# AUTHOR BIOGRAPHIES

---

## **Robert (Bob) J. Kizior, BS, RPh**

Bob graduated from the University of Illinois School of Pharmacy and is licensed to practice in the state of Illinois. He has worked as a hospital pharmacist for more than 40 years at Alexian Brothers Medical Center in Elk Grove Village, Illinois—a suburb of Chicago. Bob is the Pharmacy Surgery Coordinator for the Department of Pharmacy, where he participates in educational programs for pharmacists, nurses, physicians, and patients. He plays a major role in coordinating pharmacy services in the OR satellite. Bob is a former adjunct faculty member at William Rainey Harper Community College in Palatine, Illinois.

An avid sports fan, Bob also has eclectic tastes in music that range from classical, big band, rock 'n' roll, and jazz to country and western. Bob spends much of his free time reviewing the professional literature to stay current on new drug information.

## **Keith J. Hodgson, RN, BSN, CCRN**

Keith was born into a loving family in Chicago, Illinois. His mother, Barbara B. Hodgson, was an author and publisher of several medication products, and her work has been a part of his life since he was a child. By the time he was 4 years old, Keith was already helping his mother with drug cards by stacking the draft pages that were piled up throughout their home.

Because of his mother's influence, Keith contemplated becoming a nurse in college, but his mind was fully made up after he shadowed his sister in the Emergency Department. Keith received his Associates Degree in Nursing from Hillsborough Community College and his Bachelor of Science in Nursing from the University of South Florida in Tampa, Florida. Keith started his career in the Emergency Department and now works in the Trauma/Neurological/Surgical Intensive Care Unit at St. Joseph's Hospital in Tampa, Florida.

Keith's favorite interests include music, reading, Kentucky basketball, and, if he gets the chance, watching every minute of the Olympic Games.

# CONSULTANTS\*

---

**Katherine B. Barbee, MSN, ANP, F-NP-C**

Kaiser Permanente  
Washington, District of Columbia

**Marla J. DeJong, RN, MS, CCRN, CEN,  
Capt**

Wilford Hall Medical Center  
Lackland Air Force Base, Texas

**Diane M. Ford, RN, MS, CCRN**

Andrews University  
Berrien Springs, Michigan

**Denise D. Hopkins, PharmD**

College of Pharmacy  
University of Arkansas  
Little Rock, Arkansas

**Barbara D. Horton, RN, MS**

Arnot Ogden Medical Center School of Nursing  
Elmira, New York

**Mary Beth Jenkins, RN, CCRN, CAPA**

Elliott One Day Surgery Center  
Manchester, New Hampshire

**Kelly W. Jones, PharmD, BCPS**

McLeod Family Medicine Center  
McLeod Regional Medical Center  
Florence, South Carolina

**Linda Laskowski-Jones, RN, MS, CS,  
CCRN, CEN**

Christiana Care Health System  
Newark, Delaware

**Jessica K. Leet, RN, BSN**

Cardinal Glennon Children's Hospital  
St. Louis, Missouri

**Denise Macklin, BSN, RNC, CRNI**

President, Professional Learning Systems, Inc.  
Marietta, Georgia

**Judith L. Myers, MSN, RN**

Health Sciences Center  
St. Louis University School of Nursing  
St. Louis, Missouri

**Kimberly R. Pugh, MEd, RN, BS**

Nurse Consultant  
Baltimore, Maryland

**Regina T. Schiavello, BSN, RNC**

Wills Eye Hospital  
Philadelphia, Pennsylvania

**Gregory M. Susla, PharmD, FCCM**

National Institutes of Health  
Bethesda, Maryland

---

\*The authors acknowledge the work of the consultants in previous editions.

## ACKNOWLEDGMENTS

I would like to thank my co-author, Bob Kizior, for his knowledge, experience, support, and friendship. We would like to give special thanks to Sonya Seigafuse, Charlene Ketchum, Carrie Stetz, Tina Kaemmerer, and the entire Elsevier team for their superior dedication, hard work, and belief in us. Without this wonderful team, none of this would be possible.

**Keith J. Hodgson, RN, BSN, CCRN**

## DEDICATION

I dedicate my work to the practicing nurse, those aspiring to become nurses, and to all health care professionals who are dedicated to the art and science of healing.

**Bob Kizior, BS, RPh**

I dedicate this work to my wife, Jen Hodgson, the love of my life; my sister, Lauren, a foundation for our family; my sister, Kathryn, for her love and support; my father, David Hodgson, the best father a son could have; my brothers-in-law, Andy and Nick, great additions to the family; the grandchildren, Paige Olivia, Logan James, Ryan James, and Dylan Boyd; and to my band of brothers, Peter, Jamie, Miguel, Ritch, George, Jon, Domingo, Ben, Craig, Pat, and Shay.

We also make a special dedication to Barbara B. Hodgson, RN, OCN. She truly was a piece of something wonderful. Barbara often gave her love and support without needing any in return and would do anything for a smile. Not only was she a colleague and a friend, she was also a small business owner, an artist, a dreamer, and an innovator. We hope the pride we offer in her honor comes close to what she always gave us. Her dedication and perseverance lives on.

**Keith J. Hodgson, RN, BSN, CCRN**

# NEWLY APPROVED MEDICATIONS

Amivantamab (Rybrevant)	A bispecific EGF receptor and MET antibody for treatment of adults with locally advanced or metastatic non-small-cell lung cancer (NSCLC)
Belantamab mafodotin-blmf (Blenrep)	A monoclonal antibody for multiple myeloma
Dolutegravir (Tivicay)	Treatment of the infection caused by human immunodeficiency virus (HIV)
Dostarlimab-gxly (Jemperli)	A monoclonal antibody for endometrial cancer
Emtricitabine	Treatment of the infection caused by HIV.
Evinacumab-dgnb (Evkeeza)	A monoclonal antibody for homozygous familial hypercholesterolemia
Idecabtagene (Abecma)	A B-cell maturation antigen (BCMA)-directed, genetically modified, autologous chimeric antigen receptor (CAR) T-cell immunotherapy for treatment of adults with relapsed or refractory multiple myeloma
Lamivudine	Treatment of the infection caused by HIV
Loncastuximab (Zynlonta)	A monoclonal antibody for relapsed or refractory large B-cell lymphoma
Lurbinectedin (Zepzelca)	An alkylating drug for metastatic small-cell lung cancer
Margetuximab-cmkb (Margetenza)	An intravenous HER2/neu receptor antagonist for metastatic HER2-positive breast cancer
Naxitamab-gqqk (Danyelza)	A monoclonal antibody for relapsed or refractory neuroblastoma in the bone or bone marrow
Pertuzumab/trastuzumab hyaluronidase-zzxf (Phesgo)	Monoclonal antibodies for HER2-positive breast cancer
Ponesimod (Ponvory)	A selective sphingosine-1-phosphate receptor 1 modulator for treatment of relapsing forms of multiple sclerosis
Pralsetinib (Gavreto)	A kinase inhibitor for non-small-cell lung cancer, RET-mutant medullary thyroid cancer, and RET fusion-positive thyroid cancer
Relugolix (Orgovyx)	An oral gonadotropin-releasing hormone receptor antagonist for advanced prostate cancer
Serdexmethylphenidate/dexmethylphenidate (Azstarys)	A CNS stimulant for ADHD
Tafasitamab-cxix (Monjuvi)	A monoclonal antibody for diffuse large B-cell lymphoma
Tenecteplase (TNKase)	Thrombolytic agent
Tenofovir	Treatment of the infection caused by HIV

---

Tepotinib (Tepmetko)	A kinase inhibitor for metastatic non–small-cell lung cancer
Tivozanib (Fotivda)	A kinase inhibitor for renal cell carcinoma
Umbralisib (Ukoniq)	A kinase inhibitor for marginal zone lymphoma and follicular lymphoma
Vibegron (Gemtesa)	An oral beta-3 agonist for overactive bladder
Viloxazine (Qelbree)	A serotonin norepinephrine modulating agent (SNMA) for treatment of ADHD in pts 6 to 17 yrs of age

---

# PREFACE

---

Nurses are faced with the ever-challenging responsibility of ensuring safe and effective drug therapy for their patients. Not surprisingly, the greatest challenge for nurses is keeping up with the overwhelming amount of new drug information, including the latest FDA-approved drugs and changes to already approved drugs, such as new uses, dosage forms, warnings, and much more. Nurses must integrate this information into their patient care quickly and in an informed manner.

**Saunders Nursing Drug Handbook 2023** is designed as an easy-to-use source of current drug information to help the nurse meet these challenges. What separates this book from others is that it guides the nurse through patient care to better practice and better care. This handbook contains the following:

1. **An IV compatibility chart.** This handy chart is bound into the handbook to prevent accidental loss.
2. **The Drug Classifications section.** The action and uses for some of the most common clinical and pharmacotherapeutic classes are presented. Unique to this handbook, each class provides an at-a-glance table that compares all the generic drugs within the classification according to product availability, dosages, side effects, and other characteristics. Its half-page color tab ensures you can't miss it!
3. **An alphabetical listing of drug entries by generic name.** Blue letter thumb tabs help you page through this section quickly. Information on medications that contain a Black Box Alert is an added feature of the drug entries. This alert identifies those medications for which the FDA has issued a warning that the drugs may cause serious adverse effects. Tall Man lettering, with emphasis on certain syllables to avoid confusing similar sounding/looking medications, is shown in capitalized letters (e.g., oxy**CODONE**). High Alert drugs with a color icon  are considered dangerous by The Joint Commission and the Institute for Safe Medication Practices (ISMP) because if they are administered incorrectly, they may cause life-threatening or permanent harm to the patient. The entire High Alert generic drug entry sits on a shaded background so that it's easy to spot! To make scanning pages easier, each new entry begins with a shaded box containing the generic name, pronunciation, trade name(s), fixed combination(s), and classification(s).
4. **A comprehensive reference section.** Appendixes include vital information on calculation of doses; controlled drugs; chronic wound care; drugs of abuse; equi-analgesic dosing; herbals: common natural medicines; lifespan, cultural aspects, and pharmacogenomics of drug therapy; normal laboratory values; drug interactions; antidotes or reversal agents; preventing medication errors; parenteral fluid administration; and Common Terminology Criteria for Adverse Events (CTCAE).
5. **Drugs by Disorder.** You'll find Drugs by Disorder in the front of the book for easy reference. It lists common disorders and the drugs most often used for treatment.
6. **The index.** The comprehensive index is located at the back of the book on light blue pages. Undoubtedly the best tool to help you navigate the handbook, the comprehensive index is organized by showing generic drug names in **bold**, trade names in regular type, classifications in *italics*, and the page number of the main drug entry listed first and in **bold**.

## A DETAILED GUIDE TO THE SAUNDERS NURSING DRUG HANDBOOK

An intensive review by consultants and reviewers helped us to revise the **Saunders Nursing Drug Handbook** so that it is most useful in both educational and clinical practice. The main objective of the handbook is to provide essential drug information in a user-friendly format. The bulk of the handbook contains an alphabetical listing of drug entries by generic name.

To maintain the portability of this handbook and meet the challenge of keeping content current, we have also included additional information for some medications on the Evolve® Internet site. Users can also choose from 100 monographs for the most commonly used medications and customize and print drug cards. Evolve® also includes drug alerts (e.g., medications removed from the market) and drug updates (e.g., new drugs, updates on existing entries). Information is periodically added, allowing the nurse to keep abreast of current drug information.

We have incorporated the IV Incompatibilities/Compatibilities  heading. The drugs listed in this section are compatible or incompatible with the generic drug when administered directly by IV push, via a Y-site, or via IV piggyback. We have highlighted the intravenous drug administration and handling information with a special heading icon  and have broken it down by Reconstitution, Rate of Administration, and Storage.

We present entries in an order that follows the logical thought process the nurse undergoes whenever a drug is ordered for a patient:

- What is the drug?
- How is the drug classified?
- What does the drug do?
- What is the drug used for?
- Under what conditions should you **not** use the drug?
- How do you administer the drug?
- How do you store the drug?
- What is the dose of the drug?
- What should you monitor the patient for once he or she has received the drug?
- What do you assess the patient for?
- What interventions should you perform?
- What should you teach the patient?

The following are included within the drug entries:

**Generic Name, Pronunciation, Trade Names.** Each entry begins with the generic name and pronunciation, followed by the U.S. and Canadian trade names. Exclusively Canadian trade names are followed by a maple leaf . Trade names that were most prescribed in the year 2020 are underlined in this section.

**Black Box Alert.** This feature highlights drugs that carry a significant risk of serious or life-threatening adverse effects. Black Box Alerts are ordered by the FDA.

**Do Not Confuse With.** Drug names that sound similar to the generic and/or trade names are listed under this heading to help you avoid potential medication errors.

**Fixed-Combination Drugs.** Where appropriate, fixed-combinations, or drugs made up of two or more generic medications, are listed with the generic drug.

**Pharmacotherapeutic and Clinical Classification Names.** Each entry includes both the pharmacotherapeutic and clinical classifications for the generic drug.

**Action/Therapeutic Effect.** This section describes how the drug is predicted to behave, with the expected therapeutic effect(s) under a separate heading.

**Pharmacokinetics.** This section includes the absorption, distribution, metabolism, excretion, and half-life of the medication. The half-life is bolded in blue for easy access.

**Uses/Off-Label.** The listing of uses for each drug includes both the FDA uses and the off-label uses. The off-label heading is shown in bold blue for emphasis.

**Precautions.** This heading incorporates a discussion about when the generic drug is contraindicated or should be used with caution. The cautions warn the nurse of specific situations in which a drug should be closely monitored.

**Lifespan Considerations** . This section includes pregnancy/lactation data and age-specific information concerning children and elderly people.

**Interactions.** This heading enumerates drug, food, and herbal interactions with the generic drug. As the number of medications a patient receives increases, awareness of drug interactions becomes more important. Also included is information about therapeutic and toxic blood levels in addition to effects the drug may have on lab results.

**Product Availability.** Each drug monograph gives the form and availability of the drug. The icon  identifies noncrushable drug forms.

**Administration/Handling.** Instructions for administration are given for each route of administration (e.g., IV, IM, PO, rectal). Special handling, such as refrigeration, is also included where applicable. The routes in this section are always presented in the order IV, IM, SQ, and PO, with subsequent routes in alphabetical order (e.g., Ophthalmic, Otic, Topical). **IV administration**  is broken down by reconstitution, rate of administration (how fast the IV should be given), and storage (including how long the medication is stable once reconstituted).

**IV Incompatibilities/IV Compatibilities** . These sections give the nurse the most comprehensive compatibility information possible when administering medications by direct IV push, via a Y-site, or via IV piggyback.

**Indications/Routes/Dosage.** Each entry provides specific dosing guidelines for adults, elderly, children, and patients with renal and/or hepatic impairment. Dose modification for toxicity has been added where applicable. Dosages are clearly indicated for each approved indication and route.

**Side Effects.** Side effects are defined as those responses that are usually predictable with the drug, are **not** life-threatening, and may or may not require discontinuation of the drug. Unique to this handbook, side effects are grouped by frequency listed from highest occurrence percentage to lowest so that the nurse can focus on patient care without wading through myriad signs and symptoms of side effects.

**Adverse Effects/Toxic Reactions.** Adverse effects and toxic reactions are very serious and often life-threatening undesirable responses that require prompt intervention from a health care provider.

**Nursing Considerations.** Nursing considerations are organized as care is organized:

- What needs to be assessed or done before the first dose is administered? (Baseline Assessment)
- What interventions and evaluations are needed during drug therapy? (Intervention/Evaluation)
- What teaching is needed for the patient and family? (Patient/Family Teaching)

**Saunders Nursing Drug Handbook** is an easy-to-use source of current drug information for nurses, students, and other health care providers. It is our hope that this handbook will help you provide quality care to your patients.

We welcome any comments to improve future editions of the handbook. Please contact us via the publisher at <http://evolve.elsevier.com/SaundersNDH>.

**Robert J. Kizior, BS, RPh**  
**Keith J. Hodgson, RN, BSN, CCRN**

# DRUGS BY DISORDER

---

**Note: Not all medications appropriate for a given condition are listed, nor are those not listed inappropriate.**

Generic names appear first, followed by brand names in parentheses.

## **Alcohol dependence**

Acamprosate (Campral)  
Disulfiram (Antabuse)  
Naltrexone (Depade, ReVia, Vivitrol)

## **Allergic conjunctivitis**

Alcaftadine (Lastacaft)  
Azelastine – generic  
Bepotastine (Bepreve)  
Cetirizine (Zerviate)  
Cromolyn – generic  
Emedastine (Emadine)  
Epinastine (Elestat)  
Ketorolac (Acular)  
Ketotifen (Alaway, Zaditor)  
Lodoxamide (Alomide)  
Loteprednol (Alrex, Lotemax)  
Naphazoline (Clear Eyes Maximum)  
Naphazoline/pheniramine (Naphcon A, Opcon A)  
Nedocromil (Alocril)  
Olopatadine (Pataday, Patanol, Pazeo)  
Prednisone (Pred Mild)  
Tetrahydrozoline (Visine AC)

## **Allergic rhinitis**

### **Nasal spray**

Azelastine (Astelin, Astepro)  
Azelastine/fluticasone (Dymista)  
Beclomethasone (Beconase AQ, Qnasl)  
Budesonide (Rhinocort Allergy Spray)  
Ciclesonide (Omnaris, Zetonna)  
Cromolyn (Nasalcrom)  
Flunisolide  
Fluticasone (Flonase Sensimist Allergy Relief)  
Ipratropium (generic)  
Mometasone (Nasonex)  
Olopatadine (Patanase)  
Triamcinolone (Nasacort Allergy 24 HR)

## **Oral form**

Cetirizine (Zyrtec Allergy)  
Cetirizine/pseudoephedrine (Zyrtec-D 12 hour)  
Desloratadine (Clarinox)  
Desloratadine/pseudoephedrine (Clarinox-D 12 hour)  
Fexofenadine (Allegra)  
Fexofenadine/pseudoephedrine (Allegra-D 12 hour, Allegra-D 24 hour)  
Levocetirizine (Xyzal Allergy 24 hour)  
Loratadine (Alavert, Claritin)  
Loratadine/pseudoephedrine (Alavert-D 12 hour, Claritin-D 12 hour, Claritin-D 24 hour)  
Montelukast (Singulair)

## **Alzheimer's disease**

### **Acetylcholinesterase inhibitors**

Donepezil (Aricept)  
Galantamine (Razadyne)  
Rivastigmine (Exelon Patch)

### **Anyloid Beta-directed monoclonal antibody**

Aducanumab-awwa (Aduhelm)

### **NMDA receptor antagonist**

Memantine (Namenda)

### **NMDA receptor antagonist/ acetylcholinesterase inhibitor**

Namzaric

## **Angina**

Amlodipine (Norvasc)  
Atenolol (Tenormin)  
Diltiazem (Cardizem, Dilacor)  
Isosorbide (Imdur, Isordil)  
Metoprolol (Lopressor)  
Nadolol (Corgard)  
Nicardipine (Cardene)

Nifedipine (Adalat, Procardia)  
 Nitroglycerin  
 Propranolol (Inderal)  
 Verapamil (Calan, Isoptin)

### Anxiety

Alprazolam (Xanax)  
 Buspirone (BuSpar)  
 Diazepam (Valium)  
 Hydroxyzine (Atarax, Vistaril)  
 Lorazepam (Ativan)  
 Oxazepam (Serax)  
 Paroxetine (Paxil)  
 Trazodone (Desyrel)  
 Venlafaxine (Effexor)

### Arrhythmias

Adenosine (Adenocard)  
 Amiodarone (Cordarone, Pacerone)  
 Digoxin (Lanoxin)  
 Diltiazem (Cardizem, Dilacor)  
 Disopyramide (Norpace)  
 Dofetilide (Tikosyn)  
 Dronedaron (Multaq)  
 Esmolol (Brevibloc)  
 Flecainide (Tambocor)  
 Ibutilide (Corvert)  
 Lidocaine  
 Metoprolol (Lopressor)  
 Mexiletine (Mexitil)  
 Propafenone (Rythmol)  
 Propranolol (Inderal)  
 Sotalol (Betapace)  
 Verapamil (Calan, Isoptin)

### Arthritis, rheumatoid

#### Conventional DMARDs

Hydroxychloroquine (Plaquenil)  
 Leflunomide (Arava)  
 Methotrexate (Otrexup, Rasuvo, Trexall)  
 Sulfasalazine (Azulfidine)

#### Biologic agents

##### TNF inhibitors

Adalimumab (Humira)  
 Certolizumab pegol (Cimzia)  
 Etanercept (Enbrel)  
 Golimumab (Simponi, Simponi Aria)  
 Infliximab (Remicade, Inflectra, Renflexis)

##### IL-6 inhibitors

Sarilumab (Kevzara)  
 Tocilizumab (Actemra)

### Other biologic agents

Abatacept (Orencia)  
 Anakinra (Kineret)  
 Rituximab (Rituxan)  
**JAK inhibitors**  
 Baricitinib (Olumiant)  
 Tofacitinib (Xeljanz, Xeljanz XR)  
 Upadacitinib (Rinvoq)

### Asthma

#### Short-acting beta-2 agonists (SABA)

Albuterol (ProAir HFA, Proventil HFA,  
 Ventolin HFA, ProAir RespiClick)  
 Levalbuterol (Xopenex HFA)

#### Short-acting muscarinic antagonists (SAMA)

Ipratropium (Atrovent HFA)

#### Inhaled corticosteroids

Beclomethasone (QVAR)  
 Budesonide (Pulmicort)  
 Ciclesonide (Alvesco)  
 Flunisolide (Aerospan)  
 Fluticasone (Arnuity Ellipta, Flovent Diskus)  
 Mometasone (Asmanex)

#### Long-acting beta-2 agonists (LABA)

Formoterol (Perforomist)  
 Salmeterol (Serevent)

#### Inhaled corticosteroid/LABA combinations

Budesonide/formoterol (Symbicort)  
 Fluticasone/vilanterol (Breo Ellipta)  
 Fluticasone/Salmeterol (Advair, AirDuo  
 RespiClick)

Mometasone, formoterol (Dulera)

#### Inhaled long-acting muscarinic antagonist (LAMA)

Tiotropium (Spiriva)

#### Inhaled corticosteroid/LAMA/LABA

Fluticasone/umeclidinium/vilanterol  
 (Trelegy Ellipta)

### Atrial fibrillation

#### Oral anticoagulants

##### Vitamin K antagonist

Warfarin (Coumadin)

##### Direct thrombin inhibitor

Dabigatran (Pradaxa)

##### Direct factor Xa inhibitors

Apixaban (Eliquis)  
 Edoxaban (Savaysa)  
 Rivaroxaban (Xarelto)

**Rate control****Beta adrenergic blockers**

Atenolol (Tenormin)  
 Bisoprolol  
 Carvedilol (Coreg, Coreg CR)  
 Metoprolol (Lopressor, Toprol XL)  
 Nadolol (Corgard)  
 Propranolol (Inderal LA, InnoPran XL)

**Calcium channel blockers**

Diltiazem (Cardizem CD, Cartia XT,  
 Taztia XT, Tiazac)  
 Verapamil (Calan, Verelan)

**Other**

Amiodarone (Pacerone)  
 Digoxin (Digitek, Lanoxin)

**Rhythm control**

Amiodarone (Pacerone)  
 Dronedarone (Multaq)  
 Dofetilide (Tikosyn)  
 Flecainide  
 Propafenone (Rythmol SR)  
 Sotalol (Betapace, Sotalol AF)

**Attention-deficit hyperactivity disorder (ADHD)**

Amphetamine (Adzenys XR-ODT,  
 Dyanavel XR)  
 Atomoxetine (Strattera)  
 Clonidine (Catapres, Kapvay)  
 Desipramine (Norpramin)  
 Dexamethylphenidate (Focalin, Focalin XR)  
 Dextroamphetamine (Dexedrine,  
 ProCentra, Zenzedi)  
 Guanfacine (Intuniv)  
 Lisdexamfetamine (Vyvanse)  
 Methylphenidate (Aptensio XR, Concerta,  
 Cotempla XR-ODT, Daytrana, Focalin,  
 Focalin XR, Jornay PM, Metadate CD,  
 Methylin, QuilliChew ER,  
 Quillivant XR, Ritalin)  
 Mixed amphetamine (dextroamphetamine  
 and amphetamine salts) (Adderall,  
 Adderall XR, Mydayis)  
 Serdexmethylphenidate/  
 dexmethylphenidate (Azstarys)  
 Viloxazine ER (Qelbree)

**Benign prostatic hypertrophy (BPH)**

Alfuzosin (Uroxatral)  
 Doxazosin (Cardura)  
 Dutasteride (Avodart)

Fesoterodine (Toviaz)  
 Finasteride (Proscar)  
 Mirabegron (Myrbetriq)  
 Silodosin (Rapaflo)  
 Tadalafil (Cialis)  
 Tamsulosin (Flomax)  
 Terazosin (Hytrin)  
 Tolterodine (Detrol)

**Bipolar disorder**

Aripiprazole (Abilify)  
 Asenapine (Saphris)  
 Carbamazepine (Tegretol)  
 Lamotrigine (Lamictal)  
 Lithium (Lithobid)  
 Lurasidone (Latuda)  
 Olanzapine (Zyprexa)  
 Olanzapine/fluoxetine (Symbyax)  
 Oxcarbazepine (Trileptal)  
 Paliperidone (Invega)  
 Quetiapine (Seroquel)  
 Risperidone (Risperdal)  
 Valproic acid (Depakene, Depakote)  
 Ziprasidone (Geodon)

**Bladder hyperactivity**

Darifenacin (Enablex)  
 Oxybutynin (Ditropan, Gelnique)  
 Solifenacin (VESicare)  
 Tolterodine (Detrol)  
 Trospium (Sanctura)  
 Vibegron (Gemtesa)

**Bronchospasm**

Albuterol (Proventil, Ventolin)  
 Bitolterol (Tornalate)  
 Levalbuterol (Xopenex)  
 Metaproterenol (Alupent)  
 Salmeterol (Serevent)  
 Terbutaline (Brethine)

**Cancer**

Abarelix (Plenaxis)  
 Abemaciclib (Verzenio)  
 Abiraterone (Zytiga)  
 Acalabrutinib (Calquence)  
 Ado-trastuzumab (Kadcyla)  
 Afatinib (Gilotrif)  
 Aldesleukin (Proleukin)  
 Alemtuzumab (Campath)  
 Alitretinoin (Panretin)

- Altretamine (Hexalen)  
 Amivantamab (Rybrevant)  
 Anastrozole (Arimidex)  
 Apalutamide (Erleada)  
 Alpelisib (Piqray)  
 Arsenic trioxide (Trisenox)  
 Asparaginase (Elspar)  
 Atezolizumab (Tecentriq)  
 Avapritinib (Ayvakit)  
 Avelumab (Bavencio)  
 Axitinib (Inlyta)  
 Azacitidine (Vidaza)  
 BCG (TheraCys, Tice BCG)  
 Belantamab mafodotin-blmf (Blenrep)  
 Belinostat (Beleodaq)  
 Bendamustine (Treanda)  
 Bevacizumab (Avastin)  
 Bexarotene (Targretin)  
 Bicalutamide (Casodex)  
 Binimetinib (Mektovi)  
 Bleomycin (Blenoxane)  
 Blinatumomab (Blincyto)  
 Bortezomib (Velcade)  
 Bosutinib (Bosulif)  
 Brentuximab (Adcetris)  
 Brigatinib (Alunbrig)  
 Busulfan (Myleran)  
 Cabazitaxel (Jevtana)  
 Capmatinib (Tabrecta)  
 Cabozantinib (Cabometyx)  
 Capecitabine (Xeloda)  
 Carboplatin (Paraplatin)  
 Carfilzomib (Kyprolis)  
 Carmustine (BiCNU)  
 Ceritinib (Zykadia)  
 Cetuximab (Erbix)  
 Chlorambucil (Leukeran)  
 Cisplatin (Platinol)  
 Cladribine (Leustatin)  
 Clofarabine (Clolar)  
 Cobimetinib (Cotellic)  
 Copanlisib (Aliqopa)  
 Crizotinib (Xalkori)  
 Cyclophosphamide (Cytozan)  
 Cytarabine (Ara-C, Cytosar)  
 Dabrafenib (Tafinlar)  
 Dacarbazine (DTIC)  
 Dacomitinib (Vizimpro)  
 Dactinomycin (Cosmegen)  
 Daratumumab (Darzalex)  
 Daratumumab/hyaluronidase (Darzalex Fasprou)  
 Darolutamide (Nubeqa)  
 Dasatinib (Sprycel)  
 Daunorubicin (Cerubidine, DaunoXome)  
 Degarelix (Firmagon)  
 Denileukin (Ontak)  
 Dinutuximab (Unituxin)  
 Docetaxel (Taxotere)  
 Dostarlimab-gxly (Jemperli)  
 Doxorubicin (Adriamycin, Doxil)  
 Durvalumab (Imfinzi)  
 Duvelisib (Copiktra)  
 Elotuzumab (Empliciti)  
 Enasidenib (IDHIFA)  
 Encorafenib (Braftovi)  
 Enfortumab vedotin (Padcev)  
 Entrectinib (Rozlytrek)  
 Enzalutamide (Xtandi)  
 Epirubicin (Ellence)  
 Erdafitinib (Balversa)  
 Eribulin (Halaven)  
 Erlotinib (Tarceva)  
 Estramustine (Emcyt)  
 Etoposide (VePesid)  
 Everolimus (Afinitor)  
 Fam-trastuzumab (Enhertu)  
 Fludarabine (Fludara)  
 Fluorouracil  
 Flutamide (Eulexin)  
 Fulvestrant (Faslodex)  
 Gefitinib (Iressa)  
 Gemcitabine (Gemzar)  
 Gilteritinib (Xospata)  
 Glasdegib (Daurismo)  
 Goserelin (Zoladex)  
 Hydroxyurea (Hydrea)  
 Ibritumomab (Zevalin)  
 Ibrutinib (Imbruvica)  
 Idarubicin (Idamycin)  
 Idecabtagene (Abecma)  
 Idelalisib (Zydelig)  
 Ifosfamide (Ifex)  
 Imatinib (Gleevec)  
 Inotuzumab ozogamicin (Besponsa)  
 Interferon alfa-2b (Intron A)  
 Ipilimumab (Yervoy)  
 Irinotecan (Camptosar)  
 Isatuximab (Sarclisa)  
 Ivosidenib (Tibsovo)  
 Ixabepilone (Ixempra)  
 Ixazomib (Ninlaro)  
 Lapatinib (Tykerb)  
 Larotrectinib (Vitrakvi)

Letrozole (Femara)  
 Leuprolide (Lupron)  
 Lenvatinib (Lenvima)  
 Lomustine (CeeNU)  
 Loncastuximab (Zynlonta)  
 Lorlatinib (Lorbrena)  
 Lurbinectedin (Zepzelca)  
 Margetuximab-cmkb (Margenza)  
 Mechlorethamine (Mustargen)  
 Megestrol (Megace)  
 Melphalan (Alkeran)  
 Mercaptopurine (Purinethol)  
 Methotrexate  
 Midostaurin (Rydapt)  
 Mitomycin (Mutamycin)  
 Mitotane (Lysodren)  
 Mitoxantrone (Novantrone)  
 Moxetumomab (Lumoxiti)  
 Naixamab-ggqk (Danyelza)  
 Necitumumab (Portrazza)  
 Nelarabine (Arranon)  
 Neratinib (Nerlynx)  
 Nilotinib (Tasigna)  
 Nilutamide (Nilandron)  
 Niraparib (Zejula)  
 Nivolumab (Opdivo)  
 Obinutuzumab (Gazyva)  
 Ofatumumab (Arzerra)  
 Olaparib (Lynparza)  
 Olaratumab (Larturvo)  
 Omacetaxine (Synribo)  
 Osimertinib (Tagrisso)  
 Oxaliplatin (Eloxatin)  
 Paclitaxel (Taxol)  
 Palbociclib (Ibrance)  
 Panitumumab (Vectibix)  
 Panobinostat (Farydak)  
 Pazopanib (Votrient)  
 Pegaspargase (Oncaspar)  
 Pembrolizumab (Keytruda)  
 Pemetrexed (Alimta)  
 Pentostatin (Nipent)  
 Pertuzumab (Perjeta)  
 Pertuzumab/trastuzumab  
   hyaluronidase-zzxf (Phesgo)  
 Plicamycin (Mithracin)  
 Polatuzumab (Polivy)  
 Pomalidomide (Pomalyst)  
 Ponatinib (Iclusig)  
 Pralatrexate (Folotyn)  
 Pralsetinib (Gavreto)  
 Procarbazine (Matulane)  
 Ramucirumab (Cyramza)  
 Rasburicase (Elitek)  
 Regorafenib (Stivarga)  
 Relugolix (Orgovyx)  
 Ribociclib (Kisqali)  
 Ripretinib (Qinlock)  
 Rituximab (Rituxan)  
 Rituximab/hyaluronidase (Rituxan  
   Hycela)  
 Romidepsin (Istodax)  
 Rucaparib (Rubraca)  
 Sacituzumab (Trodelvy)  
 Selinexor (Xpovio)  
 Selpercatinib (Retevmo)  
 Sipuleucel-T (Provenge)  
 Sonidegib (Odomzo)  
 Sorafenib (Nexavar)  
 Streptozocin (Zanosar)  
 Sunitinib (Sutent)  
 Tafasitamab-cxix (Monjuvi)  
 Talazoparib (Talzenna)  
 Tamoxifen (Nolvadex)  
 Temozolomide (Temodar)  
 Temsirolimus (Torisel)  
 Teniposide (Vumon)  
 Tepotinib (Tepmetko)  
 Thioguanine  
 Thiotepa (Thioplex)  
 Tipifarnib (Zarnestra)  
 Tipiracil/trifluridine (Lonsurf)  
 Tisagenlecleucel (Kymriah)  
 Tivozanib (Fotivda)  
 Topotecan (Hycamtin)  
 Toremfene (Fareston)  
 Tositumomab (Bexxar)  
 Trabectedin (Yondelis)  
 Trametinib (Mekinist)  
 Trastuzumab (Herceptin)  
 Trastuzumab/hyaluronidase (Herceptin  
   Hylecta)  
 Tretinoin (ATRA, Vesanoid)  
 Tucatinib (Tukysa)  
 Umbralisib (Ukonig)  
 Valrubicin (Valstar)  
 Vandetanib (Caprelsa)  
 Vemurafenib (Zelboraf)  
 Venetoclax (Venclexta)  
 Vinblastine (Velban)  
 Vincristine (Oncovin)  
 Vinorelbine (Navelbine)  
 Vismodegib (Erivedge)  
 Vorinostat (Zolinza)

Zanubrutinib (Brukinsa)  
Ziv-aflibercept (Zaltrap)

### Cerebrovascular accident (CVA)

Aspirin  
Clopidogrel (Plavix)  
Heparin  
Nimodipine (Nimotop)  
Prasugrel (Effient)  
Warfarin (Coumadin)

### Chronic obstructive pulmonary disease (COPD)

**Inhaled short-acting antimuscarinic**  
Ipratropium (Atrovent HFA)

**Inhaled short-acting Beta-2 agonists (SABA)**

Albuterol (ProAir HFA, Proventil HFA, Ventolin HFA)  
Levalbuterol (Xopenex HFA)

**Inhaled short-acting Beta-2 agonist (SABA)/short-acting antimuscarinic (SAMA)**

Albuterol/Ipratropium (Combivent Respimat)

**Inhaled long-acting Beta-2 agonists (LABA)**

Arformoterol (Brovana)  
Formoterol (Perforomist)  
Olodaterol (Striverdi Respimat)  
Salmeterol (Serevent Diskus)

**Inhaled long-acting antimuscarinic agents (LAMA)**

Aclidinium (Tudorza Pressair)  
Glycopyrrolate (Seebri Neohaler)  
Revefenacin (Yupelri)

Tiotropium (Spiriva Respimat)  
Umeclidinium (Incruse Ellipta)

**Inhaled long-acting Beta-2 agonists (LABA)/long-acting antimuscarinic agents (LAMA)**

Glycopyrrolate/formoterol (Bevespi)  
Tiotropium/olodaterol (Stiolto Respimat)  
Umeclidinium/vilanterol (Anoro Ellipta)

**Inhaled corticosteroids**

Beclomethasone (QVAR)  
Budesonide (Pulmicort)  
Ciclesonide (Alvesco)  
Flunisolide (Aerospan HFA)  
Fluticasone (Flovent Diskus, Flovent HFA)

Mometasone (Asmanex HFA, Asmanex Twisthaler)

**Inhaled corticosteroids/long-acting Beta-2 agonists (LABA)**

Fluticasone/salmeterol (Advair Diskus)

Fluticasone/vilanterol (Breo Ellipta)  
Budesonide/formoterol (Symbicort)

**Inhaled corticosteroids/long-acting Beta-2 agonists (LABA)/long-acting antimuscarinic agents (LAMA)**

Fluticasone/vilanterol/umeclidinium (Trelegy Ellipta)

### Constipation

Bisacodyl (Dulcolax)  
Docusate (Colace)  
Lactulose (Kristalose)  
Lubiprostone (Amitiza)  
Methylcellulose (Citrucel)  
Milk of magnesia (MOM)  
Polyethylene glycol (MiraLAX)  
Psyllium (Metamucil)  
Senna (Senokot)

### Crohn's disease

Azathioprine  
Adalimumab (Humira)  
Certolizumab (Cimzia)  
Corticosteroids  
Infliximab (Inflectra, Remicade)  
6-Mercaptopurine  
Ustekinumab (Stelara)  
Vedolizumab (Entyvio)

### Deep vein thrombosis (DVT)

Dalteparin (Fragmin)  
Edoxaban (Savaysa)  
Enoxaparin (Lovenox)  
Heparin  
Tinzaparin (Innohep)  
Warfarin (Coumadin)

### Depression

#### SSRIs

Citalopram (Celexa)  
Escitalopram (Lexapro)  
Fluoxetine (Prozac, Prozac Weekly)  
Paroxetine (Paxil, Paxil CR)  
Sertraline (Zoloft)

**SNRIs**

Desvenlafaxine (Pristiq, Khedezla)  
 Duloxetine (Cymbalta)  
 Venlafaxine (Effexor XR)  
 Levomilnacipran (Fetzima)

**TCAs**

Amoxapine (generic)  
 Desipramine (Norpramin)  
 Imipramine (generic)  
 Amitriptyline (Elavil)  
 Nortriptyline (Pamelor)

**MAOIs**

Isocarboxid (Marplan)  
 Phenelzine (Nardil)  
 Selegiline (Emsam)  
 Tranylcypromine (Parnate)

**Other**

Bupropion (Wellbutrin SR, Aplenzin,  
 Forfivo XL)  
 Esketamine (Spravato)  
 Mirtazapine (Remeron, Remeron SolTab)  
 Olanzapine/fluoxetine (Symbyax)  
 Trazodone (Oleptro)  
 Vilazodone (Viibryd)  
 Vortioxetine (Trintellix)

**Diabetes****Biguanides**

Metformin (Glucophage, Glucophage  
 XR, Glumetza, Fortamet, Riomet)

**Sulfonylureas**

Glimepiride (Amaryl, Glipizide,  
 Glucotrol, Glucotrol XL)  
 Glyburide (Glynase)

**GLP-1 receptor agonists**

Albiglutide (Tanzeum)  
 Dulaglutide (Trulicity)  
 Exenatide (Byetta, Bydureon)  
 Liraglutide (Victoza)  
 Lixisenatide (Adlyxin)  
 Semaglutide (Ozempic)

**DDP-4 inhibitors**

Alogliptin (Nesina)  
 Linagliptin (Tradjenta)  
 Saxagliptin (Onglyza)  
 Sitagliptin (Januvia)

**SGLT2 inhibitors**

Canagliflozin (Invokana)  
 Dapagliflozin (Farxiga)  
 Empagliflozin (Jardiance)  
 Ertugliflozin (Steglatro)

**Meglitinides**

Nateglinide (Starlix)  
 Repaglinide (Prandin)

**Thiazolidinediones**

Pioglitazone (Actos)  
 Rosiglitazone (Avandia)

**Alpha-glucosidase inhibitors**

Acarbose (Precose)  
 Miglitol (Glyset)

**Other**

Colesevelam (Welchol)  
 Bromocriptine (Cycloset)  
 Pramlintide (Symlin)

**Insulin****Rapid-acting**

Insulin aspart (Fiasp, Novolog)  
 Insulin glulisine (Apidra)  
 Insulin lispro (Admelog, Humalog,  
 Lyumjev)

Insulin inhalation powder (Afrezza)

**Regular insulin**

Humulin R  
 Novolin R

**Intermediate insulin**

NPH (Humulin N, Novolin N)

**Long-acting insulin**

Insulin detemir (Levemir)  
 Insulin glargine (Basaglar, Lantus,  
 Semglee, Toujeo)  
 Insulin degludec (Tresiba)

**Diabetic peripheral neuropathy**

Amitriptyline (Elavil)  
 Bupropion (Wellbutrin)  
 Capsaicin (Trixaicin)  
 Carbamazepine (Tegretol)  
 Citalopram (Celexa)  
 Desipramine (Norpramin)  
 Duloxetine (Cymbalta)  
 Gabapentin (Neurontin)  
 Lamotrigine (Lamictal)  
 Lidocaine patch (Lidoderm)  
 Nortriptyline (Pamelor)  
 Oxcarbazepine (Trileptal)  
 Oxycodone (OxyContin)  
 Paroxetine (Paxil)  
 Pregabalin (Lyrica)  
 Tramadol (Ultram)  
 Valproic acid (Depakote)  
 Venlafaxine, extended-release  
 (Effexor XR)

**Diarrhea**

Bismuth subsalicylate (Pepto-Bismol)  
 Diphenoxylate and atropine (Lomotil)  
 Fidaxomicin (Dificid)  
 Kaolin-pectin (Kaopectate)  
 Loperamide (Imodium)  
 Octreotide (Sandostatin)  
 Rifaximin (Xifaxan)

**Edema**

Amiloride (Midamor)  
 Bumetanide (Bumex)  
 Chlorthalidone (Hygroton)  
 Ethacrynic acid (Edecrin)  
 Furosemide (Lasix)  
 Hydrochlorothiazide (Hydrodiuril)  
 Indapamide (Lozol)  
 Metolazone (Zaroxolyn)  
 Spironolactone (Aldactone)  
 Torsemide (Demadox)  
 Triamterene (Dyrenium)

**Epilepsy**

Brivaracetam (Briviact)  
 Carbamazepine (Tegretol)  
 Cenobamate (Xcopri)  
 Clobazam (Onfi)  
 Clonazepam (Klonopin)  
 Clorazepate (Tranxene)  
 Diazepam (Valium)  
 Eslicarbazepine (Aptiom)  
 Ethosuximide (Zarontin)  
 Ezogabine (Potiga)  
 Fosphenytoin (Cerebyx)  
 Gabapentin (Neurontin)  
 Lacosamide (Vimpat)  
 Lamotrigine (Lamictal, Lamictal ODT,  
 Lamictal XR)  
 Levetiracetam (Keppra)  
 Lorazepam (Ativan)  
 Midazolam (Versed)  
 Oxcarbazepine (Trileptal)  
 Perampanel (Fycompa)  
 Phenobarbital  
 Phenytoin (Dilantin)  
 Pregabalin (Lyrica)  
 Primidone (Mysoline)  
 Rufinamide (Banzel)  
 Tiagabine (Gabitril)  
 Topiramate (Qudexy XR, Topamax,  
 Trokendi XR)

Valproic acid (Depakene, Depakote)  
 Vigabatrin (Sabril)  
 Zonisamide (Zonegran)

**Esophageal reflux, esophagitis**

Cimetidine (Tagamet)  
 Dexlansoprazole (Dexilant)  
 Esomeprazole (Nexium)  
 Famotidine (Pepcid)  
 Lansoprazole (Prevacid)  
 Nizatidine (Axid)  
 Omeprazole (Prilosec)  
 Pantoprazole (Protonix)  
 Rabeprazole (AcipHex)  
 Ranitidine (Zantac)

**Fever**

Acetaminophen (Tylenol)  
 Aspirin  
 Ibuprofen (Advil, Caldolor, Motrin)  
 Naproxen (Aleve, Anaprox, Naprosyn)

**Fibromyalgia**

Acetaminophen (Tylenol)  
 Amitriptyline (Elavil)  
 Carisoprodol (Soma)  
 Citalopram (Celexa)  
 Cyclobenzaprine (Flexeril)  
 Duloxetine (Cymbalta)  
 Fluoxetine (Prozac)  
 Gabapentin (Neurontin)  
 Milnacipran (Savella)  
 Paroxetine (Paxil)  
 Pregabalin (Lyrica)  
 Tramadol (Ultram)  
 Venlafaxine (Effexor)

**Gastric/duodenal ulcer**

Cimetidine (Tagamet)  
 Esomeprazole (Nexium)  
 Famotidine (Pepcid)  
 Lansoprazole (Prevacid)  
 Nizatidine (Axid)  
 Omeprazole (Prilosec)  
 Pantoprazole (Protonix)  
 Rabeprazole (AcipHex)  
 Ranitidine (Zantac)  
 Sucralfate (Carafate)

**Gastritis**

Cimetidine (Tagamet)

Famotidine (Pepcid)  
 Nizatidine (Axid)  
 Ranitidine (Zantac)

### **Gastroesophageal reflux disease (GERD)**

#### **H<sub>2</sub> receptor antagonists**

Cimetidine (Tagamet HB)  
 Famotidine (Pepcid)  
 Nizatidine  
 Ranitidine (Zantac)

#### **Proton pump inhibitors (PPIs)**

Dexlansoprazole (Dexilant)  
 Esomeprazole (Nexium)  
 Lansoprazole (Prevacid)  
 Omeprazole (Prilosec)  
 Rabeprazole (AcipHex)

### **Glaucoma**

Acetazolamide (Diamox)  
 Apraclonidine (Iopidine)  
 Betaxolol (Betoptic)  
 Bimatoprost (Lumigan, Durysta)  
 Brimonidine (Alphagan)  
 Brinzolamide (Azopt)  
 Carbachol  
 Dorzolamide (Trusopt)  
 Echothiophate iodide (Phospholine)  
 Latanoprost (Xalatan)  
 Levobunolol (Betagan)  
 Pilocarpine (Isopto Carpine)  
 Tafluprost (Zioptan)  
 Timolol (Timoptic)  
 Travoprost (Travatan)  
 Unoprostone (Rescula)

### **Gout**

#### **Anti-inflammatory agents**

Anakinra (Kineret)  
 Canakinumab (Ilaris)  
 Colchicine (Colcris, Mitigare)  
 Ibuprofen (Motrin)  
 Naproxen (Naprosyn)  
 Prednisone

#### **Urate-lowering agents**

Allopurinol (Zyloprim)  
 Febuxostat (Uloric)  
 Probenecid  
 Pegloticase (Krystexxa)

### **Heart failure**

#### **Angiotensin-converting enzyme (ACE) inhibitors**

Captopril  
 Enalapril (Vasotec)  
 Fosinopril  
 Lisinopril (Prinivil, Zestril)  
 Quinapril (Accupril)  
 Ramipril (Altace)

#### **Angiotensin receptor blockers (ARBs)**

Candesartan (Atacand)  
 Losartan (Cozaar)  
 Valsartan (Diovan)

#### **Angiotensin receptor-neprilysin inhibitor**

Sacubitril/valsartan (Entresto)

#### **Beta adrenergic blockers**

Bisoprolol  
 Carvedilol (Coreg)  
 Metoprolol succinate (Toprol XL)

#### **Soluble guanylate cyclase (sGS) inhibitor**

Vericiguat (Verqugo)

#### **Cardiac glycoside**

Digoxin (Digitek, Lanoxin)

#### **Diuretics (loop)**

Bumetanide (Bumex)  
 Furosemide (Lasix)  
 Torsemide (Demadex)

#### **HCN channel blocker**

Ivabradine (Corlanor)

#### **Mineralocorticoid receptor antagonists**

Eplerenone (Inspra)  
 Spironolactone (Aldactone)

#### **SGLT2**

Dapagliflozin (Farxiga)  
 Empagliflozin (Jardiance)

#### **Vasodilators**

Isosorbide/hydralazine (BiDil)  
 Hydralazine (generic)

### **Hepatitis B**

Adefovir (Hepsera)  
 Entecavir (Baraclude)  
 Lamivudine (Epivir)  
 Peginterferon alpha-2a (Pegasys)  
 Telbivudine (Tyzeka)  
 Tenofovir (Viread)

**Hepatitis C**

Daclatasvir (Daklinza)  
 Elbasvir/grazoprevir (Zepatier)  
 Glecaprevir/pibrentasvir (Mavyret)  
 Ledipasvir/sofosbuvir (Harvoni)  
 Ombitasvir/paritaprevir/ritonavir  
 (Technivie)  
 Ombitasvir/paritaprevir/ritonavir/  
 dasabuvir (Viekira Pak)  
 Peginterferon alfa-2a (Pegasys)  
 Peginterferon alfa-2b (Pegintron)  
 Ribavirin (Copegus, Rebetol, Ribasphere)  
 Simeprevir (Olysio)  
 Sofosbuvir (Sovaldi)  
 Sofosbuvir/velpatasvir (Epclusa)  
 Sofosbuvir/velpatasvir/voxilaprevir (Vosevi)

