (15%–6%):** Headache, hypertension, peripheral edema, nausea, dizziness, diarrhea, extremity pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening infections (bronchitis, sinusitis, upper respiratory tract infection, fungal skin infection) reported in 3% of pts. Fatal cases of cryptococcal meningitis, disseminated cryptococcal infections were reported. Herpes zoster infections reported in 5% of pts. Reactivation of herpes viral infection may cause varicella zoster meningitis. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may evolve into an ischemic CVA or cerebral hemorrhage, may occur. Macular edema reported in 2% of pts. Pts with diabetes or history of uveitis are at an increased risk for developing macular edema. Bradycardia reported in 4% of pts. AV conduction delays reported in 5% of pts. Dose-dependent reductions of pulmonary function (absolute forced expiratory volume over 1 sec) reported in 3% of pts. Hepatic injury (transaminitis)

reported in 10% of pts. Seizures reported in 2% of pts. Falls reported in 11% of pts. Rebound or severe exacerbation of disease may occur after discontinuation. May increase risk of hypertension, new malignancies. Fatal thromboembolic events including CVA, pulmonary embolism, MI reported in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, ECG. Test all pts for CYP2C9 variants to determine CYP2C9 genotype. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Consultation with a cardiologist is advised in pts with QT interval prolongation greater than 500 msec; arrhythmias requiring treatment with Class Ia or Class III antiarrhythmic; ischemic heart disease, HF, history of cardiac arrest, recent MI; history of Mobitz type II second- or third-degree AV block, sick sinus syndrome, sinoatrial heart block. First-dose monitoring is recommended in pts with preexisting cardiac conditions (baseline sinus bradycardia, first- or second-degree [Mobitz type I], HF) in a medical setting that can adequately treat symptomatic bradycardia. Pts without a documented history of vaccination against varicella zoster or a confirmed history of varicella infection (chickenpox) should be tested for antibodies prior to initiation. A full vaccination course for varicella in antibody-negative pts is recommended prior to initiation. Perform baseline ophthalmologic evaluation of the fundus (including the macula) prior to initiation. Receive full medication history and screen for interaction (esp. immunosuppressants; drugs known to bradycardia, AV conduction delay). Question history as listed in Precautions. Screen for active infection.

### INTERVENTION/EVALUATION

At initial treatment (within first 4–6 hrs after dose), therapy reduces heart rate,

AV conduction. In pts with preexisting cardiac conditions, monitor for symptomatic bradycardia for at least 6 hrs after first dose with hourly pulse, B/P, and then obtain ECG at the end of day 1. If heart rate is less than 45 beats/min, QTc interval is 500 msec or greater, or new-onset second-degree (or higher) AV block is present after 6 hrs of first dose, continue monitoring until resolved. If intervention is required, continue heart monitoring overnight and repeat 6-hr monitoring after second dose. Conduct ophthalmic examination with any change of vision. Pts with altered mental status, seizures, visual disturbances, unilateral weakness should be evaluated for cryptococcal meningitis, varicella zoster meningitis, posterior reversible encephalopathy syndrome, PML. Persistent immunosuppressive effects may occur for up to 3–4 wks after discontinuation. Closely monitor for adverse effects if other immunosuppressants are initiated within the first 3–4 wks after discontinuation. Monitor B/P for hypertension. Monitor for systemic or local infections, herpetic infections; symptoms of new malignancies. Conduct neurologic assessment. Assess for symptoms improvement of MS. Monitor for symptoms of MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation), CVA (aphasia, altered mental status, facial droop, hemiplegia, vision loss), pulmonary embolism (chest pain, dyspnea, tachycardia).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Any change of vision will require an immediate eye examination.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities or death. Report symptoms of PML such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures,

- weakness.
- Treatment may worsen high blood pressure or cause new cancers.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark colored urine, yellowing of the skin or eyes), lung problems (reduced lung function, shortness of breath), heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate).
- Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may cause a stroke or bleeding in the brain, may occur.
- Treatment may cause life-threatening blood clots; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision).
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Due to high risk of interactions, do not take newly prescribed medications unless approved by the provider who originally started treatment.
- Do not receive live vaccines for at least 4 wks after last dose.
- Severe worsening of MS symptoms may occur after stopping treatment.

## sirolimus

sir-oh-li-mus  
(Rapamune)

**BLACK BOX ALERT** Increased susceptibility to infection and potential for development of lymphoma may result from immunosuppression. Not recommended for liver or lung transplant pts. Use only by physicians experienced in immunosuppressive therapy and management of transplant pts.

**Do not confuse Rapamune with Rapaflo, or sirolimus with everolimus, pimecrolimus, tacrolimus, or temsirolimus.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** mTOR kinase inhibitor. **CLINICAL:** Immunosuppressant.

**USES**

Prophylaxis of organ rejection in pts receiving renal transplant (in combination with cycloSPORINE and corticosteroids). Treatment of lymphangiomyomatosis. **OFF-LABEL:** Prophylaxis of organ rejection in heart transplant recipients. Prevention of acute graft-vs-host disease in allogeneic stem cell transplantation. Treatment of refractory acute or chronic graft-vs-host disease. Rescue agent for acute and chronic organ rejection.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to sirolimus. **Cautions:** Cardiovascular disease (HF, hypertension); pulmonary disease, hepatic impairment, renal impairment, hyperlipidemia, perioperative period due to increased chance of surgical complications from impaired wound and tissue healing. Concurrent use with medications that may alter renal function.

**ACTION**

Inhibits T-lymphocyte activation and proliferation in response to antigenic and cytokine stimulation, and inhibits antibody production. **Therapeutic Effect:** Inhibits acute rejection of allografts and prolongs graft survival.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 92%. Extensively metabolized in liver. Primarily excreted in feces (91%). **Half-life:** 57–63 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than

13 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, rifabutin, rifampin) may decrease concentration/effect. CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, itraconazole, verapamil) may increase concentration, toxicity. May increase concentration/effect of cycloSPORINE (take sirolimus 4 hrs after cycloSPORINE for renal transplant). May decrease the therapeutic effect; increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease the therapeutic effect. **FOOD:** Grapefruit products may increase risk of myelotoxicity, nephrotoxicity. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, LDH, BUN, creatine phosphate, cholesterol, triglycerides, creatinine. May alter WBC, serum glucose, calcium. May decrease Hgb, Hct.

**AVAILABILITY (Rx)**

**Oral Solution:** 1 mg/mL.

 **Tablets:** 0.5 mg, 1 mg, 2 mg.

**ADMINISTRATION/HANDLING**

- Doses should be taken 4 hrs after cycloSPORINE.
- Take consistently with or without food.
- Do not break, crush, dissolve, or divide tablets.
- Mix oral solution with only water or orange juice, stir vigorously, drink immediately.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Tablets and oral solution are not bioequivalent. (However, clinical equivalence shown at 2 mg dose.)

**Prevention of Organ Transplant Rejection (Low to Moderate Risk)**

**PO: ADULTS, CHILDREN 13 YRS AND OLDER WEIGHING MORE THAN 40 KG:** Loading dose: 6 mg on day 1. **Maintenance:** 2 mg/day. **ADULTS, CHILDREN 13 YRS AND OLDER WEIGHING LESS THAN 40 KG:** Loading dose: 3 mg/m<sup>2</sup> on day 1. **Maintenance:** 1 mg/m<sup>2</sup>/day.

**Prevention of Organ Transplant Rejection (High Risk)**

**PO: ADULTS:** Loading dose: Up to 15 mg on day 1. **Maintenance:** 5 mg/day. Obtain trough between 5–7 days. Continue therapy for 1 yr following transplantation. Further adjustments based on clinical status.

**Lymphangioleiomyomatosis**

**PO: ADULTS, ELDERLY:** Initially, 2 mg/day with dosage adjustment to maintain concentration between 5–15 ng/mL. Obtain serum trough level after 10–20 days. Once maintenance dose is adjusted, further adjustments should be made at 7- to 14-day intervals. Once a stable dose is attained, serum trough levels should be assessed at least q3mos.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Loading dose:** No change. **Maintenance dose: Mild to moderate impairment:** Reduce dose by 33%. **Severe impairment:** Reduce dose by 50%.

**SIDE EFFECTS**

**Occasional:** Hypercholesterolemia, hyperlipidemia, hypertension, rash. **High doses (5 mg/day):** Anemia, arthralgia, diarrhea, hypokalemia, peripheral edema, thrombocytopenia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hepatotoxicity occurs rarely. Skin carcinoma (including basal cell, squamous cell, melanoma) has been observed.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT; pregnancy test in females of reproductive potential. Question for medication usage (esp. cycloSPORINE, dilTIAZem, ketoconazole, rifAMPin). Determine if pt has chickenpox, herpes zoster, malignancy, infection.

**INTERVENTION/EVALUATION**

Monitor renal function, LFT periodically. Monitor serum cholesterol, triglycerides, platelets; Hgb. Obtain trough concentration 10–20 days after dose. Once maintenance dose is adjusted, make further adjustments at intervals of 7–14 days. Once stable dose is attained, assess trough concentration at least q3mos.

**PATIENT/FAMILY TEACHING**

- Avoid those with colds, other infections.
- Avoid grapefruit products.
- Avoid exposure to sunlight, artificial light sources.
- Strict monitoring is essential in identifying, preventing symptoms of organ rejection.
- Do not chew, crush, dissolve, or divide tablets.

**SITagliptin**

TOP 100 HIGH ALERT

sit-a-glip-tin  
(Januvia)

**Do not confuse Januvia with Enjuvia, Jantoven, or Janumet, or SITagliptin with SAXagliptin or SUMAtriptan.**

**FIXED-COMBINATION(S)**

**Janumet, Janumet XR:** SITagliptin/metFORMIN (an antidiabetic): 50 mg/500 mg, 50 mg/1,000 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** DPP-4 inhibitors (gliptins). **CLINICAL:** Antidiabetic agent.

**USES**

Adjunctive treatment to diet, exercise to improve glycemic control in pts with type 2 diabetes as monotherapy or in combination with other antidiabetic agents.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to SITagliptin. **Cautions:** Type 1 diabetes, diabetic ketoacidosis, renal impairment, end-stage renal disease, history of

pancreatitis, angioedema with other DPP-4 inhibitors. Concurrent use of other glucose-lowering agents may increase risk of hypoglycemia.

## ACTION

Inhibits DPP-4 enzyme, causing prolonged active incretin levels. Incretin regulates glucose homeostasis. **Therapeutic Effect:** Regulates glucose homeostasis. Increases synthesis and release of insulin from pancreatic cells; lowers glucagon secretion from pancreas, decreases hepatic glucose production.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	N/A	1–4 hrs	24 hrs

Rapidly absorbed. Protein binding: 38%. Excreted in urine (87%), feces (13%).

**Half-life:** 12 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May enhance hypoglycemic effect of insulin, sulfonyleureas (e.g., glipizide, glyburide). **HERBAL:** Maitake may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May slightly increase WBCs, particularly neutrophil count. May increase serum creatinine.

## AVAILABILITY (Rx)

**Tablets, Film-Coated:** 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes

**PO: ADULTS OVER 18 YRS, ELDERLY:** 100 mg once daily.

## Dosage in Renal Impairment

**CrCl 30 mL/min to less than 50 mL/min:** 50 mg once daily. **CrCl less than 30 mL/min, ESRD, dialysis:** 25 mg once daily.

## Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (5% and greater):** Headache, nasopharyngitis. **Rare (3%–1%):** Diarrhea, abdominal pain, nausea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including angioedema, Stevens-Johnson syndrome reported. Acute pancreatitis occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test, serum glucose; Hgb A1c. Assess pt's understanding of diabetes management, routine home glucose monitoring. Obtain dietary consult for nutritional education. Question history of renal impairment, type 1 diabetes, ketoacidosis, pancreatitis. Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Monitor blood glucose, hemoglobin A1c level, renal function. Assess for hypoglycemia (diaphoresis, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia, difficulty concentrating), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, fatigue, Kussmaul breathing), hypersensitivity reaction. Concomitant use of beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Dietary consult for nutritional education. Severe abdominal pain, nausea may indicate pancreatitis.

### PATIENT/FAMILY TEACHING

- Diabetes mellitus requires lifelong control. Diet and exercise is a principal

part of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake. • When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose). • Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis. • Report joint pain; allergic reactions of any kind.

## sodium bicarbonate

soe-dee-um bye-kar-boe-nate  
(Neut)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkalinizing agent. **CLINICAL:** Antacid, electrolyte supplement, urinary/systemic alkalinizer.

### USES

Management of metabolic acidosis, gastric hyperacidity. Alkalinization agent for urine; hyperkalemia treatment; management of overdose of tricyclic antidepressants and aspirin. **OFF-LABEL:** Prevention of contrast-induced nephropathy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to sodium bicarbonate. Hyponatremia, alkalosis, unknown abdominal pain, hypocalcemia, severe pulmonary edema. **Cautions:** HF, edematous states, renal insufficiency, cirrhosis.

### ACTION

Dissociates to provide bicarbonate ion. **Therapeutic Effect:** Neutralizes hydrogen ion concentration, raises blood, urinary pH.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15 min	N/A	1–3 hrs
IV	Immediate	N/A	8–10 min

Well absorbed following PO administration, sodium bicarbonate dissociates to sodium and bicarbonate ions. With increased hydrogen ion concentrations, bicarbonate ions combine with hydrogen ions to form carbonic acid, which then dissociates to CO<sub>2</sub>, which is excreted by the lungs. Plasma concentration regulated by kidney (ability to form, excrete bicarbonate).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May produce hyponatremia, increase tendon reflexes in neonate or fetus whose mother is administered chronically high doses. May be distributed in breast milk. **Children:** No age-related precautions noted. Do not use as antacid in pts younger than 6 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** May increase concentration, toxicity of **quinidine**, **quinine**. May decrease effects of **lithium**. **HERBAL:** None significant. **FOOD:** **Milk, other dairy products** may result in milk-alkali syndrome. **LAB VALUES:** May increase serum, urinary pH.

### AVAILABILITY (Rx)

**Injection Solution (Rx):** 0.5 mEq/mL (4.2%), 1 mEq/mL (8.4%). **Tablets (OTC):** 325 mg, 650 mg.

### ADMINISTRATION/HANDLING

**◀ALERT▶** For direct IV administration in neonates or infants, use 0.5 mEq/mL concentration.

**Reconstitution** • May give undiluted. **Rate of administration** • For IV push, give up to 1 mEq/kg over 1–3 min for cardiac arrest. • For IV infusion, do not

exceed rate of infusion of 1 mEq/kg/hr. • For children younger than 2 yrs, premature infants, neonates, administer by slow infusion, up to 10 mEq/min.

**Storage** • Store at room temperature.

#### PO

- Give 1–3 hrs after meals.

#### IV INCOMPATIBILITIES

Amiodarone (Cordarone), ascorbic acid, calcium chloride, dilTIAZem (Cardizem), DOBUtamine (Dobutrex), DOPamine (Intropin), HYDROmorphone (Dilaudid), magnesium sulfate, midazolam (Versed), norepinephrine (Levophed), ondansetron (Zofran).

#### IV COMPATIBILITIES

Dexmedetomidine (Precedex), furosemide (Lasix), heparin, insulin, lidocaine, mannitol, milrinone (Primacor), morphine, phenylephrine (Neo-Synephrine), potassium chloride, propofol (Diprivan), vancomycin (Vancocin).

#### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** May give by IV push, IV infusion, or orally. Dose individualized based on severity of acidosis, laboratory values, pt age, weight, clinical conditions. Do not fully correct bicarbonate deficit during the first 24 hrs (may cause metabolic alkalosis).

#### Cardiac Arrest

**◀ALERT▶** Routine use not recommended.

**IV: ADULTS, ELDERLY:** Initially, 1 mEq/kg. May repeat based on arterial blood gases. **CHILDREN, INFANTS:** Initially, 0.5–1 mEq/kg. May repeat based on arterial blood gases.

#### Metabolic Acidosis (Mild to Moderate)

**IV: ADULTS, ELDERLY, CHILDREN:** 2–5 mEq/kg over 4–8 hrs. May repeat based on acid-base status.

#### Prevention of Contrast-Induced Nephropathy

**IV infusion: ADULTS, ELDERLY:** 154 mEq/L sodium bicarbonate in D<sub>5</sub>W solution: 3 mL/

kg/hr 1 hr immediately before contrast injection, then 1 mL/kg/hr during contrast exposure and for 6 hrs after procedure.

#### Metabolic Acidosis (Associated With Chronic Renal Failure)

**PO: ADULTS, ELDERLY:** Initially, 15.4–23.1 mEq/day in divided doses. Titrate to normal serum bicarbonate level of 23–29 mEq/L.

#### Renal Tubular Acidosis (Distal)

**PO: ADULTS, ELDERLY:** 0.5–2 mEq/kg/day in 4–6 divided doses. **CHILDREN:** 2–3 mEq/kg/day in divided doses.

#### Renal Tubular Acidosis (Proximal)

**PO: ADULTS, ELDERLY, CHILDREN:** 5–10 mEq/kg/day in divided doses. Maintenance dose to maintain serum bicarbonate in normal range.

#### Urine Alkalinization

**PO: ADULTS, ELDERLY:** Initially, 4 g, then 1–2 g q4h. **Maximum:** 16 g/day (8 g/day in adults older than 60 yrs).

#### Antacid

**PO: ADULTS, ELDERLY:** 300 mg–2 g 1–4 times/day.

#### Hyperkalemia

**IV: ADULTS, ELDERLY:** 50 mEq over 5 min.

#### SIDE EFFECTS

**Frequent:** Abdominal distention, flatulence, belching.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive, chronic use may produce metabolic alkalosis (irritability, twitching, paresthesia, cyanosis, slow or shallow respirations, headache, thirst, nausea). Fluid overload results in headache, weakness, blurred vision, behavioral changes, incoordination, muscle twitching, elevated B/P, bradycardia, tachypnea, wheezing, coughing, distended neck veins. Extravasation may occur at the IV site, resulting in tissue necrosis, ulceration.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess for symptoms of acidosis, alkalosis. Do not give PO medication within 1 hr of antacids.

### INTERVENTION/EVALUATION

Monitor serum, urinary pH, CO<sub>2</sub> level, serum electrolytes, plasma bicarbonate levels. Monitor for metabolic alkalosis, fluid overload. Assess for clinical improvement of metabolic acidosis (relief from hyperventilation, weakness, disorientation). Monitor serum phosphate, calcium, uric acid levels. Assess for relief of gastric distress.

## sodium chloride

so-dee-um klor-ide  
(Muro 128, Nasal Moist, Ocean,  
SalineX)

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Electrolyte supplement. **CLINICAL:** Electrolyte, isotonic volume expander, ophthalmic adjunct.

### USES

**Parenteral:** Source of hydration; prevention/treatment of sodium, chloride deficiencies (hypertonic for severe deficiencies). Prevention of muscle cramps, heat prostration occurring with excessive perspiration. **Nasal:** Restores moisture, relieves dry, inflamed nasal membranes. **Ophthalmic:** Therapy in reduction of corneal edema, diagnostic aid in ophthalmoscopic exam.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to sodium chloride. Fluid retention, hypernatremia, hypertonic uterus. **Cautions:** HF, renal impairment, cirrhosis, hypertension, edema. Do not use sodium chloride preserved with benzyl alcohol in neonates.

## ACTION

Sodium is a major cation of extracellular fluid. **Therapeutic Effect:** Controls water distribution, fluid and electrolyte balance, osmotic pressure of body fluids; maintains acid-base balance.

## PHARMACOKINETICS

Widely distributed. Primarily excreted in urine and, to a lesser degree, in sweat, tears, saliva.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** No precautions noted. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease effect of lithium. May enhance adverse/toxic effects of tolvaptan. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Concentrate (Rx):** 23.4% (4 mEq/mL). **Injection Solution (Rx):** 0.45%, 0.9%, 3%. **Irrigation (Rx):** 0.45%, 0.9%. **Nasal Gel (OTC): (Nasal Moist):** 0.65%. **Nasal Solution (OTC): (SalineX):** 0.4% (*Nasal Moist, Ocean*): 0.65%. **Ophthalmic Ointment (OTC): (Muro 128):** 5%. **Ophthalmic Solution (OTC): (Muro 128):** 2%, 5%.

 **Tablets (OTC):** 1 g.

## ADMINISTRATION/HANDLING

• Hypertonic solutions (3% or 5%) are administered via large vein; avoid infiltration; do not exceed 100 mL/hr. • Vials containing 2.5–4 mEq/mL (concentrated NaCl) must be diluted with D<sub>5</sub>W or D<sub>10</sub>W before administration.

### PO

• Do not crush/break enteric-coated or extended-release tablets. • Administer with full glass of water.

### Nasal

• Instruct pt to begin inhaling slowly just before releasing medication into nose.

• Instruct pt to inhale slowly, then release air gently through mouth. • Continue technique for 20–30 sec.

#### Ophthalmic

• Place gloved finger on lower eyelid and pull out until pocket is formed between eye and lower lid. • Place prescribed number of drops (or ¼–½ inch of ointment) into pocket. • Instruct pt to close eye gently for 1–2 min so that medication will not be squeezed out of sac. • When lower lid is released, have pt keep eye open without blinking for at least 30 sec for solution; for ointment, have pt close eye, roll eyeball around to distribute medication. • When using drops, apply gentle finger pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.

#### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Dosage based on age, weight, clinical condition; fluid, electrolyte, acid-base balance status.

#### Usual Parenteral Dosage

**IV; ADULTS, ELDERLY, CHILDREN:** Goal of initial therapy is to achieve a 24-hr increase in serum sodium concentration by 4–6 mEq/L (maximum serum sodium increase: 8 mEq/L in any 24-hr period), which is sufficient to improve most symptoms of hyponatremia. Determined by laboratory determinations (mEq). Dosage varies widely based on clinical conditions.

#### Usual Oral Dosage

**PO; ADULTS, ELDERLY:** 1–2 g 3 times/day.

#### Usual Nasal Dosage

**Intranasal; ADULTS, ELDERLY, CHILDREN:** 2–3 sprays as needed.

#### Usual Ophthalmic Dosage

**Ophthalmic solution; ADULTS, ELDERLY:** Apply 1–2 drops q3–4h.

**Ophthalmic ointment; ADULTS, ELDERLY:** Apply once daily or as directed.

#### SIDE EFFECTS

**Frequent:** Facial flushing. **Occasional:** Fever; irritation, phlebitis, extravasation at injection site. **Ophthalmic:** Temporary burning, irritation.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Too-rapid administration may produce peripheral edema, HF, pulmonary edema. Excessive dosage may produce hypokalemia, hypervolemia, hypernatremia.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain serum electrolytes, B/P. Assess fluid balance (I&O, daily weight, lung sounds, edema).

##### INTERVENTION/EVALUATION

Monitor serum electrolytes, acid-base balance, B/P. Monitor fluid balance (I&O, daily weight, lung sounds, edema), IV site for extravasation. Hypernatremia associated with edema, weight gain, elevated B/P; hyponatremia associated with muscle cramps, nausea, vomiting, dry mucous membranes.

##### PATIENT/FAMILY TEACHING

• Temporary burning, irritation may occur upon instillation of eye medication. • Discontinue eye medication and report if severe pain, headache, rapid change in vision (peripheral, direct), sudden appearance of floating spots, acute redness of eyes, pain on exposure to light, double vision occurs.

## sofosbuvir/ velpatasvir

soe-fos-bue-vir/vel-pat-as-vir  
(Eplusa)

**■BLACK BOX ALERT■** Test all pts for hepatitis B virus (HBV) infection before initiation. HBV reactivation was reported in pts with hepatitis C virus (HCV)/HBV coinfection.

**Do not confuse sofosbuvir with boceprevir, dasabuvir, fosamprenavir, or simeprevir, or velpatasvir with daclatasvir, grazoprevir, or paritaprevir.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Nucleotide analog NS5B polymerase inhibitor; NSA inhibitor. **CLINICAL:** Antiviral.

**USES**

Treatment of chronic hepatitis C virus (HCV) genotype 1, 2, 3, 4, 5, or 6 infection in adults and pediatric pts 3 yrs and older or weighing at least 17 kg without cirrhosis, or with compensated cirrhosis, or in combination with ribavirin in pts with decompensated cirrhosis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to sofosbuvir, velpatasvir. If given with ribavirin, contraindications to ribavirin apply. **Cautions:** Anemia (when used with ribavirin), renal impairment, end-stage renal disease requiring hemodialysis, hepatic disease unrelated to HCV infection, HIV infection. Concomitant use of amiodarone (with or without beta blockers) in pts with underlying cardiac disease. Concomitant use of P-glycoprotein inducers, moderate CYP2B6 inducers, strong CYP2C8 inducers, moderate or strong CYP3A4 inducers not recommended.

**ACTION**

Sofosbuvir inhibits the HCV NS5B RNA-dependent RNA polymerase. Velpatasvir inhibits the VCV NS5A protein. **Therapeutic Effect:** Inhibits viral replication of HCV.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: sofosbuvir: 61%–68%; velpatasvir: greater than 99.5%. Peak plasma concentration: sofosbuvir: 0.5–1 hr; velpatasvir: 3 hrs. Excretion: sofosbuvir: urine (80%), feces (14%); velpatasvir: feces (94%), urine (0.4%). **Half-life:** sofosbuvir: 0.5 hr; velpatasvir: 15 hrs.

**🕒 LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** When used with ribavirin, therapy is contraindicated in pregnant women and in men whose female

partners are pregnant. Females and males with female partners of reproductive potential must use effective contraception for at least 6 mos following discontinuation (if therapy includes ribavirin). Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Moderate or strong inducers of CYP2B6, CYP2C8, CYP3A4, P-glycoprotein (e.g., carbamazepine, phenytoin, oxcarbazepine, rifampicin) may decrease concentration/effect of sofosbuvir/velpatasvir. Amiodarone (with or without beta blockers [e.g., carvedilol, metoprolol]) may significantly increase risk of symptomatic bradycardia. Proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin (indirect), creatine phosphokinase (CPK), lipase.

**AVAILABILITY (Rx)**

**Tablets, Fixed-Dose:** sofosbuvir 400 mg/velpatasvir 100 mg, sofosbuvir 200 mg/velpatasvir 50 mg. **Oral Pellets:** sofosbuvir 200 mg/velpatasvir 50 mg, sofosbuvir 150 mg/velpatasvir 37.5 mg.

**ADMINISTRATION/HANDLING**  
**PO**

- Give without regard to food. **Oral pellets:**
  - Pellets should not be chewed (causes bitter aftertaste).
  - Give without regard to food. In pediatric pts younger than 6 yrs of age, give oral pellets with food to increase tolerability related to palatability.
  - May sprinkle on 1 or more spoonfuls of non-acidic soft food (e.g., pudding, chocolate syrup, ice cream) at or below room temperature. Administer within 15 min of mixing with food.

**INDICATIONS/ROUTES/DOSAGE****Hepatitis C Virus Infection**

**PO:** **ADULTS, ELDERLY:** 400 mg/100 mg once daily. **CHILDREN 3 YRS AND OLDER:**

**30 KG OR GREATER:** 400 mg/100 mg once daily. **17–29 KG:** 200 mg/50 mg once daily. **WEIGHING LESS THAN 17 KG:** 150 mg/37.5 mg once daily.

#### Treatment Regimen and Duration

**Pts without cirrhosis or pts with compensated cirrhosis (Child-Pugh A):** 400 mg/100 mg once daily for 12 wks. **Pts with decompensated cirrhosis (Child-Pugh B or C):** 1 tablet once daily with ribavirin for 12 wks (ribavirin ineligible: One tablet once daily for 24 wks).

#### Dosage in Renal Impairment

**Mild to moderate impairment: CrCl greater than or equal to 30 mL/min:** No dose adjustment. **Severe impairment: CrCl less than 30 mL/min, end-stage renal disease:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** No dose adjustment.

#### SIDE EFFECTS

**Frequent (22%–15%):** Headache, fatigue. **Occasional (9%–5%):** Nausea, asthenia, insomnia, irritability. **Rare (2%):** Rash.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Symptomatic bradycardia requiring pacemaker intervention was reported in pts taking amiodarone and sofosbuvir, in combination with daclatasvir or simeprevir. Cardiac arrest was reported in a pt taking amiodarone in combination with sofosbuvir and ledipasvir. Bradycardia usually occurred within hrs to days, but may occur up 2 wks after initiation (when used with amiodarone). Pts with underlying cardiac disease or advanced hepatic disease or taking concomitant beta blockers are at an increased risk for bradycardia when used concomitantly with amiodarone. Depression reported in 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (when used with ribavirin), renal function test, LFT, HCV-RNA level; serum lipase, CPK; pregnancy test in female pts of reproductive potential. Confirm hepatitis C virus genotype. Question history of renal impairment, hepatic disease unrelated to HCV infection; HIV infection or use of antiretroviral therapy. Receive full medication history, and screen for interactions (esp. concomitant use of amiodarone).

### INTERVENTION/EVALUATION

Monitor serum lipase, CPK. Periodically monitor HCV-RNA level for treatment effectiveness. If unable to discontinue amiodarone, recommend inpatient cardiac monitoring for at least 48 hrs, followed by outpatient or self-monitoring of HR for at least 2 wks after initiation. Cardiac monitoring is also recommended in pts who discontinue amiodarone just prior to initiation. Reinforce birth control compliance and obtain monthly pregnancy tests in female pts of reproductive potential taking concomitant ribavirin. Encourage nutritional intake.

### PATIENT/FAMILY TEACHING

- Pts who take amiodarone during therapy may require inpatient and outpatient cardiac monitoring (and in some cases, pacemaker implantation) due to an increased risk of slow heartbeats or cardiac arrest. If amiodarone cannot be interrupted or discontinued, immediately report symptoms of slow heartbeat such as chest pain, confusion, dizziness, fainting, light-headedness, memory problems, palpitations, weakness.
- Treatment may be used in combination with ribavirin. Inform pt of contraindications/adverse effects of ribavirin therapy. Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Do not take herbal products.
- Avoid alcohol.
- Maintain proper nutritional intake.

## solifenacin

 TOP  
100

sol-i-fen-a-sin  
(VESicare, VESicare LS)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinergic agent, muscarinic receptor antagonist. **CLINICAL:** Urinary antispasmodic.

### USES

Treatment of overactive bladder with symptoms of urinary frequency, urgency, or urge incontinence. Treatment of neurogenic detrusor overactivity (NDO) in children 2 yrs and older.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to solifenacin. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention (tablet only). **Cautions:** Bladder outflow obstruction, GI obstructive disorders, decreased GI motility, controlled narrow-angle glaucoma, renal/hepatic impairment, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), hot weather and/or exercise.

### ACTION

Inhibits muscarinic receptors. **Therapeutic Effect:** Decreases urinary bladder contractions, increases residual urine volume, decreases detrusor muscle pressure.

### PHARMACOKINETICS

Widely distributed. Protein binding: 98%. Metabolized in liver. Excreted in urine (69%), feces (23%). **Half-life:** 40–68 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., ketoconazole, erythromycin, azole antifungals, clarithromycin) may increase concentration/effect. **Aclidinium, ipratropium, tiotropium, umeclidinium** may increase anticholinergic effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Oral Suspension:** 5 mg/5 mL.

**Tablets:** 5 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. Swallow tablets whole, with liquids.

### INDICATIONS/ROUTES/DOSAGE

#### Overactive Bladder

**PO: ADULTS, ELDERLY:** 5 mg/day; if tolerated, may increase to 10 mg/day.

#### NDO

**PO: CHILDREN (WEIGHING MORE THAN 60 KG):** 5 mg once daily. **Maximum:** 10 mg. **(46–60 KG):** 4 mg once daily. **Maximum:** 8 mg. **(31–45 KG):** 3 mg once daily. **Maximum:** 6 mg. **(16–30 KG):** 3 mg once daily. **Maximum:** 5 mg. **(9–15 KG):** 2 mg once daily. **Maximum:** 4 mg.

#### Dose Modification

**Concomitant Use of Strong CYP3A4 Inhibitors**

**Maximum:** 5 mg/day.

#### Dosage in Renal/Hepatic Impairment

**Severe renal impairment (CrCl less than 30 mL/min) or moderate hepatic impairment:** Maximum dosage is 5 mg/day. Not recommended in severe hepatic impairment.

**SIDE EFFECTS**

**Frequent (28%–13%):** Dry mouth, constipation. **Occasional (5%–3%):** Blurred vision, UTI, dyspepsia, nausea. **Rare (2%–1%):** Dizziness, dry eyes, fatigue, depression, edema, hypertension, epigastric pain, vomiting, urinary retention.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Angioneurotic edema, GI obstruction occur rarely. Overdose can result in severe anticholinergic effects.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess symptoms of overactive bladder before beginning the drug. Question medical history as listed in Precautions. Screen for concomitant medications known to prolong QT interval. Obtain baseline ECG.

**INTERVENTION/EVALUATION**

Monitor I&O, anticholinergic effects, creatinine clearance. Assess for decrease in symptoms. Obtain bladder scan if urinary retention is suspected.

**PATIENT/FAMILY TEACHING**

- Avoid tasks requiring alertness, motor skills until response to drug is established.
- Anticholinergic side effects include constipation, urinary retention, blurred vision, heat prostration in hot environment.
- Use caution during exercise, exposure to heat.

**somatropin**

soe-ma-troe-pin  
(Genotropin, Genotropin Miniquick, Humatrope, Norditropin FlexPro, Nutropin, Nutropin AQ NuSpin, Omnitrope, Saizen, Serostim, Zomacton, Zorbtive)

**Do not confuse somatropin with SUMatriptan.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Polypeptide hormone. **CLINICAL:** Growth hormone.

**USES**

**Adults:** Growth deficiency due to pituitary disease, hypothalamic disease, surgery, radiation, or trauma. **Serostim:** AIDS-related wasting or cachexia. **Zorbtive:** Short bowel syndrome. **Children:** Long-term treatment of growth failure due to lack of or inadequate endogenous growth hormone secretion; chronic renal insufficiency; short stature associated with Turner syndrome or Noonan syndrome Prader-Willi syndrome, or homeobox gene deficiency; idiopathic short stature. **OFF-LABEL:** Treatment of pediatric HIV pts with wasting/cachexia; HIV adipose redistribution syndrome.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to growth hormone. Pts with Prader-Willi syndrome with growth hormone deficiency who are severely obese or have severe respiratory impairment, Prader-Willi syndrome who have a history of upper airway obstruction or sleep apnea, children with closed epiphyses, acute critical illness due to complications after open heart or abdominal surgery, multiple accidental trauma, acute respiratory failure, active neoplasia, diabetic retinopathy. Active malignancy, progression of active growing intracranial lesion or tumor. **Cautions:** Diabetes, elderly.

**ACTION**

Stimulates cartilaginous growth areas of long bones; increases number, size of skeletal muscle cells; influences size of organs; increases RBC mass by stimulating erythropoietin. Influences metabolism of carbohydrates (decreases insulin sensitivity), fats (mobilizes fatty acids), minerals (retains phosphorus, sodium, potassium by promotion of cell growth), proteins (increases protein synthesis). Exerts both insulin-like and diabetogenic effects. Enhances transmucosal transport of water, electrolytes, and nutrients across the gut. **Therapeutic Effect:** Stimulates growth.

**PHARMACOKINETICS**

Well absorbed after SQ, IM administration. Localized primarily in kidneys, liver.

**Half-life:** IV: 20–30 min; SQ, IM: 3–5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Corticosteroids (e.g., hydrocortisone, prednisone) may inhibit growth response. Oral estrogens may decrease response to somatropin.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, inorganic phosphorus, parathyroid hormone. May decrease glucose tolerance. May slightly decrease thyroid function.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (*Genotropin*): 5 mg, 12 mg. (*Genotropin Miniquick*): 0.2 mg, 0.4 mg, 0.6 mg, 0.8 mg, 1 mg, 1.2 mg, 1.4 mg, 1.6 mg, 1.8 mg, 2 mg. (*Humatrope*): 5 mg, 6 mg, 12 mg, 24 mg. (*Omnitrope*): 5.8 mg. (*Saizen*): 5 mg, 8.8 mg. (*Serostim*): 4 mg, 5 mg, 6 mg. (*Zomacton*): 5 mg, 10 mg. (*Zorbtive*): 8.8 mg. **Injection Solution:** (*Omnitrope*): 5 mg/1.5 mL, 10 mg/1.5 mL. (*Norditropin FlexPro Pen*): 5 mg/1.5 mL, 10 mg/1.5 mL, 15 mg/1.5 mL, 30 mg/3 mL. (*Nutropin AQ NuSpin*): 5 mg/2 mL, 10 mg/2 mL, 20 mg/2 mL.

### ADMINISTRATION/HANDLING

**◀ ALERT ▶ Neonate:** Benzyl alcohol as a preservative has been associated with fatal toxicity (gasping syndrome) in premature infants. Reconstitute with Sterile Water for Injection only. Use only 1 dose per vial. Discard unused portion.

**Reconstitution • Genotropin, Genotropin Miniquick:** Reconstitute with diluent provided. **Humatrope:** Reconstitute with 1.5–5 mL diluent provided, swirl gently, do not shake. **Humatrope Cartridge:** Dilute with solution provided with cartridge only. **Nutropin:** Reconstitute each 5 mg

with 1.5–5 mL diluent, swirl gently, do not shake. **Omnitrope:** Reconstitute with diluents provided, swirl gently, do not shake. **Saizen:** 5 mg: Reconstitute with 1–3 mL diluent provided, swirl gently, do not shake. 8.8 mg: Reconstitute with 2–3 mL diluent provided, swirl gently, do not shake. **Serostim:** Reconstitute with Sterile Water for Injection. **Zorbtive:** Reconstitute with 1–2 mL Bacteriostatic Water for Injection.

**Storage • Long-term:** Refrigerate all products except Zorbtive. Once reconstituted, Humatrope, Nutropin, Saizen, Zorbtive stable for 14 days, Genotropin for 21 days, Humatrope Cartridge for 28 days. **Genotropin Miniquick:** Refrigerate, use within 24 hrs.

### INDICATIONS/ROUTES/DOSAGE

#### Growth Hormone Deficiency

**SQ:** (*Genotropin, Omnitrope*): **ADULTS:** 0.04 mg/kg wkly divided into 6–7 equal doses/wk. May increase at 4- to 8-wk intervals to maximum of 0.08 mg/kg/wk. **CHILDREN:** 0.16–0.24 mg/kg wkly divided into equal daily doses.

**SQ:** (*Humatrope*): **ADULTS:** 0.006 mg/kg once daily. May increase to maximum of 0.0125 mg/kg/day. **CHILDREN:** 0.18–0.3 mg/kg wkly divided into alternate-day doses or 6 doses/wk.

**SQ:** (*Norditropin*): **ADULTS:** 0.004 mg/kg/day. May increase after 6 wks up to 0.016 mg/kg/day. **CHILDREN:** 0.024–0.034 mg/kg/dose 6–7 days/wk.

**SQ:** (*Nutropin, Nutropin AQ*): **ADULTS:** 0.006 mg/kg once daily. May increase to maximum of 0.025 mg/kg/day (younger than 35 yrs) or 0.0125 mg/kg/day (35 yrs and older). **CHILDREN:** 0.3–0.7 mg/kg wkly divided into equal daily doses.

**SQ:** (*Saizen*): **ADULTS:** 0.005 mg/kg/day. May increase up to 0.01 mg/kg/day after 4 wks. **CHILDREN:** 0.18 mg/kg/wk divided into equal daily doses or 0.06 mg/kg 3 times/wk or as 0.03 mg/kg administered 6 days/wk.

#### Noonan Syndrome

**SQ:** (*Norditropin*): Up to 0.066 mg/kg/day.

**Chronic Renal Insufficiency**

**SQ: (Nutropin, Nutropin AQ): CHILDREN:** 0.35 mg/kg wky divided into equal daily doses. Continue until the time of renal transplantation.

**Idiopathic Short Stature**

**SQ: (Genotropin, Omnitrope):** 0.47 mg/kg wky divided into equal doses 6–7 times/wk. (**Humatrope**): 0.37 mg wky divided into equal doses 6–7 times/wk. (**Nutropin, Nutropin AQ**): Up to 0.3 mg/kg wky divided into daily doses.

**Turner's Syndrome**

**SQ: (Humatrope, Nutropin, Nutropin AQ): CHILDREN:** 0.375 mg/kg wky divided into equal doses 7 times/wk. (**Genotropin, Omnitrope**): 0.33 mg/kg wky divided into 6–7 doses.

**AIDS-Related Wasting**

**SQ: (Serostim): ADULTS WEIGHING MORE THAN 55 KG:** 6 mg once daily at bedtime. **ADULTS WEIGHING 45–55 KG:** 5 mg once daily at bedtime. **ADULTS WEIGHING 35–44 KG:** 4 mg once daily at bedtime. **ADULTS WEIGHING LESS THAN 35 KG:** 0.1 mg/kg once daily at bedtime.

**Prader-Willi Syndrome**

**SQ: (Genotropin, Omnitrope):** 0.24 mg/kg wky divided into equal doses 6–7 times/wk.

**Short Bowel Syndrome**

**SQ: (Zorbtive): ADULTS:** 0.1 mg/kg/day. **Maximum:** 8 mg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Otitis media, other ear disorders (with Turner's syndrome). **Occasional:** Carpal tunnel syndrome, gynecomastia, myalgia, peripheral edema, fatigue, asthenia. **Rare:** Rash, pruritus, visual changes, headache, nausea, vomiting, injection site pain/swelling, abdominal pain, hip/knee pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May cause fluid retention, glucose tolerance, lipotrophy. Intracranial

hypertension may manifest as change of vision, headache, papilledema, nausea, vomiting. May increase risk of malignancy progression. Rapid growth may cause slipped capital femoral epiphyses. Hypersensitivity reactions including angioedema, anaphylaxis were reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain baseline lab chemistries, thyroid function, serum glucose, height, weight. Obtain full medical history (drug has multiple contraindications).

**INTERVENTION/EVALUATION**

Monitor bone growth, growth rate in relation to pt's age. Monitor serum calcium, glucose, phosphorus levels; renal, parathyroid, thyroid function. Observe for decreased muscle wasting in AIDS pts.

**PATIENT/FAMILY TEACHING**

- Follow correct procedure to reconstitute drug for administration and for safe handling/disposal of needles.
- Regular follow-up with physician is important part of therapy.
- Report development of severe headache, visual changes, pain in hip/knee, limping.

**sonidegib**

soe-ni-deg-ib  
(Odomzo)

■ **BLACK BOX ALERT** ■ May cause embryo-fetal death/severe malformations when given during pregnancy. Verify pregnancy status before initiation. Female patients of reproductive potential must use effective contraception during treatment and for at least 20 mos after discontinuation. Due to the potential risk of exposure through semen, male patients must use condoms during sexual activity (even after a vasectomy) during treatment and for at least 8 mos after discontinuation.

**Do not confuse sonidegib with vismodegib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Hedgehog pathway inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adult pts with locally advanced basal cell carcinoma that has recurred following surgery or radiation therapy, or those who are not candidates for surgery or radiation.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to sonidegib. **Cautions:** Renal/hepatic impairment. Avoid concomitant use of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

**ACTION**

Basal cell cancer is associated with mutation in Hedgehog pathway components, which can activate the pathway, causing nonrestrictive proliferation of skin basal cells. Binds to and inhibits smoothed homologue (SMO), the protein involved in Hedgehog signal transduction. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

**PHARMACOKINETICS**

Poorly absorbed after PO administration (less than 10%). Metabolized in liver. Protein binding: greater than 97%. Peak plasma concentration: 2–4 hrs. Steady state reached in 4 mos. Excreted in feces (70%), urine (30%). **Half-life:** 28 days.

**🕒 LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid use; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and up to 20 mos after discontinuation. May impair fertility. **Males:** Males must use condoms during sexual activity (even after a vasectomy) during treatment and up to 8 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of

severe musculoskeletal adverse events (e.g., muscle spasms, myopathy).

**INTERACTIONS**

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A inhibitors (e.g., atazanavir, fluconazole) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** High-fat meals may increase absorption/concentration. **LAB VALUES:** May increase serum ALT/AST, amylase, creatinine, CK, glucose, lipase. May decrease Hct, Hgb, lymphocytes.

**AVAILABILITY (Rx)**

**Capsules:** 200 mg.

**ADMINISTRATION/HANDLING****PO**

- Give on an empty stomach at least 1 hr before or 2 hrs after a meal.

**INDICATIONS/ROUTES/DOSAGE****Basal Cell Carcinoma**

**PO: ADULTS, ELDERLY:** 200 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

Interrupt therapy for severe or intolerable musculoskeletal adverse reactions; first occurrence of serum CK level 2.5–10 times upper limit of normal (ULN); recurrent serum CK level 2.5–5 times ULN. Once resolved, resume at 200 mg once daily.

**Discontinuation**

Permanently discontinue for serum CK level greater than 2.5 times ULN with worsening renal function; serum CK level greater than 10 times ULN; recurrent serum CK level greater than 5 times ULN; recurrent severe or intolerable musculoskeletal adverse reactions.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not studied; use caution.

**SIDE EFFECTS**

**Frequent (54%–23%):** Muscle spasm, alopecia, dysgeusia, fatigue, nausea, diarrhea, musculoskeletal pain, decreased appetite. **Occasional (19%–10%):** Myalgia, abdominal pain, headache, generalized pain, vomiting, pruritus.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Musculoskeletal events occurred in 68% of pts. Grade 3 or 4 musculoskeletal events (9% of pts) may require administration of muscle relaxants, analgesics/narcotics, magnesium supplementation, IV hydration. Serum CK level elevations usually occur before musculoskeletal pain or spasms. Increased serum CK levels reported in 61% of pts. The median onset of serum CK elevation was approx. 12 wks. May increase risk of rhabdomyolysis. Amenorrhea lasting longer than 18 mos has occurred.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Receive medication history and screen for interactions. Assess hydration status. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor renal function, serum CK levels periodically and with any musculoskeletal adverse events. If musculoskeletal adverse reactions occur with serum CK levels greater than 2.5 times ULN, obtain serum CK level at least wkly until resolution. Monitor urine color, output. Serum CK level elevation or worsening of renal function may indicate rhabdomyolysis. Monitor pregnancy status during therapy.

**PATIENT/FAMILY TEACHING**

- Treatment may cause severe muscle damage, which may cause kidney

damage. • Report dark-colored urine or decreased urine output despite hydration. • Immediately report musculoskeletal symptoms such as muscle pain/spasms/tenderness/weakness. • Do not donate blood or blood products during treatment and up to 20 mos after discontinuation. • Use effective contraception to avoid pregnancy. Do not breast-feed. • Take on empty stomach at least 1 hr before or 2 hrs after a meal.

**SORafenib**

soe-raf-e-nib  
(NexAVAR)

**Do not confuse NexAVAR with NexIUM, or SORafenib with imatinib or SUNitinib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

**USES**

Treatment of advanced renal cell carcinoma (RCC), unresectable hepatocellular carcinoma (HCC), locally recurrent or metastatic progressive differentiated thyroid carcinoma (DTC) refractive to radioactive iodine treatment. **OFF-LABEL:** Recurrent or metastatic angiosarcoma, resistant gastrointestinal stromal tumor.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to SORafenib. Use in combination with CARBOplatin and PACLitaxel in pts with squamous cell lung cancer. **Cautions:** Uncontrolled hypertension, pulmonary disease, pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia,

hypomagnesemia), pts at risk for bleeding (e.g., history of intracranial/GI/genitourinary bleeding, coagulation disorders, recent trauma, concomitant use of anticoagulants, antiplatelets); unstable coronary artery disease, recent MI, HF; concurrent use with strong CYP3A4 inducers.

## ACTION

Inhibits tumor cell proliferation by inhibiting intracellular Raf kinases and cell surface kinase receptors. **Therapeutic Effect:** Inhibits tumor growth and survival.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: 99.5%. Excreted in feces (77%), urine (19%). **Half-life:** 25–48 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid use; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carBAMazepine, PHENobarbital, rifAMPin) may decrease concentration/effect. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. May increase adverse effects of **carboplatin**. May increase anticoagulant effect of **warfarin**. **HERBAL:** None significant. **FOOD:** High-fat meals decrease effectiveness. **LAB VALUES:** May increase serum lipase, amylase, bilirubin, alkaline phosphatase, transaminases. May decrease

serum phosphorus, lymphocytes, WBCs, Hgb, Hct.

## AVAILABILITY (Rx)

 **Tablets:** (NexAVAR): 200 mg.

## ADMINISTRATION/HANDLING

### PO

• Give 1 hr before or 2 hrs after meal (high-fat meal reduces effectiveness). • Swallow tablet whole; do not break, crush, dissolve, or divide tablet.

## INDICATIONS/ROUTES/DOSAGE

**Renal Cell Carcinoma, Hepatocellular Carcinoma, Thyroid Carcinoma**

**PO: ADULTS, ELDERLY:** 400 mg (2 tablets) twice daily without food. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**HCC/RCC: First dose reduction:** 400 mg once daily. **Second dose reduction:** 200 mg once daily or 400 mg every other day.

**DTC: First dose reduction:** 400 mg once in the morning and 200 mg once at night (12 hrs apart). **Second dose reduction:** 200 mg twice daily. **Third dose reduction:** 200 mg once daily

### Dose Modification

Based on Common Terminology Criteria for Adverse Events.

### Cardiac Toxicity

**Grade 3 congestive HF:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. Permanently discontinue for Grade 3 congestive HF that does not improve within 30 days; Grade 4 congestive HF; Grade 2 or greater cardiac ischemia/infarction.

### Dermatologic Toxicity

**Note:** If improved to Grade 1 or 0 from Grade 2 or 3 toxicity for at least 28 days, may increase dose by one dose level.

**HCC/RCC: Grade 2 toxicity: (First occurrence):** Continue same dose and start topical therapy. **(Not improved within 7 days; second or third occurrence):** Withhold treatment until

improved to Grade 1 or 0, then resume at reduced dose level. (**Fourth occurrence**): Permanently discontinue. **Grade 3 toxicity: (First or second occurrence)**: Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. (**Third occurrence**): Permanently discontinue.

**DTC: Grade 2 toxicity: (First occurrence)**: Reduce dose to 600 mg once daily. (**Not improved within 7 days; second or third occurrence**): Withhold treatment until improved to Grade 1, then reduce dose by one dose level (for second occurrence) or by two dose levels (for third occurrence). (**Fourth occurrence**): Permanently discontinue.

**Grade 3 toxicity: (First occurrence)**: Withhold treatment until improved to Grade 1, then resume at reduced dose level. (**Second occurrence**): Withhold treatment until improved to Grade 1, then reduce dose by two dose levels. (**Third occurrence**): Permanently discontinue.

#### *Hypertension*

**Grade 2 (symptomatic/persistent) hypertension; Grade 2 symptomatic increase greater than 20 mm Hg (diastolic); B/P greater than 140/90 mm Hg if previously within normal limits; Grade 3 hypertension**: Withhold treatment until symptoms resolve and diastolic B/P is less than 90 mm Hg, then resume at reduced dose level. May further reduce if needed. **Grade 4 hypertension; more than 2 dose reductions are required**: Permanently discontinue.

#### *Nonhematologic Toxicity*

**Any Grade 2 toxicity**: Reduce dose by one dose level. **Any Grade 3 toxicity: (First occurrence)**: Withhold treatment until Grade 2 or less, then resume at reduced dose level. (**Not improved within 7 days; second or third occurrence**): Withhold treatment until Grade 2 or less, then reduce dose by two dose levels. (**Fourth occurrence**): Withhold treatment until Grade 2 or less, then reduce dose by two dose levels for HCC and RCC, or 3 dose levels for DTC.

#### *QT Interval Prolongation*

**QT interval greater than 500 msec; increase of 60 msec or greater from baseline**: Withhold treatment and correct electrolyte abnormalities. May restart based on clinical judgment.

#### *Permanent Discontinuation*

Grade 2 or greater hemorrhage requiring medical intervention; any grade GI perforation; Grade 3 or 4 serum ALT elevation; serum ALT/ALT elevation greater than 3 times ULN with serum bilirubin 2 times ULN.

#### *Dosage in Renal Impairment*

**Mild to severe impairment (not requiring dialysis)**: No dose adjustment.

#### *Dosage in Hepatic Impairment*

**Mild to moderate impairment**: No dose adjustment. **Severe impairment**: Not specified.

## SIDE EFFECTS

**Frequent (43%–16%)**: Diarrhea, rash, fatigue, exfoliative dermatitis, alopecia, nausea, pruritus, hypertension, anorexia, vomiting. **Occasional (15%–10%)**: Constipation, minor bleeding, dyspnea, sensory neuropathy, cough, abdominal pain, dry skin, weight loss, joint pain, headache. **Rare (9%–1%)**: Acne, flushing, stomatitis, mucositis, dyspepsia, arthralgia, myalgia, hoarseness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to the therapy. Cardiac ischemia/MI reported in 3% of pts. Fatal hemorrhage (esophageal hemorrhage, bleeding from any site) was reported. Life-threatening cutaneous toxicities including Stevens-Johnson syndrome, toxic epidermal necrolysis, hand-foot skin reactions may occur. GI perforation reported in less than 1% of pts. May impair healing of wounds. An increased risk of mortality was reported in pts receiving other chemotherapeutic agents. May cause QT interval prolongation, thyroid-stimulating hormone (TSH)

suppression, hepatotoxicity, neuropathy, intracranial hemorrhage, interstitial lung disease, pneumonitis, thrombotic microangiopathy, osteonecrosis of the jaw; arterial aneurysms, dissections, rupture.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, TSH, B/P; pregnancy test in females of reproductive potential. Screen for active infection. Question history as listed in Precautions. Receive full medication history and screen for interactions. Conduct dermatologic exam. Assess for poorly healed wounds/recent surgical wounds. Assess risk for QT interval prolongation. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, serum electrolytes, ECG; TSH (if applicable), LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting). Monitor B/P frequently. Diligently assess skin for cutaneous toxicities, impaired wound healing. Monitor for cardiac ischemia/infarction (chest pain, diaphoresis, left arm or jaw pain, ST segment elevation, serum troponin elevation), GI perforation (abdominal pain, fever, nausea, vomiting), infection (cough, fatigue, fever); neuropathy (gait disturbance, fine motor control difficulties, numbness); hypersensitivity reactions (anaphylaxis, urticaria), bleeding of any kind.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), toxic skin reactions

(rash, redness, sloughing, swelling).

- Life-threatening cardiac events may occur; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm or jaw, sweating).
- Treatment may affect the heart's ability to pump blood or alter the electrical conduction of the heart, which may lead to HE, cardiac arrhythmias; report chest pain, difficulty breathing, dizziness, swelling of extremities, fainting, palpitations.
- Bleeding of any kind can be life-threatening
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Treatment may worsen high blood pressure.
- Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract.

## sotalol

**HIGH ALERT**

### soe-ta-lol

(Betapace, Betapace AF, Sorine, Sotylize)

**BLACK BOX ALERT** ■ Initiation, titration to occur in a hospital setting with continuous ECG to monitor potential onset of life-threatening arrhythmias. Calculate CrCl prior to dosing. Adjust dose based on CrCl. Betapace should not be substituted for Betapace AF.

**Do not confuse Betapace with Betapace AF, or sotalol with Stadol or Sudafed.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nonselective beta-adrenergic blocking agent.

**CLINICAL:** Antiarrhythmic Class II, Class III.

### USES

Treatment of documented, life-threatening ventricular arrhythmias. Maintain normal sinus rhythm in pts with symptomatic atrial fibrillation/flutter.

**OFF-LABEL:** Fetal tachycardia, treatment of atrial fibrillation with hypertrophic cardiomyopathy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to sotalol. Cardiogenic shock, congenital or acquired long QT syndrome, second- or third-degree heart block (unless functioning pacemaker is present), sinus bradycardia, uncontrolled HF, bronchial asthma or related bronchospastic conditions. Baseline QT interval greater than 450 msec, bronchospastic conditions, CrCl less than 40 mL/min, serum potassium less than 4 mEq/L, sick sinus syndrome.

**Cautions:** Pts with history of ventricular tachycardia, ventricular fibrillation, cardiomegaly, compensated HF, diabetes mellitus, QT interval prolongation, concurrent medications that prolong QT interval, hypokalemia, hypomagnesemia, renal impairment, within first 2 wks post MI, peripheral vascular disease, Raynaud's syndrome, myasthenia gravis, psychiatric disease, bronchospastic disease. Concurrent use of digoxin, verapamil, diltiazem, history of severe anaphylaxis to allergens.

## ACTION

**Class II effects:** Increases sinus cycle length, AV nodal refractoriness; decreases AV nodal conduction; slows heart rate.

**Class III effects:** Prolongs atrial/ventricular action potentials, inducing effective refractory prolongation of atrial/ventricular muscle and atrial/ventricular accessory pathways. **Therapeutic Effect:** Produces antiarrhythmic activity.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1–2 hrs	2.5–4 hrs	8–16 hrs

Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 12 hrs (increased in elderly, renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk.

**Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Calcium channel blockers (e.g., diltiazem, verapamil) may increase effect on AV conduction, B/P. May mask symptoms of hypoglycemia, prolong hypoglycemic effects of insulin, oral hypoglycemics (e.g., glipizide, metformin). QT-prolonging medications (e.g., amiodarone, ciprofloxacin, fingolimod, haloperidol, ondansetron) may increase risk of prolonged QT interval. Antacids may decrease concentration/effect.

**HERBAL:** Herbals with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects.

**FOOD:** None known. **LAB VALUES:** May increase serum BUN, glucose, alkaline phosphatase, LDH, lipoprotein, ALT, AST, triglycerides, potassium, uric acid.

## AVAILABILITY (Rx)

**Solution, Intravenous:** 150 mg/10 mL.

**Solution, Oral:** 5 mg/mL. **Tablets:** 80 mg, 120 mg, 160 mg, 240 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Do not administer antacids within 2 hrs after dose.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Baseline QTc interval and CrCl must be determined before initiation.

**Atrial Fibrillation/Flutter (Symptomatic), Ventricular Arrhythmias**

**PO: ADULTS, ELDERLY:** Initially, 80 mg twice daily. If initial dose does not reduce the frequency of relapse and excessive QTc interval prolongation does not occur after 3 days, may increase dose to 120 mg twice daily. May increase dose after another 3 days to a maximum dose of 160 mg twice daily.

**IV:** Initially, 75 mg infused over 5 hrs twice daily. If initial dose does not reduce frequency of relapse and excessive QTc interval prolongation does not occur after 3 days, may increase dose to 112.5 mg twice daily. May increase after another 3 days to a maximum dose of 150 mg twice daily.

#### Usual Dosage for Children

**PO:** Initially, 90 mg/m<sup>2</sup>/day in 3 divided doses. May incrementally increase up to a maximum of 180 mg/m<sup>2</sup>/day not to exceed maximum adult dose of 320 mg/day.

#### Dosage in Renal Impairment

Dosage interval is modified based on creatinine clearance.

##### Atrial Fibrillation/Flutter

Creatinine Clearance	Dosage
Greater than 60 mL/min	12 hrs
40–60 mL/min	24 hrs
Less than 40 mL/min	Contraindicated

##### Ventricular Arrhythmias

Creatinine Clearance	Dosage
Greater than 60 mL/min	12 hrs
30–60 mL/min	24 hrs
10–29 mL/min	q36–48h

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Diminished sexual function, drowsiness, insomnia, asthenia.

**Occasional:** Depression, cold hands/feet, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting.

**Rare:** Altered taste, dry eyes, pruritus, paresthesia of fingers, toes, scalp.

### ADVERSE EFFECTS/TOXIC REACTIONS

Bradycardia, HF, hypotension, bronchospasm, hypoglycemia, prolonged QT interval, torsades de pointes, ventricular tachycardia, premature ventricular complexes may occur.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

QTc interval and CrCl must be determined prior to initiation. Pt must be on continu-

ous cardiac monitoring upon initiation of therapy. Do not administer without consulting physician if pulse is 60 beats/min or less. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

Diligently monitor for arrhythmias. Assess B/P for hypotension, pulse for bradycardia. Assess for HF: dyspnea, peripheral edema, jugular vein distention, increased weight, rales in lungs, decreased urinary output.

#### PATIENT/FAMILY TEACHING

- Do not discontinue, change dose without physician approval.
- Avoid tasks requiring alertness, motor skills until response to drug is established (may cause drowsiness).
- Periodic lab tests, ECGs are essential part of therapy.
- Report rapid heartbeat, chest pain, swelling of ankles/legs, difficulty breathing.

## spironolactone

spir-on-oh-lak-tone  
(Aldactone, CaroSpir)

**Do not confuse Aldactone with Aldactazide.**

### FIXED-COMBINATION(S)

**Aldactazide:** spironolactone/hydrochlorothiazide (a thiazide diuretic): 25 mg/25 mg, 50 mg/50 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aldosterone receptor antagonist. **CLINICAL:** Potassium-sparing diuretic, antihypertensive.

### USES

Management of edema in cirrhotic pts when edema is unresponsive to fluid and sodium restriction. Heart failure (NYHA class III–IV and reduced ejection fraction) to increase survival, manage edema,

and to reduce need for hospitalization for HF. Management of hypertension (unresponsive to other therapies). Treatment of primary hyperaldosteronism. **OFF-LABEL:** Treatment of edema, hypertension in children, female acne, female hirsutism. Ascites due to cirrhosis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to spironolactone. Hyperkalemia, Addison's disease, concomitant use with eplerenone. **Cautions:** Dehydration, hyponatremia, concurrent use of supplemental potassium, elderly. Mild renal impairment, declining renal function, ACE inhibitors or angiotensin receptor blockers.

## ACTION

Interferes with sodium reabsorption by competitively inhibiting action of aldosterone in distal tubule, promoting sodium and water excretion, increasing potassium retention. May decrease effect of aldosterone on arteriolar smooth muscle. **Therapeutic Effect:** Produces diuresis, lowers B/P.

## PHARMACOKINETICS

Widely distributed. Protein binding: 91%–98%. Metabolized in liver to active metabolite. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 78–84 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Active metabolite excreted in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** May be more susceptible to developing hyperkalemia. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** ACE inhibitors (e.g., captopril, lisinopril), angiotensin receptor blockers (e.g., valsartan), eplerenone, potassium-containing medications, potassium supplements may increase risk of hyperkalemia. May

decrease therapeutic effect of digoxin. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Food increases absorption. **LAB VALUES:** May increase urinary calcium excretion, serum BUN, glucose, creatinine, magnesium, potassium, uric acid. May decrease serum sodium.

## AVAILABILITY (Rx)

**Oral Suspension:** 25 mg/5 mL.  
**Tablets:** 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Take with food to reduce GI irritation and increase absorption. **Suspension:**
- Shake well. • May give with or without food (give consistently with respect to food).

## INDICATIONS/ROUTES/DOSAGE

### Ascites (Due to Cirrhosis)

**PO: ADULTS, ELDERLY: (Tablet):** Initially, 100 mg/day as single dose. May titrate q3–5 days based on response and tolerability. **Maximum dose:** 400 mg once daily.

### Hypertension

**PO: ADULTS, ELDERLY: (Tablet):** Initially, 12.5–25 mg once daily. May titrate q2wks as needed. **Maximum:** 100 mg. **(Suspension):** 20–75 mg daily in 1 or 2 divided doses. May titrate q2wks based on response and tolerability.

### Primary Aldosteronism

**PO: ADULTS, ELDERLY:** Initially, 12.5–25 mg once daily. Gradually titrate to the lowest effective dose. **Maximum dose:** 400 mg/day.

### HF

**PO: ADULTS, ELDERLY: (Tablet):** Initially, 12.5–25 mg/day. May double the dose q4wks if serum potassium remains less than 5 mEq/L and renal function remains stable. **Maximum:** 50 mg/day. in 1 or 2 divided doses. **(Suspension):** Initially,

10–20 mg once daily. May titrate to 37.5 mg once daily if serum potassium remains less than 5 mEq/L and renal function remains stable.

#### Dosage in Renal Impairment

**CrCl 50 mL/min or greater:** Initially, 12.5–25 mg once daily. **Maintenance:** 25 mg once or twice daily. **CrCl 30–49 mL/min:** Initially, 12.5 mg once daily or every other day. **Maintenance:** 12.5–25 mg once daily. **CrCl less than 30 mL/min:** Not recommended.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Hyperkalemia (in pts with renal insufficiency, those taking potassium supplements), dehydration, hyponatremia, lethargy. **Occasional:** Nausea, vomiting, anorexia, abdominal cramps, diarrhea, headache, ataxia, drowsiness, confusion, fever. **Male:** Gynecomastia, impotence, decreased libido. **Female:** Menstrual irregularities (amenorrhea, postmenopausal bleeding), breast tenderness. **Rare:** Rash, urticaria, hirsutism.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe hyperkalemia may produce arrhythmias, bradycardia, ECG changes (tented T waves, widening QRS complex, ST segment depression). May proceed to cardiac standstill, ventricular fibrillation. Cirrhosis pts at risk for hepatic decompensation if dehydration, hyponatremia occurs. Pts with primary aldosteronism may experience rapid weight loss, severe fatigue during high-dose therapy.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain serum electrolytes, renal function test, weight; B/P. Assess hydration status.

#### INTERVENTION/EVALUATION

Monitor serum electrolyte values, esp. for increased potassium, BUN, creatinine. Monitor B/P. Monitor for hyponatremia:

mental confusion, thirst, cold/clammy skin, drowsiness, dry mouth. Monitor for hyperkalemia: colic, diarrhea, muscle twitching followed by weakness/paralysis, arrhythmias. Obtain daily weight. Note changes in edema, skin turgor.

#### PATIENT/FAMILY TEACHING

- Expect increase in volume, frequency of urination.
- Therapeutic effect takes several days to begin and can last for several days when drug is discontinued.
- Report irregular or slow pulse, symptoms of electrolyte imbalance (see previous Intervention/Evaluation).
- Avoid foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Avoid alcohol.

## sulfamethoxazole-trimethoprim

sul-fa-meth-ox-a-zole-trye-meth-oh-prim  
(Bactrim, Bactrim DS, Sulfatrim)  
**Do not confuse Bactrim with bacitracin or Bactroban.**

#### FIXED-COMBINATION(S)

**Bactrim, Septra:** sulfamethoxazole/trimethoprim: 5:1 ratio remains constant in all dosage forms (e.g., 400 mg/80 mg).

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sulfonamide derivative. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *S. pneumoniae*, *H. influenzae*, *E. coli*, *Klebsiella* spp., *Enterobacter* spp., *M. organii*, *P. mirabilis*, *P. vulgaris*, *S. flexneri*, *Pneumocystis jiroveci*, including acute or complicated and recurrent or chronic UTI, *Pneumocystis jiroveci* pneumonia (PCP), shigellosis, enteritis,

otitis media, chronic bronchitis, traveler's diarrhea. Prophylaxis of PCP. Acute exacerbation of COPD. **OFF-LABEL:** Chronic prostatitis, prophylaxis for UTI, MRSA infections, prosthetic joint infection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to any sulfa medication, trimethoprim. History of drug-induced immune thrombocytopenia with sulfonamides or trimethoprim, infants younger than 4 wks, megaloblastic anemia due to folate deficiency, severe hepatic/renal impairment. Concomitant administration of dofetilide. **Cautions:** Pts with G6PD deficiency, hepatic/renal/thyroid impairment, porphyria, asthma, elderly, concurrent anticonvulsant therapy.

## ACTION

**Sulfamethizole:** Interferes with bacterial folic acid synthesis and growth. **Trimethoprim:** Inhibits dihydrofolic acid reduction. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

## PHARMACOKINETICS

Widely distributed. Protein binding: 45%–60%. Metabolized in liver. Excreted in urine. Minimally removed by hemodialysis. **Half-life:** sulfamethoxazole, 6–12 hrs; trimethoprim, 6–17 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated during pregnancy at term and during lactation. Readily crosses placenta. Distributed in breast milk. May produce kernicterus in newborn. **Children:** Contraindicated in pts younger than 2 mos; may increase risk of kernicterus in newborn. **Elderly:** Increased risk for severe skin reaction, myelosuppression, decreased platelet count.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **phenytoin**, **digoxin**, **oral hypoglycemics (e.g., glipiZIDE, metFORMIN)**, **warfarin**. May increase adverse effects of

**methotrexate**. **Strong CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin)** may decrease concentration/effect. Trimethoprim may increase concentration/effect of **dofetilide**. **Leucovorin** may increase adverse effects of trimethoprim. **HERBAL:** **St. John's wort** may decrease concentration/effect. **Herbals with hypoglycemic properties (e.g., fenugreek)** may increase concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, ALT, AST, bilirubin.

## AVAILABILITY (Rx)

 **ALERT** All dosage forms have same 5:1 ratio of sulfamethoxazole (SMZ) to trimethoprim (TMP).

**Injection Solution:** SMZ 80 mg and TMP 16 mg per mL. **Oral Suspension:** SMZ 200 mg and TMP 40 mg per 5 mL. **Tablets: (Bactrim):** SMZ 400 mg and TMP 80 mg. **Tablets, Double Strength: (Bactrim DS):** SMZ 800 mg and TMP 160 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute each 5 mL with 75–125 mL D<sub>5</sub>W. • Do not mix with other drugs or solutions.

**Rate of administration** • Infuse over 60–90 min. Must avoid bolus or rapid infusion. • Do not give IM.

**Storage** • IV infusion (piggyback) stable for 2 hrs (5 mL/75 mL D<sub>5</sub>W), 4 hrs (5 mL/100 mL D<sub>5</sub>W), 6 hrs (5 mL/125 mL D<sub>5</sub>W). • Discard if cloudy or precipitate forms.

### PO

• Administer without regard to food. • Give with at least 8 oz water.

## IV INCOMPATIBILITIES

Fluconazole (Diflucan), foscarnet (Foscavir), midazolam (Versed), vinorelbine (Navelbine).

## IV COMPATIBILITIES

Dexmedetomidine (Precedex), dilTIAZem (Cardizem), heparin, HYDROmorphone

(Dilaudid), LORazepam (Ativan), magnesium sulfate, morphine, niCARDipine (Cardene).

## INDICATIONS/ROUTES/DOSAGE

### Usual Adult/Elderly Dosage Range

**PO:** 1–2 double-strength tablets q12–24h. **IV:** 8–20 mg/kg/day as trimethoprim in divided doses q6–12h.

### Usual Dosage Range for Infants 2 Mos and Older, Children, Adolescents

**PO/IV:** 6–12 mg TMP/kg/day in divided doses q12h. **Maximum single dose:** 160 mg TMP.

### Dosage in Renal Impairment

#### Creatinine

Clearance	Dosage
15–30 mL/min	50% of usual dosage
Less than 15 mL/min	Not recommended
HD	2.5–10 mg/kg trimethoprim q24h (or 5–20 mg/kg 3 times/wk) (give after HD)
CRRT	2.5–7.5 mg/kg trimethoprim q12h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Anorexia, nausea, vomiting, rash (generally 7–14 days after therapy begins), urticaria. **Occasional:** Diarrhea, abdominal pain, pain/irritation at IV infusion site. **Rare:** Headache, vertigo, insomnia, seizures, hallucinations, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

Rash, fever, sore throat, pallor, purpura, cough, shortness of breath may be early signs of serious adverse effects. Fatalities are rare but have occurred in sulfonamide therapy following Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, agranulocytosis, aplastic anemia, other blood dyscrasias. Myelosuppression, decreased

platelet count, severe dermatologic reactions may occur, esp. in the elderly.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain history for hypersensitivity to trimethoprim or any sulfonamide, sulfite sensitivity, bronchial asthma. Determine serum renal, hepatic, hematologic baselines.

### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, pallor, purpura. Check IV site, flow rate. Monitor renal, hepatic, hematology function. Assess I&O. Check for CNS symptoms (headache, vertigo, insomnia, hallucinations). Monitor for cough, shortness of breath. Assess for overt bleeding, ecchymosis, edema.

### PATIENT/FAMILY TEACHING

- Continue medication for full length of therapy.
- Take oral doses with 8 oz water and drink several extra glasses of water daily.
- Report immediately any new symptoms, esp. rash, other skin changes, bleeding/bruising, fever, sore throat, diarrhea.
- Avoid prolonged exposure to UV, direct sunlight.

## sulfaSALazine

### sul-fa-sal-a-zeen

(Apo-SulfaSALazine , Azulfidine, Azulfidine EN-tabs, Salazopyrin )

**Do not confuse Azulfidine with Augmentin or azaTHIOprine, or sulfaSALazine with sulfADIAZINE or sulfiSOXAZOLE.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** 5-Aminosalicylic acid derivative. **CLINICAL:** Anti-inflammatory.

## USES

Treatment of mild to moderate ulcerative colitis, adjunctive therapy in severe

ulcerative colitis, rheumatoid arthritis (RA). **OFF-LABEL:** Treatment of ankylosing spondylitis, Crohn's disease, psoriasis, psoriatic arthritis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to sulfaSALazine, sulfa, salicylates; porphyria; GI or GU obstruction. **Cautions:** Severe allergies, bronchial asthma, impaired hepatic/renal function, G6PD deficiency, blood dyscrasias, history of recurring or chronic infections.

## ACTION

Modulates local mediators of inflammatory response. Inhibits tumor necrosis factor (TNF). **Therapeutic Effect:** Decreases inflammatory response, interferes with GI secretion. Effect appears topical rather than systemic.

## PHARMACOKINETICS

Poorly absorbed from GI tract. Cleaved, absorbed in colon by intestinal bacteria, forming sulfapyridine and mesalamine (5-ASA). Widely distributed. Metabolized via colonic intestinal flora. Primarily excreted in urine. **Half-life:** 5.7–10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause infertility, oligospermia in men while taking medication. Readily crosses placenta; if given near term, may produce jaundice, hemolytic anemia, kernicterus in newborn. Distributed in breast milk. Pt should not breastfeed premature infant or those with hyperbilirubinemia or G6PD deficiency. **Children:** No age-related precautions noted in pts older than 2 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** Impairs folate absorption. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 500 mg.

 **Tablets, Delayed-Release:** 500 mg.

## ADMINISTRATION/HANDLING

### PO

- Space doses evenly (intervals not to exceed 8 hrs).
- Administer after meals or with food.
- Swallow enteric-coated tablets whole; do not break, crush, dissolve, or divide.
- Give with 8 oz of water; encourage several glasses of water between meals.

## INDICATIONS/ROUTES/DOSAGE

### Ulcerative Colitis

**PO: ADULTS, ELDERLY:** (*Immediate-Release, Delayed-Release*): Initially, 3–4 g/day in divided doses q8h. May initiate at 1–2 g/day to reduce GI intolerance. **Maximum:** 6 g/day. **Maintenance:** 2 g/day in divided doses at intervals less than or equal to q8h. **CHILDREN 6 YRS AND OLDER:** Initially, 40–70 mg/kg/day in 3–6 divided doses. **Maximum initial dose:** 4 g/day. **Maintenance:** 30–70 mg/kg/day in 3–6 divided doses. **Maximum daily dose:** 4 g/day.

### Rheumatoid Arthritis (RA)

**PO: (Delayed-Release Tablets): ADULTS, ELDERLY:** Initially, 0.5 g once daily or 1 g/day in 2 divided doses for 1 wk. Increase by 0.5 g/wk, up to 2 g/day in 2 divided doses. **Maximum:** 3 g/day (if response to 2 g/day is inadequate after 12 wks of treatment).

### Dosage in Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent (33%):** Anorexia, nausea, vomiting, headache, oligospermia (generally reversed by withdrawal of drug). **Occasional (3%):** Hypersensitivity reaction (rash, urticaria, pruritus, fever, anemia). **Rare (less than 1%):** Tinnitus, hypoglycemia, diuresis, photosensitivity.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anaphylaxis, Stevens-Johnson syndrome, hematologic toxicity (leukopenia, agranulocytosis), hepatotoxicity, nephrotoxicity occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT. Question history of prior hypersensitivity reactions.

### INTERVENTION/EVALUATION

Monitor I&O, urinalysis, renal function tests; ensure adequate hydration (minimum output 1,500 mL/24 hrs) to prevent nephrotoxicity. Assess skin for rash (discontinue drug, notify physician at first sign). Monitor daily pattern of bowel activity, stool consistency. (Dosage increase may be needed if diarrhea continues, recurs.) Monitor CBC closely; assess for and report immediately any hematologic effects (bleeding, ecchymoses, fever, pharyngitis, pallor, weakness, purpura). Monitor LFT; observe for jaundice.

### PATIENT/FAMILY TEACHING

- May cause orange-yellow discoloration of urine, skin.
- Take after or with food with 8 oz of water; drink several glasses of water between meals.
- Continue for full length of treatment; may be necessary to take drug even after symptoms relieved.
- Routinely monitor blood levels.
- Inform dentist, surgeon of sulfa/SALazine therapy.
- Avoid exposure to sun, ultraviolet light until photosensitivity determined (may last for mos after last dose).

## SUMatriptan

soo-ma-trip-tan

(Imitrex, Onzetra, Sumavel DosePro, Tosymra, Xsail, Zembrace SymTouch)

**Do not confuse SUMatriptan with SAXagliptin, SITagliptin, somatropin, or ZOLMitriptan.**

### FIXED-COMBINATION(S)

**Treximet:** SUMatriptan/naproxen (an NSAID): 85 mg/500 mg, 10 mg/60 mg.

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin 5-HT<sub>1</sub> receptor agonist. **CLINICAL:** Antimigraine.

## USES

**PO, SQ, Intranasal, Transdermal:** Acute treatment of migraine headache with or without aura. **SQ: (Excluding Zembrace)** Treatment of cluster headaches in adults as monotherapy or in combination with 100% oxygen.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to SUMatriptan. Management of hemiplegic or basilar migraine, peripheral vascular disease, CVA, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal's angina), severe hepatic impairment, transient ischemic attack, uncontrolled hypertension, MAOI use within 14 days, use within 24 hrs of ergotamine preparations or another 5-HT<sub>1</sub> agonist. Wolff-Parkinson-White syndrome or arrhythmias associated with other cardiac accessory conduction pathway disorders. **Cautions:** Mild to moderate hepatic impairment, seizure disorder, hypertension, elderly.

## ACTION

Binds selectively to serotonin 5-HT<sub>1</sub> receptors in cranial arteries, producing vasoconstrictive effect on cranial blood vessels. **Therapeutic Effect:** Relieves migraine headache.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Nasal	15 min	N/A	24–48 hrs
PO	30 min	2 hrs	24–48 hrs
SQ	10 min	1 hr	24–48 hrs

Widely distributed. Metabolized in liver. Protein binding: 10%–21%. Excreted in urine. **Half-life:** 2 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety

and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Ergotamine-containing medications may produce vasospastic reaction. MAOIs (e.g., phenelzine, selegiline) may increase concentration, half-life. SSRIs (e.g., escitalopram, PARoxetine, sertraline) and SNRIs (e.g., DULoxetine, venlafaxine) may increase risk of serotonin syndrome. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection, Prefilled Autoinjector:** 4 mg/0.5 mL, 6 mg/0.5 mL. (*Zembrace SymTouch*): 3-mg prefilled syringe. **Injection Solution:** 6 mg/0.5 mL. (*Sumavel DosePro*): 6 mg/0.5 mL. **Nasal Powder:** (*Onzetra, Xsail*): **Capsules:** 11 mg (to be used with Xsail breath powdered nasal device). **Nasal Spray:** (*Imitrex Nasal*): 5 mg/actuation, 20 mg/actuation. (*Tosymra*): 10 mg/actuation. **Tablets:** (*Imitrex*): 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### SQ

- Follow manufacturer's instructions for autoinjection device use.
- Administer needleless (Sumavel DosePro) only to abdomen or thigh.