**Human immunodeficiency virus (HIV)**

Abacavir/dolutegravir/lamivudine  
 (Triumeq)  
 Abacavir (Ziagen)  
 Atazanavir (Reyataz)  
 Bictegravir/emtricitabine/tenofovir  
 alafenamide (Biktarvy)  
 Cabotegravir/rilpivirine (Cabenuva)  
 Cobicistat (Tybost)  
 Darunavir (Prezista)  
 Delavirdine (Rescriptor)  
 Didanosine (Videx)  
 Dolutegravir (Tivicay)  
 Dolutegravir/lamivudine (Dovato)  
 Doravirine (Pifeltro)  
 Doravirine/lamivudine/tenofovir  
 (Delstrigo)  
 Efavirenz (Sustiva)  
 Efavirenz/lamivudine/tenofovir  
 disoproxil (Symfi)  
 Elvitegravir (Vitekta)  
 Elvitegravir/cobicistat/emtricitabine,  
 tenofovir (Genova/Stribild)  
 Emtricitabine (Emtriva)  
 Emtricitabine/tenofovir (Truvada)  
 Enfuvirtide (Fuzeon)  
 Etravirine (Intelence)  
 Fosamprenavir (Lexiva)  
 Ibalizumab-uiyk (Trogarzo)  
 Indinavir (Crixivan)  
 Lamivudine (Epivir)  
 Lamivudine/tenofovir (Cimduo)  
 Lopinavir/ritonavir (Kaletra)  
 Maraviroc (Selzentry)

Nelfinavir (Viracept)  
 Nevirapine (Viramune)  
 Raltegravir (Isentress)  
 Rilpivirine (Edurant)  
 Ritonavir (Norvir)  
 Saquinavir (Invirase)  
 Stavudine (Zerit)  
 Tenofovir (Viread)  
 Tesamorelin (Egrifta)  
 Tipranavir (Aptivus)  
 Zidovudine (AZT, Retrovir)

**Hyperphosphatemia**

Aluminum salts  
 Calcium salts  
 Ferric citrate (Auryxia)  
 Lanthanum (Fosrenol)  
 Sevelamer (Renalog)

**Hypertension****Thiazide diuretics**

Hydrochlorothiazide

**Loop diuretics**

Bumetanide (Bumex)  
 Furosemide (Lasix)

**Aldosterone antagonists**

Eplerenone (Inspra)  
 Spironolactone (Aldactone)

**ACE inhibitors**

Benazepril (Lotensin)  
 Enalapril (Vasotec)  
 Lisinopril (Zestril, Prinivil)  
 Quinapril (Accupril)  
 Ramipril (Altace)

**ARBs**

Azilsartan (Edarbi)  
 Candesartan (Atacand)  
 Irbesartan (Avapro)  
 Losartan (Cozaar)  
 Valsartan (Diovan)

**Calcium channel blockers****dihydropyridines**

Amlodipine (Norvasc)  
 Nifedipine (Adalat CC, Procardia XL)

**Nondihydropyridines**

Diltiazem (Cardizem LA, Taztia XT)  
 Verapamil (Calan)

**Beta blockers**

Atenolol (Tenormin)  
 Carvedilol (Coreg, Coreg CR)  
 Labetalol

Metoprolol (Lopressor, Toprol XL)  
Nebivolol (Bystolic)

**Central alpha-adrenergic agonists**

Clonidine (Catapres)

**Direct vasodilators**

Hydralazine (Apresoline)

**Hypertriglyceridemia**

Atorvastatin (Lipitor)  
Colesevelam (Welchol)  
Fenofibrate (Tricor)  
Fluvastatin (Lescol)  
Gemfibrozil (Lopid)  
Icosapent (Vascepa)  
Lovastatin (Mevacor)  
Niacin (Niaspan)  
Omega-3 acid ethyl esters (Lovaza)  
Pravastatin (Pravachol)  
Rosuvastatin (Crestor)  
Simvastatin (Zocor)

**Hyperuricemia**

Allopurinol (Zyloprim)  
Febuxostat (Uloric)  
Pegloticase (Krystexxa)  
Probenecid (Benemid)

**Hypotension**

Dobutamine (Dobutrex)  
Dopamine (Intropin)  
Ephedrine  
Epinephrine  
Norepinephrine (Levophed)  
Phenylephrine (Neo-Synephrine)

**Hypothyroidism**

Levothyroxine (Levoxyl, Synthroid)  
Liothyronine (Cytomel)  
Thyroid

**Idiopathic thrombocytopenic purpura (ITP)**

Cyclophosphamide (Cytoxan)  
Dexamethasone (Decadron)  
Hydrocortisone (Solu-Cortef)  
Immune globulin intravenous  
Methylprednisolone (Solu-Medrol)  
Prednisone  
Rh<sub>0</sub>(D) immune globulin (RhoGAM)  
Rituximab (Rituxan)

**Inflammatory bowel disease (Crohn's disease, ulcerative colitis)**

**Aminosalicylates**

Mesalamine: Oral: (Apriso, Asacol HD, Delzicol, Lialda, Pentasa); Rectal: (Rowasa, Canasa)

**5-ASA pro-drugs**

Balsalazide (Colazal, Giazol)  
Olsalazine (Dipentum)  
Sulfasalazine (Azulfidine)

**Corticosteroids**

Budesonide (Entocort EC, Uceris)  
Hydrocortisone (Colocort, Cortenema)  
Prednisone (Rayos)

**Immunosuppressants**

Azathioprine (Azasan, Imuran)  
Cyclosporine (Sandimmune)  
Mercaptopurine (Purixan)  
Methotrexate (Otrexup, Rasuvo)

**TNF inhibitors**

Adalimumab (Humira)  
Certolizumab pegol (Cimzia)  
Golimumab (Simponi, Simponi Aria)  
Infliximab (Remicade, Inflectra, Renflexis)

**Integrin receptor antagonists**

Natalizumab (Tysabri)  
Vedolizumab (Entyvio)

**Interleukin antagonist**

Ustekinumab (Stelara)

**JAK inhibitor**

Tofacitinib (Xeljanz)

**Insomnia**

**Benzodiazepine receptor agonists**

Eszopiclone (Lunesta)  
Zaleplon (Sonata)  
Zolpidem (Ambien, Zolpimist, Edluar, Intermezzo)

**Benzodiazepines**

Estazolam  
Flurazepam (Dalmane)  
Lorazepam (Ativan)  
Temazepam (Restoril)

**Melatonin receptor agonist**

Ramelteon (Rozerem)

**Orexin receptor antagonist**

Suvorexant (Belsomra)

**Irritable bowel syndrome with constipation**

Chloride channel activator  
lubiprostone (Amitiza)

**Guanylate cyclase-C receptor agonist**

Linaclotide (Linzess)

**Irritable bowel syndrome with diarrhea****Antibiotic**

Rifaximin (Xifaxan)

**Mu-opioid receptor agonist/  
delta-opioid receptor antagonist**

Eluxadoline (Viberzi)

**5-HT modulators**

Alosetron (Lotronex)  
Ondansetron (Zofran)

**Lipid disorders****Statins**

Atorvastatin (Lipitor)  
Fluvastatin (Lescol)  
Lovastatin (Altoprev)  
Pitavastatin (Livalo)  
Pravastatin (Pravachol)  
Rosuvastatin (Crestor)  
Simvastatin (Zocor)

**Cholesterol absorption inhibitor**

Ezetimibe (Zetia)

**PCSK9 inhibitors**

Alirocumab (Praluent)  
Evolocumab (Repatha)

**Bile acid sequestrants**

Colesevelam (Welchol)  
Colestipol (Colestid)  
Cholestyramine (Questran)

**Fibrates**

Gemfibrozil (Lopid)  
Fenofibrate (Lipofen, Lofibra, Tricor,  
Antara, Fibricor, Trilipix)

**Fish oil**

Icosapent ethyl (Vascepa)  
Omega-3 acid ethyl esters (Lovaza)

**Migraine prevention**

Eptinezumab (Vyepti)  
Erenumab-aooe (Aimovig)  
Fremanezumab (Ajovy)  
Galcanezumab-gnlm (Emgality)

**Migraine treatment**

Almotriptan (Axert)  
Dihydroergotamine (DHE 45, Migranal)  
Eletriptan (Relpax)  
Ergotamine/cafeine (Cafergot)  
Frovatriptan (Frova)  
Lasmiditan (Reyvow)  
Naratriptan (Amerge)  
Rimegepant (Nurtec)  
Rizatriptan (Maxalt)  
Sumatriptan (Imitrex)  
Ubrogепant (Ubrolevy)  
Zolmitriptan (Zomig, Zomig-ZMT)

**Multiple sclerosis (MS)**

Alemtuzumab (Lemtrada)  
Cladribine (Mavenclad)  
Daclizumab (Zinbryta)  
Dalfampridine (Ampyra)  
Dimethyl fumarate (Tecfidera)  
Diroximel fumarate (Vumerity)  
Fingolimod (Gilenya)  
Glatiramer (Copaxone)  
Interferon beta-1a (Avonex, Rebif)  
Interferon beta-1b (Betaseron, Extavia)  
Mitoxantrone (Novantrone)  
Natalizumab (Tysabri)  
Ocrelizumab (Ocrevus)  
Ofatumumab (Kesimpta)  
Ozanimod (Zeposia)  
Peginterferon beta-1a (Plegridy)  
Posesimod (Ponvory)  
Rituximab (Rituxan)  
Siponimod (Mayzent)  
Teriflunomide (Aubagio)

**Myelodysplastic syndrome**

Azacitidine (Vidaza)  
Clofarabine (Clolar)  
Decitabine (Dacogen)  
Lenalidomide (Revlimid)

**Myocardial infarction (MI)**

Alteplase (Activase)  
Aspirin  
Atenolol (Tenormin)  
Captopril (Capoten)  
Clopidogrel (Plavix)  
Dalteparin (Fragmin)

Diltiazem (Cardizem, Dilacor)  
 Enalapril (Vasotec)  
 Enoxaparin (Lovenox)  
 Heparin  
 Lidocaine  
 Lisinopril (Prinivil, Zestril)  
 Metoprolol (Lopressor)  
 Morphine  
 Nitroglycerin  
 Propranolol (Inderal)  
 Quinapril (Accupril)  
 Ramipril (Altace)  
 Reteplase (Retavase)  
 Warfarin (Coumadin)

### Nausea

Aprepitant (Emend)  
 Chlorpromazine (Thorazine)  
 Dexamethasone (Decadron)  
 Dimenhydrinate (Dramamine)  
 Dronabinol (Marinol)  
 Droperidol (Inapsine)  
 Fosaprepitant (Emend)  
 Fosnetupitant/palonosetron (Akyzreo)  
 Granisetron (Kytril)  
 Hydroxyzine (Vistaril)  
 Lorazepam (Ativan)  
 Meclizine (Antivert)  
 Metoclopramide (Reglan)  
 Nabilone (Cesamet)  
 Ondansetron (Zofran)  
 Ozanimod (Zeposia)  
 Palonosetron (Aloxi)  
 Prochlorperazine (Compazine)  
 Promethazine (Phenergan)  
 Rolapitant (Varubi)

### Obsessive-compulsive disorder (OCD)

Citalopram (Celexa)  
 Clomipramine (Anafranil)  
 Escitalopram (Lexapro)  
 Fluoxetine (Prozac)  
 Fluvoxamine (Luvox)  
 Paroxetine (Paxil)  
 Sertraline (Zoloft)

### Organ transplant, rejection prophylaxis

Azathioprine (Imuran)  
 Basiliximab (Simulect)

Belatacept (Nulojix)  
 Cyclophosphamide (Cytoxan, Neosar)  
 Cyclosporine (Sandimmune)  
 Daclizumab (Zenapax)  
 Everolimus (Zortress)  
 Mycophenolate (CellCept)  
 Sirolimus (Rapamune)  
 Tacrolimus (Prograf)

### Osteoarthritis

Acetaminophen (Tylenol)  
 Celecoxib (Celebrex)  
 Diclofenac (Cataflam, Pennsaid, Voltaren)  
 Duloxetine (Cymbalta)  
 Etodolac (Lodine)  
 Flurbiprofen (Ansaid)  
 Ibuprofen (Motrin)  
 Ketoprofen (Orudis)  
 Meloxicam (Mobic)  
 Nabumetone (Relafen)  
 Naproxen (Naprosyn)  
 Sulindac (Clinoril)  
 Tramadol (Ultram)

### Osteoporosis

#### Bisphosphonates

Alendronate (Binosto, Fosamax)  
 Ibandronate (Boniva)  
 Risedronate (Actonel, Atelvia)  
 Zoledronic acid (Reclast)

#### Anti-RANK ligand antibody

Denosumab (Prolia)

#### Parathyroid hormone receptor agonists

Abaloparatide (Tymlos)  
 Teriparatide (Forteo)

#### Sclerostin inhibitor

Romosozumab (Evenity)

#### Selective estrogen receptor modulator (SERM)

Raloxifene  
 Conjugated estrogens/bazedoxifene (Duavee)

#### Calcitonin

Miacalcin injection  
 Nasal spray (generic)

### Paget's disease

Alendronate (Fosamax)  
 Calcitonin (Miacalcin)  
 Etidronate (Didronel)

Pamidronate (Aredia)  
Risedronate (Actonel)  
Tiludronate (Skelid)  
Zoledronic acid (Reclast)

**Pain, mild to moderate**

Acetaminophen (Tylenol)  
Aspirin  
Celecoxib (Celebrex)  
Codeine  
Diclofenac (Cataflam, Voltaren, Zipsor)  
Diflunisal (Dolobid)  
Etodolac (Lodine)  
Flurbiprofen (Ansaid)  
Ibuprofen (Advil, Caldolor, Motrin)  
Ketorolac (Toradol)  
Naproxen (Anaprox, Naprosyn)  
Salsalate (Disalcid)  
Tramadol (Ultram)

**Pain, moderate to severe**

Butorphanol (Stadol)  
Fentanyl (Onsolis, Sublimaze)  
Hydromorphone (Dilaudid)  
Methadone (Dolophine)  
Morphine (MS Contin)  
Morphine/naltrexone (Embeda)  
Nalbuphine (Nubain)  
Oxycodone (OxyFast, Roxicodone)  
Oxymorphone (Opana)  
Ziconotide (Prialt)

**Panic attack disorder**

Alprazolam (Xanax)  
Clonazepam (Klonopin)  
Paroxetine (Paxil)  
Sertraline (Zoloft)  
Venlafaxine (Effexor)

**Parkinson's disease**

**Adenosine A Receptor Antagonist**

Istradefylline (Nourianz)

**Carbidopa/levodopa**

Immediate-release (Sinemet)  
Orally disintegrating  
Sustained-release (Sinemet CR)  
Extended-release (Rytary)  
Intrajejunal infusion (Duopa)

**Dopamine agonists**

Apomorphine (Apokyn, Kynmobi)

Pramipexole (Mirapex)  
Ropinirole (Requip)  
Rotigotine (Neupro)

**COMT inhibitors**

Entacapone (Comtan)  
Opicapone (Ongentys)  
Tolcapone (Tasmar)

**MAO-B inhibitors**

Rasagiline (Azilect)  
Safinamide (Xadago)  
Selegiline (Eldepryl, Zelapar)

**Peptic ulcer disease**

**H<sub>2</sub> receptor antagonists**

Cimetidine (Tagamet HB)  
Famotidine (Pepcid)  
Nizatidine  
Ranitidine (Zantac)

**Proton pump inhibitors (PPIs)**

Dexlansoprazole (Dexilant)  
Esomeprazole (Nexium)  
Lansoprazole (Prevacid)  
Omeprazole (Prilosec)  
Rabeprazole (AcipHex)

**Pneumonia**

Amoxicillin (Amoxil)  
Amoxicillin/clavulanate (Augmentin)  
Ampicillin (Polycillin)  
Azithromycin (Zithromax)  
Cefaclor (Ceclor)  
Cefpodoxime (Vantin)  
Ceftriaxone (Rocephin)  
Cefuroxime (Kefurox, Zinacef)  
Clarithromycin (Biaxin)  
Co-trimoxazole (Bactrim, Septra)  
Erythromycin  
Gentamicin (Garamycin)  
Levofloxacin (Levaquin)  
Linezolid (Zyvox)  
Moxifloxacin (Avelox)  
Piperacillin/tazobactam (Zosyn)  
Tobramycin (Nebcin)  
Vancomycin (Vancocin)

**Pneumonia, *pneumocystis jirovecii***

Atovaquone (Mepron)  
Clindamycin (Cleocin)  
Co-trimoxazole (Bactrim, Septra)  
Pentamidine (Pentam)  
Trimethoprim (Proloprim)

**Post-traumatic stress disorder (PTSD)**

Amitriptyline (Elavil)  
 Aripiprazole (Abilify)  
 Citalopram (Celexa)  
 Escitalopram (Lexapro)  
 Fluoxetine (Prozac)  
 Imipramine (Tofranil)  
 Lamotrigine (Lamictal)  
 Olanzapine (Zyprexa)  
 Paroxetine (Paxil)  
 Phenelzine (Nardil)  
 Prazosin (Minipress)  
 Propranolol (Inderal)  
 Quetiapine (Seroquel)  
 Risperidone (Risperdal)  
 Sertraline (Zoloft)  
 Topiramate (Topamax)  
 Valproic acid (Depakote)  
 Venlafaxine (Effexor)  
 Ziprasidone (Geodon)

**Pruritus**

Amcinonide (Cyclocort)  
 Cetirizine (Zyrtec)  
 Clemastine (Tavist)  
 Clobetasol (Temovate)  
 Cyproheptadine (Periactin)  
 Desloratadine (Clarinex)  
 Desonide (Tridesilon)  
 Desoximetasone (Topicort)  
 Diphenhydramine (Benadryl)  
 Fluocinolone (Synalar)  
 Fluocinonide (Lidex)  
 Halobetasol (Ultravate)  
 Hydrocortisone (Cort-Dome, Hytone)  
 Hydroxyzine (Atarax, Vistaril)  
 Prednisolone (Prelone)  
 Prednisone (Deltasone)  
 Promethazine (Phenergan)

**Psoriasis****Vitamin D analogs**

Calcipotriene (Dovonex, Sorilux)  
 Calcitriol (Vectical)

**Retinoids**

Acitretin (Soriatane)  
 Tazarotene (Tazorac)

**Phosphodiesterase 4 (PDE4) inhibitor**

Apremilast (Otezla)

**Immunosuppressants**

Cyclosporine (Neoral)  
 Methotrexate (Otrexup, Rasuvo)

**TNF inhibitors**

Adalimumab (Humira)  
 Certolizumab pegol (Cimzia)  
 Etanercept (Enbrel)  
 Infliximab (Remicade, Inflectra, Renflexis)

**IL 12-23 antagonist**

Ustekinumab (Stelara)

**IL 17A antagonists**

Brodalumab (Siliq)  
 Ixekizumab (Taltz)  
 Secukinumab (Cosentyx)

**IL 23 antagonists**

Guselkumab (Tremfya)  
 Risankizumab (Skyrizi)  
 Tildrakizumab (Ilumya)

**Psychotic disorders**

Aripiprazole (Abilify)  
 Asenapine (Saphris)  
 Brexpiprazole (Rexulti)  
 Cariprazine (Vraylar)  
 Chlorpromazine (Thorazine)  
 Clozapine (Clozaril)  
 Fluphenazine (Prolixin)  
 Haloperidol (Haldol)  
 Iloperidone (Fanapt)  
 Loxapine (Adasuve)  
 Lumateperone (Caplyta)  
 Lurasidone (Latuda)  
 Olanzapine (Zyprexa, Zyprexa Zydis)  
 Paliperidone (Invega)  
 Pimavanserin (Nuplazid)  
 Quetiapine (Seroquel, Seroquel XR)  
 Risperidone (Risperdal)  
 Thioridazine (Mellaril)  
 Thiothixene (Navane)  
 Ziprasidone (Geodon)

**Pulmonary arterial hypertension**

Ambrisentan (Letairis)  
 Bosentan (Tracleer)  
 Epoprostenol (Flolan)  
 Iloprost (Ventavis)  
 Macitentan (Opsumit)  
 Riociguat (Adempas)  
 Selexipag (Uptravi)  
 Sildenafil (Revatio)

Tadalafil (Adcirca)  
 Treprostinil (Remodulin, Tyvaso)

**Respiratory distress syndrome (RDS)**

Beractant (Survanta)  
 Calfactant (Infasurf)  
 Poractant alfa (Curosurf)

**Restless legs syndrome**

Cabergoline (Dostinex)  
 Carbamazepine (Tegretol)  
 Carbidopa/levodopa (Sinemet)  
 Clonazepam (Klonopin)  
 Gabapentin (Horizant, Neurontin)  
 Levodopa  
 Pramipexole (Mirapex)  
 Pregabalin (Lyrica)  
 Ropinirole (Requip)  
 Rotigotine (Neupro)

**Schizophrenia**

Aripiprazole (Abilify)  
 Asenapine (Saphris, Secuado)  
 Brexpiprazole (Rexulti)  
 Cariprazine (Vraylar)  
 Chlorpromazine (Thorazine)  
 Clozapine (Clozaril)  
 Fluphenazine (Prolixin)  
 Haloperidol (Haldol)  
 Iloperidone (Fanapt)  
 Lumateperone (Caplyta)  
 Lurasidone (Latuda)  
 Olanzapine (Zyprexa, Zyprexa Zydis)  
 Paliperidone (Invega, Invega Sustenna)  
 Quetiapine (Seroquel, Seroquel XR)  
 Risperidone (Risperdal)  
 Thioridazine (Mellaril)  
 Thiothixene (Navane)  
 Ziprasidone (Geodon)

**Smoking cessation**

Bupropion (Zyban)  
 Nicotine (NicoDerm, Nicotrol)  
 Varenicline (Chantix)

**Thrombosis**

Apixaban (Eliquis)  
 Dalteparin (Fragmin)  
 Edoxaban (Savaysa)  
 Enoxaparin (Lovenox)

Fondaparinux (Arixtra)  
 Heparin  
 Tinzaparin (Innohep)  
 Warfarin (Coumadin)

**Thyroid disorders**

Levothyroxine (Levoxyl, Synthroid)  
 Liothyronine (Cytomel)  
 Thyroid

**Transient ischemic attack (TIA)**

Aspirin  
 Clopidogrel (Plavix)  
 Prasugrel (Effient)  
 Warfarin (Coumadin)

**Tremor**

Atenolol (Tenormin)  
 Chlordiazepoxide (Librium)  
 Diazepam (Valium)  
 Lorazepam (Ativan)  
 Metoprolol (Lopressor)  
 Nadolol (Corgard)  
 Propranolol (Inderal)

**Tuberculosis (TB)**

Bedaquiline (Sirturo)  
 Cycloserine (Seromycin)  
 Ethambutol (Myambutol)  
 Isoniazid (INH)  
 Pyrazinamide  
 Rifabutin (Mycobutin)  
 Rifampin (Rifadin)  
 Rifapentine (Priftin)

**Urticaria**

Cetirizine (Zyrtec)  
 Cimetidine (Tagamet)  
 Clemastine (Tavist)  
 Cyproheptadine (Periactin)  
 Diphenhydramine (Benadryl)  
 Hydroxyzine (Atarax, Vistaril)  
 Loratadine (Claritin)  
 Promethazine (Phenergan)  
 Ranitidine (Zantac)

**Vertigo**

Dimenhydrinate (Dramamine)  
 Diphenhydramine (Benadryl)  
 Meclizine (Antivert)  
 Scopolamine (Trans-Derm Scop)

**Vomiting**

Aprepitant (Emed)  
 Chlorpromazine (Thorazine)  
 Dexamethasone (Decadron)  
 Dimenhydrinate (Dramamine)  
 Dronabinol (Marinol)  
 Droperidol (Inapsine)  
 Fosaprepitant (Emed)  
 Granisetron (Kytril)  
 Hydroxyzine (Vistaril)  
 Lorazepam (Ativan)  
 Meclizine (Antivert)  
 Metoclopramide (Reglan)  
 Nabilone (Cesamet)  
 Ondansetron (Zofran)  
 Palonosetron (Aloxi)  
 Prochlorperazine (Compazine)  
 Promethazine (Phenergan)  
 Rolapitant (Varubi)  
 Scopolamine (Trans-Derm Scop)  
 Trimethobenzamide (Tigan)

**Weight management****Sympathomimetic amines**

Benzphetamine  
 Diethylpropion

Phendimetrazine

Phentermine (Adipex, Lomaira)

Phentermine/topiramate (Qsymia)

**Hydrogel**

Gelesis (Plenity)

**Lipase inhibitor**

Orlistat (Alli, Xenical)

**Serotonin receptor agonist**

Lorcaserin (Belviq)

**Opioid antagonist/antidepressant**

Naltrexone/bupropion (Contrave)

**GLP-1 receptor agonist**

Liraglutide (Saxenda)

Semaglutide (Wegovy)

**Zollinger-Ellison syndrome**

Aluminum salts

Cimetidine (Tagamet)

Esomeprazole (Nexium)

Famotidine (Pepcid)

Lansoprazole (Prevacid)

Omeprazole (Prilosec)

Pantoprazole (Protonix)

Rabeprazole (AcipHex)

Ranitidine (Zantac)

# DRUG CLASSIFICATION CONTENTS

Alzheimer's disease agents	beta-adrenergic blockers
angiotensin-converting enzyme (ACE) inhibitors	calcium channel blockers
angiotensin II receptor antagonists	chemotherapeutic agents
antianxiety agents	contraception
antiarrhythmics	corticosteroids
antibiotics	diuretics
antibiotic: aminoglycosides	H <sub>2</sub> antagonists
antibiotic: carbapenems	hepatitis C virus infection
antibiotic: cephalosporins	hormones
antibiotic: fluoroquinolones	human immunodeficiency virus (HIV) infection
antibiotic: macrolides	immunosuppressive agents
antibiotic: penicillins	laxatives
anticoagulants/antiplatelets/thrombolytics	multiple sclerosis
anticonvulsants	nonsteroidal anti-inflammatory drugs (NSAIDs)
antidepressants	nutrition: enteral
antidiabetics	nutrition: parenteral
antidiarrheals	obesity management
antifungals: systemic mycoses	osteoporosis
antiglaucoma agents	Parkinson's disease treatment
antihistamines	proton pump inhibitors
antihyperlipidemics	rheumatoid arthritis
antihypertensives	rhinitis preparations
antimigraine	sedative-hypnotics
antipsychotics	skeletal muscle relaxants
antivirals	smoking cessation agents
asthma/COPD	vitamins

## Alzheimer's Disease

Dementia is a general term used describing a decline in mental ability that is severe enough to interfere with the function of daily living. Alzheimer's disease (AD) is the most common cause of dementia. Cognitive loss in AD is associated with depletion of acetylcholine (involved with learning and memory). AD is confirmed only at autopsy and is characterized by the presence of beta-amyloid plaques on the outer portions of neurons.

Currently, two classes of medications are used as therapies for AD, *acetylcholinesterase inhibitors (AChEIs)* and an *N-methyl-D-aspartate (NMDA) receptor antagonist*.

AChEIs increase the concentration of acetylcholine and may have beneficial effects on dementia. NMDA receptor antagonist mechanism of action is unclear, but may reduce glutamatergic overstimulation at the NMDA receptor, which may have symptomatic benefits on dementia.

### ACETYLCHOLINESTERASE INHIBITORS

Name	Uses	Availability	Dose/Titration	Adverse Effects
<b>Donepezil (Aricept, Aricept ODT)</b>	Mild, moderate, severe AD	<b>T:</b> 5 mg, 10 mg, 23 mg <b>ODT:</b> 5 mg, 10 mg	Initially, 5 mg once daily, may increase to 10 mg once daily after 4–6 wks. After 3 months, if suboptimal response, may increase to 23 mg once daily	Nausea, vomiting, abdominal cramping, diarrhea, bradycardia, syncope
<b>Galantamine (Razadyne, Razadyne ER)</b>	Mild, moderate AD	<b>T:</b> 4 mg, 8 mg, 12 mg <b>OS:</b> 4 mg/mL <b>ER:</b> 8 mg, 16 mg, 24 mg	<b>T, OS:</b> Initially, 4 mg bid; may increase to 8 mg bid after 4 wks, then to 12 mg bid after additional 4 wks <b>ER:</b> Initially, 8 mg once daily, may increase to 16 mg once daily after 4 wks, then to 24 mg once daily after additional 4 wks	Nausea, vomiting, diarrhea, weight loss, decreased appetite, syncope

Name	Uses	Availability	Dose/Titration	Adverse Effects
<b>Rivastigmine (Exelon, Exelon Patch)</b>	Mild, moderate AD Patch also approved for severe AD	<b>C:</b> 1.5 mg, 3 mg, 4.5 mg, 6 mg <b>OS:</b> 2 mg/mL <b>PATCH:</b> 4.6 mg/24 hrs, 9.5 mg/24 hrs, 13.3 mg/24 hrs	<b>C, OS:</b> Initially, 1.5 mg bid, may increase in increments of 1.5 mg bid every 2 wks up to 6 mg bid	Nausea, vomiting, abdominal cramping, diarrhea, bradycardia, syncope, loss of appetite, weight loss

### NMDA Receptor Antagonist

<b>Memantine (Namenda, Namenda XR)</b>	Moderate, severe AD	<b>T:</b> 5 mg, 10 mg <b>OS:</b> 2 mg/mL <b>XR:</b> 7 mg, 14 mg, 21 mg, 28 mg	<b>T, OS:</b> Initially, 5 mg once daily, may increase in increments of 5 mg/wk up to 10 mg bid	Dizziness, headache, diarrhea, constipation, confusion
--	---------------------	---	---	--

### NMDA Receptor Antagonist/ Acetylcholinesterase Inhibitor

<b>Memantine/donepezil (Namzaric)</b>	Moderate, severe AD	<b>ER:</b> 14/10 mg, 28/10 mg	<b>14/10 mg:</b> Once/d in evening in patients previously stabilized on memantine 5 mg bid or 14 mg once daily and donepezil 10 mg once/d <b>28/10 mg:</b> Once daily in evening in patients previously stabilized on memantine 10 mg bid or 28 mg once daily and donepezil 10 mg once daily	Refer to individual agents for adverse effects
---------------------------------------	---------------------	-------------------------------	---	--

### Amyloid Beta-Directed Monoclonal Antibody

<b>Aducanumab-avwa (Aduhelm)</b>	Moderate, severe AD	<b>IV:</b> 170 mg/1.7 mL, 300 mg/3 mL	<b>IV (q4wks)</b> 1mg/kg (first 2 infusions) 3 mg/kg (3 and 4) 6 mg/kg (5 and 6) 10 mg/kg thereafter	Cerebral edema, microhemorrhages, superficial siderosis
----------------------------------	---------------------	---------------------------------------	--	---

**C:** Capsule, **ER:** extended-release, **OS:** oral solution, **T:** tablet, **XR:** extended-release

## Angiotensin-Converting Enzyme (ACE) Inhibitors

### USES

Treatment of hypertension (HTN), adjunctive therapy for heart failure (HF).

### ACTION

*Antihypertensive:* Inhibits angiotensin-converting enzyme (ACE). ACE catalyzes conversion of angiotensin I to angiotensin II, a potent vasoconstrictor that also stimulates aldosterone secretion by adrenal cortex. Beneficial effects in HTN/HF appear to be suppression of the renin-angiotensin-aldosterone system. Reduces peripheral arterial resistance.

*HF:* Decreases peripheral vascular resistance (afterload), pulmonary capillary wedge pressure (pre-load); improves cardiac output, exercise tolerance.

### ACE INHIBITORS

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
<b>Benazepril (Lotensin)</b>	T: 5 mg, 10 mg, 20 mg, 40 mg	HTN	<b>HTN:</b> Initially, 10 mg/day. Usual dose: 20–80 mg once daily or divided bid	<b>Class Effects</b> Cough, hypotension, rash, acute renal failure (in pts with renal artery stenosis), angioedema, hyperkalemia, mild-moderate loss of taste, hepatotoxicity, pancreatitis, blood dyscrasias, renal damage
<b>Captopril (Capoten)</b>	T: 12.5 mg, 25 mg, 50 mg, 100 mg	HTN HF	<b>HTN:</b> Initially, 12.5–25 mg 2–3 times/day. Usual dose: 50–100 mg 2 times/day <b>HF:</b> Initially, 6.25 mg 3 times/day. Target: 50 mg 3 times/day	
<b>Enalapril (Vasotec)</b>	T: 2.5 mg, 5 mg, 10 mg, 20 mg IV: 1.25 mg/mL	HTN HF	<b>HTN:</b> Initially, 2.5–5 mg/day; may increase at 1–2 wk intervals. Usual dose: 5–40 mg once/d or divided bid <b>HF:</b> Initially, 2.5 mg 2 times/day, may increase at 1–2 wk intervals. Target: 10 mg bid	
<b>Fosinopril (Monopril)</b>	T: 10 mg, 20 mg, 40 mg	HTN HF	<b>HTN:</b> Initially, 10 mg/day Usual dose: 10–80 mg once daily <b>HF:</b> Initially, 5–10 mg once daily Target: 40 mg once daily	

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
<b>Lisinopril (Prinivil, Zestril)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg, 20 mg, 40 mg	HTN HF	<b>HTN:</b> Initially, 5–10 mg/day. Usual dose: 10–40 mg once daily <b>HF:</b> Initially, 2.5–5 mg once daily. Target: 40 mg once daily	
<b>Moexipril (Univasc)</b>	<b>T:</b> 7.5 mg, 15 mg	HTN	<b>HTN:</b> Initially, 3.75–7.5 mg/day. Usual dose: 7.5–30 mg/day in 1–2 divided doses	
<b>Perindopril (Aceon)</b>	<b>T:</b> 2 mg, 4 mg, 6 mg	HTN	<b>HTN:</b> Initially, 4 mg/day. May increase at 1–2 wk intervals. Usual dose: 4–8 mg once daily or divided bid	
<b>Quinapril (Accupril)</b>	<b>T:</b> 5 mg, 10 mg, 20 mg, 40 mg	HTN HF	<b>HTN:</b> Initially, 10–20 mg once daily. Usual dose: 10–40 mg once daily or divided bid <b>HF:</b> Initially, 5 mg 2 times/day. Titrate to 20–40 mg/day in 2 divided doses	
<b>Ramipril (Altace)</b>	<b>C:</b> 1.25 mg, 2.5 mg, 5 mg, 10 mg	HTN HF	<b>HTN:</b> Initially, 2.5 mg once daily. Usual dose: 2.5–20 mg once daily or divided bid <b>HF:</b> Initially, 1.25–2.5 mg once daily. Target: 10 mg once daily	
<b>Trandolapril (Mavik)</b>	<b>T:</b> 1 mg, 2 mg, 4 mg	HTN HF	<b>HTN:</b> Initially, 1–2 mg once daily. Usual dose: 2–8 mg once daily or divided bid <b>HF:</b> Initially, 1 mg once daily. Target: 4 mg once daily	

*C*, Capsules; *HF*, heart failure; *HTN*, hypertension; *T*, tablets.

## Angiotensin II Receptor Antagonists

### USES

Treatment of hypertension (HTN) alone or in combination with other antihypertensives. Treatment of heart failure (HF).

### ACTION

Angiotensin II receptor antagonists (AIIRA) block vasoconstrictor and aldosterone-secreting effects on angiotensin II by selectively blocking the binding of angiotensin

II to AT<sub>1</sub> receptors in vascular smooth muscle and the adrenal gland, causing vasodilation and a decrease in aldosterone effects.

### ANGIOTENSIN II RECEPTOR ANTAGONISTS

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
<b>Azilsartan (Edarbi)</b>	T: 40 mg, 80 mg	HTN	40–80 mg once daily	<b>Class Effects</b> Hypotension, rash, acute renal failure (in pts with renal artery stenosis), hyperkalemia, mild-moderate loss of taste, hepatotoxicity, pancreatitis, blood dyscrasias, renal damage
<b>Candesartan (Atacand)</b>	T: 4 mg, 8 mg, 16 mg, 32 mg	HTN, HF	<b>HTN:</b> Initially, 16 mg once daily. Usual dose: 8–32 mg in 1–2 divided doses. <b>HF:</b> Initially, 4–8 mg once daily. Double dose at 2 wk intervals. Target: 32 mg once daily	
<b>Eprosartan (Teveten)</b>	T: 400 mg, 600 mg	HTN	Initially, 600 mg/day. Usual dose: 600 mg once daily	
<b>Irbesartan (Avapro)</b>	T: 75 mg, 150 mg, 300 mg	HTN Nephropathy	150–300 mg once daily 300 mg once daily	
<b>Losartan (Cozaar)</b>	T: 25 mg, 50 mg, 100 mg	HTN Nephropathy HF	Initially, 50 mg once daily. Usual dose: 25–100 mg/once daily or divided bid Initially, 50 mg/day; may increase to 100 mg/day Initially, 25–50 mg once daily. Target: 150 mg once daily	
<b>Olmесartan (Benicar)</b>	T: 5 mg, 20 mg, 40 mg	HTN	Initially, 20 mg once daily. May increase to 40 mg once daily after 2 wks	

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
<b>Telmisartan (Micardis)</b>	<b>T:</b> 40 mg, 80 mg	HTN CV risk reduction	Initially, 40 mg once daily. Usual dose: 40–80 mg once daily. 80 mg once daily	
<b>Valsartan (Diovan)</b>	<b>T:</b> 80 mg, 160 mg	HTN  HF  Post MI	Initially, 80 or 160 mg once daily. Usual dose: 80–320 mg once daily Initially, 20–40 mg 2 times/day. Titrate to 80–160 mg 2 times/day Initially, 20 mg 2 times/day. Titrate to target of 160 mg 2 times/day	

**CV**, Cardiovascular; **HF**, heart failure; **HTN**, hypertension; **MI**, myocardial infarction; **T**, tablets.

## Antianxiety Agents

### USES

Anxiety disorders are the most common form of psychiatric illness and include generalized anxiety disorder (GAD), panic disorder, obsessive-compulsive disorder (OCD), social anxiety disorder (SAD), post-traumatic stress disorder (PTSD), and acute stress

disorder. Treatment options for anxiety disorders include pharmacotherapy and psychological therapy (e.g., behavioral therapy). A selective serotonin reuptake inhibitor (SSRI) or a serotonin norepinephrine reuptake inhibitor (SNRI) is generally used for initial

treatment. Benzodiazepines can provide immediate relief of anxiety symptoms and are often used as adjuncts to SSRIs and SNRIs (see classification Antidepressants for SSRI and SNRI charts).

### ACTION

**Benzodiazepines:** The exact mechanism is unknown, but they may increase the inhibiting effect of gamma-

aminobutyric acid (GABA), which inhibits nerve impulse transmission by binding to specific benzodiaz-

epine receptors in various areas of the central nervous system (CNS).

## ANTIANXIETY AGENTS

Name	Availability	Uses	Dosage	Side Effects
<b>Benzodiazepine</b>				
<b>Alprazolam (Xanax)</b>	<b>T:</b> 0.25 mg, 0.5 mg, 1 mg, 2 mg <b>S:</b> 1 mg/ml <b>ER:</b> 0.5 mg, 1 mg, 2 mg, 3 mg <b>ODT:</b> 0.25 mg, 0.5 mg, 1 mg, 2 mg	Anxiety, panic disorder	Initially, 0.25–0.5 mg 3 times/day. May increase every 3–4 days. <b>Maximum:</b> 4 mg/day	Drowsiness, weakness, fatigue, ataxia, slurred speech, confusion, lack of coordination, impaired memory, paradoxical agitation, dizziness, nausea
<b>Clonazepam (Klonopin)</b>	<b>T:</b> 0.5 mg, 1 mg, 2 mg <b>ODT:</b> 0.125, 0.25, 0.5, 1, 2 mg	Anxiety, panic disorder	Anxiety: 1–4 mg divided bid	Drowsiness, ataxia, behavioral disturbances
<b>Clorazepate (Tranxene)</b>	<b>T:</b> 3.75 mg, 7.5 mg, 15 mg <b>SD:</b> 11.25 mg, 22.5 mg	Anxiety, alcohol withdrawal, anticonvulsant	7.5–15 mg 2–4 times/day	Hypotension, drowsiness, fatigue, ataxia, memory impairment, headache, nausea
<b>Diazepam (Valium)</b>	<b>T:</b> 2 mg, 5 mg, 10 mg <b>S:</b> 5 mg/5 mL <b>I:</b> 5 mg/mL	Anxiety, alcohol withdrawal, anticonvulsant, muscle relaxant	2–10 mg, 2–4 times/day	Hypotension, ataxia, drowsiness, fatigue, vertigo
<b>Lorazepam (Ativan)</b>	<b>T:</b> 0.5 mg, 1 mg, 2 mg <b>S:</b> 2 mg/mL <b>I:</b> 2 mg/mL, 4 mg/mL	Anxiety, alcohol withdrawal	Initially, 2–3 mg/day in 2–3 divided doses. Usual dose: 2–6 mg/day in divided doses	Sedation, respiratory depression, ataxia, dizziness, headache

## Nonbenzodiazepine

<b>Buspirone (BuSpar)</b>	<b>T:</b> 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg	Anxiety	Initially, 7.5 mg 2 times/day. May increase every 2–3 days by 2.5 mg bid. <b>Maximum:</b> 30 mg 2 times/day	Dizziness, light-headedness, headaches, nausea, restlessness
<b>Hydroxyzine (Atarax, Vistaril)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg <b>C:</b> 25 mg, 50 mg, 100 mg <b>S:</b> 10 mg/5 mL	Anxiety	50–100 mg 4 times/day	Drowsiness; dry mouth, nose, and throat

**C**, Capsules; **CR**, controlled-release; **ER**, extended-release; **I**, injection; **ODT**, orally disintegrating tablet; **S**, solution; **SD**, single dose; **T**, tablets.

# Antiarrhythmics

## USES

Prevention and treatment of cardiac arrhythmias, such as premature ventricular contractions, ventricular tachycardia, premature atrial contractions, paroxysmal atrial tachycardia, atrial fibrillation, and flutter.

## ACTION

The antiarrhythmics are divided into four classes based on their effects on certain ion channels and/or receptors located on the myocardial cell membrane. Class I is further divided into three subclasses (IA, IB, IC) based on electrophysiologic effects.

*Class I:* Blocks cardiac sodium channels and slows conduction velocity, prolonging refractory period, and decreasing automaticity of sodium-dependent tissue.

*Class IA:* Blocks sodium and potassium channels.

*Class IB:* Shortens the repolarization phase.

*Class IC:* Slows conduction velocity; no effect on repolarization phase.

*Class II:* Slows sinus and atrioventricular (AV) nodal conduction.

*Class III:* Blocks cardiac potassium channels, prolonging the repolarization phase of electrical cells.

*Class IV:* Inhibits the influx of calcium through its channels, causing slower conduction through the sinus and AV nodes; decreases contractility.

## ANTIARRHYTHMICS

Name	Availability	Uses	Dosage Range	Side Effects
<b>Class IA</b>				
<b>Disopyramide (Norpace, Norpace CR)</b>	<b>C:</b> 100 mg, 150 mg <b>C (ER):</b> 100 mg, 150 mg	AF, WPW, PSVT, PVCs, VT	<b>C:</b> 100–200 mg q6h <b>ER:</b> 200–400 mg q12h	Dry mouth, blurred vision, urinary retention, HF, proarrhythmia, heart block, nausea, vomiting, diarrhea, hypoglycemia, nervousness
<b>Procainamide (Procan-SR, Pronestyl)</b>	<b>I:</b> 100 mg/mL, 500 mg/mL	AF, WPW, PVCs, VT	Loading dose: 15–18 mg/kg over 20–30 min. Maintenance dose: 1–4 mg/min as a continuous infusion	Hypotension, fever, agranulocytosis, SLE, headaches, proarrhythmia, confusion, disorientation, GI symptoms, hypotension

<b>Quinidine (Quinaglute, Quinidex)</b>	<b>T:</b> 200 mg, 300 mg <b>T (ER):</b> 300 mg, 324 mg <b>I:</b> 80 mg/mL	AF, WPW, PVCs, VT	<b>A (PO):</b> 400 mg q6h. <b>(ER):</b> 300 mg q8–12h or 648 mg q8h	Diarrhea, hypotension, nausea, vomiting, cinchonism, fever, bitter taste, heart block, thrombocytopenia, proarrhythmia
---	---	-------------------	--	--

### Class IB

<b>Lidocaine (Xylocaine)</b>	<b>I:</b> 300 mg for IM <b>IV Infusion:</b> 2 mg/mL, 4 mg/mL	PVCs, VT, VF	<b>IV:</b> Initially, 1–1.5 mg/kg. May repeat 0.5–0.75 mg/kg q5–10 min. <b>Maximum cumulative dose:</b> 3 mg/kg, then 1–4 mg/min infusion	Drowsiness, agitation, muscle twitching, seizures, paresthesia, proarrhythmia, slurred speech, tinnitus, cardiac depression, bradycardia, asystole
<b>Mexiletine (Mexitol)</b>	<b>C:</b> 150 mg, 200 mg, 250 mg	PVCs, VT, VF	<b>A:</b> Initially, 200 mg q8h. Adjust every 2–3 days in 50–100 mg increments. <b>Maximum:</b> 1,200 mg/day	Drowsiness, agitation, muscle twitching, seizures, paresthesia, proarrhythmia, nausea, vomiting, blood dyscrasias, hepatitis, fever

### Class IC

<b>Flecainide (Tambacor)</b>	<b>T:</b> 50 mg, 100 mg, 150 mg	AF, PSVT, life-threatening ventricular arrhythmias	<b>A:</b> Initially, 100 mg q12h. May increase by 50 mg q12h at 4 day intervals. <b>Maximum:</b> 400 mg/day	Dizziness, tremors, bradycardia, heart block, HF, GI upset, neutropenia, flushing, blurred vision, metallic taste, proarrhythmia
<b>Propafenone (Rythmol)</b>	<b>T:</b> 150 mg, 225 mg, 300 mg <b>ER:</b> 225 mg, 325 mg, 425 mg	PAF, WPW, life-threatening ventricular arrhythmias	<b>A: T:</b> Initially, 150 mg q8h. May increase at 3–4 day intervals up to 300 mg q8h <b>ER:</b> Initially, 225 mg q12h. May increase at a minimum of 5 days up to 425 mg q12h	Dizziness, blurred vision, altered taste, nausea, exacerbation of asthma, proarrhythmia, bradycardia, heart block, HF, GI upset, bronchospasm, hepatotoxicity

*Continued*

## ANTIARRHYTHMICS—cont'd

Name	Availability	Uses	Dosage Range	Side Effects
<b>Class II (Beta-Blockers)</b>				
<b>Acebutolol (Sectral)</b>	<b>C:</b> 100 mg, 200 mg, 400 mg	Ventricular arrhythmias	<b>A:</b> Initially, 200 mg 2 times/day Maintenance: 600–1200 mg/day in divided doses	Bradycardia, hypotension, depression, nightmares, fatigue, sexual dysfunction, SLE, arthritis, myalgia
<b>Esmolol (Brevibloc)</b>	<b>I:</b> 10 mg/mL	Supraventricular tachycardia	<b>A:</b> 50–200 mcg/kg/min	Hypotension, heart block, HF, bronchospasm
<b>Propranolol (Inderal)</b>	<b>T:</b> 10 mg, 20 mg, 40 mg	Tachyarrhythmias	<b>A:</b> Initially, 10–30 mg 3–4 times/day Maintenance: 10–40 mg 3–4 times/day	Bradycardia, hypotension, depression, nightmares, fatigue, sexual dysfunction, heart block, bronchospasm
<b>Class III</b>				
<b>Amiodarone (Cordarone, Pacerone)</b>	<b>T:</b> 100 mg, 200 mg, 400 mg <b>I:</b> 50 mg/mL	AF, PAF, PSVT, life-threatening ventricular arrhythmias	<b>A (PO):</b> 800–1,600 mg/day in divided doses for 1–3 wks, then 600–800 mg/day in divided doses <b>(IV):</b> 150 mg bolus, then 900 mg over 18 hrs	Blurred vision, photophobia, constipation, ataxia, proarrhythmia, pulmonary fibrosis, bradycardia, heart block, hyperthyroidism or hypothyroidism, peripheral neuropathy, GI upset, blue-gray skin, optic neuritis, hypotension
<b>Dofetilide (Tikosyn)</b>	<b>C:</b> 125 mcg, 250 mcg, 500 mcg	AF, A flutter	<b>A:</b> Individualized	Torsades de pointes, hypotension
<b>Dronedarone (Multaq)</b>	<b>T:</b> 400 mg	AF, A flutter	<b>A (PO):</b> 400 mg 2 times/day	Diarrhea, nausea, abdominal pain, vomiting, asthenia
<b>Ibutilide (Corvert)</b>	<b>I:</b> 0.1 mg/mL	AF, A flutter	<b>A (greater than 60 kg):</b> 1 mg over 10 min; <b>(less than 60 kg):</b> 0.01 mg/kg over 10 min	Torsades de pointes

<b>Sotalol (Betapace)</b>	<b>T:</b> 80 mg, 120 mg, 160 mg	AF, PAF, PSVT, life-threatening ventricular arrhythmias	<b>A:</b> Initially, 80 mg 2 times/day May increase at 3 day intervals up to 160 mg 2 times/day	Fatigue, dizziness, dyspnea, bradycardia, proarrhythmia, heart block, hypotension, bronchospasm
---------------------------	---------------------------------	---	--	---

#### Class IV (Calcium Channel Blockers)

<b>Diltiazem (Cardizem)</b>	<b>I:</b> 25 mg/mL vials <b>Infusion:</b> 1 mg/mL	AF, A flutter, PSVT	<b>A (IV):</b> 20–25 mg bolus, then infusion of 5–15 mg/hr	Hypotension, bradycardia, dizziness, headaches, heart block, asystole, HF
<b>Verapamil (Calan, Isoptin)</b>	<b>I:</b> 5 mg/2 mL	AF, A flutter, PSVT	<b>A (IV):</b> 5–10 mg	Hypotension, bradycardia, dizziness, headaches, constipation, heart block, HF, asystole, fatigue, edema, nausea

**A**, Adults; **AF**, atrial fibrillation; **A flutter**, atrial flutter; **C**, capsules; **ER**, extended-release; **HF**, heart failure; **I**, injection; **PAF**, paroxysmal atrial fibrillation; **PSVT**, paroxysmal supraventricular tachycardia; **PVCs**, premature ventricular contractions; **SLE**, systemic lupus erythematosus; **SR**, sustained-release; **T**, tablets; **VT**, ventricular tachycardia; **WPW**, Wolff-Parkinson-White syndrome.