### PO

- Swallow tablets whole. Do not break, crush, dissolve, or divide.
- Take with full glass of water.

### Nasal

- Unit contains only one spray—do not test before use.
- Instruct pt to gently blow nose to clear nasal passages.
- With head upright, close one nostril with index finger, breathe out gently through mouth.
- Have pt insert nozzle into open nostril about one-half inch, close mouth and, while taking a breath through nose, release spray dosage by firmly pressing plunger.
- Instruct pt to remove nozzle

from nose and gently breathe in through nose and out through mouth for 10–20 sec; do not breathe in deeply.

## INDICATIONS/ROUTES/DOSAGE

### Acute Migraine Headache

**PO: ADULTS, ELDERLY:** 50–100 mg. Dose may be repeated after at least 2 hrs. **Maximum:** 100 mg/single dose; 200 mg/24 hrs.

**SQ: ADULTS, ELDERLY:** Initially, 6 mg once. May repeat a dose (usually same as first dose) after 1 hr. If 6-mg dose was not tolerated, subsequent doses of 1–5 mg may provide sufficient relief with better tolerability. **Maximum:** 6 mg/dose (12 mg/24 hrs).

**Intranasal: ADULTS, ELDERLY: (Solution):** Initially, 20 mg once (usual dose) in a single nostril. May repeat once after at least 2 hrs. **Maximum:** 40 mg/24 hr. (**Spray:**) Initially, 10 mg once in one nostril. If initial dose was partially effective or headache recurs, may repeat dose once after at least 1 hr. **Maximum:** 30 mg/4 hrs. (**Nasal Powder:**) Initially, a single dose of 22 mg (11 mg in each nostril). May repeat once after at least 2 hrs. **Maximum:** 44 mg/24 hrs separated by at least 2 hrs.

### Cluster Headaches

**SQ: ADULTS, ELDERLY:** Initially, 6 mg. May repeat after 1 hr. **Maximum:** 6 mg/dose; two 6-mg doses/24 hrs.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment: Maximum PO dose:** 50 mg. **Severe impairment:** Contraindicated.

## SIDE EFFECTS

**Frequent: PO (10%–5%):** Tingling, nasal discomfort. **SQ (greater than 10%):** Injection site reactions, tingling, warm/hot sensation, dizziness, vertigo. **Nasal (greater than 10%):** Altered taste, nausea, vomiting. **Occasional: PO (5%–1%):** Flushing, asthenia, visual

disturbances. **SQ (10%–2%)**: Burning sensation, numbness, chest discomfort, drowsiness, asthenia. **Nasal (5%–1%)**: Nasopharyngeal discomfort, dizziness. **Rare: PO (less than 1%)**: Agitation, eye irritation, dysuria. **SQ (less than 2%)**: Anxiety, fatigue, diaphoresis, muscle cramps, myalgia. **Nasal (less than 1%)**: Burning sensation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Excessive dosage may produce tremors, redness of extremities, reduced respirations, cyanosis, seizures, paralysis. Serious arrhythmias occur rarely, esp. in pts with hypertension, obesity, smokers, diabetes, strong family history of coronary artery disease. Serotonin syndrome may occur (agitation, confusion, hallucinations, hyperreflexia, myoclonus, shivering, tachycardia).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Receive full medical history, medication history and screen for contraindications. Obtain pregnancy test in female pts of reproductive potential. Question regarding onset, location, duration of migraine, possible precipitating symptoms.

### INTERVENTION/EVALUATION

Evaluate for relief of migraine headache and resulting photophobia, phonophobia (sound sensitivity), nausea, vomiting.

### PATIENT/FAMILY TEACHING

- Follow proper technique for loading of autoinjector, injection technique, discarding of syringe.
- Do not use more than 2 injections during any 24-hr period and allow at least 1 hr between injections.
- Report immediately if

wheezing, palpitations, skin rash, facial swelling, pain/tightness in chest/throat occur.

## SUNtinib

**HIGH ALERT**

soo-nit-in-ib  
(Sutent)

**BLACK BOX ALERT** Hepatotoxicity may be severe and/or result in fatal liver failure.

**Do not confuse SUNtinib with imatinib or SORafenib.**

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

## USES

Treatment of GI stromal tumor (GIST) after disease progression while on or demonstrating intolerance to imatinib. Treatment of advanced renal cell carcinoma (RCC). Adjuvant treatment of adults at high risk of recurrent RCC following nephrectomy. Treatment of pancreatic neuroendocrine tumor (PNET). **OFF-LABEL:** Non-GI stromal tumor, soft tissue sarcomas, advanced thyroid cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to SUNtinib. **Cautions:** Cardiac dysfunction, bradycardia, electrolyte imbalance, bleeding tendencies, hypertension, history of prolonged QT interval, medications that prolong QT interval, hypokalemia, hypomagnesemia, concurrent use of strong CYP3A4 inducers or inhibitors, HF, renal/hepatic impairment, pregnancy.

## ACTION

Inhibitory action against multiple receptor tyrosine kinases including growth factor

receptors, vascular endothelial growth factors, colony-stimulating factor receptors, glial cell-line neurotrophic factor receptors. **Therapeutic Effect:** Prevents tumor cell growth, produces tumor regression, inhibits metastasis.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95%. Excreted in feces (61%), urine (16%). **Half-life:** 40–60 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has potential for embryotoxic, teratogenic effects. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ketoconazole, voriconazole) may increase concentration, toxicity. Strong CYP3A4 inducers (e.g., carbamazepine, PHENobarbital, phenytoin, rifAMPin) may decrease concentration/effects. QT interval–prolonging medications (e.g., amiodarone, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. May increase adverse effects of bevacizumab. May increase adverse effects; decrease therapeutic effect of vaccines (live). **HERBAL:** St. John's wort may decrease concentration. **Herbals with hypoglycemic properties** (e.g., fenugreek) may increase hypoglycemic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, amylase, lipase, creatinine, ALT, AST. May alter serum potassium, sodium, uric acid. May produce thrombocytopenia, neutropenia. May decrease serum phosphate, thyroid function levels.

### AVAILABILITY (Rx)

**Capsules:** 12.5 mg, 25 mg, 37.5 mg, 50 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. Avoid grapefruit products.

### INDICATIONS/ROUTES/DOSAGE

#### GI Stromal Tumor, Renal Cell Carcinoma, RCC (Adjuvant Treatment)

**PO: ADULTS, ELDERLY:** 50 mg once daily for 4 wks, followed by 2 wks off in 6-wk cycle.

#### Pancreatic Neuroendocrine Tumor

**PO: ADULTS, ELDERLY:** 37.5 mg once daily continuously without a scheduled off-treatment period. **Maximum:** 50 mg/day.

#### Dose Modification

**PO: ADULTS, ELDERLY:** Dosage increase or reduction in 12.5-mg increments is recommended based on safety and tolerability.

#### Concomitant Use of Strong CYP3A4 Inhibitors

Consider a dose reduction to a minimum of 37.5 mg/day (GIST, RCC) or 25 mg/day (PNET).

#### Concomitant Use of CYP3A4 Inducers

Consider a dose increase (monitor carefully for toxicity) to maximum of 87.5 mg/day (GIST, RCC) or 62.5 mg (PNET).

#### Dosage in Renal Impairment

No initial dose adjustment; subsequent adjustment may be needed.

#### Dosage in Hepatic Impairment

No dose adjustment initially; Grade 3 or 4 hepatotoxicity during treatment: withhold/discontinue if hepatotoxicity does not resolve.

### SIDE EFFECTS

**Stromal tumor: Common (42%–30%):** Fatigue, diarrhea, anorexia, abdominal pain, nausea, hyperpigmentation.

**Frequent (29%–18%):** Mucositis/stomatitis, vomiting, asthenia, altered taste, constipation, fever. **Occasional (15%–8%):** Hypertension, rash, myalgia, headache, arthralgia, back pain, dyspnea, cough. **Renal carcinoma: Common (74%–43%):** Fatigue, diarrhea, nausea, mucositis/stomatitis, dyspepsia, altered taste. **Frequent (38%–20%):** Rash, vomiting, constipation, hyperpigmentation, anorexia, arthralgia, dyspnea, hypertension, headache, abdominal pain. **Occasional (18%–11%):** Limb pain, peripheral/orbital edema, dry skin, hair color change, myalgia, cough, back pain, dizziness, fever, tongue pain, flatulence, alopecia, dehydration.

### ADVERSE EFFECTS/TOXIC REACTIONS

Palmar-plantar erythrodysesthesia syndrome (PPES) occurs occasionally (14%), manifested as blistering/rash/peeling of skin on palms of hands, soles of feet. Bleeding, decrease in left ventricular ejection fraction, deep vein thrombosis (DVT), pancreatitis, neutropenia, seizures occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question possibility of pregnancy. Obtain baseline CBC, BMP, LFT before beginning therapy and prior to each treatment. Obtain baseline ECG, thyroid function tests. Question medical history as listed in Precautions.

### INTERVENTION/EVALUATION

Assess eye area, lower extremities for early evidence of fluid retention. Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Monitor CBC for evidence of neutropenia, thrombocytopenia; assess LFT for hepatotoxicity. Monitor for PPES. Monitor B/P.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy; use effective contraceptive measures.
- Promptly report fever, unusual bruising/bleeding from any site.

**tacrolimus**ta-**kro**-li-mus(Astagraf XL, Envarsus XR, Prograf, Protopic)

**BLACK BOX ALERT** ■ Increased susceptibility to infection and potential for development of lymphoma. Extended-release associated with increased mortality in female liver transplant recipients. Topical form associated with rare cases of malignancy. Topical form should be used only for short-term and intermittent treatment. Not recommended in children younger than 2 yrs. Use only 0.03% ointment for children 2–15 yrs of age. Administer under supervision of physician experienced in immunosuppressive therapy.

**Do not confuse Protopic with Protonix, or tacrolimus with everolimus, pimecrolimus, sirolimus, or temsirolimus.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Calcineurin inhibitor. **CLINICAL:** Immunosuppressant.

**USES**

**PO, Injection:** Prevention of organ rejection in adult and pediatric pts receiving allogeneic heart, kidney, liver, or lung transplant recipients in combination with other immunosuppressants. **Topical:** Moderate to severe atopic dermatitis in immunocompetent pts. **OFF-LABEL:** Prevention of organ rejection in lung, small bowel recipients; prevention and treatment of graft-vs-host disease in allogeneic hematopoietic stem cell transplantation.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tacrolimus. **Cautions:** Hypersensitivity to HCO-60 polyoxyl 60 hydrogenated castor oil (used in solution for injection). Renal/hepatic impairment cardiac disease; history of chronic, opportunistic infections, concurrent use with other nephrotoxic drugs (e.g.,

cycloSPORINE), concurrent use of strong CYP3A4 inhibitors or inducers. Avoid use of potassium-sparing diuretics, ACE inhibitors, potassium-based salt substitutes. Pts at risk for pure red cell aplasia (e.g., concurrent use of mycophenolate); pts at risk for QTc interval prolongation (congenital long QT syndrome, HE, medications that prolong QTc interval, hypokalemia, hypomagnesemia). **Topical:** Exposure to sunlight.

**ACTION**

Inhibits T-lymphocyte activation by binding to intracellular protein FKBP-12, forming a complex with calcineurin-dependent proteins, inhibiting calcineurin phosphatase activity. **Therapeutic Effect:** Suppresses immunological-mediated inflammatory response; prevents organ transplant rejection.

**PHARMACOKINETICS**

Variably absorbed after PO administration (food reduces absorption). Widely distributed. Protein binding: 99%. Metabolized in liver. Primarily excreted in feces. Not removed by hemodialysis. **Half-life:** 21–61 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Hyperkalemia, renal dysfunction noted in neonates. Distributed in breast milk. Breast-feeding not recommended. **Children:** May require higher dosages (decreased bioavailability, increased clearance). May make post-transplant lymphoproliferative disorder more common, esp. in pts younger than 3 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Aluminium-containing antacids may increase concentration/effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), **calcium channel blockers** (e.g., diltiazem, verapamil) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin), **enzalutamide** may decrease

concentration/effect. **CycloSPORINE, foscarnet** may increase nephrotoxic effect. May decrease therapeutic effect; increase adverse effect of **vaccines (live)**. **Eplerenone, potassium-sparing diuretics (e.g., spironolactone)** may increase hyperkalemic effect. **QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol)** may increase risk of QTc interval prolongation. **HERBAL: Echinacea** may decrease therapeutic effect. **St. John's wort** may decrease concentration/effect. **FOOD: Food** decreases rate/extent of absorption. **Grapefruit products** may increase concentration, toxicity (potential for nephrotoxicity). **LAB VALUES:** May increase serum ALT, AST, amylase, bilirubin, BUN, cholesterol, creatinine, potassium, glucose, triglycerides. May decrease serum magnesium; Hgb, Hct, platelets. May alter leukocytes.

## AVAILABILITY (Rx)

**Capsules:** (*Prograf*): 0.5 mg, 1 mg, 5 mg. **Injection Solution:** (*Prograf*): 5 mg/mL. **Ointment:** (*Protopic*): 0.03%, 0.1%. **Packet, Oral:** 0.2 mg, 2 mg.

 **Capsules, Extended-Release:** (*Astagraf XL*): 0.5 mg, 1 mg, 5 mg. **Tablets, Extended-Release:** (*Envarsus XR*): 0.75 mg, 1 mg, 4 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute with appropriate amount (250–1,000 mL, depending on desired dose) 0.9% NaCl or D<sub>5</sub>W to provide concentration between 0.004 and 0.02 mg/mL.

**Rate of administration** • Give as continuous IV infusion. • Continuously monitor pt for anaphylaxis for at least 30 min after start of infusion. • Stop infusion immediately at first sign of hypersensitivity reaction.

**Storage** • Store diluted infusion solution in glass or polyethylene containers and discard after 24 hrs. • Do not store in PVC container (decreased stability, potential for extraction).

## PO

• **Immediate-Release:** Administer without regard to food. Be consistent with timing of administration. • **Extended-Release:** Administer at least 1 hr before or 2 hrs after a meal. Do not crush, cut, dissolve, or divide; administer whole. • **Granules for Oral Suspension:** Mix with 15–30 mL of water (do not sprinkle on food). Give immediately after mixing. Add additional 15–30 mL of water to rinse cup and ensure all medication is taken.

## Topical

• For external use only. • Do not cover with occlusive dressing. • Rub gently, completely onto clean, dry skin.

## IV INCOMPATIBILITIES

Acyclovir.

## IV COMPATIBILITIES

Calcium gluconate, dexamethasone (Decadron), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, HYDROMorphone (Dilaudid), insulin, leucovorin, LORazepam (Ativan), morphine, nitroglycerin, potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Give initial postoperative dose no sooner than 6 hrs after liver or heart transplant and within 24 hrs of kidney transplant.

### Prevention of Liver Transplant Rejection

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): 0.1–0.15 mg/kg/day in 2 divided doses 12 hrs apart (in combination with corticosteroids). Titrate to target trough concentration. **CHILDREN:** 0.15–0.2 mg/kg/day (capsules) or 0.2 mg/kg/day (oral suspension) in 2 divided doses 12 hrs apart. Titrate to target trough concentration. **IV: ADULTS, ELDERLY, CHILDREN:** Initially, 0.03–0.05 mg/kg/day as continuous infusion.

### Prevention of Kidney Transplant Rejection

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): 0.2 mg/kg/day (in combination with azaTHIOprine) in 2 divided doses 12 hrs apart or 0.1 mg/kg/day (in combination with mycophenolate) in 2 divided doses 12

hrs apart. Titrate to target trough concentration. **CHILDREN:** 0.3 mg/kg/day (capsules or oral suspension) divided q12h. (**Extended-Release [Astagraf XL]: (With Basiliximab Induction):** (Prior to or within 48 hrs of transplant completion): 0.15–0.2 mg/kg once daily (in combination with corticosteroids and mycophenolate). Titrate to target trough concentration. **CHILDREN 4 YRS AND OLDER:** 0.3 mg/kg once daily. (**Without Basiliximab Induction):** Preoperative dose: 0.1 mg/kg (administer within 12 hrs prior to reperfusion). Post-operative dosing: 0.2 mg/kg once daily (in combination with corticosteroids and mycophenolate). Give at least 4 hrs after pre-operative dose and within 12 hrs of reperfusion. Titrate to target trough concentration. (**Extended-Release [Envarsus XL]:** 0.14 mg/kg/day.

**IV: ADULTS, ELDERLY:** Initially, 0.03–0.05 mg/kg/day as continuous infusion.

#### Prevention of Heart Transplant Rejection

**Note:** Use in combination with an anti-metabolite agent (e.g., azaTHIOprine, mycophenolate). May also use with an mTOR kinase inhibitor (e.g., sirolimus).

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 0.075 mg/kg/day in 2 divided doses 12 hrs apart. **CHILDREN:** 0.3 mg/kg/day (capsules or oral suspension) divided in 2 doses q12h. Titrate to target trough concentration.

**IV: ADULTS, ELDERLY:** Initially, 0.01 mg/kg/day as continuous infusion.

#### Lung Transplant

**Note:** Use in combination with an anti-metabolite agent (e.g., azaTHIOprine, mycophenolate). Adjunct corticosteroid therapy recommended in early postoperative period.

**PO: ADULTS, ELDERLY: (Immediate-Release):** Initially, 0.075 mg/kg/day in 2 divided doses, administered q12h. **CHILDREN:** 0.3 mg/kg/day (capsules or oral suspension) divided q12h. Titrate to target trough concentration.

**IV: ADULTS, ELDERLY:** Initially, 0.01–0.03 mg/kg/day as a continuous infusion.

#### Atopic Dermatitis

**Topical: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** Apply 0.03% or 0.1% ointment

to affected area twice daily. **CHILDREN 2–15 YRS:** Use 0.03% ointment twice daily. Continue treatment for 1 wk after symptoms have resolved. If no improvement within 6 wks, re-examine to confirm diagnosis.

#### SIDE EFFECTS

**Frequent (greater than 30%):** Headache, tremor, insomnia, paresthesia, diarrhea, nausea, constipation, vomiting, abdominal pain, hypertension. **Occasional (29%–10%):** Rash, pruritus, anorexia, asthenia, peripheral edema, photosensitivity.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions, including anaphylaxis, were reported. Cardiac toxicities including myocardial hypertrophy, QT interval prolongation, torsades de pointes, MI, pericardial effusion, SVT, ventricular arrhythmias, may occur. May increase risk of new-onset diabetes after transplantation. May cause acute renal failure, GI perforation, hepatotoxicity, hyperkalemia, hypertension, myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia), new malignancies, pure red cell aplasia, thrombotic microangiopathy. Fatal infections including bacterial, fungal, protozoal, opportunistic, viral infections (including cytomegalovirus) were reported. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Nephrotoxicity may occur with high doses. Neurotoxicities (e.g., confusion, depression, encephalopathy, myasthenia, myoclonus, neuralgia, neuropathy, paralysis, seizures) were reported.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; ECG; pregnancy test in females of reproductive potential. Question history of hepatic/renal impairment, cardiac disease, chronic opportunistic infections. Screen for active infection. Receive full medication history and screen for interaction (esp.

use of other immunosuppressants). Have aqueous solution of EPINEPHrine 1:1,000, O<sub>2</sub> available at bedside before beginning IV infusion.

**INTERVENTION/EVALUATION**

CBC should be performed wkly during first mo of therapy, twice monthly during second and third mos of treatment, then monthly throughout the first yr. Monitor BUN, serum creatinine, CrCL, eGFR pts with renal impairment. Monitor LFT periodically. Assess continuously for first 30 min following start of infusion and at frequent intervals thereafter. Monitor I&O closely. Monitor for infections (cough, fatigue fever), neurotoxicities, psychiatric symptoms. Monitor for cardiac ischemia/infarction (chest pain, diaphoresis, left arm or jaw pain, ST segment elevation, serum troponin elevation), GI perforation (abdominal pain, fever, nausea, vomiting), infection (cough, fatigue, fever); neuropathy (gait disturbance, fine motor control difficulties, numbness); hypersensitivity reactions (anaphylaxis, urticaria), bleeding of any kind.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report lung problems (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine), skin toxicities (rash, peeling); symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating); bleeding of any kind.
- Allergic reactions, including anaphylaxis, may occur.
- Treatment may alter the electrical conduction of the heart, which may lead to cardiac arrhythmias; report chest pain, difficulty breathing, dizziness, swelling of extremities, fainting, palpitations.
- Use effective contraception to

avoid pregnancy. Do not breastfeed.

- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Treatment may worsen high B/P.
- Avoid exposure to sun, artificial light (may cause photosensitivity reaction).
- Do not take within 2 hrs of taking antacids.
- Do not ingest grapefruit products.

**tafasitamab-cxix**

ta-fa-sit-a-mab  
(Monjuvi)

**Do not confuse tafasitamab with basiliximab, naxitamab, rituximab, or trastuzumab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-CD19, monoclonal antibody. **CLINICAL:** Anti-neoplastic.

**USES**

Treatment (in combination with lenalidomide) of adults with relapsed or refractory diffuse large B-cell lymphoma (DLBCL) not otherwise specified, including DLBCL arising from low-grade lymphoma and who are not eligible for autologous stem cell transplant.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tafasitamab-cxix. Use of lenalidomide in pregnancy. **Cautions:** Baseline cytopenias, hepatic impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic viral infections.

**ACTION**

Binds to CD19 antigen (expressed on the surface of pre-B and mature B lymphocytes and several B-cell malignancies, including DLBCL). Mediates B-cell lysis through apoptosis and immune effector mechanisms, including antibody-dependent cellular cytotoxicity and phagocytosis.

T

**Therapeutic Effect:** Causes cellular damage and death of malignant B cells.

## PHARMACOKINETICS

Widely distributed. Metabolism not specified. Peripheral B-cell count reduced by day 8. Nadir reached within 16 wks. Excretion not specified. **Half-life:** 17 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm due to fetal B-cell depletion and neonatal lymphopenia. Females of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk if adverse reactions.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase toxic effect of **cladribine**. May increase immunosuppressive effect of **baricitinib**,  **fingolimid**,  **tofacitinib**,  **upadacitinib**. May increase the adverse/toxic effect of  **natalizumab**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum AST, creatinine, glucose, GGT, uric acid. May decrease serum albumin, calcium, magnesium, phosphate; Hgb, lymphocytes, neutrophils, platelets. May prolong activated partial thromboplastin (aPTT). May decrease diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 200 mg.

## ADMINISTRATION/HANDLING

 IV

**Premedication** • Premedicate with acetaminophen, histamine H<sub>1</sub> or H<sub>2</sub> antagonist,

and/or glucocorticosteroid 30 min to 2 hrs prior to initial infusion. If infusion reactions do not occur during the first 3 infusions, premedication is optimal for subsequent infusions. If infusion-related reaction occurs, administer premedication prior to each subsequent infusion.

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the dose based on weight in kg. • While directing stream toward glass wall of vial, reconstitute each vial with 5 mL Sterile Water for Injection to a final concentration of 40 mg/mL. • Swirl vial(s) gently until powder is completely dissolved (up to 5 min). Do not shake or swirl aggressively. • Visually inspect for particulate matter or discoloration. Solution should appear colorless to slightly yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 250 mL 0.9% NaCl infusion bag. • Mix by gentle inversion. Do not shake or agitate. • Discard used portions of vial(s).

**Rate of Administration** • **Initial infusion:** Infuse via dedicated IV catheter at 70 mL/hr for 30 min, then increase to a rate so the infusion is completed within 1.5–2.5 hrs. • **Subsequent infusions:** Infuse within 1.5–2 hrs as tolerated.

**Infusion-Related Reaction** • **Grade 2 reaction:** Interrupt infusion and treat symptoms until improved to Grade 1, then resume infusion at no more than 50% of the infusion rate prior to interruption. If no further reactions occur within 1 hr and vital signs are stable, may increase infusion rate q30min to the rate prior to interruption. • **Grade 3 reaction:** Interrupt infusion and treat symptoms until improved to Grade 1, then resume infusion at no more than 25% of the infusion rate prior to interruption. If no further reactions occur within 1 hr and vital signs are stable, may increase infusion rate q30min to 50% of the infusion rate prior to interruption. Discontinue infusion if reaction recurs after escalating infusion rate.

• **Grade 4 infusion reaction:** Discontinue infusion and permanently discontinue treatment.

**Storage** • Refrigerate unused vials in original carton. Protect from light. • May refrigerate or store reconstituted vials at room temperature for up to 12 hrs. • Diluted solution may be refrigerated for up to 18 hrs or stored at room temperature for up to 12 hrs. Protect from light. Do not freeze.

## IV INCOMPATIBILITIES

Do not administer with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Diffuse Large B-Cell Lymphoma (Relapsed or Refractory)

**IV; ADULTS:** 12 mg/kg (in combination with lenalidomide 25 mg for a maximum of 12 cycles) on treatment days (of 28-day cycle) as follows: **Cycle 1:** Days 1, 4, 8, 15, and 22. **Cycle 2 and 3:** Days 1, 8, 15, and 22. **Cycle 4 and thereafter:** Days 1 and 15. After 12 cycles, continue tafasitamab-cxix as a monotherapy until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Neutropenia

Neutrophil count 1,000 cells/mm<sup>3</sup> or less for at least 7 days; neutrophil count 1,000 cells/mm<sup>3</sup> or less with fever 100.4°F (38°C) or higher; neutrophil count less than 500 cells/mm<sup>3</sup>: Withhold treatment and lenalidomide until neutrophil count is 1,000 cells/mm<sup>3</sup> or greater, then resume at same dose and reduce lenalidomide dose (see manufacturer guidelines).

### Thrombocytopenia

Platelet count 50,000 cells/mm<sup>3</sup> or less: Withhold treatment and lenalidomide until platelet count is 50,000 cells/mm<sup>3</sup> or greater, then resume at same dose and

reduce lenalidomide dose (see manufacturer guidelines).

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (38%–22%):** Fatigue, diarrhea, cough, pyrexia, peripheral edema, decreased appetite. **Occasional (19%–6%):** Back pain, constipation, abdominal pain, nausea, vomiting, muscle spasm, dyspnea, rash, pruritus, headache, arthralgia, extremity pain, paresthesia, dysgeusia. **Rare (5%–3%):** Decreased weight, nasal congestion, erythema, musculoskeletal pain, alopecia, hyperhidrosis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, lymphopenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including febrile neutropenia, may be life-threatening. Infusion reactions, including chills, dyspnea, fever, flushing, hypertension, rash, may require emergent medical attention. Life-threatening infections, including bronchitis, nasopharyngitis, pneumonia, respiratory tract infection, sepsis, UTI, reported in 71% of pts. Grade 3 or 4 infections reported in 30% of pts. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Exacerbation of COPD reported in 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; pregnancy test in females of reproductive potential. Verify use of effective contraception. Obtain weight in kg.

Administer in an environment equipped to monitor for and manage infusion-related reactions; verify emergency resuscitation equipment/medications are readily available. Question history and severity of infusion reactions prior to each infusion. Screen for active infection. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression prior to each cycle. If neutrophil count is 1,000 cells/mm<sup>3</sup> or less or platelet count is 50,000 cells/mm<sup>3</sup> or less, monitor CBC w/ly until improved. Consider granulocyte-stimulating factor in pts with neutropenia. Diligently monitor for infusion reactions during each infusion. Severe infusion reactions may require emergency resuscitation; early detection is vital. Monitor for infections (cough, fatigue, fever, urinary frequency/dysuria), symptoms of PML (confusion, dysarthria, paralysis, seizures). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

• Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Severe infusion reactions may occur. Immediately report infusion reactions of any kind. • PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities and death. Report symptoms of PML, brain hemorrhage such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Maintain proper hydration and nutrition.

## talazoparib

tal-a-zoe-pa-rib  
(Talzenna)

**Do not confuse talazoparib with niraparib, olaparib, or ruca-parib, or Talzenna with Senna.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Poly (ADP-ribose) polymerase (PARP) inhibitor. **CLINICAL:** Antineoplastic.

#### USES

Treatment of adults with deleterious or suspected deleterious germline BRCA-mutation (*gBRCAm*) HER2-negative locally advanced or metastatic breast cancer.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to talazoparib. **Cautions:** Baseline cytopenias, renal/hepatic impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); concomitant use of P-gp inhibitors. Do not initiate in pts who have not recovered from hematological toxicities related to prior chemotherapy.

#### ACTION

Inhibits poly (ADP-ribose) polymerase (PARP) enzymatic activity. PARP enzymes are involved in DNA transcription, cell cycle regulation and DNA repair. Inhibition causes cell death due to DNA damage. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

#### PHARMACOKINETICS

Widely distributed. Metabolized by oxidation, dehydrogenation, and conjugation (with minimal hepatic metabolism). Protein binding: 74%. Peak plasma concentration: 1–2 hrs. Excreted in urine (69%), feces (20%). **Half-life:** 90 (±58) hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 4 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** P-gp inhibitors (e.g., amiodarone, carvedilol, clarithromycin, itraconazole, verapamil) may significantly increase concentration/effect. **Cladribine** may increase myelosuppression. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, glucose. May decrease Hgb, leukocytes, neutrophils, lymphocytes, platelets; serum calcium.

## AVAILABILITY (Rx)

**Capsules:** 0.25 mg, 1 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to meals.
- Administer capsules whole; do not break, cut, or open. Capsules cannot be chewed.
- If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Administer only to pts with germline BRCA mutation.

### Breast Cancer

**PO: ADULTS, ELDERLY:** 1 mg once daily. Continue until disease progression or unacceptable toxicity.

## Dose Reduction Schedule

**First reduction:** 0.75 mg once daily.

**Second reduction:** 0.5 mg once daily.

**Third reduction:** 0.25 mg once daily.

**Unable to tolerate 0.25 mg dose:** Permanently discontinue.

## Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Hematologic Toxicity

**Hemoglobin less than 8 g/dL:** Withhold treatment until improved to 9 g/dL (or greater), then resume at next reduced dose.

**Platelet count less than 50,000 cells/mm<sup>3</sup>:** Withhold treatment until improved to 75,000 cells/mm<sup>3</sup> (or greater), then resume at next reduced dose.

**Neutrophil count less than 1,000 cells/mm<sup>3</sup>:** Withhold treatment until improved to 1,500 cells/mm<sup>3</sup> (or greater), then resume at next reduced dose.

### Nonhematologic Toxicity

**Any Grade 3 or 4 adverse reaction:** Withhold treatment until improved to Grade 1 or 0, then consider resuming at a reduced dose or discontinue.

### Concomitant Use of P-gp Inhibitors

Reduce dose to 0.75 mg once daily. If P-gp inhibitor is discontinued for 3–5 half-lives, resume talazoparib dose to the dose used prior to starting P-gp inhibitor.

### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment.

**Moderate impairment (CrCl 30–59 mL/min):** Reduce dose to 0.75 mg once daily. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (62%–21%):** Fatigue, asthenia, nausea, headache, vomiting, alopecia, diarrhea, decreased appetite.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Grade 3 (or higher) anemia, neutropenia, thrombocytopenia reported in 39%–15% of pts. Acute myeloid leukemia, myelodysplastic syndrome was reported in pts who received prior chemotherapy with platinum agents and/or DNA-damaging agents.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC; pregnancy test in females of reproductive potential. Obtain renal function test (BUN, serum creatinine, CrCl, eGFR) in pts with renal impairment; LFT in pts with hepatic impairment. Question history of hepatic/renal impairment, prior treatment with other chemotherapeutic agents. Receive full medication history and screen for interactions (esp. P-gp inhibitors). Screen for active infection. Do not initiate in pts who have not recovered from hematological toxicities related to prior chemotherapy. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC monthly. If hematologic toxicities occur, monitor CBC w/ly until blood counts recover. If blood counts do not recover, consider hematology consultation for further investigations such as bone marrow analysis and blood sample for cytogenetics. Monitor for acute myeloid leukemia, myelodysplastic syndrome (bleeding, bruising easily; fatigue, frequent infections, pyrexia, hematuria, melena, weakness, weight loss; cytopenias, increased requirements for blood transfusion). If acute myeloid leukemia or myelodysplastic syndrome occurs, discontinue treatment. If concomitant use of P-gp inhibitor is unavoidable, monitor for adverse reactions/drug toxicities. Diligently screen for infections (cough, fatigue, fever). Monitor daily pattern of bowel activity, stool consistency. Encourage nutritional intake.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Treatment may cause severe bone marrow depression or new-onset myeloid leukemia; report bruising, fatigue, fever, frequent infections, shortness of breath, weight loss; bleeding easily, blood in urine or stool.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.

**tamoxifen****HIGH ALERT**

ta-MOKS-i-fen  
(Nolvadex-D , Soltamox)

**BLACK BOX ALERT** Serious, possibly life-threatening CVA, pulmonary emboli, uterine malignancy (endometrial adenocarcinoma, uterine sarcoma) have occurred. **Do not confuse tamoxifen with pentoxifylline, tamsulosin, or temazepam.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective estrogen receptor modulator (SERM). Estrogen receptor antagonist. **CLINICAL:** Antineoplastic.

**USES**

Adjunct treatment in advanced breast cancer after primary treatment with surgery and radiation, reduction of risk of breast cancer in women at high risk, reduction of risk of invasive breast cancer in women with ductal carcinoma in situ (DCIS), metastatic breast cancer in

women and men. **OFF-LABEL:** Ovarian cancer (advanced and/or recurrent), treatment of endometrial cancer; risk reduction of breast cancer in women with Paget's disease of the breast.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to tamoxifen. Concomitant warfarin therapy when used in treatment of breast cancer in high-risk women, history of deep vein thrombosis (DVT) or pulmonary embolism (in high-risk women for breast cancer and in women with DCIS). **Cautions:** Thrombocytopenia, pregnancy, history of thromboembolic events, hyperlipidemia, concomitant use of strong CYP2D6 inhibitors and/or moderate CYP2D6 inhibitors.

## ACTION

Competitively binds to estrogen receptors on tumor, producing a complex. **Therapeutic Effect:** Inhibits DNA synthesis and estrogen effects. Slows tumor growth.

## PHARMACOKINETICS

Well absorbed from GI tract. Metabolized in liver. Primarily excreted in feces. **Half-life:** 7 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Nonhormonal contraceptives recommended during therapy and for at least 2 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safe and effective in girls 2–10 yrs with McCune-Albright syndrome, precocious puberty. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. May increase anticoagulant effect of warfarin.

May decrease effect of anastrozole. **Moderate/strong CYP2D6 inhibitors** (e.g., fluoxetine, sertraline) may decrease efficacy and increase risk of breast cancer. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, calcium, triglycerides, AST, ALT.

## AVAILABILITY (Rx)

**Solution, Oral: (Soltamox):** 10 mg/5 mL. **Tablets:** 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Use supplied dosing cup for oral solution.

## INDICATIONS/ROUTES/DOSAGE

### Metastatic Breast Cancer (Males and Females)

**PO: ADULTS, ELDERLY:** 20–40 mg/day. Give doses greater than 20 mg/day in 2 divided doses. **Premenopausal:** Tamoxifen may be given (with ovarian suppression) in pts with no prior endocrine therapy or prior treatment with ovarian suppression and an AI. **Postmenopausal:** Tamoxifen may be given in pts with no prior endocrine therapy or prior endocrine therapy with an AI.

### Breast Cancer Treatment

**PO: ADJUVANT THERAPY (FEMALES), PREMENOPAUSAL WOMEN:** 20 mg once daily for 5 yrs. May continue for total of 10 yrs if premenopausal or perimenopausal after 5 yrs. If postmenopausal after 5 yrs, may continue for total of 10 yrs or switch to an AI up to total of 10 yrs of endocrine therapy. **POSTMENOPAUSAL WOMEN:** Total duration of 10 yrs, or tamoxifen for an initial duration of 5 yrs, followed by an AI for up to 5 yrs (for total duration of 10 yrs) or tamoxifen for 2–3 yrs, followed by an AI for up to 5 yrs (for a total duration of 7–8 yrs) or an AI for 5 yrs.

### Ductal Carcinoma in Situ (DCIS)

**PO: ADULTS, ELDERLY:** 20 mg once daily for 5 yrs.

**Breast Cancer Risk Reduction**

**PO: ADULTS, ELDERLY:** 20 mg once daily for 5 yrs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent: Women (greater than 10%):** Hot flashes, nausea, vomiting. **Occasional:** Headache, nausea, vomiting, rash, bone pain, confusion, weakness, drowsiness. **Women (9%–1%):** Changes in menstruation, genital itching, vaginal discharge, endometrial hyperplasia, polyps. **Men:** Impotence, decreased libido.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Retinopathy, corneal opacity, decreased visual acuity noted in pts receiving extremely high dosages (240–320 mg/day) for longer than 17 mos.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, serum calcium, estrogen receptor assay prior to therapy. Obtain baseline breast and gynecologic exams, mammogram results. Question history of thrombosis (DVT, PE).

**INTERVENTION/EVALUATION**

Obtain CBC, serum calcium periodically. Monitor for increased bone pain; ensure adequate pain relief. Monitor I&O, weight. Monitor for symptoms of DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia). Assess for hypercalcemia (increased urinary volume, excessive thirst, nausea, vomiting, constipation, hypotonicity of muscles, deep bone/flank pain, renal stones).

**PATIENT/FAMILY TEACHING**

- Report vaginal bleeding/discharge/itching, leg cramps, weight gain, shortness of breath, weakness.
- May initially experience increase in bone, tumor pain (appears to indicate good tumor response).
- Report persistent nausea, vomiting.
- Report

symptoms of DVT (e.g., swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (e.g., difficulty breathing, chest pain, rapid heart rate). • Nonhormonal contraceptives are recommended during treatment.

**tamsulosin**

tam-soo-loe-sin  
(Flomax, Flomax CR )

**Do not confuse Flomax with Flonase, Flovent, Foltx, Fosamax, or Volmax, or tamsulosin with tamoxifen or terazosin.**

**FIXED-COMBINATION(S)**

**Jalyn:** tamsulosin/dutasteride (an androgen hormone inhibitor): 0.4 mg/0.5 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Alpha<sub>1</sub>-adrenergic blocker. **CLINICAL:** Benign prostatic hyperplasia agent.

**USES**

Treatment of symptoms of benign prostatic hyperplasia (BPH). **OFF-LABEL:** Treatment of bladder outlet obstruction or dysfunction. To facilitate expulsion of ureteral stones (distal).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tamsulosin. **Cautions:** Concurrent use of phosphodiesterase (PDE5) inhibitors (e.g., sildenafil, tadalafil, vardenafil), baseline orthostatic hypotension.

**ACTION**

Antagonist of alpha receptors in prostate. **Therapeutic Effect:** Relaxes smooth muscle in bladder neck and prostate; improves urinary flow, symptoms of prostatic hyperplasia.

## PHARMACOKINETICS

Widely distributed. Protein binding: 94%–99%. Metabolized in liver. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 9–13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not indicated for use in women. **Children:** Not indicated in this pt population. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Other alpha-adrenergic blocking agents (e.g., doxazosin, prazosin, terazosin) may increase alpha-blockade effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifAMPin) may decrease concentration/effect. **HERBAL:** Herbs with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **St. John's wort** may decrease concentration/effect. **FOOD:** Grapefruit products may increase risk for orthostatic hypotension. **LAB VALUES:** None known.

## AVAILABILITY (Rx)

 **Capsules:** 0.4 mg.

## ADMINISTRATION/HANDLING

### PO

• Give at same time each day, 30 min after the same meal. • Do not break, crush, or open capsule.

## INDICATIONS/ROUTES/DOSAGE

### Benign Prostatic Hyperplasia (BPH)

**PO: ADULTS:** 0.4 mg once daily, approximately 30 min after same meal each day. May increase dosage to 0.8 mg if inadequate response in 2–4 wks. If therapy discontinued or interrupted for several days, restart at 0.4 mg once daily.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (9%–7%):** Dizziness, drowsiness. **Occasional (5%–3%):** Headache, anxiety, insomnia, orthostatic hypotension. **Rare (less than 2%):** Nasal congestion, pharyngitis, rhinitis, nausea, vertigo, impotence.

## ADVERSE EFFECTS/TOXIC REACTIONS

First-dose syncope (hypotension with sudden loss of consciousness) may occur within 30–90 min after initial dose. May be preceded by tachycardia (pulse rate of 120–160 beats/min).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain vital signs. Assess history of prostatic hyperplasia (difficulty initiating urine stream, dribbling, sense of urgency, leaking). Question for sensitivity to tamsulosin, or use of other alpha-adrenergic blocking agents.

### INTERVENTION/EVALUATION

Monitor renal function, I&O, weight changes, peripheral edema, B/P. Monitor for first-dose syncope. Assist with ambulation if dizziness occurs.

### PATIENT/FAMILY TEACHING

- Take at same time each day, 30 min after the same meal.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid grapefruit products.

## tapentadol

ta-pen-ta-dol  
(Nucynta, Nucynta ER, Nucynta IR )

### BLACK BOX ALERT

Exposes pt to risks of opioid addiction, abuse, misuse. Serious, life-threatening respiratory depression may occur. Accidental ingestion can result in a fatal overdose. May cause neonatal opioid withdrawal

syndrome. Avoid alcohol while taking tapentadol ER. Benzodiazepines, CNS depressants may cause profound sedation, respiratory depression, coma, or death.

**Do not confuse tapentadol with traMADol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Centrally acting opioid (Schedule II). **CLINICAL:** Analgesic.

### USES

**Nucynta:** Relief of moderate to severe acute pain in adults 18 yrs and older. **Nucynta ER:** Management of moderate to severe chronic or neuropathic pain associated with diabetic peripheral neuropathy when around-the-clock analgesic is needed for extended period.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to tapentadol. Severe respiratory depression, acute or severe bronchial asthma, hypercapnia in uncontrolled settings, known or suspected paralytic ileus, concurrent use or ingestion within 14 days of MAOI use.

**Cautions:** Respiratory disease or respiratory compromise (e.g., hypoxia, hypercapnia, or decreased respiratory reserve), asthma, COPD, severe obesity, sleep apnea syndrome, CNS depression; history of drug abuse and misuse, drug-seeking behavior, dependency; head injury, intracranial lesions, pancreatic or biliary disease, renal or hepatic impairment, seizure disorder; baseline hypotension, adrenal insufficiency, elderly, debilitated, cachexia; concomitant use with serotonergic agents.

### ACTION

Binds to mu-opioid receptors in the central nervous system, causing inhibition of ascending pain pathways; increases norepinephrine by inhibiting its reabsorption into nerve cells. **Therapeutic Effect:** Produces analgesia. Reduces level of pain perception.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 20%. Excreted in urine (99%). **Half-life:** 4 hrs (immediate-release); 5–6 hrs (extended-release).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for use in this pt population. **Elderly:** Age-related renal impairment may increase risk of side effects.

### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression, respiratory depression. **MAOIs** (e.g., phenelzine, selegiline), **SSRIs** (e.g., FLUoxetine) may increase risk of serotonin syndrome.

**HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Tablets:** 50 mg, 75 mg, 100 mg.

 **Tablets, Extended-Release:** 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Tablets may be crushed.
- Give extended-release tablets whole; do not break, crush, dissolve, or divide.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Not recommended in severe renal or hepatic impairment.

#### Pain Control

**PO: ADULTS, ELDERLY: (Nucynta):** 50–100 mg q4–6h as needed (may administer an additional dose 1h or longer after initial dose). **Maximum:** 600 mg/day (700 mg on day 1). **(Nucynta ER):** Initially, 50 mg twice daily (12

hrs apart). May increase by 50 mg twice daily q3days to effective dose. Range: 100–250 mg twice daily. **Maximum:** 500 mg/day.

#### Conversion to Extended-Release

**Conversion from other oral opioids:** Initially, 50 mg q12h. (*Immediate-Release Tapentadol*): Use same total daily dose but divide into 2 equal doses given twice daily. **Maximum:** 500 mg daily.

#### Neuropathic Pain Associated With Diabetic Peripheral Neuropathy

**PO: ADULTS, ELDERLY:** (*Extended-Release*): Initially, 50 mg q12h. Titrate in increments of 50 mg no more frequently than twice daily q3days. Range: 100–250 mg q12h.

#### Dosage in Renal Impairment

**CrCl 30 mL/min or greater:** No adjustment. **CrCl less than 30 mL/min:** Not recommended.

#### Dosage in Hepatic Impairment

(*Immediate-Release*): Moderate impairment: 50 mg q8h. **Maximum:** 3 doses/24 hrs. (*Extended-Release*): Initially, 50 mg/day. **Maximum:** 100 mg/day.

### SIDE EFFECTS

**Frequent (greater than 10%):** Nausea, dizziness, vomiting, sleepiness, headache.

### ADVERSE EFFECTS/TOXIC REACTIONS

Respiratory depression, serotonin syndrome have been reported.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess onset, type, location, and duration of pain. Obtain vital signs. If respirations are 12/min or lower, withhold medication, contact physician. Question medical history as listed in Precautions. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

### INTERVENTION/EVALUATION

Monitor for decreased respirations or B/P. Initiate deep breathing and coughing exercises, particularly in pts with impaired pulmonary function. Assess for clinical improvement and record onset of pain relief. Screen for drug abuse and misuse, drug-seeking behavior.

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, CNS depressants.
- Report nausea, vomiting, shortness of breath, difficulty breathing.
- Chronic use may increase risk of opioid dependency, addiction.

## telmisartan

tel-mi-sar-tan

(Apo-Telmisartan , Micardis)

**BLACK BOX ALERT** May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

### FIXED-COMBINATION(S)

**Micardis HCT:** telmisartan/hydrochlorothiazide (a diuretic): 40 mg/12.5 mg, 80 mg/12.5 mg. **Twynsta:** telmisartan/amLODIPine (a calcium channel blocker): 40 mg/5 mg, 40 mg/10 mg, 80 mg/5 mg, 80 mg/10 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension alone or in combination with other antihypertensives. Reduces cardiovascular risk in pts 55 yrs of age and older unable to take ACE inhibitors and at high risk of major cardiovascular event (e.g., MI, stroke).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to telmisartan. Concurrent use with alisk-

ren in pts with diabetes. **Cautions:** Hypovolemia, hyperkalemia, hepatic/renal impairment, renal artery stenosis (unilateral, bilateral), biliary obstructive disease, significant aortic/mitral stenosis. Concurrent use with ramipril not recommended. Avoid potassium supplements.

## ACTION

Blocks vasoconstrictor and aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

## PHARMACOKINETICS

Widely distributed. Protein binding: greater than 99%. Metabolized in liver. Excreted in feces. **Half-life:** 24 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., diclofenac, meloxicam, naproxen) may increase adverse effects. May increase lithium concentration, risk of toxicity. Aliskiren may increase hyperkalemic effect. May increase adverse effect/toxicity of ACE inhibitors (e.g., benazepril, lisinopril, ramipril). **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid, cholesterol. May decrease Hgb, Hct.

## AVAILABILITY (Rx)

**Tablets:** 20 mg, 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 20–40 mg once daily. Titrate based on pt's response up to 80 mg once daily.

### Cardiovascular Risk Reduction

**PO: ADULTS, ELDERLY:** 80 mg once daily.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Use with caution.

## SIDE EFFECTS

**Occasional (7%–3%):** Upper respiratory tract infection, sinusitis, back/leg pain, diarrhea. **Rare (1%):** Dizziness, headache, fatigue, nausea, heartburn, myalgia, cough, peripheral edema.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage may manifest as hypotension, tachycardia; bradycardia occurs less often.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test. Obtain B/P, heart rate immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Assess medication history (esp. diuretics). Question for history of hepatic/renal impairment, renal artery stenosis.

### INTERVENTION/EVALUATION

Monitor B/P, pulse, serum electrolytes, renal function.

### PATIENT/FAMILY TEACHING

Report symptoms of low blood pressure (pale, clammy skin; dizziness, fainting, weakness). • Maintain proper hydration. • Avoid pregnancy. • Immediately report suspected pregnancy. • Avoid excessive exertion during hot weather (risk of dehydration, hypotension).

## temozolomide

**HIGH  
ALERT**

tem-oh-zoe-loe-myde  
(Temodal , Temodar)

**Do not confuse Temodar with Tambocor.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Imidazo-tetrazine derivative, alkylating agent.

**CLINICAL:** Antineoplastic.

### USES

Treatment of adults with refractory anaplastic astrocytoma, newly diagnosed glioblastoma multiforme (concomitantly with radiotherapy, then as maintenance therapy). **OFF-LABEL:** Malignant glioma, metastatic melanoma, metastatic CNS lesions, cutaneous T-cell lymphomas, advanced neuroendocrine tumors, soft tissue sarcoma, pediatric neuroblastoma. Ewing's sarcoma (recurrent or progressive).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to temozolomide, dacarbazine. **Cautions:** Baseline cytopenias, severe hepatic/renal impairment, pulmonary disease, seizure disorder, hypothyroidism, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); history of chronic opportunistic infections (bacterial, fungal, protozoal, viral).

### ACTION

Produces cytotoxic effect through alkylation of DNA, causing DNA double strand breaks and apoptosis. **Therapeutic Effect:** Inhibits DNA replication, causing cell death.

### PHARMACOKINETICS

Widely distributed. Penetrates blood-brain barrier. Metabolized via hydrolysis. Protein binding: 15%. Peak plasma concentration: 1 hr. Excreted in urine (38%), feces (less than 1%). **Half-life:** 1.6–1.8 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception and must not donate sperm during treatment and for at least 3 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** Pts older than 70 yrs may experience higher risk of developing Grade 4 neutropenia, thrombocytopenia.

### INTERACTIONS

**DRUG:** Valproic acid may increase adverse effects. **Bone marrow depressants (e.g., cladribine)** may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease effects. **FOOD:** All foods decrease rate, extent of drug absorption. **LAB VALUES:** May decrease Hgb, neutrophils, platelets, WBC count, lymphocytes.

### AVAILABILITY (Rx)

**Capsules:** 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg. **Injection, Powder for Reconstitution:** 100 mg.

### ADMINISTRATION/HANDLING

**IV**

- Reconstitute each 100-mg vial with 41 mL Sterile Water for Injection to provide concentration of 2.5 mg/mL.
- Swirl gently; do not shake.
- Do NOT further dilute.
- Infuse over 90 min.
- Stable for 14 hrs (includes infusion time).

### PO

- High-fat food reduces absorption; increases risk of nausea, vomiting.
- For best results, administer at bedtime.
- Give

capsule whole with water. Do not break, open, or crush capsules.

## INDICATIONS/ROUTES/DOSAGE

### Anaplastic Astrocytoma (Refractory)

**IV infusion, PO: ADULTS, ELDERLY:** Initially, 150 mg/m<sup>2</sup>/day for 5 consecutive days of 28-day treatment cycle. If absolute neutrophil count (ANC) is 1,500/cells/mm<sup>3</sup> or greater and platelet count is 100,000 cells/mm<sup>3</sup> or greater at nadir, increase to 200 mg/m<sup>2</sup> on days 15 q28 days. Continue until disease progression or unacceptable toxicity. **Maintenance:** 200 mg/m<sup>2</sup>/day for 5 days q4wks if ANC greater than 1,500 cells/mm<sup>3</sup> and platelets more than 100,000 cells/mm<sup>3</sup>. If ANC is less than 1,000 cells/mm<sup>3</sup> or platelet count is less than 50,000 cells/mm<sup>3</sup> during any cycle, reduce dose for the next cycle by 50 mg/m<sup>2</sup>/day. Permanently discontinue if unable to tolerate 100 mg/m<sup>2</sup>/day.

### Glioblastoma Multiforme

**Note:** *Pneumocystis carinii* pneumonia (PCP) prophylaxis required during concomitant phase and continue in pts who develop lymphocytopenia until recovery to Grade 1 or less. **IV infusion, PO: ADULTS, ELDERLY: Concomitant phase:** 75 mg/m<sup>2</sup> daily for 42 days (with focal radiotherapy) if ANC 1,500 cells/mm<sup>3</sup> or greater, platelet count 100,000 cells/mm<sup>3</sup> or greater, and nonhematologic toxicity Grade 1 or less. **Maintenance phase: (begin 4 wks after concomitant phase completion): (Cycle 1):** 150 mg/m<sup>2</sup> once daily for 5 days followed by 23 days without treatment. **(Cycles 2–6):** May increase to 200 mg/m<sup>2</sup> once daily for 5 days followed by 23 days without treatment if ANC greater than 1,500 cells/mm<sup>3</sup>, platelets greater than 100,000 cells/mm<sup>3</sup>, and nonhematologic toxicity with previous cycle is Grade 2 or less (exclude alopecia, nausea, vomiting). If ANC is less than 1,000 cells/mm<sup>3</sup> or platelet count is less than 50,000 cells/mm<sup>3</sup> during any cycle, reduce dose for the next cycle by 50 mg/m<sup>2</sup>/day. Permanently discontinue if unable to tolerate 100 mg/m<sup>2</sup>/day.

## Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (53%–33%):** Nausea, vomiting, headache, fatigue, constipation. **Occasional (16%–5%):** Diarrhea, asthenia, pyrexia, dizziness, peripheral edema, coordination abnormality, amnesia, insomnia, anorexia, abdominal pain, back pain, paresthesia, somnolence, paresis, urinary incontinence, ataxia, rash, pruritus, dysphagia, anxiety, abnormal gait, increased urination, breast pain, confusion, weight increase, myalgia, diplopia, vision changes.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, pancytopenia) is an expected response to therapy, but fatal outcomes were reported. Elderly pts and women showing higher incidence of developing severe myelosuppression. Usually occurs within first few cycles; is not cumulative. Nadir occurs in approximately 26–28 days, with recovery within 14 days of nadir. Prolonged pancytopenia may result in aplastic anemia, which can be fatal. May increase occurrence of *Pneumocystis carinii* pneumonia, myelodysplastic syndrome including myeloid leukemia, or secondary malignancies. Fatal infections including bacterial, fungal, protozoal, viral (new or chronic) infections may occur. Upper respiratory tract infections, pharyngitis, sinusitis reported in 6%–8% of pts. Convulsion reported in 23% of pts. Adrenal hypercorticism reported in 8% of pts. Skin toxicities including Stevens-Johnson syndrome, toxic epidermal necrolysis may occur. Fatal hepatotoxicity, hyperbilirubinemia, cholestasis, hepatitis may occur. May cause *Pneumocystis carinii* pneumonia, myelodysplastic syndrome (including myeloid leukemia), secondary malignancies, interstitial lung disease, pneumonitis, alveolitis, pulmonary fibrosis, diabetes insipidus.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. ANC must be greater than 1,500 cells/mm<sup>3</sup> and platelet count greater than 100,000 cells/mm<sup>3</sup>. Question history of seizure disorder, pulmonary disease. Screen for active infection, dormant opportunistic infections. Offer emotional support.

**INTERVENTION/EVALUATION**

Obtain CBC on day 22 (21 days after first dose) or within 48 hrs of that day, and wkly, until ANC is greater than 1,500 cells/mm<sup>3</sup> and platelet count is greater than 100,000 cells/mm<sup>3</sup>. Monitor LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting). Assess skin for cutaneous toxicities. Monitor for infection (cough, fatigue, fever), myelodysplastic syndrome (bone pain, decreased appetite, fatigue, fever; unusual bruising, bleeding). Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), toxic skin reactions (rash, redness, sloughing, swelling).
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Maintain proper hydration and nutrition.
- Do not take newly pre-

scribed medications unless approved by prescriber who originally started treatment. • Secondary cancers may occur.

**temsirolimus**

**HIGH ALERT**

tem-sir-oh-li-mus  
(Torisel)

**Do not confuse temsirolimus with everolimus, sirolimus, or tacrolimus.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** mTOR kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of advanced renal cell carcinoma.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to temsirolimus. Moderate to severe hepatic impairment; serum bilirubin greater than 1.5 times upper limit of normal (ULN).

**Cautions:** Hypersensitivity to sirolimus, hepatic/renal impairment, baseline cytopenias, pulmonary disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn’s disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, genetic hypercoagulable conditions); history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); poorly healed wounds/recent incisions, diabetes, hyperlipidemia. Concurrent use with other medication that may cause angioedema (e.g., ACE inhibitors).

**ACTION**

Binds to FKBP12, an intracellular protein-forming complex that inhibits

**T**

mTOR signaling, arresting the cell cycle at G1 phase in tumor cells. **Therapeutic Effect:** Inhibits tumor cell growth, produces tumor regression.

### PHARMACOKINETICS

Metabolized in liver. Excreted in feces (78%), urine (5%). **Half-life:** 17 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 3 wks after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions.

### INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease therapeutic effect; increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase plasma concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, AST, bilirubin, creatinine, glucose, cholesterol, triglycerides. May decrease Hgb, leukocytes, lymphocytes, neutrophils, platelets; serum phosphorus, potassium.

### AVAILABILITY (Rx)

**Injection Solution Kit:** 25 mg/mL supplied with 1.8-mL diluent vial.

### ADMINISTRATION/HANDLING

**Reconstitution** • Inject 1.8 mL of diluent into vial. • The vial contains an

overflow of 0.2 mL (30 mg/1.2 mL). • Due to the overflow, the drug concentration of resulting solution will be 10 mg/mL. • A total volume of 3 mL will be obtained, including the overflow. • Mix well by inverting the vial. Allow sufficient time for air bubbles to subside. • Dilute in 250 mL 0.9% NaCl. • Invert bag to mix; avoid excessive shaking (may cause foaming).

**Rate of administration** • Administer through an in-line filter not greater than 5 microns; infuse over 30–60 min. • Infusion should be completed within 6 hrs (includes preparation time).

**Storage** • Refrigerate kit. • Reconstituted solution appears clear to slightly turbid, colorless to yellow, and free from visible particulates. • The 10 mg/mL drug solution/diluent mixture is stable for up to 24 hrs at room temperature. • Solutions diluted for infusion (in 250 mL 0.9% NaCl) must be infused within 6 hrs of preparation.

### IV INCOMPATIBILITIES

Both acids and bases degrade solution; combinations of temsirolimus with agents capable of modifying solution pH should be avoided.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Pretreat with IV diphenhydramine 25–50 mg, 30 min before infusion.

#### Renal Cancer

**IV: ADULTS/ELDERLY:** 25 mg once wkly. Treatment should continue until disease progresses or unacceptable toxicity occurs.

#### Dose Modification

**Concomitant CYP3A4 inhibitors:** Consider dose of 12.5 mg/wk.

**Concomitant CYP3A4 inducers:** Consider dose of 50 mg/wk.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild impairment:** Reduce dose to 15 mg/wk. **Moderate to severe impairment:** Contraindicated.

## SIDE EFFECTS

**Common (51%–32%):** Asthenia, rash, mucositis, nausea, edema (facial edema, peripheral edema), anorexia. **Frequent (28%–20%):** Generalized pain, dyspnea, diarrhea, cough, fever, abdominal pain, constipation, back pain, impaired taste. **Occasional (19%–8%):** Weight loss, vomiting, pruritus, chest pain, headache, nail disorder, insomnia, nosebleed, dry skin, acne, chills, myalgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including apnea, chest pain, dyspnea, flushing, hypotension, anaphylaxis may occur. May cause acute renal failure, deep vein thrombosis (DVT), GI perforation, hepatotoxicity, hyperglycemia/glucose intolerance, hyperlipidemia, proteinuria, nephrotic syndrome; fatal interstitial lung disease, pneumonitis. May impair healing of wounds. May increase risk of intracranial hemorrhage in pts with CNS tumors or receiving anticoagulation therapy.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Screen for active infection. Question history of hepatic/renal impairment, latent chronic infections, thromboembolism. Receive full medication history and screen for interactions. Assess risk of bleeding. Assess skin for poorly healed wounds/recent surgery. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression, LFT for hepatotoxicity (abdominal pain, jaundice, nausea, transaminitis, vomiting); blood glucose for hyperglycemia (fatigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting); lipid panel. Obtain urine protein periodically; proteinuria may indicate nephrotic syndrome. Monitor for infections (cough, fatigue, fever). Monitor daily pattern of bowel activity, stool consistency. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea,

fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess skin for impaired wound healing. Monitor for symptoms of DVT (leg or arm pain/swelling, redness), GI perforation (abdominal pain, fever, nausea, vomiting), hypersensitivity reactions (anaphylaxis, urticaria), bleeding of any kind. Assess oral cavity for stomatitis.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Treatment may cause reactivation of chronic viral infections, new cancers.
- Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), high blood sugar (fatigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting), bleeding of any kind.
- Immediately report severe or persistent abdominal pain, bloody stool, fever; may indicate rupture in GI tract.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## tenecteplase

**HIGH ALERT**

ten-eck-te-plase  
(TNKase)

**Do not confuse TNKase with t-PA or tenecteplase with alteplase or Activase.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tissue plasminogen activator (tPA). **CLINICAL:** Thrombolytic.

**USES**

Management of ST-elevation myocardial infarction (STEMI) for lysis of thrombi to restore perfusion and reduce mortality.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tenecteplase. Active internal bleeding, cerebral aneurysm, AV malformation, bleeding diathesis, history of CVA, intracranial or intraspinal surgery or trauma within past 2 mos, intracranial neoplasm, severe uncontrolled hypertension. **Cautions:** Recent major surgery, GI or genitourinary (GU) bleeding, trauma, acute pericarditis, subacute bacterial endocarditis, pregnancy, severe hepatic impairment, hemorrhagic ophthalmic conditions, concurrent use of anticoagulants, elderly pts, cerebrovascular disease, hemostatic defects.

**ACTION**

Binds to fibrin in a thrombus and converts entrapped plasminogen to plasmin, initiating fibrinolysis. **Therapeutic Effect:** Degrades fibrin clots, fibrinogen, other plasma proteins.

**PHARMACOKINETICS**

Widely distributed. Completely eliminated by hepatic metabolism. **Half-life:** 90-130 min.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of intracranial hemorrhage, stroke, major bleeding; caution advised.

**INTERACTIONS**

**DRUG:** Anticoagulants (e.g., apixaban, dabigatran, heparin, rivaroxaban, warfarin), antiplatelets (e.g., aspirin, clopidogrel) may increase risk of bleeding. May decrease effects of tranexamic acid. **HERBAL:** Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger,

ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** Decreases plasminogen, fibrinogen levels during infusion, decreasing clotting time (confirms presence of lysis). May decrease Hgb, Hct.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 50 mg.

**ADMINISTRATION/HANDLING** **IV**

**Reconstitution** • Add 10 mL Sterile Water for Injection without preservative to vial to a final concentration of 5 mg/mL. • Gently swirl until powder is dissolved. Do not shake. • If foaming occurs, leave vial undisturbed for several min. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Rate of administration** • Administer as IV push over 5 sec.

**Storage** • Unused vial may be refrigerated or stored at room temperature. • If possible, use immediately, but may refrigerate up to 8 hrs after reconstitution.

 **IV INCOMPATIBILITIES**

Do not mix with dextrose-containing solutions or any other medications.

**INDICATIONS/ROUTES/DOSAGE**

Give as single IV bolus over 5 sec. Precipitate may occur when given in IV line containing dextrose. Flush line with saline before and after administration.

**Acute MI**

**IV: ADULTS:** Dosage is based on pt's weight. Treatment should be initiated as soon as possible after onset of symptoms.

Weight (kg)	(mg)	(mL)
90 or more	50	10
80–less than 90	45	9
70–less than 80	40	8
60–less than 70	35	7
Less than 60	30	6

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Bleeding (minor, 21.8%; major, 4.7%).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Internal bleeding, including intracranial, retroperitoneal, GI, GU, respiratory sites, may occur. Lysis of coronary thrombi may produce atrial or ventricular arrhythmias, stroke.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, aPTT, fibrinogen level; ECG before initiation. Screen for contraindications.

**INTERVENTION/EVALUATION**

Monitor CBC, fibrinogen, aPTT per protocol. Monitor continuous ECG for arrhythmias, B/P, pulse, respirations q15min until stable, then hourly or per protocol. Assess peripheral pulses. Auscultate heart and lung sounds. Monitor for chest pain relief; notify physician of continuation/recurrence (note location, type, intensity). Monitor for bleeding of any kind, including symptoms of intracranial hemorrhage (altered mental status, aphasia, hemiparesis, unequal pupils, seizures, vision loss). Avoid any trauma that might increase risk of bleeding (e.g., injections, shaving). Assess neurologic status with vital signs.

## tenofovir alafenamide (TAF) tenofovir disoproxil fumarate (TDF)

TOP  
100

ten-oh-foe-veer (Vemlidy TAF, Vi-read TDF)

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, lactic acidosis and

severe hepatomegaly with steatosis (fatty liver) have been reported. Severe exacerbations of hepatitis B virus (HBV) reported in pts coinfecting with HIV-1 and HBV after discontinuation. If discontinuation of therapy occurs, monitor hepatic function for at least several mos. Reinitiate anti-HBV therapy if warranted.

**Do not confuse tenofovir with adefovir, acyclovir, cidofovir, famciclovir, Retrovir, or valacyclovir.**

**FIXED-COMBINATION(S)**

**Atripla:** tenofovir (TDF)/efavirenz/emtricitabine (antiretroviral agents): 300 mg/600 mg/200 mg. **Biktarvy:** tenofovir (TAF)/bictegravir/emtricitabine: 25 mg/50 mg/200 mg. **Cimduo:** tenofovir (TDF)/lamivudine 300 mg. **Complera:** tenofovir (TDF)/emtricitabine/rilpivirine (antiretroviral agents): 300 mg/200 mg/25 mg. **Delstrigo:** tenofovir (TDF)/doravirine/lamivudine: 300 mg/100 mg/300 mg. **Descovy:** tenofovir (TAF)/emtricitabine: 25 mg/200 mg. **Genvoya:** tenofovir (TAF)/elvitegravir/cobicistat/emtricitabine: 10 mg/150 mg/150 mg/200 mg. **Odefsey:** tenofovir (TAF)/emtricitabine/rilpivirine: 25 mg/200 mg/25 mg. **Stribild:** tenofovir (TDF)/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/emtricitabine (a nucleoside reverse transcriptase inhibitor): 300 mg/150 mg/150 mg/200 mg. **Symtuza:** tenofovir (TAF)/darunavir/cobicistat/emtricitabine: 800 mg/200 mg/200 mg. **Symfi:** tenofovir (TDF)/efavirenz/lamivudine: 300 mg/600 mg/300 mg; 300 mg/400 mg/300 mg. **Truvada:** tenofovir (TDF)/emtricitabine (an antiretroviral agent): 300 mg/200 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Nucleotide analogue (reverse transcriptase inhibitor). **CLINICAL:** Antihepadnaviral, antiretroviral.

T

**USES**

**Viread:** Treatment of human immunodeficiency virus type 1 (HIV-1) infection, in combination with other antiretroviral agents, in adults and children 2 yrs of age and older weighing at least 10 kg. Treatment of chronic hepatitis B virus infection in adults and children 2 yrs of age and older and weighing at least 10 kg. **Vemlidy:** Treatment of chronic hepatitis B virus infection in adults with compensated hepatic disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tenofovir. **Cautions:** Hepatic/renal impairment, elderly; history of pathological fractures, osteoporosis, osteopenia; depression.

**ACTION**

Inhibits HIV reverse transcriptase by interfering with HIV viral RNA-dependent DNA polymerase. Inhibits replication of hepatitis B virus (HBV) by inhibiting HBV polymerase. **Therapeutic Effect:** Slows HIV replication, reduces HIV RNA levels (viral load). Inhibits HBV replication.

**PHARMACOKINETICS**

Widely distributed. Not significantly metabolized. Protein binding: 0.7%–7.2%. Excreted in urine. Removed by hemodialysis. **Half-life:** 17 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta and is distributed in breast milk. Complete avoidance of breastfeeding by HIV-infected women is recommended to decrease potential transmission of HIV. **Children:** Safety and efficacy not established in children younger than 2 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration/effect of **didanosine**. May decrease concentration/effect of **adefovir**, **atazanavir**, **lamivudine**. **Protease inhibitors** (e.g., **lopinavir/ritonavir**, **darunavir/ritonavir**) **hepatitis C antivirals**

(e.g., **ledipasvir/sofosbuvir**, **sofosbuvir/velpatasvir**) may increase concentration/effect. **Carbamazepine**, **fosphenytoin**, **oxcarbazepine**, **phenobarbital**, **primidone**, **rifampin**, **tipranavir** may decrease concentration/effect of TAF. **HERBAL:** **St. John's wort** may decrease concentration/effects of TAF. **FOOD:** **High-fat food** increases bioavailability. **LAB VALUES:** May increase serum amylase, ALT, AST, LDL-cholesterol, creatinine, creatine kinase, triglycerides; urine glucose.

**AVAILABILITY (Rx)**

**Tablets:** (**Vemlidy**): 25 mg, (**Viread**): 150 mg, 200 mg, 250 mg, 300 mg. **Oral Powder:** (**Viread**): 40 mg per 1 g of oral powder.

**ADMINISTRATION/HANDLING****PO**

• **Vemlidy:** Give with food. **Viread:** Give without regard to food. • Give oral powder with soft food. Do not mix in liquid; use only the supplied dosing scoop to measure powder.

**INDICATIONS/ROUTES/DOSAGE****Hepatitis B**

**PO:** (**Vemlidy**): **ADULTS, ELDERLY:** 25 mg once daily with food.

**HIV (in Combination With Other Antiretroviral Agents)**

**PO:** (**Viread**): **ADULTS, ELDERLY:** 300 mg once daily. **CHILDREN 2 YRS AND OLDER and ADOLESCENTS WEIGHING 10 KG OR GREATER:** 8 mg/kg/dose once daily. **Maximum:** 300 mg/day.

**Dosage in Renal Impairment Creatinine**

Clearance	Dosage
30–49 mL/min	300 mg q48h
10–29 mL/min	300 mg q72–96h
Hemodialysis	300 mg q7days or after approximately 12 hrs of dialysis

**Dosage in Hepatic Impairment**

**Mild to severe impairment:** No dose adjustment.

**SIDE EFFECTS**

**Occasional (11%–7%):** Diarrhea, nausea, asthenia, pain (generalized). **Rare (5%–1%):** Headache, rash, abdominal pain, vomiting, decreased appetite, insomnia, dyspepsia, flatulence, sweating, myalgia, peripheral neuropathy, back pain, chest pain, fever, weight loss, dizziness.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May cause new or worsening renal failure, including Fanconi syndrome (renal tubular injury, non-absorption of essential electrolytes, acids, buffers in renal tubules). Renal tubular injury may lead to rhabdomyolysis, osteomalacia, muscle weakness, myopathy. May decrease bone mineral density, leading to pathological fractures. May cause redistribution/accumulation of body fat (lipodystrophy). Fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) was reported. If therapy is discontinued, pts coinfecting with hepatitis B or C virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis or acceleration of autoimmune disorders, including Graves' disease, polymyositis, Guillain-Barre). Depression reported in 4% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LFT, BUN, serum creatinine, CrCl, eGFR, CD4+ count, viral load, HIV-1 RNA level; urine glucose, urine protein; pregnancy test in females of reproductive potential. Obtain serum phosphate level in pts with renal impairment. Test all pts for HBV infection. Receive full medication history and screen for interactions. Question history of hepatic/renal impairment, hyperlipidemia, decreased mineral bone density, osteopenia, depression. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor renal function as clinically indicated. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Obtain serum lactate level if lactic acidosis suspected. If concomitant medications were not discontinued or adjusted, closely monitor for adverse effects/toxic reactions. Assess for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). If discontinuation of treatment occurs, monitor hepatic function for at least several months. Reinitiate anti-HBV therapy if warranted. Monitor for immune recovery syndrome, esp. after initiating treatment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV infection). Monitor daily pattern of bowel activity, stool consistency; I&Os.

**PATIENT/FAMILY TEACHING**

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Fatal cases of liver inflammation or failure have occurred; report abdominal pain, clay-colored stools, yellowing of skin or eyes, weight loss.
- Report symptoms of kidney inflammation or disease (decreased urine output, flank pain, darkened urine); toxic skin reactions (rash, pustules, skin eruptions).
- Report any psychiatric symptoms (agitation, delusions, depression, mood alteration, paranoia, suicidal ideation).
- Breastfeeding not recommended.
- Decreased bone density may lead to pathological fractures; report bone/extremity pain, suspected fractures.
- Antiretrovirals may cause excess body fat in upper back,

neck, breast, trunk, while also causing decreased body fat in legs, arms, face. • Do not take newly prescribed medications unless approved by prescriber who originally started treatment. • Do not take herbal products, esp. St. John's wort.

## tepotinib

tep-oh-ti-nib  
(Tepmetko)

**Do not confuse tepotinib with capmatinib, crizotinib, erlotinib, nilotinib, talazoparib, tofacitinib, trametinib, or tucatinib or Tepmetko with Tabrecta.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** MET inhibitor; tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Treatment of adults with metastatic non-small-cell lung cancer (NSCLC) harboring MET exon 14 skipping alterations.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to tepotinib. **Cautions:** Hepatic/renal impairment, pts at risk for interstitial lung disease (e.g., COPD, sarcoidosis, connective tissue disease), conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), history of effusion or edema (pleural effusion, generalized edema). Avoid concomitant use of combined P-glycoprotein (P-gp) and strong CYP3A inhibitors; P-gp substrates, strong CYP3A inducers.

### ACTION

Selectively targets mesenchymal-epithelial transition (MET) (including mutant

variant produced by exon 14 skipping). Inhibits hepatocyte growth factor–dependent and –independent MET phosphorylation and MET-dependent downstream signaling pathways. **Therapeutic Effect:** Inhibits tumor cell proliferation, anchorage-independent growth, and metastases of MET-dependent tumor cells.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%. Peak plasma concentration: 8 hrs. Excreted in feces (85%), urine (14%). **Half-life:** 32 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Combined strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) and P-gp inhibitors (e.g., amiodarone, azithromycin, cyclosporine, diltiazem, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, PHENytoin, riFAMPin) may decrease concentration/effect. May increase toxic effects of P-glycoprotein substrates (e.g., digoxin, diltiazem, tacrolimus). May increase the serum concentration of colchicine, DOXOrubicin, PAZOpanib, topotecan, venetoclax. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase se-

rum alkaline phosphatase, ALT, amylase, AST, creatinine, GGT, potassium. May decrease serum albumin, sodium; Hgb, lymphocytes, leukocytes.

## AVAILABILITY (Rx)

**Tablets:** 225 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food (increases absorption).
- Administer tablet whole; do not break, cut, or crush. Tablets cannot be chewed.
- If a dose is missed, do not give within 8 hrs of next dose.
- If vomiting occurs after administration, give the next dose at regularly scheduled time (do not give additional dose).

## INDICATIONS/ROUTES/DOSAGE

### NSCLC (Metastatic, MET Exon 14 Skipping Alterations)

**PO: ADULTS, ELDERLY:** 450 mg once daily until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**Reduction for adverse reaction:** 225 mg once daily. **Unable to tolerate 225-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Serum ALT/AST Elevation

Grade 3 serum ALT/AST elevation without total bilirubin elevation: Withhold treatment until improved to baseline, then either resume at a same dose if serum ALT/AST elevation improves within 7 days or reduce dose if not improved within 7 days. Grade 4 serum ALT/AST elevation without total bilirubin elevation: Permanently discontinue.

### Hyperbilirubinemia

Grade 3 total bilirubin elevation without serum ALT/AST elevation: Withhold

treatment until improved to baseline, then either resume at a same dose if total bilirubin elevation improves within 7 days or permanently discontinue if not improved within 7 days. Grade 4 total bilirubin elevation without serum ALT/AST elevation: Permanently discontinue. Total bilirubin elevation greater than 2 times with ALT/AST greater than 3 times ULN: Permanently discontinue.

### Pulmonary Toxicity

ILD/pneumonitis (any grade): Withhold treatment if ILD/pneumonitis is suspected. Permanently discontinue if ILD/pneumonitis is confirmed.

### Other Adverse Reactions

Any other Grade 2 reactions: Continue same dose. If reaction is not tolerated, consider withholding treatment until resolved, then resume at reduced dose. Any other Grade 3 reaction: Withhold treatment until resolved, then resume at reduced dose. Any other Grade 4 reaction: Permanently discontinue.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (70%–20%):** Edema (eye, face, general, genital, localized, periorbital, peripheral, scrotal), nausea, diarrhea, pain (back, bone, chest, extremity, musculoskeletal spine), arthralgia, arthritis, myalgia, fatigue, asthenia, dyspnea. **Occasional (16% to less than 10%):** Abdominal pain, constipation, decreased appetite, cough, vomiting, rash, pyrexia, dizziness, pruritus, headache.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia) is an expected response to therapy. Life-threatening LID/pneumonitis reported in 2% of pts. Serum ALT, AST elevation reported in 13% of pts. Grade 3 or 4 hepatotoxicity reported in 4% of pts. Pleural effusion reported in 13% of pts. Pneumonia reported in 11% of pts. Pulmonary embolism reported in 2% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective nonhormonal contraception. Verify presence of MET 14 skipping alterations in plasma or tumor specimens. Question history of hepatic/renal impairment, pulmonary disease, pleural effusion. Receive full medication history and screen for interactions. Assess for baseline edema. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression periodically; LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) q2wks for 3 mos, then monthly thereafter (or more frequently if hepatotoxicity occurs). Monitor for infections (cough, fatigue, fever). Consider ABG, radiologic test if pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if pneumonitis is confirmed. If dyspnea occurs, obtain radiologic test to assess for pleural effusion. Monitor for edema (third spacing, dyspnea, weight gain). Monitor for toxicities if concomitant use with strong CYP3A inhibitors, P-gp inhibitors, or substrates is unavoidable. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Treatment may depress the immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), inflammation of the lung (excessive cough, difficulty breathing, chest pain), kidney problems (decreased urine output, flank pain, darkened urine), symptoms of edema (shortness of breath, swelling of extremities, weight gain), lung effusion (chest pain, dry cough, shortness of breath); symptoms of lung embolism (difficulty breathing, chest pain, rapid heart rate).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy.

**teriflunomide**

ter-i-floo-noe-myde  
(Aubagio)

**■ BLACK BOX ALERT ■** May result in major birth defects. Pregnancy must be excluded before initiating therapy and must be avoided during treatment or prior to completion of an accelerated elimination procedure. Severe hepatic injury may occur. Do not initiate in pts with acute/chronic liver disease or serum ALT greater than 2 times upper limit of normal.

**Do not confuse teriflunomide with leflunomide.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Pyrimidine synthesis inhibitor, immunomodulatory agent. **CLINICAL:** Multiple sclerosis agent.

## USES

Treatment of relapsing forms of multiple sclerosis, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to teriflunomide, leflunomide. Pregnant women or women of childbearing potential who are not using reliable contraception, severe hepatic impairment, concurrent use of leflunomide. **Cautions:** Baseline cytopenias, diabetes, pts older than 60 yrs, pulmonary disease, mild to moderate hepatic disease; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of chronic opportunistic infections (esp. fungal/viral infections, TB); concomitant use of nephrotoxic medications. Not recommended in pts with severe immunodeficiency, bone marrow disease; severe, active infection. Do not initiate in pts with active or chronic infections until resolved.

## ACTION

Inhibits pyrimidine synthesis, exhibiting anti-inflammatory and antiproliferative properties. **Therapeutic Effect:** May reduce number of activated lymphocytes in the CNS. May slow progression of multiple sclerosis.

## PHARMACOKINETICS

Widely distributed. Peak concentration: 1–4 hrs. Protein binding: greater than 99%. Metabolized by hydrolysis. Excreted in urine (23%), feces (38%). **Half-life:** 18–19 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective

contraception during treatment and until plasma drug concentrations are at least 0.02 mg/L following accelerated elimination procedure. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **CYP2C8 substrates** (e.g., **repaglinide**, **PAcLitaxel**, **rosuvastatin**, **topotecan**). May decrease concentration/effects of **warfarin**, **CYP1A2 substrates** (e.g., **DULoxetine**, **tizANidine**). May decrease therapeutic effect; increase adverse effects of **vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, ALT, AST, alkaline phosphatase, bilirubin. May decrease WBCs, neutrophil count.

## AVAILABILITY (Rx)

**Tablets:** 7 mg, 14 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Sclerosis

**PO: ADULTS, ELDERLY:** 7 mg or 14 mg once daily.

### Adjustment of Toxicity

ALT elevation greater than 3 times ULN: Discontinue teriflunomide and initiate drug elimination procedures: cholestyramine 8 g q8h for 11 days (if not tolerated, may decrease to 4 g q8h) or activated charcoal 50 g q12h for 11 days. **Note:** The 11 days do not need to be consecutive unless plasma concentration needs to be lowered rapidly.

### Dosage in Renal Impairment

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Contraindicated.

**SIDE EFFECTS**

**Frequent (19%–6%):** Headache, diarrhea, nausea, alopecia, paresthesia, upper abdominal pain. **Occasional (4%–3%):** Hypertension, oral herpes, anxiety, hypertension, toothache, musculoskeletal pain. **Rare (2%–1%):** Seasonal allergy, sciatica, burning sensation, carpal tunnel syndrome, blurred vision, acne, pruritus, myalgia, abdominal distention, conjunctivitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (lymphopenia, neutropenia, thrombocytopenia) was reported. Severe hepatic injury, hepatotoxicity may occur. Infections, opportunistic infections including aspergillosis, influenza, *Klebsiella* pneumonia, *Pneumocystis jiroveci* pneumonia, TB were reported (mainly occurring in pts taking concomitant immunosuppressive therapy). May increase risk of malignancies, proliferative disorders. Hypersensitivity reactions including angioedema, dyspnea, urticaria, and anaphylaxis may occur. May cause acute renal failure, peripheral neuropathy, hypertension, interstitial lung disease, pneumonitis, sudden cardiac death. Skin toxicities including Steven-Johnson syndrome, toxic epidermal necrolysis may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Screen

for active infection. Question history of hepatic/renal impairment, pulmonary disease, neuropathy; chronic, opportunistic infections. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression; LFT for hepatotoxicity (abdominal pain, jaundice, nausea, transaminitis, vomiting) at least monthly for 6 mos. Conduct neurologic assessment. Assess for symptomatic improvement of MS. Monitor for neuropathy. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for TB regardless of baseline PPD. Diligently monitor for acute infection (cough, fatigue, fever), opportunistic infections; reactivation of chronic infections. Monitor B/P for hypertension. Assess skin for cutaneous toxicities. Due to extended drug clearance (elimination may take up to 2 yrs), an accelerated elimination program may be needed (e.g., cholestyramine 8 g q8h for 11 days; activated charcoal 50 g q12h for 11 days).

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Expect routine tuberculosis screening. Report any travel plans to possible endemic ar-

eas. • Do not receive live vaccines. • Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine); skin toxicities (rash, peeling, sloughing), nervous system pain/weakness/tingling. • Allergic reactions such as difficulty breathing, hives, rash, swelling of the face or tongue, can happen at any time. If allergic reaction occurs, seek immediate medical attention. • Treatment may worsen high blood pressure or cause new cancers. • Severe worsening of MS symptoms may occur after stopping treatment. • Use effective contraception to avoid pregnancy. Do not breastfeed.

## teriparatide

ter-i-par-a-tide  
(Forteo)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Parathyroid hormone analog. **CLINICAL:** Osteoporosis agent.

### USES

Treatment of postmenopausal women with osteoporosis who are at increased risk for fractures. Treatment of men with primary or hypogonadal osteoporosis who are at high risk for fractures. High-risk pts include those with a history of osteoporotic fractures, who have failed previous osteoporosis therapy, or were intolerant of previous osteoporosis therapy. Treatment of glucocorticoid-induced osteoporosis in men and women.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to teriparatide. **Cautions:** Conditions that

increase risk of osteosarcoma (e.g., Paget's disease, unexplained elevations of alkaline phosphatase level, children or young adults with open epiphyses, prior skeletal radiation therapy, implant therapy), hypercalcemia, hypercalcemic disorders (e.g., hyperparathyroidism), bone metastases, history of skeletal malignancies, metabolic bone diseases other than osteoporosis, cardiac disease, renal/hepatic impairment, pts at risk for orthostasis, active or recent urolithiasis.

### ACTION

Stimulates osteoblast function by increasing gastrointestinal calcium absorption and increasing renal tubular reabsorption of calcium. **Therapeutic Effect:** Increases bone mineral density, bone mass/strength, reduces osteoporosis-related fractures.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Excreted in urine. **Half-life:** 1 hr.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium (transient), uric acid.

### AVAILABILITY (Rx)

**Injection Solution:** 600 mcg/2.4 mL (injector pen containing 28 daily doses of 20 mcg).

### ADMINISTRATION/HANDLING

#### SQ

• Refrigerate, but minimize time out of refrigerator. Do not freeze; discard if frozen. • Administer into thigh, abdominal wall.

**INDICATIONS/ROUTES/DOSAGE****Osteoporosis**

**SQ: ADULTS, ELDERLY:** 20 mcg once daily into thigh, abdominal wall. Continue for up to 2 yrs (lifetime duration).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional:** Leg cramps, nausea, dizziness, headache, orthostatic hypotension, tachycardia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Angina pectoris has been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum calcium, phosphate, PTH, bone mineral density. Question medical history as listed in Precautions.

**INTERVENTION/EVALUATION**

Monitor bone mineral density, serum calcium, phosphate, PTH. Observe for symptoms of hypercalcemia (anxiety, bradycardia, facial twitching; muscle cramps, spasm, weakness; seizures). Monitor B/P for hypotension, pulse for tachycardia.

**PATIENT/FAMILY TEACHING**

- Go from lying to standing slowly.
- Report persistent symptoms of hypercalcemia (nausea, vomiting, constipation, lethargy, asthenia).

**testosterone**TOP  
100HIGH  
ALERT

tes-tos-te-rone

(Androderm, AndroGel Pump, Avedo, Depo-Testosterone, Fortesta, Jatenzo, Natesto, Testim, Testopel, Vogelxo, Xyosted)

**BLACK BOX ALERT**

Testosterone undecanoate and testosterone enanthate may cause

an increase of blood pressure (B/P) that can increase the risk of life-threatening cardiovascular events, including CVA, MI, and cardiovascular death. Virilization in children and women may occur following secondary exposure to testosterone topical gel and solution. **Avedo:** Serious pulmonary oil microembolism reaction involving chest pain, dizziness, urge to cough, dyspnea, throat tightening, syncope; life-threatening hypersensitivity reactions, including anaphylaxis, reported during or immediately after administration.

**Do not confuse testosterone with testosterone.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Androgen. **CLINICAL:** Sex hormone.

**USES**

Treatment of testicular failure due to cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchiectomy, Klinefelter syndrome, chemotherapy, or toxic damage from alcohol or heavy metals; gonadotropin or luteinizing hormone-releasing hormone deficiency; or pituitary-hypothalamic injury from tumors, trauma, or radiation. To stimulate puberty in carefully selected males with delayed puberty.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to testosterone. Breastfeeding, pregnant or who may become pregnant, prostate (known or suspected) or breast cancer in males. **Depo-Testosterone (additional):** Severe cardiac/hepatic/renal disease. **Cautions:** Renal/hepatic/cardiac dysfunction, pts with history of MI or CAD; conditions influenced by edema (e.g., seizure disorder, migraines).

**ACTION**

Principal endogenous androgen promoting growth, development of male sex organs, maintains secondary sex char-

acteristics in androgen-deficient males. **Therapeutic Effect:** Relieves androgen deficiency.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 10–100 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnant women, women who may become pregnant, or during lactation. **Children:** Safety and efficacy not established; use with caution. **Elderly:** May increase risk of hyperplasia, stimulate growth of occult prostate carcinoma.

## INTERACTIONS

**DRUG:** May increase hepatotoxic effect of cycloSPORINE. May increase the anticoagulant effect of warfarin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase Hgb, Hct, LDL, serum alkaline phosphatase, bilirubin, calcium, potassium, sodium, AST. May decrease HDL.

## AVAILABILITY (Rx)

**Capsule:** (*Jatenzo*): 158 mg, 198 mg, 237 mg. **Gel, Topical:** (*AndroGel, Testim*): 1%, 1.62%. (*Vogelxo*): 50-mg packet or tube, 12.5 mg/actuation metered dose pump. (*Fortesta*): 10 mg/actuation. **Injection:** (*Cypionate [Depo-Testosterone]*): 100 mg/mL, 200 mg/mL. (*Enanthate [Delatestryl]*): 200 mg/mL. (*Aveed [Undecanoate]*): 750 mg/3 mL. **Nasal Gel:** (*Natesto*): 5.5 mg/actuation. **Pellet for SQ Implantation:** (*Testopel*): 75 mg. **Solution, Metered Dose Pump:** (*Axiron*): 30 mg/activation. **Transdermal System Patch:** (*Androderm*): 2 mg/day or 4 mg/day. **Solution, Auto-injector:** (*Xyosted*): 50 mg/0.5 mL, 75 mg/0.5 mL, 100 mg/0.5 mL.

## ADMINISTRATION/HANDLING

### IM

- Give deep in gluteal muscle. • Do not give IV. • Warming or shaking re-

dissolves crystals that may form in long-acting preparations. • Wet needle of syringe may cause solution to become cloudy; this does not affect potency.

### PO

- Give with meals. • Administer capsule whole; do not break, cut, or crush. Capsule cannot be chewed.

### Transdermal

- (*Androderm*): Apply to clean, dry area on skin on back, abdomen, upper arms, thighs. • Do not use tape to secure. Avoid bathing, swimming for at least 3 hrs after each application. • Do not apply to bony prominences (e.g., shoulder) or oily, damaged, irritated skin. Do not apply to scrotum. • Rotate application site with 7-day interval to same site.

### Transdermal Gel

- (*AndroGel, Testim, Vogelxo*): Apply (morning preferred) to clean, dry, intact skin of shoulder, upper arms. (*AndroGel* 1% may also be applied to abdomen.) • Upon opening packet(s), squeeze entire contents into palm of hand, immediately apply to application site. • Allow to dry. • Do not apply to genitals. • (*Fortesta*): Apply to skin of front and inner thighs.

### Topical Solution

- (*Axiron*): Apply using applicator to axilla at same time each morning. • Avoid washing site for 2 hrs after application.

## INDICATIONS/ROUTES/DOSAGE

### Male Hypogonadism (Primary or Hypogonadotropic)

**IM: ADULTS:** (*Cypionate or Enanthate*): 75–100 mg/wk or 150–200 mg q2wks. (*Undecanoate*): 750 mg at initiation, 4 wks and q10 wks thereafter. **CHILDREN 12 YRS AND OLDER:** (*Cypionate or Enanthate*): Initiation of pubertal growth: 25–75 mg q3–4wks, gradually titrate q6–9mos to 100–150 mg. Duration: 3–4yrs. **Maintenance**

**virilizing dose:** 200–250 mg q3–4wks. May convert to other testosterone replacement dosages once expected adult height and adequate virilization achieved.

**PO: (Capsules):** 237 mg twice daily in morning and evening. Range: 158–396 mg twice daily.

**SQ: (Pellets): ADULTS, CHILDREN 12 YRS AND OLDER:** 150–450 mg q3–6mos. **(Enanthate): ADULTS, ELDERLY:** 75 mg once wkly. Range: 50–100 mg once wkly.

**Topical gel: (Fortesta):** 40 mg once daily in morning. Range: 10–70 mg.

**Maximum:** 70 mg. **(Vogelxo):** 50 mg once daily (one tube or one packet or 4 pump actuations).

**Topical solution: (Axiron): ADULTS, ELDERLY:** 60 mg once daily (1 pump activation of 30 mg to each axilla). Range: 30–120 mg.

**Transdermal patch: (Androderm): ADULTS, ELDERLY:** Start therapy with 4 mg/day patch applied at night. Apply patch to abdomen, back, thighs, upper arms. Dose adjustment based on testosterone levels. Range: 2–6 mg/day.

**Transdermal gel: ADULTS, ELDERLY: (AndroGel 1%):** Initial dose of 5 g delivers 50 mg testosterone and is applied once daily to abdomen, shoulders, upper arms. May increase to 7.5 g (75 mg testosterone), then to 10 g (100 mg testosterone), if necessary. **(AndroGel 1.62%):** Initial dose of 40.5 mg applied once daily in the morning to shoulder and upper arms. May increase to 81 mg. Further adjustments based on testosterone levels.

**Transdermal gel: (Testim, Vogelxo): ADULTS, ELDERLY:** Initial dose of 5 g delivers 50 mg testosterone and is applied once daily to the shoulders, upper arms. May increase to 10 g (100 mg testosterone).

**Nasal gel: (Natesto): ADULTS ELDERLY:** 11 mg (2 actuations, 1 per each nostril) 3 times/day (6–8 hrs apart).

### Delayed Male Puberty

**IM: (Enanthate): ADOLESCENTS:** 50–200 mg q2–4wks for limited duration (4–6 months).

**SQ: (Pellets): ADULTS:** 150–450 mg q3–6mos.

### Breast Carcinoma

**IM: (Ethanate): ADULTS:** 200–400 mg q2–4wks.

### Dosage in Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent:** Gynecomastia, acne. **Females:** Hirsutism, amenorrhea, other menstrual irregularities; deepening of voice; clitoral enlargement (may not be reversible when drug is discontinued).

**Occasional:** Edema, nausea, insomnia, oligospermia, priapism, male-pattern baldness, bladder irritability, hypercalcemia (in immobilized pts, those with breast cancer), hypercholesterolemia, inflammation/pain at IM injection site.

**Transdermal:** Pruritus, erythema, skin irritation. **Rare:** Polycythemia (with high dosage), hypersensitivity.

## ADVERSE EFFECTS/TOXIC REACTIONS

Peliosis hepatitis (presence of blood-filled cysts in parenchyma of liver), hepatic neoplasms, hepatocellular carcinoma have been associated with prolonged high-dose therapy. Anaphylactic reactions occur rarely. Venous thromboembolism (e.g., DVT, PE) reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, lipid panel; weight, B/P. Wrist X-rays may be ordered to determine bone maturation in children. Question history of hepatic/renal impairment, seizure disorder, thromboembolism (CVA, MI, pulmonary embolism).

**INTERVENTION/EVALUATION**

Weigh daily, report wkly gain of more than 5 lb; evaluate for edema. Monitor B/P. Assess serum electrolytes, cholesterol, Hgb, Hct (periodically for high dosage), LFT, radiologic exam of wrist, hand (when using in prepubertal children). With breast cancer or immobility, check for hypercalcemia (anxiety, bradycardia, facial twitching; muscle cramps, spasm, weakness; seizures). Ensure adequate intake of protein, calories. Assess for virilization. Monitor sleep patterns. Monitor for CVA (aphasia, confusion, paresthesia, hemiparesis, seizures), MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation), pulmonary embolism (chest pain, dyspnea, hypoxia, tachycardia).

**PATIENT/FAMILY TEACHING**

- Do not take any other medication without consulting physician.
- Maintain diet high in protein, calories.
- Weigh daily; report 5 lb/wk gain.
- Report nausea, vomiting, acne, pedal edema.
- **Females:** Promptly report menstrual irregularities, hoarseness, deepening of voice.
- **Males:** Report frequent erections, difficulty urinating, gynecomastia.
- Treatment may cause arterial or venous blood clots; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures); DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate).

**tiaGABine**

tye-a-ga-been  
(Gabitril)

**Do not confuse tiaGABine with tiZANidine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective GABA reuptake inhibitor. **CLINICAL:** Anticonvulsant.

**USES**

Adjunctive therapy for treatment of partial seizures in adults and children 12 yrs or older.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tiaGABine. **Cautions:** Hepatic impairment. Pts at risk for suicidal behavior/thoughts.

**ACTION**

Enhances activity of gamma-aminobutyric acid (GABA), the major inhibitory neurotransmitter in the CNS. **Therapeutic Effect:** Inhibits seizure activity.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 96%. Metabolized in liver. Primarily excreted in feces. **Half-life:** 2–5 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** May cause fetal harm. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depression. **Strong CYP3A4 inducers** (e.g., carbAMazepine, phenytoin, riFAMPin) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) may increase concentration/effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)****Tablets:** 2 mg, 4 mg, 12 mg, 16 mg.**ADMINISTRATION/HANDLING**

- Give with food.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Pts not taking enzyme-inducing antiepileptic drugs (AEDs): Lower doses required and slower titration may be needed. Do not use a loading dose, rapid titration, and/or increase in large-dose increments.

**Partial Seizures**

**PO: ADULTS, ELDERLY: Pts receiving enzyme-inducing AED regimens:** Initially, 4 mg once daily. May increase by 4–8 mg/day at wkly intervals. **Maintenance:** 32–56 mg/day in 2–4 divided doses. **CHILDREN 12–18 YRS: Pts receiving enzyme-inducing AED regimens:** Initially, 4 mg once daily for 1 wk. May increase by 4 mg in 2 divided doses for 1 wk, then may increase by 4–8 mg at wkly intervals thereafter. **Maximum:** 32 mg/day in 2–4 divided doses.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (34%–20%):** Dizziness, asthenia (loss of strength, energy), drowsiness, nervousness, confusion, headache, infection, tremor. **Occasional:** Nausea, diarrhea, abdominal pain, impaired concentration.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose characterized by agitation, confusion, hostility, weakness. Full recovery occurs within 24 hrs of discontinuation. Depression, suicidal ideation.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Review history of seizure disorder (intensity, frequency, duration, level of

consciousness). Observe frequently for recurrence of seizure activity. Initiate seizure precautions.

**INTERVENTION/EVALUATION**

For pts on long-term therapy, serum hepatic/renal function tests, CBC should be performed periodically. Assist with ambulation if dizziness occurs. Assess for clinical improvement (decrease in intensity, frequency of seizures). Monitor for depression, unusual behavior, suicidal ideation or thoughts.

**PATIENT/FAMILY TEACHING**

- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report worsening seizure activity, thoughts of suicide, increased depression.

**ticagrelor**

tye-ka-grel-or  
(Brilinta)

**■ BLACK BOX ALERT ■** May cause significant, sometimes fatal bleeding. Do not use with active bleeding or history of intracranial bleeding. Do not initiate in pts planning urgent coronary artery bypass graft (CABG) surgery. Discontinue at least 5 days prior to any surgery. Suspect bleeding in any pt who is hypotensive and has had recent percutaneous coronary intervention (PCI), CABG, or other surgical procedures. If possible, manage bleeding without discontinuing therapy to decrease risk of cardiovascular events. Aspirin maintenance doses greater than 100 mg/day may reduce effectiveness and should be strictly avoided.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** P2Y<sub>12</sub> platelet aggregation inhibitor. **CLINICAL:** Antiplatelet.

## USES

Reduce rate of cardiovascular death, MI, stroke in pts with acute coronary syndrome (ACS) or history of MI. Reduce rate of stent thrombosis in pts who have been stented for treatment of ACS. Reduce risk of first MI or stroke in pts with coronary artery disease (CAD) at high risk for such events. To reduce risk of stroke in pts with acute ischemic stroke (NIH Stroke Scale score 5 or less) or high-risk transient ischemic attack (TIA).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ticagrelor. History of intracranial hemorrhage, active pathologic bleeding, severe hepatic impairment. **Cautions:** Moderate hepatic impairment, renal impairment, history of hyperuricemia or gouty arthritis. Pts at increased risk of bradycardia, concurrent use of strong CYP3A4 inhibitors or inducers, elderly. (Recommend holding dose 5 days before planned surgery if applicable.) Pts with risk factors for bleeding (e.g., trauma, peptic ulcer disease).

## ACTION

Reversibly inhibits platelet P2Y<sub>12</sub> ADP receptor to prevent signal transduction and platelet activation. **Therapeutic Effect:** Reduces platelet aggregation.

## PHARMACOKINETICS

Readily absorbed after PO administration. Protein binding: 99%. Metabolized in liver. Primarily excreted in feces (58%), urine (26%). **Half-life:** 7–9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Aspirin greater than 100 mg/day may decrease effect. **CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole)** may increase concentration/effect.

**Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **Anticoagulants (e.g., warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen)** may increase risk of bleeding. May increase adverse effects of **apixaban, dabigatran, edoxaban**. May increase concentration/effect of **digoxin, simvastatin, lovastatin**. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), **glucosamine** may increase risk of bleeding. **FOOD:** Grapefruit products may increase potential for bleeding. **LAB VALUES:** May increase serum uric acid, creatinine.

## AVAILABILITY (Rx)

**Tablets:** 60 mg, 90 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • May be crushed, mixed with water, and drunk immediately (refill glass with water, stir and drink contents).

## INDICATIONS/ROUTES/DOSAGE

### Acute Coronary Syndrome

**PO: ADULTS:** Initially, 180 mg once, then 90 mg twice daily. (begin 12h after initial loading dose). Give in combination with aspirin. Continue for up to 12 mos, then decrease dose to 60 mg twice daily in combination with aspirin.

### CAD (With High Risk for Cardiovascular Events, Primary Prevention)

**PO: ADULTS, ELDERLY:** 60 mg twice daily (in combination with aspirin). Continue indefinitely.

### Minor Ischemic Stroke (NIHSS Score 5 or Less), High-Risk TIA

**PO: ADULTS, ELDERLY:** Initially, 180 mg once (in combination with aspirin), then 90 mg twice daily in combination with aspirin for 30 days.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment.

**Moderate impairment:** Use caution.

**Severe impairment:** Avoid use.

**SIDE EFFECTS**

**Occasional (13%–7%):** Dyspnea, headache. **Rare (5%–3%):** Cough, dizziness, nausea, diarrhea, back pain, fatigue.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Life-threatening events including intracranial bleeding, epistaxis, intrapericardial bleeding with cardiac tamponade, hypovolemic shock requiring vasopressive support or blood transfusion was reported. Pts with history of sick sinus syndrome, second- or third-degree AV block, bradycardic syncope have increased risk of bradycardia. May cause atrial fibrillation, hypotension, hypertension. Gynecomastia reported in less than 1% of men.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function test. Question for history of bleeding, stomach ulcers, colon polyps, head trauma, cardiac arrhythmias, unstable angina, recent MI, hepatic impairment, hypertension, stroke, pulmonary disease. Receive full medication history including herbal products.

**INTERVENTION/EVALUATION**

Routinely screen for bleeding. Assess skin for bruising, hematoma. Monitor renal function, uric acid, digoxin levels if applicable. Report hematuria, epistaxis, coffee-ground emesis, black/tarry stools.

**PATIENT/FAMILY TEACHING**

- It may take longer to stop bleeding during therapy.
- Do not vigorously blow nose.
- Use soft toothbrush, electric razor to decrease risk of bleeding.
- Immediately report bloody stool, urine, or nosebleeds.
- Report all

newly prescribed medications. • Inform physician of any planned dental procedures or surgeries.

**tigecycline**

tye-gee-sye-kleen  
(Tygacil)

**BLACK BOX ALERT** ■ An increase in all-cause mortality observed in Phase 3 and 4 clinical trials. Use is reserved when alternate treatment is not appropriate.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Glycylcycline. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to *E. coli*, *E. faecalis*, *S. aureus*, *S. agalactiae*, *S. anginosus* group (includes *S. anginosus*, *S. intermedius*, *S. constellatus*), *S. pyogenes*, *B. fragilis*, *Citrobacter freundii*, *E. cloacae*, *K. oxytoca*, *K. pneumoniae*, *B. thetaiotaomicron*, *B. uniformis*, *B. vulgatus*, *C. perfringens*, *Peptostreptococcus micros* including complicated skin/skin structure infections, complicated intra-abdominal infections, community-acquired bacterial pneumonia.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tigecycline. **Cautions:** Hypersensitivity to tetracyclines; pregnancy, hepatic impairment, monotherapy for pts with intestinal perforation. Do not use for diabetic foot infections, healthcare (hospital)-acquired pneumonia, or ventilator-associated pneumonia.

**ACTION**

Inhibits protein synthesis by binding to ribosomal receptor sites of bacterial cell wall. **Therapeutic Effect:** Bacteriostatic effect.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 71%–89%. Excreted in feces (59%), urine (33%). **Half-life:** Single dose: 27 hrs; following multiple doses: 42 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. May be distributed in breast milk. Permanent discoloration of the teeth (brown-gray) may occur if used during tooth development. **Children:** Safety and efficacy not established in pts younger than 8 yrs. Use is reserved for when no effective alternative is available. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effect of **warfarin**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, BUN, bilirubin, glucose, LDH, ALT, AST. May decrease serum potassium; Hgb, leukocytes, platelets.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (*Ty-gacil*): 50-mg vial.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute with 5.3 mL 0.9% NaCl or D<sub>5</sub>W to a concentration of 10 mg/mL. Dilute in 100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • Infuse over 30–60 min. Flush IV line after infusion is complete.

**Storage** • Refrigerate diluted solution for up to 24 hrs or store at room temperature for up to 6 hrs. • Reconstituted solution appears yellow to red-orange. • Discard if solution is discolored (green, black) or precipitate forms.

## IV INCOMPATIBILITIES

Amphotericin B, methylPREDNISolone, voriconazole.

## IV COMPATIBILITIES

Amikacin, azithromycin, aztreonam, cefepime, cefTAZidime, ciprofloxacin, doripenem, ertapenem, fluconazole, gentamicin, linezolid, piperacillin-tazobactam, potassium chloride, telavancin, tobramycin, vancomycin.

## INDICATIONS/ROUTES/DOSAGE

### Systemic Infections

**IV: ADULTS OVER 18 YRS, ELDERLY:** Initially, 100 mg, followed by 50 mg q12h for 5–14 days. **CHILDREN 12 YRS AND OLDER:** 50 mg q12h. **CHILDREN 8–11 YRS:** 1.2–2 mg/kg q12h. **Maximum:** 50 mg/dose.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** **IV: ADULTS OVER 18 YRS, ELDERLY:** Initially, 100 mg, followed by 25 mg q12h.

## SIDE EFFECTS

**Frequent (29%–13%):** Nausea, vomiting, diarrhea. **Occasional (7%–4%):** Headache, hypertension, dizziness, increased cough, delayed healing. **Rare (3%–2%):** Peripheral edema, pruritus, constipation, dyspepsia, asthenia (loss of strength, energy), hypotension, phlebitis, insomnia, rash, diaphoresis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Dyspnea, abscess, pseudomembranous colitis (abdominal cramps, severe watery diarrhea, fever) ranging from mild to life-threatening may result from altered bacterial balance in GI tract.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT. Question for history of allergies, esp. tetracyclines.

### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Be alert for superinfection:

fever, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

#### PATIENT/FAMILY TEACHING

- Report diarrhea, rash, mouth soreness, other new symptoms.

## tildrakizumab-asmn

til-dra-kiz-ue-mab-asmn  
(Ilumya)

**Do not confuse tildrakizumab-asmn with atezolizumab, benralizumab, certolizumab, daclizumab, eculizumab, efalizumab, mepolizumab, tosutumomab, or trastuzumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-23 antagonist. Monoclonal antibody. **CLINICAL:** Antipsoriatic agent.

#### USES

Treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy or phototherapy.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to tildrakizumab-asmn. **Cautions:** Conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), prior exposure to tuberculosis. Concomitant use of live vaccines not recommended.

#### ACTION

Selectively binds to p19 subunit of interleukin-23 (IL-23) and inhibits interaction with IL-23 receptor. IL-23 is a cytokine that is involved in inflammatory and immune response. **Therapeutic Effect:** Alters biologic immune response; reduces inflammation.

#### PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration:

6 days. Steady state reached in 16 wks. **Half-life:** 23 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease therapeutic effect of **live vaccines**. May increase risk of adverse effects/toxic reactions of **belimumab, live vaccines**. **InFLIXimab** may increase immunosuppressive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

#### AVAILABILITY (Rx)

**Injection Solution, Prefilled Syringe:** 100 mg/mL.

#### ADMINISTRATION/HANDLING

##### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min). • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed. • If present, air bubbles do not need to be removed before administration.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscular. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from light. • May store at room temperature for up to 30 days. Once warmed to room temperature, do not place back into

refrigerator. • Do not freeze or expose to heating sources. • Do not shake.

## INDICATIONS/ROUTES/DOSAGE

### Plaque Psoriasis

**SO: ADULTS, ELDERLY:** 100 mg at wk 0 and wk 4, then q12wks thereafter.

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Rare (3%–2%):** Injection site reactions (bruising, edema, erythema, hematoma, hemorrhage, inflammation, pain, pruritus, swelling, urticaria), diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including angioedema, urticaria may occur. Upper respiratory tract infections reported in 14% of pts. Infections reported in 23% of pts. May increase risk of serious infections. Immunogenicity (auto-tildrakizumab-asmn antibodies) occurred in 7% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Consider completion of immunizations before initiation. Pts should be evaluated for active tuberculosis and tested for latent infection before initiation and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Screen for active infection. Question history of chronic infections, hypersensitivity reactions. Conduct dermatologic exam; record characteristics of psoriatic lesions.

### INTERVENTION/EVALUATION

Assess skin for improvement of lesions. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection before initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs. Monitor for hypersensitivity reaction, angioedema.

## PATIENT/FAMILY TEACHING

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection. • Do not receive live vaccines. • Expect frequent tuberculosis screening. • Report travel plans to possible endemic areas. • Report allergic reactions such as itching, swelling of the face or tongue.

## tiotropium

TOP  
100

tye-oh-trope-ee-yum  
(Spiriva HandiHaler, Spiriva  
Respimat)

**Do not confuse Spiriva with  
Inspira, or tiotropium with  
ipratropium.**

### FIXED-COMBINATION(S)

**Stiolto Respimat:** tiotropium/olodaterol (a bronchodilator): 2.5 mcg/  
2.5 mcg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinergic (long-acting). **CLINICAL:** Bronchodilator.

## USES

Long-term maintenance treatment of bronchospasm associated with COPD, including chronic bronchitis, emphysema, and for reducing COPD exacerbations. **Spiriva Respimat only:** Maintenance treatment of asthma in pts 6 yrs and older.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to tiotropium. History of hypersensitivity to ipratropium. **Cautions:** Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, moderate to severe renal impairment, history of hypersensitivity to atropine, myasthenia gravis.

**ACTION**

Competitively and reversibly inhibits action of acetylcholine at muscarinic receptors in bronchial smooth muscle.

**Therapeutic Effect:** Causes bronchodilation.

**PHARMACOKINETICS**

Binds extensively to tissue. Protein binding: 72%. Metabolized by oxidation. Excreted in urine. **Half-life:** 5–6 days.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Higher frequency of dry mouth, constipation, UTI noted with increasing age.

**INTERACTIONS**

**DRUG:** Concurrent administration with **anticholinergics (e.g., acridinium, umeclidinium, ipratropium)** may increase adverse effects. **Potassium chloride, potassium citrate** may increase risk of ulcers. **Pramlintide** may increase anticholinergic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Inhalation Spray: (Spiriva Respimat):** 1.25 mcg/actuation, 2.5 mcg/actuation. **Powder for Inhalation: (Spiriva):** 18 mcg/capsule (in blister packs).

**ADMINISTRATION/HANDLING****Inhalation**

- **(Spiriva):** Open dustcap of HandiHaler by pulling it upward, then open mouthpiece. • Place capsule in center chamber and firmly close mouthpiece until a click is heard, leaving the dustcap open. • Hold HandiHaler device with mouthpiece upward, press piercing button completely in once, and release. • Instruct pt to breathe out completely

before breathing in slowly and deeply but at rate sufficient to hear the capsule vibrate. • Have pt hold breath as long as it is comfortable until exhaling slowly. • Instruct pt to repeat once again to ensure full dose is received. • **(Spiriva Respimat):** See manufacturer guidelines.

**Storage** • Store at room temperature. Do not expose capsules to extreme temperature, moisture. • Do not store capsules in HandiHaler device. • Use immediately once foil is peeled back or removed.

**INDICATIONS/ROUTES/DOSAGE****COPD (Maintenance Treatment, Reduction of COPD Exacerbations)**

**Inhalation: ADULTS, ELDERLY: (Spiriva):** 18 mcg (1 capsule)/day via HandiHaler inhalation device. **(Spiriva Respimat [2.5 mcg/actuation]):** 2 inhalations (2.5 mcg/inhalation) once daily.

**Asthma**

**Inhalation: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: (Spiriva Respimat [1.25 mcg/actuation]):** 2 inhalations of 1.25 mcg once daily. Maximum benefit may take up to 4–8 wks.

**Dosage in Renal Impairment**

**CrCl 60 mL/min or less:** Use caution in moderate to severe impairment.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (16%–6%):** Dry mouth, sinusitis, pharyngitis, dyspepsia, UTI, rhinitis. **Occasional (5%–4%):** Abdominal pain, peripheral edema, constipation, epistaxis, vomiting, myalgia, rash, oral candidiasis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Angina pectoris, depression, flu-like symptoms, glaucoma, increased intraocular pressure occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question history of glaucoma, bladder outlet obstruction, renal impairment, myasthenia gravis. Auscultate lung sounds.

### INTERVENTION/EVALUATION

Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Monitor ABGs. Observe for clavicular retractions, hand tremor. Evaluate for clinical improvement (quieter, slower respirations, relaxed facial expression, cessation of clavicular retractions).

### PATIENT/FAMILY TEACHING

- Increase fluid intake (decreases lung secretion viscosity).
- Do not use more than 1 capsule for inhalation in a 24-h period.
- Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness, thrush.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).
- Report eye pain/discomfort, blurred vision, visual halos.

## tipiracil/trifluridine

trye-flure-i-deen/tye-pir-a-sil  
(Lonsurf)

**Do not confuse trifluridine with floxuridine, or tipiracil with tipifarnib or Pipracil.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimetabolite/thymidine phosphorylase inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of pts with metastatic colorectal cancer who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial

growth factor (VEGF) biological therapy, and if RAS wild-type, an anti-epidermal growth factor (EGFR) therapy. Treatment of metastatic gastric or gastroesophageal junction adenocarcinoma previously treated with a fluoropyrimidine, a platinum, and either a taxane or irinotecan.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to trifluridine or tipiracil. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for tumor lysis syndrome (high tumor burden, dehydration), history of pulmonary embolism; pregnancy, moderate to severe hepatic impairment.

## ACTION

Trifluridine (active cytotoxic component) interferes with DNA synthesis and cell proliferation of cancer cells. Tipiracil increases exposure of trifluridine by inhibiting metabolism via thymidine phosphorylase. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

## PHARMACOKINETICS

Widely distributed. Metabolized by thymidine phosphorylase (not metabolized in liver). Protein binding: trifluridine: 96%; tipiracil: 8%. Peak plasma concentration: 2 hrs. Excreted primarily in urine (50%). **Half-life:** trifluridine: 1.4 hrs (2.1 hrs at steady state); tipiracil: 2.1 hrs (2.4 hrs at steady state).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mo after discontinuation. Breastfeeding not recommended during treatment and for at least 1 day after discontinuation.

**Children:** Safety and efficacy not established. **Elderly:** May have increased risk of neutropenia, thrombocytopenia.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**. **Cladribine** may increase immunosuppressive, myelosuppressive effect. May increase immunosuppressive effect of  **fingolimod**. May increase toxic effect of **leflunomide**. May decrease therapeutic effect; increase adverse effects of **vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease Hct, Hgb, platelets, neutrophils, RBC, WBC.

## AVAILABILITY (Rx)

**Fixed-Dose Combination Tablets: (Trifluridine/Tipiracil):** 15 mg/6.14 mg, 20 mg/8.19 mg.

## ADMINISTRATION/HANDLING

### PO

- Give within 1 hr of completion of morning and evening meals. Do not give on empty stomach.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Do not initiate the cycle until ANC is 1,500 cells/mm<sup>3</sup> or greater; febrile neutropenia is resolved; platelet count is 75,000 cells/mm<sup>3</sup> or greater; Grade 3 or 4 nonhematologic toxicity is resolved to Grade 1 or 0.

### Colorectal, Gastric Cancer

**PO: ADULTS, ELDERLY:** (Dose based on trifluridine component) 35 mg/m<sup>2</sup> (rounded to nearest 5-mg increment) twice daily on days 1–5 and days 8–12 of 28-day cycle. Continue until disease progression or unacceptable toxicity. **Maximum:** 80 mg/dose (based on trifluridine component).

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Hematologic/Nonhematologic Toxicity

Interrupt treatment for ANC less than 500 cells/mm<sup>3</sup>; febrile neutropenia; platelet count less than 50,000 cells/mm<sup>3</sup>; Grade 3 or 4 nonhematologic toxicity. Do not restart until ANC is 1,500 cells/mm<sup>3</sup> or greater; febrile neutropenia is resolved; platelet count is 75,000 cells/mm<sup>3</sup> or greater; Grade 3 or 4 nonhematologic toxicity is resolved to Grade 1 or 0 (except Grade 3 nausea and/or vomiting controlled by antiemetic therapy; Grade 3 diarrhea responsive to antidiarrheal medication). Once resolved, resume at decreased incremental dose of 5 mg/m<sup>2</sup> from previous dose. A maximum of 3 dose reductions is allowed to dosage minimum of 20 mg/m<sup>2</sup> twice daily. Do not increase dose after it has been reduced.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose to 20 mg/m<sup>2</sup> twice daily on days 1–5 and days 8–12 of a 28-day cycle. May further reduce dose to 15 mg/m<sup>2</sup> twice daily if unable to tolerate 20 mg/m<sup>2</sup> dose. Permanently discontinue if unable to tolerate 15 mg/m<sup>2</sup> dose.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Avoid use.

## SIDE EFFECTS

**Frequent (52%–19%):** Asthenia, fatigue, nausea, diarrhea, decreased appetite, vomiting, abdominal pain, pyrexia. **Occasional (8%–7%):** Stomatitis, dysgeusia, alopecia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe and/or life-threatening myelosuppression including anemia (77% of pts), Grade 3 anemia (18% of pts), neutropenia (67% of pts), Grade 3 or 4 neutropenia (27% and 11% of pts), thrombocytopenia (42% of pts), Grade 3 or 4 thrombocytopenia (5% and 1% of pts),

febrile neutropenia (3.8% of pts) may occur. Infections including nasopharyngitis, UTI reported in 2%–4% of pts. Pulmonary embolism occurred in 2% of pts. Interstitial lung disease occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

CBC; pregnancy test in females of reproductive potential. Screen for active infection, history of pulmonary embolism. Assess hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

### INTERVENTION/EVALUATION

Follow proper handling and disposal procedures for cytotoxic drugs. Monitor ANC, CBC on day 15 of each cycle. If any Grade 3 or 4 hematologic toxicity occurs, repeat ANC, CBC more frequently. If chest pain, dyspnea, tachycardia occurs, provide supplemental O<sub>2</sub> and obtain radiologic testing to rule out pulmonary embolism. Diligently monitor for infection (cough, fatigue, fever). Monitor daily stool pattern, consistency. Encourage PO intake. Monitor for bleeding if thrombocytopenia occurs.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Immediately report chest pain, difficult breathing, fast heart rate, rapid breathing; may indicate life-threatening blood clot in the lungs.
- Drink plenty of fluids.
- Report diarrhea, nausea, vomiting that is not controlled by anti-nausea, anti-diarrheal medication.
- Report bleeding of any kind.

## tisagenlecleucel

tis-a-jen-lek-loo-sel  
(Kymriah)

**BLACK BOX ALERT** Life-threatening cytokine release syndrome (CRS) was reported. Do not administer in pts with inflammatory disorders or severe active infection. Treat CRS with tocilizumab and corticosteroids. Life-threatening neurologic toxicities may occur. Monitor for neurological events after treatment.

**Do not confuse tisagenlecleucel with sipuleucel-T or Kymriah with Kynamro.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD19. Chimeric antigen receptor (CAR) T-cell immunotherapy. **CLINICAL:** Antineoplastic.

## USES

Treatment of B-cell precursor acute lymphoblastic leukemia (ALL) that is refractory or in second or later relapse in pts up to 25 yrs of age. Treatment of adults with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, high-grade B-cell lymphoma and DLBCL arising from follicular lymphoma. Limitations: Not indicated for treatment of primary central nervous system lymphoma.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to tisagenlecleucel. **Cautions:** Baseline cytopenias, elderly, cardiac/pulmonary disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of venous thromboembolism (DVT, PE); pts at risk for acute thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions);

history of HIV infection, hepatitis B or C virus infection; pts at risk for tumor lysis syndrome (high tumor burden). Not recommended during active infection or in pts with inflammatory disorders. Avoid administration of live vaccines during treatment and after discontinuation until B cells are no longer depleted.

## ACTION

A CD-19–directed genetically modified autologous T-cell immunotherapy that reprograms T cells with a transgene encoding a chimeric antigen receptor, which identifies and eliminates CD19-expressing malignant and normal cells. CAR recognizes CD19 and is fused to CD137 (enhances expansion and persistence of tisagenlecleucel) and CD3 zeta (a critical component for initiating T-cell activation and antitumor activity). **Therapeutic Effect:** Causes antitumor activity by initiating activation of T cells.

## PHARMACOKINETICS

Highly distributed into bone marrow. Peak plasma concentration: approx. 10 days. **Half-life:** 17 days (ALL); 45 days (DCBC).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm due to fetal B-cell depletion and neonatal lymphocytopenia. Unknown if distributed in breast milk. **Children:** Safety and efficacy has been established. **Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** Systemic corticosteroids (e.g., dexamethasone, prednisone) may decrease therapeutic effect; may increase risk of infection. May decrease therapeutic effect of vaccines. May increase adverse/toxic effects of live vaccines. **Granulocyte colony-stimulating factors, sargramostim** may increase adverse/toxic effects of tisagenlecleucel. May increase immunosuppressive effect of baricitinib, fingolimod. May decrease therapeutic effect of BCG (intravesical). May

increase toxic effect of natalizumab. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease serum potassium, phosphorus, sodium; B-cell counts, fibrinogen, immunoglobulin concentrations, leukocytes, lymphocytes, neutrophils, platelets. May prolong aPTT.

## AVAILABILITY (Rx)

**Patient-Specific Autologous Infusion:** 0.2–5 × 10<sup>6</sup> CAR-positive viable T cells/kg, 0.1–2.5 × 10<sup>8</sup> CAR-positive viable T cells, 0.6–6 × 10<sup>8</sup> CAR-positive viable T cells.

## ADMINISTRATION/HANDLING

**ALERT** Premedicate with acetaminophen and diphenhydramine (or another H<sub>1</sub> antihistamine) approx. 30–60 min before infusion. Do not use a leukocyte-depleting filter during infusion. Infusion bags contain human cells genetically modified with a lentivirus. Follow bio-safety handling and safety guidelines.

**Preparation** • Verify the number of infusion bags needed for dose (up to 3 cryopreserved patient-specific infusion bags may be required to complete a single dose). • Verify dose with Certificate of Conformance (CoC) and Certificate of Analysis (CoA). • Thawing time must be coordinated with infusion time. If more than 1 bag is needed for dose, recommend thawing 1 bag at a time (allows verification that the previous bag was administered safely). • Match pt identity with infusion bag identifiers. • Visually inspect for cracks or breaks. Do not infuse if cracks or breaks are present. • Prime infusion tubing with 0.9% NaCl. • **Thawing:** Place infusion bag inside a second sterile bag to safeguard infusion bag from leaks and to protect ports from contamination. • Thaw 1 bag at a time using either a water bath at 37°C or dry thawing method. • Continue to thaw until no ice is visible on infusion bag. Then remove bag from thawing device. • Visually

inspect for clumps. Gently mix if clumps are present (small clumps should disperse). • Do not infuse if bag is leaking, damaged, or if clumps do not disperse after gentle mixing. • Do not spin down, wash, or resuspend contents.

**Rate of administration** • Infuse at 10–20 mL/min (adjust as needed for small children who require smaller volumes) until all contents are infused. • Upon completion, rinse infusion bag with 10–30 mL of 0.9% NaCl (while maintaining a closed system) to ensure that as many cells as possible are administered.

**Storage** • Infusion bags are frozen until time of use. • Thawed infusion bags that have reached room temperature must be infused within 30 min. • Do not store thawed infusion bags at 37°C.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Single-dose infusion(s) contains specimen of chimeric antigen receptor (CAR)-positive viable T cells. Dose is based on weight at the time of leukapheresis.

### ALL (Relapsed/Refractory)

**Note:** Give 2–14 days following lymphodepleting chemotherapy with fludarabine and cyclophosphamide.

**IV: ADULTS YOUNGER THAN 25 YRS, CHILDREN WEIGHING 50 KG OR LESS:** 0.2–5 × 10<sup>6</sup> CAR-positive viable T cells/kg. **WEIGHING 50 KG OR MORE:** 0.1–2.5 × 10<sup>8</sup> CAR-positive viable T cells.

### DLBCL (Relapsed/Refractory)

**Note:** Give 2–11 days following lymphodepleting chemotherapy with fludarabine and cyclophosphamide.

**IV: ADULTS:** 0.6–6 × 10<sup>8</sup> CAR-positive viable T cells.

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Frequent (40%–18%):** Pyrexia, decreased appetite, headache, migraine, tachycardia, nausea, diarrhea, vomiting, fatigue, malaise, cough, edema (generalized, peripheral), delirium, agitation, hal-

lucination, irritability, restlessness, generalized pain, constipation. **Occasional (16%–6%):** Abdominal pain, rash (maculopapular, papular, pruritic), myalgia, arthralgia, anxiety, tachypnea, chills, fluid overload, back pain, sleep disorder, insomnia, nightmares, nasal congestion, tremor, dizziness, oropharyngeal pain. **Rare (3%–1%):** Speech disorder (dysarthria, aphasia), visual impairment, motor dysfunction, muscle spasm.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including bone marrow depression, febrile neutropenia may be life-threatening. Prolonged cytopenias may occur for several wks following lymphodepleting chemotherapy. Life-threatening CRS reported in up to 79% of pts. Symptoms of CRS may include asthenia, hypotension, nausea, pyrexia; elevated ALT/AST, bilirubin; disseminated intravascular coagulation (DIC), capillary leak syndrome, hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLH/MAS). Infusion reactions may be clinically indistinguishable from CRS. Life-threatening neurological toxicities including altered mental status, balance disorders, confusion, disorientation, encephalopathy, seizures, speech disorders, syncope occurred in up to 72% of pts. Cardiac events including cardiac failure, cardiac arrest may occur, esp. in pts with history of cardiac disease. Life-threatening opportunistic infections, bacterial/viral/fungal infections, sepsis were reported. Other life-threatening or fatal events may include abdominal compartment syndrome, acute kidney injury, ARDS, graft-versus-host disease, multiple organ dysfunction syndrome, respiratory distress/failure, seizures, thrombosis (DVT, PE, venous thrombosis). May cause HBV reactivation, resulting in fulminant hepatitis, hepatic failure, or death. Tumor lysis syndrome may present as acute renal

failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Hypogammaglobulinemia, agammaglobulinemia (IgG) (related to B-cell aplasia) reported in 43% of pts. May increase risk of new malignancies. Hypersensitivity reactions including anaphylaxis may occur. Immunogenicity (anti-mCAR19 antibodies) occurred in 5% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, vital signs; pregnancy test in females of reproductive potential. Test all pts for hepatitis B or C virus infection, HIV infection before cell collection. Withhold infusion if any of the following are present: active graft-versus-host disease, unresolved adverse effect from previous chemotherapies (e.g., cardiac reactions, hypotension, pulmonary reactions); severe, uncontrolled infection; worsening of leukemia burden following lymphodepleting chemotherapy. Ensure that tocilizumab, emergency resuscitative equipment are readily available before initiation and following completion. Question history of cardiac disease, pulmonary disease, chronic infections, renal impairment, thrombosis. Question for recent administration of vaccines, live vaccines. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC, BMP, LFT, vital signs as clinically indicated; immunoglobulin levels after treatment (and in newborns of treated mothers). Manage hypogammaglobulinemia as clinically appropriate. Obtain serum calcium, phosphate, uric acid if tumor lysis syndrome is suspected. Diligently monitor for CRS. Recommend observation 2–3 times/wk during the first wk at a healthcare facility. Follow manufacturer's guidelines regarding management of CRS (e.g., administration of IV fluids, vasopressors, tocilizumab). Monitor for infections of any kind. Due to risk of cardiovascular events, have emergency resuscitation equipment readily avail-

able. Conduct routine neurological assessments. Monitor for symptoms of DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia). Monitor for bleeding events, renal toxicity (anuria, hypertension, generalized edema, flank pain), secondary malignancies, recurrence of cancer, HBV reactivation (amber to orange-colored urine, fatigue, jaundice, nausea, vomiting), neurological toxicities. Monitor weight, I&Os; daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss, bleeding easily, bloody urine or stool.
- CRS, a life-threatening condition caused by immune activation, may occur; report difficulty breathing, headache, fever, low blood pressure, rash, rapid heart rate. Stay within the proximity of a healthcare facility for at least 4 wks after infusion.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine, confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Effective contraception may be required based on treatment with other medications.
- Report cardiovascular events (e.g., difficulty breathing, fainting, irregular heartbeats, palpitations, sweating).
- Report bleeding of any kind.
- If applicable, vaccinations should be up-to-date at least 6 wks before starting treatment. Do not receive live vaccines.
- Report symptoms of DVT (e.g., swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (e.g., difficulty breathing, chest pain, rapid heart rate).
- Re-

port liver problems such as bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes; kidney problems such as decreased urine output, dark-colored urine; allergic reactions such as difficulty breathing, hives, low blood pressure, rash, swelling of the face or tongue. • Treatment may cause reactivation of chronic viral infections, new cancers.

## tivozanib

tye-voe-zan-ib  
(Fotivda)

**Do not confuse tivozanib with axitinib, cabozantinib, lenvatinib, PAZOPanib, regorafenib, SORafenib, SUNItinib, tepotinib, or tucatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGFR) receptor inhibitor, kinase inhibitor.  
**CLINICAL:** Antineoplastic.

### USES

Treatment of adults with relapsed or refractory advanced renal cell carcinoma (RCC) after 2 or more prior systemic therapies.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to tivozanib. **Cautions:** Baseline cytopenias, hepatic impairment, end-stage renal disease (ESRD), hypertension, cardiomyopathy, thyroid dysfunction (hyperthyroidism, hypothyroidism); recent (within 6 mos) CVA, MI, unstable angina, hemorrhagic events; pts at risk for hemorrhage (e.g., history of intracranial/GI/GU/pulmonary bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelets, chronic NSAIDs); history of arterial/venous thrombosis (e.g., CVA, DVT, MI, pulmonary embolism); pts at risk for thrombosis (immobility, indwelling venous catheter/access

device, morbid obesity, genetic hypercoagulable conditions); recent or poorly healed wounds (e.g., recent or planned surgery, chronic open wounds, ulcers). Avoid use of strong CYP3A inducers.

### ACTION

Inhibit phosphorylation of VEGFR-1, VEGFR-2, and VEGFR-3, preventing angiogenesis, vascular permeability, and tumor cell proliferation. **Therapeutic Effect:** Inhibits tumor growth.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 10 hrs (range: 3–24 hrs). Steady state reached in 14 days. Excreted in feces (79%), urine (12%). **Half-life:** 111 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), chronic use of NSAIDs (e.g., diclofenac, meloxicam, naproxen) may increase risk of bleeding. **Strong CYP3A4 inducers** (e.g., carBAMazepine, PHENytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May increase serum

alkaline phosphatase, ALT, amylase, AST, bilirubin, calcium, creatinine, glucose, lipase, potassium. May decrease serum magnesium, phosphate, sodium; lymphocytes, platelets. May increase or decrease Hgb. May prolong activated partial thromboplastin (aPTT).

## AVAILABILITY (RX)

**Capsules:** 0.89 mg, 1.34 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer whole with water; do not break, cut, or open capsule. Capsule cannot be chewed.
- If a dose is missed or vomiting occurs after administration, give next dose at regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

**Renal Cell Carcinoma (Advanced, Relapsed, or Refractory)**

**PO: ADULTS:** 1.34 mg once daily for 21 days, followed by a 7-day interruption, of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

### Dose Reduction

If dose modification is required for an adverse reaction, reduce dose 0.89 mg once daily for 21 days, followed by a 7-day interruption, of a 28-day cycle.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Cardiac Toxicity

**Grade 3 cardiac failure:** Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose. Consider discontinuation based on severity.

### Hypertension

**Grade 3 hypertension (despite optimal hypertensive therapy):** Withhold treatment until adequately controlled (Grade 2 or less), then resume at reduced dose level. **Grade 4 hypertension:** Permanently discontinue.

### Proteinuria

**Urine protein level greater than 2 g/24 hrs:** Withhold treatment until urine protein level is less than 2 g/24 hrs, then resume at reduced dose. **Nephrotic syndrome:** Permanently discontinue.

### Other Adverse Reactions

Any other persistent or intolerable Grade 2 or 3 adverse reaction; Grade 4 lab abnormality: Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at reduced dose. Any other Grade 4 adverse reaction: Permanently discontinue.

### Permanent Discontinuation

Permanently discontinue in pts with Grade 3 or 4 hemorrhage; occurrence of arterial thromboembolism, reversible posterior leukoencephalopathy syndrome.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment. **ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Reduce dose 0.89 mg once daily for 21 days, followed by a 7-day interruption, of a 28-day cycle. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (67%–21%):** Fatigue, asthenia, diarrhea, decreased appetite, nausea, dysphonia, cough, stomatitis. **Occasional (19% to less than 15%):** Back pain, rash, dermatitis, eczema, erythema, photosensitivity reaction, pruritus, psoriasis, skin exfoliation/irritation, vomiting, decreased weight, dyspnea, delirium.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe hypertension, hypertensive crisis may occur. Hypertension reported in 45% of pts with median onset occurring in 2 wks. Hypertensive crisis reported in 1% of pts. Life-threatening cardiac failure, cardiac ischemia reported in 2% and 3% of

pts, respectively. Fatal arterial thrombosis, including CVA, has occurred. Life-threatening venous thromboembolism reported in 2% of pts. Hemorrhagic events, including epistaxis, hematuria, hemoptysis, contusion, intraocular hematoma, intracranial hemorrhage, GI/GU bleeding (hematemesis, melena, rectal bleeding), vaginal hemorrhage, were reported. Proteinuria may indicate acute renal injury or nephrotic syndrome. Thyroid dysfunction (hyperthyroidism, hypothyroidism) reported in 1% of pts. May cause impaired wound healing or wound dehiscence requiring medical intervention. Posterior reversible encephalopathy syndrome (PRES), a dysfunction of the brain that may evolve into an ischemic CVA or cerebral hemorrhage, may occur. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with skin redness, swelling, numbness, sloughing of the hands and feet, may occur. Elevated hepatic enzymes (transaminitis) reported in 28%–30% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, LFT, thyroid panel; B/P; pregnancy test in females of reproductive potential. Confirm compliance with effective contraception. Verify baseline hypertension is adequately controlled prior to initiation. Consider echocardiogram to assess LVEF in pts with cardiomyopathy. Question history of ESRD, hepatic impairment, hemorrhagic events, hypertension, recent surgery, thromboembolism (CVA, DVT, MI, pulmonary embolism), thyroid dysfunction. Assess risk for thrombosis. Receive full medication history and screen for interactions. Conduct dermatological exam; assess for open wounds, lesions, surgical incisions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor renal function test, LFT, thyroid panel, urine protein periodically. If urine protein is greater than or equal to 2+ on dipstick, obtain 24-hr urine protein test. Monitor for decreased urine output, renal

dysfunction, nephrotic syndrome. Monitor B/P after initiation, then at least monthly thereafter. Persistent diastolic hypertension may indicate hypertensive crisis. Medically manage diarrhea, nausea, vomiting prior to withholding treatment or dose reduction. Withhold treatment for at least 24 days prior to elective surgery or for at least 2 wks after major surgery and until wound is fully healed. Assess skin for impaired wound healing, new skin lesions, rash; symptoms of PPES. Monitor for MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST-segment elevation), CVA (aphasia, altered mental status, facial droop, hemiplegia, vision loss), pulmonary embolism (chest pain, dyspnea, tachycardia); cardiac failure (dyspnea, edema, palpitations, syncope); hemorrhagic events, including intracranial hemorrhage (altered mental status, aphasia, blindness, hemiparesis, unequal pupils, seizures), GI/GU bleeding (hematemesis, melena, rectal bleeding), epistaxis. RPLS should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances.

### PATIENT/FAMILY TEACHING

- Life-threatening blood clots of the arteries and veins may occur; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures), DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate).
- Life-threatening bleeding may occur; report bloody stool, urine; rectal bleeding, nosebleeds, vomiting up blood, or bleeding of any kind.
- Treatment may cause or worsen high blood pressure. Blurry vision, confusion, chest pain, headache, seizures may indicate life-threatening high blood pressure crisis.
- Notify physician before any planned surgeries/invasive dental procedures.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin

or eyes), kidney problems (decreased urine output, flank pain, darkened urine), toxic skin reactions (sloughing, rash, poor healing of wounds). • Posterior reversible encephalopathy syndrome, a dysfunction of the brain that may cause a stroke or bleeding in the brain, may occur. • Treatment may reduce the heart's ability to pump effectively; report heart problems (difficulty breathing, fainting, palpitations, swelling of extremities). • Do not take newly prescribed medications unless approved by prescriber who originally started treatment.

## tiZANidine

tye-zan-i-deen  
(Zanaflex)

**Do not confuse tiZANidine with tiaGABine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha<sub>2</sub>-adrenergic agonist. **CLINICAL:** Antispastic.

### USES

Acute and intermittent management of muscle spasticity (spasms, stiffness, rigidity), spasticity associated with multiple sclerosis or spinal cord injury.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to tiZANidine. Concurrent use with strong CYP1A2 inhibitors (e.g., ciprofloxacin, fluvoxamine). **Cautions:** Renal/hepatic disease, pts at risk for severe hypotensive effects, cardiac disease, psychiatric disorders, elderly.

### ACTION

Increases presynaptic inhibition of spinal motor neurons mediated by alpha<sub>2</sub>-adrenergic agonists, reducing facilitation to postsynaptic motor neurons. **Therapeutic Effect:** Reduces muscle spasticity.

### PHARMACOKINETICS

Metabolized in liver. Primarily excreted in urine. **Half-life:** 2 hrs.

### INTERACTIONS

**DRUG:** Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Strong CYP1A2 inhibitors** (e.g., ciprofloxacin, fluvoxamine) may increase concentration/adverse effects (contraindicated). **HERBAL:** Herbals with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

### AVAILABILITY (Rx)

**Capsules:** 2 mg, 4 mg, 6 mg. **Tablets:** 2 mg, 4 mg.

### ADMINISTRATION/HANDLING

#### PO

• Capsules may be opened and sprinkled on food. • May give without regard to food. • Administration should be consistent and not switched between giving with or without food.

### INDICATIONS/ROUTES/DOSAGE

#### Muscle Spasticity

**PO:** **ADULTS, ELDERLY:** Initially, 2 mg once daily at bedtime. May increase by 2–4 mg at intervals of 1–4 days. **Maximum:** 36 mg/day in 3–4 divided doses. **Discontinuation of therapy:** Gradually taper dose by 2–4 mg daily.

#### Dosage in Renal Impairment

May require dose reduction/less frequent dosing. **CrCl less than 25 mL/min:** Reduce dose by 50%. If higher doses needed, increase dose instead of frequency.

#### Dosage in Hepatic Impairment

Avoid use if possible. If used, monitor for adverse effects (e.g., hypotension).

**SIDE EFFECTS**

**Frequent (49%–41%):** Dry mouth, drowsiness, asthenia. **Occasional (16%–4%):** Dizziness, UTI, constipation. **Rare (3%):** Nervousness, amblyopia, pharyngitis, rhinitis, vomiting, urinary frequency.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypotension may be associated with bradycardia, orthostatic hypotension, and, rarely, syncope. Risk of hypotension increases as dosage increases; hypotension is noted within 1 hr after administration. May cause visual hallucinations.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain LFT in pts with history of hepatic impairment. Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling.

**INTERVENTION/EVALUATION**

Assist with ambulation at all times. For those on long-term therapy, serum hepatic/renal function tests should be performed periodically. Evaluate for therapeutic response (decreased intensity of skeletal muscle pain/tenderness, improved mobility, decrease in spasticity). Go from lying to standing slowly.

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid sudden changes in posture.
- May cause hypotension, sedation, impaired coordination.
- Avoid alcohol.

**tobramycin**

toe-bra-mye-sin  
(TOBI, Tobrex)

**BLACK BOX ALERT** ■ May cause neurotoxicity, nephrotoxicity, ototoxicity. Ototoxicity usually is irreversible. Increased risk of neuromuscular blockade, including respiratory paralysis, particularly

when given after anesthesia or muscle relaxants. May cause fetal harm. **Do not confuse tobramycin with vancomycin, or Tobrex with TobraDex.**

**FIXED-COMBINATION(S)**

**TobraDex:** tobramycin/dexamethasone (a steroid): 0.3%/0.1% per mL or per g. **Zylet:** tobramycin/loteprednol: 0.3%/0.5%.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Aminoglycoside. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to *P. aeruginosa*, other gram-negative organisms including skin/skin structure, bone, joint, respiratory tract infections; postop, burn, intra-abdominal infections; complicated UTI; septicemia; meningitis. **Ophthalmic:** Superficial eye infections: blepharitis, conjunctivitis, keratitis, corneal ulcers. **Inhalation:** Bronchopulmonary infections (*Pseudomonas aeruginosa*) in pts with cystic fibrosis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tobramycin, other aminoglycosides (cross-sensitivity) and their components. **Cautions:** Renal impairment, auditory or vestibular impairment, conditions that depress neuromuscular transmission, Parkinson's disease, myasthenia gravis, hypocalcemia, pregnancy, elderly.

**ACTION**

Irreversibly binds to protein on bacterial ribosomes. **Therapeutic Effect:** Interferes with protein synthesis of susceptible microorganisms.

**PHARMACOKINETICS**

Widely distributed. Protein binding: less than 30%. Excreted in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in

T

renal impairment, neonates; decreased in cystic fibrosis, febrile, or burn pts).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. May cause fetal nephrotoxicity. Ophthalmic form should not be used in breastfeeding mothers and only when specifically indicated in pregnancy. **Children:** Immature renal function in neonates, premature infants may increase risk of toxicity. **Elderly:** Age-related renal impairment may increase risk of toxicity; dosage adjustment recommended.

### INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccine (live)**. **Foscarnet**, **mannitol** may increase nephrotoxic effect. **Penicillin** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, bilirubin, creatinine, alkaline phosphatase, LDH, ALT, AST. May decrease serum calcium, magnesium, potassium, sodium. Therapeutic peak serum level: 5–20 mcg/mL; therapeutic trough serum level: 0.5–2 mcg/mL. Toxic peak serum level: greater than 20 mcg/mL; toxic trough serum level: greater than 2 mcg/mL.

### AVAILABILITY (Rx)

**Inhalation Powder (TOBI Podhaler):** 28 mg in a capsule. **Injection, Powder for Reconstitution:** 1.2 g. **Injection Solution:** 10 mg/mL, 40 mg/mL. **Ointment, Ophthalmic (Tobrex):** 0.3%. **Solution, Nebulization (TOBI):** 60 mg/mL. **Solution, Ophthalmic (Tobrex):** 0.3%.

### ADMINISTRATION/HANDLING

 **ALERT** Coordinate peak and trough lab draws with administration times.

 **IV**

**Reconstitution** • Dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl. Amount of diluent

for infants, children depends on individual need.

**Rate of administration** • Infuse over 30–60 min.

**Storage** • Store vials at room temperature. • Solutions may be discolored by light or air (does not affect potency). • Refrigerate diluted solution for up to 96 hrs or store at room temperature for up to 24 hrs.

### IM

• To minimize discomfort, give deep IM slowly. • Less painful if injected into gluteus maximus rather than lateral aspect of thigh.

### Inhalation

• Refrigerate. • May store at room temperature up to 28 days after removing from refrigerator. • Do not use if cloudy or contains particulates. • **Podhaler:** Capsules must not be swallowed. • Doses should be as close as possible to 12 hrs apart and not less than 6 hrs apart. • Use Podhaler device supplied.

### Ophthalmic

• Place gloved finger on lower eyelid, pull out until pocket is formed between eye and lower lid. • Place correct number of drops (1/4–1/2 inch ointment) into pocket. • **Solution:** Apply digital pressure to lacrimal sac for 1–2 min (minimizes drainage into nose/throat, reducing risk of systemic effects). • **Ointment:** Instruct pt to close eye for 1–2 min, rolling eyeball (increases contact area of drug to eye). • Remove excess solution/ointment around eye.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), heparin, indomethacin (Indocin), piperacillin-tazobactam (Zosyn), propofol (Diprivan), sargramostim (Leukine, Prokine).

### IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, cefepime, ceftaroline, ceftazidime,

dexmedetomidine (Precedex), dilTIAZem (Cardizem), furosemide (Lasix), HYDROMORPHONE (Dilaudid), insulin, linezolid (Zyvox), magnesium sulfate, midazolam (Versed), morphine, niCARDIPINE (Cardene), tigecycline (Tygacil).

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Space parenteral doses evenly around the clock. Dosage based on ideal body weight. Peak, trough levels determined periodically to maintain desired serum concentrations (minimizes risk of toxicity). Recommended peak level: 4–10 mcg/mL; trough level: 0.5–2 mcg/mL.

**Usual Parenteral Dosage**

**IV: ADULTS, ELDERLY:** 3–5 mg/kg/day in divided doses q8h. Once-daily dosing: 5–7 mg/kg every 24 hrs. **CHILDREN, ADOLESCENTS:** 6–7.5 mg/kg/day divided q6–8h. **NEONATES LESS THAN 1 KG (14 DAYS OR YOUNGER):** 5 mg/kg/dose q48h; **(15–28 DAYS):** 5 mg/kg/dose q36h. **1–2 KG (7 DAYS OR YOUNGER):** 5 mg/kg/dose q48h; **(8–28 DAYS):** 5 mg/kg/dose q36h. **GREATER THAN 2 KG (7 DAYS OR YOUNGER):** 4 mg/kg q24h; **(8–28 DAYS):** 4–5 mg/kg q24h.

**Usual Ophthalmic Dosage**

**Ophthalmic ointment: ADULTS, ELDERLY, CHILDREN 2 MOS AND OLDER:** Apply 1/2 inch to conjunctiva q8–12h (q3–4h for severe infections).

**Ophthalmic solution: ADULTS, ELDERLY, CHILDREN 2 MOS AND OLDER:** 1–2 drops in affected eye q4h (2 drops/hr for severe infections).

**Usual Inhalation Dosage (Cystic Fibrosis)**

**Inhalation high dose: ADULTS, CHILDREN 6 YRS AND OLDER:** 300 mg q12h 28 days on, 28 days off. (**Tobi Podhaler**): Four 28-mg capsules twice daily for 28 days followed by 28 days off.

**Dosage in Renal Impairment**

After loading dose of 1–2 mg/kg, maintenance dose and frequency are based on serum creatinine levels, creatinine clearance.

**Creatinine Clearance Dosing Interval**

41–60 mL/min	q12h
21–40 mL/min	q24h
10–20 mL/min	q48h
Less than 10 mL/min	q72h
Hemodialysis	Loading dose 2–3 mg/kg, then 1–2 mg/kg q48–72h
Continuous renal replacement therapy	Loading dose 2–3 mg/kg, then 1–2.5 mg/kg q24–48h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional: IM:** Pain, induration. **IV:** Phlebitis, thrombophlebitis. **Topical:** Hypersensitivity reaction (fever, pruritus, rash, urticaria). **Ophthalmic:** Tearing, itching, redness, eyelid swelling. **Rare:** Hypotension, nausea, vomiting.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure) may occur. Irreversible ototoxicity (dizziness, ringing/roaring in ears, hearing loss), neurotoxicity (headache, dizziness, lethargy, tremor, visual disturbances) occur occasionally. Risk increases with higher dosages or prolonged therapy or if solution is applied directly to mucosa. Superinfections, particularly fungal infections, may result from bacterial imbalance with any administration route. Anaphylaxis may occur.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Dehydration must be treated before beginning parenteral therapy. Question for history of allergies, esp. aminoglycosides, sulfite (and parabens for topical, ophthalmic routes). Obtain baseline lab tests, esp. renal function.

**INTERVENTION/EVALUATION**

Monitor I&O (maintain hydration), urinalysis, renal function. Monitor results of peak/trough blood tests. **Therapeutic**

**serum level:** peak: 5–20 mcg/mL; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 20 mcg/mL; trough: greater than 2 mcg/mL. Be alert to ototoxic, neurotoxic symptoms. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess for rash. Monitor for superinfection, particularly anal/genital pruritus, changes of oral mucosa, diarrhea. When treating pts with neuromuscular disorders, assess respiratory response carefully. **Ophthalmic:** Assess for redness, swelling, itching, tearing.

#### PATIENT/FAMILY TEACHING

- Report any hearing, visual, balance, urinary problems, even after therapy is completed.
- **Ophthalmic:** Blurred vision, tearing may occur briefly after application.
- Report persistent tearing, redness, irritation.

## tocilizumab

toe-si-liz-oo-mab  
(Actemra)

**BLACK BOX ALERT** Tuberculosis, serious invasive fungal infections, other opportunistic infections have occurred. Test for tuberculosis prior to and during treatment, regardless of initial result. Consider treatment of latent TB prior to initiation.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin (IL)-6 receptor inhibitor.  
**CLINICAL:** Antirheumatic, disease-modifying agent.

#### USES

Treatment of moderate to severe rheumatoid arthritis in adults who had inadequate response to disease-modifying antirheumatic drugs (DMARDs). Treatment of active systemic juvenile idiopathic arthritis (SJIA) in pts 2 yrs of age and older. Treatment of active polyarticular juvenile idiopathic arthritis (PJIA) in pts 2 yrs and older. Treatment of adults and children 2 yrs of age and

older with chimeric antigen receptor (CAR) T-cell–induced severe or life-threatening cytokine release syndrome. Treatment of giant cell arteritis in adults. To slow the rate of decline in pulmonary function in adults with systemic sclerosis–associated interstitial lung disease (SSc-ILD).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to tocilizumab. **Cautions:** Preexisting or recent-onset demyelinating disorders (e.g., multiple sclerosis), elderly, recent travel or residence in TB- or mycosis-endemic areas; history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); history of HIV, herpes zoster, hepatitis B or C virus infection; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies), peptic ulcers, peritoneal malignancies). Do not initiate in pts with active infection; platelet count 100,000 cells/mm<sup>3</sup> or less, ANC less than 2,000 cells/mm<sup>3</sup>; serum ALT, AST greater than 1.5 times ULN.

#### ACTION

Binds to IL-6 receptors, inhibiting signals of proinflammatory cytokines. **Therapeutic Effect:** Inhibits/slows structural joint damage, improves physical function.

#### PHARMACOKINETICS

Distributed in steady state of plasma and tissue compartments. Undergoes biphasic elimination from circulation. **Half-life:** 11–13 days.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk; however, immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established in conditions other than SJIA, severe or life-threatening CAR T-cell–induced cytokine release syndrome. **EI-**

**derly:** Cautious use due to increased risk of serious infections, malignancy.

## INTERACTIONS

**DRUG:** May increase adverse effects of **belimumab**, **natalizumab**, **tofacitinib**, **vaccines (live)**. May decrease therapeutic effect of **vaccines (live)**. May increase immunosuppressive effect of **anti-TNF agents (e.g., adalimumab, etanercept, infliximab)**. **HERBAL:** *Echinacea* may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, lipids. May decrease platelets, neutrophils.

## AVAILABILITY (Rx)

**Injection Solution:** 20 mg/mL (80 mg/4 mL, 200 mg/10 mL, 400 mg/20 mL). **Syringe for SQ Administration:** 162 mg/0.9 mL. **Syringe Auto-injector:** 162 mg/0.9 mL.

## ADMINISTRATION/HANDLING

**⚠️ALERT** Do not infuse IV push or bolus.

**Reconstitution** • Dilute in 100 mL 0.9% NaCl (50 mL 0.9% NaCl for SJIA pts weighing less than 30 kg). • Prior to mixing, withdraw and discard volume of NaCl equal to volume of patient-dosed solution. • Invert bag to avoid foaming. • Inject solution and dilute for mixture that equals 50 mL or 100 mL in NaCl bag.

**Rate of administration** • Infuse over 1 hr.

**Storage** • Refrigerate vials; do not freeze. • Diluted solutions may be stored for 24 hrs at room temperature or refrigerated. • Protect from light until time of use. • Solution appears colorless. Discard solution if it appears cloudy, discolored, or contains particulate.

## SQ

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously and inject solution. • Do not inject

into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly. • If a dose is missed, administer as soon as possible, then adjust schedule to maintain dosing intervals.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from light. • Do not shake. • Do not freeze or expose to heating sources.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Do not infuse concomitantly in same IV line with other drugs. Do not begin if ANC less than 2,000 cells/mm<sup>3</sup>, platelets less than 100,000 cells/mm<sup>3</sup>, or ALT or AST more than 1.5 times ULN.

### Moderate to Severely Active Rheumatoid Arthritis

**IV: ADULTS, ELDERLY:** 4 mg/kg every 4 wks initially. May increase to 8 mg/kg every 4 wks. **Maximum:** 800 mg per dose. **SQ: ADULTS, ELDERLY WEIGHING 100 KG OR GREATER:** 162 mg/0.9 mL every 4 wks. **WEIGHING LESS THAN 100 KG:** 162 mg every other wk. May increase to every wk based on clinical response.

### Cytokine Release Syndrome

**IV: ADULTS, CHILDREN WEIGHING 30 KG OR GREATER:** 8 mg/kg. **PTS WEIGHING LESS THAN 30 KG:** 12 mg/kg. If no clinical improvement, 3 additional doses may be given with an interval of at least 8 hrs. **Maximum:** 800 mg/dose.

### Giant Cell Arteritis

**SQ: ADULTS, ELDERLY:** 162 mg once every wk (in combination with tapering course of glucocorticoid). May be given alone following discontinuation of glucocorticoid.

### SSc-ILD

**SQ: ADULTS, ELDERLY:** 162 mg once weekly.

### Dosage Modification

Hepatic enzyme levels greater than ULN.

Lab Value	Recommendation
1–3 times ULN	Dose modify concomitant DMARDs or reduce dose to 4 mg/kg until ALT, AST normalized

Lab Value	Recommendation
Greater than 3–5 times ULN	Interrupt treatment until ALT, AST less than 3 times ULN, then follow guidelines for 1–3 times ULN
Greater than 5 times ULN	Discontinue treatment

**SJIA**

**IV: CHILDREN WEIGHING 30 KG OR MORE:** 8 mg/kg q2wks. **CHILDREN WEIGHING LESS THAN 30 KG:** 12 mg/kg q2wks.

**SQ: CHILDREN WEIGHING 30 KG OR MORE:** 162 mg once every wk. **CHILDREN WEIGHING LESS THAN 30 KG:** 162 mg q2wks.

**PJIA**

**IV: CHILDREN WEIGHING 30 KG OR MORE:** 8 mg/kg q4wks. **CHILDREN WEIGHING LESS THAN 30 KG:** 10 mg/kg q4wks.

**SQ: WEIGHING 30 KG OR MORE:** 162 mg q2wks. **WEIGHING LESS THAN 30 KG:** 162 mg q3wks.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Use caution (not studied).

**Dosage in Hepatic Impairment**

Not recommended.

**SIDE EFFECTS**

**Occasional (8%–6%):** Upper respiratory tract infection, nasopharyngitis, headache, hypertension. **Rare (5%–3%):** Infusion reaction, dizziness, bronchitis, rash, oral ulceration.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Neutropenia may increase risk of infections. Fatal infections (bacterial arthritis, cellulitis, herpes zoster, pneumonia, UTI, gastroenteritis, diverticulitis), opportunistic infections (aspergillosis, candidiasis, *Cryptococcus*, pneumocystosis, TB) were reported. Serious hepatotoxicity may lead to liver transplantation or death. Hypersensitivity reactions (anaphylaxis, erythema, rash, urticaria) may occur. Demyelinating disorders (multiple sclerosis, chronic inflammatory demyelinating polyneuropathy) may occur.

May increase risk of GI perforation, new malignancies. Other reactions may include Stevens-Johnson syndrome, pancreatitis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT, lipid panel; pregnancy test in females of reproductive potential. Assess onset, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities. Evaluate for active TB and test for latent infection prior to and during treatment. An induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB. Screen for active infection; history of chronic, opportunistic infections. Question history of hepatic impairment, malignancies; prior hypersensitivity reactions. Screen for concomitant use of other immunosuppressants.

**INTERVENTION/EVALUATION**

Monitor neutrophil, platelet count 4–8 wks after initiation, then q3mos thereafter. Monitor LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting) q4–8 wks for 6 mos after initiation, then q3mos thereafter. Obtain lipid panel 4–8 wks after initiation. Monitor for TB infection regardless of baseline PPD. Consider discontinuation if serious infection, opportunistic infection, sepsis occurs. Monitor for hypersensitivity reactions, demyelinating disorders, new malignancies. Report abdominal pain, GI hemorrhage, melena, hematemesis (may indicate GI perforation). Assess skin for cutaneous toxicities. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infec-

tion. • Expect routine tuberculosis screening. Report any travel plans to possible endemic areas. • Do not receive live vaccines. • Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), skin reactions (rash, redness, swelling). • Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract. • Treatment may cause reactivation of chronic viral infections; new cancers; demyelinating disorders such as MS. • Immediately report allergic reactions of any kind. • Other immunosuppressant drugs may increase risk of infection, bleeding.