# Antibiotics

## USES

Treatment of wide range of gram-positive or gram-negative bacterial infections, suppression of intestinal flora before surgery, control of acne, prophylactically to prevent rheumatic fever, prophylactically in high-risk situations (e.g., some surgical procedures or medical conditions) to prevent bacterial infection.

## ACTION

Antibiotics are natural or synthetic compounds that have the ability to kill or suppress the growth of microorganisms.

One means of classifying antibiotics is by their antimicrobial spectrum. Narrow-spectrum agents are effective against few microorganisms (e.g., aminoglycosides are effective against gram-negative aerobes), whereas broad-spectrum agents are effective against a wide variety of microorganisms (e.g., fluoroquinolones are effective against gram-positive cocci and gram-negative bacilli).

Antimicrobial agents may also be classified based on their mechanism of action.

- Agents that inhibit cell wall synthesis or activate enzymes that disrupt the cell wall, causing a weakening in the cell, cell lysis, and death. Include penicillins, cephalosporins, vancomycin, imidazole antifungal agents.
- Agents that act directly on the cell wall, affecting permeability of cell membranes, causing leakage of intracellular substances. Include antifungal agents amphotericin and nystatin, polymyxin, colistin.

- Agents that bind to ribosomal subunits, altering protein synthesis and eventually causing cell death. Include aminoglycosides.
- Agents that affect bacterial ribosome function, altering protein synthesis and causing slow microbial growth. Do not cause cell death. Include chloramphenicol, clindamycin, erythromycin, tetracyclines.
- Agents that inhibit nucleic acid metabolism by binding to nucleic acid or interacting with enzymes necessary for nucleic acid synthesis. Inhibit DNA or RNA synthesis. Include rifampin, metronidazole, fluoroquinolones (e.g., ciprofloxacin).
- Agents that inhibit specific metabolic steps necessary for microbial growth, causing a decrease in essential cell components or synthesis of nonfunctional analogues of normal metabolites. Include trimethoprim, sulfonamides.
- Agents that inhibit viral DNA synthesis by binding to viral enzymes necessary for DNA synthesis, preventing viral replication. Include acyclovir, vidarabine.

## SELECTION OF ANTIMICROBIAL AGENTS

The goal of therapy is to achieve antimicrobial action at the site of infection sufficient to inhibit the growth of the microorganism. The agent selected should be the most active against the most likely infecting organism, least likely to cause toxicity or allergic reaction. Factors to

consider in selection of an antimicrobial agent include the following:

- Sensitivity pattern of the infecting microorganism
- Location and severity of infection (may determine route of administration)

- Pt's ability to eliminate the drug (status of renal and hepatic function)
- Pt's defense mechanisms (includes both cellular and humoral immunity)
- Pt's age, pregnancy status, genetic factors, allergies, CNS disorder, preexisting medical problems

## CATEGORIZATION OF ORGANISMS BY GRAM STAINING

Gram-Positive Cocci	Gram-Negative Cocci	Gram-Positive Bacilli	Gram-Negative Bacilli
<b>Aerobic</b> <i>Staphylococcus aureus</i> <i>Staphylococcus epidermidis</i> <i>Streptococcus pneumoniae</i> <i>Streptococcus pyogenes</i> <i>Viridans streptococci</i> <i>Enterococcus faecalis</i> <i>Enterococcus faecium</i> <b>Anaerobic</b> <i>Peptostreptococcus spp.</i> <i>Peptococcus spp.</i>	<b>Aerobic</b> <i>Neisseria gonorrhoeae</i> <i>Neisseria meningitidis</i> <i>Moraxella catarrhalis</i>	<b>Aerobic</b> <i>Listeria monocytogenes</i> <i>Bacillus anthracis</i> <i>Corynebacterium diphtheriae</i> <b>Anaerobic</b> <i>Clostridium difficile</i> <i>Clostridium perfringens</i> <i>Clostridium tetani</i> <i>Actinomyces spp.</i>	<b>Aerobic</b> <i>Escherichia coli</i> <i>Klebsiella pneumoniae</i> <i>Proteus mirabilis</i> <i>Serratia marcescens</i> <i>Acinetobacter spp.</i> <i>Pseudomonas aeruginosa</i> <i>Enterobacter spp.</i> <i>Haemophilus influenzae</i> <i>Legionella pneumophila</i> <b>Anaerobic</b> <i>Bacteroides fragilis</i> <i>Fusobacterium spp.</i>

## Antibiotic: Aminoglycosides

### USES

Treatment of serious infections when other less-toxic agents are not effective, are contraindicated, or require adjunctive therapy (e.g., with penicillins or cephalosporins). Used primarily in the treatment of infections caused by gram-negative microorganisms, such as those caused by *Proteus*, *Klebsiella*, *Pseudomonas*, *Escherichia coli*, *Serratia*, and *Enterobacter*. Inactive

### ACTION

Bactericidal. Transported across bacterial cell membrane; irreversibly bind to specific receptor proteins of bacterial ribosomes. Interfere with protein synthesis, preventing cell reproduction and eventually causing cell death.

### ANTIBIOTIC: AMINOGLYCOSIDES

Name	Availability	Dosage Range	Class Side Effects
<b>Amikacin</b>	I: 50 mg/mL, 250 mg/mL	<b>A:</b> 5–7.5 mg/kg q8h or 15–20 mg/kg once daily <b>C:</b> 5–7.5 mg/kg q8h	Nephrotoxicity, neurotoxicity, ototoxicity (both auditory and vestibular), hypersensitivity (skin itching, redness, rash, swelling)
<b>Gentamicin</b>	I: 10 mg/mL, 40 mg/mL	<b>A:</b> 4–7 mg/kg once daily or 1–2.5 mg/kg q8–12h <b>C:</b> 2–2.5 mg/kg q8h	
<b>Plazomicin (Zemdri)</b>	I: 50 mg/mL	<b>A:</b> 15 mg/kg q24h	Decreased renal function, diarrhea, hypertension, headache, nausea, vomiting, hypotension
<b>Tobramycin</b>	I: 10 mg/mL, 40 mg/mL	<b>A:</b> 5–7 mg/kg once daily or 1–2.5 mg/kg q8h <b>C:</b> 2–2.5 mg/kg q8h	

**A**, Adults; **C** (*dosage*), children; **I**, injection; **T**, tablets.

## Antibiotic: Carbapenems

Carbapenems are a class of beta-lactam antibiotics that are used to treat severe or high-risk bacterial infections. They may be used in the treatment of intra-abdominal infections, complicated urinary tract infections, pneumonia, and sepsis.

### SPECTRUM OF ACTIVITY

Doripenem, imipenem, and meropenem exhibit broad spectrum activity against gram-negative bacteria including most *Enterobacteriaceae* (e.g., *Escherichia coli*, *Klebsiella pneumoniae*, *Enterobacter*, *Citrobacter*, *Proteus mirabilis*, and *Serratia marcescens*) and good activity against *Pseudomonas aeruginosa* and *Acinetobacter* species.

Meropenem/vaborbactam exhibits activity against *Enterobacter cloacae* species complex, *E. coli*, and *K. pneumoniae*.

Carbapenems exhibit narrower activity against gram-positive bacteria including methicillin-sensitive strains of *Staphylococcus* and *Streptococcus* species.

Carbapenems exhibit good activity against anaerobes (e.g., *Bacteroides fragilis*).

### ACTION

Inhibit bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins, causing cell lysis and death.

### ANTIBIOTIC: CARBAPENEMS

Name	Indications	Dosage Range	Side Effects
<b>Doripenem (Dorbox)</b>	Intra-abdominal infection Complicated urinary tract infection (including pyelonephritis)	500 mg q8h	Headache, diarrhea, nausea, skin rash, anemia
<b>Ertapenem (Invanz)</b>	Acute pelvic infections Community-acquired pneumonia Complicated intra-abdominal infections, skin and skin structure, and UTI	1 g once daily	Diarrhea, vomiting, nausea, abdominal pain, increased AST, ALT

*Continued*

**ANTIBIOTIC: CARBAPENEMS**

Name	Indications	Dosage Range	Side Effects
<b>Imipenem (Primaxin)</b>	Lower respiratory tract infections Urinary tract infections. Intra-abdominal infections. Gynecologic infections Bacterial septicemia Bone and joint infections Skin and skin structure infections Endocarditis	500–1,000 mg q6h or 1,000 mg q8h	Decreased hematocrit, hemoglobin, eosinophilia, thrombocythemia, increased ALT, AST
<b>Meropenem (Merrem)</b>	Meningitis Intra-abdominal infection Pneumonia Sepsis	1.5-6 g daily divided q8h	Headache, pain, skin rash, nausea, diarrhea, constipation, vomiting, anemia
<b>Meropenem/vaborbactam (Vabomere)</b>	Complicated urinary tract infection (including pyelonephritis)	4 g (2 g meropenem/2 g vaborbactam) q8h	Headache, diarrhea, phlebitis/infusion site reactions

# Antibiotic: Cephalosporins

## USES

Broad-spectrum antibiotics, which, like penicillins, may be used in a number of diseases, including respiratory diseases, skin and soft tissue infection, bone/joint infections, and genitourinary infections and prophylactically in some surgical procedures.

*First-generation cephalosporins* have activity against gram-positive organisms (e.g., streptococci and most staphylococci) and activity against some gram-negative organisms, including *Escherichia coli*, *Klebsiella pneumoniae*, and *Proteus mirabilis*.

## ACTION

*Second-generation cephalosporins* have same effectiveness as first-generation and increased activity against gram-negative organisms, including *Haemophilus influenzae*, *Neisseria gonorrhoeae*, *E. coli*, and *Klebsiella*. Cefoxitin has activity against gram-negative bacilli *Bacteroides fragilis* and certain *Enterobacteriaceae*.

*Third-generation cephalosporins* are less active against gram-positive organisms but active against gram-negative bacteria including *Haemophilus influenzae*, and *Proteus*, *Citrobacter*, *Serratia*, *Enterobacteriaceae* (*E. coli*), and *Klebsiella* species. Ceftazidime has activity against *Pseudomonas aeruginosa*.

*Fourth-generation cephalosporins* have good activity against gram-positive organisms (e.g., *Staphylococcus*

*aureus*) and gram-negative organisms (e.g., *Pseudomonas aeruginosa*, *E. coli*, *Klebsiella*, and *Proteus*). Cefepime penetrates the CNS and can be used in treating meningitis.

*Fifth-generation cephalosporins* have good activity against gram-positive organisms (e.g., *Staphylococcus aureus*, *Streptococcus* spp.) and gram-negative organisms (e.g., *E. coli*, *Klebsiella* spp.). Ceftriaxone has activity against multidrug-resistant *Staphylococcus aureus*, including MRSA, VRSA, and VISA.

Cephalosporins inhibit cell wall synthesis or activate enzymes that disrupt the cell wall, causing cell lysis and cell death. May be bacteriostatic or bactericidal. Most effective against rapidly dividing cells.

## ANTIBIOTIC: CEPHALOSPORINS

Name	Availability	Dosage Range	Side Effects
<b>First-Generation</b>			
<b>Cefadroxil (Duricef)</b>	<b>C:</b> 500 mg <b>T:</b> 1 g <b>S:</b> 125 mg/5 mL, 250 mg/5 mL, 500 mg/5 mL	<b>A:</b> 500 mg–1 g <b>C:</b> 15 mg/kg q12h	Abdominal cramps/pain, fever, nausea, vomiting, diarrhea, headaches, oral/vaginal candidiasis

Continued

## ANTIBIOTIC: CEPHALOSPORINS—cont'd

Name	Availability	Dosage Range	Side Effects
<b>Cefazolin (Ancef)</b>	I: 500 mg, 1 g, 2 g	<b>A:</b> 500 mg–2 g q6–8h <b>C:</b> 25–100 mg/kg/day divided q6–8h	Fever, rash, diarrhea, nausea, pain at injection site
<b>Cephalexin (Keflex, Keftab)</b>	<b>C:</b> 250 mg, 500 mg <b>T:</b> 250 mg, 500 mg, 1 g	<b>A:</b> 250 mg–1 g q6–12h <b>C:</b> 25–100 mg/kg/day divided q6–8h	Headache, abdominal pain, diarrhea, nausea, dyspepsia

## Second-Generation

<b>Cefaclor (Ceclor)</b>	<b>C:</b> 250 mg, 500 mg <b>T (ER):</b> 500 mg <b>S:</b> 125 mg/5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL	<b>A:</b> 250–500 mg q8h <b>ER:</b> 500 mg q12h <b>C:</b> 20–40 mg/kg/day q8–12h	Rash, diarrhea, increased transaminases May have serum sickness-like reaction
<b>Cefotetan</b>	I: 1g, 2 g	<b>A:</b> 500 mg–3 g q12h <b>C:</b> 20–40 mg/kg q12h	Diarrhea, increased AST, ALT, hypersensitivity reactions
<b>Cefoxitin (Mefoxin)</b>	I: 1g, 2 g	<b>A:</b> 1–2 g q6–8h <b>C:</b> 80–160 mg/kg/day divided q6h	Diarrhea
<b>Cefprozil (Cefzil)</b>	<b>T:</b> 250 mg, 500 mg <b>S:</b> 125 mg/5 mL, 250 mg/5 mL	<b>A:</b> 500 mg q12–24h <b>C:</b> 7.5–15 mg/kg q12h	Dizziness, abdominal pain, diarrhea, nausea, increased AST, ALT
<b>Cefuroxime (Ceftin, Kefurox, Zinacef)</b>	<b>T:</b> 125 mg, 250 mg, 500 mg <b>S:</b> 125 mg/5 mL, 250 mg/5 mL <b>I:</b> 750 mg, 1.5 g	<b>A (PO):</b> 125–500 mg q12h <b>(IM/IV):</b> 750 mg–1.5 g q8–12h <b>C (PO):</b> 10–15 mg/kg q12h <b>(IM/IV):</b> 75–150 mg/kg/day divided q8h	Diarrhea, nausea, vomiting, thrombophlebitis, increased AST, ALT

## Third-Generation

<b>Cefdinir (Omnicef)</b>	<b>C:</b> 300 mg <b>S:</b> 125 mg/5 mL	<b>A:</b> 300 mg q12h or 600 mg once daily <b>C:</b> 7 mg/kg q12h or 14 mg/kg once daily	Headache, hyperglycemia, abdominal pain, diarrhea, nausea
<b>Cefditoren (Spectracef)</b>	<b>T:</b> 200 mg, 400 mg	<b>A:</b> 200–400 mg q12h <b>C: (&gt;11 yrs):</b> 200–400 mg q12h	Diarrhea, nausea
<b>Cefotaxime (Claforan)</b>	I: 500 mg, 1 g, 2 g	<b>A:</b> 1–2 g q4–12h <b>C:</b> 50–300 mg/kg/day divided q4–6h	Rash, diarrhea, nausea, pain at injection site

<b>Cefpodoxime (Vantin)</b>	<b>T:</b> 100 mg, 200 mg <b>S:</b> 50 mg/5 mL, 100 mg/5 mL	<b>A:</b> 100–400 mg q12h <b>C:</b> 5 mg/kg q12h	Rash, diarrhea, nausea
<b>Ceftazidime (Fortaz, Tazicef, Tazidime)</b>	<b>I:</b> 500 mg, 1 g, 2 g	<b>A:</b> 500 mg–2 g q8–12h <b>C:</b> 30–50 mg/kg q8h	Diarrhea, pain at injection site
<b>Ceftibuten (Cedax)</b>	<b>C:</b> 400 mg <b>S:</b> 90 mg/5 mL, 180 mg/5 mL	<b>A:</b> 400 mg once daily <b>C:</b> 4.5 mg/kg bid or 9 mg/kg once daily	Headache, nausea, diarrhea
<b>Ceftriaxone (Rocephin)</b>	<b>I:</b> 250 mg, 500 mg, 1 g, 2 g	<b>A:</b> 1–2 g q12–24h <b>C:</b> 50–100 mg/kg/day divided q12–24h	Rash, diarrhea, eosinophilia, increased AST, ALT
<b>Fourth-Generation</b>			
<b>Cefepime (Maxipime)</b>	<b>I:</b> 1g, 2g	<b>A:</b> 1–2 g q8–12h <b>C:</b> 50 mg/kg q8–12h	Rash, diarrhea, nausea, increased AST, ALT
<b>Fifth-Generation</b>			
<b>Ceftaroline (Teflaro)</b>	<b>I:</b> 400 mg, 600 mg	<b>A:</b> 600 mg q12h	Headache, insomnia, rash, pruritus, diarrhea, nausea
<b>Fixed-Combinations</b>			
<b>Ceftazidime/avibactam (Avycaz)</b>	<b>I:</b> 2 g ceftazidime/0.5 g avibactam	<b>A:</b> 2.5 g q8h	Nausea, vomiting, constipation, anxiety
<b>Ceftolozane/tazobactam (Zerbaxa)</b>	<b>I:</b> 1 g ceftolozane/0.5 g tazobactam	<b>A:</b> 1.5 g q8h	Nausea, diarrhea, headache, pyrexia

**A**, Adults; **C**, capsules; **C (dosage)**, children; **ER**, extended-release; **I**, injection; **S**, suspension; **T**, tablets.

## Antibiotic: Fluoroquinolones

### USES

Fluoroquinolones act against a wide range of gram-negative and gram-positive organisms. They are used primarily in the treatment of lower respiratory infections, skin/skin

structure infections, urinary tract infections, and sexually transmitted diseases.

### ACTION

Bactericidal. Inhibit DNA gyrase in susceptible microorganisms, interfering with bacterial DNA replication and repair.

### ANTIBIOTIC: FLUOROQUINOLONES

Name	Availability	Dosage Range	Side Effects, Comments
<b>Ciprofloxacin (Cipro)</b>	<b>T:</b> 100 mg, 250 mg, 500 mg, 750 mg <b>S:</b> 250 mg/5 mL, 500 mg/5 mL <b>I:</b> 200 mg, 400 mg	<b>A (PO):</b> 250–750 mg q12h <b>(IV):</b> 200–400 mg q12h	Dizziness, headaches, anxiety, drowsiness, insomnia, abdominal pain, nausea, diarrhea, vomiting, phlebitis (parenteral) Good aerobic gram-negative activity. Considered most active against <i>Pseudomonas aeruginosa (PsAg)</i>
<b>Delafloxacin (Baxdela)</b>	<b>T:</b> 450 mg <b>I:</b> 300 mg	<b>A (PO):</b> 450 mg q12h <b>(IV):</b> 300 mg q12h	Nausea, diarrhea, headache, elevation of transaminases, vomiting Best aerobic gram-positive activity, good aerobic gram-negative activity including fluoroquinolone susceptible <i>PsAg</i>
<b>Levofloxacin (Levaquin)</b>	<b>T:</b> 250 mg, 500 mg, 750 mg <b>I:</b> 250 mg, 500 mg, 750 mg <b>OS:</b> 250 mg/10 mL	<b>A (PO/IV):</b> 250–750 mg/day as single dose	Headache, insomnia, dizziness, rash, nausea, diarrhea, constipation Good aerobic gram-positive activity, good aerobic gram-negative activity including fluoroquinolone susceptible <i>PsAg</i>
<b>Moxifloxacin (Avelox)</b>	<b>T:</b> 400 mg <b>I:</b> 400 mg	<b>A:</b> 400 mg/day	Headache, dizziness, insomnia, nausea, diarrhea Good aerobic gram-positive activity, less aerobic gram-negative activity including fluoroquinolone susceptible <i>PsAg</i> Has anaerobic coverage

**A**, Adults; **I**, injection; **OS**, oral solution; **PO**, oral; **S**, suspension; **T**, tablets.

## Antibiotic: Macrolides

### USES

Macrolides act primarily against most gram-positive microorganisms and some gram-negative cocci. Azithromycin and clarithromycin appear to be more potent than erythromycin. Macrolides are used in the treatment of pharyngitis/tonsillitis, sinusitis, chronic bronchitis, pneumonia, uncomplicated skin/skin structure infections.

### ACTION

Bacteriostatic or bactericidal. Reversibly binds to the P site of the 50S ribosomal subunit of susceptible organisms, inhibiting RNA-dependent protein synthesis.

### ANTIBIOTIC: MACROLIDES

Name	Availability	Dosage Range	Side Effects
<b>Azithromycin (Zithromax)</b>	<b>T:</b> 250 mg, 600 mg <b>S:</b> 100 mg/5 mL, 200 mg/5 mL, 1-g packet <b>I:</b> 500 mg	<b>A (PO):</b> 500 mg once, then 250 mg once daily <b>(IV):</b> 500 mg/day <b>C (PO/IV):</b> 5–10 mg/kg once daily	<b>PO:</b> Nausea, diarrhea, vomiting, abdominal pain <b>IV:</b> Pain, redness, swelling at injection site
<b>Clarithromycin (Biaxin)</b>	<b>T:</b> 250 mg, 500 mg <b>T (XL):</b> 500 mg <b>S:</b> 125 mg/5 mL	<b>A:</b> 250–500 mg q12h (or XL 1,000 mg once daily) <b>C:</b> 7.5 mg/kg q12h	Headaches, loss of taste, nausea, vomiting, diarrhea, abdominal pain/discomfort
<b>Erythromycin (EES, Eryc, EryPed, Ery-Tab, Erythrocin, PCE)</b>	<b>T:</b> 200 mg, 250 mg, 333 mg, 400 mg, 500 mg <b>C:</b> 250 mg <b>S:</b> 100 mg/2.5 mL, 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL	<b>A (PO):</b> 250–500 mg q6h <b>(IV):</b> 500 mg–1 g q6h <b>C (PO):</b> 7.5 mg/kg q6h <b>(IV):</b> 15–20 mg/kg/day in divided doses q6h	<b>PO:</b> Nausea, vomiting, diarrhea, abdominal pain <b>IV:</b> Inflammation, phlebitis at injection site

**A**, Adults; **C**, capsules; **C (dosage)**, children; **I**, injection; **S**, suspension; **T**, tablets; **XL**, long-acting.

## Antibiotic: Penicillins

### USES

Penicillins (also referred to as beta-lactam antibiotics) may be used to treat a large number of infections, including pneumonia and other respiratory diseases, urinary tract infections, septicemia, meningitis, intra-abdominal infections, gonorrhea and syphilis, and bone/joint infection.

Penicillins are classified based on an antimicrobial spectrum:

*Natural penicillins* are very active against gram-positive cocci but ineffective against most strains of *Staphylococcus aureus* (inactivated by enzyme penicillinase).

*Penicillinase-resistant penicillins* are effective against penicillinase-producing *Staphylococcus aureus* but are less effective against gram-positive cocci than the natural penicillins.

*Broad-spectrum penicillins* are effective against gram-positive cocci and some gram-negative bacteria (e.g., *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Salmonella*, and *Shigella*).

*Extended-spectrum penicillins* are effective against gram-negative organisms, including *Pseudomonas aeruginosa*, *Enterobacter*, *Proteus* spp., *Klebsiella*, *Serratia* spp., and *Acinetobacter* spp.

### ACTION

Penicillins inhibit cell wall synthesis or activate enzymes, which disrupt the bacterial cell wall, causing cell lysis and cell death. May be bacteriostatic or bactericidal. Most effective against bacteria undergoing active growth and division.

### ANTIBIOTIC: PENICILLINS

Name	Availability	Dosage Range	Side Effects
Natural			
<b>Penicillin G benzathine (Bicillin, Bicillin LA)</b>	I: 600,000 units, 1.2 million units, 2.4 million units	<b>A:</b> 1.2–2.4 million units as single dose <b>C:</b> 25,000–50,000 units/kg as single dose	Mild diarrhea, nausea, vomiting, headaches, sore mouth/tongue, vaginal itching/discharge, allergic reaction (including anaphylaxis, skin rash, urticaria, pruritus)

<b>Penicillin G potassium (Pfizerpen)</b>	<b>I:</b> 1, 2, 3, 5 million-unit vials	<b>A:</b> 2–4 million units q4h <b>C:</b> 100,000–400,000 units/kg/day divided q4–6h	Rash, injection site reaction, phlebitis
<b>Penicillin V potassium (Apo-Pen-VK)</b>	<b>T:</b> 250 mg, 500 mg <b>S:</b> 125 mg/5 mL, 250 mg/5 mL	<b>A:</b> 250–500 mg q6–8h <b>C:</b> 25–50 mg/kg/day in divided doses q6–8h	Diarrhea, nausea, vomiting

#### Penicillinase-Resistant

<b>Dicloxacillin (Dynapen, Pathocil)</b>	<b>C:</b> 125 mg, 250 mg, 500 mg <b>S:</b> 62.5 mg/5 mL	<b>A:</b> 125–500 mg q6h <b>C:</b> 25–50 mg/kg/day divided q6h	Abdominal pain, diarrhea, nausea
<b>Nafcillin (Unipen)</b>	<b>I:</b> 500 mg, 1 g, 2 g	<b>A (IV):</b> 500 mg–2 g q4–6h <b>C (IV):</b> 50–200 mg/kg/day in divided doses q4–6h	Inflammation, pain, phlebitis, increased risk of interstitial nephritis
<b>Oxacillin (Bactocill)</b>	<b>C:</b> 250 mg, 500 mg <b>S:</b> 250 mg/5 mL <b>I:</b> 250 mg, 500 mg, 1 g, 2 g	<b>A (IV):</b> 1–2 g q4–6h <b>C (IV):</b> 25–50 mg/kg q6h	Diarrhea, nausea, vomiting, increased risk of hepatotoxicity, interstitial nephritis

#### Broad-Spectrum

<b>Amoxicillin (Amoxil, Trimox)</b>	<b>T:</b> 125 mg, 250 mg, 500 mg, 875 mg <b>C:</b> 250 mg, 500 mg <b>S:</b> 200 mg/5 mL, 400 mg/5 mL, 125 mg/5 mL, 250 mg/5 mL	<b>A:</b> 250–500 mg q8h or 500–875 mg q12h <b>C:</b> 20–90 mg/kg/day divided q8–12h	Diarrhea, colitis, nausea
-------------------------------------	--	---	---------------------------

*Continued*

## ANTIBIOTIC: PENICILLINS—cont'd

Name	Availability	Dosage Range	Side Effects
<b>Amoxicillin/clavulanate (Augmentin)</b>	<b>T:</b> 250 mg, 500 mg, 875 mg <b>T (Chew):</b> 125 mg, 200 mg, 250 mg, 400 mg <b>S:</b> 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL	<b>A:</b> 875 mg q12h or 250–500 mg q8h <b>C:</b> 25–90 mg/kg/day divided q12h	Diarrhea, rash, nausea, vomiting
<b>Ampicillin (Principen)</b>	<b>C:</b> 250 mg, 500 mg <b>S:</b> 125 mg/5 mL, 250 mg/5 mL <b>I:</b> 125 mg, 250 mg, 500 mg, 1 g, 2 g	<b>A (PO):</b> 250–500 mg q6h <b>(IV):</b> 500 mg–2 g q6h <b>C (PO):</b> 12.5–50 mg/kg q6h <b>(IV):</b> 25–50 mg/kg q6h	Nausea, vomiting, diarrhea
<b>Ampicillin/sulbactam (Unasyn)</b>	<b>I:</b> 1.5 g, 3 g	<b>A:</b> 1.5–3 g q6h <b>C:</b> 25–50 mg/kg q6h	Local pain at injection site, rash, diarrhea
<b>Extended-Spectrum</b>			
<b>Piperacillin/tazobactam (Zosyn)</b>	<b>I:</b> 2.25 g, 3.375 g, 4.5 g	<b>A:</b> 3.375 g q6h or 4.5 g q6–8h <b>C:</b> 240–300 mg/kg/day divided q8h	Diarrhea, insomnia, headache, fever, rash

**A**, Adults; **C**, capsules; **C (dosage)**, children; **I**, injection; **PO**, oral; **S**, suspension; **T**, tablets.

## Anticoagulants/Antiplatelets/Thrombolytics

### USES

Treatment and prevention of venous thromboembolism, acute MI, acute cerebral embolism; reduce risk of acute MI; reduction of total mortality in pts with unstable angina; prevent occlusion of saphenous grafts following open heart surgery; prevent embolism in select pts with atrial fibrillation, prosthetic heart valves, valvular heart disease, cardiomyopathy. Heparin also used for acute/chronic consumption coagulopathies (disseminated intravascular coagulation).

### ACTION

**Anticoagulants:** Inhibit blood coagulation by preventing the formation of new clots and extension of existing ones *but do not dissolve formed clots*. Anticoagulants are subdivided. **Heparin** (including low molecular weight heparin): Indirectly interferes with blood coagulation by blocking the conversion of prothrombin to thrombin and fibrinogen to fibrin. **Coumarin:** Acts indirectly to prevent synthesis in the liver of vitamin K–dependent clotting factors. **Direct Thrombin Inhibitors:** Inhibit thrombin from converting fibrinogen to fibrin. **Factor Xa Inhibitors:** Inhibit platelet activation and fibrin clot formation.

**Antiplatelets:** Interfere with platelet aggregation. Effects are irreversible for life of platelet. Medications in this

group act by different mechanisms. Aspirin irreversibly inhibits cyclo-oxygenase and formation of thromboxane  $A_2$ . Clopidogrel, dipyridamole, prasugrel, and ticlopidine have similar effects as aspirin and are known as adenosine diphosphate (ADP) inhibitors. Abciximab, eptifibatide, and tirofiban block binding of fibrinogen to the glycoprotein IIb/IIIa receptor on platelet surface (known as platelet glycoprotein IIb/IIIa receptor antagonists).

**Thrombolytics:** Act directly or indirectly on fibrinolytic system to dissolve clots (converting plasminogen to plasmin, an enzyme that digests fibrin clot).

### ANTICOAGULANTS/ANTIPLATELETS/THROMBOLYTICS

Name	Availability	Uses	Side Effects
Anticoagulants			
Direct Thrombin Inhibitors			
<b>Argatroban</b>	I: 100 mg/mL	Prevent/treat VTE in pts with HIT or at risk for HIT undergoing PCI	Bleeding, hypotension, hematuria

Continued

**ANTICOAGULANTS/ANTIPLATELETS/THROMBOLYTICS—cont'd**

Name	Availability	Uses	Side Effects
<b>Bivalirudin (Angiomax)</b>	I: 250-mg vials	Pts with unstable angina undergoing PTCA	Bleeding, hypotension, pain, headache, nausea, back pain
<b>Dabigatran (Pradaxa)</b>	C: 75 mg, 110 mg, 150 mg	Reduce risk for stroke/embolism with nonvalvular atrial fibrillation, prevent/treat DVT/PE, postoperative prophylaxis of DVT/ PE following hip replacement	Bleeding, gastritis, dyspepsia
<b>Desirudin (Iprivask)</b>	I: 15 mg	Prophylaxis of DVT following hip surgery	Bleeding, drainage from a wound, nausea, anemia, DVT, serious allergic reactions

**Heparin, Low Molecular Weight Heparins**

<b>Dalteparin (Fragmin)</b>	I: 2,500 units, 5,000 units, 7,500 units, 10,000 units	Prevent DVT following hip surgery, abdominal surgery, unstable angina or non-Q-wave MI	Bleeding, hematoma, increased ALT, AST, pain at injection site, bruising, pruritus, fever, thrombocytopenia
<b>Enoxaparin (Lovenox)</b>	I: 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg, 150 mg	Prevent DVT following hip surgery, knee surgery, abdominal surgery, unstable angina or non-Q-wave MI, acute illness	Bleeding, thrombocytopenia, hematoma, increased ALT, AST, nausea, bruising Injection site reactions, anemia, diarrhea, fever
<b>Heparin</b>	I: 1,000 units/mL, 2,500 units/mL, 5,000 units/mL, 7,500 units/mL, 10,000 units/mL, 20,000 units/mL	Prevent/treat VTE	Bleeding, thrombocytopenia, skin rash, itching, burning Increased hepatic transaminase

**Factor Xa Inhibitor**

<b>Apixaban (Eliquis)</b>	T: 2.5 mg, 5 mg	Reduce risk of stroke/embolism in nonvalvular atrial fibrillation. Prevent VTE post hip/knee replacement surgery, prevent/treat recurrence	Bleeding, nausea, anemia Confusion, increased AST, ALT
---------------------------	-----------------	--	---

<b>Betrixaban (Bevyxxa)</b>	<b>C:</b> 40 mg, 80 mg	Prophylaxis of VTE in adults with acute medical illness at risk for thromboembolic complications due to restricted mobility, other VTE risk factors	Bleeding, nausea, diarrhea, UTI, hypokalemia, hypertension, headache
<b>Edoxaban (Savaysa)</b>	<b>T:</b> 15 mg, 30 mg, 60 mg	Prevent thromboembolism in nonvalvular atrial fibrillation, treat DVT/PT	Bleeding, anemia, rash, abnormal liver function tests
<b>Fondaparinux (Arixtra)</b>	<b>I:</b> 2.5 mg, 5 mg, 7.5 mg, 10 mg	Prophylaxis of DVT following hip fracture, abdominal surgery, hip surgery, knee surgery, treat DVT/PE	Bleeding, thrombocytopenia, hematoma, fever, nausea, anemia Increased AST, ALT; insomnia, dizziness, hypokalemia
<b>Rivaroxaban (Xarelto)</b>	<b>T:</b> 10 mg	Prevent DVT post knee, hip replacement Prevent thromboembolism in atrial fibrillation Prevent/treat DVT/PE	Bleeding, abdominal pain, fatigue, muscle spasms, anxiety, depression, UTI, increased AST, ALT

### Coumarin

<b>Warfarin (Coumadin)</b>	<b>PO:</b> 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg <b>I:</b> 5 mg	Prevent/treat VTE in pts, prevent systemic embolism in pts with heart valve replacement, valve heart disease, MI, atrial fibrillation	Bleeding, skin necrosis, anorexia, nausea, vomiting, diarrhea, rash, abdominal cramps, purple toe syndrome, drug interactions (see individual monograph)
----------------------------	--	---	--

### Antiplatelets

<b>Abciximab (ReoPro)</b>	<b>I:</b> 2 mg/mL	Adjunct to PCI to prevent acute cardiac ischemic complications (with heparin and aspirin)	Bleeding, hypotension, nausea, vomiting, back pain, allergic reactions, thrombocytopenia
<b>Aspirin</b>	<b>PO:</b> 81 mg, 165 mg, 325 mg, 500 mg, 650 mg	TIA, acute MI, chronic stable/unstable angina, revascularization procedures, prevent reinfarction and thromboembolism post MI	Tinnitus, dizziness, hypersensitivity, dyspepsia, minor bleeding, GI ulceration

*Continued*

## ANTICOAGULANTS/ANTIPLATELETS/THROMBOLYTICS—cont'd

Name	Availability	Uses	Side Effects
<b>Clopidogrel (Plavix)</b>	<b>PO:</b> 75 mg	Reduce risk of stroke, MI, or vascular death in pts with recent MI, noncardioembolic stroke, peripheral artery disease, reduce CV death, MI, stroke, reinfarction in pts with non-STEMI/STEMI	Bleeding, rash, pruritus, bruising, epistaxis
<b>Cangrelor (Kengreal)</b>	<b>I:</b> 50 mg	Adjunct to PCI to reduce risk of MI, repeat coronary revascularization, stent thrombosis	Bleeding
<b>Eptifibatide (Integrilin)</b>	<b>I:</b> 0.75 mg/mL, 2 mg/mL	Treat acute coronary syndrome	Bleeding, hypotension
<b>Prasugrel (Effient)</b>	<b>PO:</b> 5 mg, 10 mg	Reduce thrombotic cardiovascular events in pts with ACS to be managed with PCI (including stenting)	Bleeding, hypotension
<b>Ticagrelor (Brilinta)</b>	<b>PO:</b> 60 mg, 90 mg	Reduce thrombotic cardiovascular events in pts with ACS	Bleeding, dyspnea
<b>Tirofiban (Aggrastat)</b>	<b>I:</b> 50 mcg/mL, 250 mcg/mL	Treat acute coronary syndrome	Bleeding, thrombocytopenia, bradycardia, pelvic pain
<b>Vorapaxar (Zontivity)</b>	<b>T:</b> 2.08 mg	Reduce thrombotic cardiovascular events (e.g., MI, stroke) in pts with history of MI or peripheral arterial disease	Bleeding

## Thrombolytics

<b>Alteplase (Activase)</b>	<b>I:</b> 50 mg, 100 mg	Acute MI, acute ischemic stroke, pulmonary embolism	Bleeding, epistaxis
<b>Tenecteplase (TNKase)</b>	<b>I:</b> 50 mg	Acute MI	Bleeding, hematuria

**ACS**, Acute coronary syndrome; **DVT**, deep vein thrombosis; **HIT**, heparin-induced thrombocytopenia; **I**, injection; **MI**, myocardial infarction; **PCI**, percutaneous coronary intervention; **PO**, oral; **PTCA**, percutaneous transluminal coronary angioplasty; **STEMI**, ST segment elevation MI; **T**, tablet; **TIA**, transient ischemic attack; **VTE**, venous thromboembolism.

# Anticonvulsants

## USES

Anticonvulsants are used to treat seizures. Seizures can be divided into two broad categories: partial seizures and generalized seizures. *Partial seizures* begin locally in the cerebral cortex, undergoing limited spread. Simple partial seizures do not involve loss of consciousness but may evolve secondarily into generalized seizures. Complex partial seizures involve impairment of consciousness.

*Generalized seizures* may be convulsive or nonconvulsive and usually produce immediate loss of consciousness.

## ACTION

Anticonvulsants can prevent or reduce excessive discharge of neurons with seizure foci or decrease the spread of excitation from seizure foci to normal neurons. The exact mechanism is unknown but may be due to (1) suppressing sodium influx, (2) suppressing calcium influx, or (3) increasing the action of gamma-aminobutyric acid (GABA), which inhibits neurotransmitters throughout the brain.

## ANTICONVULSANTS

Name	Availability	Uses	Dosage Range	Side Effects
<b>Brivaracetam (Briviact)</b>	<b>I:</b> 10 mg/mL <b>S:</b> 10 mg/mL <b>T:</b> 10 mg, 25 mg, 50 mg, 75 mg, 100 mg	Partial-onset seizure	<b>A:</b> Initially, 50 mg bid. (May decrease to 25 mg bid or increase to 100 mg bid)	Nausea, vomiting, dizziness, fatigue, angioedema, psychiatric symptoms
<b>Carbamazepine (Carbatrol, Carnexiv, Epitol, Tegretol, Tegretol XR)</b>	<b>S:</b> 100 mg/5 mL <b>T (Chew):</b> 100 mg <b>T:</b> 200 mg <b>T (ER):</b> 100 mg, 200 mg, 400 mg <b>C (ER):</b> 100 mg, 200 mg, 300 mg <b>I:</b> 10 mg/mL	Complex partial, tonic-clonic, mixed seizures; trigeminal neuralgia	<b>Note:</b> Refer to monograph for IV dosage <b>A:</b> Initially, 400 mg/day in 2 divided doses. May increase up to 200 mg/day at wkly intervals up to 800–1,600 mg/day in 2–3 doses <b>C:</b> Initially, 200 mg/day in 2 divided doses. May increase by 100 mg/day at wkly intervals up to 400–800 mg/day in 3–4 doses	Dizziness, diplopia, leukopenia, drowsiness, blurred vision, headache, ataxia, nausea, vomiting, hyponatremia, rash, pruritus

Continued

## ANTICONVULSANTS—cont'd

Name	Availability	Uses	Dosage Range	Side Effects
<b>Cenobamate (Xcopri)</b>	<b>T:</b> 12.5 mg, 25 mg, 50 mg, 100 mg, 150 mg, 200 mg	Partial-onset seizures in adults	Initially, 12.5 mg once daily; titrate to the recommended maintenance dose of 200 mg once daily. <b>Maximum:</b> 400 mg once daily	Somnolence, dizziness, fatigue, diplopia, headache
<b>Clonazepam (Klonopin)</b>	<b>T:</b> 0.5 mg, 1 mg, 2 mg	Petit mal, akinetic, myoclonic, absence seizures	<b>A:</b> Initially, not to exceed 1.5 mg in 3 divided doses. May increase q3days up to 2–8 mg/day in 1–2 divided doses	CNS depression, sedation, ataxia, confusion, depression, behavior disorders, respiratory depression
<b>Ezogabine (Potiga)</b>	<b>T:</b> 50 mg, 200 mg, 300 mg, 400 mg	Partial onset seizures	<b>A:</b> Initially, 100 mg 3 times/day. May increase at weekly intervals up to 150 mg/day. Usual dose: 200–400 mg 3 times/day	Dizziness, somnolence, fatigue, confusion, vertigo, tremor, balance disorder, urinary retention
<b>Fosphenytoin (Cerebyx)</b>	<b>I:</b> 50 mg PE/mL	Status epilepticus, seizures occurring during neurosurgery	<b>A:</b> 15–20 mg PE/kg bolus, then 4–6 mg PE/kg/day maintenance	Burning, itching, paresthesia, nystagmus, ataxia
<b>Gabapentin (Neurontin)</b>	<b>C:</b> 100 mg, 300 mg, 400 mg <b>S:</b> 250 mg/5 mL	Partial and generalized seizures	<b>A:</b> 300 mg 3 times/day. Usual dose: 900–1,800 mg/day in 3 doses	CNS depression, fatigue, drowsiness, dizziness, ataxia, nystagmus, blurred vision, confusion; may cause weight gain
<b>Lacosamide (Vimpat)</b>	<b>T:</b> 50 mg, 100 mg, 150 mg, 200 mg <b>S:</b> 10 mg/mL <b>I:</b> 10 mg/mL	Adjunctive therapy, partial seizures	<b>A:</b> Monotherapy: Initially, 100 mg 2 times/day. May increase at wkly intervals by 50 mg 2 times/day. Maintenance: 150–200 mg 2 times/day Adjunctive: Initially, 50 mg 2 times/day. May increase by 50 mg 2 times/day. Maintenance: 100–200 mg 2 times/day	Diplopia, headache, dizziness, nausea

<b>Lamotrigine (Lamictal)</b>	<b>T:</b> 25 mg, 100 mg, 150 mg, 200 mg <b>T (ER):</b> 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg <b>T (ODT):</b> 25 mg, 50 mg, 100 mg, 200 mg <b>T (Chew):</b> 5 mg, 25 mg	Partial seizures, primary generalized tonic-clonic seizures, generalized seizures of Lennox-Gastaut syndrome	<b>A:</b> Refer to individual monograph	Dizziness, ataxia, drowsiness, diplopia, nausea, rash, headache, vomiting, insomnia, incoordination
<b>Levetiracetam (Keppra)</b>	<b>T:</b> 250 mg, 500 mg, 750 mg, 1,000 mg <b>S:</b> 100 mg/ml <b>T (ER):</b> 500 mg, 750 mg	Adjunctive therapy, partial seizures, primary tonic-clonic seizures, myoclonic seizures	<b>A: T:</b> Initially, 500 mg 2 times/day. May increase q2wks by 500mg/dose. Usual dose: 1,500 mg 2 times/day <b>ER:</b> Initially, 1,000 mg once daily. May increase q2wks by 1,000 mg/day up to 3,000 mg once daily	Dizziness, drowsiness, weakness, irritability, hallucinations, psychosis
<b>Oxcarbazepine (Trileptal)</b>	<b>T:</b> 150 mg, 300 mg, 600 mg <b>T (ER):</b> 150 mg, 300 mg, 600 mg	Partial seizures	<b>A: T:</b> 600 mg/day in 2 divided doses. May increase by 600 mg/day at wkly intervals up to 1,200 mg/day in 2 divided doses <b>ER:</b> 600 mg once daily. May increase by 600 mg/day at wkly intervals up to 1,200–2,400 mg/day	Drowsiness, dizziness, headaches, diplopia, ataxia, nausea, vomiting, hyponatremia, skin reactions
<b>Perampanel (Fycompa)</b>	<b>S:</b> 0.5 mg/ml <b>T:</b> 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg	Partial onset seizure, primary generalized tonic-clonic seizure	<b>A, C (12 yrs or older):</b> Initially, 2 mg daily at hs May increase by 2 mg/d at wkly intervals <b>Usual dose:</b> 8–12 mg qhs	Weight gain, abnormal gait, dizziness, headache, somnolence, serious psychiatric reactions
<b>Phenobarbital</b>	<b>T:</b> 30 mg, 60 mg, 100 mg <b>I:</b> 65 mg, 130 mg	Tonic-clonic, partial seizures; status epilepticus	<b>A (PO):</b> 100–300 mg/day <b>(IM/IV):</b> 200–600 mg <b>C (PO):</b> 3–5 mg/kg/day <b>(IM/IV):</b> 100–400 mg	CNS depression, sedation, paradoxical excitement and hyperactivity, rash, hypotension

*Continued*

## ANTICONVULSANTS—cont'd

Name	Availability	Uses	Dosage Range	Side Effects
<b>Phenytoin (Dilantin)</b>	<b>C:</b> 30 mg, 100 mg <b>T (Chew):</b> 50 mg <b>S:</b> 125 mg/5 mL <b>I:</b> 50 mg/mL	Tonic-clonic, psychomotor seizures	<b>A:</b> Initially, 100 mg 3 times/day. May increase at 7–10 day intervals. Usual dose: 400 mg/day <b>C:</b> Initially, 5 mg/kg/day in 2–3 divided doses. May increase at 7–10 day intervals. Usual dose: 4–8 mg/kg/day in 1–3 doses	Nystagmus, ataxia, hypertrichosis, gingival hyperplasia, rash, osteomalacia, lymphadenopathy
<b>Pregabalin (Lyrica)</b>	<b>C:</b> 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg	Adjunctive therapy, partial seizures	<b>A:</b> Initially, 150 mg/day (75 mg 2 times/day or 50 mg 3 times/day) up to 600 mg/day in 2 or 3 doses	Confusion, drowsiness, dizziness, ataxia, weight gain, dry mouth, blurred vision, peripheral edema, myopathy, angioedema, decreased platelet count
<b>Primidone (Mysoline)</b>	<b>T:</b> 50 mg, 250 mg	Complex partial, akinetic, tonic-clonic seizures	<b>A:</b> 750–1250 mg/day in 3–4 doses <b>C:</b> 10–25 mg/kg/day	CNS depression, sedation, paradoxical excitement and hyperactivity, rash, dizziness, ataxia
<b>Rufinamide (Banzel)</b>	<b>S:</b> 40 mg/mL <b>T:</b> 200 mg, 400 mg	Lennox-Gastaut syndrome (adjunct)	<b>A:</b> Initially, 400–800 mg/day in 2 divided doses. May increase by 400–800 mg/day every other day <b>C:</b> Initially, 10 mg/kg/day in 2 divided doses. May increase by 10 mg/kg/day every other day up to 45 mg/kg/day <b>Maximum:</b> 3,200 mg/day	Fatigue, dizziness, headache, nausea, drowsiness
<b>Tiagabine (Gabitril)</b>	<b>T:</b> 4 mg, 12 mg, 16 mg, 20 mg	Partial seizures	<b>A:</b> Initially, 4 mg up to 56 mg/day in 2–4 doses. May increase by 4–8 mg/day at wklly intervals <b>C:</b> Initially, 4 mg up to 32 mg/day in 2–4 doses. May increase by 4–8 mg/day at wklly intervals	Dizziness, asthenia, nervousness, anxiety, tremors, abdominal pain

<b>Topiramate (Topamax)</b>	<b>T:</b> 25 mg, 100 mg, 200 mg <b>C (Sprinkle):</b> 15 mg, 25 mg <b>C (ER 24HR Sprinkle) (Qudexy XR):</b> 25 mg, 50 mg, 100 mg, 150 mg <b>C XR (Trokendi XR):</b> 25 mg, 50 mg, 100 mg, 200 mg	Partial seizures, Lennox-Gastaut syndrome	See individual monograph	Drowsiness, dizziness, headache, ataxia, confusion, weight loss, diplopia
<b>Valproic acid (Depakene, Depakote)</b>	<b>C:</b> 250 mg <b>S:</b> 250 mg/5 mL <b>Sprinkle:</b> 125 mg <b>T:</b> 125 mg, 250 mg, 500 mg <b>T (ER):</b> 500 mg <b>I:</b> 100 mg/mL	Complex partial, absence seizures	<b>A, C:</b> Initially, 15 mg/kg/day. May increase by 5–10 mg/kg/day at wkly intervals up to 60 mg/kg/day	Nausea, vomiting, tremors, thrombocytopenia, hair loss, hepatic dysfunction, weight gain, decreased platelet function
<b>Vigabatrin (Sabril)</b>	<b>T:</b> 500 mg <b>PS:</b> 500 mg	Infantile spasms, refractory complex partial seizures	<b>A:</b> Initially, 500 mg 2 times/day. May increase by 500 mg increments at wkly intervals up to 1,500 mg 2 times/day <b>C:</b> Initially, 250 mg 2 times/day. May increase by 500 mg/day at wkly intervals up to 1,000 mg 2 times/day	Vision changes, eye pain, abdominal pain, agitation, confusion, mood/mental changes, abnormal coordination, weight gain
<b>Zonisamide (Zonegran)</b>	<b>C:</b> 100 mg	Partial seizures	<b>A:</b> Initially, 100 mg/day. May increase to 200 mg/day after 2 wks, then 300 mg/day up to 400 mg/day at 2 wk intervals	Drowsiness, dizziness, anorexia, diarrhea, weight loss, agitation, irritability, rash, nausea, cognitive side effects, kidney stones

**A**, Adults; **C**, capsules; **C (dosage)**, children; **ER**, extended-release; **I**, injection; **ODT**, orally disintegrating tablets; **PE**, phenytoin equivalent; **PO**, oral; **PS**, powder sachet; **qhs**, every night at bedtime; **S**, suspension; **T**, tablets.