## tofacitinib

toe-fa-sye-ti-nib

(Xeljanz, Xeljanz XR)

**BLACK BOX ALERT** ■ Increased risk for developing bacterial, viral, invasive fungal, other opportunistic infections including tuberculosis, cryptococcosis, pneumocystosis that may lead to hospitalization or death; infections often occurred in combination with other immunosuppressants (methotrexate, corticosteroids). Closely monitor for development of infection. Test for latent tuberculosis prior to treatment and during treatment, regardless of initial result. Treatment for latent TB should be initiated before use. Malignancies including lymphoma, nonmelanoma skin cancer reported. Increased rate of Epstein-Barr virus–associated post-transplant lymphoproliferative disorder observed in renal transplant pts who are treated with tofacitinib and other immunosuppressive therapy drugs.

**Do not confuse tofacitinib with tipifarnib or Xeljanz with Xeloda.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Janus-associated kinase (JAK) inhibitor.

**CLINICAL:** Antirheumatic, disease-modifying.

## USES

Treatment of adult pts with moderate to severe active rheumatoid arthritis with previous inadequate response or intolerance to methotrexate. May be used as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs). Treatment of active psoriatic arthritis (PsA) in pts who have had inadequate response to methotrexate, other DMARDs. Treatment of moderate to severe active ulcerative colitis (UC) in adults who have had an inadequate response or intolerance to tumor necrosis factor blockers. Treatment of active polyarticular course juvenile idiopathic arthritis (pJIA) in pts 2 yrs and older. Do not use in combination with other biologic DMARDs or with potent immunosuppressants (e.g., azaTHIOprine, cycloSPORINE).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to tofacitinib. **Cautions:** Baseline cytopenias, hepatic/renal impairment, elderly, pulmonary disease, hyperlipidemia, pts who resided in or traveled to endemic areas; cardiac conduction abnormalities, HF; Asian ancestry, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral infections including TB); thrombosis (arterial thrombosis, DVT, pulmonary embolism).

## ACTION

Inhibits JAK enzymes, which are intracellular enzymes involved in stimulating hematopoiesis and immune cell functioning through a signaling pathway. **Therapeutic Effect:** Reduces inflammation, tenderness, swelling of joints; slows or prevents progressive joint destruction in rheumatoid arthritis (RA). Prevents cytokine or growth factor gene expression, reducing circulating natural killer cells and increasing B cells.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 40%. Peak plasma concentration: 30–60 min (instant-release); 4 hrs (extended-release). Steady state reached in 24–48 hrs. Excreted primarily in urine. **Half-life:** 3 hrs (instant-release); 6–8 hrs (extended-release).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Females of reproductive potential should use effective contraception during treatment. Breastfeeding not recommended during treatment and for at least 18 hrs after discontinuation. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** Increased risk for serious infections, malignancy.

**INTERACTIONS**

**DRUG:** Immunosuppressants (e.g., **azaTHIOprine**, **cycloSPORINE**) may increase risk for added immunosuppression, infection. **Strong CYP3A4 inhibitors** (e.g., **clarithromycin**, **ketoconazole**, **ritonavir**) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., **carBAMazepine**, **phenytoin**, **rifAMPin**) may decrease concentration/effect. May increase adverse effects; decrease therapeutic effect of **vaccines (live)**. **HERBAL:** **Echinacea** may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase ALT, AST, bilirubin, lipids, creatinine. May decrease Hgb, neutrophils, lymphocytes.

**AVAILABILITY (Rx)**

**Tablets, Film-Coated:** (*Xeljanz*): 5 mg, 10 mg. (*Xeljanz XR*): 11 mg, 22 mg. **Oral Solution:** 1 mg/mL.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food. • Do not cut, split, crush, or chew XR tablet.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Do not initiate treatment in pts with baseline active infection (systemic/localized), severe hepatic impair-

ment, lymphocytes less than 500 cells/mm<sup>3</sup>, ANC less than 1,000 cells/mm<sup>3</sup>, Hgb less than 9 g/dL.

**Rheumatoid Arthritis (Monotherapy or with nonbiologic DMARD)**

**PO: ADULTS/ELDERLY:** (*Xeljanz*): 5 mg twice daily. (*Xeljanz XR*): 11 mg once daily.

**PsA (With nonbiologic DMARD)**

**PO: ADULTS/ELDERLY:** (*Xeljanz*): 5 mg twice daily. (*Xeljanz XR*): 11 mg once daily.

**UC**

**PO: ADULTS/ELDERLY:** (*Xeljanz*): Induction: 10 mg twice daily for 8 wks. May transition to maintenance dose or continue 10 mg twice daily for additional 8 wks. Discontinue if 10 mg twice daily is ineffective after 4 mos. **Maintenance:** 5 mg twice daily. May increase to 10 mg twice daily for shortest duration. Use lowest effective dose to maintain response. (*Xeljanz XR*): **Induction:** 22 mg once daily for at least 8 wks. May continue for maximum of 16 wks or transition to maintenance dose. Discontinue if 22 mg once daily dose is ineffective after 16 wks. **Maintenance:** 11 mg once daily. May increase to 22 mg once daily for shortest duration. Use lowest effective dose to maintain response.

**pcJIA**

**PO: CHILDREN 2 YRS AND OLDER WEIGHING 10–19 KG:** 3.2 mg (3.2 mL oral solution) twice daily. **20–39 KG:** 4 mg (4 mL oral solution) twice daily. **40 KG OR GREATER:** 5 mg (one 5-mg tablet or 5 mL oral solution) twice daily.

**Dose Modification for RA/Psoriatic Arthritis****Hematologic Toxicity**

**ANC 500–1,000 cells/mm<sup>3</sup>:** Withhold treatment until ANC is 1,000 cells/mm<sup>3</sup>, then resume previous dose based on response and tolerability. **ANC or lymphocyte count less than 500 cells/mm<sup>3</sup>:** Permanently discontinue. **Hgb less than 8 g/dL or a decrease of more than 2 g/dL:** Withhold treatment until Hgb level normalizes.

**Concomitant Use of Strong/Moderate CYP3A4 Inhibitor, Strong CYP3C19 Inhibitor**  
Reduce dose to 5 mg once daily (if taking 5 mg twice daily or 11 mg once daily).

#### Dose Modification for UC

##### Hematologic Toxicity

**ANC 500–1,000 cells/mm<sup>3</sup>: (Instant-Release):** Reduce dose to 5 mg twice daily (if taking 10 mg twice daily) or withhold treatment (if taking 5 mg twice daily) until ANC is greater than 1,000 cells/mm<sup>3</sup>, then resume previous dose based on response and tolerability. **(Extended-Release):** Reduce dose to 11 mg once daily (if taking 22 mg once daily) or withhold treatment (if taking 11 mg once daily) until ANC is greater than 1000 cells/mm<sup>3</sup>, then resume previous dose based on response and tolerability. **ANC or lymphocyte count less than 500 cells/mm<sup>3</sup>:** Permanently discontinue. **Hgb less than 8 g/dL or a decrease of more than 2 g/dL:** Withhold treatment until Hgb level normalizes.

**Concomitant Use of Strong/Moderate CYP3A4 Inhibitor, Strong CYP3C19 Inhibitor (Instant-Release):** Reduce dose to 5 mg twice daily (if taking 10 mg twice daily) or 5 mg once daily (if taking 5 mg twice daily). **(Extended-Release):** Reduce dose to 11 mg once daily (if taking 22 mg once daily) or 5 mg once daily (if taking 11 mg once daily).

#### Dose Modification for pcJIA

##### Hematologic Toxicity

**ANC 500–1,000 cells/mm<sup>3</sup>:** Withhold treatment until ANC is greater than 1,000 cells/mm<sup>3</sup>. **ANC or lymphocyte count less than 500 cells/mm<sup>3</sup>:** Permanently discontinue. **Hgb less than 8 g/dL or a decrease of more than 2 g/dL:** Withhold treatment until Hgb level normalizes.

**Concomitant Use of Strong/Moderate CYP3A4 Inhibitor, Strong CYP3C19 Inhibitor**  
Reduce dose to 3.2 mg once daily (if taking 3.2 mg twice daily), or 4 mg once daily (if taking 4 mg twice daily), or 5 mg once daily (if taking 5 mg twice daily).

#### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment: (RA/Psoriatic arthritis):** Reduce dose to 5 mg once daily (if 5 mg twice daily or 11 mg once daily). **(UC): (Instant-Release):** If taking 10 mg twice daily, reduce to 5 mg twice daily. If taking 5 mg twice daily, reduce to 5 mg once daily. **(Extended-Release):** Reduce dose to 11 mg once daily (if taking 22 mg once daily) or 5 mg once daily (if taking 11 mg once daily). **(pcJIA):** Reduce dose to 3.2 mg once daily (if taking 3.2 mg twice daily), or 4 mg once daily (if taking 4 mg twice daily), or 5 mg once daily (if taking 5 mg twice daily).

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment: (RA/Psoriatic arthritis):** Reduce dose to 5 mg once daily (if 5 mg twice daily or 11 mg once daily). **(UC): (Instant-Release):** If taking 10 mg twice daily, reduce to 5 mg twice daily. If taking 5 mg twice daily, reduce to 5 mg once daily. **(Extended-Release):** Reduce dose to 11 mg once daily (if taking 22 mg once daily) or 5 mg once daily (if taking 11 mg once daily). **(pcJIA):** Reduce dose to 3.2 mg once daily (if taking 3.2 mg twice daily), or 4 mg once daily (if taking 4 mg twice daily), or 5 mg once daily (if taking 5 mg twice daily). **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Rare (4%–2%):** Upper respiratory tract infection, diarrhea, nasopharyngitis, headache, hypertension.

## ADVERSE EFFECTS/TOXIC REACTIONS

Neutropenia, lymphopenia may increase risk for infection. Serious infections may include aspergillosis, BK virus, cellulitis, coccidioidomycosis, *Cryptococcus*, cytomegalovirus, esophageal candidiasis, histoplasmosis, invasive fungal infections, listeriosis, pneumocystosis, pneumonia,

tuberculosis, UTI, sepsis. May cause viral reactivation of herpes zoster infection. May increase risk of GI perforation, lymphoma, new malignancies (breast, lung, pancreatic, prostate cancer; melanoma, nonmelanoma skin cancer). Pts older than 50 yrs with at least one cardiovascular risk factor are at increased risk of sudden cardiac death if taking higher dose. Thrombotic events (arterial thrombosis, DVT, pulmonary embolism) have occurred. Hypersensitivity reactions (angioedema, urticaria) were reported. Hepatotoxicity reported in 1% of pts. Fatal interstitial lung disease may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, lipid panel; pregnancy test in females of reproductive potential. Assess onset, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities in pts with RA. Assess usual bowel movement patterns, stool characteristics in pts with UC. Evaluate for active TB and test for latent infection prior to and during treatment. An induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB. Screen for active infection; history of chronic, opportunistic infections. Question history of hepatic/renal impairment, pulmonary disease, cardiovascular risk, thrombosis, malignancies; prior hypersensitivity reactions. Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Monitor neutrophil, platelet count 4–8 wks after initiation, then q3mos thereafter. Monitor LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting) q4–8 wks for 6 mos after initiation, then q3mos thereafter. Obtain lipid panel 4–8 wks after initiation. Monitor for TB infection regardless of baseline PPD. Consider discontinuation if serious infection, opportunistic infection, sepsis occurs. Monitor for hypersensitivity reactions, new malignan-

cies; symptoms of arterial thrombosis, DVT (leg or arm pain/swelling); PE (chest pain, dyspnea, tachycardia). Report abdominal pain, GI hemorrhage, melena, hematemesis (may indicate GI perforation). Monitor daily pattern of bowel activity, stool consistency. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess for therapeutic response (arthritis): relief of pain, stiffness, swelling; increased joint mobility, improved grip strength; (UC): decreased abdominal pain, cramping, diarrhea; increased appetite, weight gain.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect routine tuberculosis screening. Report any travel plans to possible endemic areas.
- Do not receive live vaccines.
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate).
- Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract.
- Treatment may cause reactivation of chronic viral infections, new cancers.
- Immediately report allergic reactions of any kind.
- Avoid pregnancy. Do not breastfeed.

## tolterodine

tol-ter-oh-deen  
(Detrol, Detrol LA)

**Do not confuse Detrol with Ditropan, or tolterodine with fesoterodine.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimuscarinic agent. **CLINICAL:** Antispasmodic.

## USES

Treatment of overactive bladder in pts with symptoms of urinary frequency, urgency, or urge incontinence.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to tolterodine or fesoterodine. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Renal impairment, bladder outflow obstruction (risk of urinary retention), GI motility disorders (e.g., pyloric stenosis [risk of gastric retention]), treated narrow-angle glaucoma, myasthenia gravis, pts risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), hepatic impairment, elderly.

## ACTION

Antagonist of muscarinic receptors mediating urinary bladder contraction. Increases residual urine volume, reduces detrusor muscle pressure. **Therapeutic Effect:** Decreases urinary frequency, urgency.

## PHARMACOKINETICS

Widely distributed. Protein binding: 96%. Metabolized in liver. Primarily excreted in urine. **Half-life:** Immediate-release: 2–10 hrs. Extended-release: 7–18 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole,

ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Anticholinergics** (e.g., acridinium, ipratropium, tiotropium, umclidinium) may increase anticholinergic effect. **Strong CYP2D6 inhibitors** (e.g., fluoxetine, paroxetine) may inhibit drug metabolism. **QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

## AVAILABILITY (Rx)

**Tablets:** 1 mg, 2 mg.

 **Capsules, Extended-Release:** 2 mg, 4 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.
- Give extended-release capsules whole; do not break, crush, or open.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO: ADULTS, ELDERLY:** (*Immediate-Release*): 1–2 mg twice daily. **With CYP3A4 inhibitors:** 1 mg twice daily. (*Extended-Release*): 2–4 mg once daily. **With CYP3A4 inhibitors:** 2 mg once daily.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** (*Immediate-Release*): 1 mg twice daily. Use caution. (*Extended-Release*): 2 mg once daily. Use caution. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (40%):** Dry mouth. **Occasional (11%–4%):** Headache, dizziness, fatigue, constipation, dyspepsia, upper respiratory tract infection, UTI, dry eyes, abnormal vision (accommodation problems), nausea,

diarrhea. **Rare (3%):** Drowsiness, chest/back pain, arthralgia, rash, weight gain, dry skin.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions (angioedema, airway obstruction, dyspnea, hypotension) resulting in hospitalization were reported. May cause gastric retention in pts with gastric motility disorders. Overdose can result in severe anticholinergic effects, including abdominal cramps, facial warmth, excessive salivation/lacrimation, diaphoresis, pallor, urinary urgency, blurred vision, prolonged QT interval.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess degree of overactive bladder (urinary urgency, frequency, incontinence). Question history as listed in Precautions.

### INTERVENTION/EVALUATION

Assist with ambulation if dizziness occurs. Question for visual changes. Monitor incontinence, postvoid residuals. Monitor ECG in pts at risk for QT interval prolongation.

### PATIENT/FAMILY TEACHING

- May cause blurred vision, dry eyes/mouth, constipation.
- Report any confusion, altered mental status.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## topiramate

toe-**peer**-a-mate  
(Qudexy XR, **Topamax**, Topamax Sprinkle, Trokendi XR)

**Do not confuse Topamax or topiramate with TEGretol, TEGretol XR, or Toprol XL.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Miscellaneous agent. **CLINICAL:** Anticonvulsant.

## USES

Monotherapy for treatment of partial-onset or primary generalized tonic-clonic seizures in pts 2 yrs and older (immediate-release, Qudexy XR) or 6 yrs and older (Trokendi XR). Adjunctive therapy for partial-onset, primary generalized tonic-clonic seizures or seizures associated with Lennox-Gastaut syndrome in pts 2 yrs and older (immediate-release, Qudexy XR) or 6 yrs and older (Trokendi XR). Prevention of migraine headache in pts 12 yrs and older. **OFF-LABEL:** Neuropathic pain, diabetic neuropathy, prophylaxis of cluster headaches, infantile spasms.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to topiramate. (**Extended-Release:** **Trokendi XR:** Recent alcohol use (within 6 hrs prior to or after). (**Qudexy XR:** Pts with metabolic acidosis who are taking metFORMIN. **Cautions:** Hepatic/renal impairment, elderly, respiratory impairment, strenuous exercise, heat exposure, concomitant use anticholinergic agents; history of congenital metabolism dysfunction, decreased mitochondrial activity; suicidal ideation and behavior.

## ACTION

Blocks neuronal sodium channels, enhances GABA activity; antagonizes glutamate receptors and weakly inhibits carbonic anhydrase. **Therapeutic Effect:** Decreases seizure activity.

## PHARMACOKINETICS

Widely distributed. Protein binding: 15%–41%. Metabolized in liver. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 21 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Carbonic anhydrase inhibitors** may increase risk of kidney stone formation and severity of metabolic acidosis. May decrease therapeutic effect of **oral contraceptives**. **Salicylates** (e.g., aspirin), **thiazide diuretics** (e.g., hydrochlorothiazide) may increase concentration/effect. **HERBAL:** Herbs with **sedative properties** (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May reduce serum bicarbonate, increase ALT, AST.

**AVAILABILITY (Rx)**

**Capsules (Sprinkle):** 15 mg, 25 mg.

**Tablets: (Topamax):** 25 mg, 50 mg, 100 mg, 200 mg.

 **Capsules, Extended-Release: (Trokendi XR):** 25 mg, 50 mg, 100 mg, 200 mg. **(Qudexy XR):** 25 mg, 50 mg, 100 mg, 150 mg, 200 mg.

**ADMINISTRATION/HANDLING****PO**

• Do not break, crush, dissolve, or divide tablets (bitter taste). • Give without regard to food. • Sprinkle capsules may either be swallowed whole or contents sprinkled on teaspoonful of soft food and swallowed immediately; do not chew. • **(Trokendi XR):** Give whole. Do not sprinkle on food, chew, or crush. **(Qudexy XR):** Swallow whole; may open and sprinkle on spoonful of soft food.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Do not abruptly discontinue; taper gradually to prevent rebound effects.

**Adjunctive Treatment of Partial-Onset Seizures, Lennox-Gastaut Syndrome (LGS), Tonic-Clonic Seizures**

**PO: ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER: (Immediate-Release):** Initially, 25 mg once or twice daily for

1 wk. May increase by 25–50 mg/day at wkly intervals. Usual maintenance dose: 100–200 mg twice daily (partial-onset) or 200 mg 2 times/day (primary tonic-clonic). **Maximum:** 400 mg/day. **CHILDREN 2–16 YRS:** Initially, 1–3 mg/kg/day to maximum of 25 mg at night for 1 wk. May increase by 1–3 mg/kg/day at wkly intervals given in 2 divided doses. **Maintenance:** 5–9 mg/kg/day in 2 divided doses. **Maximum:** 400 mg/day. **ADULTS, ELDERLY: (Extended-Release):** Initially, 25–50 mg/day. Increase by 25–50 mg/day at wkly intervals, up to 400 mg/day. **CHILDREN 2 YRS AND OLDER:** Initially, 25 mg (based on range of 1–3 mg/kg) once daily at bedtime for 1 wk. Increase dose by 1–3 mg/kg at 1–2 wk intervals up to 5–9 mg/kg once daily. **Maximum:** 400 mg/day.

**Monotherapy With Partial-Onset, Tonic-Clonic Seizures**

**PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: (Immediate-Release):** Initially, 25 mg twice daily. May increase at wkly intervals up to 400 mg/day according to the following schedule: Wk 1, 25 mg twice daily. Wk 2, 50 mg twice daily. Wk 3, 75 mg twice daily. Wk 4, 100 mg twice daily. Wk 5, 150 mg twice daily. Wk 6, 200 mg twice daily. **CHILDREN 2–9 YRS:** Initially, 25 mg once daily. Then 25 mg 2 times/day Wk 2; then increase by 25–50 mg/day at wkly intervals up to minimum dose. (See table below.) **ADULTS, ELDERLY, CHILDREN 10 YRS OR OLDER: (Extended-Release): (Qudexy XR, Trokendi XR):** Initially, 50 mg once daily for 1 wk. Increase by 50 mg/day at wkly intervals for first 4 wks, then by 100 mg/day for Wks 5 and 6, up to 400 mg once daily.

Wgt.	Minimum	Maximum
11 kg or less	150 mg/day in 2 divided doses	250 mg/day in 2 divided doses
12–22 kg	200 mg/day in 2 divided doses	300 mg/day in 2 divided doses
23–31 kg	200 mg/day in 2 divided doses	350 mg/day in 2 divided doses

Wgt.	Minimum	Maximum
32–38 kg	250 mg/day in 2 divided doses	350 mg/day in 2 divided doses
39 kg or greater	250 mg/day in 2 divided doses	400 mg/day in 2 divided doses

**Migraine Prevention**

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 25 mg/day. May increase by 25–50 mg/day at 7-day intervals up to a total daily dose of 100 mg/day in 2 divided doses.

**Dosage in Renal Impairment**

Reduce dose by 50% and titrate more slowly in pts who have CrCl less than 70 mL/min.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (30%–10%):** Drowsiness, dizziness, ataxia, nervousness, nystagmus, diplopia, paresthesia, nausea, tremor. **Occasional (9%–3%):** Confusion, breast pain, dysmenorrhea, dyspepsia, depression, asthenia, pharyngitis, weight loss, anorexia, rash, musculoskeletal pain, abdominal pain, difficulty with coordination, sinusitis, agitation, flu-like symptoms. **Rare (3%–2%):** Mood disturbances (e.g., irritability, depression), dry mouth, aggressive behavior, impaired heat regulation.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Psychomotor slowing, impaired concentration, language problems (esp. word-finding difficulties), memory disturbances occur occasionally. Metabolic acidosis, suicidal ideation occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

**Seizures:** Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate seizure precautions. Provide quiet, dark envi-

ronment. Question history of suicidal ideation and behavior; congenital metabolism dysfunction. **Migraine:** Assess pain location, duration, intensity. Assess renal function.

**INTERVENTION/EVALUATION**

Monitor renal function tests, LFT. Observe frequently for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder.

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, drowsiness, impaired concentration).
- Drowsiness usually diminishes with continued therapy.
- Avoid use of alcohol, other CNS depressants.
- Do not abruptly discontinue drug (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Maintain adequate fluid intake (decreases risk of renal stone formation).
- Report blurred vision, eye pain.
- Report suicidal ideation, depression, unusual behavior.
- Use caution with activities that may increase core temperature (exposure to extreme heat, dehydration).
- Oral contraceptives may become ineffective. Use other contraceptive measures to avoid pregnancy.

**topotecan****HIGH ALERT**

toe-poe-tee-kan  
(Hycamtin)

**BLACK BOX ALERT** Severe myelosuppression may occur. Do not administer first cycle in pts with neutrophil count less than 1,500 cells/mm<sup>3</sup> and platelet count less than 100,000 cells/mm<sup>3</sup>.

**Do not confuse Hycamtin with Hycomine, Mycamine, or topotecan with irinotecan.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Topoisomerase inhibitor. **CLINICAL:** Antineoplastic.

## USES

**Injection:** Treatment (in combination with CISplatin) of stage IVB, recurrent or persistent cervical cancer that is not amenable to curative treatment. Treatment of metastatic ovarian cancer (as a single agent) after disease progression on or after initial or subsequent chemotherapy. Treatment of small-cell lung cancer (SCLC) (as a single agent) in pts with platinum-sensitive disease that has progressed at least 60 days after initiation of first-line chemotherapy. **Oral:** Treatment of relapsed SCLC in pts with a prior complete or partial response and who are at least 45 days from the end of first-line chemotherapy. **OFF-LABEL:** Treatment of central nervous system lesions/lymphoma, Ewing's sarcoma, rhabdomyosarcoma, neuroblastoma, acute myeloid leukemia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to topotecan. Baseline neutrophil count less than 1,500 cells/mm<sup>3</sup> and platelet count less than 100,000 cells/mm<sup>3</sup>, severe myelosuppression. **Cautions:** Mild myelosuppression, renal impairment, pulmonary disease, elderly, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

## ACTION

Interacts with topoisomerase I, an enzyme that relieves torsional strain in DNA by inducing reversible single-strand breaks. Prevents relegation of DNA strand, resulting in damage to double-strand DNA, cell death. Acts at S phase of cell cycle. **Therapeutic Effect:** Produces cytotoxic effect.

## PHARMACOKINETICS

Widely distributed. Metabolized via enzymatic hydrolysis. Protein binding: 35%. Excreted in urine (51%), feces (18%).

**Half-life:** 2–3 hrs (increased in renal impairment).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility in both females and males.

**Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Other bone marrow depressants (e.g., cladribine)** may increase risk of myelosuppression. **BCRP/ABCG2 inhibitors (e.g., omeprazole, verapamil), P-glycoprotein/ABCB1 inhibitors (e.g., amLODIPine, digoxin)** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease Hgb, leukocytes, neutrophils, platelets, RBCs.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 4 mg (single-dose vial). **Injection Solution:** 1 mg/mL (4 mL).

**Capsules:** 0.25 mg, 1 mg.

## ADMINISTRATION/HANDLING

**◀ ALERT ▶** Due to cytotoxic properties, handle with extreme care during preparation/administration.

### PO

• Give without regard to food. • Administer whole; do not break, crush, dis-

solve, or divide capsule. • Do not give replacement dose if vomiting occurs.

IV

**Reconstitution** • Calculate the number of vials needed for reconstitution based on body surface area. • Swirl vial gently until powder is completely dissolved. Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear light yellow to greenish in color. Dilute in 50–100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • Infuse over 30 min.

**Storage** • Store unused vials in original carton at room temperature. • May store diluted solution at controlled room temperature for no more than 24 hrs. • Protect from light.

### IV INCOMPATIBILITIES

Dexamethasone (Decadron), 5-fluorouracil, mitoMYcin (Mutamycin).

### IV COMPATIBILITIES

CARBOplatin (Paraplatin), CISplatin (Platinol AQ), cyclophosphamide (Cytosan), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), ondansetron (Zofran), PACLitaxel (Taxol), palonosetron (Aloxi), vinCRIStine (Oncovin).

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Do not give if baseline neutrophil count is less than 1,500 cells/mm<sup>3</sup> and platelet count is less than 100,000 cells/mm<sup>3</sup>. For retreatment, neutrophils should be greater than 1,000 cells/mm<sup>3</sup>, platelets greater than 100,000 cells/mm<sup>3</sup>, and Hgb 9 g/dL or greater.

#### Ovarian Carcinoma

**IV: ADULTS, ELDERLY:** 1.5 mg/m<sup>2</sup>/day for 5 consecutive days, beginning on day 1 of 21-day course. Continue until disease progression or unacceptable toxicity. **Neutrophils less than 500 cells/mm<sup>3</sup> or**

**platelets less than 25,000 cells/mm<sup>3</sup>:** Reduce dose to 1.25 mg/m<sup>2</sup>/day for subsequent cycles.

#### Small-Cell Lung Cancer

**PO: ADULTS, ELDERLY:** 2.3 mg/m<sup>2</sup>/day for 5 days; repeat q21days (dose rounded to nearest 0.25 mg). **Severe neutropenia or prolonged neutropenia, platelets less than 25,000 cells/mm<sup>3</sup>, recovery from Grade 3 or 4 diarrhea:** Reduce dose by 0.4 mg/m<sup>2</sup>/day for subsequent cycles.

**IV: ADULTS, ELDERLY:** 1.5 mg/m<sup>2</sup>/day for 5 consecutive days q21days. **Neutrophils less than 500 cells/mm<sup>3</sup> or platelets less than 25,000 cells/mm<sup>3</sup>:** Reduce dose to 1.25 mg/m<sup>2</sup>/day for subsequent cycles.

#### Cervical Cancer

**IV: ADULTS, ELDERLY:** 0.75 mg/m<sup>2</sup>/day for 3 days (followed by CISplatin 50 mg/m<sup>2</sup> on day 1 only). Repeat q21days (baseline neutrophil count greater than 1,500 cells/mm<sup>3</sup> and platelet count greater than 100,000 cells/mm<sup>3</sup>). **Severe febrile neutropenia (neutrophils less than 1,000 cells/mm<sup>3</sup> with temperature of 38°C) or platelet count less than 25,000 cells/mm<sup>3</sup>:** Reduce dose to 0.6 mg/m<sup>2</sup>/day for subsequent cycles. If necessary, further decrease dose to 0.45 mg/m<sup>2</sup>/day. Continue for a maximum of 6 cycles (in nonresponders) or until disease progression or unacceptable toxicity.

#### Dosage in Renal Impairment

**IV:** No dosage adjustment in pts with mild renal impairment (CrCl 40–60 mL/min).

**CrCl 20–29 mL/min:** 0.75 mg/m<sup>2</sup>.

**PO: CrCl 30–49 mL/min:** 1.5 mg/m<sup>2</sup>/day. May increase by 0.4 mg/m<sup>2</sup>/day following first cycle if no GI/hematologic toxicities occur. **CrCl less than 30 mL/min:** Decrease dose to 0.6 mg/m<sup>2</sup>/day. May increase by 0.4 mg/m<sup>2</sup>/day following first cycle if no GI/hematologic toxicities occur.

#### Dosage in Hepatic Impairment

No dose adjustment.

T

## SIDE EFFECTS

**Frequent (77%–21%):** Nausea, vomiting, diarrhea, total alopecia, headache, dyspnea.

**Occasional (9%–3%):** Paresthesia, constipation, abdominal pain. **Rare:** Anorexia, malaise, arthralgia, asthenia, myalgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including Grade 4 neutropenia, thrombocytopenia, Grade 3 or 4 anemia, febrile neutropenia, neutropenic enterocolitis may occur. Life-threatening sepsis reported. Fatal interstitial lung disease, pneumonitis was reported. May cause severe extravasation and tissue injury. Hypersensitivity reactions including anaphylaxis, angioedema may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (prior to each dose), LFT; pregnancy test in females of reproductive potential. Assess LVEF by echocardiogram. Question history pulmonary disease, renal impairment. Screen for active infection. Consider premedication with antiemetic at least 30 min before each dose. Due to high risk of extravasation and tissue injury with infusion, ensure patency of IV catheter. Assess hydration status. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression, LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting), renal function test in pts with renal impairment. Monitor for severe neutropenia, febrile neutropenia, infections (cough, fatigue, fever); thrombocytopenia-associated bleeding. Monitor daily pattern of bowel activity, stool consistency. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is

confirmed. Monitor for hypersensitivity reactions (anaphylaxis, angioedema).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Seek immediate medical attention if severe allergic reactions (anaphylaxis, difficulty breathing; swelling of the face, tongue, throat) occur.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes).
- Maintain proper hydration and nutrition.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## torsemide

tore-se-myde

**Do not confuse torsemide with furosemide.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Loop diuretic. **CLINICAL:** Antihypertensive, diuretic.

### USES

Treatment of hypertension either alone or in combination with other antihypertensives. (Not recommended for initial treatment of hypertension.) Edema associated with HF, hepatic/renal impairment.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to torsemide or any sulfonyleurea. Anuria, hepatic coma. **Cautions:** Pts with cirrhosis, hypotension, hypokalemia.

**ACTION**

Enhances excretion of sodium, chloride, potassium, water at ascending limb of loop of Henle and distal renal tubules. Reduces plasma, extracellular fluid volume. **Therapeutic Effect:** Produces diuresis, relieves edema; lowers B/P.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO (diuresis)	30–60 min	1–2 hrs	6–8 hrs

Widely distributed. Protein binding: 97%–99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–4 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** NSAIDs (e.g., diclofenac, meloxicam, naproxen), aspirin may increase risk of renal toxicity. May increase risk of digoxin toxicity associated with torsemide-induced hypokalemia. May increase risk of lithium toxicity. **Bile acid sequestrants** (e.g., cholestyramine), **sucralfate** may decrease absorption. May increase hyponatremic effect of desmopressin. May increase concentration/effect of foscarnet. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **Licorice** may increase hypokalemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid. May decrease serum calcium, chloride, magnesium, potassium, sodium.

**AVAILABILITY (Rx)**

**Tablets:** 5 mg, 10 mg, 20 mg, 100 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food. Give with food to avoid GI upset, preferably with breakfast (prevents nocturia).

**INDICATIONS/ROUTES/DOSAGE****Hypertension**

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day. May increase to 10 mg/day if no response in 4–6 wks. **Range:** 5–10 mg/day.

**Edema Associated With HF**

**PO: ADULTS, ELDERLY:** Initially, 10–20 mg/day. May increase by approximately doubling dose until desired therapeutic effect is attained. **Maximum:** 200 mg.

**Edema Associated With Chronic Renal Failure**

**PO: ADULTS, ELDERLY:** Initially, 20 mg/day. May increase by approximately doubling dose until desired therapeutic effect is attained. **Maximum:** 200 mg/day.

**Edema Associated With Hepatic Cirrhosis**

**PO: ADULTS, ELDERLY:** Initially, 5–10 mg once daily. May increase gradually by doubling dose until the desired diuretic response is achieved. **Maximum single dose:** 40 mg.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (10%–4%):** Headache, dizziness, rhinitis. **Occasional (3%–1%):** Asthenia, insomnia, nervousness, diarrhea, constipation, nausea, dyspepsia, edema, ECG changes, pharyngitis, cough, arthralgia, myalgia. **Rare (less than 1%):** Syncope, hypotension, arrhythmias.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Ototoxicity may occur with too-rapid IV administration or with high doses; must be given slowly. Overdose produces acute, profound water loss, volume/electrolyte depletion, dehydration, decreased blood volume, circulatory collapse.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test, serum electrolyte levels, esp. potassium. Obtain weight, B/P. Assess for peripheral edema. Assess lungs for crackles, signs of HF.

### INTERVENTION/EVALUATION

Monitor B/P, renal function, serum electrolytes (esp. potassium), I&O, weight. Monitor for ototoxicity. Auscultate lungs for crackles. Check for signs of edema, particularly of dependent areas. Although less potassium is lost with torsemide than with furosemide, assess for signs of hypokalemia (change of muscle strength, tremor, muscle cramps, altered mental status, cardiac arrhythmias).

### PATIENT/FAMILY TEACHING

- Take medication in morning to prevent excessive urination at night.
- Expect increased urinary volume, frequency.
- Report palpitations, muscle weakness, cramps, nausea, dizziness.
- Do not take other medications (including OTC drugs) without consulting physician.
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.

## trabectedin

tra-bek-te-din  
(Yondelis)

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

### USES

Treatment of unresectable or metastatic soft tissue sarcoma (liposarcoma or leiomyosarcoma) in pts who have received a prior anthracycline-containing regimen.

### PRECAUTIONS

**Contraindications:** Hypersensitivity reaction, anaphylactic reaction to trabectedin.

**Cautions:** Baseline cytopenias, hepatic impairment, cirrhosis, renal impairment; history of DVT, pulmonary embolism; recent MI, cardiomyopathy, HF. Concomitant use of strong CYP3A inducers, strong CYP3A inhibitors not recommended.

### ACTION

Binds to guanine residues in the minor groove of DNA, leading to cell cycle disruption and cellular death. Blocks cell cycle at G<sub>2</sub>/M phase. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 97%. Excreted in feces (58%), urine (6%). Hemodialysis not expected to enhance elimination. **Half-life:** 175 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential should use effective contraception during treatment and for at least 2 mos after discontinuation. Breastfeeding not recommended. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and up to 5 mos after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** Strong CYP3A<sub>4</sub> inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A<sub>4</sub> inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Alcohol** may increase hepatotoxic effect. May decrease therapeutic effect; increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, platelets, neutrophils, RBCs; serum albumin, phosphate. May increase

serum alkaline phosphatase, ALT, AST, bilirubin, CPK, creatinine. May reduce diagnostic effect of *Coccidioides immitis* skin test.

## AVAILABILITY (Rx)

**Powder for Reconstitution:** 1 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Contents are hazardous; use cytotoxic precautions during handling and disposal. • Reconstitute with 20 mL Sterile Water for Injection for final concentration of 0.05 mg/mL. • Shake until fully dissolved. • Visually inspect solution for particulate matter or discoloration. Solution should appear clear, colorless to pale brownish-yellow in color. Discard if solution is discolored or particles are observed. • Dilute in 500 mL 0.9% NaCl or D<sub>5</sub>W. • See manufacturer guidelines for materials/containers that are compatible with diluted solution.

**Infusion guidelines** • Premedicate with dexamethasone 20 mg IV (or appropriate corticosteroid) 30 min prior to each infusion. • Infuse diluted solution immediately after reconstitution. • Use an in-line, 0.2-micron polyethersulfone filter. • Infuse via dedicated central venous line using an infusion pump.

**Rate of administration** • Infuse over 24 hrs.

**Storage** • Refrigerate unused vials. • Diluted solution must be administered within 30 hrs of reconstitution.

## IV INCOMPATIBILITIES

Do not mix or infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Liposarcoma, Leiomyosarcoma

**IV infusion: ADULTS, ELDERLY:** 1.5 mg/m<sup>2</sup> once q3wks until disease progression or unacceptable toxicity.

### Dose Reduction for Normal Hepatic Function or Mild Hepatic Impairment

**Initial dose:** 1.5 mg/m<sup>2</sup> once q3wks.  
**First dose reduction:** 1.2 mg/m<sup>2</sup> once

q3wks. **Second dose reduction:** 1 mg/m<sup>2</sup> once q3wks.

### Dose Reduction for Moderate Hepatic Impairment

**Initial dose:** 0.9 mg/m<sup>2</sup> once q3wks.  
**First dose reduction:** 0.6 mg/m<sup>2</sup> once q3wks. **Second dose reduction:** 0.3 mg/m<sup>2</sup> once q3wks.

### Dose Modification

#### Hepatotoxicity

**Serum ALT/AST greater than 2.5 times upper limit of normal (ULN):** Delay next dose for up to 3 wks. **Serum alkaline phosphatase greater than 2.5 times ULN; serum ALT/AST greater than 5 times ULN; total serum bilirubin greater than ULN:** Delay next dose for up to 3 wks, then resume at reduced dose level.

#### Hematologic Toxicity

**Absolute neutrophil count (ANC) less than 1,500 cells/mm<sup>3</sup>:** Delay next dose for up to 3 wks. **ANC less than 1,000 cells/mm<sup>3</sup> with fever or infection; ANC less than 500 cells/mm<sup>3</sup> lasting more than 5 days:** Delay next dose for up to 3 wks, then resume at reduced dose level. **Platelet count less than 100,000 cells/mm<sup>3</sup>:** Delay next dose for up to 3 wks. **Platelet count less than 25,000 cells/mm<sup>3</sup>:** Delay next dose for up to 3 wks, then resume at reduced dose level.

#### Nonhematologic Toxicity

**CPK greater than 2.5 times ULN:** Delay next dose for up to 3 wks. **CPK greater than 5 times ULN:** Delay next dose for up to 3 wks, then resume at reduced dose level.

**Decreased LVEF less than lower limit of normal or clinical evidence of cardiomyopathy:** Delay next dose for up to 3 wks. **Decreased LVEF with an absolute decrease of 10% or more from baseline and less than lower limit of normal, or clinical evidence of cardiomyopathy:** Delay next dose for up to 3 wks, then resume at reduced dose level.

**Any other Grade 3 or 4 reaction:** Delay next dose for up to 3 wks, then resume at reduced dose level.

#### Permanent Discontinuation

Permanently discontinue for persistent adverse effects requiring a delay of treatment for more than 3 wks; continued adverse effects after reducing dose to 1 mg/m<sup>2</sup> in pts with normal hepatic function, or 0.3 mg/m<sup>2</sup> in pts with preexisting moderate hepatic impairment; severe hepatic dysfunction with bilirubin 2 times ULN, and ALT/AST 3 times ULN, and alkaline phosphatase less than 2 times ULN in prior treatment cycle in pts with baseline normal hepatic function; exacerbation of hepatic dysfunction in pts with preexisting moderate hepatic impairment.

#### Dosage in Renal Impairment

**CrCl greater than or equal to 30 mL/min or greater:** No dose adjustment. **CrCl less than 30 mL/min or end-stage renal disease:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** 0.9 mg/m<sup>2</sup> once q3wks. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (75%–25%):** Nausea, fatigue, asthenia, malaise, vomiting, decreased appetite, constipation, diarrhea, peripheral edema, dyspnea, headache. **Occasional (15%–11%):** Insomnia, arthralgia, myalgia, paresthesia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including Grade 3 or 4 neutropenia, febrile neutropenia, fatal sepsis may occur. Fatal rhabdomyolysis, muscular toxicity may result in renal failure. CPK elevation occurred in 32% of pts; Grade 3 or 4 CPK

elevation occurred in 6% of pts. Hepatotoxicity, including hepatic failure, may occur. LFT elevation occurred in 70%–90% of pts. Cardiomyopathy including decreased ejection fraction, diastolic dysfunction, HF, right ventricular dysfunction reported in 6% of pts; Grade 3 or 4 cardiomyopathy reported in 4% of pts. Drug extravasation may result in tissue necrosis requiring debridement. Other adverse effects may include phlebitis (15% of pts), pulmonary embolism (less than 10% of pts), hypersensitivity reaction.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, CPK, BMP, LFT; vital signs prior to each dose and periodically thereafter. Obtain LVEF by echocardiogram. Verify placement of central venous line. Receive full medication history. Assess nutritional status. Question history of DVT, pulmonary embolism, cardiac disease, recent MI; renal/hepatic impairment; prior hypersensitivity reaction. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression; CPK, serum creatinine for rhabdomyolysis, renal failure; LFT for hepatotoxicity; BMP for electrolyte imbalance (esp. in pts with diarrhea, vomiting, malnutrition); vital signs. Assess LVEF by echocardiogram at 2- to 3-mo intervals (or more frequently in pts with cardiomyopathy). Diligently screen for infections (cough, fatigue fever), sepsis. Monitor for DVT (leg or arm pain/swelling), rhabdomyolysis (decreased urinary output, amber-colored urine, fatigue, muscle pain/weakness), pulmonary embolism (sudden chest pain, dyspnea, hypoxia, tachycardia), HF (dyspnea, fatigue, palpitations, edema, exercise intolerance); hypersensitivity reaction; side effects of dexamethasone (e.g., hyperglycemia, weight loss, decreased appetite). Monitor I&O. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

• Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Life-threatening events, such as HF (shortness of breath, fast or slow heart rate, palpitations, swelling of the ankles or legs), liver injury or failure (abdominal pain, easy bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes), muscle toxicity (muscle pain/weakness, kidney failure), blood clots in lungs (difficulty breathing, fast heart rate, chest pain), may occur. • Use effective contraception to avoid pregnancy. Do not breast-feed. • Avoid grapefruit products, herbal supplements. • Do not receive live vaccines.

**traMADol****tram-a-dol**(Apo-TraMADol , ConZip, Qdolo, Ultram)

**BLACK BOX ALERT** ■ May cause opioid addiction, abuse, misuse. Serious, life-threatening respiratory depression may occur. Extended-release tablets must be swallowed whole. Crushing, chewing, or dissolving of ER tablets can result in a fatal overdose. May cause neonatal opioid withdrawal syndrome. Concomitant use of alcohol, benzodiazepines, CNS depressants may cause profound sedation, respiratory depression, coma, or death. Use with any CYP3A4 inhibitor may result in increased concentration/effect, which may cause potentially fatal respiratory depression.

**Do not confuse traMADol with tapentadol, Toradol, or Tramdate, or Ultram with Ultracet.**

**FIXED-COMBINATION(S)**

**Ultracet:** traMADol/acetaminophen (a non-narcotic analgesic): 37.5 mg/325 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Centrally acting synthetic opioid. **CLINICAL:** Analgesic.

**USES**

**Immediate-Release:** Management of moderate to moderately severe pain.

**Extended-Release:** Around-the-clock management of moderate to moderately severe pain for extended period.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to traMADol, opioids. Pediatric pts under 12 yrs of age; postop management in pts under 18 yrs following tonsillectomy and/or adenoidectomy; severe respiratory depression; acute bronchial asthma in absence of appropriate monitoring; GI obstruction (paralytic ileus [known or suspected]). Concomitant use with or within 14 days following MAOI therapy. **Cautions:** CNS depression, anoxia, advanced hepatic cirrhosis, respiratory depression, elevated ICP, seizure disorder, hepatic/renal impairment, treatment of acute abdominal conditions, opioid-dependent pts, head injury, myxedema, hypothyroidism, hypoadrenalism, pregnancy. Avoid use in pts who are suicidal or addiction prone, emotionally disturbed, depressed, heavy alcohol users, elderly, debilitated.

**ACTION**

Binds to mu-opioid receptors in CNS, inhibiting ascending pain pathway. Inhibits reuptake of norepinephrine, serotonin, inhibiting descending pain pathways.

**Therapeutic Effect:** Reduces pain.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	Less than 1 hr	2–3 hrs	9 hrs

Widely distributed. Protein binding: 20%. Metabolized in liver (reduced in pts with advanced cirrhosis). Primarily excreted in urine. **Half-life:** 6–7 hrs (increased in renal/hepatic failure).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 17 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May increase CNS depressant effect; decrease therapeutic effect of carbamazepine. **Carbamazepine** may decrease concentration/effect. **Strong CYP2D6 inhibitors** (e.g., FLUoxetine, PARoxetine) may decrease therapeutic effect. **Linezolid, MAOIs** (e.g., phenelzine, selegiline), **ondansetron, SNRIs** (e.g., DULoxetine, venlafaxine), **SSRIs** (e.g., escitalopram, PARoxetine, sertraline) may increase risk of serotonin syndrome, seizure activity. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease concentration/effect. **Maitake** may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, ALT, AST, urine protein. May decrease Hgb.

## AVAILABILITY (Rx)

**Tablets, Immediate-Release:** 50 mg, 100 mg. **Solution, Oral: (Qdolo):** 5 mg/mL.

 **Capsules, Extended-Release:** 100 mg, 200 mg, 300 mg. **Tablets, Extended-Release:** 100 mg, 200 mg, 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food but consistently with or without meals.
- **(Extended-Release):** Administer whole; do not break, crush, dissolve, or divide.

## INDICATIONS/ROUTES/DOSAGE

### Moderate to Moderately Severe Pain

**PO: (Immediate-Release):** ADULTS, ELDERLY, CHILDREN 17 YRS AND OLDER: 50 mg q4–6h as needed. May increase to 50–100 mg q4–6h as needed. **Maximum:** 400 mg/day for pts 75 yrs and younger; 300 mg/day for pts older than 75 yrs.

**PO: (Extended-Release):** ADULTS, ELDERLY, CHILDREN 18 YRS AND OLDER: Initially, 100 mg once daily. Titrate q5days. **Maximum:** 300 mg once daily.

### Dosage in Renal Impairment

**(Immediate-Release):** For pts with CrCl less than 30 mL/min, increase dosing interval to q12h. **Maximum:** 200 mg/day. Do not use extended-release.

### Dosage in Hepatic Impairment

**(Immediate-Release):** Cirrhosis: Dosage is decreased to 50 mg q12h. Do not use extended-release with severe hepatic impairment.

## SIDE EFFECTS

**Frequent (25%–15%):** Dizziness, vertigo, nausea, constipation, headache, drowsiness. **Occasional (10%–5%):** Vomiting, pruritus, CNS stimulation (e.g., nervousness, anxiety, agitation, tremor, euphoria, mood swings, hallucinations), asthenia, diaphoresis, dyspepsia, dry mouth, diarrhea. **Rare (less than 5%):** Malaise, vasodilation, anorexia, flatulence, rash, blurred vision, urinary retention/frequency, menopausal symptoms.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause seizure activity at usual dosages. Serotonin syndrome (altered mental status, autonomic instability, clonus, diaphoresis, hyperthermia, hyperreflexia, tremor) was reported. Hypersensitivity reactions (anaphylaxis, angioedema, bronchospasm), toxic skin reactions (Stevens-Johnson syndrome, toxic epidermal necrolysis), severe hypotension, respiratory depression, secondary hypogonadism, thyroid dysfunction, psychosis may occur. May increase risk of suicidal ideation and behavior.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain. Receive full medication history (esp. serotonergic agents, CNS depressants). Question history as listed in Precautions. Assess risk of drug abuse and misuse.

**INTERVENTION/EVALUATION**

Monitor heart rate, B/P. Assist with ambulation if dizziness, vertigo occurs. Palpate bladder for urinary retention. Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Screen for drug abuse and misuse, drug-seeking behavior. Monitor for seizure activity; symptoms of serotonin syndrome. Assess for clinical improvement, record onset of relief of pain. Monitor closely for misuse or abuse.

**PATIENT/FAMILY TEACHING**

- May cause physical dependence.
- Pts with history of drug abuse are at increased risk for misuse or abuse. Take medication only as prescribed.
- Avoid alcohol, other narcotics, sedatives.
- Avoid tasks requiring alertness, motor skills until response to drug is established.
- Report severe confusion, excessive sweating, difficulty breathing, excessive sedation, seizures, muscle weakness, tremors, chest pain, palpitations.

T

**trametinib**

tra-me-ti-nib  
(Mekinist)

**Do not confuse trametinib with imatinib or tipifarnib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** MEK inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Used as a single agent or in combination with dabrafenib for treatment of unresect-

able or metastatic melanoma with BRAF V600E or V600L mutations, as detected by FDA-approved test. Single-agent regimen is not indicated in pts who have received prior BRAF-inhibitor therapy. Adjuvant treatment of melanoma in combination with dabrafenib in pts with BRAF V600E or BRAF V600K mutations and lymph node involvement, following complete resection. Treatment of locally advanced or metastatic anaplastic thyroid cancer (in combination with dabrafenib). Treatment of metastatic non–small-cell lung cancer (NSCLC) in pts with BRAF V600E mutation in combination with dabrafenib.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to trametinib. **Cautions:** Baseline cytopenias, cardiac disease (cardiomyopathy), diabetes, ocular disease, hepatic impairment, history of thromboembolic events (CVA, DVT, MI, pulmonary embolism [PE]), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), interstitial lung disease (sarcoidosis, pulmonary fibrosis); conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds).

**ACTION**

Reversibly and selectively inhibits mitogen-activated extracellular kinase (MEK). MEK is a downstream effector of protein kinase Braf (BRAF). **Therapeutic Effect:** Decreases cellular proliferation; causes cell cycle arrest and apoptosis (cellular death).

**PHARMACOKINETICS**

Widely distributed. Protein binding: 97.4%. Peak plasma concentration: 1.5 hrs. Metabolized in liver. Excreted in feces (80%), urine (20%). **Half-life:** 3.9–4.8 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive

potential must use effective contraception during treatment and for at least 4 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 4 mos after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects, skin lesions, primary malignancies. **Males:** May decrease sperm count.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None known. **FOOD:** High-fat meals may decrease absorption/efficacy. **LAB VALUES:** **Single regimen:** May increase serum alkaline phosphatase, ALT, AST. May decrease serum albumin; Hgb, Hct. **Combination regimen:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, calcium, creatinine, glucose, GGT, potassium. May decrease Hgb, Hct, leukocytes, lymphocytes, neutrophils, platelets; serum albumin, calcium, magnesium, phosphorus, potassium, sodium.

## AVAILABILITY (Rx)

**Tablets:** 0.5 mg, 2 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer at least 1 hr before or 2 hrs after meal.

## INDICATIONS/ROUTES/DOSAGE

### Melanoma (Metastatic or Unresectable)

**PO: ADULTS/ELDERLY:** 2 mg once daily (either as a single agent or in combination with dabrafenib). Continue until disease progression or unacceptable toxicity.

### Melanoma (Adjuvant Treatment)

**PO: ADULTS, ELDERLY:** 2 mg once daily (in combination with dabrafenib). Continue for up to 1 yr in absence of disease progression or unacceptable toxicity.

### Thyroid Cancer

**PO: ADULTS, ELDERLY:** 2 mg once daily (in combination with dabrafenib). Continue until disease progression or unacceptable toxicity.

### NSCLC (Metastatic)

**PO: ADULTS, ELDERLY:** 2 mg once daily in combination with dabrafenib. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**Trametinib regimen: FIRST DOSE REDUCTION:** 1.5 mg once daily. **SECOND DOSE REDUCTION:** 1 mg once daily. Discontinue if unable to tolerate 1-mg dose.

**Dabrafenib combination regimen: FIRST DOSE REDUCTION:** 100 mg twice daily. **SECOND DOSE REDUCTION:** 75 mg twice daily. **THIRD DOSE REDUCTION:** 50 mg twice daily. Discontinue if unable to tolerate 50-mg dose.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events.

### Cardiotoxicity

**Asymptomatic decrease of left ventricular ejection fraction (LVEF) greater than 10% from baseline:** Withhold trametinib up to 4 wks. If LVEF improved, resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib dose. **Symptomatic HF or decrease of LVEF greater than 20% from baseline:** Discontinue trametinib. Withhold dabrafenib until improved, then resume at lower dose level.

### Cutaneous Toxicity

**Intolerable Grade 2 skin toxicity; Grade 3 or 4 skin toxicity:** Withhold both regimens for up to 3 wks. If improved, resume both at lower dose level. Discontinue both regimens if not improved.

### Febrile Events

**Fever of 101.3°F–104°F (38.5°C–40°C):** Do not modify trametinib dose. Withhold dabrafenib until fever resolved, then resume at either same dose or lower dose level. **Fever greater than 104°F (40°C) or complicated fever (dehydration, hypotension, renal failure):** Withhold trametinib until re-

solved, then resume at either same dose or lower dose level. Withhold dabrafenib until resolved, then resume at either lower dose level or discontinue.

### **New Primary Malignancies**

**Cutaneous:** No changes required for either regimen. **Noncutaneous:** Do not change trametinib dose. Discontinue dabrafenib in pts who develop RAS mutation-positive malignancies.

### **Nonspecific Adverse Reactions**

**Other intolerable Grade 2 reactions; any other Grade 3 reactions:** Withhold both regimens until resolved to Grade 0–1, then resume at lower dose level. Discontinue both regimens if not improved. **First occurrence of any other Grade 4 reaction:** Withhold both regimens until resolved to Grade 0–1, then resume at lower dose level or discontinue.

### **Ocular Toxicity**

**Grade 2 or 3 retinal pigment epithelial detachment:** Withhold trametinib up to 3 wks. If improved to Grade 0–1, resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib. **Retinal vein occlusion:** Discontinue trametinib. Do not modify dabrafenib. **Uveitis or iritis:** Do not modify trametinib. Withhold dabrafenib for up to 6 wks. If improved to Grade 0–1, then resume at same dose level. Discontinue if not improved.

### **Pulmonary Toxicity**

**Interstitial lung disease:** Discontinue trametinib. Do not modify dabrafenib.

### **Venous Thromboembolism**

**Uncomplicated DVT/PE:** Withhold trametinib for up to 3 wks. If improved to Grade 0–1, then resume at lower dose level. Discontinue if not improved. Do not modify dabrafenib. **Life-threatening PE:** Discontinue both regimens.

### **Dosage in Renal/Hepatic Impairment**

No dose adjustment.

## **SIDE EFFECTS**

### **Single Regimen**

**Frequent (57%–32%):** Rash, diarrhea, lymphedema, peripheral edema. **Occasional (19%–10%):** Dermatitis acneiform, hypertension, stomatitis, mouth ulceration, mucosal ulceration, abdominal pain, dry skin, pruritus, paronychia, folliculitis, cellulitis, dizziness, dysgeusia, blurred vision, dry eye.

### **Combination Regimen**

**Frequent (71%–40%):** Pyrexia, chills, fatigue, rash, nausea, vomiting. **Occasional (36%–11%):** Diarrhea, abdominal pain, peripheral edema, headache, cough, arthralgia, night sweats, myalgia, constipation, decreased appetite, back pain, dry skin, insomnia, dermatitis acneiform, dizziness, muscle spasm, extremity pain, actinic keratosis, erythema, oral/throat pain, pruritus, dry mouth, dehydration.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Primary malignancies (basal or squamous cell carcinoma, keratoacanthoma, pancreatic adenocarcinoma, glioblastoma) were reported. DVT, PE reported in 9% of pts. May increase cell proliferation of wild-type BRAF melanoma or new malignant melanomas. Serious, sometimes fatal intracranial or GI bleeding occurred in 5% of pts. Other hemorrhagic events may include conjunctival/gingival/rectal/hemorrhoidal/vaginal bleeding, epistaxis, melena. Cardiomyopathy, HF, decreased LVEF reported in 7%–9% of pts. Ocular toxicities such as retinal vein occlusion, retinal detachment, vision loss, glaucoma, uveitis, iritis were reported. Cough, dyspnea, hypoxia, pleural effusion, infiltrates may indicate interstitial lung disease. Serious febrile reactions may lead to renal failure, severe dehydration, hypotension, rigors. Skin toxicities including palmar-plantar erythrodysesthesia syndrome (PPES), papilloma have occurred. Hyperglycemia reported in 2%–5% of pts. Other adverse effects may include hypertension, rhabdomyolysis, QT interval prolongation.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, ECG, vital signs; pregnancy test in females of reproductive potential. Verify BRAF V600E status. Obtain LVEF by echocardiogram. Assess skin for moles, lesions. Receive full medication history and screen for interactions. Screen for active infection. Question history as listed in Precautions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression, LFT for hepatic injury (abdominal pain, jaundice, nausea, transaminitis, vomiting), ECG. Monitor for severe neutropenia, febrile neutropenia, infections (cough, fatigue, fever); symptoms of hyperglycemia (dehydration, confusion, extreme thirst, sweet-smelling breath, Kussmaul respirations, nausea); GI perforation (abdominal pain, fever, hematemesis). Assess skin for new lesion, toxicities q2mos. Assess LVEF for cardiomyopathy (dyspnea, edema, palpitations) by echocardiogram 1 mo after initiation, then q2–3mos thereafter. Obtain ophthalmologic exam for change of vision, eye irritation. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for ocular toxicities; symptoms of DVT (leg or arm pain/swelling), intracranial hemorrhage (aphasia, altered mental status, facial droop, hemiplegia, vision loss), PE (chest pain, dyspnea, tachycardia). Bleeding of any kind can be life-threatening and must be treated promptly.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report

liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), eye toxicities (eye redness, irritation; change of vision), heart problems (swelling of extremities, palpitations), symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain), DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate), high blood sugar levels (confusion, frequent urination, hunger, thirst).

- Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- New cancers may occur.
- Immediately report severe or persistent abdominal pain, bloody stool, fever, vomiting blood; may indicate rupture in GI tract.
- Bleeding may be life-threatening; report GI bleeding, symptoms of hemorrhagic stroke (confusion, one-sided weakness or paralysis, difficulty speaking).

## trastuzumab

TOP 100 HIGH ALERT

tras-**too**-zoo-mab

(Herceptin, Herzuma, Kanjinti, Ogivri, Ontruzant, Trazimera)

**■ BLACK BOX ALERT ■** Sub-clinical and clinical HF (manifested as CHF, decreased left ventricular ejection fraction) may occur, esp. in pts receiving concomitant anthracycline therapy. Fatal infusion reactions and pulmonary toxicities may occur. Monitor for anaphylaxis, angioedema, interstitial pneumonitis, acute respiratory distress syndrome. Exposure during pregnancy may cause fetal harm and neonatal death.

**Do not confuse trastuzumab with ado-trastuzumab, fam-trastuzumab (or biosimilars).**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** HER2 receptor antagonist. Monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of HER2-overexpressing breast cancer (adjuvant), metastatic breast cancer, metastatic gastric or gastroesophageal junction adenocarcinoma (in pts without prior treatment). **OFF-LABEL:** Treatment of HER2-positive metastatic breast cancer in pts who have not received prior anti-HER2 therapy or in pts whose cancer has progressed on prior trastuzumab therapy (in combination with lapatinib).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to trastuzumab. **Cautions:** Baseline cytopenias, cardiac disease (cardiomyopathy, HF), pts at risk for interstitial lung disease (sarcoidosis, pulmonary fibrosis), tumor lysis syndrome (high tumor burden, dehydration); conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds).

**ACTION**

Binds to extracellular domain of human epidermal growth factor receptor 2 (HER2) protein, inhibiting proliferation of tumor cells that overexpresses HER2 protein. **Therapeutic Effect:** Inhibits tumor cell growth and survival; mediates antibody-dependent cellular cytotoxicity.

**PHARMACOKINETICS**

**Half-life:** 11–23 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Females of reproductive potential should use effective contraception during treatment and for at least 7 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related cardiac dysfunction may require dosage adjustment.

**INTERACTIONS**

**DRUG:** May increase levels/toxicity of **belimumab**. May decrease concentration/efficacy of **paclitaxel (conventional)**. May increase cardiotoxic effect of **anthracyclines**

(e.g., **DOXOrubicin**, **epiRUBicin**). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 150 mg, 420 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute 420-mg vial with 20 mL Bacteriostatic Water for Injection (150-mg vial with 7.4 mL Sterile Water for Injection) to yield concentration of 21 mg/mL. • Gently swirl vial to mix. Do not shake. • If foaming appears, allow vial to stand for up to 5 min. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale yellow. Do not use if cloudy or discolored or if visible particles are observed. • Dilute in 250 mL 0.9% NaCl (do not dilute in D<sub>5</sub>W). • Gently invert bag to mix.

**Rate of administration** • Do not give IV push or bolus. • Infuse loading dose (4 mg/kg) over 90 min. Infuse maintenance infusion (2 mg/kg) over 30–90 min.

**Storage** • Refrigerate unused vials. • May refrigerate diluted solution for up to 24 hrs. • Do not freeze.

**IV INCOMPATIBILITIES**

Do not mix with D<sub>5</sub>W or any other medications.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Do not substitute with adotrastuzumab emtansine.

**Breast Cancer (Adjuvant)**

**IV: ADULTS, ELDERLY: (With concurrent PAclitaxel or DOCEtaxel):** Initially, 4 mg/kg (loading dose), then 2 mg/kg wkly for 12 wks, followed 1 wk later (when concurrent chemotherapy completed) by 6 mg/kg q3wks for total therapy duration of 52 wks. **(With DOCEtaxel/CARBOplatin):** Initially, 4 mg/kg (loading dose), then 2 mg/kg wkly for a total of 18 wks, followed 1 wk

later (when concurrent chemotherapy completed) by 6 mg/kg q3wks for total therapy duration of 52 wks. (**Following multimodality chemotherapy**): Initially, 8 mg/kg (loading dose), then 6 mg/kg q3wks for total of 52 wks.

#### Breast Cancer (Metastatic)

**IV: ADULTS, ELDERLY: (Either as single agent or in combination with Paclitaxel):** Initially, 4 mg/kg (loading dose), then 2 mg/kg wky until disease progression.

#### Gastric Cancer

**IV: ADULTS, ELDERLY: (In combination with Cisplatin and either capecitabine or fluorouracil for 6 cycles, then as monotherapy):** Initially, 8 mg/kg (loading dose), then 6 mg/kg q3wks until disease progression.

#### Dosage Adjustment in Cardiotoxicity

Left ventricular ejection fraction (LVEF) 16% or greater decrease from baseline WNL (within normal limits) or LVEF below normal limits and 10% or greater decrease from baseline: Hold treatment for 4 wks. Repeat LVEF q4wks. Resume therapy if LVEF returns to normal limits in 4–8 wks and remains at 15% or less decrease from baseline.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (47%–18%):** Generalized pain, asthenia, fever, nausea, chills, headache, cough, diarrhea, abdominal pain, dyspnea, rash. **Occasional (14%–6%):** Anorexia, insomnia, dizziness, peripheral edema, paresthesia, edema, nausea, vomiting, bone pain, arthralgia, accidental injury. **Rare (5%–1%):** Tachycardia, acne, peripheral neuritis, neuropathy.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including febrile neutropenia

may occur. May cause decrease in LVEF, cardiac arrhythmias, hypertension, HF, cardiomyopathy, cardiac death. Infusion reactions (asthenia, chills, fever, hypotension, nausea, vomiting, rash) have occurred, but more severe reactions including anaphylaxis, angioedema, hypoxia, severe hypotension can be fatal. Pulmonary toxicities (acute respiratory distress syndrome, dyspnea, interstitial pneumonitis, pulmonary infiltrates), infections (influenza, pharyngitis, rhinitis, sinusitis) were reported. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, ECG; pregnancy test in females of reproductive potential. Assess LVEF by echocardiogram. Screen for active infection. Question for history of cardiac/pulmonary disease, infusion reactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression. Monitor for severe neutropenia, febrile neutropenia, infections (cough, fatigue, fever). Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Assess LVEF for cardiomyopathy (dyspnea, edema, palpitations) by echocardiogram q3mos (monthly if treatment is withheld for severe cardiomyopathy), then q6mos for 2 yrs after discontinuation. Diligently monitor infusion reactions. Have resuscitative equipment available if infusion reactions occur. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of

infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms. • Report heart problems (difficulty breathing, swelling of extremities, palpitations), kidney problems (decreased urine output, flank pain, darkened urine); symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain). • Use effective contraception to avoid pregnancy. Do not breast-feed. • Life-threatening infusion reactions may occur. Immediately report difficulty breathing, dizziness, rash; swelling of face, tongue, throat.

## trastuzumab/ hyaluronidase

tras-tu-zoo-mab hye-al-ure-on-i-dase

(Herceptin Hylecta)

**BLACK BOX ALERT** ■ May cause cardiac failure, esp. in pts with anthracycline-containing chemotherapy regimens. Monitor left ventricular function prior to initiation and during treatment. Serious and fatal cases of interstitial lung disease (ILD), pneumonitis were reported. Symptoms usually occurred during or within 24 hrs of administration. Permanently discontinue if anaphylaxis, ILD, acute respiratory distress syndrome occurs. Treatment may cause fetal harm. Recommend effective contraception.

**Do not confuse trastuzumab/hyaluronidase with ado-trastuzumab emtansine, daratumumab/hyaluronidase, fam-trastuzumab deruxtecan, pertuzumab, trastuzumab (or biosimilars), or rituximab/hyaluronidase.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Human epidermal growth factor receptor 2 (HER2) antagonist; monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Adjuvant treatment of adults with HER2-overexpressing node-positive or node-negative (estrogen receptor [ER]/progesterone receptor [PR]-negative or with one high-risk feature) breast cancer: as part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; as part of a treatment regimen with docetaxel and carboplatin; as a single agent following multimodal anthracycline-based therapy. Treatment of adults as first-line therapy for HER2-overexpressing metastatic breast cancer (in combination with paclitaxel); as a single agent for HER2-overexpressing breast cancer in pts who have received one or more chemotherapy regimens for metastatic disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to trastuzumab/hyaluronidase, trastuzumab-containing regimens. **Cautions:** Baseline cytopenias, active infection, pulmonary disorders (e.g., COPD, emphysema, pulmonary fibrosis), cardiovascular disease, HF, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds). Do not substitute with ado-trastuzumab or intravenous trastuzumab.

### ACTION

Binds to extracellular domain of HER2 protein, inhibiting proliferation of HER2-overexpressing tumor cells. Mediates antibody-dependent cellular toxicity. Hyaluronidase increases dispersion and absorption of SQ injected medications by increasing permeability. **Therapeutic Effect:** Inhibits proliferation of cells overexpressing HER2 protein.

## PHARMACOKINETICS

Widely distributed. Peak plasma concentration: 3 days. Eliminated by parallel and nonlinear saturable target mediated clearance. **Half-life:** Not specified.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 7 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 7 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of cardiac dysfunction.

## INTERACTIONS

**DRUG:** May increase cardiotoxic effects of **anthracyclines** (e.g., **daunorubicin**, **doxorubicin**, **epirubicin**). **Systemic corticosteroids** (e.g., **dexamethasone**, **methylprednisolone**, **prednisone**) may decrease therapeutic effect of hyaluronidase. Hyaluronidase may increase vasoconstricting effect of **phenylephrine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, neutrophils, RBCs.

## AVAILABILITY (Rx)

**Injection Solution:** trastuzumab 600 mg/hyaluronidase 10,000 units (120 mg/2,000 units/mL).

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to yellow in color. Do not use if solution is cloudy or discolored or visible particles are observed. • Withdraw contents from vial into syringe. • To avoid clogging, immediately attach a hypodermic needle or subcutaneous infusion set to syringe.

**Administration** • Insert needle subcutaneously into left or right thigh (only), approx. 2.5 cm from previous injection sites. • Do not inject into areas of active skin disease or injury such as sunburns,

skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly. • If a dose is missed, administer as soon as possible and adjustment schedule to maintain dosing intervals.

**Rate of administration** • Inject over 2–5 min.

**Storage** • Refrigerate vials in original carton until time of use. • Protect from light. • Do not shake or freeze. • After vial is removed from refrigerator, use within 4 hrs. • May store syringe containing solution at room temperature for up to 4 hrs or refrigerate for up to 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Breast Cancer (HER2-Positive) (Adjuvant)

**SQ: ADULTS:** 600 mg/10,000 units q3wks (21-day cycle) for 52 wks or until disease progression or unacceptable toxicity. Give in combination with DOXOrubicin, cyclophosphamide, and either PAC-Litaxel or DOCEtaxel; or in combination with DOCEtaxel and CARBOplatin; or as a single agent following multimodality anthracycline-based therapy.

### Breast Cancer (HER2-Positive, Metastatic)

**SQ: ADULTS:** 600 mg/10,000 units q3wks (21-day cycle) (in combination with PACLitaxel or as a single agent following one or more chemotherapy regimens for metastatic disease). Continue until disease progression or unacceptable toxicity.

### Dose Modification

#### Cardiac Toxicity

Withhold treatment for 4 wks for an absolute decrease in left ventricular ejection fraction (LVEF) that is greater than or equal to 16% from baseline; absolute decrease in LVEF below institutional limits of normal and greater than or equal to 10% from baseline. May resume if LVEF returns to normal limits and the absolute decrease from baseline is greater than or equal to 15% within 4–8 wks. Permanently discontinue if left ventricular dysfunction persists longer than 8 wks or treatment is withheld on more than three occasions for cardiac toxicity.

**Dosage in Renal Impairment**

**Mild to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (33%–17%):** Fatigue, diarrhea, arthralgia, injection site reactions (e.g., bruising, pain, dermatitis, discoloration, discomfort, erythema, fibrosis, hematoma, hemorrhage, induration, irritation, nodule, rash, ulcer), rash, myalgia.

**Occasional (15%–6%):** Nausea, peripheral neuropathy, headache, flushing, edema, cough, extremity pain, pyrexia, nail disorder, abdominal pain, alopecia, erythema, constipation, hypertension, stomatitis, dyspnea, back pain, generalized pain, vomiting, insomnia, mucosal inflammation, pruritus, dizziness, paresthesia, nasal inflammation/discomfort.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia) is an expected response to therapy. Cardiomyopathy reported in 5% of pts. Other cardiac disorders may include tachycardia, palpitations, congestive HF. Pulmonary toxicities (acute respiratory distress syndrome, dyspnea, hypoxia, ILD, noncardiogenic pulmonary edema, pneumonitis, pleural effusions, pulmonary fibrosis, pulmonary infiltrates, pulmonary insufficiency) were reported. Infections (upper respiratory tract infections, UTI, viral infections) were reported. Epistaxis reported in 6% of pts. Hypersensitivity reactions, including anaphylaxis, may occur. Immunogenicity (auto-trastuzumab antibodies) reported in 10% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Verify presence of HER2 protein overexpres-

sion or HER2 gene amplification in tumor specimen. Assess LVEF by echocardiogram. Question history of cardiovascular disease, HE, hypersensitivity reactions, pulmonary disease. Screen for active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC periodically. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Auscultate lung sounds. Monitor for symptoms of HF (chest pain, dyspnea, palpitations, swelling of extremities). Assess LVEF by echocardiogram q3mos. If treatment withheld due to change in LVEF, monitor LVEF at 4-wk intervals. If treatment is used as adjuvant therapy, assess LVEF q6mos for at least 2 yrs upon completion. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetic if nausea/vomiting occurs. Monitor for hypersensitivity reactions.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); heart failure (e.g., chest pain, difficulty breathing, palpitations, swelling of extremities); UTI (fever, urinary frequency, burning during urination, foul-smelling urine).
- Treatment may reduce the heart's ability to pump effectively; expect routine echocardiograms.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Nausea/vomiting is a common side effect.
- Maintain proper hydration and nutrition.
- Severe allergic reac-

tions, including anaphylaxis, can occur. If allergic reaction occurs, seek immediate medical attention.

## traZODone

traz-o-done  
(Apo-TraZODone )

**BLACK BOX ALERT** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. **Do not confuse traZODone with traMADol or ziprasidone.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin reuptake inhibitor/antagonist.  
**CLINICAL:** Antidepressant.

### USES

Treatment of major depressive disorder (MDD). **OFF-LABEL:** Insomnia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to traZODone. Use of MAOIs (concurrently or within 14 days of discontinuing traZODone or MAOI); initiation in pt receiving linezolid or IV methylene blue. **Cautions:** Cardiac disease, cardiac conduction disorders, seizure disorder, elderly, hepatic/renal impairment, cerebrovascular disease; history of suicidal ideation and behavior, conditions predisposing to priapism (e.g., sickle cell disease), concomitant use of antihypertensives.

### ACTION

Blocks reuptake of serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression.

### PHARMACOKINETICS

Widely distributed. Protein binding: 85%–95%. Metabolized in liver. Primar-

ily excreted in urine. **Half-life:** 5–9 hrs (increased in elderly).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; minimally distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** More likely to experience sedative, hypotensive effects; lower dosage recommended.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. May increase concentration/effect of phenytoin. Strong CYP3A4 inducers (e.g., carbamazepine, rifampin) may increase QT interval-prolonging effect of clarithromycin. Linezolid, MAOIs (e.g., phenelzine, selegiline) venlafaxine may increase serotonergic effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase toxic effect. **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, WBCs.

### AVAILABILITY (Rx)

**Tablets:** 50 mg, 100 mg, 150 mg, 300 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give shortly after snack, meal (reduces risk of dizziness). • Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Therapeutic effect may take up to 6 wks to occur.

#### Depression

**PO: ADULTS:** Initially, 50 mg twice daily. May increase in increments of 50 mg/day q3–7 days up to 75–150 mg twice daily. May further increase by 50–100 mg/day q2–4 wks. Usual dosage range: 200 to 400 mg/day. **Maximum:** 600 mg/day.

**ELDERLY:** Initially, 25–50 mg at bedtime. May increase by 25–50 mg every 3–7 days. Range: 75–150 mg/day.

#### Dosage in Renal/Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Frequent (9%–3%):** Drowsiness, dry mouth, light-headedness, dizziness, headache, blurred vision, nausea, vomiting. **Occasional (3%–1%):** Nervousness, fatigue, constipation, myalgia/arthralgia, mild hypotension. **Rare:** Photosensitivity reaction.

### ADVERSE EFFECTS/TOXIC REACTIONS

Priapism, altered libido, retrograde ejaculation, impotence occur rarely. Appears to be less cardiotoxic than other antidepressants, although arrhythmias may occur in pts with preexisting cardiac disease.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess mental status, mood, behavior. For pts on long-term therapy, serum hepatic/renal function tests, blood counts should be performed periodically. Question history as listed in Precautions.

#### INTERVENTION/EVALUATION

Monitor for suicidal ideation (esp. at beginning of therapy or dosage change). Assess appearance, behavior, speech pattern, level of interest, mood. Assist with ambulation if dizziness, light-headedness occurs.

#### PATIENT/FAMILY TEACHING

- Immediately discontinue medication, consult physician if priapism occurs.
- **Immediate-Release:** May take after meal, snack.
- **Extended-Release:** Take on empty stomach.
- May take at bedtime if drowsiness occurs.
- Change positions slowly to avoid hypotensive effect.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Photosensitivity to sun may occur.
- Report visual distur-

bances, worsening depression, suicidal ideation, unusual changes in behavior. • Do not abruptly discontinue medication. • Avoid alcohol.

## tropium

tro-spee-um  
(Trosec) 

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticholinergic. **CLINICAL:** Antispasmodic.

### USES

Treatment of overactive bladder with symptoms of urge urinary incontinence, urgency, urinary frequency.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to tropium. Pts with or at increased risk of gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Decreased GI motility, renal/hepatic impairment, obstructive GI disorders, ulcerative colitis, intestinal atony, myasthenia gravis, controlled narrow-angle glaucoma, bladder flow obstruction, Alzheimer's disease, hot weather/exercise, elderly.

### ACTION

Antagonizes effect of acetylcholine on muscarinic receptors, producing parasympatholytic action. **Therapeutic Effect:** Reduces smooth muscle tone in bladder.

### PHARMACOKINETICS

Minimally absorbed after PO administration. Protein binding: 50%–85%. Distributed in plasma. Excreted in feces (82%), urine (6%). **Half-life:** 20 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Higher

incidence of dry mouth, constipation, dyspepsia, UTI, urinary retention in pts 75 yrs and older.

## INTERACTIONS

**DRUG:** Alcohol may increase CNS depression. **Anticholinergics** (e.g., **aclidinium**, **ipratropium**, **tiotropium**, **umeclidinium**) may increase anticholinergic effect. **HERBAL:** None significant. **FOOD:** High-fat meals may reduce absorption. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

 **Tablets:** 20 mg. **Capsules, Extended-Release:** 60 mg.

## ADMINISTRATION/HANDLING

### PO

- Give at least 1 hr before meals or on an empty stomach.
- Do not break, crush, dissolve, or divide tablets or extended-release capsules; administer whole.
- Administer tablets at bedtime, capsules in morning with full glass of water, 1 hr before eating.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO: ADULTS:** (*Immediate-Release*): 20 mg twice daily. **ELDERLY 75 YRS AND OLDER:** 20 mg once daily. **ADULTS, ELDERLY:** (*Extended-Release*): 60 mg once daily in the morning.

### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** Immediate-release dose is reduced to 20 mg once daily at bedtime. Extended-release not recommended.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Use with caution.

## SIDE EFFECTS

**Frequent (20%):** Dry mouth. **Occasional (10%–4%):** Constipation, headache. **Rare (less than 2%):** Fatigue, upper abdominal

pain, dyspepsia (heartburn, indigestion, epigastric pain), flatulence, dry eyes, urinary retention.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may result in severe anticholinergic effects, characterized by nervousness, restlessness, nausea, vomiting, confusion, diaphoresis, facial flushing, hypertension, hypotension, respiratory depression, irritability, lacrimation. Supraventricular tachycardia and hallucinations occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess for dysuria, urinary urgency, frequency, incontinence.

### INTERVENTION/EVALUATION

Monitor for symptomatic relief. Monitor I&O; palpate bladder for retention. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Report nausea, vomiting, diaphoresis, increased salivary secretions, palpitations, severe abdominal pain.
- Swallow tablets, extended-release capsules whole.
- Take 1 hr before meals.