## Antidepressants

### USES

Used primarily for the treatment of depression. Depression can be a chronic or recurrent mental disorder presenting with symptoms such as depressed mood, loss of interest or pleasure, guilt feelings, disturbed sleep/appetite, low energy, and difficulty in thinking. Depression can also lead to suicide.

### ACTION

Antidepressants include tricyclics, monoamine oxidase inhibitors (MAOIs), selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), and other antidepressants. Depression may be due to reduced functioning of monoamine neurotransmitters (e.g., norepinephrine, serotonin [5-HT], dopamine) in the CNS (decreased amount and/or decreased effects at the receptor sites). Antidepressants

block metabolism, increase amount/effects of monoamine neurotransmitters, and act at receptor sites (change responsiveness/sensitivities of both presynaptic and postsynaptic receptor sites).

### ANTIDEPRESSANTS

Name	Availability	Uses	Dosage Range (per day)	Side Effects
<b>Tricyclics</b>				
<b>Amitriptyline (Elavil)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg	Depression, neuropathic pain	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day	Drowsiness, blurred vision, constipation, confusion, postural hypotension, cardiac conduction defects, weight gain, seizures, dry mouth
<b>Desipramine (Norpramin)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg	Depression, neuropathic pain	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day	Dizziness, drowsiness, fatigue, headache, anorexia, diarrhea, nausea

<b>Imipramine (Tofranil)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg <b>C:</b> 75 mg, 100 mg, 125 mg, 150 mg	Depression, enuresis, neuropathic pain, panic disorder, ADHD	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day	Dizziness, fatigue, headache, vomiting, xerostomia
<b>Nortriptyline (Aventyl, Pamelor)</b>	<b>C:</b> 10 mg, 25 mg, 50 mg, 75 mg <b>S:</b> 10 mg/5 mL	Depression, neuropathic pain, smoking cessation	Initially, 50–100 mg once daily. Usual dose: 50–150 mg once daily	Dizziness, fatigue, headache, anorexia, xerostomia

### Selective Serotonin Reuptake Inhibitors

<b>Citalopram (Celexa)</b>	<b>T:</b> 10 mg, 20 mg, 40 mg <b>ODT:</b> 40 mg <b>S:</b> 10 mg/5 mL	Depression, OCD, panic disorder	20–40 mg	<b>Class Side Effects:</b> Restlessness, sleep disturbances, nausea, diarrhea, headache, fatigue, sexual dysfunction, weight gain; increased risk of bleeding; may prolong QT interval
<b>Escitalopram (Lexapro)</b>	<b>T:</b> 5 mg, 10 mg, 20 mg <b>S:</b> 5 mg/5 mL	Depression, GAD	10–20 mg	
<b>Fluoxetine (Prozac)</b>	<b>C:</b> 10 mg, 20 mg, 40 mg <b>C (DR):</b> 90 mg <b>T:</b> 10 mg, 20 mg <b>S:</b> 20 mg/5 mL	Depression, OCD, bulimia, panic disorder, anorexia, bipolar disorder, premenstrual syndrome	Initially, 10–20 mg once daily. Usual dose: 20 mg once daily <b>DR:</b> 90 mg once wkly	
<b>Paroxetine (Paxil)</b>	<b>T:</b> 10 mg, 20 mg, 30 mg, 40 mg <b>S:</b> 10 mg/5 mL <b>ER:</b> 12.5 mg, 25 mg, 37.5 mg	Depression, OCD, panic attack, SAD	Initially/usual dose: 20 mg once daily <b>ER:</b> Initially, 12.5–25 mg once daily. Usual dose: 25 mg once daily	

## ANTIDEPRESSANTS—cont'd

Name	Availability	Uses	Dosage Range (per day)	Side Effects
<b>Sertraline (Zoloft)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg <b>S:</b> 20 mg/ml	Depression, OCD, panic attack	50–200 mg	
<b>Vortioxetine (Trintellix)</b>	<b>T:</b> 5 mg, 10 mg, 15 mg, 20 mg	Depression	Initially, 10 mg once daily. Usual dose: 10–20 mg once daily	
<b>Serotonin-Norepinephrine Reuptake Inhibitors</b>				
<b>Desvenlafaxine (Pristiq)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg	Depression	50–100 mg	<b>Class Side Effects:</b> Similar to SSRIs. Additionally, sweating, tachycardia, urinary retention, increase in blood pressure
<b>Duloxetine (Cymbalta)</b>	<b>C:</b> 20 mg, 30 mg, 60 mg	Depression, fibromyalgia, neuropathic pain	Initially, 30–60 mg once daily. Usual dose: 60 mg once daily or 2 divided doses	
<b>Venlafaxine (Effexor)</b>	<b>T:</b> 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg, 150 mg, 225 mg <b>T (ER):</b> 37.5 mg, 75 mg, 150 mg	Depression, anxiety	Initially, 25 mg 3 times or <b>(ER):</b> 37.5 mg once daily. Usual dose: 75 mg 3 times/day or <b>(ER):</b> 75–225 mg once daily	
<b>Other</b>				
<b>Brexiprazole (Rexulti)</b>	<b>T:</b> 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg	Depression	Initially, 0.5–1 mg/day. May increase at wkly intervals to 1 mg/day <b>Maximum:</b> 3 mg/day	Weight gain, akathisia
<b>Bupropion (Wellbutrin)</b>	<b>T:</b> 75 mg, 100 mg <b>SR:</b> 100 mg, 150 mg, 200 mg	Depression, smoking cessation, ADHD, bipolar disorder	Initially, 100 mg 2 times/day. Usual dose: 100 mg 3 times/day <b>SR:</b> Initially, 150 mg once daily. Usual dose: 150 mg 2 times/day	Insomnia, irritability, seizures

<b>Esketamine (Spravato)</b>	<b>Nasal Spray:</b> delivers 2 sprays containing a total of 28 mg of esketamine	Depression	Induction Phase Wks 1–4: Administer twice per wk day 1 (starting dose): 56 mg. Subsequent doses: 56 mg or 84 mg. Maintenance Phase Wks 5–8: Give once wkly as 56 mg or 84 mg. Wk 9 and thereafter: Administer q2wks or once wkly as 56 mg or 84 mg	Anxiety, dissociation, dizziness, hypertension, hypoesthesia, lethargy, nausea, sedation, vertigo, vomiting
<b>Mirtazapine (Remeron)</b>	<b>T:</b> 7.5 mg, 15 mg, 30 mg, 45 mg	Depression	Initially, 15 mg once at bedtime. Usual dose: 30–45 mg once daily	Sedation, dry mouth, weight gain, agranulocytosis, hepatic toxicity
<b>Trazodone (Desyrel)</b>	<b>T:</b> 50 mg, 100 mg, 150 mg, 300 mg <b>ER:</b> 150 mg, 300 mg	Depression	Initially, 75 mg 2 times/day or <b>(ER):</b> 150 mg once daily. Usual dose: 150 mg bid or <b>(ER):</b> 150–375 mg once daily	Sedation, orthostatic hypotension, priapism
<b>Vilazodone (Viibryd)</b>	<b>T:</b> 10 mg, 20 mg, 40 mg	Depression	Initially, 10 mg once daily. Usual dose: 40 mg once daily	Diarrhea, nausea, dizziness, dry mouth, insomnia, vomiting, decreased libido
<b>Vortioxetine (Trintellix)</b>	<b>T:</b> 5 mg, 10 mg, 20 mg	Depression	Initially, 10 mg once daily. Usual dose: 10–20 mg once daily	Restlessness, agitation, insomnia

**ADHD**, Attention-deficit hyperactivity disorder; **C**, capsules; **DR**, delayed-release; **ER**, extended-release; **GAD**, generalized anxiety disorder; **OC**, oral concentrate; **OCD**, obsessive-compulsive disorder; **ODT**, orally disintegrating tablets; **S**, suspension; **SAD**, social anxiety disorder; **SR**, sustained-release; **T**, tablets.

## Antidiabetics

### USES

**Insulin:** Treatment of insulin-dependent diabetes (type 1) and non-insulin-dependent diabetes (type 2). Also used in acute situations such as ketoacidosis, severe infections, major surgery in otherwise non-insulin-dependent

diabetics. Administered to pts receiving parenteral nutrition. Drug of choice during pregnancy. All insulins, including long-acting insulins, can cause hypoglycemia and weight gain.

**Alpha-glucosidase inhibitors:** Adjunct to diet and exercise for management of type 2 diabetes mellitus.

**Biguanides:** Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Continued*

## ACTION

*Dipeptidyl peptidase 4 inhibitors (DPP-4):* Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Meglitinide:* Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Sulfonylureas:* Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Thiazolidinediones:* Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Sodium-glucose co-transporter 2 (SGLT2):* Adjunct to diet and exercise for management of type 2 diabetes mellitus.

*Insulin:* A hormone synthesized and secreted by beta cells of Langerhans' islet in the pancreas. Controls storage and utilization of glucose, amino acids, and fatty acids by activated transport systems/enzymes. Inhibits breakdown of glycogen, fat, protein. Insulin lowers blood glucose by inhibiting glycogenolysis and gluconeogenesis in liver; stimulates glucose uptake by muscle, adipose tissue. Activity of insulin is initiated by binding to cell surface receptors.

*Alpha-glucosidase inhibitors:* Work locally in small intestine, slowing carbohydrate breakdown and glucose absorption.

*Biguanides:* Inhibit hepatic gluconeogenesis, glycogenolysis; enhance insulin sensitivity in muscle and fat.

*DPP-4:* Inhibit degradation of endogenous incretins, which increases insulin secretion, decreases glucagon secretion.

*Meglitinide:* Stimulates pancreatic insulin secretion.

*Sulfonylureas:* Stimulate release of insulin from beta cells of the pancreas.

*Thiazolidinediones:* Enhance insulin sensitivity in muscle and fat.

*SGLT2:* Blocks glucose reabsorption in proximal tubule in the kidney, increases urinary glucose excretion.

## ANTIDIABETICS

## INSULIN

Type	Onset	Peak	Duration	Comments
<b>Rapid-Acting</b>				
<b>Apidra, glulisine</b>	10–15 min	1–1.5 hrs	3–5 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening Can mix with NPH
<b>Admelog, lispro</b>	15–30 min	2 hrs	6–7 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening
<b>Humalog, lispro</b>	15–30 min	0.5–2.5 hrs	6–8 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening Can mix with NPH

<b>Novolog, aspart</b>	10–20 min	1–3 hrs	3–5 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening Can mix with NPH
<b>Fiasp, aspart</b>	15–20 min	1.5–2.5 hrs	5–7 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening

### Short-Acting

<b>Humulin R, Novolin R, regular</b>	30–60 min	1–5 hrs	6–10 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening Can mix with NPH
--------------------------------------	-----------	---------	----------	--

### Intermediate-Acting

<b>Humulin N, Novolin N, NPH</b>	1–2 hrs	6–14 hrs	16–24 hrs	Refrigerate unopened vial. Do not freeze. Stable at room temperature for 31 days after opening (Pen 14 days) Can mix with aspart, lispro, glulisine
----------------------------------	---------	----------	-----------	--

### Long-Acting

<b>Basaglar, glargine</b>	1–4 hrs	No significant peak	24 hrs	Do NOT mix with other insulins Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening
<b>Lantus, glargine</b>	1–4 hrs	No significant peak	24 hrs	Do NOT mix with other insulins Refrigerate unopened vial. Do not freeze. Stable at room temperature for 28 days after opening
<b>Semglee, glargine</b>	Not available	12 hrs	24 hrs	Do NOT mix with other insulins. Refrigerate unused vial; do not refrigerate prefilled pen. Do not freeze. Vial: stable at room temperature for 28 days after opening vial. Pre-filled pen: stable at room temperature per expiration date until used; then stable for 28 days

## ANTIDIABETICS—cont'd

Type	Onset	Peak	Duration	Comments
<b>Levemir, detemir</b>	0.8–2 hrs	No significant peak	12–24 hrs (dose dependent)	Do NOT mix with other insulins Refrigerate unopened vial. Do not freeze. Stable at room temperature for 42 days after opening
<b>Toujeo, glargine</b>	1–6 hrs	No significant peak	Longer than 24 hrs	Do NOT mix with other insulins Refrigerate unopened vial. Do not freeze. Stable at room temperature for 42 days after opening
<b>Tresiba, degludec</b>	0.5–1.5 hrs	12 hrs	42 hrs	Do NOT mix with other insulins Refrigerate unopened vial. Do not freeze. Stable at room temperature for 56 days after opening

## ORAL AGENTS

Name	Availability	Dosage Range	Side Effects
<b>Sulfonylureas</b>			
<b>Glimepiride (Amaryl)</b>	<b>T:</b> 1 mg, 2 mg, 4 mg	Initially, 1–2 mg/day. May increase by 1–2 mg q1–2 wks. <b>Maximum:</b> 8 mg/day	Hypoglycemia, dizziness, headache, nausea, flu-like syndrome
<b>Glipizide (Glucotrol)</b>	<b>T:</b> 5 mg, 10 mg <b>T (XL):</b> 5 mg	<b>T:</b> Initially, 5 mg/day. May increase by 2.5–5 mg q3–4 days. <b>(XL):</b> Initially, 5 mg/day. <b>Maximum:</b> 20 mg/day	Dizziness, nervousness, anxiety, diarrhea, tremor
<b>Glyburide (DiaBeta, Micronase)</b>	<b>T:</b> 1.25 mg, 2.5 mg, 5 mg <b>PT:</b> 1.5 mg, 3 mg	<b>T:</b> Initially, 2.5–5 mg/day. May increase by 2.5 mg/day at wkly intervals up to 20 mg/day <b>PT:</b> Initially, 1.5–3 mg/day. May increase by 1.5 mg at wkly intervals up to 12 mg/day	Dizziness, headache, nausea

### Alpha-Glucosidase Inhibitors

<b>Acarbose (Precose)</b>	T: 25 mg, 50 mg, 100 mg	Initially, 25 mg 3 times/day. May increase at 4–8 wk intervals. Usual dose: 50–100 mg 3 times/day	Flatulence, diarrhea, abdominal pain, increased risk of hypoglycemia when used with insulin or sulfonylureas
<b>Miglitol (Glyset)</b>	T: 25 mg, 50 mg, 100 mg	Initially, 25 mg 3 times/day. May increase at 4–8 wk intervals to 50 mg 3 times/day, then 100 mg 3 times/day	Flatulence, diarrhea, abdominal pain, rash

### Dipeptidyl Peptidase Inhibitors

<b>Alogliptin (Nesina)</b>	T: 6.25 mg, 12.5 mg, 25 mg	6.25–25 mg/day	Nasopharyngitis, cough, headache, upper respiratory tract infections
<b>Linagliptin (Tradjenta)</b>	T: 5 mg	5 mg/day	Arthralgia, back pain, headache
<b>Saxagliptin (Onglyza)</b>	T: 2.5 mg, 5 mg	2.5–5 mg/day	Upper respiratory tract infection, urinary tract infection, headache
<b>Sitagliptin (Januvia)</b>	T: 25 mg, 50 mg, 100 mg	25–100 mg/day	Nasopharyngitis, upper respiratory infection, headaches, modest weight gain, increased incidence of hypoglycemia when added to a sulfonyleurea

### Biguanides

<b>Metformin (Glucophage)</b>	T: 500 mg, 850 mg, 1,000 mg XR: 500 mg, 750 mg, 1,000 mg	T: Initially, 500 mg 2 times/day or 850 mg once daily. May increase by 500 mg/day at wkly intervals up to 2,550 mg/day XR: Initially, 500–1,000 mg/day. May increase by 500 mg/day at wkly intervals up to 2,500 mg/day	Nausea, vomiting, diarrhea, loss of appetite, metallic taste, lactic acidosis (rare but potentially fatal complication)
-------------------------------	---	--	---

## ANTIDIABETICS—cont'd

Name	Availability	Dosage Range	Side Effects
<b>Glucagon-Like Peptide-1 (GLP-1)</b>			
<b>Albiglutide (Tanzeum)</b>	I: 30 mg, 50 mg	30–50 mg once wkly	Diarrhea, nausea, upper respiratory tract infection, injection site reaction
<b>Exenatide (Byetta)</b>	I: 5 mcg, 10 mcg	5–10 mcg 2 times/day	Diarrhea, dizziness, dyspnea, headaches, nausea, vomiting
<b>Exenatide extended-release (Bydureon)</b>	I: 2 mg	2 mg once wkly	Diarrhea, nausea, headache
<b>Liraglutide (Victoza)</b>	I: 0.6 mg, 1.2 mg, 1.8 mg (6 mg/mL)	Initially, 0.6 mg/day. May increase at weekly intervals up to 1.2 mg/day, then 1.8 mg/day	Headache, nausea, diarrhea
<b>Lixisenatide (Adlyxin)</b>	I: 50 mcg/mL, 100 mcg/mL	20 mcg SC once daily	Nausea, vomiting, headache, dizziness
<b>Semaglutide (Ozempic, Rybelsus)</b>	I: 2 mg/1.5 mL delivers 0.25 mg, 0.5 mg or 1 mg per injection T: 3 mg, 7 mg, 14 mg	<b>SO:</b> Initially, 0.25 mg once wkly for 4 wks, then 0.5 mg for at least 4 wks up to maximum of 1 mg once wkly. <b>PO:</b> Initially, 3 mg once daily for 30 days, then 7 mg once daily for 30 days, then 14 mg once daily thereafter	<b>SO:</b> Increased amylase, lipase, nausea, diarrhea, vomiting, abdominal pain, constipation, dyspepsia <b>PO:</b> Nausea, vomiting, abdominal pain, diarrhea, constipation
<b>Meglitinides</b>			
<b>Nateglinide (Starlix)</b>	T: 60 mg, 120 mg	60–120 mg 3 times/day	Hypoglycemia, upper respiratory infection, dizziness, back pain, flu-like syndrome

<b>Repaglinide (Prandin)</b>	T: 0.5 mg, 1 mg, 2 mg	0.5–1 mg with each meal. Usual dose: 0.5–4 mg/day <b>(Maximum: 16 mg/day)</b>	Headache, hypoglycemia, upper respiratory infection
<b>SGLT2</b>			
<b>Canagliflozin (Invokana)</b>	T: 100 mg, 300 mg	100–300 mg/day before first meal of day	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct. Hyperkalemia, hypermagnesemia, hyperphosphatemia, fractures
<b>Dapagliflozin (Farxiga)</b>	T: 5 mg, 10 mg	5–10 mg/day in morning	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct. Hyperphosphatemia, fractures
<b>Empagliflozin (Jardiance)</b>	T: 10 mg, 25 mg	10–25 mg/day in morning	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct
<b>Ertugliflozin (Steglatro)</b>	T: 5 mg, 15 mg	Initially, 5 mg once daily in morning. <b>Maximum:</b> 15 mg once daily	Genital candidiasis, headache, back pain, urinary frequency, vulvovaginal pruritus, nasopharyngitis

*Continued*

## ANTIDIABETICS—cont'd

Name	Availability	Dosage Range	Side Effects
<b>Thiazolidinediones</b>			
<b>Pioglitazone (Actos)</b>	<b>T:</b> 15 mg, 30 mg, 45 mg	15–30 mg/day	Mild to moderate peripheral edema, weight gain, increased risk of HF, associated with reduced bone mineral density and increased incidence of fractures
<b>Rosiglitazone (Avandia)</b>	<b>T:</b> 2 mg, 4 mg, 8 mg	Initially, 4 mg/day. May increase at 8–12 wks to 8 mg/day as a single or 2 divided doses	Increased cholesterol, weight gain, back pain, upper respiratory tract infection
<b>Miscellaneous</b>			
<b>Bromocriptine (Cycloset)</b>	<b>T:</b> 0.8 mg	1.6–4.8 mg/day	Nausea, fatigue, dizziness, vomiting
<b>Colesevelam (Welchol)</b>	<b>T:</b> 625 mg <b>S:</b> 1.875 g, 3.75 g packet	3.75 g/day	Constipation, dyspepsia, nausea
<b>Pramlintide (Symlin)</b>	<b>I:</b> 1,500 mcg/1.5 mL, 2,700 mcg/2.7 mL	Type 1: 15–60 mcg immediately prior to meals Type 2: 60–120 mcg immediately prior to meals	Abdominal pain, anorexia, headaches, nausea, vomiting, severe hypoglycemia may occur when used in combination with insulin (reduction in dosages of short-acting, including premixed, insulins recommended)

**HF**, Heart failure; **I**, injection; **PT**, pretab; **S**, suspension; **T**, tablets; **XL**, extended-release; **XR**, extended-release.

# Antidiarrheals

## USES

Acute diarrhea, chronic diarrhea of inflammatory bowel disease, reduction of fluid from ileostomies.

## ACTION

*Systemic agents:* Act as smooth muscle receptors (enteric) disrupting peristaltic movements, decreasing GI motility, increasing transit time of intestinal contents.

*Local agents:* Adsorb toxic substances and fluids to large surface areas of particles in the preparation. Some of these agents coat and protect irritated intestinal walls. May have local anti-inflammatory action.

## ANTIDIARRHEALS

Name	Availability	Type	Dosage Range
<b>Bismuth (Pepto-Bismol)</b>	<b>T:</b> 262 mg <b>C:</b> 262 mg <b>L:</b> 130 mg/15 mL, 262 mg/15 mL, 524 mg/15 mL	Local	<b>A:</b> 2 <b>T</b> or 30 mL <b>C (9–12 yrs):</b> 1 <b>T</b> or 15 mL <b>C (6–8 yrs):</b> 2/3 <b>T</b> or 10 mL <b>C (3–5 yrs):</b> 1/3 <b>T</b> or 5 mL
<b>Diphenoxylate with atropine (Lomotil)</b>	<b>T:</b> 2.5 mg <b>L:</b> 2.5 mg/5 mL	Systemic	<b>A:</b> 5 mg 4 times/day <b>C:</b> 0.3–0.4 mg/kg/day in 4 divided doses ( <b>L</b> )
<b>Loperamide (Imodium)</b>	<b>C:</b> 2 mg <b>T:</b> 2 mg <b>L:</b> 1 mg/5 mL, 1 mg/mL	Systemic	<b>A:</b> Initially, 4 mg ( <b>Maximum:</b> 16 mg/day) <b>C (9–12 yrs):</b> 2 mg 3 times/day <b>C (6–8 yrs):</b> 2 mg 2 times/day <b>C (2–5 yrs):</b> 1 mg 3 times/day ( <b>L</b> )

**A,** Adults; **C,** capsules; **C (dosage),** children; **L,** liquid; **S,** suspension; **T,** tablets.

## Antifungals: Systemic Mycoses

Systemic mycoses are subdivided into opportunistic infections (candidiasis, aspergillosis, cryptococcosis, and mucormycosis) that are seen primarily in debilitated or immunocompromised hosts and nonopportunistic infections (blastomycosis, histoplasmosis, and coccidioidomycosis) that occur in any host. Treatment can be difficult because these infections often resist treatment and may require prolonged therapy.

### ANTIFUNGALS: SYSTEMIC MYCOSES

Name	Indications	Side Effects
<b>Amphotericin B</b>	Potentially life-threatening fungal infections, including aspergillosis, blastomycosis, coccidioidomycosis, cryptococcosis, histoplasmosis, systemic candidiasis	Fever, chills, headache, nausea, vomiting, nephrotoxicity, hypokalemia, hypomagnesemia, hypotension, dyspnea, arrhythmias, abdominal pain, diarrhea, increased hepatic function tests
<b>Amphotericin B lipid complex (Abelcet)</b>	Invasive fungal infections	Chills, fever, hypotension, headache, nausea, vomiting
<b>Amphotericin B liposomal (AmBisome)</b>	Empiric therapy for presumed fungal infections in febrile neutropenic pts, treatment of cryptococcal meningitis in HIV-infected pts, treatment of <i>Aspergillus</i> , <i>Candida</i> , <i>Cryptococcus</i> infections, treatment of visceral leishmaniasis	Peripheral edema, tachycardia, hypotension, chills, insomnia, headache
<b>Amphotericin colloidal dispersion (Amphotec)</b>	Invasive <i>Aspergillus</i>	Hypotension, tachycardia, chills, fever, vomiting
<b>Anidulafungin (Eraxis)</b>	Candidemia, esophageal candidiasis	Diarrhea, hypokalemia, increased hepatic function tests, headache

<b>Caspofungin (Cancidas)</b>	Candidemia, invasive aspergillosis, empiric therapy for presumed fungal infections in febrile neutropenic pts	Headache, nausea, vomiting, diarrhea, increased hepatic function tests
<b>Fluconazole (Diflucan)</b>	Treatment of vaginal candidiasis; oropharyngeal, esophageal candidiasis; and cryptococcal meningitis. Prophylaxis to decrease incidence of candidiasis in pts undergoing bone marrow transplant receiving cytotoxic chemotherapy and/or radiation	Nausea, vomiting, abdominal pain, diarrhea, dysgeusia, increased hepatic function tests, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia, alopecia
<b>Isavuconazonium (Cresemba)</b>	Treatment of invasive aspergillosis, invasive mucormycosis	Nausea, vomiting, diarrhea, increased hepatic enzymes, hypokalemia, constipation, dyspnea, cough, peripheral edema, back pain
<b>Itraconazole (Sporanox)</b>	Blastomycosis, histoplasmosis, aspergillosis, onychomycosis, empiric therapy of febrile neutropenic pts with suspected fungal infections, treatment of oropharyngeal and esophageal candidiasis	Congestive heart failure, peripheral edema, nausea, vomiting, abdominal pain, diarrhea, increased hepatic function tests, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia
<b>Ketoconazole (Nizoral)</b>	Candidiasis, chronic mucocutaneous candidiasis, oral thrush, candiduria, blastomycosis, coccidioidomycosis	Nausea, vomiting, abdominal pain, diarrhea, gynecomastia, increased LFTs, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia
<b>Micafungin (Mycamine)</b>	Esophageal candidiasis, <i>Candida</i> infections, prophylaxis in pts undergoing hematopoietin stem cell transplantation	Fever, chills, hypokalemia, hypomagnesemia, hypocalcemia, myelosuppression, thrombocytopenia, nausea, vomiting, abdominal pain, diarrhea, increased LFTs, dizziness, headache, rash, pruritus, pain or inflammation at injection site, fever
<b>Posaconazole (Noxafil)</b>	Prevent invasive aspergillosis and <i>Candida</i> infections in pts 13 yrs and older who are immunocompromised, treatment of oropharyngeal candidiasis	Fever, headaches, nausea, vomiting, diarrhea, abdominal pain, hypokalemia, cough, dyspnea
<b>Voriconazole (Vfend)</b>	Invasive aspergillosis, candidemia, esophageal candidiasis, serious fungal infections	Visual disturbances, nausea, vomiting, abdominal pain, diarrhea, increased LFTs, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia

## Antiglaucoma Agents

### USES

Reduction of elevated intraocular pressure (IOP) in pts with open-angle glaucoma and ocular hypertension.

### ACTION

Medications decrease IOP by two primary mechanisms: decreasing aqueous humor (AH) production or increasing AH outflow.

- *Alpha<sub>2</sub> agonists*: Activate receptors in ciliary body, inhibiting aqueous secretion and increasing uveoscleral aqueous outflow.
- *Beta blockers*: Reduce production of aqueous humor.
- *Carbonic anhydrase inhibitors*: Decrease production of AH by inhibiting enzyme carbonic anhydrase.
- *Prostaglandins*: Increase outflow of aqueous fluid through uveoscleral route.
- *Rho kinase inhibitors*: Inhibits the norepinephrine transporter. Decreases resistance in the trabecular meshwork outflow pathway, decreases aqueous humor production, and increases outflow of aqueous humor.

### ANTIGLAUCOMA AGENTS

Name	Availability	Dosage Range	Side Effects
<b>Alpha<sub>2</sub> Agonists</b>			
<b>Apraclonidine (Iopidine)</b>	<b>S:</b> 0.5%, 1%	1 drop bid or tid	Fatigue, somnolence, local allergic reaction, dry eyes, stinging
<b>Brimonidine (Alphagan HP)</b>	<b>S:</b> 0.1%, 0.15%, 0.2%	1 drop bid or tid	Same as apraclonidine

## Prostaglandins

<b>Bimatoprost (Lumigan)</b>	<b>S:</b> 0.01%, 0.03%	1 drop daily in evening	Conjunctival hyperemia; darkening of iris, eyelids; increase in length, thickness, and number of eye-lashes; local irritation; itching; dryness; blurred vision
<b>Latanoprost (Xalatan)</b>	<b>S:</b> 0.005%	1 drop daily in evening	See bimatoprost
<b>Latanoprostene bunod (Vyelta)</b>	<b>S:</b> 0.0024%	1 drop every evening	Conjunctival hyperemia, eye irritation, eye pain, iris pigmentation
<b>Tafluprost (Zioptan)</b>	<b>S:</b> 0.0015%	1 drop daily in evening	See bimatoprost
<b>Travoprost (Travatan)</b>	<b>S:</b> 0.004%	1 drop daily in evening	See bimatoprost

## Beta Blockers

<b>Betaxolol (Betoptic, Betoptic-S)</b>	<b>Suspension (Betoptic-S):</b> 0.25% <b>S (Betoptic):</b> 0.5%	Betoptic-S: 1 drop 2 times/day Betoptic: 1–2 drops 2 times/day	Fatigue, dizziness, bradycardia, respiratory depression, mask symptoms of hypoglycemia, block effects of beta agonists in treatment of asthma
<b>Carteolol (Ocupress)</b>	<b>S:</b> 1%	1 drop 2 times/day	Same as betaxolol
<b>Levobunolol (Betagan)</b>	<b>S:</b> 0.25%, 0.5%	1 drop 1–2 times/day	Same as betaxolol
<b>Metipranolol (OptiPranolol)</b>	<b>S:</b> 0.3%	1 drop 2 times/day	Same as betaxolol
<b>Timolol (Betimol, Istalol, Timoptic, Timoptic XE)</b>	<b>S:</b> 0.25%, 0.5% <b>G, Timoptic XE:</b> 0.25%, 0.5%	<b>S:</b> 1 drop 2 times/day (Istalol): 1 drop daily <b>G:</b> 1 drop daily	Same as betaxolol

## Carbonic Anhydrase Inhibitors

<b>Brinzolamide (Azopt)</b>	<b>Suspension:</b> 1%	1 drop 3 times/day	Bitter taste, stinging, redness, burning, conjunctivitis, dry eyes, blurred vision
<b>Dorzolamide (Trusopt)</b>	<b>S:</b> 2%	1 drop 3 times/day	Same as brinzolamide

Continued

**ANTIGLAUCOMA AGENTS—cont'd**

Name	Availability	Dosage Range	Side Effects
<b>Rho Kinase Inhibitors</b>			
<b>Netarsudil (Rhopressa)</b>	<b>S:</b> 0.02%	1 drop every evening	Conjunctival hyperemia, corneal verticillata, instillation site pain, conjunctival hemorrhage, blurred vision, increased lacrimation, reduced visual acuity
<b>Combinations</b>			
<b>Brimonidine/timolol (Combigan)</b>	0.2%/0.5%	1 drop bid	See individual agents
<b>Brinzolamide/brimonidine (Simbrinza)</b>	1%/0.2%	1 drop tid	See individual agents
<b>Timolol/dorzolamide (Cosopt)</b>	0.5%/2%	1 drop bid	See individual agents

*C*, Capsules; *G*, gel; *O*, ointment; *S*, solution; *T*, tablets.

## Antihistamines

### USES

Symptomatic relief of upper respiratory allergic disorders. Allergic reactions associated with other drugs respond to antihistamines, as do blood transfusion reactions. Used as a second-choice drug in treatment of angioneurotic edema. Effective in treatment of acute urticaria and other dermatologic conditions. May also be used for preop sedation, Parkinson's disease, and motion sickness.

### ACTION

Antihistamines ( $H_1$  antagonists) inhibit vasoconstrictor effects and vasodilator effects on endothelial cells of histamine. They block increased capillary permeability, formation of edema/wheal caused by histamine. Many antihistamines can bind to receptors in CNS, causing

primarily depression (decreased alertness, slowed reaction times, drowsiness) but also stimulation (restlessness, nervousness, inability to sleep). Some may counter motion sickness.

## ANTIHISTAMINES

Name	Availability	Dosage Range	Side Effects
<b>Cetirizine (Zyrtec)</b>	<b>T:</b> 5 mg, 10 mg <b>C:</b> 5 mg, 10 mg <b>T (Chew):</b> 5 mg/10 mg <b>S:</b> 5 mg/5 mL	<b>A:</b> 5–10 mg/day <b>C (6–12 yrs):</b> 5–10 mg/day <b>C (2–5 yrs):</b> 2.5–5 mg/day	Headache, somnolence, fatigue, abdominal pain, dry mouth
<b>Desloratadine (Clarinet)</b>	<b>T:</b> 5 mg <b>ODT:</b> 2.5 mg, 5 mg <b>S:</b> 0.5 mg/mL	<b>A, C (12 yrs and older):</b> 5 mg/day <b>C (6–11 yrs):</b> 2.5 mg/day <b>C (1–5 yrs):</b> 1.25 mg/day <b>C (6–11 mos):</b> 1 mg/day	Dizziness, fatigue, headache, nausea
<b>Dimenhydrinate (Dramamine)</b>	<b>T:</b> 50 mg <b>T (Chew):</b> 25 mg, 50 mg	<b>A:</b> 50–100 mg q4–6h <b>C:</b> 12.5–50 mg q6–8h	Dizziness, drowsiness, headache, nausea
<b>Diphenhydramine (Benadryl)</b>	<b>T:</b> 25 mg, 50 mg <b>C:</b> 25 mg, 50 mg <b>L:</b> 12.5 mg/5 mL	<b>A:</b> 25–50 mg q6–8h <b>C (6–11 yrs):</b> 12.5–25 mg q4–6h <b>C (2–5 yrs):</b> 6.25 mg q4–6h	Chills, confusion, dizziness, fatigue, headache, sedation, nausea
<b>Fexofenadine (Allegra)</b>	<b>T:</b> 30 mg, 60 mg, 180 mg <b>ODT:</b> 30 mg <b>S:</b> 30 mg/5 mL	<b>A:</b> 60 mg q12h or 180 mg/day <b>C (2–11 yrs):</b> 30 mg q12h <b>(6–23 mos):</b> 15 mg bid	Headache, vomiting, fatigue, diarrhea
<b>Hydroxyzine (Atarax)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg <b>C:</b> 25 mg, 50 mg, 100 mg <b>S:</b> 10 mg/5 mL	<b>A:</b> 25 mg q6–8h <b>C:</b> 2 mg/kg/day in divided doses q6–8h	Dizziness, drowsiness, fatigue, headache
<b>Levocetirizine (Xyzal)</b>	<b>T:</b> 5 mg <b>S:</b> 2.5 mg/mL	<b>A, C (12 yrs and older):</b> 5 mg once daily in evening <b>C (6–11 yrs):</b> 2.5 mg once daily in evening <b>(6 mos–5 yrs):</b> 1.25 mg once daily	Fatigue, fever, somnolence, vomiting

Continued

## ANTIHISTAMINES—cont'd

Name	Availability	Dosage Range	Side Effects
<b>Loratadine (Claritin)</b>	<b>ODT:</b> 10 mg <b>T (Chew):</b> 5 mg <b>T:</b> 10 mg <b>S:</b> 1 mg/mL	<b>A:</b> 10 mg/day <b>C (6–12 yrs):</b> 10 mg/day (2–5 yrs): 5 mg/day	Fatigue, headache, malaise, somnolence, abdominal pain
<b>Promethazine (Phenergan)</b>	<b>T:</b> 12.5 mg, 25 mg, 50 mg <b>S:</b> 6.25 mg/5 mL	<b>A:</b> 25 mg at bedtime or 12.5 mg q8h <b>C:</b> 0.5 mg/kg at bedtime or 0.1 mg/kg q6–8h	Confusion, dizziness, drowsiness, fatigue, constipation, nausea, vomiting

**A**, Adults; **C**, capsules; **C** (*dosage*), children; **L**, liquid; **ODT**, orally disintegrating tablet; **S**, syrup; **SR**, sustained-release; **T**, tablets.

## Antihyperlipidemics

### USES

Cholesterol management.

### ACTION

**Bile acid sequestrants:** Bind bile acids in the intestine; prevent active transport and reabsorption and enhance bile acid excretion. Depletion of hepatic bile acid results in the increased conversion of cholesterol to bile acids.

**HMG-CoA reductase inhibitors (statins):** Inhibit HMG-CoA reductase, the last regulated step in the synthesis of cholesterol. Cholesterol synthesis in the liver is reduced.

**Niacin (nicotinic acid):** Reduces hepatic synthesis of triglycerides and secretion of very low density lipoprotein (VLDL) by inhibiting the mobilization of free fatty acids from peripheral tissues.

**Fibric acid:** Increases the oxidation of fatty acids in the liver, resulting in reduced secretion of triglyceride-rich lipoproteins,

and increases lipoprotein lipase activity and fatty acid uptake.

**Cholesterol absorption inhibitor:** Acts in the gut wall to prevent cholesterol absorption through the intestinal villi.

**Omega fatty acids:** Exact mechanism unknown. Mechanisms may include inhibition of acyl-CoA, decreased lipogenesis in liver, increased lipoprotein lipase activity.

**PCSK9 inhibitors:** Binds with high-affinity and specificity to LDL cholesterol receptors, promoting their degradation.

**Adenosine triphosphate–citrate lyase (ACL) inhibitor:** ACL is an enzyme involved in hepatic cholesterol synthesis. Increases LDL from blood.

## ANTHYPERLIPIDEMICS

Name	Primary Effect	Dosage	Comments/Side Effects
<b>Bile Acid Sequestrants</b>			
<b>Cholestyramine (Prevalite, Questran)</b>	Decreases LDL Increases HDL, TG	4 g 1–2 times/day. May increase over 1 mo interval. Usual dose: 8–16 g/day in 2 divided doses	<b>Class Side Effects:</b> Constipation, heartburn, nausea, eructation, and bloating May increase triglyceride levels. Avoid use with triglyceride levels greater than 300 mg/dL
<b>Colesevelam (Welchol)</b>	Decreases LDL Increases HDL, TG	3.75 g once daily or 1.875 g 2 times/day	
<b>Colestipol (Colestid)</b>	Decreases LDL Increases TG	<b>G:</b> Initially, 5 g once or twice daily. May increase by 5 g/day q1–2 mos. Maintenance: 5–30 g/day. <b>T:</b> Initially, 2 g once or twice daily. May increase by 2 g 2 times/day at 1–2 mo intervals. Maintenance: 2–16 g/day	
<b>Cholesterol Absorption Inhibitor</b>			
<b>Ezetimibe (Zetia)</b>	Decreases LDL Increases HDL Decreases TG	10 mg once daily	Administer at least 2 hrs before or 4 hrs after bile acid sequestrants <b>Side Effects:</b> Dizziness, headache, fatigue, diarrhea, abdominal pain, arthralgia, sinusitis, pharyngitis
<b>Fibric Acid Derivatives</b>			
<b>Fenofibrate (Antara, Lofibra, Tricor, Triglide)</b>	Decreases TG Decreases LDL Increases HDL	<b>Antara:</b> 43–130 mg/day <b>Lofibra:</b> 67–200 mg/day <b>Tricor:</b> 48–145 mg/day <b>Triglide:</b> 50–160 mg/day <b>Fenoglide:</b> 40–120 mg/day <b>Lipofen:</b> 50–150 mg/day	May increase levels of ezetimibe. Concomitant use of statins may increase rhabdomyolysis, elevate CPK levels, and cause myoglobinuria <b>Side Effects:</b> Abdominal pain, constipation, diarrhea, respiratory complaints, headache, fever, flu-like syndrome, asthenia

Continued

## ANTHYPERLIPIDEMICS—cont'd

Name	Primary Effect	Dosage	Comments/Side Effects
<b>Fenofibric acid (Fibricor, Trilipix)</b>	Decreases TG, LDL Increases HDL	<b>Trilipix:</b> 45–135 mg/day <b>Fibricor:</b> 35–105 mg/day	May give without regard to meals. Concomitant use of statins may increase rhabdomyolysis <b>Side Effects:</b> Headache, upper respiratory tract infection, pain, nausea, dizziness, nasopharyngitis
<b>Gemfibrozil (Lopid)</b>	Decreases TG Increases HDL	600 mg 2 times/day	Give 30 min before breakfast and dinner. Concomitant use of statins may increase rhabdomyolysis, elevate CPK levels, and cause myoglobinuria <b>Side Effects:</b> Fatigue, vertigo, headache, rash, eczema, diarrhea, abdominal pain, nausea, vomiting, constipation
<b>Niacin</b>			
<b>Niacin, nicotinic acid (Niacor, Niaspan)</b>	Decreases LDL, TG Increases HDL	<b>Regular-release (Niacor):</b> 1 g tid <b>Extended-release (Niaspan):</b> 1 g at bedtime	Diabetics may experience a dose-related elevation in glucose <b>Side Effects:</b> Increased LFT, hyperglycemia, dyspepsia, itching, flushing, dizziness, insomnia
<b>Statins</b>			
<b>Atorvastatin (Lipitor)</b>	Decreases LDL, TG Increases HDL	Initially, 10–20 mg/day Range: 10–80 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit juice) increasing risk of myopathy <b>Side Effects:</b> Myalgia, myopathy, rhabdomyolysis, headache, chest pain, peripheral edema, dizziness, rash, abdominal pain, constipation, diarrhea, dyspepsia, nausea, flatulence, increased LFT, back pain, sinusitis
<b>Fluvastatin (Lescol)</b>	Decreases LDL, TG Increases HDL	40–80 mg/day	Primarily metabolized by CYP2C9 enzyme system. May increase levels of phenytoin, rifampin. May lower fluvastatin levels <b>Side Effects:</b> Headache, fatigue, dyspepsia, diarrhea, nausea, abdominal pain, myalgia, myopathy, rhabdomyolysis

<b>Lovastatin (Mevacor)</b>	Decreases LDL, TG Increases HDL	Initially, 20 mg/day. Adjust at 4 wk intervals <b>Maximum:</b> 80 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit products) increasing risk of myopathy <b>Side Effects:</b> Increased CPK levels, headache, dizziness, rash, constipation, diarrhea, abdominal pain, dyspepsia, nausea, flatulence, myalgia, myopathy, rhabdomyolysis
<b>Pitavastatin (Livalo)</b>	Decreases LDL, TG Increases HDL	Initially, 2 mg/day. May increase at 4 wk intervals to 4 mg/day	Erythromycin, rifampin may increase concentration <b>Side Effects:</b> Myalgia, back pain, diarrhea, constipation, pain in extremities
<b>Pravastatin (Pravachol)</b>	Decreases LDL, TG Increases HDL	Initially, 40 mg/day. Titrate to response Range: 10–80 mg/day	May be less likely to be involved in drug interactions Cyclosporine may increase pravastatin levels <b>Side Effects:</b> Chest pain, headache, dizziness, rash, nausea, vomiting, diarrhea, increased LFTs, cough, flu-like symptoms, myalgia, myopathy, rhabdomyolysis
<b>Rosuvastatin (Crestor)</b>	Decreases LDL, TG Increases HDL	Initially, 10–20 mg/day Titrate to response Range: 5–40 mg/day	May be less likely to be involved in drug interactions Cyclosporine may increase rosuvastatin levels <b>Side Effects:</b> Chest pain, peripheral edema, headache, rash, dizziness, vertigo, pharyngitis, diarrhea, nausea, constipation, abdominal pain, dyspepsia, sinusitis, flu-like symptoms, myalgia, myopathy, rhabdomyolysis
<b>ACL Inhibitor</b>			
<b>Bempedoic acid (Nexletol)</b>	Decreases LDL	180 mg once daily	Back pain, extremity pain, elevated liver enzymes, hyperuricemia, gout, tendonitis

*Continued*

**ANTHYPERLIPIDEMICS—cont'd**

Name	Primary Effect	Dosage	Comments/Side Effects
<b>Simvastatin (Zocor)</b>	Decreases LDL, TG Increases HDL	5–40 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit products) increasing risk of myopathy <b>Side Effects:</b> Constipation, flatulence, dyspepsia, increased LFTs, increased CPK, upper respiratory tract infection
<b>Omega Fatty Acids</b>			
<b>Icosapent (Vascepa)</b>	Decreases TG	2 g 2 times/day	<b>Side Effects:</b> Arthralgia
<b>Lovaza</b>	Decreases TG Increases LDL, HDL	2 g 2 times/day or 4 g once daily	Use with caution with fish or shellfish allergy <b>Side Effects:</b> Eructation, dyspepsia, taste perversion
<b>PCSK9 Inhibitors</b>			
<b>Alirocumab (Praluent)</b>	Decreases LDL	<b>SQ:</b> 75 mg q2wks	<b>Side Effects:</b> Hypersensitivity reactions (e.g., rash), nasopharyngitis, injection site reactions, influenza
<b>Evolocumab (Repatha)</b>	Decreases LDL	<b>SQ:</b> 140 mg q2wks or 420 mg qmo	<b>Side Effects:</b> Nasopharyngitis, upper respiratory tract infection, influenza, back pain, injection site reactions

**CPK**, Creatine phosphokinase; **G**, granules; **HDL**, high-density lipoprotein; **LDL**, low-density lipoprotein; **SQ**, subcutaneous; **T**, tablets; **TG**, triglycerides.

# Antihypertensives

## USES

Treatment of mild to severe hypertension.

## ACTION

Many groups of medications are used in the treatment of hypertension.

*ACE inhibitors:* Decrease conversion of angiotensin I to angiotensin II, a potent vasoconstrictor, reducing peripheral vascular resistance and B/P.

*Alpha agonists (central action):* Stimulate alpha<sub>2</sub>-adrenergic receptors in the cardiovascular centers of the CNS, reducing sympathetic outflow and producing an antihypertensive effect.

*Alpha antagonists (peripheral action):* Block alpha<sub>1</sub>-adrenergic receptors in arterioles and veins, inhibiting vasoconstriction and decreasing peripheral vascular resistance, causing a fall in B/P.

*Angiotensin receptor blockers:* Block vasoconstrictor effects of angiotensin II by blocking the binding of angiotensin II to AT1 receptors in vascular smooth muscle, helping blood vessels to relax and reduce B/P.

*Beta blockers:* Decrease B/P by inhibiting beta<sub>1</sub> adrenergic receptors, which lowers heart rate, heart workload, and the heart's output of blood.

*Calcium channel blockers:* Reduce B/P by inhibiting flow of extracellular calcium across cell membranes of vascular tissue, relaxing arterial smooth muscle.

*Diuretics:* Inhibit sodium (Na) reabsorption, increasing excretion of Na and water. Reduce plasma, extracellular fluid volume, and peripheral vascular resistance.

*Renin inhibitors:* Directly inhibit renin, decreasing plasma renin activity (PRA), inhibiting conversion of angiotensinogen to angiotensin, producing antihypertensive effect.

*Vasodilators:* Directly relax arteriolar smooth muscle, decreasing vascular resistance. Exact mechanism unknown.