## tucatinib

too-ka-ti-nib  
(Tukysa)

**Do not confuse tucatinib with afatinib, dasatinib, lapatinib, neratinib, talazoparib, tofacitinib, or trametinib.**

### ◆ Classification

**PHARMACOTHERAPEUTIC:** Human epidermal growth factor receptor 2 (HER2) antagonist, tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with advanced unresectable or metastatic HER2-positive breast cancer (in combination with trastuzumab and capecitabine), including pts with or without brain metastases, who have received one or more prior anti-HER2-based regimens in the metastatic setting.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to tucatinib. **Cautions:** Baseline anemia, hepatic/renal impairment, dehydration, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); concomitant use of CYP3A substrates, P-glycoprotein substrates, moderate CYP2C8 inhibitors. Avoid concomitant use of strong CYP2C8 inhibitors.

**ACTION**

Highly selective for HER2 kinase domain. Inhibits HER2 phosphorylation, causing downstream inhibition of MAPK and AKT signaling and cell proliferation.

**Therapeutic Effect:** Shows antitumor activity in HER2-expressing tumor cells and inhibits the growth of HER2-expressing tumors.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 97%. Peak plasma concentration: 2 hrs. Excreted in feces (86%), urine (4%). **Half-life:** 8.5 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility. **Children:** Safety and efficacy not estab-

lished. **Elderly:** May have increased risk of adverse effects/toxic reactions.

**INTERACTIONS**

**DRUG:** Strong CYP2C8 inhibitors (e.g., gemfibrozil, clopidogrel), moderate CYP2C8 inhibitors (e.g., irbesartan, efavirenz) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin), moderate CYP2C8 inducers (e.g., rifampin) may decrease concentration/effect. May increase concentration/effect of acalabrutinib, axitinib, bosutinib, cyclosporine, irinotecan, ranolazine, simvastatin, tamsulosin, topotecan, trazodone. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine. May decrease serum magnesium, phosphate, potassium, sodium; Hgb.

**AVAILABILITY (Rx)**

**Tablets:** 50 mg, 150 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food. Administer tablet whole; do not break, cut, or crush.
- Do not give if tablet is cracked, broken, or not intact.
- Tablets cannot be chewed.
- If a dose is missed or vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).

**INDICATIONS/ROUTES/DOSAGE**

**Breast Cancer (HER2-Positive, Unresectable or Metastatic)**

**PO: ADULTS:** 300 mg twice daily (in combination with trastuzumab and capecitabine). Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule**

**First dose reduction:** 250 mg twice daily. **Second dose reduction:** 200 mg twice daily. **Third dose reduction:** 150 mg twice daily. **Unable to tolerate 150-mg dose:** Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Diarrhea**

**Grade 3 diarrhea without antidiarrheal therapy:** Start antidiarrheal therapy. Withhold treatment until improved to Grade 1 or 0, then resume at same dose.

**Grade 3 diarrhea with antidiarrheal therapy:** Start or intensify antidiarrheal therapy. Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. **Grade 4 diarrhea:** Permanently discontinue.

**Hepatotoxicity**

**Grade 2 serum bilirubin elevation:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose. **Grade 3 serum ALT/AST or bilirubin elevation:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. **Grade 4 serum ALT/AST or bilirubin elevation:** Permanently discontinue. Serum ALT/AST elevation greater than 3 times ULN with serum bilirubin elevation 2 times ULN: Permanently discontinue.

**Other Toxicities**

**Any other Grade 3 toxicities:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. **Any other Grade 4 toxicities:** Permanently discontinue.

**Concomitant Use of Strong CYP2C8 Inhibitor**

If strong CYP2C8 inhibitor cannot be discontinued, reduce dose to 100 mg twice daily. If strong CYP2C8 inhibitor is discontinued for 3 eliminated half-lives, may resume dose prior to starting CYP2C8 inhibitor.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose to 200 mg twice daily.

**SIDE EFFECTS**

**Note:** Frequency and occurrence of side effects may vary based on combination regimen. **Frequent (80%–20%):** Diarrhea, nausea, vomiting, stomatitis, oropharyngeal pain/discomfort, oral ulceration/blistering, decreased appetite, rash. **Occasional (15%–13%):** Arthralgia, decreased weight, peripheral neuropathy.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia is an expected response to therapy. Life-threatening diarrhea may cause dehydration, electrolyte imbalance, hypotension, acute kidney injury, and death. Median onset of diarrhea was 12 days. Severe hepatotoxicity may occur. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, reported in 63% of pts. Epistaxis reported in 12% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Confirm HER2-positive status. Question history of hepatic/renal impairment. Assess usual bowel movement patterns, stool characteristics. Assess and correct hydration status prior to initiation. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor LFT q3wks (or more frequently in pts with hepatotoxicity). Monitor CBC, renal function, electrolytes periodically. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Diarrhea must be treated promptly. If diarrhea occurs, initiate antidiarrheal therapy and evaluate for other causes (infectious processes). Consider IV hydration if severe dehydration occurs. Replete electrolytes as

clinically indicated. Assess skin for dermal toxicities, PPES. Monitor for toxicities if discontinuation or dose reduction if concomitant strong or moderate CYP2C8 inhibitors, P-glycoprotein substrates, CYP3A substrates is unavoidable.

**PATIENT/FAMILY TEACHING**

• Diarrhea, nausea, vomiting is a common side effect. • Diarrhea may cause dehydration, electrolyte imbalance, low blood pressure, kidney injury, and may be life threatening. Drink plenty of fluids. Report diarrhea or dehydration that does not improve with medical management.

• Report toxic skin reactions (itching, peeling, rash, redness, swelling); liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine). • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy. • Avoid herbal supplements (esp. St. John's wort). • Use effective contraception to avoid pregnancy. Do not breast-feed.

## ubrogepant

ue-broe-je-pant  
(Ubrelyv)

**Do not confuse ubrogepant with atogepant or rimegepant.**

### ◆ Classification

**PHARMACOTHERAPEUTIC:** Calcitonin gene-related peptide (CGRP) receptor antagonist. **CLINICAL:** Anti-migraine.

### USES

Treatment of migraines with or without aura in adults.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ubrogepant. Concomitant use of strong CYP3A4 inhibitors. **Cautions:** Hepatic/renal impairment. Not indicated for prevention of migraine. Avoid concomitant use of strong CYP3A4 inducers.

### ACTION

Exact mechanism of action unknown. Binds to and inhibits calcitonin gene-related peptide (CGRP) receptor. **Therapeutic Effect:** Relieves migraine headache.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 87%. Peak plasma concentration: 1.5 hrs. Excreted in feces (42%), urine (6%). **Half-life:** 5–7 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir),

moderate CYP3A inhibitors (e.g., cyclosporine, fluconazole, verapamil), P-gp inhibitors (e.g., amiodarone, carvedilol, clarithromycin, itraconazole, verapamil) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin), **moderate CYP3A inducers** (e.g., bosentan, nafcillin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Tablets:** 50 mg, 100 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Migraine (With or Without Aura)

**PO: ADULTS:** 50 mg or 100 mg as a single dose. May repeat dose at least 2 hrs after initial dose. Do not exceed 200 mg in a 24-hr period.

#### Dose Modification

Concomitant Drug	Initial Dose	Second Dose (if needed)
Moderate CYP3A4 inhibitors	50 mg	Avoid within 24 hrs
Weak CYP3A4 inhibitors	50 mg	50 mg
BCRP and/or P-gp only inhibitors	50 mg	50 mg
Strong CYP3A4 inducers	Avoid Use	Avoid use
Weak or moderate CYP3A4 inducers	100 mg	100 mg

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment (CrCl 15–29 mL/min):** Initially, 50 mg. May

repeat 50 mg dose at least 2 hrs after initial dose. **ESRD (CrCl less than 15 mL/min):** Avoid use.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Initially, 50 mg. May repeat 50 mg dose at least 2 hrs after initial dose.

### SIDE EFFECTS

**Rare (2%–1%):** Nausea, somnolence, dry mouth.

### ADVERSE EFFECTS/TOXIC REACTIONS

None known.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms). Receive full medication history and screen for interactions. Question history of hepatic/renal impairment.

#### INTERVENTION/EVALUATION

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, foginess).

#### PATIENT/FAMILY TEACHING

- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy. Do not take herbal products (esp. St. John's wort) or ingest grapefruit products.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## umbralisib

um-bra-lis-in  
(Ukoniq)

**Do not confuse umbralisib with alpelisib, copanlisib, duvelisib, idelalisib, or upadacitinib.**

### Classification

**PHARMACOTHERAPEUTIC:** Phosphatidylinositol-3-kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with relapsed or refractory marginal zone lymphoma who have received at least one prior anti-CD20–based regimen. Treatment of adults with relapsed or refractory follicular lymphoma who have received at least three prior lines of systemic therapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to umbralisib. **Cautions:** Baseline cytopenias, dehydration, hepatic impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic viral infections. History of cytomegalovirus virus infection.

### ACTION

Dual inhibitor of phosphatidylinositol-3-kinase-delta (PI3K $\delta$ ) and casein kinase 1 epsilon (CK1 $\epsilon$ ) with improved selectivity for the PI3K $\delta$  isoform. PI3K $\delta$  is expressed in both normal and malignant B cells; CK1 $\epsilon$  may be involved in the pathogenesis of cancer cells (including lymphoid malignancies). **Therapeutic Effect:** Inhibits cell proliferation, CXCL12-mediated cell adhesion, and CCL19-mediated cell migration in lymphoma cell lines.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99.7% (or greater). Peak plasma concentration: 4 hrs. Excreted in feces (81%), urine (3%). **Half-life:** 91 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive

potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. May cause male infertility. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions.

**INTERACTIONS**

**DRUG:** May increase immunosuppressive effect of **baricitinib, fingolimod, tofacitinib, upadacitinib.** May increase adverse/toxic effects of **leflunomide, natalizumab, vaccines (live).** May decrease therapeutic effect of **vaccines (live).** **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, creatinine. May decrease serum potassium; Hgb, neutropenia, platelets.

**AVAILABILITY (Rx)**

**Tablets:** 200 mg.

**ADMINISTRATION/HANDLING**

**PO**

- Give with food (increases absorption).
- Administer tablet whole; do not break, cut, or crush. Tablets cannot be chewed.
- If a dose is missed, do not give within 12 hrs of next dose. • If vomiting occurs after administration, give the next dose at regularly scheduled time (do not give additional dose).

**INDICATIONS/ROUTES/DOSAGE**

**NOTE:** Recommend prophylactic therapy for *Pneumocystis jirovecii* pneumonia during treatment. To prevent cytomegalovirus (CMV) infection/reactivation, recommend prophylactic antiviral therapy during treatment.

**Marginal Zone Lymphoma (Relapsed or Refractory)**

**PO: ADULTS, ELDERLY:** 800 mg once daily until disease progression or unacceptable toxicity.

**Follicular Lymphoma (Relapsed or Refractory)**

**PO: ADULTS, ELDERLY:** 800 mg once daily until disease progression or unacceptable toxicity.

**Dose Reduction Schedule**

**First reduction:** 600 mg once daily. **Second dose reduction:** 400 mg once daily. **Unable to tolerate 400-mg dose:** Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Neutropenia**

**Absolute neutrophil count (ANC) 500–1,000 cells/mm<sup>3</sup>:** Continue same dose. If ANC 500–1,000 cells/mm<sup>3</sup> is persistent or recurs, withhold treatment until ANC is 1,000 cells/mm<sup>3</sup> or greater, then resume at same dose. **ANC less than 500 cells/mm<sup>3</sup>:** Withhold treatment until ANC is 500 cells/mm<sup>3</sup> or greater, then resume at same dose. If recurs, then reduce dose.

**Thrombocytopenia**

**Platelet count 25,000–50,000 cells/mm<sup>3</sup> with bleeding; platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count is 25,000 cells/mm<sup>3</sup> or greater and bleeding has resolved (if applicable), then resume at same dose. If recurs, withhold treatment until resolved, then reduce dose.

**Dermatological Toxicity**

If severe cutaneous reaction occurs, withhold treatment until resolved, then either resume at reduced dose or discontinue treatment. If recurs after rechallenge, discontinue treatment. If life-threatening cutaneous reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia and systemic symptoms occurs, discontinue treatment.

**Diarrhea/Noninfectious Colitis**

**Mild to moderate diarrhea (up to 6 stools/day from baseline); Grade**

**1 colitis:** If persistent, withhold treatment until resolved, then resume either at same dose or reduced dose. If recurs, withhold treatment until resolved, then reduce dose. **Severe diarrhea (greater than 6 stools/day from baseline); diarrhea with abdominal pain, mucus, bleeding, change in bowel habits, peritoneal signs:** Withhold treatment until resolved, then resume at reduced dose. If severe diarrhea or colitis (any grade) recurs, discontinue treatment. **Life-threatening diarrhea:** discontinue treatment.

#### **Hepatotoxicity**

Serum ALT/AST elevation greater than 5 to less than 20 times upper limit of normal (ULN): Withhold treatment until serum ALT/AST improves to less than 3 times ULN, then resume at reduced dose. Serum ALT/AST elevation greater than 20 times ULN: Discontinue treatment.

#### **Infection (Including Opportunistic Infection)**

**Grade 3 or 4 infection:** Withhold treatment until resolved, then resume either at same dose or reduced dose. ***Pneumocystis jirovecii* pneumonia infection:** Withhold treatment if suspected. Discontinue treatment if confirmed. **Cytomegalovirus infection:** Withhold treatment until resolved (infection or viremia), then either resume at same dose or reduced dose.

#### **Other Adverse Reactions**

**Any other adverse toxic reaction:** Withhold treatment until resolved, then resume either at same dose or reduced dose. **Life-threatening adverse reaction:** Discontinue treatment.

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## **SIDE EFFECTS**

**Frequent (58%–21%):** Diarrhea, fatigue, asthenia, lethargy, nausea, pain (bone, back, chest, musculoskeletal, neck, spine), myalgia, vomiting. **Occasional (19%–10%):** Abdominal pain, decreased appetite, rash, insomnia, edema (face, generalized), pulmonary, pyrexia.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy. Life-threatening infections, including pneumonia, sepsis, UTI, were reported. Grade 3 or 4 infections reported in 10% of pts. CMV infection/reactivation or viremia may occur. Severe, sometimes life-threatening, diarrhea or colitis reported in 53% of pts. Grade 3 or 4 ALT/AST elevation reported in 1%–8% of pts. Serious cutaneous reactions, including exfoliative dermatitis, erythema, rash, skin peeling, exfoliation, keratinocyte necrosis, occurred in 5% of pts. Dermatologic toxicities, including Stevens-Johnson syndrome, toxic epidermal necrolysis, may occur. Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematological abnormalities, myocarditis, nephritis.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain ANC, CBC, LFT; pregnancy test in females of reproductive potential. Confirm compliance with effective contraception. Give prophylactic treatment for *Pneumocystis jirovecii* pneumonia, CMV during treatment. Question history of hepatic impairment, CMV infection, chronic viral infections. Assess hydration status. Screen for active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor ANC at least q2wks for 2 mos. If neutropenia occurs, monitor ANC weekly until improved. Monitor LFT for hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) as clinically appropriate. Assess skin for cutaneous reactions, rash, skin toxicities; symptoms of DRESS. In pts who develop cutaneous reactions, monitor at least weekly until resolved with supportive therapies. Be alert for infections, esp. respiratory tract infections such as *P. jirovecii* pneumonia, bacterial/fungal/pneumococcal/viral pneumonia (cough, dyspnea, hypoxia, pleuritic chest pain). If infection occurs, provide anti-infective therapy. Monitor for CMV reactivation (by PCR test or antigen test) at least monthly in pts who test positive for dormant CMV. In pts who develop diarrhea, colitis, abdominal pain, or change in bowel habits, monitor daily pattern of bowel activity and stool consistency frequently. Monitor for edema (third spacing, dyspnea, weight gain). Monitor I&Os, hydration status.

**PATIENT/FAMILY TEACHING**

- Treatment may depress the immune system and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), toxic skin reactions (itching, peeling, rash, redness, swelling).
- Report symptoms of drug-induced hypersensitivity syndrome (e.g., fever, swollen face/lymph nodes, skin rash/peeling/inflammation).
- Treatment may cause severe diarrhea, which may require supportive care. Report worsening of diarrhea or dehydration. Drink plenty of fluids.
- Use effective contraception to avoid pregnancy.

**umeclidinium**

ue-mek-li-din-ee-um  
(Incruse Ellipta)

**Do not confuse umeclidinium with aclidinium or clidinium.**

**FIXED-COMBINATION(S)**

**Anoro Ellipta:** umeclidinium/vilanterol (bronchodilator): 62.5 mcg/25 mcg. **Trelegy Ellipta:** umeclidinium/fluticasone (corticosteroid)/vilanterol (bronchodilator): 62.5 mcg/100 mcg/25 mcg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anticholinergic. **CLINICAL:** Bronchodilator (long-acting).

**USES**

Long-term, once-daily maintenance treatment of airflow obstruction in pts with COPD.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to umeclidinium. Severe hypersensitivity to milk proteins or any drug components.

**Cautions:** Bladder neck obstruction, myasthenia gravis, narrow-angle glaucoma, prostatic hypertrophy, urinary retention. Not recommended in pts with acutely deteriorating COPD requiring emergent relief of acute symptoms.

**ACTION**

Inhibits muscarinic M<sub>3</sub> receptor in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance, improves bronchodilation.

**PHARMACOKINETICS**

Rapidly absorbed following inhalation. Primarily metabolized by enzyme cytochrome P4502D6. Protein binding: 89%. Peak concentration: 5–15 min. Steady state reached within 14 days. **Half-life:** 11 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Not indicated in this pt population. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Anticholinergics (e.g., aclidinium, ipratropium, tiotropium) may increase anticholinergic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

**AVAILABILITY (Rx)**

**Inhalation Powder:** 62.5 mcg/capsule (in blister packs containing 7 or 30 doses).

**ADMINISTRATION/HANDLING****Inhalation**

**Administration** • Follow instructions for preparation according to manufacturer guidelines. • Do not shake or prime. Prior to inhaling dose, exhale fully (do not exhale into inhaler). Close lips tightly around inhaler and inhale (rapidly, steadily, and deeply). Do not breathe through nose or block air vent with fingers. • Remove mouthpiece and hold breath for 3–4 sec, then breathe out slowly and gently. Do not close container until medication has been inhaled. • Close lid cover.

**Storage** • Store at room temperature up to 6 wks after opening tray. • Do not refrigerate or freeze. • Protect from sunlight and moisture. • Discard after counter reaches 0. • Do not reuse inhaler.

**INDICATIONS/ROUTES/DOSAGE****COPD**

**Inhalation: ADULTS, ELDERLY:** One inhalation (62.5 mcg) once daily, at same time each day. **Maximum:** 1 inhalation/24 hrs.

**Dose Modification**

**Deterioration of COPD:** Discontinue treatment. Initiate short-acting bronchodilators and supportive pulmonary therapy.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**SIDE EFFECTS**

**Occasional (8%–5%):** Nasopharyngitis, upper respiratory tract infection. **Rare (3%–1%):** Cough, arthralgia, viral respiratory tract infection, pharyngitis, myalgia, abdominal pain, toothache, tachycardia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Life-threatening asthma-related events, bronchospasm, worsening of COPD-related symptoms have been reported. Hypersensitivity reactions may occur (esp. in pts with undiagnosed severe milk protein allergy or allergy to products containing lactose). Worsening of narrow-angle glaucoma (eye pain, blurry vision, visual halos, colored images in association with red eyes from conjunctival congestion and corneal edema) may occur. May cause worsening of urinary retention, esp. in pts with prostatic hypertrophy or bladder neck obstruction.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain O<sub>2</sub> saturation, vital signs; pulmonary function test, if applicable. Assess respiratory rate, depth, rhythm. Assess lung sounds for wheezing. Screen for concomitant use of anticholinergic medications. Question history of asthma, BPH, bladder neck obstruction, glaucoma. Teach proper inhaler priming and administration techniques. Conduct ophthalmologic exam in pts with narrow-angle glaucoma.

**INTERVENTION/EVALUATION**

Routinely monitor O<sub>2</sub> saturation, vital signs. Auscultate lung sounds and monitor for symptom improvement. Recommend discontinuation of short-acting beta<sub>2</sub>-agonists while on long-term

therapy. Monitor for COPD deterioration, narrow-angle glaucoma, urinary retention/obstruction. Monitor for increased use of rescue inhaler; may indicate worsening of respiratory status.

#### PATIENT/FAMILY TEACHING

- Report fever, productive cough, body aches, paradoxical bronchospasm, difficulty breathing; may indicate lung infection, worsening of COPD.
- Therapy not intended for acute COPD symptom relief, and extra doses are not advised.
- Report symptoms of acute narrow-angle glaucoma, urinary retention, bladder distention.
- Refill prescription when counter on left of inhaler reaches red area of scale.
- Follow manufacturer guidelines for proper use of inhaler.
- Drink plenty of fluids (decreases lung secretion viscosity).
- Rinse mouth with water after inhalation to decrease mouth/throat irritation.

## upadacitinib

TOP  
100

ue-pad-a-sye-ti-nib  
(Rinvoq)

**BLACK BOX ALERT** Increased risk for developing bacterial, invasive fungal, viral, other opportunistic infections (including tuberculosis, herpes zoster, cryptococcosis, pneumocystosis), which may lead to hospitalization or death. Infections often occurred in combination with other immunosuppressants (methotrexate, other disease-modifying antirheumatic drugs). Closely monitor for infections. Test for latent tuberculosis prior to initiation and during treatment, regardless of initial result. Latent TB should be treated prior to initiation. Lymphomas, other malignancies were reported. Thromboembolic events, including deep vein thrombosis (DVT), pulmonary embolism (PE), arterial thrombosis, have occurred.

**Do not confuse upadacitinib with baricitinib or tofacitinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Janus kinase (JAK) inhibitor. **CLINICAL:** Disease-modifying antirheumatic drug (DMARD).

### USES

Treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response or intolerance to methotrexate.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to upadacitinib. **Cautions:** Baseline cytopenias, hepatic/renal impairment, elderly, uncontrolled hyperlipidemia; history of arterial or venous thrombosis (CVA, DVT, MI, PE); pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions), recent travel or residence in TB- or mycosis-endemic areas; history of chronic opportunistic infections (bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); infections including HIV, herpes zoster, hepatitis B or C virus; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract or abdominal malignancies, GI ulcers). Use of live, attenuated vaccines is not recommended.

### ACTION

Inhibits JAK enzymes, which are intracellular enzymes involved in stimulating hematopoiesis and immune cell function via signaling pathway. **Therapeutic Effect:** Reduces inflammation, tenderness, swelling of joints; slows or prevents progressive joint destruction in rheumatoid arthritis (RA).

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 52%. Peak plasma

concentration: 2–4 hrs. Excreted in feces (38%), urine (24%). **Half-life:** 8–14 hrs.

### **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 4 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 6 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### **INTERACTIONS**

**DRUG:** May decrease therapeutic effect of **vaccines (live), BCG (intravesical)**. May increase adverse/toxic effects of **natalizumab, live vaccines. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin, carbamazepine, phenobarbital)** may decrease concentration/effect. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, creatine phosphokinase, low-density lipoprotein (LDL), high-density lipoprotein (HDL), total cholesterol. May decrease absolute lymphocyte count, absolute neutrophil count (ANC), Hgb.

### **AVAILABILITY (Rx)**

**Tablets, Extended-Release:** 15 mg.

### **ADMINISTRATION/HANDLING**

#### **PO**

- Give without regard to food.
- Administer tablet whole; do not break, cut, or crush.
- Tablets cannot be chewed.

### **INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Do not initiate in pts with severe, active infection (systemic/localized), absolute lymphocyte count less

than 500 cells/mm<sup>3</sup>, ANC less than 1,000 cells/mm<sup>3</sup>, Hgb less than 8 g/dL; severe hepatic impairment. Do not use in combination with other JAK inhibitors, biologic DMARDs, strong immunosuppressants (e.g., azathioprine, cycloSPORINE).

### **Rheumatoid Arthritis**

**PO: ADULTS:** 15 mg once daily.

### **Dose Modification**

#### **Hematologic Toxicity**

**Hgb less than 8 g/dL:** Withhold treatment until Hgb is greater than or equal to 8 gm/dL, then resume treatment. **Absolute lymphocyte count (ALC) less than 500 cells/mm<sup>3</sup>:** Withhold treatment until ALC is greater than or equal to 500 cells/mm<sup>3</sup>, then resume treatment. **ANC less than 1,000 cells/mm<sup>3</sup>:** Withhold treatment until ANC is greater than or equal to 1,000 cells/mm<sup>3</sup>, then resume treatment.

#### **Hepatotoxicity**

Withhold treatment until hepatotoxicity is resolved, then resume if clinically indicated.

#### **Serious Infection**

Withhold treatment until serious infection is resolved, then resume if clinically indicated.

#### **Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment.

#### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

### **SIDE EFFECTS**

**Rare (4%–1%):** Nausea, cough, pyrexia.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Neutropenia, lymphopenia may increase risk of infection. Serious and sometimes fatal infections (bacterial, mycobacterial, invasive fungal, viral, other opportunistic infections) may occur. Serious infections may include cellulitis, cryptococcosis, esophageal candidiasis, herpes zoster,

pneumonia, pneumocystosis, TB. Upper respiratory tract infections (laryngitis, nasopharyngitis, pharyngitis, pharyngotonsillitis, rhinitis, sinusitis, tonsillitis, viral infection) reported in 14% of pts. May cause viral reactivation of hepatitis B virus, herpes zoster. New nonmelanoma skin malignancies, lymphomas were reported. Thromboembolic events including DVT, pulmonary embolism, arterial thrombosis have occurred. May increase risk of GI perforation.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, lipid panel; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Evaluate for active TB and test for latent TB infection. An induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB. Screen for active infection. Question history of arterial/venous thrombosis, hepatic/renal impairment; chronic infections including HIV, hepatitis B or C virus, herpes zoster. Assess risk of GI perforation. Receive full medication history and screen for interactions. Recommend up-to-date vaccinations (non-live, attenuated), including prophylactic zoster vaccination, prior to initiation. Assess onset, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities.

### INTERVENTION/EVALUATION

Monitor CBC, LFT periodically; lipid panel 12 wks after initiation and as indicated thereafter. Monitor for TB regardless of baseline PPD. Diligently monitor for infections (cough, fatigue, fever). If severe acute infection, opportunistic infection

occurs, withhold treatment and initiate appropriate antimicrobial therapy. Monitor for symptoms of GI perforation (abdominal pain, fever, melena, hematemesis); DVT (leg or arm pain/swelling), CVA (aphasia, altered mental status, hemiplegia, vision loss, seizures); MI (arm/jaw pain, chest pain, diaphoresis, dyspnea), PE (chest pain, dyspnea, tachycardia), hepatotoxicity (bruising, jaundice, right upper abdominal pain, nausea, vomiting, weight loss), viral infection reactivation. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect routine tuberculosis screening. Report any travel plans to possible endemic areas.
- Do not receive live vaccines.
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes); symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity).
- Life-threatening arterial blood clots may occur; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm, sweating), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision).
- Report severe or persistent abdominal pain, bloody stool, fever, vomiting; may indicate rupture in GI tract.
- Treatment may cause reactivation of chronic infections, new cancers.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

U

## ustekinumab

TOP  
100yoo-ste-kin-ue-mab  
(Stelara)**Do not confuse Stelara with Aldara, or ustekinumab with inFLIXimab or riTUXimab.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-12, interleukin-23 inhibitor, monoclonal antibody. **CLINICAL:** Antipsoriasis agent.

## USES

Treatment of adults, adolescents 6 yrs or older with moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. Treatment of adults with active psoriatic arthritis alone or in combination with methotrexate. Treatment of adults with moderate to severe active Crohn's disease. Treatment of adults with moderate to severe active ulcerative colitis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ustekinumab. **Cautions:** Prior malignancies (esp. skin cancer), pts who resided or traveled to endemic areas; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral infections including herpes zoster, TB). Avoid use of live vaccines.

## ACTION

Binds to and interferes with proinflammatory cytokines, interleukin-12, and interleukin-23, reducing these proinflammatory signalers. **Therapeutic Effect:** Shows clinical improvement of psoriasis, psoriatic arthritis.

## PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic

pathways. Steady state reached in 28 wks. **Half-life:** 10–126 days.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** May have increased risk of infections.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect; increase adverse effects of **vaccines (live), BCG (intravesical)**. May increase immunosuppressive effect of **baricitinib, fingolimod, inFLIXimab, upadacitinib, Belimumab, cladribine** may increase the immunosuppressive effect. May increase the toxic effect of **natalizumab**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase lymphocyte count.

## AVAILABILITY (Rx)

**Injection Solution, Intravenous:** 130 mg/26 mL. **Injection Solution, SQ (Prefilled Syringes):** 45 mg/0.5 mL, 90 mg/mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Calculate the number of vials needed for dose based on pt's weight. • Withdraw and discard a volume from 250-mL 0.9% NaCl infusion bag equal to the volume of vials needed for dose. • Withdraw calculated dose from vial or vials and add to infusion bag to equal a final volume of 250 mL. • Visually inspect for particulate matter or discoloration. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Rate of administration** • Infuse over at least 60 min. Use an in-line, low-protein-binding filter (0.2 microns).

**Storage** • Refrigerate unused vials in original carton until time of use. • Protect from light. • Keep vials upright. • Diluted solution may be stored at room temperature for up to 4 hrs.

**SQ**

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless to slightly yellow in color. • Solution may contain a few small translucent or white particles.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscular. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • Protect from light. • Do not freeze or expose to heating sources. • Do not shake.

**INDICATIONS/ROUTES/DOSAGE****Plaque Psoriasis**

**SQ: ADULTS, ELDERLY WEIGHING 100 KG OR LESS:** Initially, 45 mg, then 45 mg 4 wks later, followed by 45 mg every 12 wks. **WEIGHING MORE THAN 100 KG:** Initially, 90 mg, then 90 mg 4 wks later, followed by 90 mg every 12 wks. **Note:** 45 mg also efficacious; however, 90 mg is recommended due to greater efficacy. **CHILDREN 6 YRS AND OLDER WEIGHING MORE THAN 100 KG:** Initially, 90 mg, repeat in 4 wks, then q12 wks. **WEIGHING 60–100 KG:** Initially, 45 mg, repeat in 4 wks, then q12 wks. **WEIGHING 59 KG OR LESS:** Initially, 0.75 mg/kg, repeat in 4 wks, then q12 wks.

**Psoriatic Arthritis**

**SQ: ADULTS, ELDERLY:** Initially, 45 mg repeated in 4 wks followed by 45 mg q12wks. **PTS WITH COEXISTENT MODERATE TO SEVERE PLAQUE PSORIASIS WEIGHING MORE THAN 100 KG:** Initially, 90 mg repeated in 4 wks, then 90 mg q12wks.

**Crohn's Disease**

**IV infusion: ADULTS, ELDERLY:** Initially, (as a single dose) 520 mg (greater than 85 kg); 390 mg (56–85 kg); 260 mg (up to 54 kg).

**SQ: Maintenance:** 90 mg q8wks beginning 8 wks following the IV induction dose.

**Ulcerative Colitis**

**IV: ADULTS, ELDERLY WEIGHING MORE THAN 85 KG: Induction:** 520 mg as single dose. **WEIGHING 56–85 KG:** 390 mg as single dose. **WEIGHING LESS THAN 56 KG:** 260 mg as single dose.

**SQ: Maintenance:** 90 mg q8wks (starting 8 wks after IV induction dose).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (8%–4%):** Nasopharyngitis, upper respiratory tract infection, headache. **Rare (3%–1%):** Fatigue, diarrhea, back pain, dizziness, pruritus, injection site erythema, myalgia, depression.

**ADVERSE EFFECTS/TOXIC REACTIONS**

May increase risk of acute infections; reactivation of latent infections. Serious invasive and opportunistic bacterial, mycobacterial, fungal, viral infections (anal abscess, appendicitis, cellulitis, cholecystitis, diverticulitis, gastroenteritis, *Listeria* meningitis, listeriosis, ophthalmic herpes zoster, osteomyelitis, pneumonia, sepsis, TB, UTI, viral infections) requiring hospitalization were reported. May increase risk of new malignancies. Hypersensitivity reactions including angioedema, anaphylaxis were reported. Reversible posterior leukoencephalopathy syndrome (RPLS) may present as aphasia, altered mental status, paralysis, vision loss, weakness. Noninfectious pneumonias (interstitial/eosinophilic/cryptogenic-organizing pneumonia) were reported. Immunogenicity (auto-ustekinumab antibodies) reported in 12% of pts. Pts genetically deficient in IL-12/IL-23 are at an increased risk of disseminated infections from mycobacteria (non-tuberculosis, environmental mycobacterial), salmonella, BCG vaccines.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain pregnancy test in females of reproductive potential. Conduct dermatological exam; record characteristics of psoriatic lesions. Assess degree of abdominal pain, cramping; usual bowel movement patterns, stool characteristics in pts with UC. Evaluate for active TB and test for latent infection. An induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Screen for active infection; history of chronic, opportunistic infections. Question history of prior malignancies. Consider completion of age-appropriate immunizations prior to initiation. BCG vaccines should not be given 1 yr prior to initiation or 1 yr after discontinuation.

**INTERVENTION/EVALUATION**

Obtain CBC if infection is suspected. Monitor for symptoms of TB (cough, fatigue, hemoptysis, nocturnal sweating, weight loss), including those who tested negative for latent TB infection. Monitor for infections (abdominal pain, cough, fatigue, fever). Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs. RPLS should be consid-

ered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Assess skin for improvement of lesions in pts with psoriasis; decreased abdominal pain, cramping, diarrhea; increased appetite, weight gain in pts with UC.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever; fungal infections. Avoid those with active infection.
- Report travel plans to possible endemic areas.
- Do not receive live vaccines, BCG vaccines.
- Expect frequent TB screening.
- Dormant or chronic viral, invasive fungal infections may become reactivated.
- Nervous system changes including altered mental status, seizures, headache, blurry vision, high blood pressure, trouble speaking, one-sided weakness may indicate life-threatening brain dysfunction/swelling.
- Treatment may cause new cancers.
- Life-threatening allergic reactions (anaphylaxis, swelling of face, tongue, throat) must be reported immediately, regardless of the time the dose was administered.

## valACYclovir

val-a-sye-kloe-veer  
(Valtrex)

**Do not confuse valACYclovir with acyclovir or valGANciclovir, or Valtrex with Keflex or Valcyte.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nucleoside analogue DNA polymerase inhibitor. **CLINICAL:** Antiviral.

### USES

Treatment of herpes zoster (shingles) in immunocompetent pts. Treatment of initial and recurrent genital herpes in immunocompetent adults. Prevention of recurrent genital herpes and reduction of transmission of genital herpes in immunocompetent pts. Suppression of genital herpes in HIV-infected pts. Treatment of herpes labialis (cold sores). Treatment of chickenpox in immunocompetent children. **OFF-LABEL:** Prophylaxis and treatment of cancer-related HSV, VZV.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to acyclovir, valACYclovir. **Cautions:** Renal impairment, concurrent use of nephrotoxic agents, elderly pts.

### ACTION

Converted to acyclovir by intestinal/hepatic metabolism. Competes for viral DNA polymerase; inhibits incorporation into viral DNA. **Therapeutic Effect:** Inhibits DNA synthesis and viral replication.

### PHARMACOKINETICS

Widely distributed to tissues, body fluids (including CSF). Protein binding: 13%–18%. Rapidly converted by hydrolysis to active compound acyclovir. Primarily excreted in urine. Removed by hemodialysis. **Half-life: Acyclovir:** 2.5–3.3 hrs (increased in renal impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cross placenta. May be distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 2 yrs (chickenpox); younger than 12 yrs (cold sores). **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Nephrotoxic medications (e.g., foscarnet) may increase risk of nephrotoxicity, renal impairment. May increase concentration/effect of tiZANidine. May decrease therapeutic effect of cladribine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Tablets:** 500 mg, 1,000 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. • If GI upset occurs, give with meals.

### INDICATIONS/ROUTES/DOSAGE

#### Herpes Zoster (Shingles)

**PO: ADULTS, ELDERLY: (Immunocompetent):** 1 g 3 times/day for 7 days. **(Immunocompromised):** 1 g 3 times/day for 7–14 days.

#### Herpes Simplex (Cold Sores)

**PO: ADULTS, ELDERLY: Immunocompetent: (Initial infection):** 1 g twice daily for 7–10 days. **(Recurrent infection):** 2 g twice daily for 1 day. **(Suppressive therapy):** 500 mg or 1 g once daily. **Immunocompromised (including pts with HIV infection): (Treatment, initial or recurrent infection):** 1 g twice daily for 5–10 days and until complete resolution of lesion. **(Suppressive therapy):** 500 mg twice daily.

#### Initial Episode of Genital Herpes

**PO: ADULTS, ELDERLY: (Immunocompetent):** 1 g twice daily for 7–10 days (extend treatment duration if lesion has not healed completely). **(Immunocom-**

**promised**): 1 g 2 times/day for 5–10 days (extend treatment duration if lesions have not healed completely after 10 days).

#### Recurrent Episodes of Genital Herpes

**PO: ADULTS, ELDERLY: (Immunocompetent)**: 500 mg twice daily for 3 days or 1 g twice daily for 5 days. **(Immunocompromised)**: 1 g 2 times/day for 5–10 days (extend treatment duration if lesions have not healed completely after 10 days).

#### Suppressive Therapy of Genital Herpes

**PO: ADULTS, ELDERLY: (Immunocompetent)**: 500 mg twice daily or 1 g once daily (500 mg once daily in pts with 9 or fewer recurrences/yr). **(Immunocompromised)**: 500 mg 2 times/day.

#### Chickenpox

**PO: CHILDREN 2–17 YRS: (Immunocompetent)**: 20 mg/kg/dose 3 times/day for 5 days. **Maximum**: 1 g 3 times/day.

#### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance. **HD**: Give dose postdialysis.

#### Cold Sores/Herpes Zoster

Creatinine Clearance	Herpes Zoster	Cold Sores
30–49 mL/min	1 g q12h	1 g q12h × 2 doses
10–29 mL/min	1 g q24h	500 mg q12h × 2 doses
Less than 10 mL/min	500 mg q24h	500 mg as single dose

#### Genital Herpes

Creatinine Clearance	Initial Episode	Recurrent Episode	Suppressive Therapy
10–29 mL/min	1 g q24h	500 mg q24h	500 mg q24–48h
Less than 10 mL/min	500 mg q24h	500 mg q24h	500 mg q24–48h

#### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent: Herpes zoster (17%–10%)**: Nausea, headache. **Genital herpes (17%)**: Headache. **Occasional: Herpes zoster (7%–3%)**: Vomiting, diarrhea, constipation (50 yrs and older), asthenia, dizziness (50 yrs and older). **Genital herpes (8%–3%)**: Nausea, diarrhea, dizziness. **Rare: Herpes zoster (3%–1%)**: Abdominal pain, anorexia. **Genital herpes (3%–1%)**: Asthenia, abdominal pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Neutropenia, thrombocytopenia, renal failure occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Tissue cultures for herpes zoster, herpes simplex should be obtained before giving first dose (therapy may proceed before results are known). Assess medical history, esp. HIV infection, bone marrow or renal transplantation, renal/hepatic impairment. Assess characteristics, frequency of lesions.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, renal function in pts requiring chronic treatment. Evaluate cutaneous lesions. Provide analgesics, comfort measures for herpes zoster (esp. exhausting to elderly). Encourage fluids.

### PATIENT/FAMILY TEACHING

- Drink adequate fluids.
- Do not touch lesions with fingers to avoid spreading infection to new site.
- **Genital herpes**: Continue therapy for full length of treatment.
- Avoid sexual intercourse during duration of lesions to prevent infecting partner.
- ValACYclovir does not cure herpes.
- Report if lesions recur or do not improve.
- Pap smears should be done at least annually due to increased risk of cervical cancer in women with genital herpes.
- Initiate treatment at first sign of recurrent episode of genital herpes or herpes zoster (early treatment within first 24–48 hrs is imperative for therapeutic results).

## valproic acid

val-**pro-ick** as-id  
(Apo-Divalproex , Depakote, Depakote ER, Depakote Sprinkle)

**BLACK BOX ALERT** Fatal hepatic failure has occurred. Children younger than 2 yrs of age have an increased risk of developing fatal hepatotoxicity. May increase risk of valproate-induced acute hepatic failure and resultant deaths in pts with hereditary neurometabolic syndromes. May cause major congenital malformations, particularly neural tube defects (e.g., spina bifida). Life-threatening pancreatitis was reported.

**Do not confuse Depakene with Depakote.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histone deacetylase inhibitor. **CLINICAL:** Anticonvulsant, antimanic, antimigraine.

### USES

Monotherapy/adjunctive therapy of complex partial seizures, simple and complex absence seizures. Adjunctive therapy of multiple seizures including absence seizures. Treatment of manic episodes with bipolar disorder, prophylaxis of migraine headaches. **OFF-LABEL:** Refractory status epilepticus, diabetic neuropathy. Mood stabilizer for behaviors in dementia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to valproic acid. Active hepatic disease, urea cycle disorders, known mitochondrial disorders caused by mutation in mitochondrial DNA polymerase gamma (POLG). Children under 2 yrs of age suspected of having POLG-related disorder. Migraine prevention in pregnant women and women of reproductive potential who are not using effective contraception. **Cautions:** Children younger than 2

yrs. Hepatic impairment, pts at risk for hepatotoxicity (e.g., cirrhosis, concomitant use of hepatotoxic medications), pts at high risk for suicide (e.g., history of ideation and behavior; depression), elderly, therapy requiring multiple anticonvulsants; congenital metabolic disorders, severe seizure disorders (accompanied by mental retardation), organic brain disease.

### ACTION

Directly increases concentration of inhibitory neurotransmitter gamma-aminobutyric acid (GABA). **Therapeutic Effect:** Decreases seizure activity, stabilizes mood, prevents migraine headache.

### PHARMACOKINETICS

Widely distributed. Protein binding: 80%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 9–16 hrs (may be increased in hepatic impairment, elderly pts, children younger than 18 mos).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta; is distributed in breast milk. **Children:** Increased risk of hepatotoxicity in pts younger than 2 yrs. **Elderly:** May have increase incidence of insomnia.

### INTERACTIONS

**DRUG:** RifAMPin may decrease concentration/effect. May increase adverse effects of lamoTRigine, LORazepam. **Alcohol** may increase CNS depression. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase toxic effects. **FOOD:** None known. **LAB VALUES:** May increase serum LDH, bilirubin, ALT, AST. May cause false interpretation of urine ketone test. **Therapeutic serum level:** 50–100 mcg/mL; **toxic serum level:** greater than 100 mcg/mL.

**AVAILABILITY (Rx)**

**Capsules:** 250 mg. **Capsules, Sprinkle:** 125 mg. **Injection Solution:** 100 mg/mL. **Oral Solution:** 250 mg/5 mL.

 **Tablets, Delayed-Release:** 125 mg, 250 mg, 500 mg. **Tablets, Extended-Release:** 250 mg, 500 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Dilute each single dose with at least 50 mL D<sub>5</sub>W, 0.9% NaCl, or lactated Ringer's.

**Rate of administration** • Infuse over 60 min at rate of 20 mg/min or less. • Alternatively, single doses of up to 45 mg/kg given over 5–10 min (1.5–6 mg/kg/min).

**Storage** • Store vials at room temperature. • Diluted solutions stable for 24 hrs. • Discard unused portion.

**PO**

• Give without regard to food. Do not mix oral solution with carbonated beverages (may cause mouth/throat irritation). • May sprinkle capsule (Depakote Sprinkle) contents on applesauce and give immediately (do not chew sprinkle beads). • Give delayed-release/extended-release tablets whole. Do not crush, break, open delayed-release capsule (Stavzor). • Regular-release and delayed-release formulations usually given in 2–4 divided doses/day. Extended-release formulation (Depakote ER) usually given once daily.

 **IV COMPATIBILITIES**

Cefepime, ceftAZidime.

**INDICATIONS/ROUTES/DOSAGE****Seizures**

**PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER:** Initially, 10–15 mg/kg/day. May increase by 5–10 mg/kg/day at wkly intervals up to 60 mg/kg/day (therapeutic serum levels usually occur with daily doses of 1.5–2.5 g).

**IV: ADULTS, ELDERLY, CHILDREN:** Equivalent to total daily oral dose divided q6h.

**Manic Episodes**

**PO: ADULTS, ELDERLY:** Initially, 500–750 mg/day. May increase by 250–500 mg q1–3days to reach desired clinical effect and therapeutic serum concentration. **Maximum:** 60 mg/kg/day.

**Prevention of Migraine Headaches**

**PO: ADULTS, ELDERLY:** Initially, 500 mg once daily (extended-release) or in 2 divided doses (delayed-release or extended-release), then increase in increments of 250 mg/day at intervals of 3 days (or more) up to 1 g/day.

**PO: (Delayed-Release [Depakote]): ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** Initially, 250 mg twice daily. May increase up to 1,000 mg/day in 2 divided doses.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** Not recommended. **Severe impairment:** Contraindicated.

**SIDE EFFECTS**

**Frequent: Epilepsy:** Abdominal pain, irregular menses, diarrhea, transient alopecia, indigestion, nausea, vomiting, tremors, fluctuations in body weight. **Mania (22%–19%):** Nausea, drowsiness. **Occasional: Epilepsy:** Constipation, dizziness, drowsiness, headache, skin rash, unusual excitement, restlessness. **Mania (12%–6%):** Asthenia, abdominal pain, dyspepsia, rash. **Rare: Epilepsy:** Mood changes, diplopia, nystagmus, spots before eyes, unusual bleeding/bruising.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Thrombocytopenia-associated bleeding, hyperammonemia, hypothermia were reported. Fatal hepatic failure may occur (particularly within the first 6 mos of treatment) and may be preceded by anorexia, facial edema, lethargy malaise, weakness, vomiting. Life-threatening pancreatitis may occur, which may include hemorrhage with rapid deteriora-

tion from initial symptoms to death. May increase risk of suicidal ideation and behavior. Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT. Question history of suicidal ideation and behavior. **Anticonvulsant:** Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate safety measures, quiet dark environment. **Antimanic:** Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. **Antimigraine:** Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms).

### INTERVENTION/EVALUATION

Monitor CBC, LFT, serum ammonia. Monitor for symptoms of DRESS. Diligently assess for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. **Anticonvulsant:** Observe frequently for recurrence of seizure activity. Assess skin for ecchymoses, petechiae. Monitor for clinical improvement (decrease in intensity/frequency of seizures). **Antimanic:** Assess for therapeutic response (interest in surroundings, increased ability to concentrate, relaxed facial expression). **Antimigraine:** Evaluate for relief of migraine headache and resulting photophobia, phonophobia, nausea, vomiting. **Therapeutic serum level:** 50–100 mcg/mL; **toxic serum level:** greater than 100 mcg/mL.

### PATIENT/ FAMILY TEACHING

- Do not abruptly discontinue medication after long-term use (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Drowsiness usually disappears during continued therapy.
- Avoid alcohol.
- Report liver problems such as nausea, vomiting, lethargy, altered mental status, weakness, loss of appetite, abdominal pain, yellowing of skin, unusual bruising/bleeding.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## valsartan

val-sar-tan

(Apo-Valsartan , Diovan)

**BLACK BOX ALERT** May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Diovan with Zyban, or valsartan with losartan or Valstar.**

### FIXED-COMBINATION(S)

**Diovan HCT:** valsartan/hydroCHLORothiazide (a diuretic): 80 mg/12.5 mg, 160 mg/12.5 mg, 160 mg/25 mg, 320 mg/12.5 mg, 320 mg/25 mg. **Exforge:** valsartan/aMLODIPine (a calcium channel blocker): 160 mg/5 mg, 160 mg/10 mg, 320 mg/5 mg, 320 mg/10 mg. **Exforge HCT:** valsartan/aMLODIPine (a calcium channel blocker)/hydroCHLORothiazide (a diuretic): 160 mg/5 mg/12.5 mg, 160 mg/5 mg/25 mg, 160 mg/10 mg/12.5 mg, 160 mg/10 mg/25 mg, 320 mg/10 mg/25 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

**USES**

Treatment of hypertension alone or in combination with other antihypertensives. Treatment of HF (NYHA Class II–IV). Reduce mortality in high-risk pts (left ventricular failure/dysfunction) following MI.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to valsartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Concurrent use of potassium-sparing diuretics or potassium supplements, mild to severe hepatic impairment, unstented bilateral/unilateral renal artery stenosis, renal impairment, significant aortic/mitral stenosis, elderly.

**ACTION**

Directly antagonizes angiotensin II receptors. Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.

**PHARMACOKINETICS**

Widely distributed. Food decreases peak plasma concentration. Protein binding: 95%. Metabolized in liver. Excreted in feces (83%), urine (13%). Unknown if removed by hemodialysis. **Half-life:** 6 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Potassium-sparing drugs (e.g., spironolactone, triamterene), potassium supplements may increase serum potassium. Aliskiren may increase hyperkalemic effect. May increase adverse/toxicity of ACE inhibitors (e.g., benazepril, lisinopril). **HERBAL:** Herbals with hypotensive properties (e.g., licorice,

yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, BUN, creatinine, potassium. May decrease Hgb, Hct, WBC.

**AVAILABILITY (Rx)**

**Tablets:** 40 mg, 80 mg, 160 mg, 320 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.

**INDICATIONS/ROUTES/DOSAGE****Hypertension**

**PO: ADULTS, ELDERLY:** Initially, 80–160 mg/day in pts who are not volume depleted. Titrate based on response. **Maximum:** 320 mg/day. **CHILDREN 6–16 YRS:** Initially, 1 mg/kg/dose once daily (maximum initial daily dose: 40 mg/day). May increase up to 4 mg/kg/day. **Maximum:** 60 mg/day.

**HF**

**PO: ADULTS, ELDERLY:** Initially, 20–40 mg twice daily. Titrate to 80 mg twice daily. May increase up to 160 mg twice daily. **Maximum:** 320 mg/day.

**Post-MI, Left Ventricular Dysfunction**

**PO: ADULTS, ELDERLY:** May initiate 12 hrs or longer following MI. Initially, 20 mg twice daily. May increase within 7 days to 40 mg twice daily. May further increase up to target dose of 160 mg twice daily.

**Dosage in Renal Impairment**

**CrCl greater than 30 mL/min:** No dose adjustment. **CrCl 30 mL/min or less:** **ADULTS:** Safety/efficacy not established. **CHILDREN 6–16 YRS:** Not recommended.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Rare (2%–1%):** Insomnia, fatigue, heartburn, abdominal pain, dizziness, headache, diarrhea, nausea, vomiting, arthralgia, edema.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often. Viral infection, upper respiratory tract infection (cough, pharyngitis, sinusitis, rhinitis) occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain renal function test; pregnancy in females of reproductive potential. Obtain B/P prior to each dose. Assess medication history (esp. diuretic). Question for history of hepatic/renal impairment, renal artery stenosis, severe HE.

### INTERVENTION/EVALUATION

Monitor renal function, serum electrolytes periodically. Monitor B/P. Assess for hypotension (dizziness, nausea, tachycardia, syncope, weakened pulse). Ensure adequate hydration.

### PATIENT/ FAMILY TEACHING

- Use effective contraception to avoid pregnancy.
- Report heart problems (difficulty breathing, palpitations, swelling of extremities), symptoms of low blood pressure (cold, clammy skin; dizziness, fast heart rate, sweating), kidney problems (decreased urine output, flank pain, darkened urine).
- Drink plenty of fluids.

## vancomycin

van-koe-mye-sin  
(Firvanq, Vancocin)

**Do not confuse vancomycin with clindamycin, gentamicin, tobramycin, or Vibramycin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tricyclic glycopeptide antibiotic. **CLINICAL:** Antibiotic.

## USES

**Systemic:** Treatment of infections caused by staphylococcal, streptococcal spp. bacteria. **PO:** Treatment of *C. difficile*-associated diarrhea and treatment of enterocolitis caused by *S. aureus* (including MRSA). **OFF-LABEL:** Treatment of infections caused by gram-positive organisms in pts with serious allergies to beta-lactam antibiotics; treatment of beta-lactam-resistant gram-positive infections. Surgical prophylaxis, treatment of prosthetic joint infection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to vancomycin. **Cautions:** Renal impairment, elderly, dehydration, pts at risk for extravasation (e.g., peripheral IV catheters, midline catheters, elderly, poor peripheral vasculature), concomitant use of other ototoxic, nephrotoxic medications.

## ACTION

Binds to bacterial cell walls, altering cell membrane permeability, inhibiting RNA synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

**PO:** Poorly absorbed from GI tract. Primarily excreted in feces. **Parenteral:** Widely distributed (except CSF). Protein binding: 10%–50%. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 4–11 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta, distributed in breast milk following IV administration. **Children:** Close monitoring of serum levels recommended in premature neonates, young infants. **Elderly:** Age-related renal impairment may increase risk of ototoxicity, nephrotoxicity; dosage adjustment recommended.

**INTERACTIONS**

**DRUG:** May increase concentration/effects of **aminoglycosides** (e.g., **amikacin**, **gentamicin**). **Bile acid sequestrants** (e.g., **cholestyramine**) may decrease therapeutic effect (oral vancomycin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase BUN. **Therapeutic peak serum level:** (Not routinely obtained) 20–40 mcg/mL; **therapeutic trough serum level:** 10–20 mcg/mL. **Toxic peak serum level:** greater than 40 mcg/mL; **toxic trough serum level:** greater than 20 mcg/mL.

**AVAILABILITY (Rx)**

**Capsules:** 125 mg, 250 mg. **Infusion, Premix:** 500 mg/100 mL, 750 mg/150 mL, 1 g/200 mL. **Injection, Powder for Reconstitution:** 500 mg, 750 mg, 1 g. **Oral Solution:** 25 mg/mL, 50 mg/mL.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Give by intermittent IV infusion (piggyback) or continuous IV infusion. Do not give IV push (may result in exaggerated hypotension or red man syndrome). Due to high risk of extravasation, consider infusion via central venous catheter.

**Reconstitution** • For intermittent IV infusion (piggyback), reconstitute each 500-mg vial with 10 mL Sterile Water for Injection (20 mL for 1-g vial) to provide concentration of 50 mg/mL. • Further dilute with D<sub>5</sub>W or 0.9% NaCl to final concentration not to exceed 5 mg/mL.

**Rate of administration** • Administer over 60 min or longer (30 min for each 500 mg recommended). • Monitor B/P closely during IV infusion.

**Storage** • Reconstituted vials are stable for 14 days at room temperature or if refrigerated. • Diluted solutions are stable for 14 days if refrigerated or 7 days at room temperature. • Discard if precipitate forms.

**PO**

• May give with food. • Powder for injection may be reconstituted and diluted for oral administration.

**IV INCOMPATIBILITIES**

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), aztreonam (Azactam), ceFAZolin (Ancef), cefotaxime (Claforan), ceFOXitin (Mefoxin), ceFTAZidime (Fortaz), ceFTRIAXone (Rocephin), cefuroxime (Zinacef), foscarnet (Foscavir), heparin, nafcillin (Nafcil), piperacillin, and tazobactam (Zosyn).

**IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), dilTIAZem (Cardizem), HYDROMorphone (Dilaudid), insulin, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, niCARDipine (Cardene), potassium chloride, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Initial IV dosing in nonobese pts is based on actual body weight. Subsequent dosing is adjusted based on serum trough concentrations and renal function. Pt-specific dosing may be necessary to determine dose and interval (e.g., morbid obesity, critical illness, unstable renal function).

**Usual Parenteral Dosage**

**IV: ADULTS, ELDERLY:** 15–20 mg/kg/dose (rounded to nearest 250 mg) q8–12h. Dosage requires adjustment in renal impairment. **Usual Maximum Dose:** 2 g. **ADOLESCENTS, CHILDREN, INFANTS:** 45–60 mg/kg/day divided q6–8h. Dose- and frequency-based serum concentrations. **NEONATES:** Loading dose of 20 mg/kg; then, 10–20 mg/kg/dose q12–48h.

**Staphylococcal Enterocolitis, Antibiotic-Associated Pseudomembranous Colitis Caused by Clostridium Difficile**

**PO: ADULTS, ELDERLY:** 125–500 mg 4 times/day for 10–14 days. **CHILDREN:** 40 mg/kg/day in 3–4 divided doses for 7–10 days. **Maximum:** 2 g/day.

**Dosage in Renal Impairment**

After loading dose, subsequent dosages and frequency are modified based on creatinine clearance, severity of infection, and serum concentration of drug.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequency:** **PO:** Bitter/unpleasant taste, nausea, vomiting, mouth irritation (with oral solution). **Rare:** **Parenteral:** Phlebitis, thrombophlebitis, pain at peripheral IV site, dizziness, vertigo, tinnitus, chills, fever, rash, necrosis with extravasation. **PO:** Rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure), ototoxicity (temporary or permanent hearing loss) may occur. Too-rapid infusion may cause red man syndrome, a common adverse reaction characterized by pruritus, urticaria, erythema, angioedema, tachycardia, hypotension, myalgia, maculopapular rash (usually appears on face, neck, upper torso). Cardiovascular toxicity (cardiac depression, arrest) occurs rarely. Onset usually occurs within 30 min of start of infusion, resolves within hrs following infusion. May result from too-rapid rate of infusion. Extravasation may cause tissue necrosis. Infusions via peripheral IV or midline access may cause thrombophlebitis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Avoid other ototoxic, nephrotoxic medications if possible. Obtain culture, sensitivity test before giving first dose (therapy may begin before results are known). Consider placement of central venous line/PICC line.

**INTERVENTION/EVALUATION**

Monitor serum renal function tests, I&O. Assess skin for rash. Check hearing acu-

ity, balance. Monitor B/P carefully during infusion. Monitor for red man syndrome. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Obtain vancomycin peak/trough level as ordered by physician or pharmacist. **Therapeutic serum level: peak:** 20–40 mcg/mL; **trough:** 10–20 mcg/mL. **Toxic serum level: peak:** greater than 40 mcg/mL; **trough:** greater than 20 mcg/mL.

**PATIENT/ FAMILY TEACHING**

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Report ringing in ears, hearing loss, changes in urinary frequency or consistency.
- Lab tests are important part of total therapy.

**vandetanib**

van-det-a-nib  
(Caprelsa)

**■ BLACK BOX ALERT ■** Can prolong QT interval (torsades de pointes and sudden cardiac death reported). Do not use in pts with hypokalemia, hypocalcemia, hypomagnesemia, congenital long QT syndrome. Electrolyte imbalances must be corrected prior to initiating therapy. If medication that prolongs QT interval is needed, more frequent ECG monitoring is recommended. ECGs should be obtained during wks 2–4 and wks 8–12 after starting therapy and 3 mos thereafter. Any dose reduction or interruption related to QT prolongation greater than 2 wks must have frequent ECG monitoring as noted above. Only certified prescribers and pharmacies with a restricted distribution program are able to prescribe and dispense.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of symptomatic or progressive medullary thyroid cancer in pts with unresectable locally advanced or metastatic disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to vandetanib. Congenital long QT syndrome. **Cautions:** Baseline cytopenias, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), hypothyroidism, cerebrovascular disease, moderate to severe renal/hepatic impairment, hypertension, uncompensated HF, history of torsades de pointes.

**ACTION**

Inhibits tyrosine kinases including epidermal growth factor (EGF) and vascular endothelial growth factor (VEGF). Blocks intracellular signaling, angiogenesis, and cellular proliferation. **Therapeutic Effect:** Inhibits thyroid tumor cell growth and survival.

**PHARMACOKINETICS**

Widely distributed. Peak concentration: 4–10 hrs. Metabolized in liver. Protein binding: 90%. Excreted in feces (44%), urine (25%). **Half-life:** 19 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 4 mos after treatment. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation.

**Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect.

**HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase risk of torsades de pointes, myelotoxicity. **LAB VALUES:** May decrease WBC, Hgb, neutrophils. May increase serum bilirubin, ALT, AST, creatinine; urine protein. May alter serum calcium, glucose, magnesium, potassium.

**AVAILABILITY (Rx)**

**Tablets:** 100 mg, 300 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • Do not crush. • May disperse in 2 oz of noncarbonated water and stir for 10 min until tablet is evenly dispersed (will not completely dissolve). Administer dispersion immediately. Rinse residue in glass with 4 oz water and administer. Can be given via feeding tube. • Direct contact of crushed tablets with skin or mucous membranes should be strictly avoided. If contact occurs, wash thoroughly.

**Storage** • Contact pharmacy to properly discard out-of-date tablets.

**INDICATIONS/ROUTES/DOSAGE****Thyroid Cancer**

**Note:** Do not begin unless QTc interval is less than 450 msec. Maintain serum calcium and magnesium within normal limits. Maintain serum potassium at least 4 mEq/L or greater.

**PO: ADULTS, ELDERLY:** 300 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dosage Adjustment for QT Prolongation or Toxicity**

Interrupt therapy until resolved or improved, then restart at 100–200 mg once daily.

**Dosage in Renal Impairment**

**CrCl less than 50 mL/min:** 200 mg once daily. Closely monitor QT interval.

**Dosage in Hepatic Impairment****Mild impairment:** No dose adjustment.**Moderate to severe impairment:** Not recommended.**SIDE EFFECTS**

**Frequent (57%–21%):** Diarrhea/colitis, rash, dermatitis acneiform/acne, nausea, headache, fatigue, anorexia, abdominal pain. **Occasional (15%–10%):** Dry skin, vomiting, asthenia, photosensitivity, insomnia, nasopharyngitis, dyspepsia, cough, pruritus, weight decrease, depression.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Prolonged QT interval resulting in torsades de pointes, ventricular arrhythmias, sudden cardiac death have been reported. Frequent diarrhea may result in electrolyte imbalances. Severe skin reactions, including Stevens-Johnson syndrome, have been reported. Interstitial lung disease (ILD) or pneumonitis reported (may result in respiratory-related death). Consider ILD in pts with hypoxia, pleural effusion, cough, dyspnea. Ischemic cerebrovascular events have been reported. Life-threatening events including hypertensive crisis, reversible posterior leukoencephalopathy syndrome (RPLS) have been noted. Adverse reactions resulting in death included respiratory failure/arrest, aspiration pneumonia, cardiac failure, sepsis, GI bleeding.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; ECG; pregnancy test in females of reproductive potential. Question for history of congenital long QT syndrome, HF, arrhythmias, hepatic/renal impairment, seizures, CVA, hemorrhagic events, HTN. Obtain full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, serum electrolytes. Obtain ECG during wks 2–4, wks 8–12, then every 3 mos thereafter. Obtain ECG for palpitations, chest pain, hypokalemia, hyperkalemia, hypocalcemia, bradycardia, ventricular arrhythmias, syncope. Report any respiratory changes including dyspnea, cough (may indicate ILD). Reversible posterior leukoencephalopathy syndrome should be considered in pts with seizures, headache, visual disturbances, confusion, altered mental status. Ophthalmologic exams including slit lamp recommended in pts with visual disturbances.

**PATIENT/FAMILY TEACHING**

- Use effective contraception to avoid pregnancy.
- Changes in mental status, seizures, headache, blurry vision, trouble speaking, one-sided weakness may indicate stroke, high blood pressure crisis, or life-threatening brain swelling. Immediately report any newly prescribed medications.
- Limit exposure to sunlight.
- Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
- Report palpitations, chest pain, shortness of breath, dizziness, fainting (may indicate arrhythmia).

**varenicline**

var-en-i-kleen  
(Champix , Chantix)

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective partial nicotine agonist. **CLINICAL:** Smoking deterrent.

**USES**

Aid to smoking-cessation treatment.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to varenicline. **Cautions:** Renal impairment, history of suicidal ideation or preexisting psychiatric illness, bipolar disorder, depression, schizophrenia, pts at risk for seizures (e.g., head trauma, seizure disorder).

**ACTION**

Prevents nicotine stimulation of mesolimbic dopamine system associated with nicotine addiction. **Therapeutic Effect:** Decreases desire to smoke.

**PHARMACOKINETICS**

Widely distributed. Absorption unaffected by food, time-of-day dosing. Peak plasma concentration: 3–4 hrs. Steady state reached within 4 days. Protein binding: 20%. Minimal metabolism. Removed by hemodialysis. Primarily excreted unchanged in urine. **Half-life:** 24 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Not recommended. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Histamine H<sub>2</sub> receptor antagonists (e.g., famotidine, ranitidine) may increase concentration/effect. May increase concentration/effect of nicotine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

 **Tablets, Film-Coated:** 0.5 mg, 1 mg.

**ADMINISTRATION/HANDLING**

- Give after meal and with full glass of water.
- Do not break, crush, dissolve, or divide film-coated tablets.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Therapy should start 1 wk before stopping smoking.

**Smoking Deterrent**

**PO: ADULTS, ELDERLY: Days 1–3:** 0.5 mg once daily. **Days 4–7:** 0.5 mg twice daily. **Day 8—end of treatment:** 1 mg twice daily. Therapy should last for total of 12 wks. Pts who have successfully stopped smoking at the end of 12 wks should continue with an additional 12 wks of treatment to increase likelihood of long-term abstinence.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** 0.5 mg once daily. **Maximum:** 0.5 mg twice daily.

**End-stage renal disease, undergoing hemodialysis: Maximum:** 0.5 mg once daily.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (30%–13%):** Nausea, insomnia, headache, abnormal dreams. **Occasional (8%–5%):** Constipation, abdominal discomfort, fatigue, dry mouth, flatulence, altered taste, dyspepsia, vomiting, anxiety, depression, irritability. **Rare (3%–1%):** Drowsiness, rash, increased appetite, lethargy, nightmares, gastric reflux, rhinorrhea, agitation, mood swings.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Abrupt withdrawal may cause irritability, sleep disturbances in 3% of pts. Hypertension, angina pectoris, arrhythmia, bradycardia, coronary artery disease, gingivitis, anemia, lymphadenopathy occur rarely. May cause bizarre behavior, suicidal ideation. May increase risk for seizure activity.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Screen, evaluate for coronary heart disease (history of MI, angina pectoris), cardiac arrhythmias, suicidal ideation. Assess smoking pack/day history.

**INTERVENTION/EVALUATION**

Discontinue use if cardiovascular symptoms occur or worsen. Monitor for psychiatric symptoms (changes in behavior, mood, level of interest, appearance). Assess for cravings, noncompliance with cessation.

**PATIENT/FAMILY TEACHING**

- Initiate treatment 1 wk before quitting date.
- Take with food and with full glass of water.
- Report persistent nausea, insomnia.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

**vasopressin**

vay-soe-pres-in  
(Vasostrict)

**Do not confuse Pitressin with Pitocin.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Posterior pituitary hormone. **CLINICAL:** Vasopressor, antidiuretic hormone analogue.

**USES**

**Vasoconstriction:** To increase blood pressure in adults with vasodilatory shock who remain hypotensive despite fluids and catecholamines. **OFF-LABEL:** Adjunct in treatment of acute massive GI hemorrhage or esophageal varices.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to vasopressin. **Cautions:** Seizure disorder, migraine, asthma, vascular disease, renal/cardiac disease, goiter (with cardiac complications), arteriosclerosis, nephritis, elderly.

**ACTION**

Stimulates a family of arginine vasopressin (AVP) receptors. **Therapeutic Effect:** Increases systemic vascular resistance and mean arterial BP; increases water permeability at renal tubules, causing a decreased urine volume and increased osmolality; causes smooth muscle contraction in GI tract.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
IV	N/A	N/A	0.5–1 hr
IM, SQ	1–2 hrs	N/A	2–8 hrs

Widely distributed. Metabolized in liver, kidney. Primarily excreted in urine. **Half-life:** 10–20 min.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Caution in giving to breastfeeding women. **Children/Elderly:** Caution due to risk of water intoxication/hyponatremia.

**INTERACTIONS**

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Injection Solution:** 20 units/mL.

**ADMINISTRATION/HANDLING**

 **IV**

**Reconstitution** • Dilute in D<sub>5</sub>W or 0.9% NaCl to concentration of 0.1–1 unit/mL (usual concentration: 100 units/500 mL D<sub>5</sub>W).

**Rate of administration** • Give as IV infusion.

**Storage** • Store at room temperature.

**IM, SQ**

- Give with 1–2 glasses of water to reduce side effects.

 **IV INCOMPATIBILITIES**

Furosemide (Lasix), phenytoin (Dilantin).

**IV COMPATIBILITIES**

Amiodarone, argatroban, diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, insulin, milrinone (Primacor), nitroglycerin, norepinephrine (Levophed), pantoprazole (Protonix), phenylephrine (Neo-Synephrine).

**INDICATIONS/ROUTES/DOSAGE****Vasodilatory Shock**

**IV infusion: ADULTS, ELDERLY:** Initially, 0.03 units/min. Titrate by 0.005 units/min at 10–15-min intervals. **Maximum:** 0.1 units/min.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Pain at injection site (with vasopressin tannate). **Occasional:** Abdominal cramps, nausea, vomiting, diarrhea, dizziness, diaphoresis, pale skin, circumoral pallor, tremors, headache, eructation, flatulence. **Rare:** Chest pain, confusion, allergic reaction (rash, urticaria, pruritus, wheezing, difficulty breathing, facial/peripheral edema), sterile abscess (with vasopressin tannate).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anaphylaxis, MI, water intoxication have occurred. Elderly, very young are at higher risk for water intoxication. May increase risk of ischemia (cardiac, mesenteric, limb, skin). Extravasation may cause tissue necrosis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum electrolytes; urine specific gravity in pts with diabetes insipidus. Obtain B/P, heart rate.

**INTERVENTION/EVALUATION**

Monitor I&O closely, restrict intake as necessary to prevent water intoxication.

Weigh daily if indicated. Check B/P, pulse frequently. Monitor serum electrolytes, urine specific gravity. Be alert for early signs of water intoxication (altered mental status, muscle cramping or twitching; seizures). Monitor for chest pain, tachycardia; hypersensitivity reactions.

**PATIENT/FAMILY TEACHING**

- Promptly report headache, chest pain, shortness of breath, other symptoms.
- Stress importance of I&O.
- Avoid alcohol.
- Report symptoms of water intoxication (e.g., confusion, cramping, nausea, muscle twitching, seizures, vomiting).

**vedolizumab**

ve-doe-liz-ue-mab  
(Entyvio)

**Do not confuse vedolizumab with certolizumab, eculizumab, natalizumab, omalizumab, tocilizumab.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective adhesion molecule inhibitor. Monoclonal antibody. **CLINICAL:** GI agent.

**USES**

Treatment of adults with moderately to severely active ulcerative colitis (UC) who have had an inadequate response with, lost response to, or were intolerant to a tumor necrosis factor (TNF) blocker or immunomodulator; or had an inadequate response with, were intolerant to, or demonstrated dependence on corticosteroids. Treatment of adults with moderately to severely active Crohn's disease (CD) who have had an inadequate response with, lost response to, or were intolerant to a TNF blocker or immunomodulator; or had an inadequate response with, were intolerant to, or demonstrated dependence on corticosteroids.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to vedolizumab. **Cautions:** Hepatic impairment, pts who resided or traveled to endemic areas; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral infections including herpes zoster, TB), prior malignancies. Preexisting or recent-onset CNS demyelinating disorders including multiple sclerosis.

## ACTION

Binds to T-lymphocyte integrin receptors and blocks the interaction with mucosal addressin cell adhesion molecule-1 (MADCAM-1). Inhibits migration of memory T-lymphocytes across the endothelium into inflamed GI parenchymal tissue. **Therapeutic Effect:** Reduces chronic inflammation of colon.

## PHARMACOKINETICS

Metabolism not specified. Excretion not specified. **Half-life:** 25 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Use caution when administering to nursing women.

**Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Anti-TNF agents (e.g., adalimumab, certolizumab, etanercept, infliximab) may increase adverse effects. May decrease the therapeutic effect; increase adverse effects of vaccines (live). May decrease therapeutic effect of BCG (intravesical). May increase toxic effect of natalizumab. **HERBAL:** Echinacea may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin.

## AVAILABILITY (Rx)

**Lyophilized Powder for Injection:** 300 mg.

## ADMINISTRATION/HANDLING

**Infusion guidelines**

- Do not administer IV push or bolus.
- Reconstitute with Sterile Water for Injection and subsequently dilute with 0.9% NaCl only.
- After infusion completed, flush IV line with 30 mL of 0.9% NaCl.

**Reconstitution**

- Reconstitute with 4.8 mL Sterile Water for Injection. Direct stream toward glass wall to avoid excessive foaming.
- Gently swirl contents for at least 15 sec until completely dissolved.
- Do not shake or agitate.
- Allow solution to sit at room temperature for up to 20 min to allow remaining foam to settle and powder to dissolve. If not fully dissolved after 20 min, allow additional 10 min for dissolution. Do not use if product is not dissolved within 30 min.
- Visually inspect for particulate matter and discoloration. Do not use if discolored or if particulate matter is observed.
- Prior to withdrawing solution, invert vial 3 times to ensure mixing.
- Withdraw 5 mL and further dilute in 250 mL 0.9% NaCl bag.
- Infuse immediately.

**Rate of administration**

- Infuse over 30 min.

**Storage**

- Reconstituted solution should appear clear to opalescent, colorless to light brownish yellow and free of particles.
- May refrigerate diluted solution for up to 4 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Ulcerative Colitis and Crohn's Disease

**IV: ADULTS, ELDERLY:** 300 mg once at wk 0, wk 2, and wk 6, then q8 wks thereafter. Discontinue in pts who do not show evidence of therapeutic benefit by wk 14.

### Dosage in Renal Impairment

**Mild to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Occasional (13%–4%):** Nasopharyngitis, headache, arthralgia, nausea, pyrexia, upper respiratory tract infection, fatigue, cough, bronchitis, influenza, back pain. **Rare (3%):** Rash, pruritus, sinusitis, oropharyngeal pain, extremity pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Infusion-related reactions, including anaphylaxis, characterized by bronchospasm, dyspnea, flushing, hypotension, laryngeal edema, nausea, pyrexia, tachycardia, wheezing, vomiting, reported in less than 1% of pts. May increase risk of severe infections such as anal abscess, cytomegaloviral colitis, giardiasis, *Listeria* meningitis, *Salmonella* sepsis, TB, UTI, which may lead to fatal sepsis. PML (weakness, paralysis, vision loss, aphasia, cognition impairment) has occurred rarely; however, immunocompromised pts are at increased risk for development. Hepatotoxicity with serum ALT, AST greater than 3 times upper limit of normal reported in less than 2% of pts. Malignancies including B-cell lymphoma, breast cancer, colon cancer, lung cancer of primary neuroendocrine carcinoma, lung neoplasm, malignant hepatic neoplasm, melanoma, renal cancer, squamous cell carcinoma, transitional cell carcinoma occur rarely. Immunogenicity (anti-vedolizumab antibodies) occurred in 4%–13% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Screen for active infection; history of chronic, opportunistic infections. Question history of prior malignancies. Consider completion of age-appropriate immunizations prior to initiation. Evaluate for active

TB and test for latent infection prior to and during treatment. An induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing for latent TB. Antifungal therapy should be considered for those who reside in or travel to regions where mycoses are endemic. Have supplemental oxygen, anaphylaxis kit readily available. Assess degree of abdominal pain, cramping; usual bowel movement patterns, stool characteristics.

**INTERVENTION/EVALUATION**

Monitor LFT. Obtain CBC if infection is suspected. Monitor for symptoms of TB (cough, fatigue, hemoptysis, nocturnal sweating, weight loss), including those who tested negative for latent TB infection. Monitor for infections (abdominal pain, cough, fatigue, fever). Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs. Monitor for hypersensitivity reaction. Infusion-related reactions generally occur within 2 hrs after infusion. Consider administration of antihistamine, antipyretic, and/or corticosteroid if mild to moderate hypersensitivity reaction occurs. If anaphylaxis occurs, provide immediate resuscitation support. Monitor for new onset or worsening of neurologic symptoms, esp. in pts with CNS disorders; may indicate PML.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever; fungal infections. Avoid those with active infection.
- Report travel plans to possible endemic areas.
- Do not receive live vaccines.
- Expect frequent TB screening.
- Dormant or chronic viral, invasive fungal infections may become reactivated.
- Treatment may cause new cancers.
- Infusion may cause severe allergic reactions such as face/tongue swelling, hives, itching, low blood pressure, trouble

breathing, or, in some cases, anaphylaxis. • Do not breastfeed. • Abdominal pain, bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes may indicate liver problem. • Paralysis, vision changes, impaired speech, altered mental status may indicate life-threatening neurologic event called progressive multifocal leukoencephalopathy (PML).

## vemurafenib

vem-ue-raf-e-nib  
(Zelboraf)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** BRAF kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of unresectable or metastatic melanoma with a BRAF V600E mutation as detected by FDA-approved test. Treatment of Erdheim-Chester disease (ECD) in pts with a BRAF V600E mutation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to vemurafenib. **Cautions:** Hepatic impairment, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), elderly, prior radiation therapy.

### ACTION

Inhibits kinase activity of certain mutated forms of BRAF. **Therapeutic Effect:** Blocks tumor cell proliferation in melanoma with the mutation.

### PHARMACOKINETICS

Widely distributed. Protein binding: 99%. Minimally metabolized in liver. Primarily excreted in feces (94%). **Half-life:** 57 hrs. Range: 30–120 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse reactions, side effects.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration/effect of digoxin. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. May increase bleeding effect with warfarin. May decrease concentration/effect of hormonal contraceptives. May increase concentration/effect of tizanidine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, gamma-glutamyl transferase (GGT), bilirubin.

### AVAILABILITY (Rx)

 **Film-Coated Tablets:** 240 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food in the morning and evening, approx. 12 hrs apart with a full glass of water. • Administer tablets whole; do not break, crush, divide, or dissolve.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Management of adverse drug reactions may require dose reduction, treatment interruption, or discontinuation.

#### ECD, Melanoma

**PO: ADULTS, ELDERLY:** 960 mg twice daily (in morning and evening about 12

hrs apart). Continue until disease progression or unacceptable toxicity.

### Dosage Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). **Grade 1 or Grade 2 (tolerable) toxicity:** No dose adjustment. **Grade 2 (intolerable) or Grade 3 toxicity: First occurrence:** Interrupt treatment until toxicity returns to Grade 0 or 1, then resume at 720 mg twice daily. **Second occurrence:** Interrupt treatment, then resume at 480 mg twice daily. **Third occurrence:** Discontinue. **Grade 4 toxicity: First occurrence:** Interrupt treatment, then resume at 480 mg twice daily. **Second occurrence:** Discontinue.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use with caution.