*Continued*

## ANTIHYPERTENSIVES

Name	Availability	Dosage Range	Side Effects
<b>ACE Inhibitors</b>			
<b>Benazepril (Lotensin)</b>	<b>T:</b> 5 mg, 10 mg, 20 mg, 40 mg	20–80 mg/day as single or 2 divided doses	Postural dizziness, headache, cough
<b>Captopril</b>	<b>T:</b> 12.5 mg, 25 mg, 50 mg, 100 mg	50–100 mg 2 times/day	Rash, cough, hyperkalemia
<b>Enalapril (Vasotec)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg, 20 mg	5–40 mg/day in 1–2 divided doses	Hypotension, chest pain, syncope, headache, dizziness, fatigue
<b>Fosinopril</b>	<b>T:</b> 10 mg, 20 mg, 40 mg	10–80 mg once daily or divided bid	Dizziness, cough, hyperkalemia
<b>Lisinopril (Prinivil, Zestril)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg	10–40 mg once daily	Hypotension, headache, fatigue, dizziness, hyperkalemia, cough
<b>Quinapril</b>	<b>T:</b> 5 mg, 10 mg, 20 mg, 40 mg	10–80 mg once daily or divided bid	Hypotension, dizziness, fatigue, headache, myalgia, hyperkalemia
<b>Ramipril (Altace)</b>	<b>T or C:</b> 1.25 mg, 2.5 mg, 5 mg, 10 mg	2.5–20 mg once daily or divided bid	Cough, hypotension, angina, headache, dizziness, hyperkalemia
<b>Alpha Agonists: Central Action</b>			
<b>Clonidine (Catapres)</b>	<b>T:</b> 0.1 mg, 0.2 mg, 0.3 mg <b>P:</b> 0.1 mg/hr, 0.2 mg/hr, 0.3 mg/hr	<b>PO:</b> 0.1–0.8 mg divided bid or tid <b>Topical:</b> 0.1–0.6 mg/wk	Sedation, dry mouth, heart block, rebound hypertension, contact dermatitis with patch, bradycardia, drowsiness
<b>Alpha Agonists: Peripheral Action</b>			
<b>Doxazosin (Cardura)</b>	<b>T:</b> 1 mg, 2 mg, 4 mg, 8 mg	<b>PO:</b> 2–16 mg/day	Dizziness, vertigo, headaches
<b>Prazosin (Minipress)</b>	<b>C:</b> 1 mg, 2 mg, 5 mg	<b>PO:</b> 6–20 mg/day	Dizziness, light-headedness, headaches, drowsiness, palpitations, fluid retention
<b>Terazosin (Hytrin)</b>	<b>C:</b> 1 mg, 2 mg, 5 mg, 10 mg	<b>PO:</b> 1–20 mg/day	Dizziness, headaches, asthenia (loss of strength, energy)

### Angiotensin Receptor Blockers

<b>Azilsartan (Edarbi)</b>	<b>T:</b> 40 mg, 80 mg	40–80 mg once daily	Diarrhea, hypotension, nausea, cough
<b>Candesartan (Atacand)</b>	<b>T:</b> 4 mg, 8 mg, 16 mg, 32 mg	8–32 mg once daily or divided bid	Hypotension, dizziness, headache, hyperkalemia
<b>Eprosartan (Teveten)</b>	<b>T:</b> 400 mg, 600 mg	600 mg once daily	Headache, cough, dizziness
<b>Irbesartan (Avapro)</b>	<b>T:</b> 75 mg, 150 mg, 300 mg	150–300 mg once daily	Fatigue, diarrhea, cough
<b>Losartan (Cozaar)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg	25–100 mg once daily or divided bid	Chest pain, fatigue, hypoglycemia, weakness, cough, hypotension
<b>Olmesartan (Benicar)</b>	<b>T:</b> 5 mg, 20 mg, 40 mg	20–40 mg once daily	Dizziness, headache, diarrhea, flu-like symptoms
<b>Valsartan (Diovan)</b>	<b>T:</b> 80 mg, 160 mg, 320 mg	80–320 mg once daily	Dizziness, fatigue, increased BUN

### Beta Blockers

<b>Atenolol (Tenormin)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg	50–100 mg once daily	Fatigue, bradycardia, reduced exercise tolerance, increased triglycerides, bronchospasm, sexual dysfunction, masked hypoglycemia
<b>Bisoprolol (Zebeta)</b>	<b>T:</b> 5 mg, 10 mg	5–20 mg once daily	Fatigue, insomnia, diarrhea, arthralgia, upper respiratory infections
<b>Carvedilol (Coreg, Coreg CR)</b>	<b>T:</b> 3.125 mg, 6.25 mg, 12.5 mg, 25 mg <b>CR:</b> 10 mg, 20 mg, 40 mg, 80 mg	<b>T:</b> 12.5–50 mg divided bid <b>CR:</b> 20–80 mg once daily	Orthostatic hypotension, fatigue, dizziness
<b>Metoprolol (Lopressor)</b>	<b>T:</b> 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg	100–450 mg bid or tid	Hypotension, bradycardia, fatigue, 1st degree heart block, dizziness
<b>Metoprolol XL (Toprol XL)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg, 200 mg	25–400 mg once daily	Same as metoprolol
<b>Nebivolol (Bystolic)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg, 20 mg	5–40 mg once daily	Upper respiratory tract infection, dizziness, fatigue

Continued

**ANTIHYPERTENSIVES—cont'd**

Name	Availability	Dosage Range	Side Effects
<b>Calcium Channel Blockers</b>			
<b>Amlodipine (Norvasc)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg	2.5–10 mg once daily	Headache, fatigue, peripheral edema, flushing, worsening heart failure, rash, gingival hyperplasia, tachycardia
<b>Diltiazem CD (Cardizem CD)</b>	<b>C:</b> 120 mg, 180 mg, 240 mg, 300 mg	240–360 mg once daily	Dizziness, headache, bradycardia, heart block, worsening heart failure, edema, constipation
<b>Felodipine (Plendil)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg	2.5–10 mg once daily	Headache, flushing, peripheral edema, rash, gingival hyperplasia, tachycardia
<b>Nifedipine XL (Adalat CC, Procardia XL)</b>	<b>T:</b> 30 mg, 60 mg, 90 mg	30–90 mg once daily	Flushing, peripheral edema, headache, dizziness, nausea
<b>Verapamil SR (Calan SR)</b>	<b>T:</b> 120 mg, 180 mg, 240 mg <b>T (Sustained-Release):</b> 120 mg, 180 mg	<b>T (Immediate-Release):</b> 80–160 mg tid <b>T (Sustained-Release):</b> 240–480 mg once daily or divided bid	Headache, gingival hyperplasia, constipation
<b>Diuretics</b>			
<b>Chlorthalidone (Hygroton)</b>	<b>T:</b> 25 mg, 50 mg	12.5–25 mg/day	Same as hydrochlorothiazide
<b>Hydrochlorothiazide (Hydrodiuril)</b>	<b>T:</b> 25 mg, 50 mg	12.5–50 mg/day	Hypokalemia, hyperuricemia, hypomagnesemia, hyperglycemia Pancreatitis, rash, photosensitivity, hyponatremia, hypercalcemia, hypercholesterolemia, hypertriglyceridemia

## Renin Inhibitor

<b>Aliskiren (Tekturna)</b>	<b>T:</b> 150 mg, 300 mg	<b>PO:</b> 150–300 mg/day	Diarrhea, dyspepsia, headache, dizziness, fatigue, upper respiratory tract infection
-----------------------------	--------------------------	---------------------------	--

## Vasodilators

<b>Hydralazine (Apresoline)</b>	<b>T:</b> 10 mg, 25 mg, 50 mg, 100 mg	<b>PO:</b> 40–300 mg/day	Headaches, palpitations, aggravation of angina, dizziness, fluid retention, nasal congestion
<b>Minoxidil (Loniten)</b>	<b>T:</b> 2.5 mg, 10 mg	<b>PO:</b> 10–40 mg/day	Rapid/irregular heartbeat, hypertrichosis, peripheral edema, aggravation of angina, fluid retention

*C*, Capsules; *P*, patch; *PO*, oral; *T*, tablets.

## Antimigraine (Treatment/Prevention)

### USES

Treatment of migraine headaches with or without aura in adults 18 yrs and older.

### ACTION

**Triptans:** Selective agonists of the serotonin (5-HT) receptor in cranial arteries, which cause vasoconstriction and reduce inflammation associated with antidromic neuronal transmission correlating with relief of migraine headache.

**CGRP RECEPTOR ANTAGONISTS:** CGRP is a potent endogenous vasodilator/pain signaling neuromodulator. CGRP appears to increase during migraine attacks.

*Continued*

## ACTION

**SELECTIVE 5-HT RECEPTOR AGONIST:** Selectively binds to 5-HT receptors expressed on trigeminal neurons, inhibits pain pathways in central/peripheral trigeminal system.

**ERGOTS:** Bind to serotonin receptors. This reduces swelling in the blood vessels. May also disrupt pain signals from the trigeminal nerves.

**CGRP ANTIBODIES:** A human monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor, antagonizing CGRP receptor function.

## ANTIMIGRAINE

Name	Availability	Dosage Range	Common Side Effects
<b>GC Receptor Antagonists</b>			
<b>Rimegepant (Nurtec ODT)</b>	<b>DT:</b> 75 mg	75 mg once ( <b>Maximum:</b> 75 mg/day)	Nausea, somnolence
<b>Ubrogepant (Ubrelvy)</b>	<b>T:</b> 50 mg, 100 mg	50 or 100 mg. May repeat after 2 hrs ( <b>Maximum:</b> 200 mg/day)	Nausea, somnolence
<b>TRIPTANS</b>			
<b>Almotriptan (Axert)</b>	<b>T:</b> 6.25 mg, 12.5 mg	6.25–12.5 mg; may repeat after 2 hrs ( <b>Maximum:</b> 25 mg/day)	Drowsiness, dizziness, paresthesia, nausea, vomiting, headache, xerostomia
<b>Eletriptan (Relpax)</b>	<b>T:</b> 20 mg, 40 mg	<b>A:</b> 20–40 mg; may repeat after 2 hrs ( <b>Maximum:</b> 80 mg/day)	Chest pain, dizziness, drowsiness, headache, paresthesia, nausea, xerostomia, weakness
<b>Frovatriptan (Frova)</b>	<b>T:</b> 2.5 mg	2.5 mg; may repeat after 2 hrs; no more than 3 <b>T</b> /day ( <b>Maximum:</b> 7.5 mg/day)	Hot/cold sensations, dizziness, fatigue, headaches, skeletal pain, dyspepsia, flushing, paresthesia, drowsiness, xerostomia, nausea
<b>Naratriptan (Amerge)</b>	<b>T:</b> 1 mg, 2.5 mg	1–2.5 mg; may repeat once after 4 hrs ( <b>Maximum:</b> 5 mg/day)	Neck pain, pain, nausea, fatigue

<b>Rizatriptan (Maxalt, Maxalt-MLT)</b>	<b>T:</b> 5 mg, 10 mg <b>DT:</b> 5 mg, 10 mg	5 or 10 mg; may repeat after 2 hrs ( <b>Maximum:</b> 30 mg/day)	Chest pain, drowsiness, xerostomia, weakness, paresthesia, nausea, dizziness, drowsiness, fatigue
<b>Sumatriptan (Imitrex, Sumavel DosePro, Onzetra, Xsail, Zecuity)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg <b>NS:</b> 5 mg, 10 mg, 20 mg <b>I:</b> 4 mg, 6 mg <b>NP:</b> 8 pouches of 2 nose pieces each 11 mg/piece	<b>PO:</b> 25–100 mg; may repeat after 2 hrs ( <b>Maximum:</b> 200 mg/day) <b>NS:</b> 5–20 mg; may repeat after 2 hrs ( <b>Maximum:</b> 40 mg/day) <b>SO:</b> 3–6 mg; may repeat after 1 hr ( <b>Maximum:</b> 12 mg/day) <b>NP:</b> 22 mg; may repeat after 2 hrs ( <b>Maximum:</b> 44 mg/day)	<i>Oral:</i> Hot/cold flashes, paresthesia, malaise, fatigue <i>Injection:</i> Atypical sensations, flushing, chest pain/discomfort, injection site reaction, dizziness, vertigo, paresthesia, bleeding, bruising, swelling, erythema at injection site <i>Nasal:</i> Discomfort, nausea, vomiting, altered taste <i>Transdermal:</i> Localized pain, skin discoloration, allergic contact dermatitis, pruritus, local irritation
<b>Zolmitriptan (Zomig, Zomig-ZMT)</b>	<b>T:</b> 2.5 mg, 5 mg <b>DT:</b> 2.5 mg, 5 mg <b>NS:</b> 2.5 mg/0.1 mL, 5 mg/0.1 mL	<b>PO:</b> 2.5–5 mg; may repeat after 2 hrs ( <b>Maximum:</b> 10 mg/day) <b>NS:</b> 1 spray (2.5 or 5 mg) at onset of migraine headache; may repeat after 2 hrs ( <b>Maximum:</b> 10 mg/day)	Atypical sensations, pain, nausea, dizziness, asthenia, drowsiness

## SELECTIVE 5-HT RECEPTOR AGONIST

<b>Lasmiditan (Reyvow)</b>	<b>T:</b> 50 mg, 100 mg	50 mg, 100 mg, or 200 mg ( <b>Maximum:</b> 1 dose/day)	Dizziness, paresthesia, sedation, vertigo, cognitive changes, confusion
----------------------------	-------------------------	--	---

## CGRP ANTIBODIES

<b>Eptinezumab (Vyepti)</b>	100 mg/mL single-dose vial	<b>IV:</b> 100 mg q3mos	Injection site reactions, constipation
<b>Erenumab (Aimovig)</b>	70 mg, 140 mg single-dose auto-injector	<b>SC:</b> 70 mg once/mo	Injection site reactions, constipation

Continued

## CGRP ANTIBODIES—cont'd

Name	Availability	Dosage Range	Common Side Effects
<b>Fremanezumab (Ajovy)</b>	225 mg/1.5 mL single-dose auto-injector	<b>SC:</b> 225 mg once/mo or 675 mg q3mos	Injection site reactions, constipation
<b>Galcanezumab (Emgality)</b>	120 mg/mL single-use pens/syringes	<b>SC:</b> 240 mg once, then 120 mg once/mo	Injection site reactions, constipation

**A**, Adults; **DT**, disintegrating tablets; **I**, injection; **NP**, nasal powder; **NS**, nasal spray; **SQ**, subcutaneous; **T**, tablets.

## Antipsychotics

### USES

Antipsychotics are primarily used in managing schizophrenia. They may also be used in treatment of bipolar disorder, schizoaffective disorder, and irritability associated with autism. The goals in treating schizophrenia include targeting symptoms, preventing relapse, and increasing adaptive functioning. Use of antipsychotic medications is the mainstay of schizophrenia management.

### ACTION

The precise mechanism of action of antipsychotic medications is unknown, but they have been categorized into two groups:

*Typical (traditional):* Associated with high dopamine antagonism and low serotonin antagonism.

*Atypical:* Those having moderate to high dopamine antagonism and high serotonin antagonism and those having low dopamine antagonism and high serotonin antagonism.

### SIDE EFFECTS (Please refer to individual monographs)

*Typical versus atypical:* Typical antipsychotics are associated with a greater risk of extrapyramidal side effects, and atypicals are associated with a greater risk of weight gain.

*Endocrine:* Hyperprolactinemia, weight gain, increased risk of diabetes.

*Cardiovascular:* Orthostatic hypotension, electrocardiographic changes.

*Lipids:* Increased triglycerides, cholesterol.

*Central nervous system:* Dystonic reactions, akathisia, pseudo-parkinsonism, tardive dyskinesia, sedation, risk of seizures.

## TYPICAL ANTIPSYCHOTICS

Name	Uses	Dosage (Oral)
<b>Fluphenazine</b>	Adult psychosis	1–5 mg/day
<b>Haloperidol (Haldol)</b>	Adult and child psychosis	1–15 mg/day
<b>Thioridazine</b>	Adult, adolescent, child schizophrenia and psychosis	200–800 mg/day
<b>Thiothixene (Navane)</b>	Adult and adolescent schizophrenia	Moderate: 15 mg/day Severe: 20–30 mg/day

## ATYPICAL ANTIPSYCHOTICS

Name	Uses	Dosage
<b>Aripiprazole (Abilify)</b>	Adult and adolescent schizophrenia; adult and child bipolar I disorder; adult major depressive disorder; irritability with adolescent autism	10–15 mg/day
<b>Brexipiprazole (Rexulti)</b>	Adult schizophrenia; adult major depressive disorder	2–4 mg/day
<b>Cariprazine (Vraylar)</b>	Adult schizophrenia, bipolar I disorder (manic or mixed episodes)	1.5–6 mg/day
<b>Clozapine (Clozaril)</b>	Schizophrenia; suicidal behavior in adult schizophrenia and schizoaffective disorder	300–450 mg/day
<b>Iloperidone (Fanapt)</b>	Adult schizophrenia	12–24 mg/day
<b>Lumateperone (Caplyta)</b>	Adult schizophrenia	40–160 mg/day
<b>Lurasidone (Latuda)</b>	Adult schizophrenia, bipolar I disorder (manic or mixed episodes)	40–160 mg/day
<b>Olanzapine (Zyprexa)</b>	Adult, adolescent, and child schizophrenia; adult, adolescent mania in bipolar I disorder	10–20 mg/day
<b>Paliperidone (Invega)</b>	Adult and adolescent schizophrenia; adult schizoaffective disorder	3–12 mg/day
<b>Quetiapine (Seroquel)</b>	Adult and adolescent schizophrenia; adult, adolescent, and child bipolar I disorder	400–800 mg/day
<b>Risperidone (Risperdal)</b>	Adult and adolescent schizophrenia; adult, adolescent, and child bipolar I disorder; irritability with adolescent and child autism	4–8 mg/day
<b>Ziprasidone (Geodon)</b>	Adult schizophrenia; manic or mixed episodes associated with adult bipolar I disorder	40–160 mg/day

## Antivirals

### USES

Treatment of HIV infection. Treatment of cytomegalovirus (CMV) retinitis in pts with AIDS, acute herpes zoster (shingles), genital herpes (recurrent), mucosal and cutaneous herpes simplex virus (HSV), chickenpox, and influenza A viral illness.

### ACTION

Effective antivirals must inhibit virus-specific nucleic acid/protein synthesis. Possible mechanisms of action of antivirals used for non-HIV infection may include interference with viral DNA synthesis and viral replication,

inactivation of viral DNA polymerases, incorporation and termination of the growing viral DNA chain, prevention of release of viral nucleic acid into the host cell, or interference with viral penetration into cells.

### ANTIVIRALS

Name	Availability	Uses	Side Effects
<b>Abacavir (Ziagen)</b>	<b>T:</b> 300 mg <b>OS:</b> 20 mg/mL	HIV infection	Nausea, vomiting, loss of appetite, diarrhea, headaches, fatigue, hypersensitivity reactions
<b>Acyclovir (Zovirax)</b>	<b>T:</b> 400 mg, 800 mg <b>C:</b> 200 mg <b>I:</b> 50 mg/mL	Mucosal/cutaneous HSV-1 and HSV-2, varicella-zoster (shingles), genital herpes, herpes simplex, encephalitis, chickenpox	Malaise, anorexia, nausea, vomiting, light-headedness
<b>Adefovir (Hepsera)</b>	<b>T:</b> 10 mg	Chronic hepatitis B	Asthenia, headaches, abdominal pain, nausea, diarrhea, flatulence, dyspepsia
<b>Amantadine (Symmetrel)</b>	<b>T:</b> 100 mg <b>C:</b> 100 mg <b>S:</b> 50 mg/5 mL	Influenza A	Anxiety, dizziness, headaches, nausea, loss of appetite
<b>Cidofovir (Vistide)</b>	<b>I:</b> 75 mg/mL	CMV retinitis	Decreased urination, fever, chills, diarrhea, nausea, vomiting, headaches, loss of appetite

<b>Darunavir (Prezista)</b>	<b>T:</b> 75 mg, 150 mg, 400 mg, 600 mg, 800 mg	HIV infection	Diarrhea, nausea, vomiting, headaches, skin rash, constipation
<b>Delavirdine (Rescriptor)</b>	<b>T:</b> 100 mg, 200 mg	HIV infection	Diarrhea, fatigue, rash, headaches, nausea
<b>Didanosine (Videx)</b>	<b>C:</b> 125 mg, 200 mg, 250 mg, 400 mg <b>Powder for suspension:</b> 2 g, 4 g	HIV infection	Peripheral neuropathy, anxiety, headaches, rash, nausea, diarrhea, dry mouth
<b>Efavirenz (Sustiva)</b>	<b>C:</b> 50 mg, 200 mg <b>T:</b> 600 mg	HIV infection	Diarrhea, dizziness, headaches, insomnia, nausea, vomiting, drowsiness
<b>Etravirine (Intelece)</b>	<b>T:</b> 25 mg, 100 mg, 200 mg	HIV infection	Rash, nausea, abdominal pain, vomiting
<b>Famciclovir (Famvir)</b>	<b>T:</b> 125 mg, 250 mg, 500 mg	Herpes zoster, genital herpes, herpes labialis, mucosal/cutaneous herpes simplex	Headaches, nausea
<b>Foscarnet (Foscavir)</b>	<b>I:</b> 24 mg/mL	CMV retinitis, HSV infections	Decreased urination, abdominal pain, nausea, vomiting, dizziness, fatigue, headaches
<b>Ganciclovir (Cytovene)</b>	<b>I:</b> 500 mg	CMV retinitis, CMV disease	Sore throat, fever, unusual bleeding/bruising
<b>Indinavir (Crixivan)</b>	<b>C:</b> 200 mg, 400 mg	HIV infection	Blood in urine, weakness, nausea, vomiting, diarrhea, headaches, insomnia, altered taste
<b>Lamivudine (Epivir)</b>	<b>T:</b> 100 mg, 150 mg, 300 mg <b>OS:</b> 5 mg/mL, 10 mg/mL	HIV infection, chronic hepatitis B	Nausea, vomiting, abdominal pain, paresthesia
<b>Lopinavir/ritonavir (Kaletra)</b>	<b>T:</b> 100 mg/25 mg, 200 mg/50 mg <b>OS:</b> 80 mg/20 mg per mL	HIV infection	Diarrhea, nausea

Continued

## ANTIVIRALS—cont'd

Name	Availability	Uses	Side Effects
<b>Maraviroc (Selzentry)</b>	<b>T:</b> 150 mg, 300 mg	HIV infection	Cough, pyrexia, upper respiratory tract infection, rash, musculoskeletal symptoms, abdominal pain, dizziness
<b>Nelfinavir (Viracept)</b>	<b>T:</b> 250 mg, 625 mg	HIV infection	Diarrhea
<b>Oseltamivir (Tamiflu)</b>	<b>C:</b> 30 mg, 45 mg, 75 mg <b>S:</b> 6 mg/mL	Influenza A or B	Diarrhea, nausea, vomiting
<b>Raltegravir (Isentress)</b>	<b>T:</b> 400 mg <b>T (Chew):</b> 25 mg, 100 mg	HIV infection	Nausea, headache, diarrhea, pyrexia
<b>Ribavirin (Virazole)</b>	<b>Aerosol:</b> 6 g <b>OS:</b> 40 mg/mL <b>T:</b> 200 mg, 400 mg, 600 mg	Lowers respiratory infections in infants, children due to respiratory syncytial virus (RSV), chronic hepatitis C	Anemia
<b>Ritonavir (Norvir)</b>	<b>C:</b> 100 mg <b>T:</b> 100 mg <b>OS:</b> 80 mg/mL	HIV infection	Weakness, diarrhea, nausea, decreased appetite, vomiting, altered taste
<b>Saquinavir (Invirase)</b>	<b>C:</b> 200 mg <b>T:</b> 500 mg	HIV infection	Weakness, diarrhea, nausea, oral ulcers, abdominal pain
<b>Stavudine (Zerit)</b>	<b>C:</b> 15 mg, 20 mg, 30 mg, 40 mg <b>OS:</b> 1 mg/mL	HIV infection	Paresthesia, decreased appetite, chills, fever, rash

<b>Tenofovir (Viread)</b>	<b>T:</b> 150 mg, 200 mg, 250 mg, 300 mg <b>Powder (oral):</b> 40 mg/g	HIV infection	Diarrhea, nausea, pharyngitis, headaches
<b>Valacyclovir (Valtrex)</b>	<b>T:</b> 500 mg, 1 g	Herpes zoster, genital herpes, herpes labialis, chickenpox	Headaches, nausea
<b>Valganciclovir (Valcyte)</b>	<b>T:</b> 450 mg <b>OS:</b> 50 mg/mL	CMV retinitis	Anemia, abdominal pain, diarrhea, headaches, nausea, vomiting, paresthesia
<b>Zanamivir (Relenza)</b>	<b>Inhalation:</b> 5 mg	Influenza A and B	Cough, diarrhea, dizziness, headaches, nausea, vomiting
<b>Zidovudine (Retrovir)</b>	<b>C:</b> 100 mg <b>S:</b> 50 mg/5 mL <b>I:</b> 10 mg/mL	HIV infection	Fatigue, fever, chills, headaches, nausea, muscle pain

*C*, Capsules; *I*, injection; *OS*, oral solution; *S*, syrup; *T*, tablets.

## Asthma/COPD

### USES

**Asthma:** Chronic lung disorder marked by recurring episodes of airway obstruction (e.g., labored breathing with wheezing and coughing) and feeling of chest constriction. Asthma is triggered by hyper-reactivity to various stimuli (e.g., allergens, rapid change in air temperature). The obstruction is usually reversible with air flow good between attacks of asthma. Medication treatment includes inhaled corticosteroid (ICS), short-acting beta<sub>2</sub>-agonist (SABA) as a reliever agent, inhaled anti-muscarinic agent as a reliever agent, leukotriene-receptor antagonist (LTRA), inhaled long-acting beta<sub>2</sub>-agonist (LABA), anti-immunoglobulin E (IgE) agent, anti-interleukin-5 (IL-5) agent, oral corticosteroids, theophylline (rarely used).

**COPD:** Disorder that persistently obstructs bronchial air flow. COPD is frequently related to cigarette smoking and mainly involves two related diseases: chronic bronchitis and emphysema. The obstruction is usually permanent with progression over time. Medication treatment includes inhaled corticosteroid (ICS), inhaled antimuscarinic agent (LAMA), and inhaled long-acting beta<sub>2</sub>-agonist (LABA).

### ACTION

*Inhaled corticosteroids:* Exact mechanism unknown. May act as anti-inflammatories, decrease mucus secretion.

*Beta<sub>2</sub>-adrenergic agonists:* Stimulate beta receptors in lung, relax bronchial smooth muscle, increase vital capacity, decrease airway resistance.

*Antimuscarinics:* Inhibit cholinergic receptors on bronchial smooth muscle (block acetylcholine action).

*Leukotriene modifiers:* Decrease effect of leukotrienes, which increase migration of eosinophils, producing mucus/edema of airway wall, causing bronchoconstriction.

*IgE:* Inhibits the binding of IgE to high-affinity receptors on surface of mast cells and basophils.

*IL-5:* Binds to IL-5, reducing the production and survival of eosinophils.

*Methylxanthines:* Directly relax smooth muscle of bronchial airway, pulmonary blood vessels (relieve bronchospasm, increase vital capacity). Increase cyclic 3,5-adenosine monophosphate.

## ASTHMA/COPD

Name	Availability	Dosage Range	Side Effects
<b>Antimuscarinics</b>			
<b>Aclidinium (Tudorza)</b>	<b>Inhalation powder:</b> 400 mcg/actuation	<b>A:</b> 400 mcg 2 times/day	Headache, nasopharyngitis, cough
<b>Glycopyrrolate (Seebri Neohaler)</b>	<b>Inhalation capsule:</b> 15.6 mcg/cap	<b>A:</b> One inhalation 2 times/day	Fatigue, diarrhea, nausea, arthralgia, nasopharyngitis, upper respiratory tract infection, wheezing
<b>Ipratropium (Atrovent)</b>	<b>NEB:</b> 0.02% (500 mcg) <b>MDI:</b> 17 mcg/actuation	<b>A (NEB):</b> 500 mcg q6–8h <b>A (MDI):</b> 2 puffs 4 times/day	Upper respiratory tract infection, bronchitis, sinusitis, headache, dyspnea
<b>Revefenacin (Yupelri)</b>	Inhalation solution for nebulization. Each vial contains 175 mcg/3 mL solution	One 175-mcg vial (3 mL) once daily	Cough, nasopharyngitis, upper respiratory tract infection, headache, back pain
<b>Tiotropium (Spiriva, Spiriva Respimat)</b>	<b>Inhalation powder:</b> 18 mcg/capsule <b>Aerosol solution:</b> 1.25 mcg/inhalation	<b>A:</b> Once/day (inhaled twice) <b>Aerosol solution:</b> 2 inhalations once daily	Xerostomia, upper respiratory tract infection, sinusitis, pharyngitis
<b>Umeclidinium (Incruse Ellipta)</b>	<b>Inhalation powder:</b> 62.5 mcg/blister	<b>A:</b> One inhalation once daily	Nasopharyngitis, upper respiratory tract infection, cough, arthralgia

<b>Ciclesonide (Alvesco HFA)</b>	<b>HFA:</b> 80, 160 mcg/inhalation	<b>HFA:</b> 80–320 mcg 2 times/day	Headache, nasopharyngitis, upper respiratory infection, epistaxis, nasal congestion, sinusitis
<b>Fluticasone (Arnuity Ellipta, Flovent Diskus, Flovent HFA)</b>	<b>DPI: (Flovent Diskus):</b> 50, 100, 250 mcg/blister <b>(Arnuity Ellipta):</b> 100 mcg, 200 mcg/activation <b>MDI: (Flovent HFA):</b> 44, 110, 220 mcg/inhalation	<b>DPI: (Flovent Diskus):</b> 100–1,000 mcg 2 times/day <b>(Arnuity Ellipta):</b> 100–200 mcg once daily <b>MDI: (Flovent HFA):</b> 88–880 mcg 2 times/day	Headache, nasal congestion, pharyngitis, sinusitis, respiratory infections
<b>Mometasone (Asmanex Twisthaler)</b>	<b>DPI:</b> 110–220 mcg/inhalation	<b>DPI:</b> 220–880 mcg once daily in evening or 220 mcg bid	Same as beclomethasone

#### Long Acting Antimuscarinic Agent/Long-Acting Beta<sub>2</sub>-Agonist (LAMA/LABA)

<b>Aclidinium/formoterol (Duaklir Presair)</b>	400 mcg/12 mcg/inhalation	1 inhalation bid	Headache, upper respiratory tract infections
<b>Glycopyrrolate/formoterol (Bevespi Aerosphere)</b>	9 mcg/4.8 mcg/inhalation	2 inhalation bid	Urinary tract infection, cough
<b>Tiotropium/olodaterol (Stiolto Respimat)</b>	2.5 mcg/2.5 mcg/inhalation	2 inhalation once daily	Nasopharyngitis, cough, back pain
<b>Umeclidinium/vilanterol (Anoro Ellipta)</b>	62.5 mcg/25 mcg/inhalation	1 inhalation once/day	Pharyngitis, sinusitis, lower respiratory tract infections, constipation, diarrhea, muscle spasms, neck/chest pain

*Continued*

## Asthma/COPD—cont'd

## Leukotriene Modifiers

<b>Montelukast (Singulair)</b>	<b>T:</b> 4 mg, 5 mg, 10 mg	<b>A:</b> 10 mg/day <b>C (6–14 yrs):</b> 5 mg/day <b>C (2–5 yrs):</b> 4 mg/day	Dyspepsia, increased LFTs, cough, nasal congestion, headache, dizziness, fatigue
<b>Zafirlukast (Accolate)</b>	<b>T:</b> 10 mg, 20 mg	<b>A, C (12 yrs and older):</b> 20 mg 2 times/day <b>C (5–11 yrs):</b> 10 mg 2 times/day	Headache, nausea, diarrhea, infection

## PDE-4 Inhibitor

<b>Roflumilast (Daliresp)</b>	<b>T:</b> 500 mcg	<b>A:</b> 500 mcg once daily	Headache, dizziness, insomnia
-------------------------------	-------------------	------------------------------	-------------------------------

Inhaled Corticosteroid/Long-Acting Beta<sub>2</sub>-Agonist (ICS/LABA)

<b>Fluticasone propionate/salmeterol (Advair Diskus)</b>	100, 250, 500 mcg/50 mcg blister	100–500 mcg bid	Same as individual listing for fluticasone and salmeterol
<b>Fluticasone propionate/salmeterol (Advair HFA)</b>	45, 115, 230 mcg/21 mcg/inhalation	2 inhalations bid	Same as individual listing for fluticasone and salmeterol
<b>Fluticasone propionate/salmeterol (AirDuo Respiclick)</b>	55, 113, 232 mcg/14 mcg/inhalation	1 inhalation bid	Same as individual listing for fluticasone and salmeterol
<b>Fluticasone furoate/vilanterol (Breo Ellipta)</b>	100, 200 mcg/25 mcg/inhalation	1 inhalation once/day	Nasopharyngitis, upper respiratory tract infection, headache, oral candidiasis
<b>Budesonide/formoterol (Symbicort)</b>	80, 160 mcg/4.5 mcg/inhalation	80–160 mcg/25 mcg bid	Same as individual listing for budesonide and formoterol
<b>Mometasone/formoterol (Dulera)</b>	100, 200 mcg/5 mcg/inhalation	2 inhalations bid	Same as individual listing for mometasone and formoterol

Name	Availability	Dosage Range	Side Effects
<b>Inhaled Corticosteroid/ Long Acting Antimuscarinic Agent /Long-Acting Beta<sub>2</sub>-Agonist (ICS/LAMA/LABA)</b>			
<b>Fluticasone furoate/umeclidinium/vilanterol (Trelegy Ellipta)</b>	100 mcg/62.5 mcg/25 mcg/ inhalation	1 inhalation once/day	Same as individual listing for fluticasone, umeclidinium, and vilanterol
<b>Anti-IgE Antibody</b>			
<b>Omalizumab (Xolair)</b>	<b>I:</b> 150 mg	<b>SQ:</b> 75–300 mcg q4wks	Arthralgia, pain, fatigue, dizziness, fracture, pruritus, earache
<b>Anti-Interleukin-5 Antibodies (Eosinophilia Asthma)</b>			
<b>Benralizumab (Fasenra)</b>	<b>I:</b> 30 mg/mL	<b>SQ:</b> 30 mg q4wks times 3 doses, then q8wks	Injection site reactions, urticaria, angioedema, rash
<b>Dupilumab (Dupixent)</b>	<b>I:</b> 200 mg/1.14 mL, 300 mg/2 mL prefilled syringes	<b>SQ:</b> Initially, 400 mg, then 200 mg q2wks or 600 mg, then 300 mg q2wks	Injection-site reactions, transient eosinophilia, eosinophilic pneumonia, vasculitis, conjunctivitis
<b>Mepolizumab (Nucala)</b>	<b>I:</b> 100 mg	100 mg <b>SQ</b> q4wks	Headache, injection site reaction, fatigue, back pain
<b>Reslizumab (Cinqair)</b>	<b>I:</b> 100 mg/10-mL vial	3 mg/kg <b>IV</b> q4wks	Antibody development, increased CPK, myalgia, oropharyngeal pain

**A**, Adults; **C** (*dosage*), children; **DPI**, dry powder inhaler; **HFA**, hydrofluoroalkane; **MDI**, metered dose inhaler; **NEB**, nebulization; **T**, tablets.

## Beta-Adrenergic Blockers

### USES

Management of hypertension, angina pectoris, arrhythmias, hypertrophic subaortic stenosis, migraine headaches, MI (prevention), glaucoma.

### ACTION

Beta-adrenergic blockers competitively block beta adrenergic receptors, located primarily in myocardium, and beta<sub>2</sub>-adrenergic receptors, located primarily in bronchial and vascular smooth muscle. By occupying beta-receptor sites, these agents prevent naturally occurring or administered epinephrine/norepinephrine from exerting their effects. The results are basically opposite to those of sympathetic stimulation.

Effects of beta<sub>1</sub> blockade include slowing heart rate, decreasing cardiac output and contractility; effects of beta<sub>2</sub>

blockade include bronchoconstriction, increased airway resistance in pts with asthma or COPD. Beta blockers can affect cardiac rhythm/automaticity (decrease sinus rate, SA/AV conduction; increase refractory period in AV node); decrease systolic and diastolic B/P; exact mechanism unknown but may block peripheral receptors, decrease sympathetic outflow from CNS, or decrease renin release from kidney. All beta blockers mask tachycardia that occurs with hypoglycemia. When applied to the eye, reduce intraocular pressure and aqueous production.

### BETA-ADRENERGIC BLOCKERS

Name	Availability	Indication	Dosage Range	Frequent or Severe Side Effects
<b>Acebutolol (Sectral)</b>	<b>C:</b> 200 mg, 400 mg	HTN, ventricular arrhythmia	<b>HTN:</b> Initially, 400 mg once daily or 2 divided doses. Usual dose: 200–1200 mg once/d or divided bid <b>Arrhythmia:</b> Initially, 200 mg 2 times/day. Gradually increase to 300–600 mg 2 times/day	<b>Class:</b> Fatigue, depression, bradycardia, decreased exercise tolerance, erectile dysfunction, heart failure, may aggravate hypoglycemia, increase incidence of diabetes, insomnia, increase triglycerides, decrease cholesterol. Sudden withdrawal may exacerbate angina and myocardial infarction.

<b>Atenolol (Tenormin)</b>	<b>T:</b> 25 mg, 50 mg, 100 mg	HTN, angina, MI	<b>Angina:</b> Initially, 50 mg once daily. May increase to 100 mg once daily after one wk <b>HTN:</b> Initially, 50 mg once daily. May increase to 100 mg once daily after 2 wks <b>MI:</b> 50 mg bid or 100 mg once daily
<b>Bisoprolol (Zebeta)</b>	<b>T:</b> 5 mg, 10 mg	HTN, HF	<b>HTN:</b> Initially, 5 mg once daily. May increase to 10 mg/day, then 20 mg/day. Usual dose: 5–10 mg/day <b>HF:</b> 1.25 mg once daily. Titrate to 10 mg once daily.
<b>Carvedilol (Coreg)</b>	<b>T:</b> 3.125 mg, 6.25 mg, 12.5 mg, 25 mg <b>C (SR):</b> 10 mg, 20 mg, 40 mg, 80 mg	HF, LVD after MI, HTN	<b>Immediate-Release HF:</b> Initially, 3.25 mg 2 times/day. May increase at 2-wk intervals to 6.25 mg 2 times/day, then 12.5 mg 2 times/day, then 25 mg 2 times/day, greater than 85 kg: 50 mg 2 times/day <b>LVD after MI:</b> Initially, 6.25 mg 2 times/day. May increase q3–10 days to 12.5 mg 2 times/day, then 25 mg 2 times/day <b>HTN:</b> Initially, 6.25 mg 2 times/day. May increase q7–14 days to 12.5 mg 2 times/day, then 25 mg 2 times/day <b>Extended-Release HF:</b> Initially, 10 mg once daily. Titrate to 80 mg once daily. <b>LVD after MI:</b> 10–80 mg once daily <b>HTN:</b> 20–80 mg once daily
<b>Labetalol (Trandate)</b>	<b>T:</b> 100 mg, 200 mg, 300 mg	HTN	Initially, 100 mg 2 times/day. May increase q2–3 days in 100 mg 2 times/day increments Usual dose: 200–1,200 mg 2 times/day

## BETA-ADRENERGIC BLOCKERS—cont'd

<b>Metoprolol (Lopressor [IR], Toprol XL [SR])</b>	<b>T (IR):</b> 50 mg, 100 mg <b>T (SR):</b> 25 mg, 50 mg	HTN, angina, HF, MI	<b>IR:</b> <b>Angina:</b> Initially, 50 mg 2 times/day. May increase up to 400 mg/day <b>HTN:</b> Initially, 100 mg once daily. May increase at weekly intervals up to 450 mg/ divided bid or tid <b>Post-MI:</b> 100 mg bid <b>SR:</b> <b>Angina:</b> 100–400 mg once daily <b>HF:</b> Initially, 12.5–25 mg once daily. Titrate up to 200 mg once daily. <b>HTN:</b> 25–400 mg once daily	
<b>Nadolol (Corgard)</b>	<b>T:</b> 20 mg, 40 mg, 80 mg	HTN, angina	<b>Angina, HTN:</b> Initially, 40 mg once/day. Usual dose: 40–320 mg once daily	
<b>Nebivolol (Bystolic)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg, 20 mg	HTN	Initially, 5 mg once daily. May increase at 2-wk intervals up to 40 mg once daily	
<b>Pindolol (Visken)</b>	<b>T:</b> 5 mg, 10 mg	HTN	Initially, 5 mg 2 times/day. May increase to 10–40 mg/day. <b>Maximum:</b> 60 mg/day divided bid	

Name	Availability	Indication	Dosage Range	Frequent or Severe Side Effects
<b>Propranolol (Inderal)</b>	<b>T (IR):</b> 10 mg, 20 mg, 40 mg, 60 mg, 80 mg <b>C (SR):</b> 60 mg, 80 mg, 120 mg, 160 mg <b>S:</b> 4 mg/mL, 8 mg/mL <b>I:</b> 1 mg/mL	HTN, angina, MI, arrhythmias, migraine, essential tremor, hypertrophic subaortic stenosis	<b>IR:</b> <b>Angina:</b> 80–320 mg/day in 2–4 divided doses <b>Arrhythmias:</b> 10–30 mg 3–4 times/day <b>HTN:</b> 40 mg bid up to 240 mg/day in 2–3 divided doses <b>Hypertrophic subaortic stenosis:</b> 20–40 mg 3–4 times/day <b>Post-MI:</b> 180–240 mg/day in 2–4 divided doses <b>Migraine:</b> Initially, 80 mg/day. May increase gradually up to 240 mg/day in divided doses <b>Tremor:</b> Initially, 40 mg 2 times/day. Usual dose: 120–320 mg/day <b>SR:</b> <b>Angina:</b> Initially, 80 mg once daily. May increase q3–7days up to 320 mg/day <b>HTN:</b> 80–120 mg once daily at bedtime <b>Migraine:</b> Initially, 80 mg once daily Gradually increase up to 240 mg once daily <b>Hypertrophic subaortic stenosis:</b> 80–160 mg once daily	

**C**, Capsules; **HF**, heart failure; **HTN**, hypertension; **I**, injection; **LVD**, left ventricular dysfunction; **MI**, acute myocardial infarction; **S**, solution; **SR**, sustained-release; **T**, tablets.

## Calcium Channel Blockers

### USES

Treatment of essential hypertension, treatment of and prophylaxis of angina pectoris (including vasospastic, chronic stable, unstable), prevention/control of supraventricular tachyarrhythmias, prevention of neurologic damage due to subarachnoid hemorrhage.

### ACTION

Calcium channel blockers inhibit the flow of extracellular  $\text{Ca}^{2+}$  ions across cell membranes of cardiac cells, vascular tissue. They relax arterial smooth muscle, depress the rate of sinus node pacemaker, slow AV conduction, decrease heart rate, produce negative inotropic

effect (rarely seen clinically due to reflex response). Calcium channel blockers decrease coronary vascular resistance, increase coronary blood flow, reduce myocardial oxygen demand. Degree of action varies with individual agent.

### CALCIUM CHANNEL BLOCKERS

Name	Availability	Indications	Dosage Range	Side Effects
<b>Amlodipine (Norvasc)</b>	T: 2.5 mg, 5 mg, 10 mg	HTN, angina	<b>HTN:</b> Initially, 2.5–5 mg once daily. May titrate q7–14 days up to 10 mg/day <b>Angina:</b> 5–10 mg once daily	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
<b>Diltiazem (Cardizem)</b>	T: 30 mg, 60 mg, 90 mg, 120 mg (ER): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg C (SR-12HR): 60 mg, 90 mg, 120 mg, (ER-24HR): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg I: 5 mg/mL	<b>PO:</b> HTN, angina <b>IV:</b> Arrhythmias	<b>See monograph</b> <b>HTN:</b> 120–540 mg/day <b>Angina:</b> 120–480 mg/day <b>I:</b> 20–25 mg IV bolus, then 5–15 mg/hr infusion	Constipation, flushing, hypotension, dizziness, AV block, bradycardia, headache, edema, HF
<b>Felodipine (Plendil)</b>	T: 2.5 mg, 5 mg, 10 mg	HTN	Initially, 5 mg/day. May increase q2wks Usual dose: 5–10 mg/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia

<b>Isradipine</b>	<b>C:</b> 2.5 mg, 5 mg	HTN	Initially, 2.5 mg 2 times/day. May increase at 2–4 wk intervals at 2.5–5 mg increments. Usual dose: 5–10 mg 2 times/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
<b>Nicardipine (Cardene)</b>	<b>C (IR):</b> 20 mg, 30 mg <b>C (ER):</b> 30 mg, 45 mg, 60 mg <b>I:</b> 2.5 mg/mL	HTN, angina	<b>Angina/HTN:</b> Initially, 20–30 mg 3 times/day. May increase q3days. Usual dose: 20–40 mg 3 times/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
<b>Nifedipine (Adalat, Procardia)</b>	<b>C (IR):</b> 10 mg, 20 mg <b>T (ER):</b> 30 mg, 60 mg, 90 mg	HTN, angina	<b>HTN (ER):</b> Initially, 30–60 mg once daily Usual dose: 90–120 mg once daily <b>Angina (IR):</b> 10–20 mg tid or <b>(ER):</b> Initially, 30–60 mg once daily. Titrate up to 90 mg daily. <b>Maximum:</b> 120 mg	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
<b>Nimodipine (Nimotop, Nymalize)</b>	<b>C:</b> 30 mg <b>S:</b> 60 mg/20 mL	Prevent neurologic damage following subarachnoid hemorrhage	60 mg q4h for 21 days	Nausea, reduced B/P, headache, rash, diarrhea
<b>Verapamil (Calan, Isoptin)</b>	<b>T (IR):</b> 40 mg, 80 mg, 120 mg <b>T (SR):</b> 120 mg, 180 mg, 240 mg	HTN, angina	<b>Angina (IR):</b> Initially, 40–120 mg 3 times/day. Usual dose: 80–160 mg tid or <b>(SR):</b> Initially, 180 mg at HS. May increase at weekly intervals up to 480 mg/day <b>HTN (IR):</b> Initially, 80 mg 3 times/day Usual dose: 240–480 mg/day in divided doses <b>(SR):</b> Initially, 120–180 mg/day. May increase at wklly intervals to 240 mg/day, then 180 mg 2 times/day <b>Maximum:</b> 240 mg 2 times/day	Constipation, dizziness, tachycardia, AV block, bradycardia, headache, edema, HF

**C,** Capsules; **CR,** controlled-release; **ER,** extended-release; **HTN,** hypertension; **I,** injection; **IR,** immediate-release; **S,** solution; **SR,** sustained-release; **T,** tablets.

## Chemotherapeutic Agents

### USES

Treatment of a variety of cancers; may be palliative or curative. Treatment of choice in hematologic cancers. Often used as adjunctive therapy (e.g., with surgery or irradiation); most effective when tumor mass has been removed or reduced by radiation. Often used in combinations to increase therapeutic results, decrease toxic effects. Certain agents may be used in nonmalignant conditions: polycythemia vera, psoriasis, rheumatoid arthritis, or immunosuppression in organ transplantation (used only in select cases that are severe and unresponsive to other forms of therapy). Refer to individual monographs.

### ACTION

Most antineoplastics can be divided into alkylating agents, antimetabolites, anthracyclines, plant alkaloids, and topoisomerase inhibitors. These agents affect cell division or DNA synthesis. Newer agents (monoclonal antibodies and tyrosine kinase inhibitors) directly target a molecular abnormality in certain types of cancer. Hormones modulate tumor cell behavior without directly attacking those cells. Some agents are classified as miscellaneous.

### CHEMOTHERAPEUTIC AGENTS

Name	Uses	Category	Side Effects
<b>Abemaciclib (Verzenio)</b>	Breast cancer, advanced or metastatic	Cyclin-dependent kinase inhibitor	Fatigue, diarrhea, nausea, anemia, decreased absolute lymphocyte count, neutropenia, thrombocytopenia, leukopenia, increased ALT, AST, serum creatinine
<b>Abiraterone (Zytiga)</b>	Prostate cancer	Antiandrogen	Joint swelling, hypokalemia, edema, muscle discomfort, hot flashes, diarrhea, UTI, cough, hypertension, arrhythmia, dyspepsia, upper respiratory tract infection
<b>Acalabrutinib (Calquence)</b>	Mantle cell lymphoma (previously treated)	Tyrosine kinase inhibitor	Headache, fatigue, skin rash, diarrhea, nausea, neutropenia, bruising, anemia, myalgia

<b>Aldesleukin (Proleukin)</b>	Melanoma (metastatic), renal cell (metastatic)	Biologic response modifier	Hypotension, sinus tachycardia, nausea, vomiting, diarrhea, renal impairment, anemia, rash, fatigue, agitation, pulmonary congestion, dyspnea, fever, chills, oliguria, weight gain, dizziness
<b>Alectinib (Alecensa)</b>	Non–small-cell lung cancer (NSCLC), metastatic	Kinase inhibitor	Constipation, fatigue, edema, myalgia
<b>Amivantamab-vmjw (Rybrevant)</b>	Locally advanced or metastatic non–small-cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) exon 20 insertion mutations	EGF receptor–directed and MET receptor–directed antibody	Rash, paronychia, musculoskeletal pain, dyspnea, nausea, fatigue, edema, stomatitis, cough, constipation, vomiting.
<b>Anastrozole (Arimidex)</b>	Breast cancer	Aromatase inhibitor	Peripheral edema, chest pain, nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, pharyngitis, vaginal hemorrhage, anemia, leukopenia, rash, weight gain, diaphoresis, increased appetite, pain, headaches, dizziness, depression, paresthesia, hot flashes, increased cough, dry mouth, asthenia, dyspnea, phlebitis
<b>Apalutamide (Erleada)</b>	Prostate cancer, non-metastatic, castration-resistant	Antiandrogen	Hypertension, fatigue, skin rash, hypercholesterolemia, hyperglycemia, hypertriglyceridemia, hyperkalemia, diarrhea, anemia, leukopenia, lymphocytopenia
<b>Alpelisib (Piqray)</b>	Breast cancer, advanced or metastatic	Phosphatidylinositol 3-kinase inhibitor	Skin rash, fatigue, hyperglycemia, diarrhea, nausea, lymphocytopenia, increased alanine aminotransferase, creatinine
<b>Arsenic trioxide (Trisenox)</b>	Acute promyelocytic leukemia (APL)	Miscellaneous	AV block, GI hemorrhage, hypertension, hypoglycemia, hypokalemia, hypomagnesemia, neutropenia, oliguria, prolonged QT interval, seizures, sepsis, thrombocytopenia
<b>Asparaginase (Elspar)</b>	Acute lymphoblastic leukemia (ALL)	Miscellaneous	Anorexia, nausea, vomiting, hepatic toxicity, pancreatitis, nephrotoxicity, clotting factor abnormalities, malaise, confusion, lethargy, EEG changes, respiratory distress, fever, hyperglycemia, depression, stomatitis, allergic reactions, drowsiness
<b>Atezolizumab (Tecentriq)</b>	NSCLC, metastatic, urothelial carcinoma, locally advanced or metastatic	Miscellaneous	Fatigue, decreased appetite, nausea, UTI, constipation, pyrexia

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Avapritinib (Ayvakit)</b>	Gastrointestinal stromal tumor, unresectable or metastatic	PDGFR-alpha blocker, tyrosine kinase inhibitor	Fatigue, cognitive dysfunction, nausea, leukopenia; decreased phosphate, potassium, albumin, sodium; increased bilirubin, aspartate aminotransferase
<b>Avelumab (Bavencio)</b>	Merkel cell carcinoma	PD-L1 blocking antibody	Fatigue, musculoskeletal pain, diarrhea, nausea, infusion-related reactions, rash, decreased appetite, peripheral edema
<b>Axitinib (Inlyta)</b>	Renal cell carcinoma, advanced	Kinase inhibitor	Diarrhea, hypertension, fatigue, decreased appetite, nausea, dysphoria, vomiting, asthenia, constipation
<b>Azacitidine (Vidaza)</b>	Myelodysplastic (MDS) syndrome	DNA methylation inhibitor	Edema, hypokalemia, weight loss, myalgia, cough, dyspnea, upper respiratory tract infection, back pain, pyrexia, weakness
<b>BCG (TheraCys, Tice BCG)</b>	Bladder cancer	Biologic response modulator	Nausea, vomiting, anorexia, diarrhea, dysuria, hematuria, cystitis, urinary urgency, anemia, malaise, fever, chills
<b>Belantamab mafodotin-blmf (Blenrep)</b>	Multiple myeloma, relapsed or refractory	B-cell maturation antigen (BCMA)-directed antibody/microtubule inhibitor conjugate	Keratopathy (corneal epithelium change on eye exam), decreased visual acuity, nausea, blurred vision, pyrexia, infusion-related reactions, fatigue
<b>Belinostat (Beleodaq)</b>	Peripheral T-cell lymphoma	Miscellaneous	Nausea, fatigue, pyrexia, anemia, vomiting
<b>Bendamustine (Treanda)</b>	Chronic lymphocytic leukemia (CLL), non-Hodgkin lymphoma (NHL)	Alkylating agent	Neutropenia, pyrexia, thrombocytopenia, nausea, anemia, leukopenia, vomiting
<b>Bevacizumab (Avastin)</b>	Cervical cancer, persistent/recurrent/metastatic, colorectal cancer, metastatic, glioblastoma, NSCLC, nonsquamous	Monoclonal antibody	Increased B/P, fatigue, blood clots, diarrhea, decreased WBCs, headaches, decreased appetite, stomatitis

<b>Bexarotene (Targretin)</b>	Cutaneous T-cell lymphoma	Miscellaneous	Anemia, dermatitis, fever, hypercholesterolemia, infection, leukopenia, peripheral edema
<b>Bicalutamide (Casodex)</b>	Prostate cancer, metastatic	Antiandrogen	Gynecomastia, hot flashes, breast pain, nausea, diarrhea, constipation, nocturia, impotence, pain, muscle pain, asthenia, abdominal pain
<b>Binimetinib (Mektovi)</b>	Melanoma (unresectable or metastatic)	Kinase inhibitor	Fatigue, nausea, diarrhea, vomiting, anemia, hemorrhage; increased CPK, serum creatinine
<b>Bleomycin (Blenoxane)</b>	Head/neck cancers, Hodgkin lymphoma, malignant pleural effusion, testicular cancer	Antibiotic	Nausea, vomiting, anorexia, stomatitis, hyperpigmentation, alopecia, pruritus, hyperkeratosis, urticaria, pneumonitis progression to fibrosis, weight loss, rash
<b>Blinatumomab (Blincyto)</b>	ALL	Miscellaneous	Pyrexia, headache, peripheral edema, febrile neutropenia, nausea, hypokalemia, tremor, rash, constipation
<b>Bortezomib (Velcade)</b>	Mantle cell lymphoma, multiple myeloma	Proteasome inhibitor	Anxiety, dizziness, headaches, insomnia, peripheral neuropathy, pruritus, rash, abdominal pain, decreased appetite, constipation, diarrhea, dyspepsia, nausea, vomiting, arthralgia, dyspnea, asthenia, edema, pain
<b>Bosutinib (Bosulif)</b>	Chronic myelogenous leukemia (CML)	Kinase inhibitor	Nausea, diarrhea, thrombocytopenia, vomiting, abdominal pain, anemia, fever, fatigue
<b>Brentuximab (Adcetris)</b>	Anaplastic large cell lymphoma, Hodgkin lymphoma (relapsed, refractory, post-autologous hematopoietic stem cell transplant)	Miscellaneous	Neutropenia, peripheral sensory neuropathy, fatigue, nausea, anemia, upper respiratory tract infection, diarrhea, pyrexia, thrombocytopenia, cough, vomiting
<b>Brigatinib (Alunbrig)</b>	NSCLC, metastatic	Kinase inhibitor	Nausea, diarrhea, fatigue, cough, headache
<b>Busulfan (Myleran)</b>	CML	Alkylating agent	Nausea, vomiting, hyperuricemia, myelosuppression, skin hyperpigmentation, alopecia, anorexia, weight loss, diarrhea, stomatitis

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Cabazitaxel (Jevtana)</b>	Prostate cancer, metastatic	Microtubule inhibitor	Neutropenia, anemia, leukopenia, thrombocytopenia, diarrhea, fatigue, nausea, vomiting, constipation, asthenia, abdominal pain, hematuria, anorexia, peripheral neuropathy, dyspnea, alopecia
<b>Capmatinib (Talbrecta)</b>	NSCLC, metastatic	MET inhibitor, tyrosine kinase inhibitor	Peripheral edema, nausea, vomiting, lymphocytopenia, fatigue; decreased albumin, glucose, phosphate, sodium; increased alanine aminotransferase, creatinine
<b>Capecitabine (Xeloda)</b>	Breast cancer, metastatic, colorectal cancer	Antimetabolite	Nausea, vomiting, diarrhea, stomatitis, myelosuppression, palmar-plantar erythrodysesthesia syndrome, dermatitis, fatigue, anorexia
<b>Carboplatin (Paraplatin)</b>	Ovarian cancer, advanced	Alkylating agent	Nausea, vomiting, nephrotoxicity, myelosuppression, alopecia, peripheral neuropathy, hypersensitivity, ototoxicity, asthenia, diarrhea, constipation
<b>Carfilzomib (Kyprolis)</b>	Multiple myeloma, relapsed/refractory	Proteasome inhibitor	Anemia, fatigue, nausea, thrombocytopenia, dyspnea, diarrhea, pyrexia
<b>Carmustine (BiCNU)</b>	Brain tumors, multiple myeloma, Hodgkin lymphoma, relapsed/refractory, NHL, relapsed/refractory	Alkylating agent	Anorexia, nausea, vomiting, myelosuppression, pulmonary fibrosis, pain at injection site, diarrhea, skin discoloration
<b>Ceritinib (Zykadia)</b>	NSCLC, metastatic	Kinase inhibitor	Diarrhea, nausea, increased LFTs, vomiting, abdominal pain, fatigue, decreased appetite, constipation
<b>Cetuximab (Erbix)</b>	Colorectal cancer, metastatic, head/neck cancer, squamous cell	Monoclonal antibody	Dyspnea, hypotension, acne-like rash, dry skin, weakness, fatigue, fever, constipation, abdominal pain
<b>Chlorambucil (Leukeran)</b>	CLL	Alkylating agent	Myelosuppression, dermatitis, nausea, vomiting, hepatic toxicity, anorexia, diarrhea, abdominal discomfort, rash
<b>Cisplatin (Platinol-AQ)</b>	Bladder cancer, advanced, ovarian cancer, metastatic, testicular cancer, metastatic	Alkylating agent	Nausea, vomiting, nephrotoxicity, myelosuppression, neuropathies, ototoxicity, anaphylactic-like reactions, hyperuricemia, hypomagnesemia, hypophosphatemia, hypokalemia, hypocalcemia, pain at injection site

<b>Cladribine (Leustatin)</b>	Hairy cell leukemia	Antimetabolite	Nausea, vomiting, diarrhea, myelosuppression, chills, fatigue, rash, fever, headaches, anorexia, diaphoresis
<b>Cobimetinib (Cotellic)</b>	Melanoma, unresectable or metastatic	Kinase inhibitor	Diarrhea, photosensitivity reaction, nausea, vomiting, pyrexia, increased ALT, AST, alkaline phosphatase
<b>Copanlisib (Aliqopa)</b>	Follicular lymphoma (relapsed)	Phosphatidylinositol 3-kinase inhibitor	Hypertension, decreased energy, hyperglycemia, hypertriglyceridemia, hypophosphatemia, hyperuricemia, diarrhea, nausea, decreased Hgb, leukopenia, decreased absolute lymphocyte count, neutropenia, thrombocytopenia, serious infection
<b>Crizotinib (Xalkori)</b>	NSCLC, metastatic	Tyrosine kinase inhibitor	Vision disorders, nausea, vomiting, diarrhea, edema, constipation
<b>Cyclophosphamide (Cytoxan)</b>	ALL, AML, breast cancer, CML, Hodgkin lymphoma, multiple myeloma, NHL, ovarian carcinoma	Alkylating agent	Nausea, vomiting, hemorrhagic cystitis, myelosuppression, alopecia, interstitial pulmonary fibrosis, amenorrhea, azoospermia, diarrhea, darkening skin/fingernails, headaches, diaphoresis
<b>Cytarabine (Ara-C, Cytosar)</b>	AML, ALL, CML, meningeal leukemia	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, esophagitis, diarrhea, myelosuppression, alopecia, rash, fever, neuropathies, abdominal pain
<b>Dabrafenib (Tafinlar)</b>	Melanoma, metastatic or unresectable	Kinase inhibitor	Hyperkeratosis, headache, pyrexia, arthralgia, constipation, alopecia, rash, cough, palmar-plantar erythrodysesthesia syndrome, papilloma
<b>Dacarbazine (DTIC)</b>	Hodgkin lymphoma, metastatic malignant melanoma	Alkylating agent	Nausea, vomiting, anorexia, hepatic necrosis, myelosuppression, alopecia, rash, facial flushing, photosensitivity, flu-like symptoms, confusion, blurred vision
<b>Dacomitinib (Vizimpro)</b>	NSCLC	Tyrosine kinase inhibitor	Skin rash, paronychia, xeroderma, alopecia, pruritus, hypoalbuminemia, hyperglycemia, hypocalcemia, hypokalemia, hyponatremia, weight loss, diarrhea, stomatitis, anemia, lymphocytopenia
<b>Daratumumab (Darzalex)</b>	Multiple myeloma, relapsed/refractory	Monoclonal antibody	Fatigue, nausea, infusion reactions, back pain, pyrexia, nausea, upper respiratory tract infections

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Daratumumab/hyaluronidase (Darzalex Faspro)</b>	Multiple myeloma, newly diagnosed, relapsed/refractory	Anti-CD38, monoclonal antibody	Decreased hemoglobin, neutrophils, platelet count; leukopenia, lymphocytopenia
<b>Darolutamide (Nubeqa)</b>	Prostate cancer, nonmetastatic, castration-resistant	Antiandrogen	Fatigue, neutropenia; increased bilirubin, aspartate aminotransferase
<b>Dasatinib (Sprycel)</b>	ALL, CML	Tyrosine kinase inhibitor	Pyrexia, pleural effusion, febrile neutropenia, GI bleeding, pneumonia, thrombocytopenia, dyspnea, anemia, cardiac failure, diarrhea
<b>Daunorubicin (Cerubidine)</b>	ALL, AML	Anthracycline	HF, nausea, vomiting, stomatitis, mucositis, diarrhea, hematuria, myelosuppression, alopecia, fever, chills, abdominal pain
<b>Daunorubicin liposomal (DaunoXome)</b>	Kaposi sarcoma	Anthracycline	Nausea, diarrhea, abdominal pain, anorexia, vomiting, stomatitis, myelosuppression, rigors, back pain, headaches, neuropathy, depression, dyspnea, fatigue, fever, cough, allergic reactions, diaphoresis
<b>Dinutuximab (Unituxin)</b>	Neuroblastoma	Monoclonal antibody	Pain, arthralgia, myalgia, neuralgia, pyrexia, hypotension, vomiting, diarrhea, urticaria, hypoxia
<b>Docetaxel (Taxotere)</b>	Breast cancer, NSCLC, prostate, gastric, head/neck cancers	Antimicrotubular	Hypotension, nausea, vomiting, diarrhea, mucositis, myelosuppression, rash, paresthesia, hypersensitivity, fluid retention, alopecia, asthenia, stomatitis, fever
<b>Dostarlimab-gxly (Jemperli)</b>	Endometrial cancer, advanced	Programmed death receptor-1 (PD-1)-blocking antibody	Fatigue/asthenia, nausea, diarrhea, anemia, constipation
<b>Doxorubicin (Adriamycin)</b>	Breast cancer, metastatic cancers	Anthracycline	Cardiotoxicity, including HF; arrhythmias, nausea, vomiting, stomatitis, esophagitis, GI ulceration, diarrhea, anorexia, hematuria, myelosuppression, alopecia, hyperpigmentation of nail beds and skin, local inflammation at injection site, rash, fever, chills, urticaria, lacrimation, conjunctivitis

<b>Doxorubicin liposomal (Doxil)</b>	AIDS-related Kaposi sarcoma, multiple myeloma, ovarian cancer, advanced	Anthracycline	Neutropenia, palmar-plantar erythrodysesthesia syndrome, cardiomyopathy, HF
<b>Durvalumab (Imfinzi)</b>	Urothelial carcinoma, advanced or metastatic	PD-L1 blocking antibody	Fatigue, musculoskeletal pain, constipation, decreased appetite, nausea, peripheral edema, UTI
<b>Duvelisib (Copiktra)</b>	Chronic lymphocytic leukemia/small lymphocytic lymphoma (relapsed or refractory), follicular lymphoma (relapsed or refractory)	Kinase inhibitor	Edema, fatigue, headache, skin rash, hypophosphatemia, hyponatremia, diarrhea, nausea, neutropenia; increased serum lipase/amylase
<b>Elotuzumab (Empliciti)</b>	Multiple myeloma, relapsed/refractory	Immunostimulatory antibody	Fatigue, diarrhea, pyrexia, constipation, cough, peripheral neuropathy, nasopharyngitis, decreased appetite, upper respiratory tract infections, pneumonia
<b>Enasidenib (Idhifa)</b>	AML, refractory	Isocitrate dehydrogenase-2 inhibitor	Nausea, vomiting, diarrhea, elevated bilirubin, decreased appetite
<b>Enasidenib (IDHIFA)</b>	Acute myeloid leukemia (relapsed/refractory)	IDH2 inhibitor	Decreased calcium, potassium, nausea, diarrhea, decreased appetite, vomiting, leukocytosis, increased bilirubin
<b>Encorafenib (Braftovi)</b>	Melanoma (unresectable or metastatic)	Kinase inhibitor	Fatigue, hyperkeratosis, alopecia, skin rash, hyperglycemia, nausea, anemia; increased serum creatinine
<b>Enfortumab vedotin (Padcev)</b>	Urothelial cancer, locally advanced or metastatic	Anti-nectin-4 antibody drug conjugate, monoclonal antibody	Fatigue, peripheral neuropathy, skin rash, alopecia, nausea, diarrhea, dysgeusia, lymphocytopenia, ocular toxicity, dry eye syndrome; decreased phosphate, potassium, appetite, hemoglobin
<b>Entrectinib (Ro-zlytrek)</b>	NSCLC, metastatic; solid tumors	Tropomyosin receptor kinase (TRK) inhibitor, tyrosine kinase inhibitor	Edema, fatigue, dizziness, dysesthesia, hyperuricemia, hypernatremia, hypocalcemia, constipation, dysgeusia, diarrhea, nausea, anemia, lymphocytopenia; increased aspartate aminotransferase, alanine aminotransferase, creatinine

Continued

**CHEMOTHERAPEUTIC AGENTS—cont'd**

Name	Uses	Category	Side Effects
<b>Enzalutamide (Xtandi)</b>	Prostate cancer, metastatic	Antiandrogen	Fatigue, weakness, back pain, diarrhea, tissue swelling, musculoskeletal pain, headache, upper respiratory tract infections, blood in urine, spinal cord compression
<b>Epirubicin (Ellence)</b>	Breast cancer, adjuvant	Anthracycline	Anemia, leukopenia, neutropenia, infection, mucositis
<b>Erdafitinib (Balversa)</b>	Urothelial carcinoma (locally advanced or metastatic)	Kinase inhibitor	Fatigue, onycholysis, hyperphosphatemia, stomatitis, diarrhea, decreased Hgb, increased serum creatinine
<b>Erlotinib (Tarceva)</b>	NSCLC, pancreatic cancer	Tyrosine kinase inhibitor	Diarrhea, rash, nausea, vomiting
<b>Etoposide (VePesid)</b>	Small-cell lung cancer, testicular cancer	Podophyllotoxin derivative	Nausea, vomiting, anorexia, myelosuppression, alopecia, diarrhea, drowsiness, peripheral neuropathies
<b>Everolimus (Afinitor)</b>	Breast cancer, advanced, neuroendocrine tumors, renal cell carcinoma, advanced, subependymal giant cell astrocytoma	mTOR kinase inhibitor	Stomatitis, infections, asthenia, fatigue, cough, diarrhea
<b>Exemestane (Aromasin)</b>	Breast cancer	Aromatase inactivator	Dyspnea, edema, hypertension, mental depression
<b>Fam-trastuzumab deruxtecan-nxki (Enhertu)</b>	Breast cancer, unresectable or metastatic	Anti-HER2, antibody drug conjugate, monoclonal antibody, topoisomerase I inhibitor	Fatigue, alopecia, nausea, vomiting, constipation, diarrhea, anemia
<b>Fludarabine (Fludara)</b>	CLL	Antimetabolite	Nausea, diarrhea, stomatitis, bleeding, anemia, myelosuppression, skin rash, weakness, confusion, visual disturbances, peripheral neuropathy, coma, pneumonia, peripheral edema, anorexia

<b>Fluorouracil (Adrucil, Efudex)</b>	Breast, colon, gastric, pancreatic, rectal cancers, basal cell carcinoma	Antimetabolite	Nausea, vomiting, stomatitis, GI ulceration, diarrhea, anorexia, myelosuppression, alopecia, skin hyperpigmentation, nail changes, headaches, drowsiness, blurred vision, fever
<b>Flutamide (Eulexin)</b>	Prostate cancer	Antiandrogen	Hot flashes, nausea, vomiting, diarrhea, hepatitis, impotence, decreased libido, rash, anorexia
<b>Fulvestrant (Faslodex)</b>	Breast cancer, metastatic or advanced	Estrogen receptor antagonist	Asthenia, pain, headaches, injection site pain, flu-like symptoms, fever, nausea, vomiting, constipation, anorexia, diarrhea, peripheral edema, dizziness, depression, anxiety, rash, increased cough, UTI
<b>Gefitinib (Iressa)</b>	NSCLC	Tyrosine kinase inhibitor	Diarrhea, rash, acne, nausea, dry skin, vomiting, pruritus, anorexia
<b>Gemcitabine (Gemzar)</b>	Breast, NSCLC, ovarian, pancreatic cancers	Antimetabolite	Increased LFT, nausea, vomiting, diarrhea, stomatitis, hematuria, myelosuppression, rash, mild paresthesia, dyspnea, fever, edema, flu-like symptoms, constipation
<b>Gilteritinib (Xospata)</b>	AML, relapsed or refractory	Kinase inhibitor	Edema, fatigue, malaise, hyperglycemia, hypertriglyceridemia, hypocalcemia, hypoalbuminemia, arthralgia, myalgia, increased serum creatinine
<b>Glasdegib (Daurismo)</b>	AML	Hedgehog pathway inhibitor	Edema, fatigue, hyponatremia, hypomagnesemia, nausea, anemia, hemorrhage, febrile neutropenia, increased serum creatinine
<b>Goserelin (Zoladex)</b>	Breast cancer, prostate cancer	Hormone agonist	Hot flashes, sexual dysfunction, erectile dysfunction, gynecomastia, lethargy, pain, lower urinary tract symptoms, headaches, nausea, depression, diaphoresis
<b>Hydroxyurea (Hydrea)</b>	CML, head/neck cancers	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, diarrhea, constipation, myelosuppression, fever, chills, malaise
<b>Ibrutinib (Imbruvica)</b>	CLL, small lymphocytic lymphoma, mantle cell lymphoma, Waldenstrom macroglobulinemia	Kinase inhibitor	Neutropenia, thrombocytopenia, diarrhea, anemia, musculoskeletal pain, rash, nausea, bruising, fatigue, hemorrhage, pyrexia
<b>Idarubicin (Idamycin PFS)</b>	AML	Anthracycline	HF, arrhythmias, nausea, vomiting, stomatitis, myelosuppression, alopecia, rash, urticaria, hyperuricemia, abdominal pain, diarrhea, esophagitis, anorexia

*Continued*

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Idecabtagene vicleucel (Abecma)</b>	Multiple myeloma, relapsed or refractory	B-cell maturation antigen (BCMA)–directed genetically modified autologous T-cell immunotherapy	Infections, fatigue, musculoskeletal pain, diarrhea, upper respiratory tract infection, nausea, viral infections, encephalopathy, edema, pyrexia, cough, headache, decreased appetite
<b>Idelalisib (Zydelig)</b>	CLL, follicular B-cell NHL, small lymphocytic lymphoma	Kinase inhibitor	Diarrhea, pyrexia, fatigue, nausea, cough, abdominal pain, pneumonia, increased ALT/AST
<b>Ienalidomide (Revlimid)</b>	Mantle cell lymphoma, multiple myeloma, myelodysplastic syndromes	Immunomodulator	Diarrhea, pruritus, rash, fatigue, DVT, pulmonary embolism, thrombocytopenia, neutropenia, upper respiratory tract infection, cellulitis, hypertension, peripheral neuropathy
<b>Ifosfamide (Ifex)</b>	Testicular cancer	Alkylating agent	Nausea, vomiting, hemorrhagic cystitis, myelosuppression, alopecia, lethargy, drowsiness, confusion, hallucinations, hematuria
<b>Imatinib (Gleevec)</b>	ALL, CML, dermatofibrosarcoma protuberans, gastrointestinal stromal tumors (GIST), chronic eosinophilic leukemias, myelodysplastic/myeloproliferative disease	Tyrosine kinase inhibitor	Nausea, fluid retention, hemorrhage, musculoskeletal pain, arthralgia, weight gain, pyrexia, abdominal pain, dyspnea, pneumonia
<b>Inotuzumab ozogamicin (Besponsa)</b>	Acute lymphoblastic leukemia (relapsed/refractory)	Monoclonal antibody	Fatigue, headache, increased GGT, lipase, nausea, abdominal pain, thrombocytopenia, neutropenia, anemia, leukopenia, lymphocytopenia, increased ALT, AST, alkaline phosphatase, infection, fever
<b>Interferon alfa-2b (Intron-A)</b>	AIDS-related Kaposi sarcoma, follicular lymphoma, hairy cell leukemia, malignant melanoma	Miscellaneous	Mild hypotension, hypertension, tachycardia with high fever, nausea, diarrhea, altered taste, weight loss, thrombocytopenia, myelosuppression, rash, pruritus, myalgia, arthralgia associated with flu-like symptoms

<b>Ipilimumab (Yervoy)</b>	Melanoma, unresectable or metastatic, melanoma, adjuvant	Miscellaneous	Fatigue, diarrhea, pruritus, rash, colitis
<b>Irinotecan (Camptosar)</b>	Colorectal cancer, metastatic, pancreatic adenocarcinoma, metastatic	Camptothecin	Diarrhea, nausea, vomiting, abdominal cramps, anorexia, stomatitis, increased AST, severe myelosuppression, alopecia, diaphoresis, rash, weight loss, dehydration, increased serum alkaline phosphatase, headaches, insomnia, dizziness, dyspnea, cough, asthenia, rhinitis, fever, back pain, chills
<b>Isatuximab-irfc (Sarclisa)</b>	Multiple myeloma, relapsed or refractory	Anti-CD38, monoclonal antibody	Diarrhea, anemia, lymphocytopenia, neutropenia, thrombocytopenia, infusion-related reaction
<b>Ivosidenib (Tibsovo)</b>	AML newly diagnosed (relapsed/refractory)	IDH1 Inhibitor	Edema, fatigue, diarrhea, nausea, decreased Hgb, leukocytosis, hypomagnesemia, hypokalemia, hyponatremia
<b>Ixabepilone (Ixempra)</b>	Breast cancer	Antimicrotubular	Peripheral sensory neuropathy, fatigue, myalgia, alopecia, nausea, vomiting, stomatitis, diarrhea, anorexia, abdominal pain
<b>Ixazomib (Ninlaro)</b>	Multiple myeloma	Proteasome inhibitor	Diarrhea, constipation, thrombocytopenia, peripheral neuropathy, nausea, peripheral edema, back pain, vomiting
<b>Lapatinib (Tykerb)</b>	Breast cancer	Tyrosine kinase inhibitor	Diarrhea, palmar-plantar erythrodysesthesia, nausea, rash, vomiting, fatigue
<b>Larotrectinib (Vitrakvi)</b>	Solid tumors	Tyrosine kinase inhibitor	Neurotoxicity, fatigue, dizziness, hypoalbuminemia, nausea, vomiting, anemia, cough
<b>Lenvatinib (Lenvima)</b>	Renal cell carcinoma, advanced, thyroid cancer, differentiated	Kinase inhibitor	Hypertension, fatigue, diarrhea, arthralgia, decreased weight, nausea, stomatitis, headache, vomiting, proteinuria, abdominal pain
<b>Letrozole (Femara)</b>	Breast cancer in postmenopausal women	Aromatase inhibitor	Hypertension, nausea, vomiting, constipation, diarrhea, abdominal pain, anorexia, rash, pruritus, musculoskeletal pain, arthralgia, fatigue, headaches, dyspnea, coughing, hot flashes

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Leuprolide (Lupron)</b>	Prostate cancer, advanced	Hormone agonist	Hot flashes, gynecomastia, nausea, vomiting, constipation, anorexia, dizziness, headaches, insomnia, paresthesia, bone pain
<b>Lomustine (CeeNu)</b>	Brain tumors, Hodgkin lymphoma	Alkylating agent	Anorexia, nausea, vomiting, stomatitis, hepatotoxicity, nephrotoxicity, myelosuppression, alopecia, confusion, slurred speech
<b>Loncastuximab tesirine-lpyl (Zynlonta)</b>	Large B-cell lymphoma, relapsed or refractory	CD19-directed antibody and alkylating agent conjugate	Thrombocytopenia, increased gamma-glutamyltransferase, neutropenia, anemia, hyperglycemia, transaminase elevation, fatigue, hypoalbuminemia, rash, edema, nausea, musculoskeletal pain
<b>Lorlatinib (Lorbrena)</b>	NSCLC, metastatic	Tyrosine kinase inhibitor	Edema, peripheral neuropathy, hypercholesterolemia, hypertriglyceridemia, anemia, dyspnea
<b>Lurbinectedin (Zepzelcatm)</b>	Metastatic small-cell lung cancer (SCLC)	Alkylating agent	Leukopenia, lymphopenia, fatigue, anemia, neutropenia, increased creatinine, increased alanine aminotransferase, increased glucose, thrombocytopenia, nausea, decreased appetite, musculoskeletal pain, decreased albumin, constipation, dyspnea, decreased sodium, increased aspartate aminotransferase, vomiting, cough, decreased magnesium, diarrhea
<b>Margetuximab-cmkb (Margenza)</b>	Metastatic HER2-positive breast cancer	HER2/neu receptor antagonist	Fatigue/asthenia, nausea, diarrhea, vomiting, constipation, headache, pyrexia, alopecia, abdominal pain, peripheral neuropathy, arthralgia/myalgia, cough, decreased appetite, dyspnea, infusion-related reactions, palmar-plantar erythrodysesthesia, extremity pain
<b>Megestrol (Megace)</b>	Breast cancer, endometrial cancer	Hormone	Deep vein thrombosis, Cushing-like syndrome, alopecia, carpal tunnel syndrome, weight gain, nausea
<b>Melphalan (Alkeran)</b>	Multiple myeloma, ovarian cancer	Alkylating agent	Anorexia, nausea, vomiting, myelosuppression, diarrhea, stomatitis
<b>Mercaptopurine (Purinethol)</b>	ALL	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, hepatic toxicity, myelosuppression, hyperuricemia, diarrhea, rash

<b>Methotrexate (Rheumatrex)</b>	ALL, trophoblastic neoplasms, breast cancer, head and neck cancer, cutaneous T-cell lymphoma, lung cancer, advanced NHL, osteosarcoma	Antimetabolite	Nausea, vomiting, stomatitis, GI ulceration, diarrhea, hepatic toxicity, renal failure, cystitis, myelosuppression, alopecia, urticaria, acne, photosensitivity, interstitial pneumonitis, fever, malaise, chills, anorexia
<b>Midostaurin (Rydapt)</b>	AML, aggressive systemic mastocytosis (ASM)	Kinase inhibitor	Febrile neutropenia, nausea, mucositis, vomiting, headache, petechiae, musculoskeletal pain, epistaxis, hyperglycemia, upper respiratory tract infections
<b>Mitomycin (Mutamycin)</b>	Gastric cancer, pancreatic cancer	Antibiotic	Anorexia, nausea, vomiting, stomatitis, diarrhea, renal toxicity, myelosuppression, alopecia, pruritus, fever, hemolytic uremic syndrome, weakness
<b>Mitotane (Lysodren)</b>	Adrenocortical carcinoma	Miscellaneous	Anorexia, nausea, vomiting, diarrhea, skin rashes, depression, lethargy, drowsiness, dizziness, adrenal insufficiency, blurred vision, impaired hearing
<b>Mitoxantrone (Novantrone)</b>	Acute nonlymphocytic leukemias, prostate cancer, advanced hormone refractory	Anthracenedione	HF, tachycardia, EKG changes, chest pain, nausea, vomiting, stomatitis, mucositis, myelosuppression, rash, alopecia, urine discoloration (bluish green), phlebitis, diarrhea, cough, headaches, fever
<b>Moxetumomab (Lumoxiti)</b>	Hairy cell leukemia (relapsed or refractory)	Anti-CD22	Peripheral edema, capillary leak syndrome, fatigue, headache, hypoalbuminemia, nausea, decreased Hgb, neutropenia; increased serum ALT, AST, creatinine
<b>Naxitamab-ggqk (Danyelza)</b>	Relapsed or refractory neuroblastoma in the bone/bone marrow	GD2-binding monoclonal antibody	Pain, tachycardia, vomiting, cough, nausea, diarrhea, decreased appetite, hypertension, fatigue, erythema multiforme, peripheral neuropathy, urticaria, pyrexia, headache, injection site reaction, edema, anxiety, localized edema
<b>Necitumumab (Portrazza)</b>	NSCLC (squamous) metastatic	Epidermal growth factor receptor (EGFR) antagonist	Rash, hypomagnesemia

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Nelarabine (Arranon)</b>	T-cell acute lymphoblastic leukemia/lymphoma	Antimetabolite	Anemia, neutropenia, thrombocytopenia, nausea, vomiting, diarrhea, fatigue, fever, dyspnea, severe neurologic events (convulsions, peripheral neuropathy)
<b>Neratinib (Nerlynx)</b>	Breast cancer	Kinase inhibitor	Diarrhea, nausea, abdominal pain, fatigue, vomiting, stomatitis, muscle spasms increase AST/ALT, UTI
<b>Nilotinib (Tasigna)</b>	CML	Tyrosine kinase inhibitor	Rash, pruritus, nausea, fatigue, headache, constipation, diarrhea, vomiting, thrombocytopenia, neutropenia
<b>Nilutamide (Nilandron)</b>	Prostate cancer, metastatic	Antiandrogen	Hypertension, angina, hot flashes, nausea, anorexia, increased hepatic enzymes, dizziness, dyspnea, visual disturbances, impaired adaptation to dark, constipation, decreased libido
<b>Niraparib (Zejula)</b>	Epithelial carcinoma, fallopian tube or peritoneal cancer	PARP inhibitor	Thrombocytopenia, anemia, neutropenia, leukopenia, palpitations, nausea, vomiting, stomatitis, UTI, elevated AST/ALT, dyspnea, hypertension
<b>Nivolumab (Opdivo)</b>	Melanoma, unresectable or metastatic, head and neck cancer, squamous cell (recurrent or metastatic), Hodgkin lymphoma, NSCLC, metastatic, renal cell cancer, advanced	Miscellaneous	Fatigue, dyspnea, musculoskeletal pain, decreased appetite, cough, nausea, constipation
<b>Obinutuzumab (Gazyva)</b>	CLL, follicular lymphoma	Monoclonal antibody	Infusion reactions, thrombocytopenia, febrile neutropenia, lymphopenia, bone marrow failure, tumor lysis syndrome
<b>Ofatumumab (Arzerra)</b>	CLL	Monoclonal antibody	Fever, cough, diarrhea, fatigue, rash, infections, septic shock, neutropenia, thrombocytopenia, infusion reactions
<b>Olaparib (Lynparza)</b>	Ovarian cancer, advanced	Miscellaneous	Anemia, fatigue, nausea, vomiting, diarrhea, dysgeusia, dyspepsia, headache, decreased appetite

<b>Olaratumab (Lartruvo)</b>	Soft tissue sarcoma	PDGFR-alpha blocking antibody	Nausea, fatigue, musculoskeletal pain, mucositis, alopecia, vomiting, neuropathy, headache
<b>Omacetaxine (Synribo)</b>	CML	Protein synthesis inhibitor	Diarrhea, nausea, fatigue, pyrexia, asthenia, vomiting, anorexia, headache, thrombocytopenia, neutropenia, leukopenia, lymphopenia
<b>Osimertinib (Tagrisso)</b>	NSCLC, metastatic	Kinase inhibitor	Diarrhea, rash, dry skin, nail toxicity
<b>Oxaliplatin (Eloxatin)</b>	Colon cancer	Alkylating agent	Fatigue, neuropathy, abdominal pain, dyspnea, diarrhea, nausea, vomiting, anorexia, fever, edema, chest pain, anemia, thrombocytopenia, thromboembolism, altered hepatic function tests
<b>Paclitaxel (Taxol)</b>	Breast cancer, Kaposi sarcoma, NSCLC, ovarian cancer	Antimicrotubular	Hypertension, bradycardia, ECG changes, nausea, vomiting, diarrhea, mucositis, myelosuppression, alopecia, peripheral neuropathies, hypersensitivity reaction, arthralgia, myalgia
<b>Palbociclib (Ibrance)</b>	Breast cancer, advanced	Kinase inhibitor	Neutropenia, leukopenia, fatigue, anemia, upper respiratory tract infection, nausea, stomatitis, alopecia, diarrhea, thrombocytopenia, decreased appetite, vomiting, asthenia, peripheral neuropathy, epistaxis
<b>Panitumumab (Vectibix)</b>	Colorectal cancer metastatic	Monoclonal antibody	Pulmonary fibrosis, severe dermatologic toxicity, infusion reactions, abdominal pain, nausea, vomiting, constipation, skin rash, fatigue
<b>Panobinostat (Farydak)</b>	Multiple myeloma	Miscellaneous	Diarrhea, fatigue, nausea, peripheral edema, decreased appetite, pyrexia, vomiting
<b>Pazopanib (Votrient)</b>	Renal cell carcinoma, soft tissue sarcoma	Kinase inhibitor	Diarrhea, hypertension, nausea, fatigue, vomiting, hepatotoxicity, hemorrhagic events
<b>Pegaspargase (Oncaspar)</b>	ALL	Miscellaneous	Hypotension, anorexia, nausea, vomiting, hepatotoxicity, pancreatitis, depression of clotting factors, malaise, confusion, lethargy, EEG changes, respiratory distress, hypersensitivity reaction, fever, hyperglycemia, stomatitis

Continued

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Pemetrexed (Alimta)</b>	NSCLC, nonsquamous, mesothelioma	Antimetabolite	Anorexia, constipation, diarrhea, neuropathy, anemia, chest pain, dyspnea, rash, fatigue
<b>Pentostatin (Nipent)</b>	Hairy cell leukemia	Antibiotic	Nausea, vomiting, hepatic disorders, elevated hepatic function tests, leukopenia, anemia, thrombocytopenia, rash, fever, upper respiratory infection, fatigue, hematuria, headaches, myalgia, arthralgia, diarrhea, anorexia
<b>Pertuzumab (Perjeta)</b>	Breast cancer, metastatic	HER2/neu receptor antagonist	Alopecia, diarrhea, nausea, neutropenia, rash, fatigue, peripheral neuropathy
<b>Pertuzumab, trastuzumab, and hyaluronidase-zzxf (Phesgo)</b>	Neoadjuvant treatment of patients with HER2-positive, locally advanced, inflammatory, or early stage breast cancer	HER2/neu receptor antagonists	Alopecia, nausea, diarrhea, anemia, and asthenia
<b>Polatuzumab vedotin-piiq (Polivy)</b>	Diffuse large B-cell lymphoma, relapsed or refractory	Anti-CD79B antibody drug conjugate, monoclonal antibody	Peripheral neuropathy, neutropenia, diarrhea, thrombocytopenia, anemia; decreased calcium; increased creatinine
<b>Pomalidomide (Pomalyst)</b>	Multiple myeloma, relapsed/refractory	Immunomodulator	Dyspnea, fatigue, peripheral edema, anorexia, rash, neutropenia, leukopenia, thrombocytopenia
<b>Ponatinib (Iclusig)</b>	ALL, CML	Kinase inhibitor	Abdominal pain, rash, fatigue, hypertension, pyrexia, myelosuppression, arthralgia, vomiting
<b>Gavreto (pralsetinib)</b>	Fusion-positive non-small-cell lung cancer, advanced or metastatic RET-mutant medullary thyroid cancer (MTC), advanced or metastatic RET fusion-positive thyroid cancer	Kinase inhibitor	Constipation, hypertension, fatigue, musculoskeletal pain, diarrhea

<b>Procarbazine (Matulane)</b>	Hodgkin lymphoma, NHLs, CNS tumors	Alkylating agent	Nausea, vomiting, stomatitis, diarrhea, constipation, myelosuppression, pruritus, hyperpigmentation, alopecia, myalgia, paresthesia, confusion, lethargy, mental depression, fever, hepatic toxicity, arthralgia, respiratory disorders
<b>Ramucirumab (Cyramza)</b>	Colorectal cancer, metastatic, gastric cancer, advanced or metastatic, NSCLC, metastatic	Miscellaneous	Diarrhea, hypertension
<b>Regorafenib (Stivarga)</b>	Colorectal cancer, GIST	VEGF inhibitor	Asthenia, fatigue, mucositis, weight loss, fever, GI perforation, hemorrhage, infections, palmer-planter erythrodysesthesia syndrome (PPES)
<b>Relugolix (Orgovyx)</b>	Advanced prostate cancer	Gonadotropin-releasing hormone (GnRH) receptor antagonist	Hot flush, increased glucose, triglycerides, musculoskeletal pain, Hgb decreased, increased ALT, AST, constipation, diarrhea
<b>Ribociclib (Kisqali)</b>	Breast cancer, metastatic or advanced	Kinase inhibitor	Neutropenia, nausea, fatigue, diarrhea, leukopenia, alopecia, vomiting, headache
<b>Ripretinib (Qinlock)</b>	Gastrointestinal stromal tumor, advanced	KIT inhibitor, PDGFR-alpha blocker, tyrosine kinase inhibitor	Alopecia, abdominal pain, constipation, decreased appetite, diarrhea, fatigue; increased INR, prolonged partial thromboplastin time
<b>Rituximab (Rituxan)</b>	CLL, NHL	Monoclonal antibody	Hypotension, arrhythmias, peripheral edema, nausea, vomiting, abdominal pain, leukopenia, thrombocytopenia, neutropenia, rash, pruritus, urticaria, angioedema, myalgia, headaches, dizziness, throat irritation, rhinitis, bronchospasm, hypersensitivity reaction
<b>Rucaparib (Rubraca)</b>	Ovarian cancer, advanced	PARP inhibitor	Nausea, fatigue, vomiting, anemia, decreased appetite, diarrhea, thrombocytopenia, dyspnea, increased AST/ALT, decreased Hgb, platelets, ANC

*Continued*

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Sacituzumab go- vitecan-hziy (Trodelvy)</b>	Breast cancer (triple negative, metastatic, refractory)	Anti-Trop-2 antibody, drug conjugate, monoclonal antibody, topoisomerase I inhibitor	Alopecia, hyperglycemia, hypermagnesemia, constipation, diarrhea, vomiting, anemia, leukopenia, neutropenia, fatigue; decreased albumin, calcium, sodium; prolonged prothrombin time
<b>Selinexor (Xpovio)</b>	Diffuse large B-cell lymphoma (relapsed or refractory), multiple myeloma (relapsed or refractory)	Nuclear export inhibitor	Fatigue, weight loss, hyponatremia, nausea, decreased appetite, diarrhea, vomiting, thrombocytopenia, anemia, neutropenia, infection
<b>Sipuleucel-T (Provenge)</b>	Prostate cancer, metastatic	Miscellaneous	Chills, fatigue, fever, back pain, nausea, headache, joint ache
<b>Sonidegib (Odomzo)</b>	Basal cell carcinoma, locally advanced	Hedgehog pathway inhibitor	Muscle spasms, alopecia, dysgeusia, fatigue, nausea, diarrhea, decreased weight, musculoskeletal pain, myalgia, headache, abdominal pain, vomiting, pruritus
<b>Sorafenib (Nexavar)</b>	Hepatocellular cancer, renal cell cancer, advanced, thyroid cancer	Tyrosine kinase inhibitor	Fatigue, alopecia, nausea, vomiting, anorexia, constipation, diarrhea, neuropathy, dyspnea, cough, asthenia, pain
<b>Selpercatinib (Retevmo)</b>	NSCLC (metastatic, RET fusion positive), thyroid, medullary cancer (RET mutant), thyroid cancer (RET fusion positive)	RET kinase inhibitor, tyrosine kinase inhibitor	Edema, hypertension, fatigue, leukopenia, thrombocytopenia; decreased albumin, calcium; increased alkaline phosphatase, ALT, AST, creatinine
<b>Sunitinib (Sutent)</b>	GIST, pancreatic neuroendocrine tumors, advanced, renal cell carcinoma, advanced	Tyrosine kinase inhibitor	Hypotension, edema, fatigue, headache, fever, dizziness, rash, hyperpigmentation, diarrhea, nausea, dyspepsia, altered taste, vomiting, neutropenia, thrombocytopenia, increased ALT/AST

<b>Tafasitamab-cxix (Monjuvi)</b>	Relapsed or refractory diffuse large B-cell lymphoma (DLBCL)	CD19-directed cytolytic antibody	Neutropenia, fatigue, anemia, diarrhea, thrombocytopenia, cough, pyrexia, peripheral edema, respiratory tract infection, decreased appetite
<b>Tamoxifen (Nolvadex-D)</b>	Breast cancer	Estrogen receptor antagonist	Skin rash, nausea, vomiting, anorexia, menstrual irregularities, hot flashes, pruritus, vaginal discharge or bleeding, myelosuppression, headaches, tumor or bone pain, ophthalmic changes, weight gain, confusion
<b>Talazoparib (Talzenna)</b>	Breast cancer	PARP inhibitor	Fatigue, hyperglycemia, nausea, decreased Hgb, anemia, neutropenia, increased serum AST, ALT, alkaline phosphatase
<b>Temozolomide (Temodar)</b>	Anaplastic astrocytoma, glioblastoma multiforme	Alkylating agent	Amnesia, fever, infection, leukopenia, neutropenia, peripheral edema, seizures, thrombocytopenia
<b>Temsirolimus (Torisel)</b>	Renal cell carcinoma, advanced	mTOR kinase inhibitor	Rash, asthenia, mucositis, nausea, edema, anorexia, thrombocytopenia, leukopenia
<b>Tepotinib (Tepmetko)</b>	Metastatic non–small-cell lung cancer (NSCLC) harboring mesenchymal epithelial transition (MET) exon 14 skipping alterations	Kinase inhibitor	Edema, fatigue, nausea, diarrhea, musculoskeletal pain, and dyspnea, increased ALT, AST, decreased Hgb
<b>Thioguanine (Tabloid)</b>	AML	Antimetabolite	Anorexia, stomatitis, myelosuppression, hyperuricemia, nausea, vomiting, diarrhea
<b>Thiotepa (Thioplex)</b>	Bladder cancer, papillary, breast cancer	Alkylating agent	Anorexia, nausea, vomiting, mucositis, myelosuppression, amenorrhea, reduced spermatogenesis, fever, hypersensitivity reactions, pain at injection site, headaches, dizziness, alopecia
<b>Tipiracil/trifluridine (Lonsurf)</b>	Colorectal cancer, metastatic	Miscellaneous	Asthenia, fatigue, nausea, diarrhea, vomiting, decreased appetite, pyrexia, abdominal pain
<b>Tisagenlecleucel (Kymriah)</b>	Acute lymphoblastic leukemia (relapsed/refractory); diffuse large B-cell lymphoma (relapsed/refractory)	Chimeric antigen receptor T-cell immunotherapy	Hypotension, tachycardia, hypertension, hypokalemia, hypophosphatemia, decreased appetite, vomiting, diarrhea, nausea, anemia, neutropenia, thrombocytopenia, lymphocytopenia, leukopenia, infection, acute renal failure, fever

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Tivozanib (Fotivda)</b>	Relapsed or refractory advanced renal cell carcinoma (RCC)	Kinase inhibitor	Fatigue, hypertension, diarrhea, decreased appetite, nausea, dysphonia, hypothyroidism, cough, and stomatitis
<b>Topotecan (Hycamtin)</b>	Cervical cancer, recurrent or resistant, ovarian cancer, metastatic, SCLC, relapsed	Camptothecin	Nausea, vomiting, diarrhea, constipation, abdominal pain, stomatitis, anorexia, neutropenia, leukopenia, thrombocytopenia, anemia, alopecia, headaches, dyspnea, paresthesia
<b>Toremifene (Fareston)</b>	Breast cancer	Estrogen receptor antagonist	Elevated hepatic function tests, nausea, vomiting, constipation, skin discoloration, dermatitis, dizziness, hot flashes, diaphoresis, vaginal discharge or bleeding, ocular changes, cataracts, anxiety
<b>Trabectedin (Yondelis)</b>	Soft tissue sarcoma	Alkylating agent	Nausea, vomiting, fatigue, diarrhea, decreased appetite, peripheral edema, dyspnea, headache, increased ALT, AST, alkaline phosphatase, neutropenia, thrombocytopenia, anemia
<b>Trametinib (Mekinist)</b>	Melanoma, metastatic or unresectable	MEK inhibitor	Rash, peripheral edema, pyrexia, malignancies, fatigue, hemorrhagic events, HF
<b>Trastuzumab (Herceptin)</b>	Gastric cancer, metastatic, breast cancer, metastatic	Monoclonal antibody	HF, heart murmur (S <sub>3</sub> gallop), nausea, vomiting, diarrhea, abdominal pain, anorexia, rash, peripheral edema, back or bone pain, asthenia (loss of strength, energy), headaches, insomnia, dizziness, cough, dyspnea, rhinitis, pharyngitis
<b>Trastuzumab/hyaluronidase (Herceptin Hylecta)</b>	Breast cancer, adjuvant treatment, metastatic	Anti-HER2 tyrosine kinase inhibitor	Fatigue, alopecia, nausea, diarrhea, neutropenia
<b>Tretinoin (Vesanoid)</b>	Acute promyelocytic leukemia	Miscellaneous	Flushing, nausea, vomiting, diarrhea, constipation, dyspepsia, mucositis, leukocytosis, dry skin/mucous membranes, rash, pruritus, alopecia, dizziness, anxiety, insomnia, headaches, depression, confusion, intracranial hypertension, agitation, dyspnea, shivering, fever, visual changes, earaches, hearing loss, bone pain, myalgia, arthralgia

<b>Tucatinib (Tukysa)</b>	Breast cancer, human epidermal growth factor receptor 2 positive, advanced, unresectable or metastatic	Anti-HER2 tyrosine kinase inhibitor	Palmar-plantar erythrodysesthesia, abdominal pain, diarrhea, nausea, hepatotoxicity, fatigue, headache; decreased magnesium, phosphate, potassium; increased ALT
<b>Umbralisib (Ukoniq)</b>	Relapsed or refractory marginal zone lymphoma (MZL), relapsed or refractory follicular lymphoma	Kinase inhibitor	Increased creatinine, diarrhea, colitis, fatigue, nausea, neutropenia, musculoskeletal pain, anemia, thrombocytopenia, upper respiratory tract infection, vomiting, abdominal pain, decreased appetite, rash
<b>Valrubicin (Valstar)</b>	Bladder cancer	Anthracycline	Dysuria, hematuria, urinary frequency/incontinence/urgency
<b>Vandetanib (Caprelsa)</b>	Thyroid cancer, medullary	Tyrosine kinase inhibitor	Diarrhea, rash, acne, nausea, hypertension, headache, fatigue, decreased appetite, abdominal pain
<b>Vemurafenib (Zelboraf)</b>	Melanoma, metastatic or unresectable	Kinase inhibitor	Arthralgia, alopecia, fatigue, malignancies, dermatological reactions
<b>Venetoclax (Venclexta)</b>	CLL	BCL-2 inhibitor	Diarrhea, neutropenia, anemia, nausea, upper respiratory tract infections, thrombocytopenia, fatigue
<b>Vinblastine (Velban)</b>	Mycosis fungoides, Hodgkin lymphoma, lymphocytic lymphoma, testicular cancer, Kaposi sarcoma	Vinca alkaloid	Nausea, vomiting, stomatitis, constipation, myelosuppression, alopecia, peripheral neuropathy, loss of deep tendon reflexes, paresthesia, diarrhea
<b>Vincristine (Oncovin)</b>	ALL, Hodgkin lymphoma, non-Hodgkin lymphomas, Wilm's tumor, neuroblastoma, rhabdomyosarcoma	Vinca alkaloid	Nausea, vomiting, stomatitis, constipation, pharyngitis, polyuria, myelosuppression, alopecia, numbness, paresthesia, peripheral neuropathy, loss of deep tendon reflexes, headaches, abdominal pain

*Continued*

## CHEMOTHERAPEUTIC AGENTS—cont'd

Name	Uses	Category	Side Effects
<b>Vincristine liposomal (Marqibo)</b>	ALL	Vinca alkaloid	Constipation, nausea, pyrexia, fatigue, peripheral neuropathy, febrile neutropenia, diarrhea, anemia, reduced appetite, insomnia
<b>Vinorelbine (Navelbine)</b>	NSCLC	Vinca alkaloid	Elevated LFT, nausea, vomiting, constipation, ileus, anorexia, stomatitis, myelosuppression, alopecia, vein discoloration, venous pain, phlebitis, interstitial pulmonary changes, asthenia, fatigue, diarrhea, peripheral neuropathy, loss of deep tendon reflexes
<b>Vismodegib (Erivedge)</b>	Basal cell carcinoma, metastatic or locally advanced	Hedgehog pathway inhibitor	Alopecia, muscle spasms, dysgenesis, weight loss, fatigue, nausea, diarrhea, reduced appetite, vomiting, arthralgia
<b>Vorinostat (Zolinza)</b>	Cutaneous T-cell lymphoma	Histone deacetylase inhibitor	Diarrhea, fatigue, nausea, thrombocytopenia, anorexia, dysgeusia
<b>Zanubrutinib (Brukinsa)</b>	Mantle cell lymphoma, relapsed or refractory	Bruton tyrosine kinase inhibitor	Skin rash, diarrhea, petechiae, lymphocytosis, neutropenia, thrombocytopenia, leukopenia, upper respiratory tract infection; increased ALT, bilirubin, uric acid
<b>Ziv-aflibercept (Zaltrap)</b>	Colorectal cancer, metastatic	Miscellaneous	Leukopenia, neutropenia, diarrhea, proteinuria, increased ALT/AST, stomatitis, thrombocytopenia, hypertension, epistaxis, headache, abdominal pain

**AV**, Atrioventricular; **C**, capsules; **ECG**, electrocardiogram; **EEG**, electroencephalogram; **GI**, gastrointestinal; **HF**, heart failure; **I**, injection; **LFT**, liver function test; **T**, tablets; **UTI**, urinary tract infection.