### SIDE EFFECTS

**Frequent (53%–33%):** Arthralgia, alopecia, fatigue, rash, nausea. **Occasional (28%–11%):** Diarrhea, hyperkeratosis, headache, pruritus, pyrexia, dry skin, extremity pain, anorexia, vomiting, peripheral edema, erythema, dysgeusia, myalgia, constipation, asthenia. **Rare (8%–5%):** Maculopapular rash, actinic keratosis, musculoskeletal pain, back pain, cough, papular rash.

### ADVERSE EFFECTS/TOXIC REACTIONS

Cutaneous squamous cell carcinoma (cuSCC) and keratoacanthomas reported in 24% of pts. Pts at increased risk of cuSCC include elderly pts, pts with prior skin cancer, chronic sun exposure. Hypersensitivity reactions including erythema, hypotension, anaphylaxis reported. Mild to severe photosensitivity was reported. Serious dermatologic reactions include Stevens-Johnson syndrome, toxic epidermal necrolysis. Ophthalmologic reactions including uveitis

reported. Hepatotoxicity may lead to discontinuation.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP; ECG; pregnancy test in females of reproductive potential. Confirm presence of BRAF V600E mutation. Review history for previous radiation therapy. Assess skin for moles, lesions, papilloma, and perform full dermatologic exam. Obtain ophthalmologic exam, visual acuity. Obtain full medication history (esp. QT interval–prolonging drugs) and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ECG 15 days after initiation, then monthly for first 3 mos, then q3mos thereafter. Routinely assess skin during treatment and for 6 mos after discontinuation. Immediately report any new skin lesions. Obtain ECG for palpitations, chest pain, syncope. Pruritus, difficulty breathing, erythema, hypotension may indicate anaphylaxis.

### PATIENT/FAMILY TEACHING

- Treatment may cause new cancers.
- Use effective contraception to avoid pregnancy.
- Avoid sunlight exposure.
- Report any skin changes, including new warts, sores, reddish bumps that bleed or do not heal, change in mole size or color.
- Report yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output, skin changes.
- Report palpitations, chest pain, shortness of breath, dizziness, fainting (may indicate arrhythmia).

## venetoclax

ven-et-oh-klax  
(Venclexta)

**Do not confuse venetoclax or Venclexta with Venelex.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** B-cell lymphoma 2 (BCL-2) inhibitor. **CLINICAL:** Antineoplastic.

## USES

Monotherapy or in combination with rituximab for treatment of pts with chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL) with or without 17p deletion who have received at least one prior therapy. Treatment of newly diagnosed acute myeloid leukemia (AML) (in combination with azacitidine, decitabine, or low-dose cytarabine) in pts 75 yrs of age or older, or with comorbidities precluding use of intensive induction chemotherapy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to venetoclax. Concomitant use of strong CYP3A inhibitors at initiation and during ramp-up phase. **Cautions:** Baseline cytopenias, concomitant use of moderate CYP3A inhibitors, P-gp inhibitors; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hepatic/renal impairment, electrolyte imbalance; history of gout; pts at high risk for tumor lysis syndrome (high tumor burden).

## ACTION

Selectively binds to and inhibits anti-apoptotic protein BCL-2 overexpressed in CLL cells and AML cells, restoring process of apoptosis. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: highly bound (unspecified). Peak plasma concentration: 5–8 hrs. Excreted in feces (greater than 99%). **Half-life:** 26 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malforma-

tions. Females and males with female partners of reproductive potential should use effective contraception during treatment and for at least 30 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May impair fertility in males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil), P-gp inhibitors (e.g., cyclosporine, ranolazine, ticagrelor) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration/effect of digoxin. May decrease the therapeutic effect; increase adverse effects of vaccines (live). May increase immunosuppressive effect of tofacitinib, upadacitinib. **HERBAL:** Bitter orange may increase concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. Low-fat meals, high-fat meals increase exposure/concentration. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets, RBCs; serum calcium, potassium. Tumor lysis syndrome may result in elevated serum phosphate, potassium, uric acid.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food and water at same time each day.
- Administer tablets whole; do not cut, crush, or divide.
- If a dose is missed by no more than 8 hrs, administer as soon as possible. If dose is missed by more than 8 hrs or if vomiting occurs after dosing, skip dose and administer the next dose on schedule.

**INDICATIONS/ROUTES/DOSAGE****CLL**

**PO: ADULTS, ELDERLY: Week 1:** 20 mg once daily for 7 days. **Week 2:** 50 mg once daily for 7 days. **Week 3:** 100 mg once daily for 7 days. **Week 4:** 200 mg once daily for 7 days. **Week 5 and thereafter:** 400 mg once daily. Continue until disease progression or unacceptable toxicity. **In combination with rituximab: Week 5 and thereafter:** 400 mg once daily. Continue until disease progression or unacceptable toxicity for up to 24 mos from day 1 (cycle 1) of rituximab. Begin rituximab after receiving venetoclax at 400 mg once daily for 7 days. **In combination with obinutuzumab:** Obinutuzumab begins on day 1 of cycle 1. Begin venetoclax on day 22 of cycle 1 (based on 5-wk ramp-up schedule). Ramp-up is completed at end of cycle 2. **Cycle 3 (day 1 and beyond):** 400 mg once daily until end of cycle 12. Each cycle is 28 days.

**AML**

**PO: ADULTS 75 YRS OR OLDER: Day 1:** 100 mg once daily. **Day 2:** 200 mg once daily. **Day 3:** 400 mg once daily. **In combination with azacITIDine or decitabine: Day 4 and beyond:** 400 mg once daily. Continue until disease progression or unacceptable toxicity. **In combination with low-dose cytarabine: Day 4 and beyond:** 600 mg once daily. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE). For pts with dose interruption greater than 1 wk during 5-wk ramp-up phase or greater than 2 wks at 400 mg daily dose, reassess risk of tumor lysis syndrome to determine if reinitiation with a reduced dose is needed. Consider discontinuation in pts who require reduced dosage of less than 100 mg for more than 2 wks.

**Dose Reduction Schedule**

**Note:** During ramp-up phase, continue reduced dose for 1 wk before increasing dose.

**Dose interruption at 400 mg:** Resume at 300 mg. **Dose interruption at 300 mg:** Resume at 200 mg. **Dose interruption at 200 mg:** Resume at 100 mg. **Dose interruption at 100 mg:** Resume at 50 mg. **Dose interruption at 50 mg:** Resume at 20 mg. **Dose interruption at 20 mg:** Resume at 10 mg.

**Tumor Lysis Syndrome**

**Any occurrence of blood chemistry abnormalities:** Withhold next dose, then resume at same dose if resolved within 24–48 hrs of last dose. If not resolved within 48 hrs, resume at reduced dose.

**Any event of tumor lysis syndrome:** Resume at reduced dose once resolved.

**Grade 3 or 4 Nonhematologic Toxicity**

**First occurrence:** Withhold treatment until resolved to Grade 1 or baseline, then resume at same dose. **Second and subsequent occurrences:** Withhold treatment until resolved, then follow dose reduction schedule (or reduce dose at prescriber's discretion).

**Hematologic Toxicity**

**First occurrence of Grade 3 or 4 neutropenia with infection or fever; Grade 4 hematologic toxicity (except lymphopenia):** Withhold treatment until resolved to Grade 1 or baseline, then resume at same dose. **Second and subsequent occurrences:** Withhold treatment until resolved, then follow dose reduction schedule (or reduce dose at prescriber's discretion).

**Concomitant Use CYP3A Inhibitors, P-gp Inhibitors**

**Strong CYP3A inhibitors:** Avoid inhibitor or reduce venetoclax dose by at least 75%. **Moderate CYP3A inhibitors or P-gp Inhibitors:** Avoid inhibitor or reduce venetoclax dose by at least 50%.

**Dosage in Renal/Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (35%–14%):** Diarrhea, nausea, fatigue, pyrexia, vomiting, headache, constipation. **Occasional (13%–10%):** Cough, peripheral edema, back pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy. Grade 3 or 4 neutropenia reported in 41% of pts. Pts with high tumor burden, renal impairment, concomitant use of strong or moderate CYP3A inhibitors, P-gp inhibitors may experience life-threatening tumor lysis syndrome, which mainly occurs during the 5-wk ramp-up phase and as early as 6–8 hrs after dose (hospitalization may be necessary). Tumor lysis syndrome may cause renal failure requiring emergent dialysis. Other reactions may include upper respiratory tract infection, pneumonia, autoimmune hemolytic anemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, BMP, renal function test; serum phosphate, calcium; vital signs prior to initiation and periodically thereafter. Obtain pregnancy test in female pts of reproductive potential. Question history of hepatic/renal impairment, gout. Assess all pts for high risk of tumor lysis syndrome and provide adequate hydration and antihyperuricemics (according to manufacturer guidelines) prior to first dose. Conduct tumor burden assessments including blood chemistries, radiologic testing (e.g., CT scan). Correct electrolyte imbalances prior to initiation. Receive full medication history (esp. CYP3A inhibitors, P-gp inhibitors, drugs with narrow therapeutic index). Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression. Diligently monitor for tumor lysis syn-

drome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Monitor for infection and provide appropriate antimicrobial therapy if indicated. To reduce risk of neutropenia-associated infection, consider administration of granulocyte-colony stimulating factor (e.g., filgrastim). Monitor for toxicities if discontinuation of CYP3A inhibitors, P-gp inhibitors is unavoidable. Monitor I&O. Assess hydration status.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and may lead to death. Report decreased urination, amber-colored urine, confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Drink at least 6–8 glasses of water every day.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Avoid grapefruit products, herbal supplements.
- Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Do not receive live vaccines.

## venlafaxine

ven-la-fax-een  
(Effexor XR)

**BLACK BOX ALERT** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin-norepinephrine reuptake inhibitor (SNRI). **CLINICAL:** Antidepressant.

**USES**

Treatment of depression. Treatment of generalized anxiety disorder (GAD), social anxiety disorder (SAD). Treatment of panic disorder, with or without agoraphobia. **OFF-LABEL:** Treatment of attention-deficit hyperactivity disorder (ADHD), obsessive-compulsive disorder (OCD), hot flashes, diabetic neuropathy, posttraumatic stress disorder (PTSD).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to venlafaxine. Use of MAOIs intended to treat psychiatric disorders concurrently or within 14 days of discontinuing MAOI. Initiation of MAOI to treat psychiatric disorder within 7 days of discontinuing venlafaxine, initiation in pts receiving linezolid or IV methylene blue. **Cautions:** Seizure disorder, renal/hepatic impairment, pts at high risk for suicide, recent MI, mania, volume-depleted pts, narrow-angle glaucoma, HF, hyperthyroidism, abnormal platelet function, elderly.

**ACTION**

Potentiates CNS neurotransmitter activity by inhibiting reuptake of serotonin, norepinephrine, and, to lesser degree, DOPamine. **Therapeutic Effect:** Relieves depression.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 25%–30%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs; metabolite, 9–13 hrs (increased in hepatic/renal impairment).

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Children, adolescents are at increased risk for suicidal ideation and behavior, worsening depression, esp. during first few mos of therapy. **Elderly:** Use caution.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. MAOIs (e.g., phenelzine, selegiline) may cause neuroleptic malignant syndrome, autonomic instability (including rapid fluctuations of vital signs), extreme agitation, hyperthermia, altered mental status, myoclonus, rigidity, coma. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. NSAIDs (e.g., diclofenac, meloxicam, naproxen), aspirin, warfarin may increase risk of bleeding. **HERBAL:** St. John's wort may decrease concentration/effect. **Herbals with anticoagulant/antiplatelet properties** (e.g., garlic, ginger, ginkgo biloba), glucosamine may increase risk of bleeding. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum cholesterol CPK, LDH, prolactin, GGT.

**AVAILABILITY (Rx)**

**Tablets:** 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg.

 **Capsules, Extended-Release:** (*Effexor XR*): 37.5 mg, 75 mg, 150 mg. **Tablets, Extended-Release:** 37.5 mg, 75 mg, 150 mg, 225 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with food.
- Scored tablet may be crushed.
- Do not break, crush, dissolve, or divide extended-release tablets.
- May open capsule, sprinkle on applesauce. Give immediately without chewing and follow with full glass of water.

**INDICATIONS/ROUTES/DOSAGE****Depression**

**PO:** (*Immediate-Release*): **ADULTS, ELDERLY:** Initially, 37.5–75 mg/day in 2–3 divided doses with food. May increase up to 75 mg/day at intervals of 4 days or longer. Usual dose: 75–375 mg/day. **Maximum:** 375 mg/day in 3 divided doses.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 37.5–75 mg/day as single dose with food. May increase by 75 mg/day at intervals of 4 days or longer. Usual dose: 75–225 mg once daily. **Maximum:** 225 mg/day.

#### Generalized Anxiety Disorder (GAD)

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 37.5–75 mg/day (pts initiated at 37.5 mg once daily may increase to 75 mg once daily after 4–7 days). May increase by 75 mg/day at 4-day intervals up to 225 mg/day.

#### Panic Disorder

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 37.5 mg/day. May increase to 75 mg after 7 days followed by increases of 75 mg/day at 7-day intervals up to 225 mg/day.

#### Social Anxiety Disorder (SAD)

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 37.5 mg once daily. May increase to 75 mg/day after 1–2 wks. May further increase in increments of 75 mg/wk up to 225 mg once daily.

#### Dosage in Renal/Hepatic Impairment

Consider decreasing venlafaxine dosage by 50% in pts with moderate hepatic impairment, 25% in pts with mild to moderate renal impairment, 50% in pts on dialysis (withhold dose until completion of dialysis). When discontinuing therapy, taper dosage slowly over 2 wks.

## SIDE EFFECTS

**Frequent (greater than 20%):** Nausea, drowsiness, headache, dry mouth. **Occasional (20%–10%):** Dizziness, insomnia, constipation, diaphoresis, nervousness, asthenia, ejaculatory disturbance, anorexia. **Rare (less than 10%):** Anxiety, blurred vision, diarrhea, vomiting, tremor, abnormal dreams, impotence.

## ADVERSE EFFECTS/TOXIC REACTIONS

Sustained increase in diastolic B/P of 10–15 mm Hg occurs occasionally. Se-

rotonin syndrome (agitation, confusion, hallucinations, hyperreflexia), neuroleptic malignant syndrome (muscular rigidity, fever, cognitive changes), suicidal ideation have occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain weight, B/P. Assess appearance, behavior, speech pattern, level of interest, mood. Assess risk of suicide.

### INTERVENTION/EVALUATION

Monitor signs/symptoms of depression, B/P, weight. Assess sleep pattern for evidence of insomnia. Check during waking hours for drowsiness, dizziness, anxiety; provide assistance as necessary. Assess appearance, behavior, speech pattern, level of interest, mood for therapeutic response. Monitor for suicidal ideation (esp. at initiation of therapy or changes in dosage).

### PATIENT/ FAMILY TEACHING

- Take with food to minimize GI distress.
- Do not increase, decrease, suddenly stop medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report if breastfeeding, pregnant, or planning to become pregnant.
- Avoid alcohol.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## verapamil

ver-ap-a-mil

(Calan SR, Verelan, Verelan PM, Isoptin SR )

**Do not confuse Verelan with Voltaren, or Calan with Colace or dILTIAZem.**

### FIXED-COMBINATION(S)

**Tarka:** verapamil/trandolapril (an ACE inhibitor): 240 mg/1 mg, 180 mg/2 mg, 240 mg/2 mg, 240 mg/4 mg.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Calcium channel blocker (nondihydropyridine). **CLINICAL:** Antihypertensive, antianginal, antiarrhythmic (class IV).

**USES**

**Parenteral:** Management of supraventricular tachyarrhythmias (SVT, rapid conversion to sinus rhythm), temporary control of rapid ventricular rate in atrial flutter/fibrillation. **PO:** Treatment of angina at rest (e.g., vasospastic angina, unstable angina, chronic stable angina). Control of ventricular rate at rest and during stress in chronic atrial flutter and/or fibrillation. Management of hypertension. Prophylaxis of repetitive paroxysmal supraventricular tachycardia (PSVT).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to verapamil. Atrial fibrillation/flutter in presence of accessory bypass tract (e.g., Wolff-Parkinson-White, Lown-Ganong-Levine syndromes), severe left ventricular dysfunction, cardiogenic shock, second- or third-degree heart block (except with pacemaker), hypotension (SBP less than 90 mm Hg), sick sinus syndrome (except with pacemaker). **IV (additional):** Current use of IV beta-blocking agents, ventricular tachycardia. **Cautions:** Renal/hepatic impairment, concomitant use of beta blockers and/or digoxin, myasthenia gravis, elderly, hypertrophic cardiomyopathy. Avoid use in HF.

**ACTION**

Inhibits calcium ion entry across cardiac, vascular smooth-muscle cell membranes, dilating coronary arteries, peripheral arteries, arterioles. **Therapeutic Effect:** Decreases heart rate, myocardial contractility; slows SA, AV conduction. Decreases total peripheral vascular resistance by vasodilation.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 90% (60% in neonates). Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life: Single dose:** 2–8 hrs; **multiple doses:** 4.5–12 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Drug crosses placenta; distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** May increase hypotensive effect of **angiotension-converting enzyme (ACE) inhibitors** (e.g., enalapril, lisinopril), **angiotensin II receptor blockers** (e.g., valsartan), **HCTZ**, **hydralazine**. May increase concentration/effects of **bosutinib**, **carbamazepine**, **cyclosporine**, **dofetilide**, **eletriptan**, **lomitapide**, **neratinib**, **simvastatin**, **theophylline**. **HERBAL:** Herbals with **hypertensive properties** (e.g., licorice, yohimbe) or **hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** **Grapefruit products** may increase concentration/effect. **LAB VALUES:** ECG may show prolonged PR interval. **Therapeutic serum level:** 0.08–0.3 mcg/mL; **toxic serum level:** N/A.

**AVAILABILITY (Rx)**

**Injection Solution:** 2.5 mg/mL. **Tablets:** 40 mg, 80 mg, 120 mg.

**Capsules, Extended-Release:** 100 mg, 120 mg, 180 mg, 200 mg, 240 mg, 300 mg, 360 mg. **Tablets, Extended-Release:** 120 mg, 180 mg, 240 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • May give undiluted.

**Rate of administration** • Administer IV push over 2 min for adults, children; give over 3 min for elderly. • Continuous ECG monitoring during IV injection is required for children, recommended for adults. • Monitor ECG for rapid ventricular rate, extreme bradycardia, heart block, asystole, prolongation of PR interval. Notify physician of any significant changes. • Monitor B/P q5–10min. • Pt should remain recumbent for at least 1 hr after IV administration.

**Storage** • Store vials at room temperature.

**PO**

- Do not give with grapefruit products.
- Do not crush or cut extended-release tablets, capsules. Give extended-release tablets with food.
- Sustained-release capsules may be opened and sprinkled on applesauce, then swallowed immediately (do not chew).

**IV INCOMPATIBILITIES**

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), nafcillin (Nafcil), propofol (Diprivan), sodium bicarbonate.

**IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium chloride, calcium gluconate, dexamethasone (Decadron), digoxin (Lanoxin), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), heparin, HYDRomorphone (Dilaudid), lidocaine, magnesium sulfate, metoclopramide (Reglan), milrinone (Primacor), morphine, multivitamins, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, procainamide (Pronestyl), propranolol (Inderal).

**INDICATIONS/ROUTES/DOSAGE**

**Supraventricular Tachycardia (SVT)**

**IV: ADULTS, ELDERLY:** Initially, 5 to 10 mg (0.075 to 0.15 mg/kg) over 2 min. Repeat dose: 10 mg (0.15 mg/kg) 30 min after initial dose.

**PO: ADULTS, ELDERLY: (Prophylaxis):** Initially, 40 mg 3–4 times daily. **Maximum:** 480 mg/day in 3–4 divided doses.

**Angina, Unstable Angina, Chronic Stable Angina**

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 80–120 mg 3 times/day. May increase at 1- to 2-day intervals up to 480 mg/day in 3 divided doses. **Maximum:** 480 mg/day.

**PO: (Extended-Release):** Initially, 180 mg once daily. May increase at 7- to 14-day intervals up to 480 mg/day in 1–2 divided doses. **Maximum:** 480 mg/day.

**Atrial Fibrillation (Rate Control)**

**IV: ADULTS, ELDERLY:** Initially, 0.075–0.15 mg/kg (usual: 5–10 mg) over 2 min. May repeat with 10 mg after 15–30 min.

**PO: (Immediate-Release):** Initially, 40 mg 3–4 times daily. To achieve rate control, may increase up to 480 mg/day in 3–4 divided doses.

**Hypertension**

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 40–80 mg 3 times daily. May increase at wkly intervals up to 480 mg/day in 3 divided doses. **Maximum:** 480 mg/day.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 120–180 mg once daily. May increase at wkly intervals to 240 mg once daily, then 180 mg twice daily. **Maximum:** 240 mg twice daily.

**PO: (Extended-Release): ADULTS, ELDERLY:** Initially, 100–200 mg once daily at bedtime. May increase dose at wkly intervals to 300 mg once daily, then 400 mg once daily maximum.

**Dosage for Renal Impairment**

**CrCl less than 10 mL/min:** Dose reduction (50%–75%) of normal dose recommended.

**Dosage in Hepatic Impairment**

Dose reduction (20%–50%) of normal dose recommended.

**SIDE EFFECTS**

**Frequent (7%):** Constipation. **Occasional (4%–2%):** Dizziness, light-headedness, headache, asthenia, nausea, peripheral edema, hypotension. **Rare (less than 1%):** Bradycardia, dermatitis, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Rapid ventricular rate in atrial flutter/fibrillation, marked hypotension, extreme bradycardia, HF, asystole, second- or third-degree AV block occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ECG, B/P, heart rate. Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress).

**INTERVENTION/EVALUATION**

Assess pulse for quality, rate, rhythm. Monitor B/P. Monitor ECG for cardiac changes, particularly prolongation of PR interval. Assess for peripheral edema. For those taking oral form, monitor daily pattern of bowel activity, stool consistency. **Therapeutic serum level:** 0.08–0.3 mcg/mL; **toxic serum level:** N/A.

**PATIENT/FAMILY TEACHING**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control anginal pain.
- Go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Limit caffeine.
- Avoid or limit alcohol.
- Report continued, persistent angina pain, irregular heartbeats, shortness of breath, swelling, dizziness, constipation, nausea, hypotension.
- Avoid grapefruit products.

**vibegron**

vye-beg-ron  
(Gemtesa)

**Do not confuse vibegron with mirabegron, vigabatrin, or viga-drone or Gemtesa with Gemzar.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Beta-3 adrenergic receptor agonist. **CLINICAL:** Urinary antispasmodic.

**USES**

Treatment of overactive bladder in adults with symptoms of urge urinary incontinence, urgency, and urinary frequency.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to vibegron. **Cautions:** Pts at risk for urinary retention (e.g., bladder outlet obstruction, concomitant use of muscarinic antagonists). Concomitant use of digoxin.

**ACTION**

Relaxes detrusor smooth muscle during bladder filling, increasing bladder capacity. **Therapeutic Effect:** Relieves urinary incontinence, urgency, frequency.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 50%. Peak plasma concentration: 1–3 hrs. Steady state reached in 7 days. Excreted in feces (59%), urine (20%). **Half-life:** 30.8 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration/toxic effect of digoxin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Tablets:** 75 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Administer tablet whole with water. Tablets may

be crushed and mixed in applesauce, followed by water.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO; ADULTS:** 75 mg once daily.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Rare (4%–2%):** Headache, diarrhea, nausea, dry mouth, hot flush.

## ADVERSE EFFECTS/TOXIC REACTIONS

Urinary retention may occur, esp. in pts with bladder outlet obstruction or taking concomitant muscarinic antagonist. Upper respiratory tract infection, including nasopharyngitis, may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain digoxin level in pts taking digoxin. Assess severity of urinary incontinence, urgency, frequency. Screen for risk of urinary retention.

### INTERVENTION/EVALUATION

Monitor for symptoms of urinary retention (abdominal pain, bladder distension, hesitancy). Obtain bladder scan in pts with urinary retention. Monitor digoxin levels (if applicable). Monitor for symptom improvement of overactive bladder.

### PATIENT/FAMILY TEACHING

- Treatment may cause retention of urine. Report symptoms of urinary retention (abdominal pain, bladder distension, hesitancy).
- Pts taking digoxin may require more frequent monitoring of digoxin lev-

els. • Notify prescriber if symptoms of overactive bladder do not improve.

## vilazodone

vil-az-oh-done  
(Viibryd)

**■ BLACK BOX ALERT ■** Increased risk of suicidal ideation and behavior in children, adolescents, and young adults 18–24 yrs of age with major depressive disorder, other psychiatric disorders.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor. **CLINICAL:** Antidepressant.

## USES

Treatment of major depressive disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to vilazodone. Use of MAOIs intended to treat psychiatric disorders (with or within 14 days of stopping vilazodone or MAOI), starting vilazodone in pts receiving linezolid or methylene blue. **Cautions:** Seizure disorder, pts at risk for suicide (history of ideation and behavior; depression), hepatic impairment, elderly.

## ACTION

Enhances serotonergic activity in CNS by selectively inhibiting reuptake of serotonin. **Therapeutic Effect:** Relieves depression.

## PHARMACOKINETICS

Widely distributed. Peak concentration: 4–5 hrs. Protein binding: 96%–99%. Metabolized in liver. **Half-life:** 25 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Alcohol may increase adverse effects. Aspirin, NSAIDs (e.g., diclofenac, meloxicam, naproxen), warfarin may increase risk of bleeding. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration. BusPIRone, lithium, MAOIs (e.g., phenelzine, selegiline) nara-triptan, SNRIs (e.g., venlafaxine), SSRIs (e.g., sertraline), traMADol, tryptophan may increase risk of serotonin syndrome. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), glucosamine may increase risk of bleeding. St. John's wort, Syrian rue may increase serotonergic effect. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food (administration without food can result in inadequate drug concentration, may diminish effectiveness).

## INDICATIONS/ROUTES/DOSAGE

### Depression

**PO: ADULTS, ELDERLY:** Initially, 10 mg once daily for 7 days, followed by 20 mg once daily. May increase to 40 mg once daily after a minimum of 7 days. **Note:** When discontinuing treatment, reduce dose gradually. From 40 mg/day: taper to 20 mg/day for 4 days, then 10 mg/day for 3 days. From 20 mg/day: taper to 10 mg/day for 7 days.

### Concomitant Moderate/Strong CYP3A4 Inhibitors

**PO: ADULTS, ELDERLY:** 20 mg/day.

### Concomitant Strong CYP3A4 Inducers

May increase dose to 80 mg/day when used concomitantly for more than 14 days.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (28%–23%):** Diarrhea, nausea. **Occasional (9%–3%):** Dizziness, dry mouth, insomnia, vomiting, decreased libido, abnormal dreams, fatigue, sweating. **Rare (2%):** Dyspepsia, flatulence, paresthesia, restlessness, arthralgia, abnormal orgasm, delayed ejaculation, increased appetite, palpitations, tremor.

## ADVERSE EFFECTS/TOXIC REACTIONS

Serotonin syndrome (agitation, confusion, hallucinations, hyperreflexia), neuroleptic malignant syndrome (fever, muscular rigidity, cognitive changes).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content, risk of suicide.

### INTERVENTION/EVALUATION

Monitor B/P, heart rate, weight. Monitor for suicidal ideation (esp. at initiation of therapy or changes in dosage). Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

### PATIENT/FAMILY TEACHING

- Avoid tasks that may require alertness, motor skills until response to drug is established (may cause dizziness).
- Slowly go from lying to standing.
- Take with food.
- Do not suddenly stop taking medication; withdraw gradually.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.
- Avoid alcohol.

## viloxazine

ve-lox-a-zeen  
(Qelbree)

**BLACK BOX ALERT** May increase risk of suicidal thoughts and behavior. Monitor closely

for emergence or worsening of symptoms.

**Do not confuse viloxazine with vilazodone.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective norepinephrine reuptake inhibitor.

**CLINICAL:** Noradrenergic agent.

### USES

Treatment of attention deficit hyperactivity disorder (ADHD) in pediatric pts 6–17 yrs of age.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to viloxazine. Use or within 14 days after MAOI therapy. Concomitant use of *sensitive* CYP1A2 substrates or CYP1A2 substrates with a narrow therapeutic index. **Cautions:** Family history of suicide, psychiatric disorders. Personal history of hypertension, tachycardia, bipolar disorder, depression, psychosis, mania, other psychiatric illness. Pts at high risk for suicide ideation and behavior; concomitant use of CYP2D6 substrates, CYP3A4 substrates. Not recommended in pts with hepatic impairment; concomitant use of *moderate* CYP1A2 substrates.

### ACTION

Blocks the reuptake of norepinephrine. The exact mechanism for the treatment of ADHD has not been fully elucidated. Appears to inhibit 5-HT<sub>2B</sub> receptors and activate 5-HT<sub>2C</sub> receptors. **Therapeutic Effect:** Increases motor acuity, attention span, mental alertness.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 76%–82%. Peak plasma concentration: approx. 5 hrs. Steady state reached in 2 days. Excreted in urine (90%), feces (1%). **Half-life:** 7 hrs (±4.74 hrs)

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal

harm. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** Not indicated in elderly population.

### INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline, tranylcypromine), potent inhibitors of monoamine oxidase (e.g., linezolid) may increase risk of hypertensive crisis, serotonin syndrome. May increase adverse/toxic effects of *sensitive* CYP1A2 substrates and CYP1A2 substrates with narrow therapeutic index (e.g., alosetron, duloxetine, melatonin, ramelteon, tizanidine, theophylline), moderate CYP1A2 substrates (e.g., clozapine, piperidone), CYP2D6 substrates (e.g., desipramine, dextromethorphan, metoprolol, venlafaxine, risperidone, CYP3A4 substrates (e.g., buspirone, midazolam, tacrolimus, tipranavir, simvastatin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Capsules, Extended-Release:** 100 mg, 150 mg, 200 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Administer capsule whole with water.
- Contents may be sprinkled onto a teaspoon of applesauce. Give immediately; do not allow chewing. Do not store for future use.

### INDICATIONS/ROUTES/DOSAGE

**Note:** If used long-term, periodically reevaluate necessity for treatment and adjust dose as needed.

#### ADHD

**PO: CHILDREN 6–11 YRS:** Initially, 100 mg once daily. May titrate in increments of 100 mg at wkly intervals based on response and tolerability. **Maximum:** 400

mg/day. **ADOLESCENTS 12–17 YRS:** Initially, 200 mg once daily. After 7 days, may increase dose to 400 mg once daily based on response and tolerability. **Maximum:** 400 mg/day.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce starting dose to 100 mg once daily. May titrate in increments of 50–100 mg at wkly intervals based on response and tolerability. **Maximum:** 200 mg/day.

#### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not recommended.

### SIDE EFFECTS

**Occasional (16%–6%):** Somnolence, lethargy, headache (migraine, tension headache), decreased appetite, fatigue. **Rare (5%–2%):** Abdominal pain, nausea, vomiting, insomnia, irritability, pyrexia.

### ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of suicidal thoughts and behavior. Increased heart rate greater than or equal to 20 bpm reported in 22%–34% of pts. Increased diastolic blood pressure greater than or equal to 15 mm Hg reported in 13%–25% of pts. May cause manic or mixed episodes in pts with history of bipolar disorder. Respiratory tract infection reported in 7% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain B/P, heart rate, height/weight. Assess attention span, impulsivity, interaction with others, distractibility. Question for history of hepatic impairment, hypertension; anxiety, bipolar disorder, depression; family history of suicide, psychiatric disorder. Receive full medication

history and screen for interactions (esp. use of MAOIs, *sensitive* CYP1A2 substrates or CYP1A2 substrates with a narrow therapeutic index). Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor B/P, heart rate periodically and during titration. Assess height/weight periodically. Diligently monitor for new-onset or worsening of agitation, anxiety, depression, mood disorder, panic attacks; manic behavior in pts with bipolar disorder (may be precursor for increased risk of suicidal thoughts and behavior), esp. during first few mos after initiation and during titration. Consult mental health professional if mood disorder is suspected. Monitor for toxicities if concomitant use of CYP2D6 substrates, CYP3A4 substrates is unavoidable. Assess for clinical improvement of ADHD.

#### PATIENT/FAMILY TEACHING

- Treatment may increase blood pressure and/or heart rate.
- Seek immediate medical attention if new-onset or worsening of agitation, anxiety, depression, or changes in mood occur, esp. during the first few mos of therapy and during titration.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Treatment affects weight and growth development.

**vinBLAStine**

**HIGH  
ALERT**

vin-**blas**-teen

**BLACK BOX ALERT** Must be administered by personnel trained in administration/handling of chemotherapeutic agents. For IV

use only. Fatal if given intrathecally (ascending paralysis, death). Vesicant; avoid extravasation.

**Do not confuse vinBLAS<sup>ti</sup>ne with vinCRIS<sup>ti</sup>ne or vinorelbine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimicrotubular. Vinca alkaloid. **CLINICAL:** Antineoplastic.

### USES

Treatment of Hodgkin's lymphoma, non-Hodgkin's lymphoma, Langerhans cell histiocytosis, advanced testicular carcinoma, Kaposi's sarcoma, Letterer-Siwe disease. Has also been used in the treatment of resistant choriocarcinoma.

**OFF-LABEL:** Treatment of bladder, ovarian cancer; non-small-cell lung cancer; soft tissue sarcoma, melanoma.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to vinBLAS<sup>ti</sup>ne. Bacterial infection, significant granulocytopenia (unless as a result of condition being treated). **Cautions:** Hepatic impairment, cardiovascular disease (e.g., cardiomyopathy, hypertension), pulmonary disease, baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of thrombosis (CVA, MI); pts at risk for extravasation (e.g., peripheral IV catheters, elderly, poor peripheral vasculature), recent exposure to radiation therapy, chemotherapy.

### ACTION

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic acid, protein synthesis. **Therapeutic Effect:** Inhibits cell division by disrupting mitotic spindle.

### PHARMACOKINETICS

Does not cross blood-brain barrier. Protein binding: 99%. Metabolized in liver. Excreted in urine (14%), feces (10%). **Half-life:** 24.8 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. May decrease therapeutic effect of BCG (intravesical). Bone marrow depressants (e.g., cladribine) may increase myelosuppression. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** None significant. **Echinacea** may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

### AVAILABILITY (Rx)

**Injection Solution:** 1 mg/mL.

### ADMINISTRATION/HANDLING

**◀ ALERT ▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation and administration. Give by IV injection. Leakage from IV site into surrounding tissue may produce extreme irritation. Avoid eye contact with solution (severe eye irritation, possible corneal ulceration may result). If eye contact occurs, immediately irrigate eye with water.

IV

**Note:** In order to prevent inadvertent intrathecal administration, dispense as a piggyback (not a syringe).

**Reconstitution** • Using 1 mg/mL solution, further dilute in 25–50 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Infuse over 5–15 min. Prolonged administration time and/or increased volume may increase risk of vein irritation and extravasation.

**Storage** • Refrigerate unopened vials. • Solution appears clear, colorless. • Following dilution, solution is stable for up to 21 days if protected from light (consult manufacturer prescribing information). • Discard if solution is discolored or precipitate forms.

### IV INCOMPATIBILITIES

Furosemide (Lasix).

### IV COMPATIBILITIES

Allopurinol (Aloprim), CISplatin (Platinol AQ), cyclophosphamide (Cytosan), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), heparin, leucovorin, methotrexate, ondansetron (Zofran), PACLitaxel (Taxol), vinorelbine (Navelbine).

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Dosage individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for optimum dosage, sequence of drug administration. Strongly recommend dispensing in a minibag (not a syringe).

#### Usual Dosage

**IV: ADULTS, ELDERLY:** Initially, 3.7 mg/m<sup>2</sup> (adjust dose q7days based on WBC response) up to 5.5 mg/m<sup>2</sup> (second wk), 7.4 mg/m<sup>2</sup> (third wk), 9.25 mg/m<sup>2</sup> (fourth wk), and 11.1 mg/m<sup>2</sup> (fifth wk). **Maximum:** 18.5 mg/m<sup>2</sup>. **CHILDREN:** 3–6 mg/m<sup>2</sup> q7–14days. **Maximum:** 12.5 mg/m<sup>2</sup>/wk.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Direct serum bilirubin 1.5–3 mg/dL:** Reduce dose by 50%. **Greater than 3 mg/dL:** Avoid use.

### SIDE EFFECTS

**Frequent:** Nausea, vomiting, alopecia.

**Occasional:** Constipation, diarrhea, rectal bleeding, headache, paresthesia (occur 4–6 hrs after administration, persist for 2–10 hrs), malaise, asthenia, dizziness, pain at tumor site, jaw/face pain, depression, dry mouth. **Rare:** Dermatitis, stomatitis, phototoxicity, hyperuricemia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia) is an expected response to therapy. WBC reaches its nadir 4–10 days after initial therapy, recovers within 7–14 days (high dosage may require 21-day recovery period). Thrombocytopenia is usually mild and transient, with recovery occurring in a few days. Hepatic impairment may increase risk of toxicity. Acute shortness of breath, bronchospasm may occur, particularly when administered concurrently with mitoMYcin. Extravasation may cause severe tissue necrosis. Neurotoxicity (seizures, severe CNS damage), cardiovascular toxicities (angina pectoris, cardiomyopathy, CVA, hypertension, limb ischemia, MI, Raynaud's phenomenon), GI toxicities (hemorrhagic enterocolitis, GI bleeding, intestinal obstruction, paralytic ileus, toxic megacolon) may occur.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Screen for active infection. Question history of cardiac/pulmonary disease, hepatic impairment. Assess patency of IV access. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression, LFT for hepatotoxicity (abdominal pain, jaundice, nausea, transaminitis, vomiting). Monitor for infections (cough, fatigue, fever), neurotoxicities (seizures, CNS effects), stomatitis, pulmonary toxicities (bronchospasm, dyspnea); symptoms of CVA (aphasia, altered mental status, facial droop, hemiplegia, vision loss); MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation). Extravasation may result in cellulitis, phlebitis. Large amount of extravasation may result in tissue sloughing. If extravasation occurs, give local injection of hyaluronidase, apply warm compresses.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Avoid pregnancy. Do not breastfeed.
- Treatment may reduce the heart's ability to pump effectively.
- Report heart problems (difficulty breathing, swelling of extremities, palpitations), liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), skin reactions (rash, redness, swelling), seizures.
- Life-threatening cardiovascular events may occur; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm or jaw, sweating), stroke (confusion, one-sided weakness or paralysis, difficulty speaking).

**vinCRiStine****HIGH  
ALERT**vin-cris-teen  
(Marqibo)

**BLACK BOX ALERT** Must be administered by personnel trained in administration/handling of chemotherapeutic agents. For IV use only. Fatal if given intrathecally (ascending paralysis, death). Vesicant; avoid extravasation. Marqibo and Vincasar are not interchangeable.

**Do not confuse vinCRiStine with vinBLASTine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Antimicrotubular. Vinca alkaloid. **CLINICAL:** Antineoplastic.

**USES**

Treatment of acute lymphocytic leukemia (ALL), Hodgkin's lymphoma, advanced non-Hodgkin's lymphomas, neuroblastoma, rhabdomyosarcoma, Wilms tumor. **Marqibo:** Relapsed Philadelphia chromosome negative (Ph<sup>-</sup>) ALL in adults whose disease has progressed after 2 or more antileukemic therapies. **OFF-LABEL:** Treatment of multiple myeloma, chronic lymphocytic leukemia (CLL), brain tumors, small-cell lung cancer, ovarian germ cell tumors, Ewing's sarcoma, gestational trophoblastic tumors, retinoblastoma.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to vinCRiStine. Demyelinating form of Charcot-Marie-Tooth syndrome. Intrathecal administration. **Cautions:** Hepatic impairment, elderly, preexisting neuromuscular disorders, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for extravasation (e.g., peripheral IV catheters, elderly, poor peripheral vasculature), recent exposure to radiation therapy, chemotherapy; pts at risk for tumor lysis syndrome (high tumor burden, dehydration); history of GI obstruction.

**ACTION**

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic

acid/protein synthesis. **Therapeutic Effect:** Inhibits cell division by disrupting mitotic spindle.

## PHARMACOKINETICS

Does not cross blood-brain barrier. Protein binding: 75%. Metabolized in liver. Primarily excreted in feces by biliary system. **Half-life:** 24 hrs. **Marqibo:** 45 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** More susceptible to neurotoxic effects.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. May decrease therapeutic effect of BCG (intravesical). Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

## AVAILABILITY (Rx)

**Injection Solution:** 1 mg/mL. **Injection Suspension:** (*Marqibo*): 5 mg/31 mL.

## ADMINISTRATION/HANDLING

**Note:** In order to prevent inadvertent intrathecal administration, dispense as a piggyback (not a syringe).

**◀ALERT▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme

care during preparation and administration. Use extreme caution in calculating, administering vinCRISStine. Overdose may result in serious or fatal outcome.

## Injection Solution

**Reconstitution** • Dilute in 25–50 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • Administer as 5–10 min infusion (preferred). • Do not infuse into extremity with impaired, potentially impaired circulation caused by compression or invading neoplasm, phlebitis, varicosity.

**Storage** • Refrigerate unopened vials. • Solution appears clear, colorless. • Discard if solution is discolored or precipitate forms. • Diluted solutions are stable for 7 days refrigerated or 2 days at room temperature.

## Injection Suspension

• Calculate dose of vinCRISStine and remove volume equal to volume of intended solution from 100 mL 0.9% NaCl or D<sub>5</sub>W infusion bag. Inject vinCRISStine into infusion bag (total volume: 100 mL).

**Rate of administration** • Administer over 60 min.

**Storage** • Must be administered within 12 hrs of preparation.

## IV INCOMPATIBILITIES

Furosemide (Lasix), IDArubicin (Idamycin).

## IV COMPATIBILITIES

Allopurinol (Aloprim), CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), cytarabine (Ara-C, Cytosar), DOXOrubicin (Adriamycin), etoposide (VePesid), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), leucovorin, methotrexate, ondansetron (Zofran), PACLitaxel (Taxol), vinorelbine (Navelbine).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Dosing may be capped at 2 mg/dose. Dosing and frequency may vary by protocol and/or treatment phase. Dispense in mini bag (not syringe).

**Usual Dosage Injection Solution**

**IV: ADULTS, ELDERLY:** 1.4 mg/m<sup>2</sup>, frequency may vary based on protocol. **CHILDREN WEIGHING MORE THAN 10 KG:** 1.5–2 mg/m<sup>2</sup>, frequency may vary based on protocol. **CHILDREN WEIGHING LESS THAN 10 KG:** 0.05 mg/kg once wkly. **Maximum:** 2 mg.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Bilirubin	Dosage
Bilirubin greater than 3 mg/dL	50% of normal

**ALL Injection Suspension**

**IV: ADULTS, ELDERLY:** 2.25 mg/m<sup>2</sup> q7days. Infuse over 1 hr.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Expected:** Peripheral neuropathy (occurs in nearly every pt; first clinical sign is depression of Achilles tendon reflex).

**Frequent:** Peripheral paresthesia, alopecia, constipation/obstipation (upper colon impaction with empty rectum), abdominal cramps, headache, jaw pain, hoarseness, diplopia, ptosis/drooping of eyelid, urinary tract disturbances. **Occasional:** Nausea, vomiting, diarrhea, abdominal distention, stomatitis, fever.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions, including febrile neutropenia, may occur. Acute dyspnea, bronchospasm may occur, esp. when administered concurrently with mitoMYcin. Prolonged or high-dose therapy may produce foot/wrist drop, difficulty walking, slapping gait, ataxia, muscle wasting. Extravasation may cause severe tissue necrosis. Tumor lysis syndrome may present as

acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Paralytic ileus, bowel obstruction, colonic pseudo-obstruction may occur. Hepatotoxicity reported in 6%–11% of pts. Infections including pneumonia, sepsis, staphylococcal bacteremia may occur. Cardiac arrest reported in 5% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT; pregnancy test in females of reproductive potential. Screen for active infection. Question history of hepatic impairment, neuromuscular disease. Assess risk of tumor lysis syndrome. Assess patency of IV access. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression; LFT for hepatotoxicity (abdominal pain, jaundice, nausea, transaminitis, vomiting). Monitor for infections (cough, fatigue, fever), sepsis, neurotoxicities, pulmonary toxicities (bronchospasm, dyspnea). Monitor serum uric acid level if tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) is suspected. Monitor for GI obstruction (abdominal pain, fever, nausea, vomiting). Extravasation produces stinging, burning, edema at injection site. Terminate injection immediately, locally inject hyaluronidase, apply heat (disperses drug, minimizes discomfort, cellulitis).

**PATIENT/FAMILY TEACHING**

- Immediately report any pain/burning at injection site during administration.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Use effective contraception to avoid pregnancy. Do not breastfeed.

Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), skin reactions (rash, redness, swelling). • Life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure, may occur. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting. • Report abdominal pain, fever, nausea, vomiting; may indicate GI obstruction.

## vinorelbine

HIGH  
ALERT

vin-oh-rei-been  
(Navelbine)

**BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Severe myelosuppression, resulting in serious infections, shock, death, may occur.

**Do not confuse vinorelbine with vinBLASTine or vinCRISTine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimitotubular. Vinca alkaloid. **CLINICAL:** Antineoplastic.

### USES

Single agent or in combination with CISplatin for treatment of unresectable, advanced or metastatic, non-small-cell lung cancer (NSCLC). **OFF-LABEL:** Treatment of metastatic breast cancer, cervical carcinoma, ovarian carcinoma, malignant pleural mesothelioma, soft tissue sarcoma, small-cell lung cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to vinorelbine. **Cautions:** Compromised marrow reserve due to prior chemotherapy/radiation therapy; hepatic impairment, neuropathy, pulmonary impairment.

### ACTION

Binds to tubulin, inhibiting microtubule formation; may interfere with nucleic acid protein synthesis. **Therapeutic Effect:** Prevents cellular division by disrupting formation of mitotic spindle.

### PHARMACOKINETICS

Widely distributed. Protein binding: 80%–90%. Metabolized in liver. Primarily excreted in feces by biliary system. **Half-life:** 28–43 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Breastfeeding not recommended during treatment and for at least 9 days after discontinuation. May impair fertility in both females and males. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase immunosuppressive effect of **baricitinib**, **tofacitinib**, **upadacitinib**. May decrease therapeutic effect of **BCG (intravesical)**. **Cladribine** may increase myelosuppressive effect. May increase toxic effect of **natalizumab**. **CISplatin** may increase risk of granulocytopenia. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole)** may increase concentration/effects. **HERBAL:** **Echinacea** may decrease the therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, alkaline phosphatase, ALT, AST.

**AVAILABILITY (Rx)**

**Injection Solution:** 10 mg/mL (5-mL vials).

**ADMINISTRATION/HANDLING**

**◀ALERT▶** IV needle, catheter must be correctly positioned before administration. Leakage into surrounding tissue produces extreme irritation, local tissue necrosis, thrombophlebitis. Handle drug with extreme care during administration; wear protective clothing per protocol. If solution comes in contact with skin/mucosa, immediately wash thoroughly with soap, water.

**Preparation** • Must be diluted and administered via syringe or IV bag.

**Syringe Dilution**

• Dilute calculated vinorelbine dose with D<sub>5</sub>W or 0.9% NaCl to concentration of 1.5–3 mg/mL.

**IV Bag Dilution**

• Dilute calculated vinorelbine dose with D<sub>5</sub>W, 0.45% or 0.9% NaCl, 5% dextrose and 0.45% NaCl, Ringer's or lactated Ringer's to concentration of 0.5–2 mg/mL.

**Rate of administration** • Administer diluted vinorelbine over 6–10 min into side port of free-flowing IV closest to IV bag followed by flushing with 75–125 mL of one of the solutions. • If extravasation occurs, stop injection immediately; give remaining portion of dose into another vein.

**Storage** • Refrigerate unopened vials. • Protect from light. • Unopened vials are stable at room temperature for 72 hrs. • Do not administer if particulate has formed. • Diluted vinorelbine may be used for up to 24 hrs under normal room light when stored in polypropylene syringes or polyvinyl chloride bags at room temperature.

**IV INCOMPATIBILITIES**

Acyclovir (Zovirax), allopurinol (Alloprim), amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Omnipen), ceFAZolin (Ancef), ceTRIAXone (Ro-

cephin), cefuroxime (Zinacef), 5-fluorouracil (5-FU), furosemide (Lasix), ganciclovir (Cytovene), methylPREDNISolone (SOLU-Medrol), sodium bicarbonate.

**IV COMPATIBILITIES**

Calcium gluconate, CARBOplatin (Paraplatin), CISplatin (Platinol AQ), cyclophosphamide (Cytoxan), cytarabine (ARA-C, Cytosar), dacarbazine (DTIC), DAUNOrubicin (Cerubidine), dexamethasone (Decadron), diphenhydramine (Benadryl), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), HYDROmorphone (Dilaudid), IDArubicin (Idamycin), methotrexate, morphine, ondansetron (Zofran), vinBLASStine (Velban), vinCRISStine (Oncovin).

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Dosage adjustments should be based on granulocyte count obtained on the day of treatment, as follows:

**Granulocyte Count**

(cells/mm<sup>3</sup>) on

Day of Treatment	Dosage
1,500 or higher	100% of starting dose
1,000–1,499	50% of starting dose
Less than 1,000	Do not administer

**NSCLC Monotherapy**

**IV injection: ADULTS, ELDERLY:** 30 mg/m<sup>2</sup> q7days.

**NSCLC Combination Therapy With CISplatin**

**IV injection: ADULTS, ELDERLY:** 25–30 mg/m<sup>2</sup> q7days.

**Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment. **ESRD requiring hemodialysis:** Decrease dose to 20 mg/m<sup>2</sup>/wk given post-HD or on non-HD days.

**Dosage in Hepatic Impairment**

Serum Bilirubin	Dosage
2 mg/dL or less	100% of dose
2.1–3 mg/dL	50% of dose
Greater than 3 mg/dL	25% of dose

## SIDE EFFECTS

**Frequent (35%–12%):** Asthenia, nausea, constipation, erythema, pain, vein discoloration at injection site, fatigue, peripheral neuropathy manifested as paresthesia, hyperesthesia, diarrhea, alopecia. **Occasional (10%–5%):** Phlebitis, dyspnea, loss of deep tendon reflexes. **Rare:** Chest pain, jaw pain, myalgia, arthralgia, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy. Hemorrhagic cystitis, syndrome of inappropriate antidiuretic hormone reported in less than 1% of pts. Acute shortness of breath, severe bronchospasm occur infrequently, particularly in pts with preexisting pulmonary dysfunction. Hepatic toxicity may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC prior to each dose. Granulocyte count should be at least 1,000 cells/mm<sup>3</sup> before vinorelbine administration. Granulocyte nadirs occur 7–10 days following dosing. Do not give hematologic growth factors within 24 hrs before administration of chemotherapy or earlier than 24 hrs following cytotoxic chemotherapy. Advise women of childbearing potential to avoid pregnancy during drug therapy. Offer emotional support.

### INTERVENTION/EVALUATION

Diligently monitor injection site for swelling, redness, pain. Monitor CBC for myelosuppression during and following therapy (infection [fever, sore throat, signs of local infection], unusual bleeding/bruising, anemia [excessive fatigue, weakness]). Monitor pts developing severe granulocytopenia for evidence of infection, fever. Crackers, dry toast, sips of cola may help relieve nausea. Moni-

tor daily pattern of bowel activity, stool consistency. Question for tingling, burning, numbness of hands/feet (peripheral neuropathy). Pt complaint of “walking on glass” is sign of hyperesthesia.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), skin reactions (rash, redness, swelling).
- Report new or worsening signs of neuropathy.

## vismodegib

vis-moe-deg-ib  
(Erivedge)

**BLACK BOX ALERT** ■ May result in embryo-fetal death or severe birth defects including missing digits, midline defects, irreversible malformations due to embryotoxic and teratogenic properties. Verify pregnancy status prior to initiation. Advise use of effective contraception in female pts. Advise male pts of potential exposure risk through seminal fluid.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hedgehog pathway inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with metastatic basal cell carcinoma, locally advanced basal cell carcinoma with recurrence after

surgery, or pts who are not candidates for surgery or radiation.

## PRECAUTIONS

**⚠️ ALERT** Do not donate blood products for at least 7 mos after discontinuation.

**Contraindications:** Hypersensitivity to vismodegib. **Cautions:** Hepatic impairment.

## ACTION

Selectively inhibits Hedgehog pathway by binding to and inhibiting smoothened, a transmembrane protein involved in Hedgehog signal transduction. Hedgehog mutations associated with basal cell cancer can activate the pathway, resulting in proliferation of skin basal cells. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: 99%. Excreted in feces (82%), urine (4%). **Half-life:** 4 days (daily dosing), 12 days (single dose).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 24 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 24 mos after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease potassium, sodium, GFR. May increase serum BUN, creatinine.

## AVAILABILITY (Rx)

 **Capsules:** 150 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Give whole. Do not break, crush, or open capsule.

## INDICATIONS/ROUTES/DOSAGE

### Advanced or Metastatic Basal Cell Carcinoma

**PO: ADULTS/ELDERLY:** 150 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (71%–40%):** Muscle spasm, alopecia, dysgeusia, weight loss, fatigue. **Occasional (30%–11%):** Nausea, amenorrhea, diarrhea, anorexia, constipation, vomiting, arthralgia, loss of taste.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe cutaneous reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis. Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pregnancy test in females of reproductive potential. Question history of hepatic impairment. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor for cutaneous toxicities; symptoms of DRESS.

**PATIENT/FAMILY TEACHING**

- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Do not donate blood for at least 2 yrs.
- Toxic skin reactions (necrosis, redness, sloughing) may occur.
- Severe multi-organ hypersensitivity reaction (DRESS) may cause life-threatening organ dysfunction; report chest pain, decreased urinary output, facial swelling, fever, rash, swelling of lymph nodes.

## vitamin D (vitamin D analogues)

### calcitriol

kal-si-trye-ole  
(Calcijex , Rocaltrol, Vectical)

### doxercalciferol

dox-er-kal-sif-e-role  
(Hectorol)

### ergocalciferol

er-goe-kal-sif-e-role  
(Drisdol)

### paricalcitol

par-i-kal-si-tol  
(Zemplar)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fat-soluble vitamin. **CLINICAL:** Vitamin D analogue.

**USES**

**Calcitriol:** Management of hypocalcemia in pts with hypoparathyroidism or pseudohypoparathyroidism. Management of secondary hyperparathyroidism in pts with moderate to severe chronic kidney disease (CKD). **(Topical):** Treatment of mild to moderate plaque psoriasis. **Doxercalciferol:** Treatment of secondary hyperparathyroidism in CKD. **Ergocalciferol:** Treatment of refractory rickets, hypophosphatemia, hypoparathyroidism, dietary supplement. **Paricalcitol: (Intravenous):** Treatment/prevention of secondary hyperparathyroidism associated CKD. **(PO):** Treatment/prevention of secondary hyperparathyroidism associated with stage 3 and 4 CKD and stage 5 CKD pts on hemodialysis or peritoneal dialysis. **OFF-LABEL: Calcitriol:** Vitamin D–dependent rickets. **Ergocalciferol:** Prevention/treatment of vitamin D deficiency in pts with CKD, osteoporosis prevention.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cholecalciferol, ergocalciferol. Vitamin D toxicity, hypercalcemia. **Cautions:** Pts with malabsorption syndrome. Concurrent use with digoxin.

**ACTION**

**Calcitriol:** Binds to and activates the vitamin D receptor in kidney, parathyroid gland, intestine, and bone, stimulating intestinal calcium transport and absorption. Reduces parathyroid hormone (PTH) levels, improves calcium and phosphate homeostasis. **Doxercalciferol:** Controls intestinal absorption of dietary calcium, tubular reabsorption of calcium by the kidneys, and in conjunction with PTH, the mobilization of calcium from the skeleton. **Ergocalciferol:** Promotes active absorption of calcium and phosphorus, increasing serum levels to allow bone mineralization; mobilizes calcium and phosphate from bone, increases reabsorption of calcium and phosphate by renal tubules. **Paricalcitol:** Activates the vitamin D

receptor in kidney, parathyroid gland, intestine and bone, reducing PTH levels and improving calcium and phosphate homeostasis. **Therapeutic Effect:** Essential for absorption, utilization of calcium, phosphate, control of PTH levels.

## PHARMACOKINETICS

**Calcitriol:** Rapidly absorbed. Protein binding: 99.9%. Metabolized to active metabolite (ergocalciferol). Excreted in feces (49%), urine (16%). **Half-life:** 5–8 hrs. **Doxercalciferol:** Metabolized in liver. **Half-life:** 32–37 hrs. **Ergocalciferol:** Metabolized in liver. **Paricalcitol:** Readily absorbed. Protein binding: 99.8%. Metabolized in liver. Primarily excreted in feces. **Half-life:** 5–7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta. Infant risk cannot be excluded. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Calcium-containing products, concurrent vitamin D (or derivatives) may increase risk of hypercalcemia. May increase digoxin toxicity due to hypercalcemia (may cause arrhythmias). May increase concentration/effect of aluminum hydroxide, sucralfate. **Bile acid sequestrants (e.g., cholestyramine)** may decrease absorption. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, calcium, magnesium, phosphate, ALT, AST, BUN, creatinine.

## AVAILABILITY (Rx)

### Calcitriol

**Capsules, Softgel:** 0.25 mcg, 0.5 mcg. **Injection Solution:** 1 mcg/mL. **Oral Solution:** 1 mcg/mL.

### Doxercalciferol

**Capsules, Softgel:** 0.5 mcg, 1 mcg, 2.5 mcg. **Injection Solution:** 2 mcg/mL.

### Ergocalciferol

**Capsules:** 50,000 units (1.25 mg). **Liquid, Oral:** 8,000 units/mL (200 mcg/mL). **Tablets:** 10 mcg (400 units); 50 mg (2,000 units).

### Paricalcitol

**Capsules, Gelatin:** 1 mcg, 2 mcg, 4 mcg. **Injection Solution:** 2 mcg/mL.

## ADMINISTRATION/HANDLING

### Calcitriol

#### PO

- May take without regard to food.

- May give as IV bolus at end of dialysis.

### Doxercalciferol

#### PO

- May take without regard to food.

- May give as IV bolus via catheter at end of dialysis.

### Ergocalciferol

#### PO

- May take without regard to food.

### Paricalcitol

#### PO

- May take without regard to food.
- For 3 times/wk dosing, give no more frequently than every other day.

- Give bolus anytime during dialysis.
- Do not give more frequently than every other day.

## INDICATIONS/ROUTES/ DOSAGE

### Calcitriol

#### Hypocalcemia on Chronic Renal Dialysis

**PO: ADULTS, ELDERLY:** Initially, 0.25 mcg/day or every other day. May increase by 0.25 mcg/day at 4- to 8-wk intervals. **Range:** 0.5–1 mcg/day.

## 1250 vitamin D (vitamin D analogues)

**IV: ADULTS, ELDERLY:** 1–2 mcg 3 times/wk. Adjust dose at 2- to 4-wk intervals. Range: 0.5–4 mcg 3 times/wk.

### Hypocalcemia in Hypoparathyroidism

**PO: ADULTS, CHILDREN 6 YRS AND OLDER:** Initially, 0.25 mcg/day. May increase at 2- to 4-wk intervals. Range: 0.5–2 mcg/day. **CHILDREN 1–5 YRS:** 0.25–0.75 mcg once daily.

### Secondary Hyperparathyroidism

#### Associated With Moderate to Severe CKD Not on Dialysis

**PO: ADULTS, ELDERLY, CHILDREN 3 YRS AND OLDER:** Initially, 0.25 mcg/day. May increase to 0.5 mcg/day. **CHILDREN YOUNGER THAN 3 YRS:** Initially, 0.01–0.015 mcg/kg/day.

### Doxercalciferol

#### Secondary Hyperparathyroidism (Dialysis)

**PO: ADULTS, ELDERLY:** Initial dose (intact parathyroid hormone [iPTH] greater than 400 pg/mL): 10 mcg 3 times/wk at dialysis. Dose titrated to lower iPTH to 150–300 pg/mL, with dosage adjustments made at 8-wk intervals. **Maximum:** 20 mcg 3 times/wk.

**IV: ADULTS, ELDERLY:** Initial dose (iPTH greater than 400 pg/mL): 4 mcg 3 times/wk after dialysis, given as bolus dose. Dose titrated to lower iPTH to 150–300 pg/mL, with dosage adjustments made at 8-wk intervals. **Maximum:** 18 mcg/wk.

#### Secondary Hyperparathyroidism (Predialysis)

**PO: ADULTS, ELDERLY:** Initially, 1 mcg/day. Titrate dose to lower iPTH to 35–70 pg/mL for stage 3 CKD and 70–110 pg/mL for stage 4 CKD. **Maximum:** 3.5 mcg/day.

### Ergocalciferol (Dietary Supplement)

**PO: ADULTS, ELDERLY, CHILDREN:** 10 mcg (400 units)/day. **NEONATES:** 10–20 mcg (400–800 units)/day.

### Hypoparathyroidism

**PO: ADULTS, ELDERLY:** 625 mcg–5 mg (25,000–200,000 units)/day (with calcium supplements). **CHILDREN:** 1.25–5 mg

(50,000–200,000 units)/day (with calcium supplements).

### Plaque Psoriasis

**Topical: ADULTS, ELDERLY:** Apply to affected area twice daily.

### Paricalcitol

#### Secondary Hyperparathyroidism in Stage 5 CKD

**IV: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER:** Initially, 0.04–0.1 mcg/kg given as bolus dose no more frequently than every other day at any time during dialysis. May increase by 2–4 mcg every 2–4 wks. Dose is based on serum iPTH levels.

#### Secondary Hyperparathyroidism in Stages 3 and 4 CKD

**Note:** Initial dose based on baseline serum iPTH levels. Dose adjusted q2wks based on iPTH levels relative to baseline.

**PO: ADULTS, ELDERLY: (iPTH 500 PG/ML OR LESS):** 1 mcg/day or 2 mcg 3 times/wk. **(iPTH GREATER THAN 500 PG/ML):** 2 mcg/day or 4 mcg 3 times/wk.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

Frequencies not defined. **Calcitriol:** Cardiac arrhythmias, headache, pruritus, hypercalcemia, polydipsia, abdominal pain, metallic taste, nausea, vomiting, myalgia, soft tissue calcification. **Doxercalciferol:** Edema, pruritus, nausea, vomiting, headache, dizziness, dyspnea, malaise, hypercalcemia. **Ergocalciferol:** Hypercalcemia, hypervitaminosis D, decreased renal function, soft tissue calcification, bone demineralization, nausea, constipation, weight loss. **Paricalcitol:** Edema, nausea, vomiting, hypercalcemia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Early signs of overdose manifested as weakness, headache, drowsiness, nausea, vomiting, dry mouth, constipation, muscle/bone pain, metallic taste. Later signs of overdose evidenced by polyuria, polydipsia, anorexia, weight loss, noctu-

ria, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, cardiac dysrhythmias.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum calcium, phosphate, PTH.

### INTERVENTION/EVALUATION

Monitor serum calcium, phosphate, PTH. (therapeutic calcium level: 9–10 mg/dL). Estimate daily dietary calcium intake. Encourage adequate fluid intake. Monitor for signs/symptoms of vitamin D intoxication.

### PATIENT/FAMILY TEACHING

- Adequate calcium intake should be maintained.
- Dietary phosphorus may need to be restricted (foods high in phosphorus include beans, dairy products, nuts, peas, whole-grain products).
- Oral formulations may cause hypersensitivity reactions. Avoid excessive doses.
- Report signs/symptoms of hypercalcemia (headache, weakness, drowsiness, nausea, vomiting, dry mouth, constipation, metallic taste, muscle or bone pain).
- Maintain adequate hydration.
- Avoid changes in diet or supplemental calcium intake (unless directed by healthcare professional).
- Avoid magnesium-containing antacids in pts with renal failure.

## voriconazole

vor-i-kon-a-zole  
(Vfend, Apo-Voriconazole )

**Do not confuse voriconazole with fluconazole or Vfend with Venofer or Vimpat.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Azole derivative. **CLINICAL:** Antifungal.

## USES

Treatment of invasive aspergillosis, esophageal candidiasis. Treatment of serious fungal infections caused by *Scedosporium apiospermum*, *Fusarium* spp. Treatment of candidemia in non-neutropenic pts. Treatment of disseminated *Candida* infections of skin and abdomen, kidney, bladder wall, and wounds. **OFF-LABEL:** Empiric treatment of fungal meningitis or osteoarticular infections, coccidioidomycosis in HIV pts, fungal endophthalmitis, infection prophylaxis of graft-vs-host disease or pts with allogeneic hematopoietic stem cell transplant.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to voriconazole. Concurrent administration of barbiturates (long acting), carbamazepine, efavirenz (400 mg/day or greater), ergot alkaloids, pimozide, ivabradine, naloxegol, pimozide, quiniDine (may cause prolonged QT interval, torsades de pointes), rifabutin, rifAMPin, ritonavir (800 mg/day or greater), sirolimus, St. John's wort, tolvaptan, venetoclax (during initiation and titration in pts with chronic lymphocytic leukemia or small lymphocytic lymphoma). **Cautions:** Severe renal/hepatic impairment, hypersensitivity to other azole antifungal agents. Pts at risk for acute pancreatitis, pts with fructose intolerance, glucose-galactose malabsorption; concomitant nephrotoxic medications; pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia).

## ACTION

Interferes with fungal cytochrome P450 activity, decreasing ergosterol synthesis, inhibiting fungal cell membrane formation. **Therapeutic Effect:** Damages fungal cell wall membrane.

## PHARMACOKINETICS

Widely distributed. Protein binding: 58%. Metabolized in liver. Primarily excreted as metabolite in urine. **Half-life:** Variable, dose dependent.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** May cause fetal harm. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration, risk of toxicity of calcium channel blockers (e.g., diTIAZem, verapamil), cycloSPORINE, ergot alkaloids, HMG-CoA reductase inhibitors (e.g., lovastatin), methadone, sirolimus, tacrolimus, warfarin. CarBAMazepine, rifabutin, rifAMPin may decrease concentration/effect. QT interval–prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** St. John's wort may significantly decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine. May decrease potassium.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 200 mg. **Powder for Oral Suspension:** 200 mg/5 mL. **Tablets:** 50 mg, 200 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute 200-mg vial with 19 mL Sterile Water for Injection to provide concentration of 10 mg/mL. Dilute in 0.9% NaCl or D<sub>5</sub>W to provide concentration of 0.5–5 mg/mL.

**Rate of administration** • Infuse over 1–2 hrs at a rate not to exceed 3 mg/kg/hr. • Do not infuse concomitantly into same line with other drug infusions. • Do not infuse concomitantly even in separate lines with concentrated electrolyte solutions or blood products.

**Storage** • Store powder for injection at room temperature. • Use reconstituted solution immediately. • Do not use after 24 hrs when refrigerated.

**PO**

- Give 1 hr before or 1 hr after a meal.
- Do not mix oral suspension with any other medication or flavoring agent.
- Shake suspension for about 10 sec before use.

 **IV INCOMPATIBILITIES**

Tigecycline (Tygacil).

 **IV COMPATIBILITIES**

Anidulafungin, caspofungin, ceftaroline, doripenem.

**INDICATIONS/ROUTES/DOSAGE****Invasive Aspergillosis**

**IV: ADULTS, ELDERLY, ADOLESCENTS 15 YRS AND OLDER:** Initially, 6 mg/kg q12h for 2 doses, then 4 mg/kg q12h. **CHILDREN 12–14 YRS WEIGHING 50 KG OR MORE:** 6 mg/kg q12h for 2 doses, then 4 mg/kg q12h. **WEIGHING LESS THAN 50 KG:** 9 mg/kg q12h for 2 doses, then 8 mg/kg q12h. **CHILDREN 2–11 YRS:** 9 mg/kg q12h for 2 doses, then 8 mg/kg q12h.

**PO: ADULTS, ELDERLY, ADOLESCENTS 15 YRS AND OLDER:** 200–300 mg q12h or 3–4 mg/kg q12h. **CHILDREN 12–14 YRS WEIGHING 50 KG OR MORE:** 200–300 mg q12h. **WEIGHING LESS THAN 50 KG:** 9 mg/kg q12h. **Maximum:** 350 mg/dose. **CHILDREN 2–11 YRS:** 9 mg/kg q12h. **Maximum:** 350 mg/dose.

**Candidemia, Other Deep Tissue Candida Infections**

**IV: ADULTS, ELDERLY, ADOLESCENTS 15 YRS AND OLDER:** Initially, 400 mg (6 mg/kg) q12h for 2 doses, then 200 mg (3 mg/kg) IV or PO q12h. **CHILDREN 12–14 YRS WEIGHING 50 KG OR MORE:** 400 mg (6 mg/kg) q12h for 2 doses, then 4 mg/kg q12h. **WEIGHING LESS THAN 50 KG:** 9 mg/kg q12h for 2 doses, then 8 mg/kg q12h. **CHILDREN 2–11 YRS:** 9 mg/kg q12h for 2 doses, then 8 mg/kg q12h.

**PO: ADULTS, ELDERLY, ADOLESCENTS 15 YRS AND OLDER:** See IV. **CHILDREN 12–14 YRS WEIGHING 50 KG OR MORE:** 200 mg (3 mg/kg) q12h. **WEIGHING LESS THAN 50 KG:** 9 mg/kg q12h. **Maximum:** 350 mg/

dose. **CHILDREN 2–11 YRS:** 9 mg/kg q12h. **Maximum:** 350 mg/dose.

### Esophageal Candidiasis

**PO: ADULTS, ELDERLY, ADOLESCENTS 15 YRS AND OLDER WEIGHING 40 KG OR MORE:** 200 mg q12h. **Maximum:** 600 mg daily. **WEIGHING LESS THAN 40 KG:** 100 mg q12h. **Maximum:** 300 mg daily. **CHILDREN 12–14 YRS WEIGHING 50 KG OR GREATER:** 200 mg q12h. **WEIGHING LESS THAN 50 KG:** 9 mg/kg q12h. **Maximum:** 350 mg/dose. **CHILDREN 2–11 YRS:** 9 mg/kg q12h. **Maximum:** 350 mg/dose.

### Fusariosis

**IV: ADULTS, ELDERLY:** Initially, 6 mg/kg q12h for 2 doses, then 4 mg/kg q12h. **PO:** (following improvement with initial IV therapy): 200 mg twice daily.

### Scedosporiosis

**IV: ADULTS, ELDERLY:** 6 mg/kg twice daily for 2 doses, then decrease to 4 mg/kg twice daily. **PO:** 400 mg twice daily for 2 doses, then decrease to 200–300 mg twice daily.

### Dosage in Pts Receiving Phenytoin

**IV:** Increase maintenance dose to 5 mg/kg q12h. **PO:** Increase 200 mg q12h to 400 mg q12h (pts weighing 40 kg or more) or 100 mg q12h to 200 mg q12h (pts weighing less than 40 kg).

### Dosage in Pts Receiving Efavirenz

Increase dose to 400 mg q12h and reduce efavirenz to 300 mg/day.

### Dosage in Renal Impairment

No dose adjustment. IV dosing not recommended in pts with CrCl 50 mL/min or less.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Reduce maintenance dose by 50%. **Severe impairment:** Use only if benefits outweigh risks. Monitor closely for toxicity.

## SIDE EFFECTS

**Frequent (20%–6%):** Abnormal vision, fever, nausea, rash, vomiting. **Occasional**

**(5%–2%):** Headache, chills, hallucinations, photophobia, tachycardia, hypertension.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hepatotoxicity (jaundice, hepatitis, hepatic failure), acute renal failure have occurred in severely ill pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, LFT; ECG. Correct electrolyte deficiencies prior to initiating treatment. Receive full medication history and screen for interactions. Question medical history as listed in Precautions.

### INTERVENTION/EVALUATION

Monitor serum renal function, LFT. Monitor visual function (visual acuity, visual field, color perception) for drug therapy lasting longer than 28 days.

### PATIENT/FAMILY TEACHING

- Take at least 1 hr before or 1 hr after a meal.
- Avoid grapefruit products.
- Report visual changes (blurred vision, photophobia, yellowing of skin/eyes).
- Avoid performing hazardous tasks if changes in vision occur.
- Avoid direct sunlight.
- Women of childbearing potential should use effective contraception.

## vorinostat

vor-in-o-stat  
(Zolinza)

**Do not confuse vorinostat with Votrient.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histone deacetylase (HDAC) inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of cutaneous manifestations in pts with cutaneous T-cell lymphoma (CTCL) with progressive, persistent, or

recurrent disease, on or following two systemic therapies.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to vorinostat. **Cautions:** Diabetes, history of thrombosis (DVT, PE); pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions); pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia); pts at risk for bleeding (e.g., history of intracranial, GI, genitourinary bleeding; coagulation disorders, recent trauma, concomitant use of anticoagulants, antiplatelets). Use caution during perioperative period in pts requiring bowel surgery.

## ACTION

Inhibits activity of histone deacetylase enzymes that catalyze removal of acetyl groups from protein lysine residues, causing accumulation of acetylated histones. **Therapeutic Effect:** Terminates cell growth, causes apoptosis.

## PHARMACOKINETICS

Widely distributed. Protein binding: 71%. Metabolized to inactive metabolites. Excreted in urine. **Half-life:** 2 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase effect of warfarin. Valproic acid increases risk of GI bleeding, thrombocytopenia. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant.

**FOOD:** None known. **LAB VALUES:** May decrease serum calcium, potassium, sodium, phosphate, platelet count. May increase serum glucose, creatinine; urine protein.

## AVAILABILITY (Rx)

 **Capsules:** 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Do not break, crush, dissolve, or divide capsules.
- Give with food.
- Maintain adequate hydration during treatment.

## INDICATIONS/ROUTES/DOSAGE

### Cutaneous T-Cell Lymphoma (CTCL)

**PO: ADULTS, ELDERLY:** 400 mg once daily with food. Continue until disease progression or unacceptable toxicity.

### Dose Modification

**Intolerance or toxicity:** Reduce dose to 300 mg once daily. **Unable to tolerate daily dose:** May further reduce to 300 mg once daily for 5 consecutive days per wk (5 out of 7 days).

### Dosage in Renal Impairment

**Mild to severe impairment:** Use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** 300 mg once daily. **Severe impairment:** 100–200 mg once daily.

## SIDE EFFECTS

**Frequent (50%–24%):** Fatigue, diarrhea, nausea, altered taste, anorexia. **Occasional (21%–11%):** Weight decrease, muscle spasms, alopecia, dry mouth, chills, vomiting, constipation, dizziness, peripheral edema, headache, pruritus, cough, fever.

## ADVERSE EFFECTS/TOXIC REACTIONS

Thrombocytopenia occurs in 25% of pts, anemia in 15%. Pulmonary embolism occurs in 4% of pts. Deep vein thrombosis (DVT) occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP; PT/INR in pts taking concomitant warfarin; pregnancy test in females of reproductive potential. Screen for active infection. Question history of thrombosis (DVT, PE). Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Monitor CBC, serum electrolytes q2wks for 2 mos, then monthly. Replace electrolyte as indicated to prevent cardiac arrhythmias. Monitor for symptoms of DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia). Bleeding of any kind can be life-threatening and must be treated promptly. Encourage fluid intake, approximately 2 L/day input. Assess for evidence of dehydration. Provide antiemetics to control nausea/vomiting. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Drink at least 2 L/day of fluids to prevent dehydration.
- Treatment may cause life-threatening blood clots; report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Treatment may increase risk of bleeding. Report bleeding of any kind.

## vortioxetine

vor-tye-ox-e-teen  
(Trintellix)

**BLACK BOX ALERT** Antidepressants have an increased risk of suicidal ideation and behavior in children, adolescents, and young adults. Monitor closely for worsening or emergence of suicidal thoughts and behaviors.

**Do not confuse vortioxetine**

with FLUoxetine, PARoxetine, or venlafaxine.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor (SSRI).  
**CLINICAL:** Antidepressant.

### USES

Treatment of major depressive disorder.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to vortioxetine. Use of monoamine oxidase inhibitors (MAOIs) intended to treat psychiatric disorders concurrently or within 21 days of stopping vortioxetine; do not use vortioxetine within 14 days of stopping an MAOI. Initiation of vortioxetine in pts receiving linezolid or intravenous methylene blue. **Cautions:** Dehydration, hepatic impairment, elderly, pts at risk for bleeding (e.g., history of intracranial/GI/genitourinary bleeding, coagulation disorders, recent trauma, concomitant use of anticoagulants, antiplatelets); history of suicidal ideation and behavior; family history of bipolar disorder, mania, hypomania.

### ACTION

Blocks reuptake of neurotransmitter serotonin at CNS presynaptic membranes, increasing availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves depression.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%. Peak plasma concentration: 7–11 hrs. Steady state reached within 2 wks. Excreted in urine (59%), feces (26%). **Half-life:** 66 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm when administered in third trimester. Unknown if distributed in breast milk. Exposed neonates are at increased risk of apnea, cyanosis, prolonged hos-

pitalization, pulmonary hypertension, seizures, serotonin syndrome. **Children:** Safety and efficacy not established in pediatric population. **Elderly:** May have increased risk of dehydration, hyponatremia.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effects. Strong CYP2D6 inhibitors (e.g., bupropion, fluoxetine, paroxetine) may increase concentration/effect. MAOIs (e.g., phenelzine, selegiline) contraindicated; may cause malignant hyperthermia, hypertensive crisis, hyperreflexia, seizures, serotonin syndrome. Alcohol may increase adverse effects. Serotonergic drugs (e.g., buspirone, linezolid, lithium, tramadol) may increase risk of serotonin syndrome. Anticoagulants, antiplatelets, NSAIDs may increase risk of bleeding. **HERBAL:** St. John's wort, Syrian rue may increase serotonergic effect. Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), glucosamine may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. May administer with milk or food if GI upset occurs.

## INDICATIONS/ROUTES/DOSAGE

### Major Depressive Disorder

**PO: ADULTS/ELDERLY:** Initially, 10 mg once daily. May increase to 20 mg as tolerated.

**Maintenance:** 5–20 mg once daily.

### Dose Modification

**Concomitant use of strong CYP2D6 inhibitors:** Reduce dose by half of intended therapy. **Maximum:** 10 mg once

daily. **Concomitant use of strong CYP inducers:** If coadministered for more than 14 days, consider increasing vortioxetine dose. **Maximum:** Do not exceed more than 3 times original dose. **CYP2D6 poor metabolizers:** **Maximum:** 10 mg once daily.

### Discontinuation

Gradually taper dose to minimize incidence of withdrawal symptoms and to allow detection of re-emerging symptoms.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (32%–22%):** Nausea, sexual dysfunction. **Occasional (10%–3%):** Diarrhea, dizziness, dry mouth, constipation, vomiting, flatulence, abnormal dreams, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening serotonin syndrome may include mental status changes (agitation, hallucinations, delirium, coma), autonomic instability (tachycardia, labile blood pressure, dizziness, sweating, flushing, hyperthermia), neuromuscular symptoms (tremor, rigidity, myoclonus [localized muscle twitching], hyperactive reflexes, incoordination), seizures, GI symptoms (nausea, vomiting, diarrhea). May increase risk of bleeding events such as ecchymosis, hematoma, epistaxis (nosebleed), petechiae. Mania/hypomania may indicate baseline bipolar disorder. Syndrome of inappropriate antidiuretic hormone (SIADH), also known as water intoxication or dilutional hyponatremia, may induce seizures, coma, or death. Angioedema, dyspnea, rash may indicate allergic reaction. May increase risk of suicidal ideation and behavior once treatment is therapeutic. May alter sexual drive, ease of arousal, ease of reaching

orgasm, or cause erectile dysfunction in men or decreased lubrication in women.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum electrolytes. Note serum sodium level. Assess appearance, behavior, speech pattern, level of interest, mood. Assess risk for bleeding. Receive full medication history including herbal products.

### INTERVENTION/EVALUATION

Monitor serum sodium levels. Screen for signs of SIADH (confusion, seizures). Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Assess for improvement of depression (improved emotion, self-image, interest in activities; decreased agitation, loneliness, self-

harm). Monitor for symptoms of serotonin syndrome, mania/hypomania. Monitor for allergic reactions.

### PATIENT/FAMILY TEACHING

- Report neurologic changes: confusion, excessive talking, hallucinations, headache, hyperactivity, insomnia, racing thoughts, seizure-like activity, tremors; sexual dysfunction; fever; or any type of allergic reaction.
- Avoid tasks that require alertness, motor skills until response to drug is established (may cause dizziness, drowsiness).
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.
- Report bleeding, bruising.
- Severe allergic reaction may occur; report rash; swelling of the face, tongue, throat.

**warfarin**TOP  
100 HIGH  
ALERTwar-far-in  
(Jantoven)

**BLACK BOX ALERT** May cause major or fatal bleeding. Risk factors include history of GI bleeding, hypertension, cerebrovascular disease, heart disease, malignancy, trauma, anemia, renal insufficiency, age 65 yrs and older, high anticoagulation factor (INR greater than 4). Consider cardiac/hepatic function, age, nutritional status, concurrent medications, risk of bleeding when dosing warfarin. Genetic variations have been identified as factors associated with dosage and bleeding risk. Genotyping tests are available. Perform regular monitoring of international normalized ratio (INR) on all pts during treatment.

**Do not confuse Jantoven with Janumet or Januvia.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vitamin K antagonist. **CLINICAL:** Anticoagulant.

### USES

Prophylaxis, treatment of thromboembolic disorders and embolic complications arising from atrial fibrillation or valve replacement. Risk reduction of systemic embolism following MI (e.g., recurrent MI, stroke). **OFF-LABEL:** Adjunct treatment in transient ischemic attacks.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to warfarin. Hemorrhagic tendencies (e.g., cerebral aneurysms, bleeding from GI tract), recent or potential surgery of eye or CNS, neurosurgical procedures, open wounds, severe uncontrolled or malignant hypertension, spinal puncture procedures, uncontrolled bleeding, ulcers, unreliable or noncompliant pts, unsupervised pts, blood dyscrasias, pericarditis or pericardial effusion, pregnancy (except in women with mechanical heart valves at high risk for thromboembolism), bacterial endocar-

ditis, threatened abortion. Major regional lumbar block anesthesia or traumatic surgery, eclampsia/preeclampsia. **Cautions:** Active tuberculosis, acute infection, diabetes, heparin-induced thrombocytopenia and deep vein thrombosis, pts at risk for hemorrhage, moderate to severe renal impairment, moderate to severe hypertension, thyroid disease, polycythemia vera, vasculitis, open wound, menstruating and postpartum women, indwelling catheters, trauma, prolonged dietary deficiencies, disruption of GI normal flora, history of peptic ulcer disease, protein C deficiency, elderly.

### ACTION

Interferes with hepatic synthesis of vitamin K–dependent clotting factors, resulting in depletion of coagulation factors II, VII, IX, X. **Therapeutic Effect:** Prevents further extension of formed existing clot; prevents new clot formation, secondary thromboembolic complications.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1.5–3 days	5–7 days	2–5 days

Widely distributed. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 20–60 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in pregnancy (fetal, neonatal hemorrhage, intrauterine death). Crosses placenta; is not distributed in breast milk. **Children:** More susceptible to effect. **Elderly:** Increased risk of hemorrhage; lower dosage recommended.

### INTERACTIONS

**DRUG:** Amiodarone, azole antifungals (e.g., fluconazole), cimetidine, disulfiram, sulfamethoxazole-trimethoprim, levothyroxine, metronidazole, NSAIDs (e.g., diclofenac, meloxicam, naproxen), omeprazole, platelet aggregation inhibitors (e.g., clopidogrel), salicylates (e.g.,

aspirin), thrombolytic agents (e.g., alteplase), thyroid hormones (e.g., levothyroxine), may increase effect. **Strong CYP3A inducers** (e.g., carbamazepine, phenytoin, rifampin), nafcillin, oral contraceptives, sucralose, vitamin K may decrease effects. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), fenugreek, glucosamine may increase risk of bleeding. **FOOD:** Foods rich in vitamin K (e.g., brussels sprouts, leafy greens, kale, spinach) may decrease therapeutic effect. **Cranberry juice** may increase effect. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Tablets:** 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. Give with food if GI upset occurs.
- Give at same time each day.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Initial dosing must be individualized with use of recommended institutional protocols. Response is influenced by numerous factors (e.g., age, organ function, genetic variations).

#### Anticoagulant

**PO: ADULTS, ELDERLY:** Initially, 5 mg once daily (for most pts). **Maintenance:** (Usual dose): 2–10 mg once daily. Once INR is therapeutic and stable, subsequent dosage may be guided by use of a maintenance dosing nomogram. INR should be checked wkly when out of range and approximately q4wks when stable and therapeutic.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment. Closely monitor INR.

### SIDE EFFECTS

**Occasional:** GI distress (nausea, anorexia, abdominal cramps, diarrhea). **Rare:** Hy-

persensitivity reaction (dermatitis, urticaria), esp. in those sensitive to aspirin.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hemorrhagic events including local ecchymoses to major hemorrhage (intracranial hemorrhage, GI/GU/nasal/oral/rectal bleeding) may occur. Hepatotoxicity, blood dyscrasias, necrosis, vasculitis, local thrombosis occur rarely. **Antidote:** Vitamin K. Amount based on INR, significance of bleeding. Range: 2.5–10 mg given orally or slow IV infusion (see Appendix J for dosage).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, PT/INR. Obtain genotyping prior to initiating therapy if available. Screen for major active bleeding, contraindications. Question recent history of bleeding, recent trauma, surgical procedures, epidural anesthesia.

#### INTERVENTION/EVALUATION

Obtain CBC, PT/INR daily until therapeutic level is achieved. When stabilized, follow with INR determination q4–6wks. Assess CBC for anemia; urine/stool for occult blood. Monitor for hypotension; complaints of abdominal/back pain, severe headache, confusion, seizures, hemiparesis, aphasia (may be sign of hemorrhage). Question for increase in amount of menstrual discharge. Assess for ecchymoses, petechiae. Check for excessive bleeding from minor cuts, scratches.

#### PATIENT/FAMILY TEACHING

- Blood levels will be monitored routinely. Do not take newly prescribed medications or discontinue treatment unless approved by prescriber who originally started treatment.
- Avoid alcohol, aspirin, foods or supplements rich in vitamin K.
- Consult with physician before surgery, dental work.
- Urine may become orange.
- Falls, subtle injuries, esp.

head or abdominal trauma, can be life-threatening. • Report bleeding, bruising, red or brown urine, black stools. • Use electric razor, soft toothbrush to prevent bleeding. • Report cof-

fee-ground vomitus, blood-tinged mucus from cough. • Seek immediate medical attention for stroke-like symptoms (confusion, difficulty speaking, headache, one-sided weakness); bloody stool or urine.

## zanamivir

zan-am-i-veer  
(Relenza Diskhaler)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Neuraminidase inhibitor. **CLINICAL:** Antiviral, anti-influenza.

### USES

Treatment of uncomplicated acute illness due to influenza virus A and B in adults, children 7 yrs and older who have been symptomatic for less than 2 days. Prevention of influenza A and B in adults and children 5 yrs and older.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to zanamivir. **Cautions:** Not recommended in pulmonary disease (e.g., COPD, asthma).

### ACTION

Inhibits influenza virus enzyme neuraminidase, essential for viral replication. **Therapeutic Effect:** Prevents viral release from infected cells.

### PHARMACOKINETICS

Widely distributed. Protein binding: less than 10%. Not metabolized. Excreted unchanged in urine. **Half-life:** 2.5–5.1 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 7 yrs (treatment) or younger than 5 yrs (prevention). **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease levels/effect of influenza virus vaccine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Powder for Inhalation:** 5 mg/blister.

### ADMINISTRATION/HANDLING

#### Inhalation

- Instruct pt to use Diskhaler device provided, exhale completely; then, holding mouthpiece 1 inch away from lips, inhale and hold breath as long as possible before exhaling.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).
- Store at room temperature.

### INDICATIONS/ROUTES/DOSAGE

#### Treatment of Influenza Virus

**Inhalation: ADULTS, ELDERLY, CHILDREN 7 YRS AND OLDER:** 2 inhalations (one 5-mg blister per inhalation for total dose of 10 mg) twice daily (approximately 12 hrs apart) for 5 days.

#### Prevention of Influenza Virus

**Inhalation: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER:** *Postexposure prophylaxis (household exposure):* Two inhalations (10 mg) once daily for 7 days after last known exposure. *(Institutional outbreak):* Two inhalations (10 mg) once daily for at least 2 wks and until approx. 7 days after identification of illness onset in the last pt.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (3%–2%):** Diarrhea, sinusitis, nausea, bronchitis, cough, dizziness, headache. **Rare (less than 1.5%):** Malaise, fatigue, fever, abdominal pain, myalgia, arthralgia, urticaria.

### ADVERSE EFFECTS/TOXIC REACTIONS

May cause neutropenia. Bronchospasm may occur in those with history of COPD, bronchial asthma. Neuropsychiatric events (e.g., confusion, seizures, hallucinations) have been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Pts requiring an inhaled bronchodilator at same time as zanamivir should use the bronchodilator before zanamivir administration.

**INTERVENTION/EVALUATION**

Provide assistance if dizziness occurs. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Follow manufacturer guidelines for use of delivery device.
- Avoid contact with those who are at high risk for influenza.
- Continue treatment for full 5-day course.
- In pts with respiratory disease, an inhaled bronchodilator should be readily available.

**zanubrutinib**

zan-ue-broo-ti-nib  
(Brukinsa)

**Do not confuse zanubrutinib with acalabrutinib or ibrutinib; Brukinsa with Imbruvica.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bruton tyrosine kinase (BTK) inhibitor.

**CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with relapsed or refractory mantle cell lymphoma (MCL) who have received at least one prior therapy. Treatment of Waldenström macroglobulinemia in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to zanubrutinib. **Cautions:** Baseline cytopenias, hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), chronic op-

portunistic infections (e.g., herpesvirus infection, hepatitis B virus [HBV] infection, fungal infections), pts at risk for bleeding (e.g., history of intracranial/GI/genitourinary bleeding, coagulation disorders, recent trauma, concomitant use of anticoagulants, antiplatelets); history of atrial fibrillation, atrial flutter, cardiac disease. Avoid concomitant use of strong or moderate CYP3A4 inducers.

**ACTION**

Highly selective BTK inhibitor that forms a covalent bond with a cysteine residue in the BTK active site, inhibiting activity of BTK. BTK is a signaling molecule of pathways necessary for B-cell proliferation. **Therapeutic Effect:** Inhibits malignant B-cell proliferation and reduces tumor growth.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 94%. Peak plasma concentration: 2 hrs. Excreted in feces (87%), urine (8%). **Half-life:** 2–4 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase effect/adverse effects of **anticoagulants** (e.g., heparin, warfarin), **antiplatelets** (e.g., aspirin, clopidogrel), increasing risk of bleeding. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir), **moderate CYP3A inhibitors** (e.g., erythromycin, ciprofloxacin, diltiazem, fluconazole, verapamil) may increase concentration/effect. **Strong**

**CYP3A4 inducers** (e.g., rifAMPin, phenytoin, carBAMazepine, phenobarbital), **moderate CYP3A inducers** (e.g., bosentan, nafcillin) may decrease concentration/effect. May decrease effects of **BCG (intravesical)**, **vaccines (live)**. May increase toxic effects of **natalizumab**, **live vaccines**. **Pimecrolimus**, **tacrolimus** may increase adverse/toxic effect. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, bilirubin, uric acid. May decrease Hgb, leukocytes, lymphocytes, platelets, neutrophils, RBCs.

## AVAILABILITY (Rx)

**Capsules:** 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer capsule whole; do not break, cut, or open.
- If a dose is missed, administer as soon as possible on same day, then follow usual dosing schedule the following day.

## INDICATIONS/ROUTES/DOSAGE

**MCL, Waldenström Macroglobulinemia**

**PO; ADULTS, ELDERLY:** 160 mg twice daily or 320 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Grade 3 or 4 nonhematologic toxicity; Grade 3 thrombocytopenia with bleeding; Grade 4 thrombocytopenia (lasting more than 10 days); Grade 3 febrile neutropenia; Grade 4 neutropenia lasting more than 7 days:** (**First occurrence**): Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at 160 mg twice daily or 320 mg once daily. (**Second occurrence**): Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at 80 mg twice daily or 160 mg once daily. (**Third**

**occurrence**): Withhold treatment until improved to Grade 1 or 0 (or baseline), then resume at 80 mg once daily. (**Fourth occurrence**): Permanently discontinue.

### Concomitant Use of CYP3A Inhibitors/Inducers

**Strong CYP3A inhibitors:** Reduce dose to 80 mg once daily. **Moderate CYP3A inhibitors:** Reduce dose to 80 mg twice daily. **Strong or moderate CYP3A inhibitors:** Avoid concomitant use.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, hemodialysis:** Monitor for adverse reactions/toxic effects.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose to 80 mg twice daily.

## SIDE EFFECTS

**Frequent (36%–23%):** Rash, diarrhea. **Occasional (14%–12%):** Bruising, musculoskeletal pain, myalgia, back pain, arthralgia, constipation, cough, hypertension. **Rare (4%):** Headache.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more severe reactions including febrile neutropenia, hemorrhagic thrombocytopenia may occur. Life-threatening hemorrhagic events including intracranial hemorrhage, GI bleeding, hematuria, hemothorax occurred in 2% of pts. Petechiae, purpura reported in 50% of pts. Life-threatening bacterial, invasive fungal, viral, other opportunistic infections; pneumonia may occur. Grade 3 infections reported in 23% of pts. Reactivation of HBV infection was reported. UTI reported in 11% of pts. New primary malignancies including basal cell carcinoma, squamous

cell carcinoma (6% of pts), nonskin carcinomas (9% of pts) have occurred. Atrial fibrillation/atrial flutter reported in 2% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; PT/INR (if on anticoagulation therapy); pregnancy test in female of reproductive potential. Confirm compliance of effective contraception. Assess risk for bleeding. Question history of atrial fibrillation, atrial flutter, cardiac disease; intracranial/GI/genitourinary bleeding, coagulation disorders, recent trauma; previous skin cancers. Assess usual bowel movement patterns, stool characteristics. Receive full medication history and screen for interactions. Screen for active infection. Consider prophylactic treatment of herpes simplex virus, *pneumocystis jirovecii* pneumonia, other infections. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC periodically for cytopenias. Diligently monitor for infections (cough, fever, fatigue), esp. respiratory tract infections, herpesvirus infection, opportunistic infections, sepsis. If serious infection or sepsis occurs, initiate appropriate antimicrobial therapy. Monitor for HBV reactivation, new malignancies (skin and nonskin). Obtain ECG if chest pain, dyspnea, palpitations occur. Monitor for hemorrhagic events including intracranial hemorrhage (altered mental status, aphasia, blindness, hemiparesis, unequal pupils, seizures), GI bleeding (hematemesis, melena, rectal bleeding), genitourinary bleeding (hematuria), epistaxis. Monitor daily pattern of bowel activity, stool consistency. Monitor for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor is unavoidable.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those

with active infection. • Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool. • Treatment may cause new cancers; reactivation of HBV. • Report liver problems (abdominal pain, bruising, clay-colored stool, dark or amber-colored urine, yellowing of the skin or eyes), heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate); symptoms of hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision, seizures). • Immediately report bleeding of any kind. • Use effective contraception to avoid pregnancy. Do not breast-feed. • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy. • Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## zidovudine

zye-doe-vue-deen  
(Retrovir)

**BLACK BOX ALERT** ■ Neutropenia, severe anemia may occur. Lactic acidosis, severe hepatomegaly with steatosis (fatty liver), including fatalities, have occurred. Symptomatic myopathy, myositis associated with prolonged use.

**Do not confuse Retrovir with acyclovir or ritonavir.**

### FIXED-COMBINATION(S)

**Combivir:** zidovudine/lamivudine (an antiviral): 300 mg/150 mg.

**Trizivir:** zidovudine/lamivudine/abacavir (an antiviral): 300 mg/150 mg/300 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nucleoside reverse transcriptase inhibitors.

**CLINICAL:** Antiretroviral.

**USES**

Treatment of HIV infection in combination with at least two other antiretroviral agents. Prevention of maternal/fetal HIV transmission. **OFF-LABEL:** Prophylaxis in health care workers at risk for acquiring HIV after occupational exposure (part of multidrug regimen).

**PRECAUTIONS**

**Contraindications:** Potentially life-threatening allergic reactions to zidovudine or its components. **Cautions:** Bone marrow compromise, renal/hepatic impairment. Combination with interferon with or without ribavirin in HIV/hepatitis C virus (HCV) coinfection.

**ACTION**

Interferes with viral RNA-dependent DNA polymerase, an enzyme necessary for viral HIV replication. **Therapeutic Effect:** Slows HIV replication, reducing progression of HIV infection.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 25%–38%. Metabolized in liver. Crosses blood-brain barrier and is widely distributed, including to CSF. Primarily excreted in urine. **Half-life:** 0.5–3 hrs (increased in renal impairment).

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Unknown if fetal harm or effects on fertility can occur. **Children:** No age-related precautions noted. **Elderly:** Information not available.

**INTERACTIONS**

**DRUG:** May decrease therapeutic effect of **cladribine, DOXOrubicin, ganciclovir, interferons, valganciclovir.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase mean corpuscular volume (MCV).

**AVAILABILITY (Rx)**

**Capsules:** 100 mg. **Injection Solution (Retrovir):** 10 mg/mL. **Syrup:** 50 mg/5 mL. **Tablets:** 300 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Dilute in D<sub>5</sub>W to a final concentration no greater than 4 mg/mL.

**Rate of administration** • Infuse over 1 hr. May infuse over 30 min in neonates.

**Storage** • Refrigerate diluted solution for up to 24 hrs or store at room temperature for up to 8 hrs. • Do not use if solution is discolored or precipitate forms.

**PO**

• Give without regard to food. • Space doses evenly around the clock. • Pt should maintain an upright position when given medication to prevent esophageal ulceration.

 **IV COMPATIBILITIES**

Dexamethasone (Decadron), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, LORazepam (Ativan), morphine, potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**HIV Infection**

**PO: ADULTS, ELDERLY:** 300 mg q12h. **CHILDREN 4 WKS TO 18 YRS WEIGHING 30 KG OR MORE:** 300 mg q12h. **WEIGHING 9–29 KG:** 9 mg/kg q12h. **WEIGHING 4–8 KG:** 12 mg/kg q12h. **PREMATURE NEONATES, GA 35 WKS OR MORE:** 4 mg/kg q12h, increase to 12 mg/kg q12h after 4 wks of age. **GA 30–34 WKS:** 2 mg/kg q12h for 2 wks, then 3 mg/kg q12h, then 12 mg/kg q12h after 6–8 wks. **GA LESS THAN 30 WKS:** 2 mg/kg q12h, then 3 mg/kg q12h at 4 wks of age, then 12 mg/kg q12h after 8–10 wks of age.

**IV: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 1 mg/kg/dose q4h around the clock. **CHILDREN 12 YRS AND YOUNGER, FULL-TERM NEONATES:** 3 mg/kg/dose q12h. **OLDER THAN 4 WKS:** Increase to 9 mg/kg/dose q12h. **PREMATURE NEONATES:** 1.5–2.3 mg/kg/dose q12h based on gestation at birth. **6–10 WKS:** Increase to 9 mg/kg/dose q12h.

#### Prevention of Maternal/Fetal HIV Transmission

**Note:** Should be given IV near delivery regardless of antepartum regimen or mode of delivery in women with HIV RNA level greater than 1,000 copies/mL (or unknown status). Other antiretrovirals should be continued orally. Zidovudine IV is not required in pts receiving HIV therapy with HIV RNA level less than 1,000 copies/mL near delivery.

**IV: DURING LABOR AND DELIVERY:** 2 mg/kg loading dose, then IV infusion of 1 mg/kg/hr until delivery. For scheduled cesarean section, begin IV zidovudine 3 hrs before surgery. **NEONATAL:** Begin 6–12 hrs after birth and continue for first 6 wks of life. Use IV route only until oral therapy can be administered.

**PO: FULL-TERM INFANTS:** 4 mg/kg/dose q12h (IV: 3 mg/kg/dose q12h). **INFANTS 30–34 WKS' GESTATION:** 2 mg/kg/dose q12h; increase to 3 mg/kg/dose at 2 wks of age (IV: 1.5 mg/kg/dose q12h; increase to 2.3 mg/kg/dose q12h at 2 wks of age). **INFANTS LESS THAN 30 WKS' GESTATION:** 2 mg/kg/dose q12h. (IV: 1.5 mg/kg/dose q12h.)

#### Dosage in Renal Impairment

**ADULTS, ELDERLY: CrCl less than 15 mL/min, including hemodialysis or peritoneal dialysis: PO:** 100 mg q8h or 300 mg once daily. **IV:** 1 mg/kg q6–8hr. **INFANTS OLDER THAN 6 WKS, CHILDREN, ADOLESCENTS: GFR 10 mL/min/1.73m<sup>2</sup> or greater:** No adjustment. **GFR less than 10 mL/min/1.73m<sup>2</sup>:** Administer 50% of dose q8h.

#### Dosage in Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Expected (46%–42%):** Nausea, headache. **Frequent (20%–16%):** Abdominal pain, asthenia, rash, fever, acne. **Occasional (12%–8%):** Diarrhea, anorexia, malaise, myalgia, drowsiness. **Rare (6%–5%):** Dizziness, paresthesia, vomiting, insomnia, dyspnea, altered taste.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Anemia (occurring most commonly after 4–6 wks of therapy), granulocytopenia may occur in pts with pretherapy low baselines. Neurotoxicity (ataxia, fatigue, lethargy, nystagmus, seizures) may occur.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain CBC, CD4 cell count, HIV RNA plasma level, viral load. Obtain specimens for viral diagnostic tests before starting therapy (therapy may begin before results are obtained).

##### INTERVENTION/EVALUATION

Monitor CBC, CD4 cell count, HIV RNA levels. Monitor for bleeding. Assess for headache, dizziness. Monitor daily pattern of bowel activity, stool consistency. Evaluate skin for acne, rash. Monitor for opportunistic infections (fever, chills, cough, myalgia). Monitor I&O, serum renal function, LFT.

##### PATIENT/FAMILY TEACHING

- Treatment is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Do not take any medications without physician's approval.
- Bleeding from gums, nose, rectum may occur and should be reported to physician immediately.
- Dental work should be done before therapy or after blood counts return to normal (often wks after ther-

apy has stopped). • Inform physician if muscle weakness, difficulty breathing, headache, inability to sleep, unusual bleeding, rash, signs of infection occur.

## ziprasidone

zi-pras-i-done  
(Geodon, Zeldox )

**BLACK BOX ALERT** Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF.

**Do not confuse ziprasidone with trazODone.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Second-generation (atypical) antipsychotic.

**CLINICAL:** Antipsychotic.

## USES

Treatment of schizophrenia, acute agitation in pts with schizophrenia. Treatment of acute mania or mixed episodes associated with bipolar disorder with or without psychosis. Maintenance treatment of bipolar disorder as adjunct to lithium or valproic acid. **OFF-LABEL:** Major depressive disorder (adjunct to antidepressants).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ziprasidone. Conditions associated with risk of prolonged QT interval, congenital long QT syndrome, concurrent use of other QT-prolongation medications (e.g., amiodarone, moxifloxacin, tacrolimus, thioridazine). Uncompensated HF. Recent MI. **Cautions:** Pts with bradycardia, hypokalemia, hypomagnesemia may be at greater risk for torsades de pointes. History of MI or unstable heart disease, seizure disorder, cardiac arrhythmias, disorders in which CNS depression is a

feature; pts at risk for aspiration pneumonia, hypotension, suicide; elderly, diabetes, hepatic impairment, Parkinson's disease, pts with breast cancer or other prolactin-dependent tumors.

## ACTION

Antagonizes alpha-adrenergic, DOPamine, histamine, serotonin receptors; inhibits reuptake of serotonin, norepinephrine. **Therapeutic Effect:** Diminishes symptoms of schizophrenia, depression.

## PHARMACOKINETICS

Widely distributed. Food increases bioavailability. Protein binding: 99%. Metabolized in liver. Excreted in feces. Not removed by hemodialysis. **Half-life:** **PO:** 7 hrs; **IM:** 2–5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted. Use caution.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. CarBAMazepine may decrease concentration. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** All foods enhance bioavailability. **LAB VALUES:** May prolong QT interval. May increase serum glucose, prolactin levels.

## AVAILABILITY (Rx)

**Capsules:** 20 mg, 40 mg, 60 mg, 80 mg. **Injection, Powder for Reconstitution:** 20 mg.

**ADMINISTRATION/HANDLING****IM**

• Store vials at room temperature; protect from light. • Reconstitute each vial with 1.2 mL Sterile Water for Injection to provide concentration of 20 mg/mL. • Reconstituted solution stable for 24 hrs at room temperature or 7 days if refrigerated.

**PO**

• Give with food containing at least 500 calories (increases bioavailability).

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Dosage greater than 80 mg twice daily is not recommended in most pts. **To discontinue therapy:** Gradually discontinue to avoid withdrawal symptoms, minimize risk of relapses.

**Schizophrenia**

**PO: ADULTS, ELDERLY:** Initially, 20 mg twice daily with food. Titrate at intervals of no less than 2 days based on response and tolerability. **Maintenance:** 40–80 mg twice daily.

**Acute Agitation (Schizophrenia)**

**IM: ADULTS, ELDERLY:** 10 mg q2h or 20 mg q4h. **Maximum:** 40 mg/day. Switch to oral therapy as soon as possible.

**Bipolar Disorder (Acute and Maintenance as Adjunct to Lithium or Valproate)**

**PO: ADULTS, ELDERLY (Acute):** Initially, 40 mg twice daily. May increase to 60–80 mg twice daily on second day of treatment. **Maintenance:** 40–80 mg twice daily.

**Dosage in Renal Impairment**

**Oral:** No dose adjustment. **IM:** Use caution.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (30%–16%):** Headache, drowsiness, dizziness. **Occasional:** Rash, orthostatic hypotension, weight gain,

restlessness, constipation, dyspepsia. **Rare:** Hyperglycemia, priapism.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Prolongation of QT interval (as seen on ECG) may produce torsades de pointes, a form of ventricular tachycardia.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum magnesium, potassium; ECG to assess risk for QT interval prolongation. Assess pt's behavior, appearance, emotional status, response to environment, speech pattern, thought content.

**INTERVENTION/EVALUATION**

Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression). Monitor weight.

**PATIENT/FAMILY TEACHING**

• Avoid tasks that require alertness, motor skills until response to drug is established. • Avoid alcohol. • Report chest pain, shortness of breathing, irregular heartbeats, fainting, palpitations.

**ziv-afibercept**

ziv-a-flib-er-sept  
(Zaltrap)

**Do not confuse ziv-afibercept with abatacept, Aricept, or etanercept.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of metastatic colorectal cancer (mCRC) (in combination with

5-fluorouracil, leucovorin, irinotecan [FOLFIRI]) in pts resistant to or has progressed following an oxaliplatin-containing regimen.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ziv-aflibercept. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for bleeding (e.g., history of intracranial/GI/GU bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelet medication, NSAIDs), hypertension, elderly, history of arterial/venous thrombosis (e.g., CVA, DVT, MI, pulmonary embolism), GI perforation or hemorrhage.

## ACTION

A recombinant fusion protein, comprising portions of binding domains of vascular endothelial growth factor (VEGF) receptors. Acts as a decoy receptor that prevents VEGF receptor binding/activation. **Therapeutic Effect:** Produces anti-angiogenesis/tumor regression.

## PHARMACOKINETICS

**Half-life:** 6 days (range: 4–7 days).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males should use effective contraception during therapy and for at least 3 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of side effects, esp. diarrhea, dehydration, dizziness, weakness, weight loss.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of BCG (intravesical). **Anticoagulants** (e.g., heparin, warfarin), **antiplatelets** (e.g., aspirin, clopidogrel), **NSAIDs** (e.g., diclofenac, meloxicam, naproxen),

**thrombolytic therapy** (e.g., alteplase) may increase risk of bleeding in pts with treatment-induced thrombocytopenia. **Cladribine** may increase myelosuppressive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, serum creatinine; urine protein. May decrease leukocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mg/4 mL (25mg/mL), 200 mg/8mL (25 mg/mL).

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow in color. Discard if solution is cloudy, discolored, or if visible particles are observed. • Withdraw proper dose from vial and dilute in 0.9% NaCl or D<sub>5</sub>W to a final concentration of 0.6–8 mg/mL. Use polyvinyl chloride (PVC) infusion bags containing bis (2-ethylhexyl) phthalate (DEHP) or polyolefin. • Mix by gentle inversion. • Do not shake or agitate. • Discard unused portions.

**Rate of administration** • Infuse over 60 min via dedicated IV line using an in-line 0.2-micron polyethersulfone filter and an infusion set made of one of the following: polypropylene, polyethylene-lined PVC, polyurethane, DEHP-free PVC-containing trioctyl-trimellitate (TOTM), PVC containing DEHP. • Do not use in-line filters made of polyvinylidene fluoride (PVDF) or nylon. • Do not administer as IV push or bolus.

**Storage** • Refrigerate unused vials. • Do not shake. • Protect from light. • May refrigerate diluted solution for up to 24 hrs or at controlled room temperature for up to 8 hrs.

## IV INCOMPATIBILITIES

Do not infuse with other medications or solutions.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Delay treatment until ANC 1,500 cells/mm<sup>3</sup> or greater.

**Metastatic Colorectal Cancer**

**IV: ADULTS, ELDERLY:** 4 mg/kg (based on actual body weight) q2wks (in combination with 5-fluorouracil, leucovorin, and irinotecan). Continue until disease progression or unacceptable toxicity.

**Dose Modification****Hypertension (Treatment-Induced)**

**Severe hypertension, recurrent hypertension:** Withhold treatment until hypertension is controlled, then permanently reduce to 2 mg/kg q2wks.

**Proteinuria**

**Urine protein greater than or equal to 2 g/24 hrs:** Withhold treatment until urine protein less than 2 g/24 hrs, then resume at previous dose. **Recurrent urine protein greater than 2 g/24 hrs:** Withhold treatment until urine protein less than 2 g/24 hrs, then resume with a permanent reduction to 2 mg/kg q2wks.

**Permanent Discontinuation**

Permanently discontinue if severe hemorrhage, GI perforation, impaired wound healing, fistula formation, hypertensive crisis, arterial thromboembolism, nephrotic syndrome, thrombotic microangiopathy, reversible posterior leukoencephalopathy occurs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (57%–24%):** Diarrhea, fatigue, stomatitis, abdominal pain, decreased appetite. **Occasional (13%–9%):** Asthenia, dyspnea, headache. **Rare (3%–2%):** Skin hyperpigmentation, dystonia, oropharyngeal pain, dehydration, rhinorrhea, hemorrhoids, proctalgia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (leukopenia, neutropenia, thrombocytopenia) is an expected response to therapy, but more

severe reactions including bone marrow depression, febrile neutropenia may be life-threatening. Severe, sometimes fatal, hemorrhagic events including intracranial/GI/GU/nasal/postprocedural hemorrhage may occur. GI perforations occurred in less than 1% of pts. May cause impaired wound healing or wound dehiscence requiring medical intervention, GI or non-GI fistula formation, severe hypertension, severe proteinuria, nephrotic syndrome, severe diarrhea, dehydration. Arterial thromboembolism including CVA, MI, TIA reported in up to 3% of pts. Reversible posterior leukoencephalopathy syndrome (RPLS) may present as aphasia, altered mental status, paralysis, vision loss, weakness. UTI reported in 6% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, reported in 4% of pts. Immunogenicity (auto-ziv-aflibercept antibodies) occurred in up to 3% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BUN, serum creatinine, LFT; urine protein; vital signs. Obtain pregnancy test in females of reproductive potential. Question for recent surgeries, dental procedures. Question history of thromboembolism (CVA, DVT, MI, pulmonary embolism), hypertension, hemorrhagic events. Screen for active infection. Screen for home medications that may increase risk of hemorrhage. Assess skin for open wounds, lesions, surgical incisions. Obtain dietary consult. Assess hydration status. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor ANC, CBC for myelosuppression prior to each cycle; renal function test, LFT, urine protein periodically. Monitor B/P at least q2wks. Persistent diastolic hypertension may indicate hypertensive

crisis. If urine dipstick proteinuria is greater than or equal to 2+, obtain 24-hr urine protein test. Withhold treatment for at least 4 wks prior to elective surgery or for at least 4 wks after major surgery and until wound is fully healed. Due to high risk for arterial occlusions, be vigilant when screening for CVA (aphasia, confusion, paresthesia, hemiparesis, seizures), MI (chest pain, diaphoresis, left arm/jaw pain, increased serum troponin, ST segment elevation). RPLS should be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Report abdominal pain, fever, hemoptysis, melena (may indicate GI perforation/fistula formation). Monitor skin for impaired wound healing, new skin lesions, rash, sloughing. Monitor for decreased urine output, renal dysfunction, nephrotic syndrome. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Life-threatening blood clots of the arteries and veins have occurred; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures), DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate). Report liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes); skin changes (sloughing, rash, poor healing of wounds).
- Life-threatening bleeding may occur; report bloody stool or urine, rectal bleeding, nosebleeds, vomiting up blood.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Use effective contraception to avoid pregnancy. Do not breast-

- feed.
- Nervous system changes, including altered mental status, seizures, headache, blurry vision, high blood pressure, trouble speaking, one-sided weakness, may indicate stroke, high blood pressure crisis, life-threatening brain dysfunction/swelling.
- Notify physician before any planned surgeries/dental procedures.
- Severe diarrhea may lead to dehydration; drink plenty of fluids.

## zoledronic acid

zoe-le-dron-ik as-id  
(Aclasta<sup>+</sup>, Reclast)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Bisphosphonate. **CLINICAL:** Calcium regulator, bone resorption inhibitor.

## USES

**Zometa:** Treatment of hypercalcemia of malignancy, bone metastases from solid tumors. Treatment of multiple myeloma osteolytic lesions. **Reclast:** Treatment and prevention of postmenopausal osteoporosis, glucocorticoid-induced osteoporosis, treatment of Paget's disease. Treatment of osteoporosis in men to increase bone mass. **OFF-LABEL:** Prevention of bone loss associated with aromatase inhibitor therapy in postmenopausal women with breast cancer or androgen deprivation therapy in men with prostate cancer. Post-renal transplant bone loss.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to zoledronic acid, other bisphosphonates (e.g., alendronate, risedronate). **Reclast only:** CrCl less than 35 mL/min, acute renal impairment, hypocalcemia. **Cautions:** Elderly. **Oncology indications:** History of aspirin-sensitive asthma, mild to moderate renal impair-

Z

ment. **Non-oncology indications:** Pts with disturbances of calcium and mineral metabolism (e.g., hypoparathyroidism, malabsorption syndrome).

## ACTION

Inhibits bone resorption by action on osteoclasts. Inhibits osteoclast activity/skeletal calcium release induced by tumors; inhibits osteoclast-mediated resorption. **Therapeutic Effect:** **Tumor:** Increases urinary calcium, phosphorus excretion; decreases serum calcium, phosphorus levels. **Osteoporosis:** Reduces bone turnover.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Recommend discontinuation of therapy as early as possible prior to a planned pregnancy. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Aminoglycosides (e.g., amikacin, gentamicin), calcitonin may increase hypocalcemic effect. NSAIDs (e.g., diclofenac, meloxicam, naproxen) may increase adverse effects. Proton pump inhibitors (e.g., lansoprazole, pantoprazole) may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, calcium, phosphate.

## AVAILABILITY (Rx)

**Injection Solution:** 4 mg/5 mL vial, 4 mg/100 mL single-use ready-to-use bottle. 5 mg diluted in 100 mL ready-to-infuse solution.

## Z

## ADMINISTRATION/HANDLING

**⚠️ALERT** Pt should be adequately rehydrated before administration of zoledronic acid.

### IV (Zometa)

**Reconstitution** • Dilute in 100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • Infuse over at least 15 min.

**Storage** • Store unused vials at room temperature. • Infusion of solution must be completed within 24 hrs.

### IV (Reclast)

• Infuse over at least 15 min. • Follow infusion with a 10-mL 0.9% NaCl flush of IV line.

## IV INCOMPATIBILITIES

Do not mix with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Hypercalcemia Malignancy (Zometa)

**IV: ADULTS, ELDERLY:** 4 mg infused over at least 15 min. Retreatment may be considered, but at least 7 days should elapse to allow for full response to initial dose.

### Multiple Myeloma, Osteolytic Lesions, Bone Metastases From Solid Tumors (Zometa)

**IV: ADULTS, ELDERLY:** 4 mg q3–4wks.

### Paget's Disease (Reclast)

**IV: ADULTS, ELDERLY:** 5 mg as a single dose. (Retreatment): A repeated dose of 5 mg may be considered after 12 mos in pts with biochemical relapse (e.g., elevated serum alkaline phosphatase), radiographic progression of disease, or recurrent pain.

### Osteoporosis Treatment (Reclast)

**IV: ADULTS, ELDERLY:** 5 mg once yearly. Consider discontinuing after 3–5 yrs in pts with low risk of fractures.

### Treatment/Prevention of Glucocorticoid-Induced Osteoporosis (Reclast)

**IV: ADULTS, ELDERLY:** 5 mg once yearly.

### Prevention of Postmenopausal Osteoporosis (Reclast)

**IV: ADULTS, ELDERLY:** 5 mg once q2yrs.

### Dosage in Renal Impairment

**(Reclast): CrCl less than 35 mL/min:** Contraindicated.

**(Zometa):** Multiple myeloma, metastatic bone lesions of solid tumors.

Creatinine Clearance	Dosage
50–60 mL/min	3.5 mg
40–49 mL/min	3.3 mg
30–39 mL/min	3 mg
Less than 30 mL/min	Not recommended

**(Zometa):** Hypercalcemia of malignancy. **Mild to moderate impairment:** No adjustment. **Severe impairment: (SCR greater than 4.5 mg/dL):** Use caution only after considering risk versus benefit.

#### Dosage in Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (44%–26%):** Fever, nausea, vomiting, constipation. **Occasional (15%–10%):** Hypotension, anxiety, insomnia, flu-like symptoms (fever, chills, bone pain, myalgia, arthralgia). **Rare:** Conjunctivitis.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Renal toxicity may occur if IV infusion is administered in less than 15 min.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain renal function test; serum calcium, phosphate. Assess hydration status (adequate hydration is essential to reduce renal injury). Obtain dental exam for pts at risk for osteonecrosis.

##### INTERVENTION/EVALUATION

Monitor renal function; serum calcium, phosphate. Assess vertebral bone mass (document stabilization, improvement). Assess for fever. Monitor food intake, daily pattern of bowel activity, stool consistency. Check I&O, serum BUN, creatinine in pts with renal impairment.

## ZOLMitriptan

zole-mi-trip-tan  
(Zomig, Zomig Rapimelt )  
**Do not confuse ZOLMitriptan with almotriptan, rizatriptan or SUMatriptan.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin 5-HT<sub>1</sub> receptor agonist. **CLINICAL:** Antimigraine.

#### USES

**Oral:** Treatment of acute migraine attack with or without aura in adults. **Nasal:** Treatment of acute migraine with or without aura in adults and children 12 yrs and older. **OFF-LABEL:** Short-term prevention of menstrual migraines.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to ZOLMitriptan. Arrhythmias associated with conduction disorders (e.g., Wolff-Parkinson-White syndrome), basilar or hemiplegic migraine, coronary artery disease, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, Prinzmetal's angina), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist, MAOI used within 14 days. **Additional for nasal spray:** Cerebrovascular syndromes (e.g., stroke), peripheral vascular disease. **Cautions:** Hepatic impairment, cardiovascular risks (e.g., hypertension, hypercholesterolemia, smoking, obesity, diabetes), elderly.

#### ACTION

Binds selectively to serotonin receptors, producing vasoconstrictive effect and reducing inflammation on cranial blood vessels. **Therapeutic Effect:** Relieves migraine headache.

Z

**PHARMACOKINETICS**

Widely distributed. Protein binding: 25%. Metabolized in liver. Excreted in urine (60%), feces (30%). **Half-life:** 2.8–3.7 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Ergot derivatives (e.g., ergotamine) may increase vasoconstrictive effect. **Bromocriptine** may increase toxic effects. **MAOIs** (e.g., phenelzine, selegiline) may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Nasal Spray:** 2.5 mg, 5 mg. **Tablets:** 2.5 mg, 5 mg.

**Tablets, Orally Disintegrating** 2.5 mg, 5 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. Tablets may be broken.

**Orally Disintegrating Tablet (ODT)**

• Give whole; do not break, crush, cut. • Place on pt's tongue; allow to dissolve. • Not necessary to administer with liquid.

**Nasal**

• Instruct pt to clear nasal passages as much as possible before use. • With head upright, pt should close one nostril with index finger, breathe out gently through mouth. • Instruct pt to insert nozzle into open nostril about one-half inch, close mouth, and while taking a breath through nose, release spray dosage by firmly pressing plunger. • Have pt remove nozzle

from nose, gently breathe in through nose and out through mouth for 15–20 sec. Tell pt to avoid breathing in deeply.

**INDICATIONS/ROUTES/DOSAGE****Acute Migraine Attack**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 18 YRS:** Initially, 1.25–2.5 mg (**Maximum:** 5 mg). If headache returns, may repeat dose after 2 hrs. **Maximum:** 10 mg/24 hrs.

**Orally disintegrating tablet: ADULTS, ELDERLY:** Initially, 2.5 mg (**Maximum:** 5 mg) at onset of migraine headache. If headache returns, may repeat dose after 2 hrs. **Maximum:** 10 mg/24 hrs.

**Intranasal: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 2.5 mg (**Maximum:** 5 mg). If headache returns, may repeat dose after 2 hrs. **Maximum:** 10 mg/24 hrs.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Nasal/ODT: Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended. **Tablet: Mild:** No dose adjustment. **Moderate to severe impairment:** Initially, 1.25 mg. **Maximum daily dose:** 5 mg in severe impairment.

**SIDE EFFECTS**

**Frequent (8%–6%): PO:** Dizziness, paresthesia, neck/throat/jaw pressure, drowsiness. **Nasal:** Altered taste, paresthesia. **Occasional (5%–3%): PO:** Warm/hot sensation, asthenia, chest pressure. **Nasal:** Nausea, drowsiness, nasal discomfort, dizziness, asthenia, dry mouth. **Rare (2%–1%):** Diaphoresis, myalgia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Cardiac events (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, stroke) occur rarely, particu-

larly in pts with hypertension, diabetes, strong family history of coronary artery disease; pts who are obese; smokers; males older than 40 yrs; postmenopausal women.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of peripheral vascular disease, coronary artery disease, renal/hepatic impairment, MAOI use. Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms).

### INTERVENTION/EVALUATION

Monitor for evidence of dizziness. Monitor B/P, esp. in pts with hepatic impairment. Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, foginess).

### PATIENT/FAMILY TEACHING

- Take single dose as soon as symptoms of actual migraine attack appear.
- Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report chest pain; palpitations; tightness in throat; edema of face, lips, eyes; rash; easy bruising; blood in urine or stool; pain or numbness in arms or legs.

## zolpidem

zole-pi-dem  
(Ambien, Ambien CR, Edluar, Intermezzo, Sublinox , Zolpimist)

**BLACK BOX ALERT** ■ Complex sleep behaviors, including sleep-walking, sleep-driving, and engaging in other activities while not fully awake, may occur. Some of these events may cause serious injuries, including death.

**Do not confuse Ambien with Abilify, Ativan, or zolpidem with LORazepam, zaleplon, or Zylloprim.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hypnotic, miscellaneous (Schedule IV).

**CLINICAL:** Sedative-hypnotic.

### USES

**Ambien, Edluar, Zolpimist:** Short-term treatment of insomnia (with difficulty of sleep onset). **Ambien CR:** Treatment of insomnia (with difficulty of sleep onset and/or sleep maintenance). **Intermezzo:** Treatment of insomnia characterized by middle-of-the-night awakening followed by difficulty returning to sleep in pts with 4 or more hrs of sleep time remaining.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to zolpidem. Pts who experience complex sleep behaviors after use. **Cautions:** Hepatic impairment, obstructive sleep apnea, debilitated, elderly, respiratory disease (e.g., COPD, emphysema), myasthenia gravis, depressive disorders; history of drug abuse and misuse.

### ACTION

Enhances action of inhibitory neurotransmitter gamma-aminobutyric acid (GABA). Increases chloride conduction, neuronal hyperpolarization; inhibits action potential and decreases neuronal excitability. **Therapeutic Effect:** Induces sleep with fewer nightly awakenings, improves sleep quality.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	N/A	6–8 hrs

Widely distributed. Protein binding: 92%. Metabolized in liver; excreted in urine. Not removed by hemodialysis. **Half-life:** 1.4–4.5 hrs (increased in hepatic impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Drug crosses placenta and is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** More likely to experience falls or confusion; decreased initial doses recommended. Age-related hepatic impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressants (e.g., gabapentin, lorazepam, morphine) may increase CNS depression. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) may increase concentration/effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Oral Solution:** (*Zolpimist*): 5 mg/actuation. **Tablets:** 5 mg, 10 mg. **Tablets, Sublingual (Edluar):** 5 mg, 10 mg. (*Intermezzo*): 1.75 mg, 3.5 mg.

**Tablets, Extended-Release:** 6.25 mg, 12.5 mg.

**ADMINISTRATION/HANDLING****PO**

- For faster sleep onset, do not give with or immediately after a meal.
- Give extended-release tablets whole;
- do not break, crush, dissolve, or divide.
- Edluar sublingual tablets to be placed under tongue and allowed to disintegrate. Do not give with water or allow pt to swallow tablet.
- Spray *Zolpimist* directly into mouth over tongue.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Dosage adjustment is recommended for female pts.

**Insomnia**

**PO:** (*Tablet [Immediate-Release], Spray, Sublingual Tablet*): **ADULTS:** 5–

10 mg (males), 5 mg (females) immediately before bedtime. **ELDERLY, DEBILITATED:** 5 mg immediately before bedtime.

(*Intermezzo*): **ADULTS, ELDERLY:** 3.5 mg (males), 1.75 mg (females), taken once in middle of night with 4 or more hrs of expected sleep yet to come.

**PO:** (*Extended-Release*): **ADULTS:** 6.25–12.5 mg (males), 6.25 mg (females) immediately before bedtime. **ELDERLY, DEBILITATED:** 6.25 mg immediately before bedtime.

**Dosage in Renal Impairment**

No dose adjustment; use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** (*Immediate-Release Tablet, Spray, Sublingual Tablet*): 5 mg. (*Extended-Release Tablet*): 6.25 mg. (*Intermezzo*): 1.75 mg. **Severe impairment:** Avoid use.

**SIDE EFFECTS**

**Occasional (7%):** Headache, change in appetite. **Rare (less than 2%):** Dizziness, nausea, diarrhea, muscle pain, sleepwalking.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may produce severe ataxia (clumsiness, unsteadiness), bradycardia, diplopia, severe drowsiness, nausea, vomiting, difficulty breathing, unconsciousness. Abrupt withdrawal following long-term use may produce weakness, facial flushing, diaphoresis, vomiting, tremor. Drug tolerance/dependence may occur with prolonged use of high dosages. May cause amnesic events that include cooking, sleepwalking, sexual activity, driving.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess vital signs, mental status, sleep patterns. Raise bed rails, provide call light. Pro-

vide environment conducive to sleep (back rub, quiet environment, low lighting). Do not give unless a full night of sleep is planned.

#### INTERVENTION/EVALUATION

Monitor sleep pattern. Evaluate for therapeutic response to insomnia: decrease in number of nocturnal awakenings, increase in length of sleep. Monitor daytime alertness, respiratory rate, behavior profile.

#### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue medication after long-term use.
- Avoid alcohol and tasks that require alertness, motor skills until response to drug is established.
- Tolerance, dependence may occur with prolonged use of high dosages.
- Do not break, chew, crush, dissolve, or divide extended-release tablets; swallow whole.
- Therapy may need to be discontinued if cooking, driving, sleepwalking occurs without recollection.
- Do not take unless a full 8 hrs of sleep is planned.

## zonisamide

zoe-nis-a-mide  
(Zonegran)

**Do not confuse Zonegran with SINEquan, or zonisamide with lacosamide.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anticonvulsant, miscellaneous. **CLINICAL:** Anticonvulsant.

#### USES

Adjunctive therapy in treatment of partial seizures in adults, children older than 16 yrs with epilepsy. **OFF-LABEL:** Bipolar disorder.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to zonisamide. Allergy to sulfonamides. **Cautions:** Renal/hepatic impairment,

metabolic acidosis (e.g., severe respiratory disease); history of suicidal ideation and behavior.

#### ACTION

May stabilize neuronal membranes, suppress neuronal hypersynchronization by blocking sodium, calcium channels. **Therapeutic Effect:** Reduces seizure activity.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Extensively bound to RBCs. Protein binding: 40%. Primarily excreted in urine. **Half-life:** 63 hrs (plasma), 105 hrs (RBCs).

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** No age-related precautions noted, but lower dosages recommended.

#### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase sedative effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may increase metabolism, decrease effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine.

#### AVAILABILITY (Rx)

 **Capsules:** 25 mg, 50 mg, 100 mg.

#### ADMINISTRATION/HANDLING

##### PO

- Give without regard to food.
- Give capsules whole; do not break, cut, or crush.
- Do not give to pts allergic to sulfonamides.

#### INDICATIONS/ROUTES/DOSAGE

**Note:** Do not use if CrCl is less than 50 mL/min. Discontinue gradually to mini-

mize the potential of increased seizure activity and withdrawal symptoms.

#### Partial Seizures

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 16 YRS:** Initially, 100 mg/day. May increase to 200 mg/day after 2 wks. Further increases to 300 mg/day and 400 mg/day can be made with minimum of 2 wks between adjustments. **Range:** 100–600 mg/day.

#### Dosage in Renal Impairment

Not recommended with CrCl less than 50 mL/min.

#### Dosage in Hepatic Impairment

Use with caution.

### SIDE EFFECTS

**Frequent (17%–9%):** Drowsiness, dizziness, anorexia, headache, agitation, irritability, nausea. **Occasional (8%–5%):** Fatigue, ataxia, confusion, depression, impaired memory/concentration, insomnia, abdominal pain, diplopia, diarrhea, speech difficulty. **Rare (4%–3%):** Paresthesia, nystagmus, anxiety, rash, dyspepsia, weight loss.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose characterized by bradycardia, hypotension, respiratory depression,

coma. Leukopenia, anemia, thrombocytopenia occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Review history of seizure disorder (intensity, frequency, duration, level of consciousness). Initiate seizure precautions. CBC, LFT should be performed before therapy begins and periodically during therapy.

### INTERVENTION/EVALUATION

Observe frequently for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity, frequency of seizures). Assist with ambulation if dizziness occurs.

### PATIENT/FAMILY TEACHING

- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report if rash, back/abdominal pain, blood in urine, fever, sore throat, ulcers in mouth, easy bruising occur.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

**Appendix A****CALCULATION OF DOSES**

Frequently, dosages ordered do not correspond exactly to what is available and must be calculated.

**RATIO/PROPORTION:**

A pt is to receive 65 mg of a medication. It is available as 80 mg/2 mL. What volume (mL) needs to be administered to the patient?

STEP 1: Set up ratio.

$$\frac{80 \text{ mg}}{2 \text{ mL}} = \frac{65 \text{ mg}}{x \text{ (mL)}}$$

STEP 2: Cross multiply and divide each side by the number with x to determine volume to be administered.

$$\begin{aligned} 80 \text{ mg} \times (x) \text{ mL} &= 65 \text{ mg} \times 2 \text{ mL} \\ 80x &= 130 \\ x &= \frac{130}{80} = 1.625 \text{ mL} \end{aligned}$$

**CALCULATIONS IN MICROGRAMS PER KILOGRAM PER MINUTE (mcg/kg/min):**

A 63-year-old pt (weight 165 lb) is to receive medication A at a rate of 8 mcg/kg/min. Given a solution containing medication A in a concentration of 500 mg/250 mL, at what rate (mL/hr) would you infuse this medication?

STEP 1: Convert to same units. In this problem, the dose is expressed in mcg/kg; therefore, convert weight to kg (2.2 lb = 1 kg) and drug concentration to mcg/mL (1 mg = 1,000 mcg).

$$165 \text{ lb divided by } 2.2 = 75 \text{ kg}$$

$$\frac{500 \text{ mg}}{250 \text{ mL}} = \frac{2 \text{ mg}}{\text{mL}} = \frac{2,000 \text{ mcg}}{\text{mL}}$$

STEP 2: Number of mcg/hr.

$$(75 \text{ kg}) \times 8 \text{ mcg/kg/min} = 600 \text{ mcg/min or } 36,000 \text{ mcg/hr}$$

STEP 3: Number of mL/hr.

$$36,000 \text{ mcg/hr divided by } 2,000 \text{ mcg/mL} = 18 \text{ mL/hr}$$

### CONTROLLED DRUGS (UNITED STATES)

**Schedule I:** Medications having no legal medical use. These substances may be used for research purposes with proper registration (e.g., heroin, LSD).

**Schedule II:** Medications having a legitimate medical use but are characterized by a very high abuse potential and/or potential for severe physical and psychic dependency. Emergency telephone orders for limited quantities of these drugs are authorized, but the prescriber must provide a written, signed prescription order (e.g., morphine, amphetamines, HYDROcodone, oxyCODONE).

**Schedule III:** Medications having significant abuse potential (less than Schedule II). Telephone orders are permitted (e.g., codeine in combination with other substances such as butalbital).

**Schedule IV:** Medications having a low abuse potential. Telephone orders are permitted (e.g., benzodiazepines, traMADol, zolpidem).

**Schedule V:** Medications having the lowest abuse potential of the controlled substances. Some Schedule V products may be available without a prescription (e.g., certain cough preparations containing limited amounts of an opiate).

## Appendix C

### WOUND CARE

A wound is any process that disrupts the normal structure and function of tissues. Wounds can be closed (e.g., bruise, sprain, deep tissue injury) or open (e.g., abrasion, surgical wound). The most common chronic wounds are nonhealing surgical wounds, pressure ulcers, diabetic foot ulcers, and venous ulcers.

#### TYPES OF OPEN WOUNDS

Superficial	Damage only to the epithelium; heals rapidly via regeneration of epithelial cells.
Partial thickness	Involves the dermal layer and is associated with blood vessel damage.
Full thickness	Involves subcutaneous fat and deeper layers (e.g., muscle, bone). Requires the longest time to heal. Connective tissue needs to regenerate; contraction occurs during the healing process.

#### WOUND HEALING

Wound healing is a complex process resulting in restored cell structure and tissue layers after an injury. When skin is damaged, it begins to heal from the bottom layer up and from the outside inward. Wound healing involves cellular, physiologic, biochemical, and molecular processes. They are interdependent and overlapping. An acute wound usually heals within several wks, whereas chronic wounds take 6 wks or longer to heal. Additionally, other factors can delay the healing process. These include trauma/edema, infection, necrosis, lack of oxygen delivery to the tissues, advanced age, obesity, chronic diseases (e.g., diabetes, anemia), vascular insufficiency, immobility, pressure necrosis, and immunodeficiency.

Wound healing can be divided into three phases: inflammation, proliferation, and maturation.

Inflammation	Occurs within seconds of the injury and can last up to 3 days. Associated with redness, heat, swelling, and pain. Immediate vasoconstriction of damaged blood vessels, and coagulation limiting blood loss occurs. Following vasoconstriction, histamine and other chemical mediators are released from damaged cells, causing vasodilation and release of growth factors essential for wound healing (e.g., increased capillary permeability and release of exudate).
Proliferation	Granulation tissue composed of macrophages, fibroblasts, immature collagen, blood vessels, and ground substance is formed. Fibroblasts stimulate production of collagen and elastin, increasing the strength of the wound and stimulating growth of new blood vessels. As granulation fills the wound site, the edges of the wound pull together, decreasing the surface of the wound.

*Continued*

Epithelialization then occurs: Epithelial cells migrate from the wound edge, covering the wound and resulting in scar formation.

This phase usually lasts 2 to 3 wks.

Maturation	Collagen fibers cross link and reorganize, increasing the strength of scar. This process can take anywhere from 3 wks to 2 yrs.
------------	---

## WOUND DRESSINGS

Dressings play a major role in wound management. They protect the wound, keeping it moist, and thus promote healing (only diabetic, dry, gangrenous toes require a moisture-free environment for effective healing).

Hydrocolloid, hydrogel, film, and foam dressing can handle large amounts of exudate and promote auto-debridement. Alginate and collagen-based dressings promote granulation of tissue. Silver and iodine dressings are used to avoid infections, which may delay wound healing.

## WOUND CARE PRODUCTS

Description	General Uses	Comments
<p><b>Alginate dressings:</b> Spun fibers of brown seaweed that act as ion exchange mechanisms to absorb serous fluid or exudate, forming a gel-like covering that conforms to the shape of the wound. Facilitate autolytic débridement and maintain a moist wound environment.</p> <p><b>Products:</b> Algicell, Carra Sorb. Available as ropes, pads.</p>	<p>Abrasions/lacerations/skin tears</p> <p>Arterial/venous ulcers</p> <p>Deep and tunneling wounds</p> <p>Diabetic ulcers</p> <p>Pressure ulcers</p> <p>Second-degree burns</p> <p>Odorous wounds</p> <p>Contaminated and infected wounds</p>	<p>Good for moderately to heavily exudative wounds and hemorrhagic wounds</p> <p>Can be left in place until soaked with exudate</p> <p>Requires a secondary dressing (e.g., transparent film, foam, hydrocolloids)</p> <p>Do not moisten prior to use</p> <p>Nonadhesive, nonocclusive</p> <p>Contraindicated in third-degree burns; not recommended for dry or minimally exudative wounds</p>
<p><b>Collagenase ointment:</b> Sterile enzymatic débriding ointment that possesses the ability to digest collagen in necrotic tissue.</p> <p><b>Products:</b> Santyl.</p>	<p>Débriding chronic dermal ulcers and severely burned areas</p>	<p>Can be used for infected wounds</p> <p>Gauze is used as a secondary dressing</p> <p>Discontinue when granulation tissue is present</p> <p>Optimal pH for enzymatic action is 6–8</p> <p>Avoid acidic agents for cleansing; avoid detergents and agents containing heavy metal (e.g., mercury or silver), which may adversely affect enzymatic activity</p>

Description	General Uses	Comments
<p><b>Trypsin, castor oil, Peru balsam:</b> Trypsin is a mild débriding agent that helps shed damaged skin cells.</p> <p><b>Castor oil</b> acts as a lubricant to protect tissue.</p> <p><b>Peru balsam</b> increases blood flow to a wound area, reduces wound odor.</p> <p><b>Products:</b> Granulex, Xenaderm. Available as gel, ointment, spray.</p>	<p>Promotes healing/treatment of decubitus ulcers, varicose ulcer, and dehiscent wounds</p>	<p>Can be used for infected wounds</p> <p>Avoid concurrent use of silver-containing products (may reduce efficacy)</p> <p>Promotes healing and relieves pain caused by bed sores and other skin ulcers</p>
<p><b>Hydrophilic polyurethane foam:</b> Also called open cell foam dressings. Sheets of foamed solutions of polymers containing variably sized open cells that can hold wound exudate away from wound bed. Maintains moist wound environment.</p> <p><b>Products:</b> Curafoam, Lyofoam. Available as sheets in a wide variety of formulations.</p>	<p>Moderate to heavy exudative wounds with or without a clean granular wound bed</p> <p>Diabetic ulcers, pressure ulcers, venous stasis ulcers</p> <p>Draining surgical incisions</p> <p>Superficial burns</p> <p>Tube and drain sites</p>	<p>Contraindicated for use in third-degree burns</p> <p>Not recommended for wounds with little to no exudate or when tunneling is present</p> <p>Good for cavitating wounds</p> <p>Highly absorbent, semioclusive dressing</p> <p>Usual dressing change is up to 3 times/wk</p> <p>Can be worn during bathing</p>
<p><b>Hydrocolloids:</b> Formulations of elastomeric, adhesive, and gelling agents; the most common absorbent ingredient is carboxymethylcellulose. Most hydrocolloids are backed with a semi-occlusive film layer. The wound side of the dressing is adhesive, adhering to a moist surface as well as to dry skin but not to the moist wound bed. As wound fluid is absorbed, the hydrocolloid forms a viscous gel in the wound bed, enhancing a moist wound environment.</p> <p><b>Products:</b> Hydrocol, Tegisorb. Available as dressings, granules, patches, paste.</p>	<p>Minimal to moderate exudate in partial and full thickness wounds</p> <p>Cuts and abrasions</p> <p>First- and second-degree burns</p> <p>Pressure ulcers</p> <p>Stasis ulcers</p>	<p>Not for wounds producing heavy exudate, infected wounds, dry eschar-covered wounds</p> <p>May provide pain relief</p> <p>Good for chronic wounds that are epithelializing</p> <p>Can be left in place for up to 7 days</p> <p>Contraindicated for third-degree burns</p> <p>Can shower while wearing</p>

Continued

Description	General Uses	Comments
<p><b>Hydrogels:</b> Glycerin- or water-based dressings designed to hydrate the wound. May absorb small amounts of exudate.</p> <p><b>Products:</b> Curacel, Duo Derm, Intra Site. Available as gel, sheets, gauze.</p>	<p>Partial and full thickness wounds Dry to minimal exudate Cuts and abrasions First- and second-degree burns Pressure ulcers Stasis ulcers</p>	<p>Not for wounds producing moderate to heavy exudate Not for infected wounds May provide pain relief Good for wounds that are debriding Good for keeping a dry wound moist Can be left in place for 1–3 days</p>
<p><b>Iodine compounds:</b> <b>Cadexomer iodine:</b> Iodine is complexed with a polymeric cadexomer starch vehicle, forming a topical gel or paste. The cadexomer moiety absorbs exudate and debris and releases iodine for antimicrobial activity.</p> <p><b>Products:</b> Iodosorb, iodoflex. Available as gel, dressing, ointment, powder.</p>	<p>Chronic nonhealing, exuding wounds including pressure or leg ulcers and exuding, infected wounds</p>	<p>Requires use of a secondary dressing Contraindicated in pts with iodine sensitivity, Hashimoto's thyroiditis, nontoxic nodular goiter, children Dressing to be changed when it turns white, indicating that the iodine has been depleted Do not use on dry necrotic tissue</p>
<p><b>Silver compounds</b> <b>Silver sulfadiazine cream:</b> Silver possesses bactericidal properties. Has been shown to reduce bacterial density, vascular margination, migration of inflammatory cells. Enhances rate of re-epithelialization.</p> <p><b>Products:</b> Silvadene, SSD, Thermazene.</p>	<p>Prevent infection in second- and third-degree burns Prevent or treat infection in chronic wounds</p>	<p>May have cytotoxic effects that could delay wound healing Allergic reactions may occur Use should be limited to a 2- to 4-wk period Bacteria may become resistant with prolonged use Avoid use with collagenase- or trypsin-containing debriding agents</p>
<p><b>Transparent film dressings:</b> Polyurethane sheets coated on one side with an adhesive that is inactivated by moisture and will not adhere to a moist surface such as the wound bed. Have no absorbent capacity and are impermeable to fluids and bacteria but are semipermeable to oxygen and water vapor.</p> <p><b>Products:</b> Bioclusive, CarraFilm, Tegaderm HP. Available in a variety of sizes and features.</p>	<p>Prophylaxis on high-risk intact skin Superficial wounds with minimal or no exudate Wounds on elbows, heels, or flat surfaces; covering of blisters; and retention of primary dressing</p>	<p>Prevents wound desiccation and contamination by bacteria Contraindicated in third-degree burns Promotes autolysis of necrotic tissue in the wound; maintains moist environment Avoid in arterial ulcers and infected wounds requiring frequent monitoring Do not use as primary dressing on wounds with depth or tunneling May provide pain relief Usually changed up to 3 times/wk</p>

Description	General Uses	Comments
<p><b>Becaplermin gel:</b> Recombinant formulation of platelet-derived growth factor that promotes cell mitogenesis and proliferation of cells involved in wound repair. Enhances formation of granulation tissue. <b>Products:</b> Regranex.</p>	<p>Diabetic foot ulcers that extend into subcutaneous tissue or beyond and have an adequate blood supply</p>	<p>Usually applied daily Adequate blood supply and absence of necrotic tissue are needed for efficacy Repeated use (3 or more tubes) may increase risk of cancer-related death Use cautiously in pts with known malignancy</p>

## Appendix D

### DRUGS OF ABUSE

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Amphet- amine	<i>Adderall, Dexedrine;</i> bennies, black beauties, hearts, speed, truck drivers, uppers	Injection, smoked, snorted	Increased heart rate, blood pressure, body temperature, metabolism; in- creased en- ergy, mental alertness; trem- ors; reduced appetite; irrita- bility; anxiety; panic; violent behavior; psy- chosis	Weight loss, insomnia, cardiac or cardiovas- cular com- plications, stroke, sei- zures, addic- tion, tremor, irritability
Barbitu- rates	<i>Nembutal, Seconal, Phenobarbital;</i> barbs, reds, phennies, yellows, yellow jackets	Injection, oral	Reduction of pain and anxi- ety; feeling of well-being; low- ered inhibitions; slowed pulse/ breathing; low- ered blood pressure; poor concentration; sedation, drowsiness	Confusion, fatigue; im- paired coord- ination, memory, judgment; respiratory depression or arrest; addiction; depression; unusual ex- citement; fever; irrita- bility; slurred speech; diz- ziness
Benzodiaz- epines	<i>Ativan, Librium, Valium, Xanax;</i> candy, downers, tranks, Xannies, Xannie bars	Oral	Reduction of pain and anxi- ety; feeling of well-being; lowered inhibi- tions; slowed pulse/breath- ing; lowered blood pressure; poor concentra- tion; sedation, drowsiness	Confusion, fatigue; im- paired coord- ination, memory, judgment; respiratory depression or arrest; addiction; dizziness

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Bupropion	<i>Wellbutrin</i> ; poor man's co- caine	Oral	Increased heart rate, B/P, and temperature; mental alertness; feel euphoric, exhilarated, energetic	Seizures, tachycardia, arrhythmias, loss of con- sciousness
Cocaine	Blow, bump, candy, coke, crack, rock, snow, toot	Injection, smoked, snorted	Increased heart rate, blood pressure, body temperature, metabolism; in- creased en- ergy, mental alertness; trem- ors; reduced appetite; irrita- bility; anxiety; panic; violent behavior; psy- chosis	Weight loss, insomnia, cardiac or car- diovas- cular com- plications, stroke, seizures, ad- diction, na- sal damage from snort- ing, rapid or irregular heartbeat, headaches, malnutrition
Codeine	<i>Fiorinal with codeine, Tylenol with codeine</i> ; Captain Cody, schoolboy, loads, pancakes and syrup	Injection, oral	Pain relief, eu- phoria, drowsi- ness	Respiratory depression and arrest, nausea, confusion, constipation, sedation, uncon- sciousness, coma, tolerance, addiction
Dextro- methorphan	Found in some cough and cold medications; poor man's PCP, velvet, Robo, Triple C	Oral	Impaired motor function, feel- ing of being separated from one's body and environment; euphoria; slurred speech; confusion; dizziness; distorted visual perceptions	

Continued

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Flunitrazepam	<i>Rohypnol</i> ; forget-me pill, Mexican Valium, roofies, roofinol, rope, rophies	Oral, snorted	Sedation, muscle relaxation, confusion, memory loss, dizziness, impaired coordination, reduced pain/anxiety, feeling of well-being	Addiction; confusion, fatigue, memory loss, respiratory depression
Gabapentin	<i>Neurontin</i> , <i>Lyrica</i> , <i>Lycia</i> ; gabbie	Oral	Self-treatment of alcohol, cocaine, or opioid craving; euphoria, relaxation	Diarrhea, double vision, drowsiness, lethargic, slurred speech
GHB	Georgia home boy, grievous bodily harm, liquid ecstasy, goop, liquid X	Oral	Drowsiness, nausea, headache, disorientation, loss of coordination, memory loss	Unconsciousness, seizures, coma, confusion, nausea, vomiting, headache
Heroin	Smack, brown sugar, dope, junk, white horse, China white	Injection, smoked, snorted	Euphoria, drowsiness, impaired coordination, dizziness, confusion, nausea, sedation, feeling of heaviness in the body, slowed breathing	Constipation, confusion, sedation, respiratory depression, coma, addiction
Hydrocodone	<i>Vicodin</i> , <i>Lortab</i> ; vike, watson-387	Oral	Pain relief, euphoria, drowsiness	Respiratory depression and arrest, nausea, confusion, constipation, sedation, unconsciousness, coma, tolerance, addiction

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Inhalants	Solvents (paint thinner, glues), nitrites (laughing gas, snappers, poppers)	Inhaled through nose or mouth	Stimulation, loss of inhibition, headache, nausea or vomiting, slurred speech, loss of motor coordination, wheezing	Cramps, muscle weakness, depression, memory impairment, damage to cardiovascular and nervous systems, unconsciousness, sudden death
Ketamine	<i>Ketalar</i> ; cat Valium, Special K, kit kat, vitamin K	Injection, snorted, smoked	Increased heart rate and blood pressure, impaired motor function, feelings of being separated from one's body and environment; at high doses: delirium, depression, respiratory depression or arrest; death	Memory loss, numbness, nausea/vomiting, anxiety, tremors, respiratory depression
Loperamide	<i>Imodium</i> ; poor man's methadone	Oral	Reducing symptoms of opioid withdrawal	CNS depression, intestinal blockage
LSD	Acid, cubes, microdot, yellow sunshine, blotter, bloomers	Oral, absorbed through mouth tissues	Altered states of perception and feeling; hallucinations; nausea; increased body temperature, heart rate, blood pressure; loss of appetite; sweating; sleeplessness; numbness; dizziness; weakness; tremors; impulsive behavior; rapid shifts in emotion	Flashbacks, hallucinogen persisting perception disorder

Continued

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Marijuana	Blunt, ganja, grass, joint, Mary Jane, pot, reefer, sinsemilla, skunk, weed	Oral, smoked	Euphoria, relaxation, slowed reaction time, impaired balance and coordination, increased heart rate and appetite, impaired learning and memory, anxiety, panic attacks, psychosis	Cough, impaired memory and learning, anxiety, panic attacks, frequent respiratory infections, possible mental health decline, addiction
MDMA	Ecstasy, Adam, clarity, Eve, lover's speed, peace, Molly	Injection, oral, snorted	Mild hallucinogenic effects, increased tactile sensitivity, empathic feelings, lowered inhibition, anxiety, chills, sweating, teeth clenching, muscle cramping	Reduced appetite, irregular heartbeat, heart failure, impaired memory, hyperthermia, addiction
Mescaline	Buttons, cactus, peyote	Oral, smoked	Altered states of perception and feeling; hallucinations; nausea; increased body temperature, heart rate, blood pressure; loss of appetite; sweating; sleeplessness; numbness; dizziness; weakness; tremors; impulsive behavior; rapid shifts in emotion	Loss of appetite, nausea, weakness, chronic mental disorders

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
Methamphetamine	<i>Desoxy</i> ; meth, ice, crank, crystal, go fast, speed	Oral, injection, smoked, snorted	Increased heart rate, blood pressure, body temperature, metabolism; increased energy, mental alertness; tremors; reduced appetite; irritability; anxiety; panic; violent behavior; psychosis	Weight loss, insomnia, cardiac or cardiovascular complications, stroke, seizures, addiction, severe dental problems, behavior/memory loss, impaired memory and learning, tolerance, addiction
Methylphenidate	<i>Ritalin</i> , JIF, MPH, Skippy, smart drug, vitamin R	Injection, oral, snorted	Increase or decrease in blood pressure; psychotic episodes	Digestive problems, loss of appetite, weight loss, reduced appetite, rapid irregular heartbeat, heart failure, seizures, stroke
Morphine	<i>Roxanol</i> , <i>Duramorph</i> ; M, Miss Emma, monkey, white stuff	Injection, oral, smoked	Pain relief, euphoria, drowsiness	Respiratory depression and arrest, nausea, confusion, constipation, sedation, unconsciousness, coma, tolerance, addiction
Oxycodone	<i>OxyContin</i> , <i>Percodan</i> ; oxycotton, oxycet, hillbilly heroin, killers, OCs	Injection, oral	Pain relief, euphoria, drowsiness	Respiratory depression and arrest, nausea, confusion, constipation, sedation, unconsciousness, coma, tolerance, addiction

Continued

Substance	Brand/ Street Names	Administered	Effects of Intoxication	Potential Health Conse- quences
PCP	<i>Phencyclidine</i> ; angel dust, boat, hog, love boat, peace pill	Injection, oral, smoked	Impaired motor function, feel- ings of being separated from one's body and environment, analgesia, psy- chosis, aggression, violence, slurred speech, loss of coordination, hallucinations	Memory loss, loss of appetite, panic, aggression, violence
Psilocybin	Magic mush- rooms, purple passion, shrooms	Oral	Altered states of perception and feeling, hallucinations, nausea, ner- vousness, para- noia, panic	Chronic mental disorders
Quetiapine	<i>Seroquel</i> ; baby heroin, Suzie-Q, Q-ball	Oral	Reduced anxi- ety, sedation	Arrhythmias, coma, death (with over- dose)

## Appendix E

## EQUIANALGESIC DOSING

Guidelines for equianalgesic dosing of commonly used analgesics are presented in the following table. The dosages are approximate to 10 mg of morphine intramuscularly. These guidelines are for the management of acute pain in the opioid-naïve pt. Dosages may vary for the opioid-tolerant pt and for the management of chronic pain. Dosing adjustments for renal or hepatic insufficiency may also be necessary. Clinical response is the criterion that must be applied for each pt with titration to desired response.

Name	Equianalgesic Oral Dose	Equianalgesic Parenteral Dose (IV, IM, SQ)
Codeine	200 mg	100–130 mg
FentaNYL	Not available	0.1 mg (100 mcg)
HYDROcodone	30–45 mg	Not available
HYDROmorphone (Dilaudid)	7.5–8 mg	1.5–2 mg
HYDROmorphone (Dilaudid) (Controlled-Release)	7.5 mg	N/A
Meperidine (Demerol)	300 mg	75 mg
Methadone (Dolophine)	10–20 mg	10 mg
Morphine	30 mg	10 mg
OxyCODONE (OxyContin)	20–30 mg	Not available
OxyMORphone	10 mg	1 mg
OxyMORphone (Extended-Release)	10 mg	N/A

## HERBALS: COMMON NATURAL MEDICINES

The use of herbal therapies is increasing in the United States. Because of the rise in the use of herbal therapy, the following is presented to provide some basic information on some of the more popular herbs. Please note this is not an all-inclusive list, which is beyond the scope of this handbook.

Name	Uses	Comments
Aloe vera	Orally: osteoarthritis, inflammatory bowel diseases (e.g., ulcerative colitis), fever, itching, inflammation. Topically: burns, wound healing, psoriasis, sunburn, frostbite, cold sores.	Well tolerated. Orally can cause abdominal pain, cramps; topically can cause burning, itching, contact dermatitis. May lower blood glucose levels and have additive effects with antidiabetic medications.
Bilberry	Orally: improve visual acuity (e.g., night vision, cataracts), atherosclerosis, chronic fatigue syndrome, venous insufficiency, varicose veins, hemorrhoids. Topically: mild inflammation of mouth and throat mucous membranes.	Can inhibit platelet aggregation, increase risk of bleeding when combined with antiplatelet or anticoagulant medications (e.g., aspirin, clopidogrel, enoxaparin, warfarin). May lower blood glucose.
Bitter orange	Orally: appetite stimulant, dyspepsia. Topically: inflammation of the eyelid, conjunctiva, retina.	May cause hypertension, cardiovascular toxicity. May increase concentration/effects of midazolam; concurrent use with MAOIs may increase blood pressure (avoid use); combination with caffeine can increase blood pressure, heart rate.
Black cohosh	Orally: symptoms of menopause, premenstrual syndrome (PMS), dysmenorrhea, dyspepsia, inducing labor in pregnant women, anxiety, fever, cough, cardiovascular disease, cognitive function, infertility, osteoarthritis, osteoporosis, rheumatoid arthritis. Topically: acne, mole, and wart removal; improve skin appearance.	Can cause GI upset, rash, headache, dizziness, increased weight, cramping, breast tenderness, vaginal spotting/bleeding. May decrease effects of cisplatin; may increase risk of hepatic damage with hepatotoxic medications.