# Contraception

## ACTION

Combination oral contraceptives decrease fertility primarily by inhibition of ovulation. In addition, they can promote thickening of the cervical mucus, thereby creating a physical barrier for the passage of sperm. Also, they can modify the endometrium, making it less favorable for nidation.

## CLASSIFICATION

Oral contraceptives either contain both an estrogen and a progestin (combination oral contraceptives) or contain only a progestin (progestin-only oral contraceptives). The combination oral contraceptives have four subgroups: *Monophasic*: Daily estrogen and progestin dosage remains constant.

*Biphasic*: Estrogen remains constant, but the progestin dosage increases during the second half of the cycle.

*Triphasic*: Progestin changes for each phase of the cycle.

*Four-phasic*: Contains four progestin/estrogen dosing combinations during the 20-day cycle.

## COMMON COMPLAINTS WITH ORAL CONTRACEPTIVES

Too much estrogen	Nausea, bloating, breast tenderness, increased B/P, melasma, headache
Too little estrogen	Early or midcycle breakthrough bleeding, increased spotting, hypomenorrhea
Too much progestin	Breast tenderness, headache, fatigue, changes in mood
Too little progestin	Late breakthrough bleeding
Too much androgen	Increased appetite, weight gain, acne, oily skin, hirsutism, decreased libido, increased breast size, breast tenderness, increased LDL cholesterol, decreased HDL cholesterol

**B/P**, Blood pressure; **HDL**, high-density lipoprotein; **LDL**, low-density lipoprotein.

Name	Estrogen Content	Progestin Content
<b>Contraceptive Patch</b>		
Twirla	EES 30 mcg and levonorgestrel 120 mcg	Apply once/wk for 3 wks, then 1 wk off
Xulane	EES 35 mcg and norelgestromin 150 mcg	Apply once/wk for 3 wks, then 1 wk off

*EE*, Ethinyl estradiol.

## Corticosteroids

### USES

Replacement therapy in adrenal insufficiency, including Addison's disease. Symptomatic treatment of multiorgan disease/conditions. Rheumatoid arthritis (RA), osteoarthritis, severe psoriasis, ulcerative colitis, lupus erythematosus, anaphylactic shock, acute exacerbation of asthma, status asthmaticus, organ transplant.

### ACTION

Suppress migration of polymorphonuclear leukocytes (PML) and reverse increased capillary permeability by their anti-inflammatory effect. Suppress immune system by decreasing activity of lymphatic system.

## CORTICOSTEROIDS

Name	Availability	Route of Administration	Side Effects
<b>Beclomethasone (Beconase, Qnasl, QVAR)</b>	<b>Aerosol (oral inhalation), QVAR:</b> 40 mcg/inhalation, 80 mcg/inhalation <b>Aerosol (spray, intranasal), Qnasl:</b> 80 mcg/inhalation <b>Suspension (intranasal), Beconase:</b> 42 mcg/inhalation	Inhalation, intranasal	<b>I:</b> Cough, dry mouth/throat, headaches, throat irritation, increased blood glucose <b>Nasal:</b> Headaches, sore throat, intranasal ulceration, increased blood glucose

<b>Betamethasone (Celestone)</b>	<b>I:</b> 6 mg/ml	IV, intralesional, intra-articular	Nausea, vomiting, increased appetite, weight gain, insomnia, increased blood glucose
<b>Budesonide (Pulmicort, Rhinocort)</b>	<b>Nasal:</b> 32 mcg/spray <b>Suspension for nebulization:</b> 250 mcg, 500 mcg	Intranasal	Headaches, sore throat, intranasal ulceration, increased blood glucose

<b>Prednisone</b>	<b>T:</b> 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg	PO	Headache, insomnia, weight gain, nausea, vomiting, increased blood glucose
<b>Triamcinolone (Kenalog, Nasacort AQ)</b>	<b>Injection, suspension:</b> 10 mg/ml, 40 mg/ml <b>Intranasal, suspension:</b> 55 mcg/ inhalation	IM, inhalation (nasal)	<b>PO:</b> Insomnia, increased appetite, nausea, vomiting, increased blood glucose <b>I:</b> Cough, dry mouth/throat, headaches, throat irritation, increased blood glucose

I, Injection; OS, oral suspension; T, tablets.

## Diuretics

### USES

*Thiazides:* Management of edema resulting from a number of causes (e.g., HF, hepatic cirrhosis); hypertension either alone or in combination with other antihypertensives.

*Loop:* Management of edema associated with HF, cirrhosis of the liver, and renal disease. Furosemide used in treatment of hypertension alone or in combination with other antihypertensives.

*Potassium-sparing:* Adjunctive treatment with thiazides, loop diuretics in treatment of HF and hypertension.

### ACTION

Increase the excretion of water/sodium and other electrolytes via the kidneys. Exact mechanism of antihypertensive effect unknown; may be due to reduced plasma volume or decreased peripheral vascular resistance. Subclassifications of diuretics are based on their mechanism and site of action.

*Thiazides:* Act at cortical diluting segment of nephron, block reabsorption of Na, Cl, and water; promote excretion of Na, Cl, K, and water.

*Loop:* Act primarily at the thick ascending limb of Henle's loop to inhibit Na, Cl, and water absorption.

*Potassium-sparing:* Spironolactone blocks aldosterone action on distal nephron (causes K retention, Na excretion). Triamterene, amiloride act on distal nephron, decreasing Na reuptake, reducing K secretion.

## DIURETICS

Name	Availability	Dosage Range	Side Effects
<b>Thiazide, Thiazide-related</b>			
<b>Chlorothiazide (Diuril)</b>	<b>T:</b> 250 mg, 500 mg <b>S:</b> 250 mg/5 mL <b>I:</b> 500 mg	<b>Edema:</b> 500–1,000 mg 1–2 times/day <b>HTN:</b> 500–2,000 mg/day in 1–2 divided doses	<b>CLASS</b> Hyperuricemia, hypokalemia, hypomagnesemia, hyperglycemia, hyponatremia, hypercalcemia, hypercholesterolemia, hypertriglyceridemia, pancreatitis, rash, photosensitivity
<b>Chlorthalidone</b>	<b>Hygroton:</b> 25 mg, 50 mg, 100 mg	<b>Edema:</b> Initially, 50–100 mg once daily or 100 mg every other day <b>Maximum:</b> 200 mg/day	
<b>Hydrochlorothiazide</b>	<b>T:</b> 12.5 mg, 25 mg, 50 mg <b>C:</b> 12.5 mg	<b>Edema:</b> 25–100 mg/day in 1–2 divided doses <b>HTN:</b> Initially, 12.5–25 mg once daily. May increase up to 50 mg/day in 1 or 2 divided doses	
<b>Indapamide (Lozol)</b>	<b>T:</b> 1.25 mg, 2.5 mg	<b>Edema:</b> Initially, 2.5 mg/day. May increase after 1 wk to 5 mg/day <b>HTN:</b> Initially, 2.5 mg/day. May increase q4wks to 2.5 mg, then to 5 mg/day	
<b>Metolazone (Zaroxolyn)</b>	<b>T:</b> 2.5 mg, 5 mg, 10 mg	<b>Edema:</b> 2.5–20 mg once daily <b>HTN:</b> 2.5–5 mg once daily

<b>Triamterene (Dyrenium)</b>	<b>C:</b> 50 mg, 100 mg	<b>Edema, HTN:</b> 100–300 mg/day in 1–2 divided doses	Hyperkalemia, nausea, abdominal pain, nephrolithiasis

**C,** Capsules; **HF,** heart failure; **HTN,** hypertension; **I,** injection; **OS,** oral solution; **S,** suspension; **T,** tablets.

## H<sub>2</sub> Antagonists

### USES

Short-term treatment of duodenal ulcer (DU), active benign gastric ulcer (GU), maintenance therapy of DU, pathologic hypersecretory conditions (e.g., Zollinger-Ellison syndrome), gastroesophageal reflux disease (GERD), and prevention of upper GI bleeding in critically ill pts.

### ACTION

Inhibits gastric acid secretion by interfering with histamine at the histamine H<sub>2</sub> receptors in parietal cells. Decreases basal acid secretion and food-stimulated acid secretion.

### H<sub>2</sub> ANTAGONISTS

Name	Availability	Usual Adult Dose	Class Side Effects
<b>Cimetidine (Tagamet)</b>	<b>T:</b> 200 mg, 300 mg, 400 mg, 800 mg <b>L:</b> 300 mg/5 mL	200–400 mg bid	Severe effects uncommon. Hepatitis, hematologic toxicity, CNS effects (e.g., headache, fatigue, cognitive impairment)
<b>Famotidine (Pepcid)</b>	<b>T:</b> 10 mg, 20 mg, 40 mg <b>OS:</b> 40 mg/5 mL <b>I:</b> 10 mg/mL	20–40 mg bid	
<b>Nizatidine (Axid)</b>	<b>OS:</b> 15 mg/mL <b>C:</b> 75 mg, 150 mg, 300 mg	150 mg bid	

**C**, Capsules; **CNS**, central nervous system; **I**, injection; **L**, liquid; **OS**, oral suspension; **T**, tablets.

## Hepatitis C Virus Infection

Hepatitis C virus (HCV) infection is the leading blood-borne infection in the US. HCV is transmitted by exposure to infected blood products. Risk factors for acquiring HCV include injection drug use, receiving contaminated blood products, needle sticks, and ver-

tical transmission. If untreated, HCV may progress to chronic HCV and long-term sequelae including cirrhosis and hepatocellular carcinoma. There are seven known genotypes of HCV (genotypes 1–7) which impact the selection of initial therapy and treatment response. Geno-

type 1 is the most common and is further subtyped into genotypes 1a and 1b.

Currently, there are two indirect-acting antivirals and seven direct-acting antivirals approved for the treatment of chronic HCV

### ACTION

#### Indirect Acting Antivirals (IAA)

*Alpha Interferons (peginterferons)*: Induces immune response against HCV, inhibiting viral replication

*Ribavirin*: Exact mechanism unknown but has activity against several RNA and DNA viruses

#### Direct Acting Antivirals (DAA)

*NS3/4A Protease Inhibitors (PIs)*: Targets the serine protease NS3/NS4 that is responsible for processing HCV polyprotein and producing new viruses.

*Nonstructural Protein 5A (NS5A) Inhibitors*: Suppress the NS5A protein, which is essential for viral assembly and replication.

*Nonstructural Protein 5B (NS5B) Inhibitors*: Suppress the NS5B RNA-dependent RNA polymerase that is responsible for HCV replication.

## ANTI-HEPATITIS C VIRUS PREPARATIONS

Name	Type	Genotype	Dosage	Side Effects
<b>Elbasvir, grazoprevir (Zepatier)</b>	DAA NS5A/NS3/4A protease inhibitor	1, 4	<b>Genotype 1a:</b> One tablet daily for 12 wks (16 wks with baseline NS5A polymorphisms) <b>Genotype 1b:</b> One tablet daily for 12 wks <b>Genotype 4:</b> One tablet daily for 12 wks (16 wks peginterferon/ribavirin experienced)	Fatigue, headache, nausea
<b>Glecaprevir, pibrentasvir (Mavyret)</b>	DAA NS5A/NS3/4A protease inhibitor	1, 2, 3, 4, 5, 6	<b>Genotypes 1, 2, 3, 4, 5, 6:</b> Three tablets once daily. Treatment duration 8–16 wks based on patients that are mono-infected, and coinfecting with compensated liver disease (with or without cirrhosis) and with or without renal impairment	Headache, fatigue, nausea, diarrhea, increased serum bilirubin
<b>Simeprevir (Olysio)</b>	DAA (NS3/4A-PI)	1, 4	150 mg once daily plus peginterferon and ribavirin for 12 wks, then additional 12–36 wks of peginterferon and ribavirin 150 mg once daily plus sofosbuvir for 12 wks without cirrhosis or 24 wks with cirrhosis	(With peginterferon, ribavirin): Rash, itching, nausea, photosensitivity (With sofosbuvir): Fatigue, headache, nausea, insomnia, pruritus, rash, dizziness, diarrhea
<b>Sofosbuvir (Sovaldi)</b>	DAA (NS5B)	1, 2, 3, 4	<b>Genotypes 1, 4:</b> 400 mg once daily plus peginterferon and ribavirin for 12 wks 400 mg once daily plus simeprevir for 12 wks without cirrhosis or 24 wks with cirrhosis <b>Genotypes 2, 3:</b> 400 mg once daily plus ribavirin for 12 wks for genotype 2 or 24 wks for genotype 3	(With peginterferon, ribavirin): Fatigue, headache, nausea, insomnia, anemia (With simeprevir): Fatigue, headache, nausea, insomnia, pruritus, rash, dizziness, diarrhea
<b>Ledipasvir, Sofosbuvir (Harvoni)</b>	DAA (NS5A/NS5B)	1, 4, 5, 6	<b>Genotype 1:</b> One tablet (90 mg/400 mg) for 12 wks in treatment-naïve pt with or without cirrhosis and treatment-experienced pt without cirrhosis; for 24 wks for treatment-experienced pts with cirrhosis <b>Genotypes 4, 5, 6:</b> One tablet daily for 12 wks	Fatigue, headache, nausea, diarrhea, insomnia; elevations in bilirubin, lipase, and creatinine kinase

Name	Type	Genotype	Dosage	Side Effects
<b>Ombitasvir, paritaprevir, ritonavir, dasabuvir (Viekira Pak)</b>	DAA (NS5A/protease inhibitor/CYP3A inhibitor/polymerase inhibitor)	1	Two ombitasvir, paritaprevir, ritonavir tablets (12.5 mg, 75 mg, 50 mg) once daily in the morning plus one dasabuvir 250 mg tablet 2 times/day Patients with <b>genotype 1a or 1b with cirrhosis</b> will also receive ribavirin for 12 wks (genotype 1a with cirrhosis: 12–24 wks based on treatment history; liver transplant pts: 24 wks)	(With ribavirin): Fatigue, nausea, itching, insomnia (Without ribavirin): Nausea, itching, insomnia
<b>Peginterferon alfa 2a (Pegasys)</b>	IAA (Interferon)	1, 2, 3, 4	180 mcg SQ wkly for 12–48 wks based on antiviral regimen, pt history, response	(With ribavirin): Fatigue, weakness, fever, myalgia, headache
<b>Peginterferon alfa 2b (PegIntron)</b>	IAA (Interferon)	1, 2, 3, 4	1.5 mcg/kg SQ wkly for 12–48 wks based on antiviral regimen, pt history, response	(With ribavirin): Injection site reaction, fatigue, weakness, headache, rigors, fever, nausea, myalgia, insomnia, mood instability, hair loss
<b>Ribavirin (Copegus, Ribasphere)</b>	IAA (Nucleoside analogue)	1, 2, 3, 4	<b>Genotypes 2, 3</b> 400 mg 2 times/day (with peginterferon) <b>Genotypes 1, 4</b> <75 kg: 400 mg qam; and 600 mg qpm; 75 kg or greater: 600 mg 2 times/day	(With peginterferon): Fatigue, weakness, headache, rigors, fever, nausea, myalgia, insomnia, mood instability, hair loss
<b>Daclatasvir (Daklinza)</b>	DAA (NS5A)	3	60 mg once daily with sofosbuvir for 12 wks	Headache, fatigue
<b>Ombitasvir, paritaprevir, ritonavir (Technivie)</b>	DAA (NS5A/protease inhibitor/CYP3A inhibitor)	4	Two tablets once daily with ribavirin for 12 wks	Asthenia, fatigue, nausea, insomnia
<b>Sofosbuvir/velpatasvir (Eplclusa)</b>	DAA (NS5B/NS5A)	1, 2, 3, 4, 5, 6	One tablet daily for 12 wks	Insomnia, anemia, headache, fatigue, nausea, diarrhea
<b>Sofosbuvir/velpatasvir/voxilaprevir (VOSEVI)</b>	DAA (NS5B/NS5A/protease inhibitor)	1, 2, 3, 4, 5, 6	One tablet daily for 12 wks	Headache, fatigue, diarrhea, nausea

# Hormones

## USES

Functions of the body are regulated by two major control systems: the nervous system and the endocrine (hormone) system. Together they maintain homeostasis and control different metabolic functions in the body.

Hormones are concerned with control of different metabolic functions in the body (e.g., rates of chemical reactions in cells, transporting substances through cell membranes, cellular metabolism [growth/secretions]). By definition, a hormone is a chemical substance secreted into body fluids by cells and has control over other cells in the body.

Hormones can be local or general:

- *Local hormones* have specific local effects (e.g., acetylcholine, which is secreted at parasympathetic and skeletal nerve endings).

- *General hormones* are mostly secreted by specific endocrine glands (e.g., epinephrine/norepinephrine are secreted by the adrenal medulla in response to sympathetic stimulation), transported in the blood to all parts of the body, causing many different reactions.

Some general hormones affect all or almost all cells of the body (e.g., thyroid hormone from the thyroid gland increases the rate of most chemical reactions in almost all cells of the body); other general hormones affect only specific tissue (e.g., ovarian hormones are specific to female sex organs and secondary sexual characteristics of the female).

## ACTION

Endocrine hormones almost never directly act intracellularly affecting chemical reactions. They first combine with hormone receptors either on the cell surface or inside the cell (cell cytoplasm or nucleus). The combination of hormone and receptors alters the function of the receptor, and the receptor is the direct cause of the hormone effects. Altered receptor function may include the following:

*Altered cell permeability*, which causes a change in protein structure of the receptor, usually opening or closing a channel for one or more ions. The movement of these ions causes the effect of the hormone.

*Activation of intracellular enzymes* immediately inside the cell membrane (e.g., hormone combines with receptor that then becomes the activated enzyme adenyl cyclase, which causes formation of cAMP).

◀**ALERT**▶ cAMP has effects inside the cell. It is not the hormone but cAMP that causes these effects.

Regulation of hormone secretion is controlled by an internal control system, the negative feedback system:

- Endocrine gland oversecretes.
- Hormone exerts more and more of its effect.

- Target organ performs its function.
- Too much function in turn feeds back to endocrine gland to decrease secretory rate.

The endocrine system contains many glands and hormones. A summary of the important glands and their hormones secreted are as follows:

The pituitary gland (hypophysis) is a small gland found in the sella turcica at the base of the brain. The pituitary is divided into two portions physiologically: the anterior pituitary (adenohypophysis) and the posterior pituitary (neurohypophysis). Six important hormones are secreted from the anterior pituitary and two from the posterior pituitary.

Anterior pituitary hormones:

- Growth hormone (GH)
- Adrenocorticotropin (corticotropin)
- Thyroid-stimulating hormone (thyrotropin) (TSH)
- Follicle-stimulating hormone (FSH)
- Luteinizing hormone (LH)
- Prolactin

Posterior pituitary hormones:

- Antidiuretic hormone (vasopressin)
- Oxytocin

Almost all secretions of the pituitary hormones are controlled by hormonal or nervous signals from the hypothalamus. The hypothalamus is a center of information concerned with the well-being of the body, which in turn is used to control secretions of the important pituitary hormones just listed. Secretions from the posterior pituitary are controlled by nerve signals originating in the hypothalamus; anterior pituitary hormones are controlled by hormones secreted within the hypothalamus. These hormones are as follows:

- Thyrotropin-releasing hormone (TRH) releasing thyroid-stimulating hormone
- Corticotropin-releasing hormone (CRH) releasing adrenocorticotropin
- Growth hormone-releasing hormone (GHRH) releasing growth hormone and growth hormone inhibitory hormone (GHIH) (same as somatostatin)
- Gonadotropin-releasing hormone (GnRH) releasing the two gonadotropic hormones, LH and FSH
- Prolactin inhibitory factor (PIF) causing inhibition of prolactin and prolactin-releasing factor

### ANTERIOR PITUITARY HORMONES

All anterior pituitary hormones (except growth hormone) have as their principal effect stimulating target glands.

### GROWTH HORMONE (GH)

Growth hormone affects almost all tissues of the body. GH (somatotropin) causes growth in almost all tissues of the body (increases cell size, increases mitosis with increased number of cells, and differentiates certain types of cells). Metabolic effects include increased rate of protein synthesis, mobilization of fatty acids from adipose tissue, decreased rate of glucose utilization.

### THYROID-STIMULATING HORMONE (TSH)

Thyroid-stimulating hormone controls secretion of the thyroid hormones. The thyroid gland is located immediately below the larynx on either side of and anterior to the trachea and secretes two significant hormones, thyroxine ( $T_4$ ) and triiodothyronine ( $T_3$ ), which have a profound effect on increasing the metabolic rate of the body. The thyroid gland also secretes calcitonin, an important hormone for calcium metabolism. Calcitonin promotes deposition of calcium in the bones, which decreases calcium concentration in the extracellular fluid.

### ADRENOCORTICOTROPIN

Adrenocorticotropin causes the adrenal cortex to secrete adrenocortical hormones. The adrenal glands lie at the

*Continued*

## Hormones—cont'd

superior poles of the two kidneys. Each gland is composed of two distinct parts: the adrenal medulla and the cortex. The adrenal medulla, related to the sympathetic nervous system, secretes the hormones epinephrine and norepinephrine. When stimulated, they cause constriction of blood vessels, increased activity of the heart inhibitory effects on the GI tract, and dilation of the pupils. The adrenal cortex secretes corticosteroids, of which there are two major types: mineralocorticoids and glucocorticoids. Aldosterone, the principal mineralocorticoid, primarily affects electrolytes of the extracellular fluids. Cortisol, the principal glucocorticoid, affects glucose, protein, and fat metabolism.

### LUTEINIZING HORMONE

Luteinizing hormone plays an important role in ovulation and causes secretion of female sex hormones by the ovaries and testosterone by the testes.

### FOLLICLE-STIMULATING HORMONE

Follicle-stimulating hormone causes growth of follicles in the ovaries before ovulation and promotes formation of sperm in the testes.

Ovarian sex hormones are estrogens and progestins. Estradiol is the most important estrogen; progesterone is the most important progestin.

*Estrogens* mainly promote proliferation and growth of specific cells in the body and are responsible for development of most of the secondary sex characteristics. Primarily cause cellular proliferation and growth of tissues of sex organs/other tissue related to reproduction. Ovaries, fallopian tubes, uterus, vagina increase in size. Estrogen initiates growth of breast and milk-producing apparatus, external appearance.

*Progesterone* stimulates secretion of the uterine endometrium during the latter half of the female sexual cycle, preparing the uterus for implantation of the fertilized ovum. Decreases the frequency of uterine contractions (helps prevent expulsion of the implanted ovum). Progesterone promotes development of breasts, causing alveolar cells to proliferate, enlarge, and become secretory in nature.

*Testosterone* is secreted by the testes and formed by the interstitial cells of Leydig. Testosterone production increases under the stimulus of the anterior pituitary gonadotropic hormones. It is responsible for distinguishing characteristics of the masculine body (stimulates the growth of male sex organs and promotes the development of male secondary sex characteristics,

e.g., distribution of body hair; effect on voice, protein formation, and muscular development).

### PROLACTIN

Prolactin promotes the development of breasts and secretion of milk.

## POSTERIOR PITUITARY HORMONES

### ANTIDIURETIC HORMONE (ADH) (VASOPRESSIN)

ADH can cause antidiuresis (decreased excretion of water by the kidneys). In the presence of ADH, the permeability of the renal-collecting ducts and tubules to water increases, which allows water to be absorbed, conserving water in the body. ADH in higher concentrations is a very potent vasoconstrictor, constricting arterioles everywhere in the body, increasing B/P.

### OXYTOCIN

Oxytocin contracts the uterus during the birthing process, esp. toward the end of the pregnancy, helping expel the baby. Oxytocin also contracts myoepithelial cells in the breasts, causing milk to be expressed from the alveoli into the ducts so that the baby can obtain it by suckling.

**PANCREAS**

The pancreas is composed of two tissue types: *acini* (secrete digestive juices in the duodenum) and *islets of Langerhans* (secrete insulin/glucagons directly into the blood). The islets of Langerhans contain three cells: alpha, beta, and delta. Alpha cells secrete glucagon, beta cells secrete insulin, and delta cells secrete somatostatin.

*Insulin* promotes glucose entry into most cells, thus controlling the rate of metabolism of most carbohydrates. Insulin also affects fat metabolism.

*Glucagon* effects are opposite those of insulin, the most important of which is increasing blood glucose

concentration by releasing it from the liver into the circulating body fluids.

*Somatostatin* (same chemical as secreted by the hypothalamus) has multiple inhibitory effects: depresses secretion of insulin and glucagon, decreases GI motility, decreases secretions/absorption of the GI tract.

## Human Immunodeficiency Virus (HIV) Infection

**USES**

*Antiretroviral (ARV) agents* are used in the treatment of HIV infection.

An ARV regimen for treatment-naïve patients generally consists of two nucleoside reverse transcriptase inhibitors (NRTIs) in combination with a third ARV medication from one of three drug classes: an integrase inhibitor (INSTI), non-nucleoside reverse transcriptase inhibitor, or a protease inhibitor (PI) with either coartemol or ritonavir.

**ACTION**

*Nucleoside reverse transcriptase inhibitors* compete with natural substrates for formation of proviral DNA by reverse transcriptase inhibiting viral replication.

*Nucleotide reverse transcriptase inhibitors (NtRTIs)* inhibit reverse transcriptase by competing with the natural substrate deoxyadenosine triphosphate and by DNA chain termination.

*Non-nucleoside reverse transcriptase inhibitors* directly bind to reverse transcriptase and block RNA-dependent and DNA-dependent DNA polymerase activities by disrupting the enzyme's catalytic site.

*Protease inhibitors (PIs)* bind to the active site of HIV-1 protease and prevent the processing of viral gag and gag-pol polyprotein precursors resulting in immature, noninfectious viral particles.

*Fusion inhibitors* interfere with the entry of HIV-1 into cells by inhibiting fusion of viral and cellular membranes. *CCR5 coreceptor antagonist* selectively binds to human chemokine receptor CCR5 present on cell membrane preventing HIV-1 from entering cells.

*Integrase inhibitor* inhibits catalytic activity of HIV-1 integrase, an HIV-1 encoded enzyme required for viral replication.

## ANTIRETROVIRAL AGENTS FOR TREATMENT OF HIV INFECTION

Name	Availability	Dosage Range	Side Effects
<b>Nucleoside Analogues</b>			
<b>Abacavir (Ziagen)</b>	<b>T:</b> 300 mg <b>OS:</b> 20 mg/mL	<b>A:</b> 300 mg 2 times/day or 600 mg once daily	Nausea, vomiting, malaise, rash, fever, headaches, asthenia, fatigue, hypersensitivity reactions
<b>Didanosine (Videx EC)</b>	<b>DR:</b> 125 mg, 200 mg, 250 mg, 400 mg <b>OS:</b> 2 g/bottle, 4 g/bottle	<b>DR (weighing 60 kg or more):</b> 400 mg once daily; <b>(weighing 25–59 kg):</b> 250 mg once daily; <b>(weighing 20–24 kg):</b> 200 mg once daily <b>OS (weighing more than 60 kg):</b> 200 mg q12h or 400 mg once daily; <b>(weighing less than 60 kg):</b> 125 mg q12h or 250 mg once daily	Peripheral neuropathy, pancreatitis, diarrhea, nausea, vomiting, headaches, insomnia, rash, hepatitis, seizures
<b>Emtricitabine (Emtriva)</b>	<b>C:</b> 200 mg <b>OS:</b> 10 mg/mL	<b>A:</b> 200 mg/day ( <b>C</b> ) 240 mg/day ( <b>OS</b> )	Headaches, insomnia, depression, diarrhea, nausea, vomiting, rhinitis, asthenia, rash
<b>Lamivudine (Epivir)</b>	<b>T:</b> 100 mg, 150 mg, 300 mg <b>OS:</b> 5 mg/mL, 10 mg/mL	<b>A:</b> 150 mg 2 times/day or 300 mg once daily <b>C:</b> 4 mg/kg 2 times/day	Diarrhea, malaise, fatigue, headaches, nausea, vomiting, abdominal pain, peripheral neuropathy, arthralgia, myalgia, skin rash
<b>Stavudine (Zerit)</b>	<b>C:</b> 15 mg, 20 mg, 30 mg, 40 mg <b>OS:</b> 1 mg/mL	<b>A (weighing more than 60 kg):</b> 40 mg 2 times/day (20 mg 2 times/day if peripheral neuropathy occurs); <b>(weighing 60 kg or less):</b> 30 mg 2 times/day (15 mg 2 times/day if peripheral neuropathy occurs)	Peripheral neuropathy, anemia, leukopenia, neutropenia
<b>Zidovudine (Retrovir)</b>	<b>C:</b> 100 mg <b>T:</b> 300 mg <b>Syrup:</b> 50 mg/5 mL, 10 mg/mL	<b>A:</b> 300 mg 2 times/day	Anemia, granulocytopenia, myopathy, nausea, malaise, fatigue, insomnia

## Nucleotide Analogues

<b>Tenofovir TAF (Vemlidy)</b>	<b>T:</b> 25 mg	<b>A:</b> 25 mg once daily	Headache, abdominal pain, fatigue, cough, nausea, back pain
<b>Tenofovir TDF (Viread)</b>	<b>T:</b> 300 mg	<b>A:</b> 300 mg once daily	Nausea, vomiting, diarrhea, headache, fatigue

## Non-nucleoside Analogues

<b>Delavirdine (Rescriptor)</b>	<b>T:</b> 100 mg, 200 mg	<b>A:</b> 200 mg 3 times/day for 14 days, then 400 mg 3 times/day	Rash, nausea, headaches, elevated hepatic function tests
<b>Efavirenz (Sustiva)</b>	<b>C:</b> 50 mg, 200 mg <b>T:</b> 600 mg	<b>A:</b> 600 mg/day <b>C:</b> 200–600 mg/day based on weight	Headaches, dizziness, insomnia, fatigue, rash, nightmares
<b>Etravirine (Intencele)</b>	<b>T:</b> 100 mg, 200 mg	<b>A:</b> 200 mg 2 times/day	Skin reactions (e.g., Stevens-Johnson syndrome, erythema multiforme), nausea, abdominal pain, vomiting
<b>Nevirapine (Viramune, Viramune XR)</b>	<b>T:</b> 200 mg <b>T (ER):</b> 400 mg <b>S:</b> 50 mg/mL	<b>A:</b> 200 mg/day for 14 days, then (if no rash) 200 mg 2 times/day	Rash, nausea, fatigue, fever, headaches, abnormal hepatic function tests
<b>Rilpivirine (Edurant)</b>	<b>T:</b> 25 mg	<b>A:</b> 25 mg once daily with a meal	Depression, insomnia, headache, rash

## Protease Inhibitors

<b>Atazanavir (Reyataz)</b>	<b>C:</b> 100 mg, 150 mg, 200 mg, 300 mg	<b>A:</b> 400 mg/day or 300 mg (with 100 mg ritonavir) once daily	Headaches, diarrhea, abdominal pain, nausea, rash
<b>Darunavir (Prezista)</b>	<b>T:</b> 400 mg, 600 mg	<b>A:</b> 600 mg 2 times/day (with ritonavir 100 mg) or 800 mg once daily with ritonavir 100 mg	Diarrhea, nausea, vomiting, headaches, skin rash, constipation
<b>Fosamprenavir (Lexiva)</b>	<b>T:</b> 700 mg <b>OS:</b> 50 mg/mL	<b>A:</b> 1,400–2,800 mg/day with 100 mg ritonavir	Headaches, fatigue, rash, nausea, diarrhea, vomiting, abdominal pain

## ANTIRETROVIRAL AGENTS FOR TREATMENT OF HIV INFECTION—cont'd

<b>Indinavir (Crixivan)</b>	<b>C:</b> 200 mg, 400 mg	<b>A:</b> 800 mg q8h or 800 mg 2 times/day with ritonavir 100 mg	Nephrolithiasis, hyperbilirubinemia, abdominal pain, asthenia, fatigue, flank pain, nausea, vomiting, diarrhea, headaches, insomnia, dizziness, altered taste
<b>Lopinavir/ritonavir (Kaletra)</b>	<b>C:</b> 133/33 mg <b>OS:</b> 80/20 mg	<b>A:</b> 400 mg/100 mg 2 times/day or 800 mg/200 mg once daily <b>C (4–12 yrs):</b> 10–13 mg/kg 2 times/day	Diarrhea, nausea, vomiting, abdominal pain, headaches, rash
<b>Nelfinavir (Viracept)</b>	<b>T:</b> 250 mg <b>Oral Powder:</b> 50 mg/g	<b>A:</b> 750 mg q8h or 1,250 mg 2 times/day <b>C:</b> 20–25 mg/kg q8h	Diarrhea, fatigue, asthenia, headaches, hypertension, impaired concentration
<b>Ritonavir (Norvir)</b>	<b>C:</b> 100 mg <b>OS:</b> 80 mg/mL	<b>A:</b> Titrate up to 800 mg/day based on protease inhibitor	Nausea, vomiting, diarrhea, altered taste, fatigue, elevated LFTs and triglyceride levels
<b>Saquinavir (Invirase)</b>	<b>C:</b> 200 mg <b>T:</b> 500 mg	<b>A:</b> 1,000 mg 2 times/day with ritonavir 100 mg	Diarrhea, elevated LFTs, hypertriglycerides, cholesterol, abnormal fat accumulation, hyperglycemia
<b>Tipranavir (Aptivus)</b>	<b>C:</b> 250 mg <b>OS:</b> 100 mg/mL	<b>A:</b> 500 mg (with 200 mg ritonavir) 2 times/day	Diarrhea, nausea, fatigue, headaches, vomiting
<b>Fusion Inhibitors</b>			
<b>Enfuvirtide (Fuzeon)</b>	<b>I:</b> 108 mg (90 mg when reconstituted)	<b>Subcutaneous:</b> 90 mg 2 times/day	Insomnia, depression, peripheral neuropathy, decreased appetite, constipation, asthenia, cough

## CCR5 Antagonists

<b>Maraviroc (Selzentry)</b>	<b>T:</b> 150 mg, 300 mg	<b>A:</b> 300 mg 2 times/day <b>CYP3A4 inducers:</b> 600 mg 2 times/day <b>CYP3A4 inhibitors:</b> 150 mg 2 times/day	Cough, pyrexia, upper respiratory tract infections, rash, musculoskeletal symptoms, abdominal pain, dizziness
------------------------------	--------------------------	--	---

## Integrase Inhibitor

<b>Raltegravir (Isentress)</b>	<b>T:</b> 400 mg	<b>A:</b> 400 mg 2 times/day	Nausea, headache, diarrhea, pyrexia
<b>Dolutegravir (Tivicay)</b>	<b>T:</b> 50 mg	<b>A:</b> 50 mg once daily or 50 mg bid (with CYP3A inducers or resistance)	Insomnia, headache

## Monoclonal Antibody

<b>Ibalizumab-uiyk (Trogarzo)</b>	<b>I:</b> 200 mg	<b>IV:</b> Initially, 2000 mg as a single dose, then 800 mg q14days	Dizziness, diarrhea; decreased Hgb, leukocytes, neutrophils, platelets; increased serum bilirubin, creatinine
-----------------------------------	------------------	---	---

**A**, Adults; **C**, capsules; **C** (*dosage*), children; **DR**, delayed-release; **ER**, extended-release; **I**, injection; **IV**, intravenous; **OS**, oral solution; **S**, suspension; **T**, tablets; **TAF**, tenofovir alafenamide; **TDF**, tenofovir disoproxil fumarate.

## FIXED-COMBINATION THERAPIES

Brand Name	Generic Name	Dosage
<b>Atripla</b>	Efavirenz 600 mg Emtricitabine 200 mg Tenofovir (TDF) 300 mg	1 tablet once daily
<b>Biktarvy</b>	Bictegravir 50 mg Emtricitabine 200 mg Tenofovir (TAF) 25 mg	1 tablet once daily
<b>Cabenuva</b>	Cabotegravir 400 mg, 600 mg Rilpivirine 600 mg, 900 mg	IM: 600/900 mg once, then 400/600 mg once/mo
<b>Cimduo</b>	Lamivudine 300 mg Tenofovir (TDF) 300 mg	1 tablet once daily
<b>Combivir</b>	Lamivudine 150 mg Zidovudine 300 mg	1 tablet twice daily
<b>Complera</b>	Emtricitabine 200 mg Rilpivirine 27.5 mg Tenofovir (TDF) 300 mg	1 tablet once daily
<b>Delstrigo</b>	Doravirine 100 mg Lamivudine 300 mg Tenofovir 300 mg	1 tablet once daily
<b>Descovy</b>	Emtricitabine 200 mg Tenofovir (TAF) 25 mg	1 tablet once daily
<b>Dovato</b>	Dolutegravir 50 mg Lamivudine 300 mg	1 tablet once daily
<b>Epzicom</b>	Abacavir 600 mg Lamivudine 300 mg	1 tablet once daily

<b>Evotaz</b>	Atazanavir 300 mg Cobicistat 150 mg	1 tablet once daily
<b>Genvoya</b>	Cobicistat 150 mg Elvitegravir 150 mg Emtricitabine 200 mg Tenofovir (TAF) 10 mg	1 tablet once daily
<b>Juluca</b>	Dolutegravir 50 mg Ralpivirine 25 mg	1 tablet once daily
<b>Odefsey</b>	Emtricitabine 200 mg Ralpivirine 25 mg Tenofovir (TAF) 25 mg	1 tablet once daily
<b>Prezcobix</b>	Cobicistat 150 mg Darunavir 800 mg	1 tablet once daily
<b>Stribild</b>	Cobicistat 150 mg Elvitegravir 150 mg Emtricitabine 200 mg Tenofovir (TDF) 300 mg	1 tablet once daily
<b>Symfi</b>	Efavirenz 400 mg Lamivudine 300 mg Tenofovir (TDF) 300 mg	1 tablet once daily
<b>Symtuza</b>	Cobicistat 150 mg Darunavir 800 mg Emtricitabine 200 mg Tenofovir 10 mg	1 tablet once daily

*Continued*

**FIXED-COMBINATION THERAPIES—cont'd**

Brand Name	Generic Name	Dosage
<b>Triumeq</b>	Abacavir 600 mg Dolutegravir 50 mg Lamivudine 300 mg	1 tablet once daily
<b>Trizivir</b>	Abacavir 300 mg Lamivudine 150 mg Zidovudine 300 mg	1 tablet twice daily

**TAF**, Tenofovir alafenamide; **TDF**, tenofovir disoproxil fumarate.

## Immunosuppressive Agents

### USES

Improvement of both short- and long-term allograft survivals.

### ACTION

*Basiliximab:* An interleukin-2 (IL-2) receptor antagonist inhibiting IL-2 binding. This prevents activation of lymphocytes, and the response of the immune system to antigens is impaired.

*Cyclosporine:* Inhibits production and release of IL-2.

*Daclizumab:* An IL-2 receptor antagonist inhibiting IL-2 binding.

*Mycophenolate:* A prodrug that reversibly binds and inhibits inosine monophosphate dehydrogenase (IMPD),

resulting in inhibition of purine nucleotide synthesis, inhibiting DNA and RNA synthesis and subsequent synthesis of T and B cells.

*Sirolimus:* Inhibits IL-2–stimulated T-lymphocyte activation and proliferation, which may occur through formation of a complex.

*Tacrolimus:* Inhibits IL-2–stimulated T-lymphocyte activation and proliferation, which may occur through formation of a complex.

## IMMUNOSUPPRESSIVE AGENTS

Name	Availability	Dosage	Side Effects
<b>Basiliximab (Simulect)</b>	<b>I:</b> 10 mg, 20 mg	20 mg for 2 doses (on day of transplant, then 4 days after transplantation)	Abdominal pain, asthenia, cough, dizziness, dyspnea, dysuria, edema, hypertension, infection, tremors
<b>Cyclosporine (Neoral, Sandimmune)</b>	<b>C:</b> 25 mg, 50 mg, 100 mg <b>S:</b> 100 mg/mL <b>I:</b> 50 mg/mL	Dose dependent on type of transplant and formulation	Hypertension, hyperkalemia, nephrotoxicity, coarsening of facial features, hirsutism, gingival hyperplasia, nausea, vomiting, diarrhea, hepatotoxicity, hyperuricemia, hypertriglyceridemia, hypercholesterolemia, tremors, paresthesia, seizures, risk of infection/malignancy
<b>Mycophenolate (CellCept, Myfortic)</b>	<b>CellCept:</b> <b>C:</b> 250 mg <b>I:</b> 500 mg <b>S:</b> 200 mg/mL <b>T:</b> 500 mg <b>Myfortic:</b> <b>T(DR):</b> 180 mg, 320 mg	<b>CellCept:</b> 1–1.5 g 2 times/day based on type of transplant <b>Myfortic:</b> <b>Renal:</b> 720 mg 2 times/day	Diarrhea, vomiting, leukopenia, neutropenia, infections
<b>Sirolimus (Rapamune)</b>	<b>S:</b> 1 mg/mL <b>T:</b> 0.5 mg, 1 mg, 2 mg	2–6 mg/day	Dyspnea, leukopenia, thrombocytopenia, hyperlipidemia, abdominal pain, acne, arthralgia, fever, diarrhea, constipation, headaches, vomiting, weight gain
<b>Tacrolimus (Prograf)</b>	<b>C:</b> 0.5 mg, 1 mg, 5 mg <b>I:</b> 5 mg/mL <b>C(ER):</b> 0.5 mg, 1 mg, 5 mg <b>T(ER):</b> 0.75 mg, 1 mg, 4 mg	<b>Heart:</b> 0.075 mg/kg/day in 2 divided doses q12h <b>Kidney:</b> 0.1–0.2 mg/kg/day in 2 divided doses q12h <b>Liver:</b> 0.1–0.15 mg/kg/day in 2 divided doses q12h	Nephrotoxicity, neurotoxicity, hyperglycemia, nausea, vomiting, photophobia, infections, hypertension, hyperlipidemia

**C,** Capsules; **DR,** delayed release; **ER,** extended release; **I,** injection; **S,** oral solution or suspension; **T,** tablets.

# Laxatives

## USES

Short-term treatment of constipation; colon evacuation before rectal/bowel examination; prevention of straining (e.g., after anorectal surgery, MI); to reduce painful elimination (e.g., episiotomy, hemorrhoids, anorectal lesions); modification of effluent from ileostomy, colostomy; prevention of fecal impaction; removal of ingested poisons.

## ACTION

Laxatives ease or stimulate defecation. Mechanisms by which this is accomplished include (1) attracting, retaining fluid in colonic contents due to hydrophilic or osmotic properties; (2) acting directly or indirectly on mucosa to decrease absorption of water and NaCl; or (3) increasing intestinal motility, decreasing absorption of water and NaCl by virtue of decreased transit time.

*Bulk-forming:* Act primarily in small/large intestine. Retain water in stool, may bind water, ions in colonic lumen (soften feces, increase bulk); may increase colonic bacteria growth (increases fecal mass). Produce soft stool in 1–3 days.

*Osmotic agents:* Act in colon. Similar to saline laxatives. Osmotic action may be enhanced in distal ileum/colon by bacterial metabolism to lactate, other organic acids. This decrease in pH increases motility, secretion. Produce soft stool in 1–3 days.

*Saline:* Acts in small/large intestine, colon (sodium phosphate). Poorly, slowly absorbed; causes hormone cholecystokinin release from duodenum (stimulates fluid secretion, motility); possesses osmotic properties; produces watery stool in 2–6 hrs (small doses produce semifluid stool in 6–12 hrs).

*Stimulant:* Acts in colon. Enhances accumulation of water/electrolytes in colonic lumen, enhances intestinal motility. May act directly on intestinal mucosa. Produces semifluid stool in 6–12 hrs.

◀ **ALERT** ▶ Bisacodyl suppository acts in 15–60 min.

*Stool softener:* Acts in small/large intestine. Hydrates and softens stools by its surfactant action, facilitating penetration of fat and water into stool. Produces soft stool in 1–3 days.

**LAXATIVES**

Name	Onset of Action	Uses	Side Effects/Precautions
<b>Bulk-forming</b>			
<b>Methylcellulose (Citrucel)</b>	12–24 hrs up to 3 days	Treatment of constipation for postpartum women, elderly, pts with diverticulosis, irritable bowel syndrome, hemorrhoids	Gas, bloating, esophageal obstruction, colonic obstruction, calcium and iron malabsorption
<b>Psyllium (Metamucil)</b>	Same as methylcellulose	Treatment of chronic constipation and constipation associated with rectal disorders; management of irritable bowel syndrome	Diarrhea, constipation, abdominal cramps, esophageal/colon obstruction, bronchospasm
<b>Stool Softener</b>			
<b>Docusate (Colace, Surfak)</b>	1–3 days	Treatment of constipation due to hard stools, in painful anorectal conditions, and for those who need to avoid straining during bowel movements	Stomachache, mild nausea, cramping, diarrhea, irritated throat (with liquid and syrup dose forms)
<b>Saline</b>			
<b>Magnesium citrate (Citrate of Magnesia, Citro-Mag)</b>	30 min–3 hrs	Bowel evacuation prior to certain surgical and diagnostic procedures	Hypotension, abdominal cramping, diarrhea, gas formation, electrolyte abnormalities
<b>Magnesium hydroxide</b>	30 min–3 hrs	Short-term treatment of occasional constipation	Electrolyte abnormalities can occur; use caution in pts with renal or cardiac impairment; diarrhea, abdominal cramps, hypotension
<b>Sodium phosphate (Fleet Phospho-Soda)</b>	2–15 min	Relief of occasional constipation; bowel evacuation prior to certain surgical and diagnostic procedures	Electrolyte abnormalities; do not use for pts with HF, severe renal impairment, ascites, GI obstruction, active inflammatory bowel disease

### Osmotic

<b>Lactulose (Kristalose)</b>	24–48 hrs	Short-term relief of constipation, treatment of hyperammonemia-induced encephalopathy	Nausea, vomiting, diarrhea, abdominal cramping, bloating, gas
<b>Polyethylene glycol (MiraLax)</b>	24–48 hrs	Short-term relief of constipation	Bitter taste, diarrhea

### Stimulant

<b>Bisacodyl (Dulcolax)</b>	<b>PO:</b> 6–12 hrs <b>Rectal:</b> 15–60 min	Short-term relief of constipation	Electrolyte imbalance, abdominal discomfort, gas, potential for overuse/abuse
<b>Senna (Senokot)</b>	6–12 hrs	Short-term relief of constipation	Abdominal discomfort, cramps

**GI**, Gastrointestinal; **HF**, heart failure.

## Multiple Sclerosis

Multiple sclerosis (MS) is the most common autoimmune disorder affecting the central nervous system. MS is a demyelinating disease where insulating covers of nerve cells in the brain and spinal cord are damaged, which disrupts the ability of parts of the nervous system to communicate. Symptoms may include double vision, blindness in one eye, muscle weakness, trouble with sensation or coordination.

Presently, there is no cure for MS. Treatment attempts to improve function and prevent new attacks.