Name	Uses	Comments
Capsicum (cayenne pepper)	Orally: dyspepsia, flatulence, diarrhea, cramps, toothache, hyperlipidemia. Topically: pain of shingles, osteoarthritis, rheumatoid arthritis, postherpetic neuralgia, diabetic neuralgia, trigeminal neuralgia.	Orally can cause upper abdominal discomfort (e.g., gas, bloating, nausea, diarrhea, belching); topically can cause burning, stinging, erythema. May increase effects/adverse effects of antiplatelet medications.
Chamomile	Prepared as a tea and used as a mild sedative, relaxant, and sleeping aid; used for indigestion, itching, and inflammation.	Large amounts may cause vomiting.
Chasteberry	Orally: menstrual irregularities (e.g., dysmenorrhea, amenorrhea, metrorrhagia).	Can cause GI upset, headache, diarrhea, nausea, itching, urticaria, rash, insomnia, increased weight, irregular menstrual bleeding. Can interfere with efficacy of oral contraceptives, hormone replacement therapy.
Clove (clove oil)	Orally: dyspepsia, expectorant, diarrhea, halitosis, flatulence, nausea, vomiting. Topically: toothache, mouth and throat inflammation.	Topically can cause tissue irritation, allergic dermatitis.
Co-enzyme Q-10	Heart failure, angina, diabetes, hypertension.	Can cause GI side effects (e.g., nausea, vomiting, diarrhea, appetite suppression, heartburn, epigastric discomfort). Can decrease blood pressure and have an additive effect with antihypertensive medications; may reduce anticoagulant effects of warfarin.
Cranberry	Prevention/treatment of urinary tract infections, neurogenic bladder, urinary deodorizer in incontinence, kidney stones, prevention of urinary catheter blockage.	Usually well tolerated. Large amounts can cause GI upset, diarrhea, nausea, vomiting. Greater than 1,000 mL daily can increase risk of uric acid, kidney stone formation.
DHEA	Slow or reverse aging, weight loss, metabolic syndrome, increase immune and cognitive function.	At high dose can cause acne, hirsutism, hair loss, voice deepening, insulin resistance, altered menstrual pattern. May interfere with antiestrogen effects of anastrozole, letrozole, or other aromatase inhibitors; may overcome estrogen receptor antagonist activity of tamoxifen in estrogen receptor positive cancer cells.

Continued

Name	Uses	Comments
Dong quai	Dysmenorrhea, premenstrual syndrome, menopausal symptoms.	May cause photosensitivity and photodermatitis. May increase effect/risk of bleeding with antiplatelet and anticoagulant medications (e.g., aspirin, warfarin).
Echinacea	Treat/prevent common cold, influenza, other upper respiratory tract infections.	Usually well tolerated. Can cause GI effects (e.g., nausea, abdominal pain, diarrhea, vomiting). Stimulates immune function—may exacerbate autoimmune diseases (e.g., multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus).
Eucalyptus	Orally: infections, fever, dyspepsia, expectorant for coughs. Topically: inflammation of respiratory tract mucous membranes, rheumatoid arthritis, nasal stuffiness.	Orally: GI effects (e.g., nausea, vomiting, diarrhea). Topically (prolonged exposure/large amounts): agitation, drowsiness, muscle weakness, ataxia.
Evening primrose oil	Premenstrual syndrome (PMS), endometriosis, symptoms of menopause (e.g., hot flashes).	May increase risk of bruising/bleeding with antiplatelet/anticoagulant medications (e.g., aspirin, clopidogrel, enoxaparin, warfarin).
Feverfew	Orally: fever, headaches, prevention of migraines, menstrual irregularities. Topically: toothaches, antiseptic.	Orally: GI effects (e.g., heartburn, nausea, diarrhea, constipation, abdominal pain, bloating, flatulence). Topically: contact dermatitis. May have additive effects, increase risk of bleeding with antiplatelet medications.
Fish oil	Hyperlipidemia, hypertriglyceridemia, hypertension, stroke, depression, rheumatoid arthritis, osteoporosis, psoriasis, Crohn's disease.	Can cause a fishy aftertaste, halitosis, heartburn, dyspepsia, nausea, loose stools, rash. May have additive effect with antihypertensive medication.
Garlic	Hypertension, hyperlipidemia, age-related vascular changes, atherosclerosis, chronic fatigue syndrome, menstrual disorders, coronary heart disease, peripheral arterial disease.	Dose-related effects including breath/body odor, mouth and GI burning/irritation, heartburn, flatulence, nausea, vomiting, diarrhea. May increase effects of antiplatelets (e.g., aspirin, clopidogrel, enoxaparin), anticoagulants (e.g., warfarin); may decrease effects of oral contraceptives, cyclosporine, protease inhibitors, and non-nucleoside reverse transcriptase inhibitors (NNRTIs).

Name	Uses	Comments
Ginger	Motion sickness, morning sickness, dyspepsia, rheumatoid arthritis, osteoarthritis, loss of appetite, migraine headache, diarrhea, flatulence, irritable bowel syndrome, dysmenorrhea.	Usually well tolerated. At high doses of 5 g/day may cause abdominal discomfort, heartburn, diarrhea, irritant effect in mouth and throat. May increase risk of bleeding with antiplatelet medications and anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin).
Ginkgo	Dementia (including Alzheimer's), vascular dementia, mixed dementia.	Mild GI upset, headache, dizziness, constipation, palpitations, allergic skin reactions. Large doses can cause diarrhea, nausea, vomiting, weakness. Decreases platelet aggregation; may increase risk of bleeding with antiplatelet and anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin).
Ginseng	Increases resistance to environmental stress, improves well-being, boosts energy, diuretic.	May cause insomnia, vaginal bleeding, headache, hypertension, hypotension, decreased appetite, edema. May decrease effectiveness of warfarin.
Glucosamine	Osteoarthritis, glaucoma, temporomandibular joint arthritis.	May cause mild GI effects (e.g., nausea, heartburn, diarrhea, constipation). May increase risk of bleeding with anticoagulants (e.g., warfarin).
Gotu kola	Reduce fatigue, anxiety, depression, improve memory and intelligence.	May cause GI upset, nausea, drowsiness. May cause additive sedative effects/side effects with CNS depressants (e.g., clonazepam, lorazepam, zolpidem).
Grapefruit	Hyperlipidemia, atherosclerosis, weight loss and obesity.	May increase concentrations/effects of benzodiazepines, calcium channel blockers, carbamazepine, carvedilol, clomipramine, cyclosporine, estrogens, lovastatin, simvastatin, atorvastatin.
Green tea	Improves cognitive performance and mental alertness.	Can cause nausea, vomiting, abdominal bloating, dyspepsia, flatulence, diarrhea. Higher doses can cause dizziness, insomnia, fatigue, agitation. May increase effects of amphetamines, caffeine.

Continued

Name	Uses	Comments
Hawthorn	Congestive HF, coronary heart disease, angina, arrhythmias.	Generally well tolerated. Can cause vertigo, dizziness, nausea, GI complaints, fatigue, sweating, rash.
Kava kava	Anxiety disorders, stress, attention-deficit hyperactivity disorder (ADHD), insomnia, restlessness.	GI upset, headache, dizziness, drowsiness, enlarged pupils and disturbances of oculomotor equilibrium and accommodation, dry mouth, allergic skin reactions. May increase drowsiness, motor reflex depression with alcohol, benzodiazepines, other CNS depressants.
L-carnitine	Treatment of primary L-carnitine deficiency, acute myocardial infarction, supplement to total parenteral nutrition, L-carnitine deficiency in those requiring hemodialysis.	Can cause nausea, vomiting, abdominal cramps, heartburn, gastritis, diarrhea, body odor, seizures.
Licorice	Gastric and duodenal ulcers, sore throat, bronchitis, dyspepsia, cough, osteoarthritis, chronic gastritis, menopausal symptoms, osteoporosis, bacterial/viral infections.	Excessive ingestion can cause pseudohyperaldosteronism with sodium and water retention, hypokalemia, alkalosis. May lead to hypertension, edema, arrhythmias. May reduce effect of antihypertensive medication therapy, warfarin.
Melatonin	Jet lag, insomnia, shift-work disorder.	Can cause daytime drowsiness, headache, dizziness. May increase effect of antiplatelets, anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin). May cause additive sedation with CNS depressants (e.g., alcohol, benzodiazepines).
Milk thistle	Liver disorders, chronic inflammatory liver disease, hepatic cirrhosis, chronic hepatitis.	Usually well tolerated. Can cause nausea, diarrhea, dyspepsia, flatulence, abdominal bloating, anorexia.
Nettle	Urinary disorders associated with benign prostatic hyperplasia (e.g., nocturia, frequency, dysuria, urinary retention).	Generally well tolerated. May cause GI complaints, sweating, allergic skin reactions. May decrease effects of warfarin.
Peppermint	Common cold, cough, inflammation of mouth and pharynx, sinusitis, fever, cramps of upper GI tract, dyspepsia, flatulence, irritable bowel syndrome (IBS), fever, tension headache.	Can cause heartburn, nausea, vomiting, allergic reactions including flushing and headache. May increase concentration/effects of cyclosporine.

Name	Uses	Comments
Red yeast	Maintain desirable cholesterol levels in healthy people; reduce cholesterol in hyperlipidemia; indigestion; diarrhea; improve blood circulation.	Can cause abdominal discomfort, heartburn, flatulence, dizziness. May increase cyclosporine concentration.
SAME	Depression, anxiety, heart disease, fibromyalgia, osteoarthritis, tendonitis, dementia, Alzheimer's disease, Parkinson's disease.	Higher doses can cause flatulence, nausea, vomiting, diarrhea, constipation, headache, mild insomnia, anorexia, sweating, dizziness, nervousness. May have additive adverse effects with MAOIs including hypertension, hyperthermia, agitation, confusion, coma. May have additive serotonergic effects and serotonin syndrome-like effects (e.g., agitation, tremors, tachycardia, diarrhea, hyperreflexia, shivering, diaphoresis) with antidepressants.
Saw palmetto	Symptoms of benign prostatic hyperplasia (BPH).	Can cause dizziness, headache, GI complaints (e.g., nausea, vomiting, constipation, diarrhea). May increase effect of antiplatelets, anticoagulants (e.g., aspirin, clopidogrel, enoxaparin, warfarin). May interfere with contraceptives.
St. John's wort	Depression, anxiety, heart palpitations; mood disturbances associated with menopause, ADHD, obsessive-compulsive disorder (OCD), seasonal affective disorder (SAD), premenstrual syndrome (PMS), social phobia.	Usually well tolerated. Can cause insomnia, vivid dreams, restlessness, agitation, irritability, GI discomfort, diarrhea, fatigue, dry mouth, dizziness, headache. May decrease effect of alprazolam, amitriptyline, oral contraceptives, cyclosporine, imatinib, irinotecan, NNRTIs, phenytoin, protease inhibitors, tacrolimus, warfarin. May cause additive serotonergic effects with antidepressants, paroxetine, sertraline, tramadol.
Turmeric	Osteoarthritis, rheumatoid arthritis, dyspepsia, abdominal pain, Crohn's disease, ulcerative colitis, diarrhea, flatulence, loss of appetite, hepatitis, <i>H. pylori</i> , peptic ulcers, irritable bowel syndrome.	Usually well tolerated. Can cause dyspepsia, diarrhea, distention, GERD, nausea, vomiting. May increase risk of bleeding with antiplatelets/anticoagulants. May increase risk of hypoglycemia with antidiabetic drugs.

Continued

Name	Uses	Comments
Valerian	Insomnia, anxiety-associated restlessness, sleeping disorders.	Can cause headache, excitability, insomnia, gastric discomfort, dry mouth, vivid dreams, morning drowsiness. May have additive sedative effects with alcohol, benzodiazepines, other CNS depressants.
Yohimbe	Aphrodisiac, impotence, exhaustion, angina, hypertension, diabetic neuropathy, postural hypotension.	Can cause excitation, tremors, insomnia, anxiety, hypertension, tachycardia, dizziness, irritability, headache, fluid retention, rash, nausea, vomiting. High doses can cause respiratory depression. May have additive effects with MAOIs. Tyramine-containing foods increase risk of hypertensive crisis.

## Appendix G

# LIFESPAN, CULTURAL ASPECTS, AND PHARMACOGENOMICS OF DRUG THERAPY

## LIFESPAN

Drug therapy is unique to pts of different ages. Age-specific competencies involve understanding the development and health needs of the various age groups. Pregnant pts, children, and elderly people represent different age groups with important considerations during drug therapy.

## CHILDREN

In pediatric drug therapy, drug administration is guided by the age of the child, weight, level of growth and development, and height. The dosage ordered is to be given either by kilogram of body weight or by square meter of body surface area, which is based on the height and weight of the child. Many dosages based on these calculations must be individualized based on pediatric response.

If the oral route of administration is used, often syrup or chewable tablets are given. Additionally, sometimes medication is added to liquid or mixed with foods. Remember to never force a child to take oral medications because choking or emotional trauma may ensue.

If an intramuscular injection is ordered, the vastus lateralis muscle in the midlateral thigh is used because the gluteus maximus is not developed until walking occurs and the deltoid muscle is too small. For intravenous medications, administer very slowly in children. If given too quickly, high serum drug levels will occur with the potential for toxicity.

## PREGNANCY

Women of childbearing years should be asked about the possibility of pregnancy before any drug therapy is initiated. Advise a woman who is either planning a pregnancy or believes she may be pregnant to inform her physician immediately. During pregnancy, medications given to the mother pass to the fetus via the placenta. Teratogenic (fetal abnormalities) effects may occur. Breastfeeding while the mother is taking certain medications may not be recommended due to the potential for adverse effects on the newborn.

The choice of drug ordered for pregnant women is based on the stage of pregnancy because the fetal organs develop during the first trimester. Cautious use of drugs in women of reproductive age who are sexually active and who are not using contraceptives is essential to prevent the potential for teratogenic or embryotoxic effects.

## ELDERLY

Elderly people are more likely to experience an adverse drug reaction owing to physiologic changes (e.g., visual, hearing, mobility changes, chronic diseases) and cognitive changes (short-term memory loss or alteration in the thought process) that may lead to multiple medication dosing. In chronic disease states such as hypertension, glaucoma, asthma, or arthritis, the daily ingestion of multiple medications increases the potential for adverse reactions and toxic effects.

Decreased renal or hepatic function may lower the metabolism of medications in the liver and reduce excretion of medications, thus prolonging the half-life of the drug

and the potential for toxicity. Dosages in elderly people should initially be smaller than for the general adult population and then slowly titrated based on pt response and therapeutic effect of the medication.

## **CULTURE**

The term *ethnopharmacology* was first used to describe the study of medicinal plants used by indigenous cultures. More recently, it is being used as a reference to the action and effects of drugs in people from diverse racial, ethnic, and cultural backgrounds. Although there are insufficient data from investigations involving people from diverse backgrounds that would provide reliable information on ethnic-specific responses to all medications, there is growing evidence that modifications in dosages are needed for some members of racial and ethnic groups. There are wide variations in the perception of side effects by pts from diverse cultural backgrounds. These differences may be related to metabolic differences that result in higher or lower levels of the drug, individual differences in the amount of body fat, or cultural differences in the way individuals perceive the meaning of side effects and toxicity. Nurses and other healthcare providers need to be aware that variations can occur with side effects, adverse reactions, and toxicity so that pts from diverse cultural backgrounds can be monitored.

Some cultural differences in response to medications include the following:

**African Americans:** Generally, African Americans are less responsive to beta blockers (e.g., propranolol [Inderal]) and angiotensin-converting enzyme (ACE) inhibitors (e.g., enalapril [Vasotec]).

**Asian Americans:** On average, Asian Americans have a lower percentage of body fat, so dosage adjustments must be made for fat-soluble vitamins and other drugs (e.g., vitamin K used to reverse the anticoagulant effect of warfarin).

**Hispanic Americans:** Hispanic Americans may require lower dosages and may experience a higher incidence of side effects with tricyclic antidepressants (e.g., amitriptyline).

**Native Americans:** Alaskan Eskimos may suffer prolonged muscle paralysis with the use of succinylcholine when administered during surgery.

There has been a desire to exert more responsibility over one's health and, as a result, a resurgence of self-care practices. These practices are often influenced by folk remedies and the use of medicinal plants. In the United States, there are several major ethnic population subgroups (white, black, Hispanic, Asian, and Native Americans). Each of these ethnic groups has a wide range of practices that influence beliefs and interventions related to health and illness. At any given time, in any group, treatment may consist of the use of traditional herbal therapy, a combination of ritual and prayer with medicinal plants, customary dietary and environmental practices, or the use of Western medical practices.

## **AFRICAN AMERICANS**

Many African Americans carry the traditional health beliefs of their African heritage. Health denotes harmony with nature of the body, mind, and spirit, whereas illness is seen as disharmony that results from natural causes or divine punishment. Common practices to the art of healing include treatments with herbals and rituals known empirically to restore health. Specific forms of healing include using home remedies, obtaining medical advice from a physician, and seeking spiritual healing.

Examples of healing practices include the use of hot baths and warm compresses for rheumatism, the use of herbal teas for respiratory illnesses, and the use of kitchen condiments in folk remedies. Lemon, vinegar, honey, saltpeter, alum, salt, baking soda,

and Epsom salt are common kitchen ingredients used. Goldenrod, peppermint, saffras, parsley, yarrow, and rabbit tobacco are a few of the herbals used.

### HISPANIC AMERICANS

The use of folk healers, medicinal herbs, magic, and religious rituals and ceremonies are included in the rich and varied customs of Hispanic Americans. This ethnic group believes that God is responsible for allowing health or illness to occur. Wellness may be viewed as good luck, a reward for good behavior, or a blessing from God. Praying, using herbals and spices, wearing religious objects such as medals, and maintaining a balance in diet and physical activity are methods considered appropriate in preventing evil or poor health.

Hispanic ethnopharmacology is more complementary to Western medical practices. After the illness is identified, appropriate treatment may consist of home remedies (e.g., use of vegetables and herbs), use of over-the-counter patent medicines, and use of physician-prescribed medications.

### ASIAN AMERICANS

For Asian Americans, harmony with nature is essential for physical and spiritual well-being. Universal balance depends on harmony among the elemental forces: fire, water, wood, earth, and metal. Regulating these universal elements are two forces that maintain physical and spiritual harmony in the body: the *yin* and the *yang*. Practices shared by most Asian cultures include meditation, special nutritional programs, herbology, and martial arts.

Therapeutic options available to traditional Chinese physicians include prescribing herbs, meditation, exercise, nutritional changes, and acupuncture.

### NATIVE AMERICANS

The theme of total harmony with nature is fundamental to traditional Native American beliefs about health. It is dependent on maintaining a state of equilibrium among the physical body, the mind, and the environment. Health practices reflect this holistic approach. The method of healing is determined traditionally by the medicine man, who diagnoses the ailment and recommends the appropriate intervention.

Treatment may include heat, herbs, sweat baths, massage, exercise, diet changes, and other interventions performed in a curing ceremony.

### EUROPEAN AMERICANS

Europeans often use home treatments as the front-line interventions. Traditional remedies practiced are based on the magical or empirically validated experience of ancestors. These cures are often practiced in combination with religious rituals or spiritual ceremonies.

Household products, herbal teas, and patent medicines are familiar preparations used in home treatments (e.g., saltwater gargle for sore throat).

### PHARMACOGENOMICS

Traditionally, medications are prescribed using a “one size fits all” philosophy. In general, the genetic makeup is similar in all humans, regardless of race or sex. However, people inherit variations in their genes, which can affect the way a person responds to a medication. A genetic variation may make a medication stay in the body longer, causing serious side effects, or a variation may make the medication less potent.

For example, two people taking the same cancer medication may have very different responses. One may have severe, life-threatening side effects, whereas the second may have few, if any, side effects. The drug may shrink a tumor in one person but not in another.

**Pharmacogenomics** examines how a person's genetic makeup affects response to medications. Although widespread application still lies in the future, pharmacogenomics has the potential to personalize medical therapies. Physicians eventually will be able to prescribe medications based on an individual's genotype, thereby maximizing effectiveness and minimizing side effects.

Pharmacogenomics is an expanding field that explores the effect of interindividual genetic differences on pharmacokinetics, pharmacodynamics, drug efficiency, and safety of drug treatments. Pharmacogenomic biomarkers (proteins) can provide predictive tools for improving drug response and reducing adverse drug reactions. These biomarkers mainly originate from genes encoding drug-metabolizing enzymes, drug transporters, drug targets, and human leukocyte antigens. Currently, more than 100 drugs contain pharmacogenomic information in the package labeling. The goal is to develop personalized genetic-based strategies that will optimize therapeutic outcomes.

Personalized treatments are especially warranted when prescribing medications with a narrow therapeutic index or when toxicity can be life-threatening. Antineoplastics, anticoagulants, and anti-HIV therapies are often administered at maximum tolerated doses. This approach can result in toxicity and/or produce a poor response to therapy. Severe adverse drug reactions are one of the most common reasons for hospital admissions. Genetic testing for drug responses is expected to decrease hospitalizations by as much as 30%.

**Carbamazepine (Tegretol)** has been linked to dose-dependent side effects and life-threatening adverse effects. It is metabolized by enzymes encoded by the CYP3A4 gene to its active metabolite. An association has been found between the HLA-B\*1502 allele and risk of Stevens-Johnson syndrome/toxic epidermal necrolysis, particularly in Asians. Before initiating carbamazepine treatment in high-risk patients, genetic testing for the HLA-B\*1502 allele is recommended by the Food and Drug Administration (FDA).

Tumor cells carry the same genetic polymorphisms of normal cells. However, malignant cells are genetically unstable and can produce genetic changes that can alter disposition of active drug at the tumor site. Genetic analysis of tumors can help predict therapeutic benefit (or lack thereof) of targeted biologics such as **trastuzumab (Herceptin)** for ERBB2 (*HER2*)-amplified breast cancers or **erlotinib (Tarceva)** for epidermal growth factor receptor (EGFR)-overexpressing lung cancers.

Genetic mutations in tumors can also predict resistance to treatment, as noted in colorectal cancers, where activating mutations in *KRAS* are known to be a predictive marker for resistance to the EGFR-specific monoclonal antibodies **cetuximab (Erbix)** and **panitumumab (Vectibix)**.

By utilizing the information provided by pharmacogenomic testing, drug therapy is changing to a more individualized approach. Anticipated benefits of pharmacogenomics include creation of better vaccines, safer medications targeted to specific diseases, and more appropriate dosing of medications at the onset of therapy. Ultimately, we may see a decrease in healthcare costs due to more efficient clinical trials, reduced adverse drug reactions, and less time needed to find effective therapy for patients.

## Appendix H

## NORMAL LABORATORY VALUES

## HEMATOLOGY/COAGULATION

Test	Normal Range
Activated partial thromboplastin time (aPTT)	25–35 sec
Erythrocyte count (RBC count)	M: 4.5–5.5 million cells/mm <sup>3</sup> F: 4.0–4.9 million cells/mm <sup>3</sup>
Hematocrit (HCT, Hct)	M: 41%–50% F: 36%–44%
Hemoglobin (Hb, Hgb)	M: 13.5–16.5 g/dL F: 12.0–15.0 g/dL
Leukocyte count (WBC count)	4.5–10.0 thousand cells/mm <sup>3</sup>
Leukocyte differential count	
Basophils	0%–0.75%
Eosinophils	1%–3%
Lymphocytes	25%–33%
Monocytes	3%–7%
Neutrophils—bands	3%–5%
Neutrophils—segmented	54%–62%
Mean corpuscular hemoglobin (MCH)	26–34 pg/cell
Mean corpuscular hemoglobin concentration (MCHC)	31%–37% Hb/cell
Mean corpuscular volume (MCV)	80–100 fL
Partial thromboplastin time (PTT)	60–85 sec
Platelet count (thrombocyte count)	100–450 thousand/mm <sup>3</sup>
Prothrombin time (PT)	11–13.5 sec
RBC count (see Erythrocyte count)	

## CLINICAL CHEMISTRY (SERUM PLASMA, URINE)

Test	Normal Range
Alanine aminotransferase (ALT)	8–36 units/L 8–78 units/L (children 0–2 mos)
Albumin	3.2–5 g/dL
Alkaline phosphatase	33–131 (adults 25–60 yrs) 51–153 (adults older than 60 yrs)
Amylase	30–110 units/L
Aspartate aminotransferase (AST)	5–35 units/L
Bilirubin (direct)	0–0.3 mg/dL
Bilirubin (total)	0.1–1.2 mg/dL
BUN	7–20 mg/dL

Test	Normal Range
Calcium, ionized	2.24–2.46 mEq/L
Calcium (total)	8.6–10.3 mg/dL
Carbon dioxide (CO <sub>2</sub> ) total	23–30 mEq/L
Chloride	95–108 mEq/L
Cholesterol (total)	Less than 200 mg/dL
HDL cholesterol	40–60 mg/dL
LDL cholesterol	Less than 160 mg/dL
Creatinine	0.5–1.4 mg/dL
Creatinine clearance	M: 80–125 mL/min/1.73 m <sup>2</sup> F: 75–115 mL/min/1.73 m <sup>2</sup>
Creatine kinase (CK) isoenzymes	0%
CK-BB	0%–3.9%
CK-MB (cardiac)	96%–100%
CK-MM (muscle)	
Creatine phosphokinase (CPK)	8–150 units/L
Ferritin	13–300 ng/mL
Glucose (preprandial)	Less than 115 mg/dL
Glucose (fasting)	60–110 mg/dL
Glucose (nonfasting, 2 hrs postprandial)	Less than 120 mg/dL
Hemoglobin A1c	Less than 8 mg/dL
Iron	66–150 mcg/dL
Iron-binding capacity, total (TIBC)	250–420 mcg/dL
Lactate dehydrogenase (LDH)	56–194 units/L
Lipase	23–208 units/L
Magnesium	1.6–2.5 mg/dL
Osmolality	289–308 mOsm/kg
Oxygen saturation	90–95 (arterial) 40–70 (venous)
pH	7.35–7.45 (arterial) 7.32–7.42 (venous)
Phosphorus, inorganic	2.8–4.2 mg/dL
Potassium	3.5–5.2 mEq/L
Protein (total)	6.5–7.9 g/dL
Sodium	134–149 mEq/L
Thyroid-stimulating hormone (TSH)	0.7–6.4 milliunits/L (adults 20 yrs or younger) 0.4–4.2 milliunits/L (adults 21–54 yrs) 0.5–8.9 milliunits/L (adults 55–87 yrs)
Transferrin	Greater than 200 mg/dL
Triglycerides (TG)	45–155 mg/dL
Urea nitrogen	7–20 mg/dL
Uric acid	M: 2–8 mg/dL F: 2–7.5 mg/dL

## Appendix I

# DRUG INTERACTIONS

## OVERVIEW

A drug interaction is a situation in which a substance (e.g., another drug, food, or herbal) can affect the activity of a drug when administered together. This action can be synergistic (drug effect is increased) or antagonistic (drug effect is decreased). Drugs that increase the concentration of another drug can lead to an increase in side effects or even a drug overdose. Drugs that decrease the concentration of another drug may decrease the therapeutic effect.

Factors that may contribute to drug interactions include:

- Old age: Liver metabolism, renal function, nerve transmission decrease with age. Also a sensory decrease increases the chance of errors in drug administration.
- Polypharmacy: As the number of medications taken increases, the potential that some of them will interact is more likely.
- Genetic factors: Genes synthesize enzymes that metabolize drugs. Some races have genotypic variations that may decrease or increase the activity of these enzymes. This is seen in variations in the isozymes of cytochrome P450.
- Hepatic or renal diseases: Blood concentrations of drugs that are metabolized in the liver and/or eliminated by the kidneys may be altered if these organs are not functioning correctly.

Drug interactions may be the result of various processes. These processes may include alterations in the pharmacokinetics of the drug such as in the absorption, distribution, metabolism, and excretion or the result of pharmacodynamics properties of the drug (e.g., coadministration of a receptor antagonist and an agonist for the same receptor).

## PHARMACOKINETIC INTERACTIONS

Modifying the effect of a drug may be caused by differences in absorption, distribution, metabolism, or excretion of one or both of the drugs compared with the expected behavior of each drug when taken individually.

## ABSORPTION

Changes in motility: Some drugs such as the prokinetic agents increase the speed that a substance passes through the intestines. If a drug is present in the digestive tract's absorption zone for less time, its blood concentration will decrease. The opposite will occur with drugs that decrease intestinal motility.

Certain drugs require an acid stomach pH for absorption while others require the basic pH of the intestines. Modification in the pH could change this absorption. In the case of antacids, an increase in pH can alter the absorption of other drugs.

Drug solubility—Food: Absorption of some drugs can be reduced if administered together with food (e.g., warfarin and avocado).

Formation of nonabsorbable complexes:

- Chelation: The presence of di- or trivalent cations can cause the chelation of certain drugs, making them harder to absorb (e.g., tetracyclines or fluoroquinolones and dairy products).

- Binding with proteins: Some drugs (e.g., sucralfate) bind to proteins and for this reason, sucralfate is contraindicated in enteral feeding.
- Drugs that are retained in the intestinal lumen can form large complexes that impede their absorption. This can occur with cholestyramine if associated with drugs such as digoxin or warfarin.

Action on the P-glycoprotein of the enterocytes appears to be one of the mechanisms promoted by consumption of grapefruit juice in increasing the bioavailability of various drugs.

## **DISTRIBUTION**

The main interaction mechanism is competition for plasma protein transport. The drug that arrives first binds with the plasma protein, leaving the second drug dissolved in plasma, which modifies its concentration (e.g., displacement of bilirubin from albumin binding site by ceftriaxone increases the risk of kernicterus in neonates).

## **METABOLISM**

Most drugs are eliminated from the body, at least in part, by being changed chemically to a less lipid-soluble product (i.e., metabolized) and thus more likely to be excreted from the body via the kidney or bile. Drugs may go through two different metabolic processes: phase 1 and phase 2 metabolism.

In phase 1 metabolism, hepatic microsomal enzymes found in the endothelium of liver cells metabolize drugs via hydrolysis and oxidation and reduction reactions. These chemical reactions make the drug more water soluble. In phase 2 metabolism, large water-soluble substances (e.g., glucuronic acid, sulfate) are attached to the drug, forming inactive, or significantly less active, water-soluble metabolites. Phase 2 processes include glucuronidation, sulfation, conjugation, acetylation, and methylation.

Virtually any of the phase 1 and phase 2 enzymes can be inhibited, and some of these enzymes can be induced by drugs. Inhibiting the activity of metabolic enzymes results in increased concentrations of the drug (substrate), whereas inducing metabolic enzymes results in decreased concentrations of the drug (substrate).

The term “cytochrome P450” (CYP enzymes) refers to a family of more than 100 enzymes in the human body that modulate various physiologic functions. First identified in the 1950s, the CYP enzyme system contains two large subgroups: steroidogenic and xenobiotic enzymes. Only the xenobiotic group is involved in the metabolism of drugs. The xenobiotic group includes four major enzyme families: CYP1, CYP2, CYP3, and CYP4. The primary role of these families is the metabolism of drugs. These families are further subdivided into subfamilies designated by a capital letter and given a specific enzyme number (1, 2, 3, etc.) according to the similarity in amino acid sequence it shares with other enzymes (e.g., CYP1A2).

The key CYP450 enzymes include CYP1A2, CYP2C9, CYP2C19, CYP2D6, and CYP3A4 and may be responsible for metabolism of 75% of all drugs, with the CYP3A subfamily responsible for nearly half of this activity.

The CYP enzymes are found in the endoplasmic reticulum of cells in a variety of human tissue but are primarily concentrated in the liver and intestine. CYP enzymes can be both inhibited and induced, leading to increased or decreased serum concentration of the drug (along with its effects).

The following tables of CYP substrates, inhibitors, and inducers provide a perspective on drugs that are affected by, or affect, cytochrome P450 (CYP) enzymes.

**CYP substrate** includes drugs reported to be metabolized, at least in part, by one or more CYP enzymes. **CYP inhibitor** includes drugs reported to inhibit one or more CYP enzymes. **CYP inducer** contains drugs reported to induce one or more CYP enzymes.

## P450 ENZYMES: SUBSTRATES, INHIBITORS, INDUCERS

### CYP1A2 ENZYME

CYP1A2 SUBSTRATES	CYP1A2 INHIBITORS	CYP1A2 INDUCERS
Clozapine (Clozaril)	Cimetidine (Tagamet)	Barbiturates
Mirtazapine (Remeron)	Ciprofloxacin (Cipro)	Carbamazepine (Tegretol)
Olanzapine (Zyprexa)	Fluvoxamine	Rifampin (Rifadin)
Ramelteon (Rozerem)		Smoking
Ropinirole (Requip)		
Tizanidine (Zanaflex)		

- CYP1A2 enzyme is increasingly involved in drug interactions.
- More potent inhibitors include cimetidine, ciprofloxacin, and fluvoxamine.
- Smoking is the most important inducer, but rifampin and barbiturates also can increase enzyme activity.
- Example of reaction: Tizanidine plasma concentrations increased more than 30-fold when the inhibitor fluvoxamine was given concurrently.

### CYP2C9 ENZYME

CYP2C9 SUBSTRATES	CYP2C9 INHIBITORS	CYP2C9 INDUCERS
Candesartan (Atacand)	Amiodarone (Cordarone)	Barbiturates
Celecoxib (Celebrex)	Clopidogrel (Plavix)	Carbamazepine (Tegretol)
Diclofenac (Voltaren)	Fluconazole (Diflucan)	Rifampin (Rifadin)
Glipizide (Glucotrol)	Metronidazole (Flagyl)	St. John's wort
Glyburide (DiaBeta)	Sulfamethoxazole	
Ibuprofen (Advil, Motrin)	Valproic acid (Depakote)	
Irbesartan (Avapro)		
Meloxicam (Mobic)		
Warfarin (Coumadin)		

- More potent inhibitors include amiodarone, metronidazole, and sulfamethoxazole.
- All of the inducers can substantially increase enzyme activity.
- Both warfarin and oral hypoglycemics are of serious concern with regard to drug interactions. Substrates warranting attention include warfarin and oral hypoglycemics.

### CYP2C19 ENZYME

CYP2C19 SUBSTRATES	CYP2C19 INHIBITORS	CYP2C19 INDUCERS
Citalopram (Celexa)	Cimetidine (Tagamet)	Barbiturates
Diazepam (Valium)	Clopidogrel (Plavix)	Carbamazepine (Tegretol)
Escitalopram (Lexapro)	Esomeprazole (Nexium)	Rifampin (Rifadin)
Omeprazole (Prilosec)	Fluconazole (Diflucan)	St. John's wort
Pantoprazole (Protonix)	Fluvoxamine	
Sertraline (Zoloft)	Modafinil (Provigil)	

## 1310 Appendix I Drug Interactions

- Inhibition by itself does not frequently cause adverse effects compared with other CYP enzymes because many of the substrates do not have serious toxicity.
- Inhibition or induction of the enzyme nonetheless may result in an adverse drug interaction.
- Racial background is important in the likelihood of being deficient in this enzyme (e.g., 3%–5% of Caucasians and 12%–23% of Asians are poor metabolizers of this enzyme).

### CYP2D6 ENZYME

CYP2D6 SUBSTRATES	CYP2D6 INHIBITORS	CYP2D6 INDUCERS
Amitriptyline (Elavil)	Amiodarone (Cordarone)	See comment below
Duloxetine (Cymbalta)	Bupropion (Wellbutrin)	
Fluoxetine (Prozac)	Fluoxetine (Prozac)	
Metoclopramide (Reglan)	Paroxetine (Paxil)	
Metoprolol (Lopressor)		
Paroxetine (Paxil)		
Risperidone (Risperdal)		
Tamoxifen (Nolvadex)		
Tolterodine (Detrol)		
Tramadol (Ultram)		
Venlafaxine (Effexor)		

- Potent inhibitors include fluoxetine and paroxetine.
- Evidence suggests that this enzyme is not very susceptible to enzyme induction.
- Genetics, rather than drug therapy, account for most ultra-rapid metabolizers (e.g., Greeks, Portuguese, Saudis, and Ethiopians have high enzyme activity).

### CYP3A4 ENZYME

CYP3A4 SUBSTRATES	CYP3A4 INHIBITORS	CYP3A4 INDUCERS
Alfuzosin (Uroxatral)	Amiodarone (Cordarone)	Carbamazepine (Tegretol)
Alprazolam (Xanax)	Clarithromycin (Biaxin)	Efavirenz (Sustiva)
Budesonide (Entocort EC)	Diltiazem (Cardizem)	Phenobarbital
Carbamazepine (Tegretol)	Fluconazole (Diflucan)	Rifampin (Rifadin)
Cyclosporine (Neoral)	Fluoxetine (Prozac)	St. John's wort
Fluticasone (Flovent)	Itraconazole (Sporanox)	
Lovastatin (Mevacor)	Ketoconazole (Nizoral)	
Sildenafil (Viagra)	Verapamil (Calan, Isoptin)	
Simvastatin (Zocor)		

- This enzyme metabolizes about half of all medications on the market.
- Drug toxicity of CYP3A4 substrates due to inhibition of CYP3A4 is relatively common.
- This enzyme is very sensitive to induction, tending to lower plasma concentrations of substrates, resulting in reduced efficacy of the substrate.
- Most potent inhibitors include clarithromycin, itraconazole, and ketoconazole.

- Rifampin is a potent inducer and may reduce serum concentrations of substrates by as much as 90%.

## EXCRETION

### RENAL EXCRETION

Only the free fraction of a drug that is dissolved in the blood is removed via the kidneys. Drugs that are tightly bound to proteins are not available for renal excretion, as long as they are not metabolized when they may be excreted as metabolites. Creatinine clearance is used as a measure of kidney function.

### BILE EXCRETION

Bile excretion always involves energy in active transport across the epithelium of the bile duct against a concentration gradient. Bile excretion of drugs mainly occurs when their molecular weight is greater than 300 and contain both polar and lipophilic groups. Glucuronidation of the drug in the kidney will also enhance bile excretion.

## PHARMACODYNAMIC INTERACTIONS

### PHARMACOLOGIC RECEPTORS

- **Pure agonists:** Drugs bind to the main locus of the receptor, causing a similar effect to that of the main drug. For example, fentanyl and midazolam can lead to increased sedation, or vancomycin and an aminoglycoside can lead to increased potential for nephrotoxicity.
- **Partial agonists:** Drugs bind to one of the receptor's secondary loci, having the same effect to that of the main drug but with lower intensity.
- **Antagonists:** Drugs bind directly to the receptor's main locus but their effect is opposite to that of the main drug. For example, an opioid and naloxone cause a decreased effect of the opioid, reversal of sedation, respiratory depression, and hypotension.

### SIGNAL TRANSDUCTION MECHANISMS

These are processes that commence after the interaction of the drug with the receptor. For example, hypoglycemia produces a release of catecholamines, which triggers compensation mechanisms that increase blood glucose levels. For example, if a patient is taking both insulin (which reduces glucose) and also a beta blocker for heart disease, the beta blocker will block the catecholamine receptors. This will block the reaction triggered by the catecholamines if hypoglycemia occurs, with an increased risk of a serious reaction.

## ANTIDOTE/REVERSAL AGENTS

Agent	Antidote/ Reversal Agents	Dosage
Acetaminophen	Acetylcysteine (Acetadote, Mucomyst)	PO: ADULTS, CHILDREN: Loading dose: 140 mg/kg, then 70 mg/kg q4h for a total of 18 doses. Total dose delivered: 1,330 mg/kg. IV: ADULTS, CHILDREN: Loading dose: 150 mg/kg over 60 min, then 50 mg/kg over 4 hrs, then 100 mg/kg over 16 hrs. Total dose delivered: 300 mg/kg.
Anticholinergic agents (e.g., atropine)	Physostigmine	IM/IV/SQ: ADULTS: Initially, 0.5–2 mg, then repeat q20min until response occurs or adverse effects occur. Repeat 1–4 mg q30–60min as life-threatening symptoms recur. IV: CHILDREN (Reserve for life-threatening situation only): 0.01–0.03 mg/kg/dose. May repeat after 15–20 min to maximum total dose of 2 mg, or until response occurs or adverse cholinergic effects occur.
Apixaban (Eliquis)	Kcentra Prothrombin Complex concentrate (Factors II, VII, IX, X, Protein C, Protein S)	Dose based on pre-dose INR, expressed in units of factor IX activity. (Give with Vitamin K) <b>INR 2 to &lt;4:</b> 25 units/kg. <b>Maximum:</b> 2,500 units. <b>INR 4–6:</b> 35 units/kg. <b>Maximum:</b> 3,500 units. <b>INR &gt;6:</b> 50 units/kg. <b>Maximum:</b> 5,000 units.
Apixaban (Eliquis)/ rivaroxaban (Xarelto)	Andexanet alfa (Andexxa)	Apixaban (5 mg or less)/rivaroxaban (10 mg or less): 4 mg IV bolus, then 4 mg/min for up to 120 min. Apixaban (more than 5 mg)/rivaroxaban (more than 10 mg): 800 mg IV bolus, then 8 mg/min for up to 120 min.
Arsenic	Dimercaprol (BAL in oil)	Mild Poisoning IM: ADULTS, CHILDREN: 2.5 mg/kg/dose q6h for 2 days, then q12h for 1 day, then once daily for 10 days. Severe Poisoning IM: ADULTS, CHILDREN: 3 mg/kg/dose q4h for 2 days, then q6h for 1 day, then q12h for 10 days.
Benzodiazepines (e.g., midazolam)	Flumazenil (Romazicon)	IV: ADULTS: 0.2 mg over 30 sec. May give 0.3-mg dose after 30 sec if desired LOC not obtained. Additional doses of 0.5 mg can be given over 30 sec at 1-min intervals up to cumulative dose of 3 mg. CHILDREN: 0.01 mg/kg ( <b>maximum:</b> 0.2 mg) with repeat doses of 0.01 mg/kg ( <b>maximum:</b> 0.2 mg) given every minute to maximum total cumulative dose of 1 mg.
Beta blockers (e.g., propranolol)	Glucagon	IV: ADULTS: 5–10 mg over 1 min, followed by infusion of 1–10 mg/hr.

Agent	Antidote/ Reversal Agents	Dosage
Calcium channel blockers (e.g., verapamil)	Glucagon	IV: ADULTS: 5–10 mg over 1 min, followed by infusion of 1–10 mg/hr.
Carbamate pesticides	Atropine	IV: ADULTS: Initially, 1–5 mg doubled q5min until signs of muscarinic excess abate. IV INFUSION: ADULTS: 0.5–1 mg/hr. IM: ADULTS (Mild symptoms): 2 mg. If severe symptoms develop after first dose, 2 additional doses should be repeated in 10 min. (Severe symptoms): Immediately administer three 2-mg doses. IV: CHILDREN: 0.02–0.05 mg/kg q10–20min until atropine effect observed, then q1–4h for at least 24 hrs. IM: 0.5–2 mg/dose based on weight (0.5 mg: 15–40 lb, 1 mg: 41–90 lb, 2 mg: greater than 90 lb). (Mild symptoms): 1 injection. (Severe symptoms): 2 additional injections given in rapid succession 10 min after receiving first injection.
Dabigatran (Pradaxa)	Idarucizumab (Praxbind)	IV: 5 g (give as 2 separate 2.5 g doses no more than 15 minutes apart).
Digoxin (Lanoxin)	Digoxin immune FAB (Digibind)	<p><b>ADULTS</b> Unknown amount of ingestion: 800 mg IV infusion if acute ingestion, 240 mg IV infusion if chronic ingestion.</p> <p><b>Dosing for Ingestion of Single Large Dose</b> Dose (in no. of vials) = (Total digitalis body load in mg)/(0.5 mg of digitalis bound per vial). Total digitalis body load in mg = (No. of tablets/capsules ingested) × (mg strength of tablet/capsule) × (bioavailability of tablet/capsule). Digoxin tablets and elixir are 80% bioavailable. Digoxin capsules and injection are 100% bioavailable.</p> <p><b>Dosing Based on Serum Level</b> Digoxin: Dose (in no. of vials) = (Serum digoxin level in ng/mL) × (weight in kg)/(100). Digitoxin: Dose (in no. of vials) = (Serum digitoxin level in ng/mL) × (weight in kg)/(1,000).</p> <p><b>CHILDREN</b> <b>Dosing for Ingestion of Single Large Dose</b> Dose (in no. of vials) = (Total digitalis body load in mg)/(0.5 mg of digitalis bound per vial). Total digitalis body load in mg = (No. of tablets/capsules ingested) × (mg strength of tablet/capsule) × (bioavailability of tablet/capsule). Digoxin tablets and elixir are 80% bioavailable. Digoxin capsules and injection are 100% bioavailable. WEIGHING 20 kg or less: Dilution of reconstituted vial to 1 mg/mL may be desirable for doses of 3 mg or less. Dose (in no. of mg) = Dose (in no. of vials) × 38 mg/vial. Dose (in no. of vials) = (Serum digoxin level in ng/mL) × (weight in kg)/(100).</p>

Continued

Agent	Antidote/ Reversal Agents	Dosage
Edoxaban (Savaysa)	See apixaban (Eliquis)	See apixaban (Eliquis)
Ethylene glycol	Fomepizole (Antizol)	IV: ADULTS, CHILDREN: Loading dose 15 mg/kg, then 10 mg/kg q12h for 4 doses, then 15 mg/kg q12h thereafter until ethylene glycol levels reduced to less than 20 mg/dL and patient is asymptomatic with normal pH.
Extravasation vasoconstrictive agents (e.g., dopamine)	Phentolamine (Regitine)	ADULTS, CHILDREN: Infiltrate area with small amount of solution made by diluting 5–10 mg in 10 mL 0.9% NaCl within 12 hrs of extravasation. In general, do not exceed 0.1–0.2 mg/kg (5 mg total).
Heparin	Protamine	IV: ADULTS, CHILDREN: Dosage is determined by most recent dosage of heparin or low molecular weight heparin (LMWH): 1 mg protamine neutralizes 90–115 units of heparin and 1 mg (100 units) of LMWH. <b>Maximum:</b> 50 mg.
Hyperkalemia	Sodium polystyrene sulfonate (Kayexalate, SPS)	PO: ADULTS, ELDERLY: 15 g 1–4 times/day. CHILDREN: 1g/kg q6h.
Hypoglycemia	Glucagon	IM/IV/SQ: ADULTS, ELDERLY, CHILDREN: 1 mg, may repeat in 15 min as needed. If pt fails to respond, IV dextrose must be given.
Ifosfamide	Mesna (Mesnex)	Mesna dose (IV) equal to 20% of daily ifosfamide dose at 0 hr, followed by 2 mesna doses (PO), each equal to 40% of daily ifosfamide dose, given 2 and 6 hrs after ifosfamide dose.
Iron	Deferoxamine (Desferal)	Acute IM: ADULTS: Initially, 1,000 mg, then 500 mg q4h for 2 doses. Additional doses of 0.5 g q4–12h. <b>Maximum:</b> 6 g/24 hrs. CHILDREN 3 YRS AND OLDER: 90 mg/kg/dose q8h (not to exceed 1 g/dose). <b>Maximum:</b> 6 g/24 hrs. IV: ADULTS, CHILDREN: 15 mg/kg/hr. <b>Maximum:</b> 6 g/24 hrs.  Chronic IM: ADULTS: 500–1,000 mg/day. IV: ADULTS, CHILDREN: 15 mg/kg/hr. <b>Maximum:</b> 12 g/24 hrs.
Isoniazid	Pyridoxine (vitamin B <sub>6</sub> )	IV: ADULTS, CHILDREN: Total dose of pyridoxine equal to amount of isoniazid ingested as first dose of 1–4 g IV, then 1 g IM q30min until total dose completed. If not known, give 5 g at rate of 1 g/min. May repeat q5–10min.

Agent	Antidote/ Reversal Agents	Dosage
Lead	Calcium EDTA	<p>Symptomatic Treat for 3–5 days; give in conjunction with dimercaprol. IM: ADULTS, CHILDREN: 167 mg/m<sup>2</sup> q4h. IV: ADULTS, CHILDREN: 1 g/m<sup>2</sup> as 8- to 24-hr infusion or divided q12h.</p> <p>Lead Encephalopathy Treat for 5 days; give concurrently with dimercaprol. IM: ADULTS, CHILDREN: 250 mg/m<sup>2</sup> q4h. IV: ADULTS, CHILDREN: 50 mg/kg/day as 24-hr continuous infusion.</p>
Lead	Dimercaprol (BAL in oil)	<p>Mild IM: ADULTS, CHILDREN: Loading dose 4 mg/kg, then 3 mg/kg/dose q4h for 2–7 days. Begin calcium EDTA with second dose.</p> <p>Severe and Lead Encephalopathy IM: ADULTS, CHILDREN: 4 mg/kg/dose q4h for 3–5 days. Begin calcium EDTA with second dose.</p>
Lead	Succimer (Chemet)	<p>PO: ADULTS, CHILDREN: 10 mg/kg/dose q8h for 5 days, then q12h for 14 days. <b>Maximum:</b> 500 mg/dose. Note: For children younger than 5 yrs, dose based on mg/m<sup>2</sup>.</p>
Methanol	Fomepizole (Antizol)	<p>IV: ADULTS, CHILDREN: Loading dose 15 mg/kg, then 10 mg/kg q12h for 4 doses, then 15 mg/kg q12h thereafter until ethylene glycol levels reduced to less than 20 mg/dL and patient is asymptomatic with normal pH.</p>
Opioids (e.g., morphine)	Naloxone (Narcan)	<p>IV/IM/SQ: ADULTS: 0.4–2 mg/dose. May repeat every 2–3 min as needed. Therapy may need to be reassessed if no response is seen after cumulative dose of 10 mg. CHILDREN (5 YRS OR OLDER or WEIGHING 20 KG OR GREATER): 2 mg/dose IV/IM/SQ. May repeat every 2–3 min as needed. Therapy may need to be reassessed if no response is seen after cumulative dose of 10 mg. CHILDREN (WEIGHING LESS THAN 20 KG): 0.1 mg/kg/dose. May repeat every 2–3 min as needed.</p>

Continued

Agent	Antidote/ Reversal Agents	Dosage
Organophosphate pesticides	Atropine	IV: ADULTS: Initially, 1–5 mg doubled q5min until signs of muscarinic excess abate. IV INFUSION: ADULTS: 0.5–1 mg/hr. IM: ADULTS (Mild symptoms): 2 mg. If severe symptoms develop after first dose, 2 additional doses should be repeated in 10 min. (Severe symptoms): Immediately administer three 2-mg doses. IV: CHILDREN: 0.02–0.05 mg/kg q10–20min until atropine effect observed, then q1–4h for at least 24 hrs. IM: 0.5–2 mg/dose based on weight (0.5 mg: 15–40 lb, 1 mg: 41–90 lb, 2 mg: greater than 90 lb). (Mild symptoms): 1 injection. (Severe symptoms): 2 additional injections given in rapid succession 10 min after receiving first injection.
Organophosphate pesticides	Pralidoxime (Protopam)	IM/IV: ADULTS: 1–2 g. Repeat in 1–2 hrs if muscle weakness has not been relieved, then at 10- to 12-hr intervals if cholinergic signs recur. CHILDREN: 20–50 mg/kg/dose. Repeat in 1–2 hrs if muscle weakness is not relieved, then at 10- to 12-hr intervals if cholinergic signs recur.
Rivaroxaban (Xarelto)	See apixaban (Eliquis)	See apixaban (Eliquis)
Warfarin (Coumadin)	Phytonadione (vitamin K)	PO/IV/SQ: ADULTS: 2.5–10 mg/dose. May repeat in 12–48 hrs if given PO, 6–8 hrs if given by IV or SQ route. CHILDREN: 0.5–5 mg depending on need for further anticoagulation, severity of bleeding.

## Appendix K

# PREVENTING MEDICATION ERRORS AND IMPROVING MEDICATION SAFETY

Medication safety is a high priority for the healthcare professional. Prevention of medication errors and improved safety for the pt are important, esp. in today's healthcare environment when today's pt is older and sometimes sicker and the drug therapy regimen can be more sophisticated and complex.

A medication error is defined by the National Coordinating Council for Medication Error Reporting and Prevention (NCC MERP) as "any preventable event that may cause or lead to inappropriate medication use or pt harm while the medication is in the control of the health care professional, pt, or consumer."

Most medication errors occur as a result of multiple, compounding events as opposed to a single act by a single individual.

Use of the wrong medication, strength, or dose; confusion over sound-alike or look-alike drugs; administration of medications by the wrong route; miscalculations (esp. when used in pediatric pts or when administering medications intravenously); and errors in prescribing and transcription all can contribute to compromising the safety of the pt. The potential for adverse events and medication errors is definitely a reality and is potentially tragic and costly in both human and economic terms.

Healthcare professionals must take the initiative to create and implement procedures to prevent medication errors from occurring and implement methods to reduce medication errors. The first priority in preventing medication errors is to establish a multidisciplinary team to improve medication use. The goal for this team would be to assess medication safety and implement changes that would make it difficult or impossible for mistakes to occur. Some important criteria in making improved medication safety successful include the following:

- Promote a nonpunitive approach to reducing medication errors.
- Increase the detection and the reporting of medication errors, near misses, and potentially hazardous situations that may result in medication errors.
- Determine root causes of medication errors.
- Educate about the causes of medication errors and ways to prevent these errors.
- Make recommendations to allow organization-wide, system-based changes to prevent medication errors.
- Learn from errors that occur in other organizations and take measures to prevent similar errors.

Some common causes and ways to prevent medication errors and improve safety include the following:

**Handwriting:** Poor handwriting can make it difficult to distinguish between two medications with similar names. Also, many drug names sound similar, esp. when the names are spoken over the telephone, poorly enunciated, or mispronounced.

- Take time to write legibly.
- Keep phone or verbal orders to a minimum to prevent misinterpretation.

- Repeat back orders taken over the telephone.
- When ordering a new or rarely used medication, print the name.
- Always specify the drug strength, even if only one strength exists.
- Express dosages for oral liquids only in metric weights or volumes (e.g., mg or mL), not by teaspoon or tablespoon.
- Print generic and brand names of look-alike or sound-alike medications.

**Zeros and decimal points:** Hastily written orders can present problems even if the name of the medication is clear.

- Never leave a decimal point “naked.” Place a zero before a decimal point when the number is less than a whole unit (e.g., use 0.25 mg or 250 mcg, **not** .25 mg).
- Never have a trailing zero following a decimal point (e.g., use 2 mg, **not** 2.0 mg).

**Abbreviations:** Errors can occur because of a failure to standardize abbreviations. Establishing a list of abbreviations that should never be used is recommended.

- Never abbreviate unit as “U”; spell out “unit.”
- Do not abbreviate “once daily” as OD or QD or “every other day” as QOD; spell it out.
- Do not use D/C, as this may be misinterpreted as either discharge or discontinue.
- Do not abbreviate drug names; spell out the generic and/or brand names.

**Ambiguous or incomplete orders:** These types of orders can cause confusion or misinterpretation of the writer’s intention. Examples include situations when the route of administration, dose, or dosage form has not been specified.

- Do not use slash marks—they may be read as the number one (1).
- When reviewing an unusual order, verify the order with the person writing the order to prevent any misunderstanding.
- Read over orders after writing.
- Encourage that the drug’s indication for use be provided on medication orders.
- Provide complete medication orders—do not use “resume preop” or “continue previous meds.”
- Provide the age and, when appropriate, the weight of the pt.

**High-alert medications:** Medications in this category have an increased risk of causing significant pt harm when used in error. Mistakes with these medications may or may not be more common but may be more devastating to the pt if an error occurs. A list of high-alert medications can be obtained from the Institute for Safe Medication Practices (ISMP) at [www.ismp.org](http://www.ismp.org).

**Technology** available today that can be used to address and help solve potential medication problems or errors includes the following:

- Electronic prescribing systems—This refers to computerized prescriber order entry systems. Within these systems is the capability to incorporate medication safety alerts (e.g., maximum dose alerts, allergy screening). Additionally, these systems should be integrated or interfaced with pharmacy and laboratory systems to provide drug-drug and drug-disease interactions alerts and include clinical order screening capability.
- Bar codes—These systems are designed to use bar-code scanning devices to validate identity of pts, verify medications administered, document administration, and provide safety alerts.

- “Smart” infusion pumps—These pumps allow users to enter drug infusion protocols into a drug library along with predefined dosage limits. If a dosage is outside the limits established, an alarm is sounded and drug delivery is halted, informing the clinician that the dose is outside the recommended range.
- Automated dispensing systems; point-of-use dispensing system—These systems should be integrated with information systems, esp. pharmacy systems.
- Pharmacy order entry system—This should be fully integrated with an electronic prescribing system with the capability of producing medication safety alerts. Additionally, the system should generate a computerized medication administration record (MAR), which would be used by the nursing staff while administering medications.

**Medication reconciliation:** Medication errors generally occur at transition points in the pt’s care (admission, transfer from one level of care to another [e.g., critical care to general care area], and discharge). Incomplete documentation can account for up to 60% of potential medication errors. Therefore, it becomes necessary to accurately and completely reconcile medication across the continuum of care. This includes the name, dosage, frequency, and route of medication administration.

Medication reconciliation programs are a process of identifying the most accurate list of all medications a pt is taking and using this list to provide correct medications anywhere within the healthcare system. The focus is on not only compiling a list but using the list to reduce medication errors and provide quality pt care.

### Additional Strategies to Reduce Medication Errors

The ISMP, Food and Drug Administration (FDA), and other agencies have identified high-risk areas associated with medication errors. They include the following:

**At-risk population:** At-risk populations primarily include pediatric and geriatric pts. For both, this risk is due to altered pharmacokinetic parameters with little published information regarding medication use in these groups. Additionally, in the pediatric population, the risk is due to the need for calculating doses based on age and weight, lack of available dosage forms, and concentrations for smaller children.

In a USP report, more than one-third of medication errors reaching the pt occurred in pts 65 yrs of age and older. Almost 40% of people 60 yrs and older take at least five medications. More than 50% of fatal hospital medication errors involve seniors. In the senior population, age-related physiologic changes (e.g., decreased renal function, reduced muscle mass) increase the risk for adverse events.

**Avoid abbreviations and nomenclature:** The confusion caused by abbreviations has prompted the ISMP to develop a list of abbreviations that should be avoided (see back cover of handbook).

**Recognize prescription look-alike and sound-alike medications:** The ISMP has developed an extensive list of confused drug names (see [www.jointcommission.org](http://www.jointcommission.org)). See individual monographs for **DO NOT CONFUSE** information.

**Focus on high-alert medications:** High-alert medications are medications that bear a heightened risk of causing significant pt harm if incorrectly used. High-alert medications in the handbook have a colored background for the entire monograph.

**Look for duplicate therapies and interactions:** Drug interactions and duplicate therapies can increase risk of adverse reactions. Refer to individual monographs for significant interaction information (drug, herbal, food).

**Report errors to improve process:** This action plays an important role in preventing further errors. The intent is to identify system failures that can be altered to prevent further errors.

## Appendix L

# PARENTERAL FLUID ADMINISTRATION

Replacing fluids in the body is based on body fluid needs. Water comprises approximately 60% of the adult body. Approximately 40% is intracellular fluid and 20% is extracellular fluid, of which 15% is interstitial (tissues) and 5% is intravascular. The walls separating these compartments are porous, allowing water to move freely between them. Small particles such as sodium and chloride can pass through the walls, but larger molecules such as proteins and starches usually are unable to pass through the walls.

Hydrostatic and osmotic pressures are forces that move water and regulate the body's water. Intravenous fluid manipulates these two pressures. Hydrostatic pressure reflects the weight and volume of water. The greater the volume, the higher the blood pressure.

**Effects of Osmotic Pressure:** *Osmosis* is the diffusion of water across a semipermeable membrane from an area of high concentration to an area of low concentration (water moves into the compartment of higher concentration of particles, or solute). This is similar to the action of a sponge soaking up water. This pull is referred to as *osmotic pressure*. It is the number of particles in each compartment that keeps water where it is supposed to be. By administering fluids with more (or fewer) particles than blood plasma, fluid is pulled into the compartment where it is needed the most.

How do we know where the water is needed? To assess water balance, measure the *osmolality* of blood plasma (number of particles [osmoles] in a kilogram of fluid). *Osmolarity* is the number of particles in a liter of fluid. Normal serum osmolality is approximately 300 milliosmoles (mOsm) per liter.

Crystalloids are made of substances that form crystals (e.g., sodium chloride) and are small, so easy movement between compartments is possible. Crystalloids are categorized by their tonicity (a synonym for osmolality). An isotonic solution has the same number of particles (osmolality) as plasma and will not promote a shift of fluids into or out of cells. Examples of isotonic crystalloid solutions are 0.9% sodium chloride and lactated Ringer's solution. Dextrose 5% in water is another isotonic crystalloid. However, it is quickly metabolized, and the fluid quickly becomes hypotonic. Hypotonic solutions (e.g., D<sub>5</sub>W, 0.45% sodium chloride) are a good source of free water, causing a shift out of the vascular bed and into cells by way of osmosis. Hypotonic solutions are given to correct cellular dehydration and hyponatremia. Hypertonic solutions have more particles than body water and pull water back into the circulation, which can shrink cells.

## SODIUM CHLORIDE

### USES

- Extracellular fluid replacement when chloride loss is greater than or equal to sodium loss
- Treatment of metabolic alkalosis in the presence of fluid loss; chloride ions cause a compensatory decrease of bicarbonate ions
- Sodium depletion, extracellular fluid volume deficit with sodium deficit
- Initiation and termination of blood transfusion, preventing hemolysis of RBCs (occurs with Dextrose in Water solutions)

**SIDE EFFECTS/ABNORMALITIES**

- Hyponatremia
- **Acidosis:** 0.9% sodium chloride contains one-third more chloride ions than is present in extracellular fluid; excess chloride ions cause loss of bicarbonate, resulting in acidosis
- **Hypokalemia:** Increased potassium excretion at the same time extracellular fluid is increasing, which further decreases potassium concentration in extracellular fluid
- Circulatory overload

**DEXTROSE (GLUCOSE)****EFFECTS**

- Provides calories for essential energy
- Improves hepatic function because it is converted into glycogen
- Spares body protein, preventing unnecessary breakdown of protein tissue
- Prevents ketosis
- Stored in the liver as glycogen, causing a shift of potassium from extracellular to intracellular fluid compartment

**USES**

- Dehydration
- Hyponatremia
- Hyperkalemia
- Vehicle of drug delivery and nutrition

**Note:** Once infused, dextrose is rapidly metabolized to water and carbon dioxide, becoming hypotonic rather than isotonic.

**SIDE EFFECTS/ABNORMALITIES**

- Dehydration: Osmotic diuresis occurs if dextrose is given faster than the pt's ability to metabolize it
- Hypokalemia (see Effects)
- Hyperinsulinism due to rapid infusion of hypertonic solution
- Water intoxication due to an imbalance based on increase in extracellular fluid volume from water alone

**SELECTED PARENTERAL FLUIDS**

Solution	Comments
Dextrose 5% in Water (D <sub>5</sub> W)	Supplies approximately 170 cal/L and free water to aid in renal excretion of solutes Avoid excessive volumes in pts with increased antidiuretic hormone activity or to replace fluids in hypovolemic pts
0.9% Sodium chloride (0.9% NaCl)	Isotonic fluid commonly used to expand extracellular fluid in presence of hypovolemia Can be used to treat mild metabolic alkalosis

Solution	Comments
0.45% Sodium chloride (0.45% NaCl)	Hypotonic solution that provides sodium, chloride, and free water; sodium and chloride allow kidneys to select and retain needed amounts Free water is desirable as aid to kidneys in elimination of solutes
3% Sodium chloride	Used only to treat severe hyponatremia
Lactated Ringer's solution	Isotonic solution that contains sodium, potassium, calcium, and chloride in approximately the same concentrations as found in plasma Used to treat hypovolemia, burns, and fluid loss as bile or diarrhea

## COMMON TERMINOLOGY CRITERIA FOR ADVERSE EVENTS (CTCAE)

The Common Terminology Criteria for Adverse Events (CTCAE) is descriptive terminology used for reporting an adverse event (AE) in a concise and standardized manner. It is supported by the U.S. Department of Health and Human Services, National Institutes of Health, and National Cancer Institute. An AE term is a unique representation of a specific event that can be used for medical documentation and scientific analyses. Along with cancer medications, other drugs may use the CTCAE system for dose and treatment modifications.

CTCAE terms are grouped by system organ classes, such as *Blood/Lymphatic*, *GI*, *Nervous*, *Renal*, and *Respiratory* disorders. Within each system organ class, AEs are listed and accompanied by a brief description. A grading scale is then provided for each AE term, and each grade refers to a specific severity.

The CTCAE grading scale displays Grades 1–5 with particular descriptions and/or recommendations. The severity for each AE is based on the following generalized guidelines: **Grade 1:** Asymptomatic or mild symptoms; clinical or diagnostic observations only; intervention not indicated. **Grade 2:** Moderate; minimal, local, or noninvasive intervention indicated; limiting age-appropriate instrumental activity of daily living (ADL). **Grade 3:** Severe or medically significant but not immediately life-threatening; hospitalization or prolonged hospitalization indicated; disabling; limiting self-care ADL. **Grade 4:** Life-threatening consequences; urgent intervention indicated. **Grade 5:** Death related to AE.

### CTCAE EXAMPLES

Adverse Event	Grade				
	1	2	3	4	5
<i>Blood/Lymphatic</i> <b>Anemia</b>	Hgb < lower limit of normal–10 g/dL	Hgb 8–10 g/dL	Hgb <8 g/dL; transfusion indicated	Life-threatening consequences Urgent intervention indicated	Death
<i>Gastrointestinal</i> <b>Diarrhea</b>	Increase of <4 stools/day over baseline Mild ostomy output	Increase of 4–6 stools/day over baseline Moderate ostomy output	Increase of 7 stools/day over baseline Severe ostomy output Hospitalization required	Life-threatening consequences Urgent intervention indicated	Death
<i>General</i> <b>Fever</b>	38–39°C (100.4–102.2°F)	>39–40°C (102.3–104°F)	>40°C (>104°F) for less than 24 hrs	>40°C (>104°F) for more than 24 hrs	Death

Adverse Event	Grade				
	1	2	3	4	5
<i>Infections</i> <b>UTI</b>	N/A	Localized; local intervention indicated (topical, antifungal, antiviral)	IV antibiotic, antifungal, antiviral intervention indicated. Radiologic or surgical intervention indicated	Life-threatening consequences Urgent intervention indicated	Death
<i>Investigations</i> <b>Lipase increased</b>	>ULN–1.5 times ULN	>1.5–2 times ULN	>2–5 times ULN	>5 times ULN	N/A
<i>Metabolism/Nutrition</i> <b>Hyperkalemia</b>	>ULN–5.5 mmol/L	>5.5–6 mmol/L	>6–7 mmol/L	>7 mmol/L; life-threatening consequences	Death

ULN, Upper limit of normal.

**Black Box Alerts** advise about the increased risks of a particular drug.

**Interactions** identify potential herbal, drug, and food interactions with a particular drug.

**Uses** section in each monograph notes the standard and off-label uses for a particular drug.

**IV Incompatibilities** present important information for IV drugs.

**Lifespan Considerations** in each monograph note factors to be considered for geriatric, pediatric, pregnant, or nursing populations. Appendix G provides additional resources.

2 panitumumab

## panitumumab

pan-i-**toom**-ue-mab  
(Vectibix)

**BLACK BOX ALERT** 90% of pts experience dermatologic toxicities (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, skin fissures, abscess). Severe infusion reactions (anaphylaxis, bronchospasm, fever, chills, hypotension), fatal reactions have occurred.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor, monoclonal antibody.  
**CLINICAL:** Antineoplastic.

### USES

Treatment of wild-type RAS metastatic colorectal cancer either as first-line therapy in combination with FOLFOX or as monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, or irinotecan-based regimens.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to panitumumab. **Cautions:** Interstitial pneumonitis, pulmonary fibrosis, pulmonary infiltrates, renal impairment, baseline electrolyte imbalance. Not indicated in pts with RAS-mutant metastatic colorectal cancer or for whom RAS mutation status is unknown.

### ACTION

Binds specifically to epidermal growth factor receptor (EGFR) and competitively inhibits binding of epidermal growth factor. Blocks activation of intracellular tyrosine kinase. **Therapeutic Effect:** Inhibits tumor cell growth, survival, and proliferation.

### PHARMACOKINETICS

Clearance varies by body weight, gender, tumor burden. **Half-life:** 3–10 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. May impair fertility. May decrease fetal body weight, increase risk of skeletal fetal abnormalities. Use effective contraception during and for at least 6 mos after treatment. Breast-feeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum magnesium, calcium.

### AVAILABILITY (RX)

**Injection Solution:** 20 mg/mL vial (5-mL, 20-mL vials).

### ADMINISTRATION/HANDLING

**ALERT** Do not give by IV push or bolus. Use low protein-binding 0.2- or 0.22-micron in-line filter. Flush IV line before and after chemotherapy administration with 0.9% NaCl.

**Reconstitution** • Dilute in 100–150 mL 0.9% NaCl to provide concentration of 10 mg/mL or less. • Do not shake solution. Invert gently to mix. • Discard any unused portion.

**Rate of Administration** • Give as IV infusion over 60 min. • Infuse doses greater than 1,000 mg over 90 min.

**Storage** • Refrigerate vials. • After dilution, solution may be stored for up to 6 hrs at room temperature, up to 24 hrs if refrigerated. • Discard if discolored, but solution may contain visible, translucent-to-white particulates (will be removed by in-line filter).

### IV INCOMPATIBILITIES

Do not mix with dextrose solutions or any other medications.

panitumumab – top prescribed drug

**Top prescribed drugs** are underlined.

**INDICATIONS/ROUTES/DOSAGE**

**ALERT** Stop infusion immediately in pts experiencing severe infusion reactions.

**Metastatic Colorectal Cancer**

**IV Infusion: ADULTS, ELDERLY:** 6 mg/kg once q14 days as a single agent or in combination with FOLFOX (fluorouracil, leucovorin and oxaliplatin). Continue until disease progression or unacceptable toxicity.

**Dose Modification****Infusion Reactions**

**Mild to moderate reactions:** Reduce infusion rate by 50% for remainder of infusion.

**Severe reactions:** Discontinue infusion. Depending on severity, consider permanent discontinuation.

**Skin Toxicity**

For all CTCAE grade 3 skin toxicities, withhold treatment for 1–2 doses until improved to better than grade 3. Then, reduce dose as follows:

**First occurrence of CTCAE grade 3:** Resume at same dose. **Second occurrence of CTCAE grade 3:** Reduce dose to 80% of initial dose. **Third occurrence of CTCAE grade 3:** Reduce dose to 60% of initial dose. **Fourth occurrence of CTCAE grade 3:** Permanently discontinue.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Common (65%–57%):** Erythema, acneiform dermatitis, pruritus. **Frequent (26%–20%):** Fatigue, abdominal pain, skin exfoliation, paronychia (soft tissue infection around nailbed), nausea, rash, diarrhea, constipation, skin fissures. **Occasional (19%–10%):** Vomiting, acne, cough, peripheral edema, dry skin. **Rare (7%–2%):** Stomatitis, mucosal inflammation, eyelash growth, conjunctivitis, increased lacrimation.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Pulmonary fibrosis, severe dermatologic toxicity (complicated by infectious sequelae) occur

rarely. Severe infusion reactions manifested as bronchospasm, fever, chills, hypotension occur rarely. Hypomagnesemia occurs in 39% of pts. Life-threatening and/or fatal bullous fasciitis, abscess, sepsis were reported. Severe dehydration and diarrhea may increase risk of acute renal failure. Exposure to sunlight may exacerbate skin toxicities. May cause ocular toxicities including keratitis, ulcerative keratitis, corneal ulceration.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess serum magnesium, calcium prior to therapy, periodically during therapy, and for 8 wks after completion of therapy. Assess *KRAS* mutational status in colorectal tumors and confirm the absence of a *RAS* mutation.

**INTERVENTION/EVALUATION**

Assess for skin, ocular, mucosal, pulmonary toxicity; report effects. Median time to development of skin/ocular toxicity is 14–15 days; resolution after last dosing is 84 days. Monitor serum electrolytes for hypomagnesemia, hypocalcemia. Offer antiemetic if nausea/vomiting occurs. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received a live virus vaccine.
- Avoid crowds, those with infection.
- There is a potential risk for development of fetal abnormalities if pregnancy occurs; take measures to prevent pregnancy.
- Report skin reactions, including rash, sloughing, blisters, erosions.
- Report difficulty breathing, fever with cough, lung pain; may indicate life-threatening lung inflammation.
- Limit sun, UV exposure. Wear protective sunscreen, hats, and clothing while outdoors.

Side Effects section in each drug monograph specifies the frequency of particular side effects.

Adverse Reactions highlight the particularly dangerous side effects.

Non-Crushable Drug

High Alert drug

High Alert drugs are shaded in blue for easy identification.

## COMMONLY USED ABBREVIATIONS

<b>ABG(s)</b> —arterial blood gas(es)	<b>IM</b> —intramuscular
<b>ACE</b> —angiotensin-converting enzyme	<b>IOP</b> —intraocular pressure
<b>ADHD</b> —attention-deficit hyperactivity disorder	<b>IV</b> —intravenous
<b>AIDS</b> —acquired immunodeficiency syndrome	<b>K</b> —potassium
<b>ALT</b> —alanine aminotransferase, serum	<b>kg</b> —kilogram
<b>ANC</b> —absolute neutrophil count	<b>LDH</b> —lactate dehydrogenase
<b>aPTT</b> —activated partial thromboplastin time	<b>LDL</b> —low-density lipoprotein
<b>AST</b> —aspartate aminotransferase, serum	<b>LFT</b> —liver function test
<b>AV</b> —atrioventricular	<b>LOC</b> —level of consciousness
<b>bid</b> —twice per day	<b>MAC</b> — <i>Mycobacterium avium</i> complex
<b>BMP</b> —basic metabolic panel	<b>MAOI</b> —monoamine oxidase inhibitor
<b>B/P</b> —blood pressure	<b>mcg</b> —microgram
<b>BSA</b> —body surface area	<b>mEq</b> —milliequivalent
<b>BUN</b> —blood urea nitrogen	<b>mg</b> —milligram
<b>CBC</b> —complete blood count	<b>MI</b> —myocardial infarction
<b>Ccr</b> —creatinine clearance	<b>min</b> —minute(s)
<b>CNS</b> —central nervous system	<b>mo/mos</b> —month/months
<b>CO</b> —cardiac output	<b>N/A</b> —not applicable
<b>COPD</b> —chronic obstructive pulmonary disease	<b>Na</b> —sodium
<b>CPK</b> —creatine phosphokinase	<b>NaCl</b> —sodium chloride
<b>CSF</b> —cerebrospinal fluid	<b>NG</b> —nasogastric
<b>CT</b> —computed tomography	<b>NSAID(s)</b> —nonsteroidal anti-inflammatory drug(s)
<b>CVA</b> —cerebrovascular accident	<b>OD</b> —right eye
<b>D<sub>5</sub>W</b> —dextrose 5% in water	<b>OS</b> —left eye
<b>dl</b> —deciliter	<b>OTC</b> —over the counter
<b>DNA</b> —deoxyribonucleic acid	<b>OU</b> —both eyes
<b>DVT</b> —deep vein thrombosis	<b>PCP</b> —Pneumocystis jiroveci pneumonia
<b>ECG</b> —electrocardiogram	<b>PO</b> —orally, by mouth
<b>EEG</b> —electroencephalogram	<b>prn</b> —as needed
<b>esp.</b> —especially	<b>PSA</b> —prostate-specific antigen
<b>g</b> —gram	<b>pt/pts</b> —patient/patients
<b>GGT</b> —gamma glutamyl transpeptidase	<b>PT</b> —prothrombin time
<b>GI</b> —gastrointestinal	<b>PTCA</b> —percutaneous transluminal coronary angiography
<b>GU</b> —genitourinary	<b>q</b> —every
<b>H<sub>2</sub></b> —histamine	<b>RBC</b> —red blood cell count
<b>Hct</b> —hematocrit	<b>REM</b> —rapid eye movement
<b>HDL</b> —high-density lipoprotein	<b>RNA</b> —ribonucleic acid
<b>HF</b> —heart failure	<b>SA</b> —sinoatrial node
<b>Hgb</b> —hemoglobin	<b>sec</b> —second(s)
<b>HIV</b> —human immunodeficiency virus	<b>SSRI</b> —selective serotonin reuptake inhibitor
<b>HMG-CoA</b> —3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase inhibitors (statins)	<b>tbsp</b> —tablespoon
<b>hr/hrs</b> —hour/hours	<b>tid</b> —three times daily
<b>HTN</b> —hypertension	<b>TNF</b> —tumor necrosis factor
<b>I&amp;O</b> —intake and output	<b>tsp</b> —teaspoon
<b>ICP</b> —intracranial pressure	<b>UTI</b> —urinary tract infection
<b>ID</b> —intra-dermal	<b>VLDL</b> —very-low-density lipoprotein
<b>IgA</b> —immunoglobulin A	<b>WBC</b> —white blood cell count
	<b>wk/wks</b> —week/weeks
	<b>yr/yrs</b> —year/years

## DANGEROUS ABBREVIATIONS

The 2004 National Patient Safety Goals of The Joint Commission (TJC) requires the elimination of dangerous abbreviations in an effort to promote patient safety by reducing medication errors. To achieve this goal, TJC developed a list of abbreviations, acronyms, and symbols that health care organizations must include in their “do not use” list. An abbreviation on the “do not use” list should not be used in any of its forms—uppercase or lowercase, with or without periods. For example, if Q.D. is on the organization’s list, health care organizations cannot use QD or qd because any of those variations are confusing and can be misinterpreted.

Abbreviation	Potential Problem	Preferred Term
U (for unit) IU (for international unit)	Mistaken as zero, four, or cc Mistaken as IV (intravenous) or 10 (ten)	Write “unit” Write “international unit”
Q.D., QD, q.d., qd (daily) Q.O.D., QOD, q.o.d., qod (every other day)	Mistaken for each other Period after “Q” mistaken for “I” and the “O” mistaken for “1”	Write “daily” Write “every other day”
Trailing zero (e.g., 5.0 mg); lack of leading zero (e.g., .5 mg)	Decimal point is missed	Always write a zero before a decimal point (0.5 mg) and never write a zero by itself after a decimal point (5 mg)
MS, MSO <sub>4</sub> , MgSO <sub>4</sub>	Confused for one another; can mean morphine sulfate or magnesium sulfate	Write “morphine sulfate” or “magnesium sulfate”

In addition, TJC requires an organization to identify and apply at least another three “do not use” abbreviations, acronyms, or symbols of its own choosing. The following list was developed by TJC for organizations to consider including on their list.

µg (for micrograms)	Mistaken for mg (milligrams) resulting in one thousand-fold-dosing overdose	Write “mcg”
H.S. (for half-strength or Latin abbreviation for bedtime)	Mistaken for either half-strength or hour of sleep (at bedtime); q.H.S. mistaken for every hour; all can result in dosing error	Write “half-strength” or “at bedtime”
T.I.W. (for three times per week)	Mistaken for three times per day or twice weekly, resulting in an overdose	Write “3 times weekly” or “three times weekly”
S.C. or S.Q. (for subcutaneous) D/C (for discharge)	Mistaken as SL for sublingual, or “5 every” Interpreted as discontinue whatever medications follow (typically discharge meds)	Write “Sub-Q,” “subQ,” or “subcutaneously” Write “discharge”
c.c. (for cubic centimeter)	Mistaken for U (units) when poorly written	Write “ml” for milliliters
A.S., A.D., A.U. (Latin abbreviation for left, right, or both ears)	Mistaken for OS, OD, OU, etc.	Write “left ear,” “right ear,” or “both ears”
> (greater than) < (less than)	Misinterpreted as number 7 or letter “L”	Write “greater than” or “less than”
Abbreviations for drug names	Misinterpreted due to similar abbreviations for multiple drugs	Write drug names in full