### MEDICATIONS FOR MULTIPLE SCLEROSIS

Name	Dosage	Side Effects
<b>Alemtuzumab (Lemtrada)</b>	12 mg IV once daily for 5 days followed 1 year later by 12 mg IV once daily for 3 days	Rigors, tremors, nausea, vomiting, rash, fatigue, hypotension, urticaria, pruritus, skeletal pain, headache, diarrhea, neutropenia, anemia, thrombocytopenia, respiratory toxicity (dyspnea, cough, pneumonitis, infections)
<b>Cladribine (Mavenclad)</b>	Recommended cumulative dosage: 3.5 mg/kg body weight administered orally and divided into 2 yearly treatment courses (1.75 mg/kg/treatment course)	Upper respiratory tract infection, headache, lymphopenia
<b>Daclizumab (Zinbryta)</b>	150 mg SQ once monthly	Autoimmune disorders (hepatitis, lymphadenopathy, noninfectious colitis), depression, severe hypersensitivity reactions, infections
<b>Dimethyl fumarate (Tecfidera)</b>	240 mg PO bid	Flushing, abdominal pain, diarrhea, nausea, vomiting, dyspepsia, lymphopenia, hepatotoxicity, progressive multifocal leukoencephalopathy (PML)
<b>Diroximel fumarate (Vumerity)</b>	<b>PO:</b> Initially, 231 mg twice daily; after 7 days, increase to maintenance dose of 462 mg twice daily	Flushing, abdominal pain, diarrhea, nausea, infection, pruritus, skin rash, erythema, albuminuria, vomiting, dyspepsia, lymphocytopenia; increased serum AST

Name	Dosage	Side Effects
<b>Fingolimod (Gilenya)</b>	0.5 mg PO once daily	Headache, back pain, cough, infections, hypersensitivity reactions, elevated LFTs, bradycardia, AV block, macular edema, decreased pulmonary function
<b>Glatiramer (Copaxone, Glatopa)</b>	<b>Copaxone:</b> 20 mg SQ once daily or 40 mg 3 times/wk <b>Glatopa:</b> 20 mg SQ once daily	Pain, erythema, inflammation, pruritus at injection site, arthralgia, transient chest pain, post-injection reactions (chest pain, palpitations, dyspnea)
<b>Interferon beta 1a (Avonex, Rebif)</b>	<b>Avonex:</b> 30 mcg IM wkly <b>Rebif:</b> 44 mcg 3 times/wk	Headache, flu-like symptoms, myalgia, depression with suicidal ideation, generalized pain, asthenia, chills, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity
<b>Interferon beta 1b (Betaseron, Extavia)</b>	250 mcg SQ every other day	Headache, flu-like symptoms, myalgia, upper respiratory tract infection, depression with suicidal ideation, generalized pain, asthenia, chills, fever, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity, seizures
<b>Mitoxantrone</b>	12 mg/m <sup>2</sup> IV q3mos	Nausea, vomiting, diarrhea, cough, headache, stomatitis, abdominal discomfort, fever, alopecia, cardiotoxicity, myelosuppression, acute/chronic myeloid leukemia
<b>Natalizumab (Tysabri)</b>	300 mg IV q4wks	Headache, fatigue, depression, arthralgia, infections, hypersensitivity reactions, hepatotoxicity, PML
<b>Ocrelizumab (Ocrevus)</b>	600 mg IV q6mos	Infusion reactions (pruritus, rash, urticaria, erythema), respiratory tract infections, skin infections, malignancies, PML
<b>Ofatumumab (Kesimpta)</b>	20 mg SQ every mo	Infections, systemic/local injection reactions, back pain, decreased immunoglobulin levels
<b>Ozanimod (Zeposia)</b>	<b>PO:</b> Initially, 0.23 mg once daily on days 1–4; then 0.46 mg once daily on days 5–7. <b>Maintenance:</b> 0.92 mg once daily starting on day 8	Infection, upper respiratory tract infection, hypertension, orthostatic hypotension, UTI; increased serum ALT, AST
<b>Pegylated interferon beta 1a (Plegridy)</b>	125 mcg SQ q2wks	Headache, flu-like symptoms, myalgia, depression with suicidal ideation, generalized pain, asthenia, chills, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity, elevated LFTs, seizures

Continued

## MEDICATIONS FOR MULTIPLE SCLEROSIS—cont'd

Name	Dosage	Side Effects
<b>Ponesimod (Ponvory)</b>	<b>PO:</b> 20 mg once daily	Upper respiratory tract infection, elevated hepatic transaminases, hypertension
<b>Rituximab (Rituxan)</b>	<b>IV:</b> 500–1,000 mg q6mos	Infections, infusion reactions, cytopenias cardiac arrhythmias, cough, rhinitis, angioedema, nausea, vomiting, diarrhea, myalgia, PML
<b>Siponimod (Mayzent)</b>	Titration required for treatment initiation Recommended maintenance dosage: 2 mg	Headache, hypertension, increased serum ALT, AST
<b>Teriflunomide (Aubagio)</b>	7 or 14 mg PO once daily	Headache, diarrhea, nausea, alopecia, paresthesia, abdominal pain, elevated LFTs, neutropenia, leukopenia, hepatic failure, acute renal failure, toxic epidermal necrolysis

**ALT**, Alanine aminotransferase; **AST**, aspartate aminotransferase; **bid**, twice daily; **IM**, intramuscular; **IV**, intravenous; **LFT**, liver function test; **PML**, progressive multifocal leukoencephalopathy; **PO**, oral; **SQ**, subcutaneous; **UTI**, urinary tract infection.

## Nonsteroidal Anti-Inflammatory Drugs (NSAIDs)

### USES

Provide symptomatic relief from *pain/inflammation* in the treatment of musculoskeletal disorders (e.g., rheumatoid arthritis [RA], osteoarthritis, ankylosing spondylitis), *analgesic* for low to moderate pain, *reduction in fever* (many agents not suited for routine/prolonged therapy due to toxicity). By virtue of its action on platelet function, aspirin is used in treatment or prophylaxis of diseases associated with hypercoagulability (reduces risk of stroke/heart attack).

### ACTION

Exact mechanism for anti-inflammatory, analgesic, antipyretic effects unknown. Inhibition of enzyme cyclooxygenase, the enzyme responsible for prostaglandin synthesis, appears to be a major mechanism of action. May inhibit other mediators of inflammation (e.g., leukotrienes). Direct action on hypothalamus heat-regulating center may contribute to antipyretic effect.

## NSAIDs

Name	Availability	Dosage Range	Side Effects
<b>Aspirin</b>	<b>Caplet:</b> 500 mg <b>Suppository:</b> 300 mg, 600 mg <b>T:</b> 325 mg <b>T (EC):</b> 81 mg, 325 mg <b>T (Chew):</b> 81 mg	<b>Analgesic/antipyretic:</b> 325–650 mg q4–6h prn or 975 mg q6h prn or 500–1000 mg q4–6h prn	GI discomfort, dizziness, headaches, increased risk of bleeding
<b>Celecoxib (Celebrex)</b>	<b>C:</b> 50 mg, 100 mg, 200 mg, 400 mg	200 mg q12h ( <b>Maximum:</b> 600 mg day 1, then 400 mg/day)	Diarrhea, back pain, dizziness, heartburn, headaches, nausea, abdominal pain
<b>Diclofenac (Voltaren, Zipsor, Zorvolex)</b>	<b>T:</b> 25 mg, 50 mg, 75 mg <b>C (Zipsor):</b> 25 mg <b>C (Zorvolex):</b> 18 mg, 35 mg	50 mg tid <b>(Zipsor):</b> 25 mg 4 times/day <b>(Zorvolex):</b> 18–35 mg 3 times/day	Indigestion, constipation, diarrhea, nausea, headaches, fluid retention, abdominal cramps
<b>Diffunisal (Dolobid)</b>	<b>T:</b> 500 mg	<b>Arthritis:</b> 0.5–1 g/day in 2 divided doses <b>Maximum:</b> 1.5 g/day <b>P:</b> 500 mg once, then 250 mg q8–12h	Headaches, abdominal cramps, indigestion, diarrhea, nausea
<b>Etodolac (Lodine)</b>	<b>T:</b> 400 mg, 500 mg <b>T (ER):</b> 400 mg, 500 mg, 600 mg <b>C:</b> 200 mg, 300 mg	<b>Arthritis:</b> 400 mg 2 times/day or 300 mg 2–3 times/day or 500 mg 2 times/day. <b>(ER):</b> 400 mg up to 1,000 mg once daily <b>P:</b> 200–400 mg q6–8h as needed	Indigestion, dizziness, headaches, bloated feeling, diarrhea, nausea, weakness, abdominal cramps
<b>Fenoprofen (Nalfon)</b>	<b>C:</b> 200 mg, 400 mg <b>T:</b> 600 mg	<b>Arthritis:</b> 400–600 mg 3–4 times/day <b>P:</b> 200 mg q4–6h as needed	Nausea, indigestion, anxiety, constipation, shortness of breath, heartburn
<b>Ibuprofen (Advil, Caldolor, Motrin)</b>	<b>I:</b> 100 mg/mL <b>T:</b> 100 mg, 200 mg, 400 mg, 600 mg, 800 mg <b>T (Chew):</b> 50 mg, 100 mg <b>C:</b> 200 mg <b>S:</b> 100 mg/5 mL	<b>Inflammatory disease:</b> 400–800 mg/dose 3–4 times/day <b>P:</b> 200–400 mg/dose q4–6h as needed	Dizziness, abdominal cramps, abdominal pain, heartburn, nausea

Continued

<b>Indomethacin (Indocin, Tivorbex)</b>	<b>(Tivorbex):</b> 20 mg, 40 mg <b>C:</b> 25 mg, 50 mg <b>C (SR):</b> 75 mg <b>S:</b> 25 mg/5 mL	<b>Arthritis:</b> 25–50 mg/dose 2–3 times/day <b>Maximum:</b> 200 mg/day <b>P: (Tivorbex only):</b> 20 mg 3 times/day or 40 mg 2–3 times/day	Fluid retention, dizziness, headaches, abdominal pain, indigestion, nausea
<b>Ketoprofen (Orudis KT)</b>	<b>C:</b> 25 mg, 50 mg <b>C (ER):</b> 200 mg	<b>Arthritis:</b> 50 mg 4 times/day or 75 mg 3 times/day <b>ER:</b> 200 mg once daily <b>P:</b> 25–50 mg q6–8h as needed	Headaches, anxiety, abdominal pain, bloated feeling, constipation, diarrhea, nausea
<b>Ketorolac (Toradol)</b>	<b>T:</b> 10 mg <b>I:</b> 15 mg/mL, 30 mg/mL	<b>P: (PO):</b> 10 mg q4–6h as needed; <b>(IM/IV):</b> 60–120 mg/day in divided doses	Fluid retention, abdominal pain, diarrhea, dizziness, headaches, nausea
<b>Meloxicam (Mobic, Vivlodex)</b>	<b>C: (Vivlodex):</b> 5 mg, 10 mg <b>T: (Mobic):</b> 7.5 mg, 15 mg <b>S:</b> 7.5 mg/5 mL	<b>Arthritis: (Mobic):</b> 7.5–15 mg once daily <b>(Vivlodex):</b> 5–10 mg once daily	Heartburn, indigestion, nausea, diarrhea, headaches
<b>Nabumetone (Relafen)</b>	<b>T:</b> 500 mg, 750 mg	<b>Arthritis:</b> 1–2 g/day in 1–2 divided doses	Fluid retention, dizziness, headaches, abdominal pain, constipation, diarrhea, nausea
<b>Naproxen (Anaprox, Naprosyn)</b>	<b>T:</b> 250 mg, 375 mg, 500 mg <b>T (CR):</b> 375 mg, 500 mg <b>S:</b> 125 mg/5 mL	<b>Arthritis:</b> 500–1,000 mg/day in 2 divided doses <b>Maximum:</b> 1,500 mg/day <b>P:</b> 500 mg once, then 500 mg q12h or 250 mg q6–8h as needed	Tinnitus, fluid retention, shortness of breath, dizziness, drowsiness, headaches, abdominal pain, constipation, heartburn, nausea
<b>Oxaprozin (Daypro)</b>	<b>C:</b> 600 mg <b>T:</b> 600 mg	<b>Arthritis:</b> 600–1,200 mg once daily	Constipation, diarrhea, nausea, indigestion
<b>Piroxicam (Feldene)</b>	<b>C:</b> 10 mg, 20 mg	<b>Arthritis:</b> 10–20 mg/day in 1–2 divided doses	Abdominal pain, stomach pain, nausea
<b>Sulindac (Clinoril)</b>	<b>T:</b> 150 mg, 200 mg	<b>Arthritis:</b> 150 mg bid	Dizziness, abdominal pain, constipation, diarrhea, nausea

**A**, Adults; **C**, capsules; **CR**, controlled-release; **ER**, extended-release; **GI**, gastrointestinal; **I**, injection; **P**, pain; **S**, suspension; **SR**, sustained-release; **T**, tablets.

## Nutrition: Enteral

### ROUTES OF ENTERAL NUTRITION DELIVERY

#### INDICATIONS

Enteral nutrition (EN), also known as *tube feedings*, provides food/nutrients via the GI tract using special formulas, delivery techniques, and equipment. All routes of EN consist of a tube through which liquid formula is infused.

Tube feedings are used in pts with major trauma, burns; those undergoing radiation and/or chemotherapy; pts with hepatic failure, severe renal impairment, physical or neurologic impairment; preop and postop to promote anabolism; prevention of cachexia, malnutrition; dysphagia, pts requiring mechanical ventilation.

#### **NASOGASTRIC (NG):**

**INDICATIONS:** Most common for short-term feeding in pts unable or unwilling to consume adequate nutrition by mouth. Requires at least a partially functioning GI tract.

**ADVANTAGES:** Does not require surgical intervention and is fairly easily inserted. Allows full use of digestive tract. Decreases abdominal distention, nausea, vomiting that may be caused by hyperosmolar solutions.

**DISADVANTAGES:** Temporary. May be easily pulled out during routine nursing care. Has potential for pulmonary aspiration of gastric contents, risk of reflux esophagitis, regurgitation.

#### **NASODUODENAL (ND), NASOJEJUNAL (NJ):**

**INDICATIONS:** Pts unable or unwilling to consume adequate nutrition by mouth. Requires at least a partially functioning GI tract.

**ADVANTAGES:** Does not require surgical intervention and is fairly easily inserted. Preferred for pts at risk for aspiration. Valuable for pts with gastroparesis.

*Continued*

## Nutrition: Enteral—cont'd

**DISADVANTAGES:** Temporary. May be pulled out during routine nursing care. May be dislodged by coughing, vomiting. Small lumen size increases risk of clogging when medication is administered via tube, more susceptible to rupturing when using infusion device. Must be radiographed for placement, frequently extubated.

**GASTROSTOMY:**

**INDICATIONS:** Pts with esophageal obstruction or impaired swallowing; pts in whom NG, ND, or NJ not feasible; when long-term feeding indicated.

**ADVANTAGES:** Permanent feeding access. Tubing has larger bore, allowing noncontinuous (bolus) feeding (300–400 ml over 30–60 min q3–6h). May be inserted endoscopically using local anesthetic (procedure called *percutaneous endoscopic gastrostomy* [PEG]).

**DISADVANTAGES:** Requires surgery; may be inserted in conjunction with other surgery or endoscopically (see **ADVANTAGES**). Stoma care required. Tube may be inadvertently dislodged. Risk of aspiration, peritonitis, cellulitis, leakage of gastric contents.

**JEJUNOSTOMY:**

**INDICATIONS:** Pts with stomach or duodenal obstruction, impaired gastric motility; pts in whom NG, ND, or NJ not feasible; when long-term feeding indicated.

**ADVANTAGES:** Allows early postop feeding (small bowel function is least affected by surgery). Risk of aspiration reduced. Rarely pulled out inadvertently.

**DISADVANTAGES:** Requires surgery (laparotomy). Stoma care required. Risk of intraperitoneal leakage. Can be dislodged easily.

### INITIATING ENTERAL NUTRITION

With continuous feeding, initiation of isotonic (about 300 mOsm/L) or moderately hypertonic feeding (up to 495 mOsm/L) can be given full strength, usually at a slow rate (30–50 ml/hr) and gradually increased (25 ml/hr q6–24h). Formulas with osmolality greater than 500 mOsm/L are generally started at half strength and gradually increased in rate, then concentration. Tolerance is increased if the rate and concentration are not increased simultaneously.

## SELECTION OF FORMULAS

**Protein:** Has many important physiologic roles and is the primary source of nitrogen in the body. Provides 4 kcal/g protein. Sources of protein in enteral feedings: sodium caseinate, calcium caseinate, soy protein, dipeptides.

**Carbohydrate (CHO):** Provides energy for the body and heat to maintain body temperature. Provides 3.4 kcal/g carbohydrate. Sources of CHO in enteral feedings: corn syrup, cornstarch, maltodextrin, lactose, sucrose, glucose.

**Fat:** Provides concentrated source of energy. Referred to as *kilocalorie dense* or *protein sparing*. Provides 9 kcal/g fat. Sources of fat in enteral feedings: corn oil, safflower oil, medium-chain triglycerides.

**Electrolytes, vitamins, trace elements:** Contained in formulas (not found in specialized products for renal/hepatic insufficiency).

All products containing protein, fat, carbohydrate, vitamin, electrolytes, trace elements are nutritionally complete and designed to be used by pts for long periods.

## COMPLICATIONS

**MECHANICAL:** Usually associated with some aspect of the feeding tube.

**Aspiration pneumonia:** Caused by delayed gastric emptying, gastroparesis, gastroesophageal reflux, or decreased gag reflex. May be prevented or treated by reducing infusion rate, using lower-fat formula, feeding beyond pylorus, checking residuals, using small-bore feeding tubes, elevating head of bed 30–45 degrees during and for 30–60 min after intermittent feeding, and regularly checking tube placement.

**Esophageal, mucosal, pharyngeal irritation, otitis:** Caused by using large-bore NG tube. Prevented by use of small bore whenever possible.

**Irritation, leakage at ostomy site:** Caused by drainage of digestive juices from site. Prevented by close attention to skin/stoma care.

**Tube, lumen obstruction:** Caused by thickened formula residue, formation of formula-medication complexes. Prevented by frequently irrigating tube with clear water (also before and after giving formulas/medication), avoiding instilling medication if possible.

**GASTROINTESTINAL:** Usually associated with formula, rate of delivery, unsanitary handling of solutions or delivery system.

**Diarrhea:** Caused by low-residue formulas, rapid delivery, use of hyperosmolar formula, hypoalbuminemia, malabsorption, microbial contamination, or rapid GI transit time. Prevented by using fiber supplemented formulas, decreasing rate of delivery, using dilute formula, and gradually increasing strength.

**Cramps, gas, abdominal distention:** Caused by nutrient malabsorption, rapid delivery of refrigerated formula. Prevented by delivering formula by continuous methods, giving formulas at room temperature, decreasing rate of delivery.

**Nausea, vomiting:** Caused by rapid delivery of formula, gastric retention. Prevented by reducing rate of delivery, using dilute formulas, selecting low-fat formulas.

**Constipation:** Caused by inadequate fluid intake, reduced bulk, inactivity. Prevented by supplementing fluid intake, using fiber-supplemented formula, encouraging ambulation.

*Continued*

## MONITORING

**METABOLIC:** Fluid/serum electrolyte status should be monitored. Refer to monitoring section. In addition, the very young and very old are at greater risk of developing complications such as dehydration or overhydration.

*Daily:* Estimate nutrient intake, fluid intake/output, weight of pt, clinical observations.

*Weekly:* Serum electrolytes (potassium, sodium, magnesium, calcium, phosphorus), blood glucose, BUN, creatinine, hepatic function tests (e.g., AST, ALT, alkaline phosphatase), 24-hr urea and creatinine excretion, total iron-binding capacity (TIBC) or serum transferrin, triglycerides, cholesterol.

*Monthly:* Serum albumin.

*Other:* Urine glucose, acetone (when blood glucose is greater than 250), vital signs (temperature, respirations, pulse, B/P) q8h.

### DRUG THERAPY: DOSAGE FOR SELECTION/ADMINISTRATION:

Drug therapy should not have to be compromised in pts receiving enteral nutrition:

- Temporarily discontinue medications not immediately necessary.
- Consider an alternate route for administering medications (e.g., transdermal, rectal, intravenous).
- Consider alternate medications when current medication is not available in alternate dosage forms.

**ENTERAL ADMINISTRATION OF MEDICATIONS:** Medications may be given via feeding tube with several considerations:

- Tube type
- Tube location in the GI tract.
- Site of drug action.
- Site of drug absorption.
- Effects of food on drug absorption.
- Use of liquid dosage forms is preferred whenever possible; many tablets may be crushed; contents of many capsules may be emptied and given through large-bore feeding tubes.
- Many oral products should not be crushed (e.g., sustained-release, enteric coated, capsule granules).
- Some medications should not be given with enteral formulas because they form precipitates that may clog the feeding tube and reduce drug absorption.
- Feeding tube should be flushed with water before and after administration of medications to clear any residual medication.

# Nutrition: Parenteral

Parenteral nutrition (PN), also known as *total parenteral nutrition* (TPN) or *hyperalimentation* (HAL), provides required nutrients to pts by IV route of administration. The goal of PN is to maintain or restore nutritional status caused by disease, injury, or inability to consume nutrients by other means.

## INDICATIONS

Conditions when pt is unable to use alimentary tract via oral, gastrostomy, or jejunostomy route. Impaired absorption of protein caused by obstruction, inflammation, or antineoplastic therapy. Bowel rest necessary because of GI surgery or ileus, fistulas, or anastomotic leaks. Conditions with increased metabolic requirements (e.g., burns, infection, trauma). Preserve tissue reserves (e.g., acute renal failure). Inadequate nutrition from tube feeding methods.

## COMPONENTS OF PN

To meet IV nutritional requirements, six essential categories in PN are needed for tissue synthesis and energy balance.

**Protein:** In the form of crystalline amino acids (CAA), primarily used for protein synthesis. Several products are designed to meet specific needs for pts with renal failure (e.g., NephroAmine), hepatic disease (e.g., HepatAmine), stress/trauma (e.g., Aminosyn HBC), use in neonates and pediatrics (e.g., Aminosyn PE, TrophAmine). Calories: 4 kcal/g protein.

**Energy:** In the form of dextrose, available in concentrations of 5%–70%. Dextrose less than 10% may be given peripherally; concentrations greater than 10% must be given centrally. Calories: 3.4 kcal/g dextrose.

**IV fat emulsion:** Available in 10% and 20% concentrations. Provides a concentrated source of energy/calories (9 kcal/g fat) and is a source of essential fatty acids. May be administered peripherally or centrally.

*Continued*

## Nutrition: Parenteral—cont'd

### ROUTE OF ADMINISTRATION

**Electrolytes:** Major electrolytes (calcium, magnesium, potassium, sodium; also acetate, chloride, phosphate). Doses of electrolytes are individualized, based on many factors (e.g., renal/hepatic function, fluid status).

**Vitamins:** Essential components in maintaining metabolism and cellular function; widely used in PN.

**Trace elements:** Necessary in long-term PN administration. Trace elements include zinc, copper, chromium, manganese, selenium, molybdenum, iodine.

**Miscellaneous:** Additives include insulin, albumin, heparin, and H<sub>2</sub> blockers (e.g., cimetidine, ranitidine, famotidine). Other medication may be included, but compatibility for admixture should be checked on an individual basis.

PN is administered via either peripheral or central vein.

**Peripheral:** Usually involves 2–3 L/day of 5%–10% dextrose with 3%–5% amino acid solution along with IV fat emulsion. Electrolytes, vitamins, trace elements are added according to pt needs. Peripheral solutions provide about 2,000 kcal/day and 60–90 g protein/day.

**ADVANTAGES:** Lower risks vs. central mode of administration.

**DISADVANTAGES:** Peripheral veins may not be suitable (esp. in pts with illness of long duration); more susceptible to phlebitis (due to osmolalities greater than 600 mOsm/L); veins may be viable only 1–2 wks; large volumes of fluid are needed to meet nutritional requirements, which may be contraindicated in many pts.

**Central:** Usually utilizes hypertonic dextrose (concentration range of 15%–35%) and amino acid

solution of 3%–7% with IV fat emulsion. Electrolytes, vitamins, trace elements are added according to pt needs. Central solutions provide 2,000–4,000 kcal/day. Must be given through large central vein with high blood flow, allowing rapid dilution, avoiding phlebitis/thrombosis (usually through percutaneous insertion of catheter into subclavian vein, then advancement of catheter to superior vena cava).

**ADVANTAGES:** Allows more alternatives/flexibility in establishing regimens; allows ability to provide full nutritional requirements without need of daily fat emulsion; useful in pts who are fluid restricted (increased concentration), those needing large nutritional requirements (e.g., trauma, malignancy), or those for whom PN indicated more than 7–10 days.

**DISADVANTAGES:** Risk with insertion, use, maintenance of central line; increased risk of infection, catheter-induced trauma, and metabolic changes.

## MONITORING

May vary slightly from institution to institution.

**Baseline:** CBC, platelet count, prothrombin time (PT), weight, body length/head circumference (in infants), serum electrolytes, glucose, BUN, creatinine, uric acid, total protein, cholesterol, triglycerides, bilirubin, alkaline phosphatase, lactate dehydrogenase (LDH), AST, albumin, prealbumin, other tests as needed.

**Daily:** Weight, vital signs (temperature, pulse, respirations [TPR]), nutritional intake (kcal, protein, fat), serum electrolytes (potassium, sodium chloride), glucose (serum, urine), acetone, BUN, osmolarity, other tests as needed.

**2–3 times/wk:** CBC, coagulation studies (PT, partial thromboplastin time [PTT]), serum creatinine, calcium, magnesium, phosphorus, acid-base status, other tests as needed.

**Weekly:** Nitrogen balance, total protein, albumin, prealbumin, transferrin, hepatic function tests (AST, ALT), serum alkaline phosphatase, LDH, bilirubin, Hgb, uric acid, cholesterol, triglycerides, other tests as needed.

## COMPLICATIONS

**Mechanical:** Malfunction in system for IV delivery (e.g., pump failure; problems with lines, tubing, administration sets, catheter). Pneumothorax, catheter misdirection, arterial puncture, bleeding, hematoma formation may occur with catheter placement.

**Infectious:** Infections (pts often more susceptible to infections), catheter sepsis (e.g., fever, shaking, chills, glucose intolerance where no other site of infection is identified).

**Metabolic:** Includes hyperglycemia, elevated serum cholesterol and triglycerides, abnormal serum hepatic function tests.

**Fluid, electrolyte, acid-base disturbances:** May alter serum potassium, sodium, phosphate, magnesium levels.

**Nutritional:** Clinical effects seen may be due to lack of adequate vitamins, trace elements, essential fatty acids.

### DRUG THERAPY/ADMINISTRATION METHODS:

Compatibility of other intravenous medications pts may be administered while receiving parenteral nutrition is an important concern.

Intravenous medications usually are given as a separate admixture via piggyback to the parenteral nutrition line, but in some instances may be added directly to the parenteral nutrition solution. Because of the possibility of incompatibility when adding medication directly to the parenteral nutrition solution, specific criteria should be considered:

- Stability of the medication in the parenteral nutrition solution
- Properties of the medication, including pharmacokinetics that determine if the medication is appropriate for continuous infusion
- Documented chemical and physical compatibility with the parenteral nutrition solution

In addition, when medication is given via piggyback using the parenteral nutrition line, important criteria should include the following:

- Stability of the medication in the parenteral nutrition solution
- Documented chemical and physical compatibility with the parenteral nutrition solution

## Obesity Management

### USES

Adjunct to diet and physical activity in the treatment of chronic, relapsing obesity.

### ACTIONS

Two categories of medications are used for weight control. *Appetite suppressants*: Block neuronal uptake of norepinephrine, serotonin, dopamine, causing a feeling of fullness or satiety.

*Digestion inhibitors*: Reversible lipase inhibitors that block the breakdown and absorption of fats, decreasing appetite and reducing calorie intake.

### ANOREXIANTS

Name	Availability	Dosage	Side Effects
<b>Diethylpropion (Tenuate, Tenuate Dospan)</b>	<b>T:</b> 25 mg, <b>T (CR):</b> 75 mg	25 mg 3–4 times/day or 75 mg once daily in midmorning	Headaches, euphoria, palpitations, hypertension, pulmonary hypertension, valvular heart disease, seizures, bone marrow depression, dependence, withdrawal psychosis
<b>Liraglutide (Victoza)</b>	<b>I:</b> 18 mg/3 mL	<b>SQ:</b> Initially, 0.6 mg/day. May increase by 0.6 mg/day wkly up to 3 mg/day	Diarrhea, constipation, dyspepsia, fatigue, vomiting, increased heart rate, renal impairment
<b>Lorcaserin (Belviq, Belviq XR)</b>	<b>C:</b> 10 mg <b>T:</b> 20 mg	<b>(Belviq):</b> 10 mg 2 times/day <b>(Belviq XR):</b> 20 mg once daily	Nausea, headache, dizziness, fatigue, dry mouth, diarrhea, constipation, hypoglycemia, hallucinations, decreased white/red blood cells, euphoria, cognitive impairment
<b>Naltrexone/bupropion (Contrave)</b>	<b>T:</b> 8 mg/90 mg	Titrate wkly up to 2 tablets 2 times/day (1 tablet once daily, then 1 tablet 2 times/day, then 2 tablets in AM and 1 in PM, then 2 tablets 2 times/day)	Suicidal ideation, mood changes, seizures, increased HR with or without B/P, allergic reactions, hepatic toxicity, nausea, vomiting, headache, dizziness, dry mouth, angle-closure glaucoma

Name	Availability	Dosage	Side Effects
<b>Orlistat (Alli, Xenical)</b>	<b>C:</b> 60 mg, 120 mg	<b>Alli:</b> 60 mg up to tid with meals <b>Xenical:</b> 120 mg tid with each meal containing fat	Flatulence, rectal incontinence, oily stools, cholelithiasis, abdominal/ rectal pain, hepatitis, pancreatitis, nausea
<b>Phentermine (Apidex-P, Suprenza)</b>	<b>C:</b> 15 mg, 30 mg, 37.5 mg <b>T:</b> 37.5 mg <b>T (ODT):</b> 15 mg, 30 mg, 37.5 mg	15–37.5 mg/day in 1 or 2 divided doses <b>ODT:</b> 15–37.5 mg once daily in morning	Headaches, euphoria, palpitations, hypertension, pulmonary hypertension, valvular heart disease, tremor, dependence, withdrawal psychosis, CNS stimulation, GI complaints
<b>Phentermine/ topiramate (Qsymia)</b>	<b>C:</b> 13.75 mg/ 23 mg	3.75 mg/23 mg to 15 mg/92 mg once daily in the morning	Paresthesia, dizziness, insomnia, depression, tachycardia, cognitive impairment, angle-closure glaucoma, hypokalemia, metabolic acidosis, constipation, dry mouth, suicidal ideation, kidney stones
<b>Semaglutide (Wegovy)</b>	<b>I:</b> 0.25 mg/0.5 mL, 0.5 mg/0.5 mL, 1 mg/0.5 mL, 1.7 mg/0.75 mL, 2.4 mg/0.75 mL	<b>SC:</b> Initially, 0.25 mg once wkly titrated to 2.4 mg once wkly.	Nausea, diarrhea, constipation, vomiting, abdominal pain, headache, fatigue, dyspepsia, dizziness
<b>Devices</b>			
<b>Cellulose and citric acid (Plenity)</b>	Single-dose pods each containing 3 capsules (2.25 g dose)	One pod 2 times/day 20–30 min before lunch and dinner	Diarrhea, abdominal distension, infrequent bowel movements, flatulence, abdominal pain, constipation

**AS**, Appetite suppressant; **B/P**, blood pressure; **C**, capsules; **CNS**, central nervous system; **CR**, controlled-release; **DI**, digestion inhibitor; **GI**, gastrointestinal; **HR**, heart rate; **I**, injection; **ODT**, orally disintegrating tablets; **SQ**, subcutaneous; **T**, tablets.

# Osteoporosis

## HISTORY

Osteoporosis is a bone disease that can lead to fractures. Bone mineral density (BMD) is reduced, bone microarchitecture is disrupted, and the amount and variety of proteins in bone are altered. Osteoporosis primarily affects women after menopause (postmenopausal osteoporosis) but may develop in men, in anyone in the presence of particular hormonal disorders (e.g., parathyroid glands), after overconsumption of dietary proteins, or as a result of medications (e.g., glucocorticoids). Several pharmacologic options, along with lifestyle changes, that can be used to prevent and/or treat osteoporotic fractures include calcium and vitamin D supplements in patients having inadequate dietary intake of calcium, bisphosphonates, selective estrogen receptor modulator (SERM), parathyroid hormone (PTH), calcitonin, and monoclonal antibodies.

## ACTION

*Bisphosphonates:* Inhibit bone resorption via actions on osteoclasts or osteoclast precursors, decrease rate of bone resorption, leading to an indirect increase in BMD.

*Selective estrogen receptor modulator (SERM):* Decreases bone resorption, increasing BMD and decreasing the incidence of fractures.

*Parathyroid hormone:* Stimulates osteoblast function, increasing gastrointestinal calcium absorption and increasing renal tubular reabsorption of calcium. This increases BMD, bone mass, and strength, resulting in a decrease in osteoporosis-related fractures.

*Calcitonin:* Inhibitor of bone resorption. Efficacy not observed in early postmenopausal women and is used only in women with osteoporosis who are at least 5 yrs beyond menopause.

*Monoclonal antibody:* Inhibits the RANK ligand (RANKL), a cytokine member of the tumor necrosis factor family. This inhibits osteoclast formation, function, and survival, which decreases bone resorption and increases bone mass and strength in cortical and trabecular bone.

*Sclerostin inhibitor:* Sclerostin is an osteocyte-derived glycoprotein that inhibits bone formation. Inhibition of sclerostin induces osteoblast activity and bone formation, decreasing bone resorption and increasing bone mineral density.

## BISPHOSPHONATES

Name	Availability	Dosage	Class Side Effects
<b>Alendronate (Binosto, Fosamax)</b>	<b>T:</b> 5 mg, 10 mg, 35 mg, 40 mg, 70 mg <b>S:</b> 70 mg/75 mL	<b>Prevention:</b> 5 mg/day or 35 mg/wk <b>Treatment:</b> 10 mg/day or 70 mg/wk	Hypocalcemia, may cause jaw osteonecrosis (rarely); GI (e.g., heartburn, esophageal irritation, esophagitis, abdominal pain, diarrhea); severe bone, joint, or muscle pain. IV: acute-phase reaction (e.g., low-grade fever, myalgia, arthralgia) within 1–3 days of the infusion
<b>Ibandronate (Boniva)</b>	<b>T:</b> 150 mg <b>I:</b> 1 mg/mL	<b>Prevention and treatment:</b> 150 mg/mo <b>IV Injection: Treatment:</b> 3 mg/3 mos	
<b>Risedronate (Actonel)</b>	<b>T:</b> 5 mg, 30 mg, 35 mg, 150 mg <b>T (DR):</b> 35 mg	<b>Prevention and treatment:</b> 5 mg/day, 35 mg/wk, or 150 mg/mo	
<b>Zoledronic acid (Reclast)</b>	<b>I:</b> 5 mg	<b>Prevention: IV:</b> 5 mg every 2 yrs <b>Treatment: IV:</b> 5 mg every yr	

## SERM

Name	Availability	Dosage	Side Effects
<b>Raloxifene (Evista)</b>	<b>T:</b> 60 mg	<b>Prevention and treatment:</b> 60 mg/day	Leg cramps, hot flashes, increased risk of thromboembolic events and stroke

*Continued*

**PARATHYROID HORMONE**

Name	Availability	Dosage	Class Side Effects
<b>Abaloparatide (Tymlos)</b>	<b>I:</b> 2,000 mcg/mL prefilled pen delivers 80 mcg/dose	<b>Treatment:</b> 80 mcg subcutaneously once daily	Muscle cramps, injection site reactions, tachycardia, hypotension, increased serum uric acid concentration, hypercalciuria, dizziness, nausea, headache, hypercalcemia
<b>Teriparatide (Forteo)</b>	<b>I:</b> 250 mcg/mL syringe delivers 20 mcg/dose	<b>Treatment:</b> 20 mcg subcutaneously once daily	

**CALCITONIN**

Name	Availability	Dosage	Side Effects
<b>Calcitonin (Fortical, Miacalcin)</b>	<b>I (Miacalcin):</b> 200 units/mL <b>Nasal (Fortical, Miacalcin):</b> 200 units/activation	<b>Treatment: IM/SQ (Miacalcin):</b> 100 units every other day <b>Nasal:</b> 200 units in 1 nostril daily	Rhinitis, local nasal irritation. <b>Injection:</b> nausea, local inflammation, flushing of face, hands

**MONOCLONAL ANTIBODY RANKL INHIBITOR**

Name	Availability	Dosage	Side Effects
<b>Denosumab (Prolia)</b>	<b>I:</b> 60 mg/mL	<b>SQ:</b> 60 mg once every 6 mos	Dermatitis, rash, eczema, hypocalcemia. May cause jaw osteonecrosis (rarely)

*DR*, Delayed-release; *I*, injection; *S*, solution (oral); *T*, tablet.

**SCLEROSTIN INHIBITOR**

Name	Availability	Dosage	Side Effects
<b>Romosozumab (Evenity)</b>	<b>I:</b> 105 mg/1.17 mL syringe	<b>SQ:</b> 210 mg (2 injections) once every mo for up to 12 doses	Arthralgia, headache

**SQ**, subcutaneous.

## Parkinson's Disease Treatment

### USES

To slow or stop clinical progression of Parkinson's disease and to improve function and quality of life in pts with Parkinson's disease, a progressive neurodegenerative disorder.

### ACTION

Normal motor function is dependent on the synthesis and release of dopamine by neurons projecting from the substantia nigra to the corpus striatum. In Parkinson's disease, disruption of this pathway results in diminished levels of the neurotransmitter dopamine. Medication is aimed at providing improved function using the lowest effective dose.

## TYPES OF MEDICATIONS FOR PARKINSON'S DISEASE DOPAMINE PRECURSOR

### Levodopa/carbidopa:

**Levodopa:** Dopamine precursor supplementation to enhance dopaminergic neurotransmission. A small amount of levodopa crosses the blood-brain barrier and is decarboxylated to dopamine, which is then available to stimulate dopaminergic receptors.

**Carbidopa:** Inhibits peripheral decarboxylation of levodopa, decreasing its conversion to dopamine in peripheral tissues, which results in an increased availability of levodopa for transport across the blood-brain barrier.

## COMT INHIBITORS

**Entacapone, tolcapone:** Reversible inhibitor of catechol-*O*-methyltransferase (COMT). COMT is responsible for catalyzing levodopa. In the presence of a decarboxylase inhibitor (carbidopa), COMT becomes the major metabolizing enzyme for levodopa in the brain and periphery. By inhibiting COMT, higher plasma levels of levodopa are attained, resulting in more dopaminergic stimulation in the brain and lessening the symptoms of Parkinson's disease.

## DOPAMINE RECEPTOR AGONISTS

**Bromocriptine:** Stimulates postsynaptic dopamine type 2 receptors in the neostriatum of the CNS.

**Pramipexole:** Stimulates dopamine receptors in the striatum of the CNS.

**Ropinirole:** Stimulates postsynaptic dopamine D2 type receptors within the caudate putamen in the brain.

## MONOAMINE OXIDASE B INHIBITORS

**Rasagiline, Safinamide, Selegiline:** Increase dopaminergic activity due to inhibition of monoamine oxidase type B (MAO B). MAO B is involved in the oxidative deamination of dopamine in the brain.

## ADENOSINE A2A RECEPTOR ANTAGONIST

**Istradefylline:** Attenuates excessive activity of the striato-pallidal neurons in pts with Parkinson's Disease. Possibly increases dopaminergic activity in the brain.

# Parkinson's Disease Treatment

## MEDICATIONS FOR TREATMENT OF PARKINSON'S DISEASE

Name	Type	Availability	Dosage	Side Effects
<b>Amantadine</b> <b>Gocovri</b> <b>Osmolex ER</b>	Dopamine agonist	<b>C:</b> 100 mg <b>Syrup:</b> 10 mg/mL <b>T:</b> 100 mg <b>ER Caps (Gocovri):</b> 68.5 mg, 137 mg <b>ER Tabs (Osmolex ER):</b> 129 mg, 193 mg, 258 mg	100 mg 2 times/day. May increase up to 400 mg/day in divided doses <b>ER Caps:</b> 274 mg once at bedtime <b>ER Tabs:</b> 129–322 mg once daily in the morning	Cognitive impairment, confusion, insomnia, hallucinations, livedo reticularis
<b>Carbidopa/levodopa</b> <b>(Rytary, Sinemet, Sinemet CR)</b>	Dopamine precursor	<b>OD:</b> 10/100 mg, 25/100 mg, 25/250 mg <b>Immediate-release (Sinemet):</b> 10/100 mg, 25/100 mg, 25/250 mg <b>ER (Sinemet CR):</b> 25/100 mg, 50/200 mg <b>(Rytary):</b> 23.75 mg/95 mg, 36.25 mg/145 mg, 48.75 mg/195 mg, 61.25 mg/245 mg	300–1,500 mg levodopa in divided doses <b>Sinemet:</b> 300–1,500 mg levodopa in divided doses <b>Sinemet CR:</b> Initially, 400 mg/day in 2 divided doses. May increase up to 1,600 mg levodopa in divided doses <b>Rytary:</b> Initially, 23.75 mg/95 mg 3 times/day May increase up to 612.5 mg/2,450 mg per day in divided doses	Anorexia, nausea, orthostatic hypotension initially; hallucinations, confusion, sleep disturbances with chronic use, constipation, dry mouth, headache, dyskinesia
<b>Entacapone</b> <b>(Comtan)</b>	COMT inhibitor	<b>T:</b> 200 mg	200 mg 3–4 times/day up to <b>maximum</b> of 8 times/day (1,600 mg)	Dyskinesias, nausea, diarrhea, urine discoloration
<b>Istradefylline</b> <b>(Nourianz)</b>	Adenosine A2a Receptor Antagonist	<b>T:</b> 20 mg, 40 mg	20–40 mg once daily	Dyskinesia, hallucinations, psychotic behavior, impulse control disorders
<b>Opicapone</b> <b>(Ongentys)</b>	COMT inhibitor	<b>C:</b> 25 mg, 50 mg	50 mg once daily at bedtime	Dyskinesia, constipation, increase creatine kinase, hypotension/syncope, weight loss
<b>Pramipexole</b> <b>(Mirapex, Mirapex ER)</b>	Dopamine agonist	<b>T:</b> 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg <b>ER:</b> 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg	<b>T:</b> Initially, 0.125 mg 3 times/day May increase q5–7 days. Usual dose: 0.5–1.5 mg 3 times/day <b>ER:</b> Initially, 0.375 mg once daily May increase q5–7 days by 0.75 mg/dose up to 4.5 mg once daily	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)

Name	Type	Availability	Dosage	Side Effects
<b>Rasagiline (Azilect)</b>	MAO B inhibitor	<b>T:</b> 0.5 mg, 1 mg	0.5–1 mg once daily	Nausea, orthostatic hypotension, hallucinations, insomnia, dry mouth, constipation, vivid dreams. Many potential drug interactions.
<b>Ropinirole (Requip, Requip XL)</b>	Dopamine agonist	<b>T:</b> 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg <b>XL:</b> 2 mg, 4 mg, 6 mg, 8 mg, 12 mg	<b>T:</b> Initially, 0.25 mg 3 times/day. May increase at wkly intervals to 0.5 mg 3 times/day, then 0.75 mg 3 times/day, then 1 mg 3 times/day. May then increase by 1.5 mg/day up to 9 mg/day, then by 3 mg/day up to total dose of 24 mg/day in divided doses <b>XL:</b> Initially, 2 mg/day for 1–2 wks, then increase by 2 mg/day at wkly intervals	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)
<b>Rotigotine (Neupro)</b>	Dopamine agonist	<b>Transdermal patch:</b> 1 mg/24 hrs, 2 mg/24 hrs, 3 mg/24 hrs, 4 mg/24 hrs, 6 mg/24 hrs, 8 mg/24 hrs	Early stage: Initially, 2 mg/24 hrs up to 6 mg/24 hrs Advanced stage: Initially, 4 mg/24 hrs up to 8 mg/24 hrs	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)
<b>Safinamide (Xadago)</b>	MAO B inhibitor	<b>T:</b> 50 mg, 100 mg	Initially, 50 mg once daily. May increase after 2 wks to 100 mg once daily	Dyskinesia, falls, hallucinations, nausea, insomnia. Many potential drug interactions
<b>Selegiline (Eldepryl, Zelapar)</b>	MAO B inhibitor	<b>C (Eldepryl):</b> 5 mg <b>OD (Zelapar):</b> 1.25 mg	<b>C:</b> 5 mg with breakfast and lunch <b>OD:</b> 1.25–2.5 mg daily in the morning	Nausea, orthostatic hypotension, hallucinations, insomnia, dry mouth, constipation, vivid dreams. Many potential drug interactions
<b>Tolcapone (Tasmar)</b>	COMT inhibitor	<b>T:</b> 100 mg	Initially, 100 mg 3 times/day. May increase to 200 mg 3 times/day	Dyskinesias, nausea, diarrhea, urine discoloration

**C,** Capsules; **COMT,** catechol-*O*-methyltransferase; **CR,** controlled-release; **ER,** extended-release; **I,** Injection; **MAO B,** monoamine oxidase B; **OD,** orally disintegrating; **T,** tablets; **XL,** extended-release.

# Proton Pump Inhibitors

## USES

Treatment of various gastric disorders, including gastric and duodenal ulcers, gastroesophageal reflux disease (GERD), pathologic hypersecretory conditions.

## ACTION

Binds to the activated proton pump on the apical membrane of parietal cells. Inhibits acid secretion into the gastric lumen.

## PROTON PUMP INHIBITORS

Name	Availability	Indications	Usual Adult Dosage	Class Side Effects
<b>Dexlansoprazole (Dexilant)</b>	<b>C:</b> 30 mg, 60 mg	Erosive esophagitis, heartburn associated with nonerosive GERD	30–60 mg/day	Generally well tolerated. Most common: headache, nausea, constipation, diarrhea, flatulence, abdominal pain. Long-term use associated with <i>C. difficile</i> infection, risk of fractures, hypomagnesemia
<b>Esomeprazole (Nexium)</b>	<b>C:</b> 20 mg, 40 mg <b>I:</b> 20 mg, 40 mg	<i>Helicobacter pylori</i> eradication, GERD, erosive esophagitis	20–40 mg/day	
<b>Lansoprazole (Prevacid)</b>	<b>C:</b> 15 mg, 30 mg <b>T (ODT):</b> 15 mg, 30 mg	Duodenal ulcer, gastric ulcer, NSAID-associated gastric ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	15–30 mg/day	
<b>Omeprazole (Prilosec)</b>	<b>C:</b> 10 mg, 20 mg, 40 mg	Duodenal ulcer, gastric ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	20–40 mg/day	
<b>Omeprazole and Sodium Bicarbonate (Zegerid)</b>	<b>P:</b> 20 mg, 40 mg	Duodenal ulcer, benign gastric ulcer, GERD, erosive esophagitis	20–40 mg/day	
<b>Pantoprazole (Protonix)</b>	<b>T:</b> 20 mg, 40 mg <b>I:</b> 40 mg	Erosive esophagitis, hypersecretory conditions	40 mg/day	
<b>Rabeprazole (Aciphex)</b>	<b>T:</b> 20 mg <b>S:</b> 5 mg, 10 mg	Duodenal ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	20 mg/day	

**C**, Capsules; **GERD**, gastroesophageal reflux disease; **I**, Injection; **NSAID**, nonsteroidal anti-inflammatory drug; **ODT**, orally disintegrating tablets; **P**, powder for suspension; **S**, sprinkles; **T**, tablets.

# Rheumatoid Arthritis

Rheumatoid arthritis (RA) is an autoimmune disease associated with progressive disability, systemic complications, early death, and socioeconomic costs. RA affects most joints and their surrounding tissues. RA is characterized by synovial inflammation and hyperplasia, autoantibody production (e.g., rheumatoid factor),

cartilage and bone destruction, and systemic features (e.g., cardiovascular, pulmonary, psychological, skeletal disorders). The clinical hallmark of RA is polyarticular synovial inflammation of peripheral joints (typically in the hands, resulting in pain, stiffness, and some degree of irreversible joint damage; deformity; and disability).

Medications used in RA include disease-modifying antirheumatic drugs (DMARDs) and biologic agents, including tumor necrosis factor (TNF) inhibitors.

Combination treatment useful in pts with a long duration of disease or clinical features indicating a poor prognosis.

## DMARDs

Name	Dosage	Side Effects/Comments
<b>Hydroxychloroquine (Plaquenil)</b>	Induction: 400–600 mg/day for 4–12 wks Maintenance: 200–400 mg/day	<b>Side Effects:</b> Nausea, epigastric pain, hemolysis may occur in pts with G6PD deficiency, retinal toxicity with long-term use
<b>Leflunomide (Arava)</b>	Induction: 100 mg/day for 3 days Maintenance: 10–20 mg/day	<b>Side Effects:</b> Diarrhea, respiratory tract infection, hypertension, headache, reversible alopecia, rash, myelosuppression, and/or elevated hepatic enzymes <b>Comments:</b> Contraindicated for use during pregnancy
<b>Methotrexate (oral) (Rheumatrex, Trexall), Methotrexate (injectable) (Otrexup, Rasuvo)</b>	Induction: 7.5–10 mg PO once wkly Maintenance: 7.5–25 mg PO once wkly Induction: 7.5 PO once wkly Maintenance: 10–25 mg IM or SQ once wkly	<b>Side Effects:</b> Stomatitis, anorexia, nausea, vomiting, diarrhea, abdominal cramps, hepatic enzyme elevations, thrombocytopenia <b>Comments:</b> Not recommended in pts with CrCl <30 mL/min; should not be prescribed for women who are or may become pregnant
<b>Sulfasalazine (Azulfidine)</b>	Induction: 3–4 g/day in divided doses Maintenance: 2 g/day in divided doses	<b>Side Effects:</b> Headache, nausea, anorexia, rash, hemolysis may occur in pts with G6PD deficiency

## BIOLOGIC AGENTS

TNF INHIBITORS		
Name	Dosage	Side Effects/Comments
<b>Adalimumab (Humira)</b>	40 mg SQ once wkly or q2wks	<b>Side Effects:</b> Headache, skin rash, positive ANA titer, antibody development, injection site reaction (erythema, itching, pain, swelling), upper respiratory tract infection <b>Comments:</b> Increased risk for serious infections (e.g., tuberculosis, invasive fungal infections), avoid use in pts with recent history of malignancy or preexisting demyelinating disorders
<b>Certolizumab (Cimzia)</b>	Induction: 400 mg SQ at 0, 2, 4 wks Maintenance: 200 mg SQ every other wk or 400 mg q4wks	<b>Side Effects:</b> Nausea, infection, upper respiratory tract infection, skin rash <b>Comments:</b> See adalimumab
<b>Etanercept (Enbrel)</b>	25 mg SQ 2 times/wk or 50 mg SQ once wkly	<b>Side Effects:</b> Headache, skin rash, diarrhea, injection site reactions (e.g., erythema, swelling), upper respiratory tract infection, rhinitis <b>Comments:</b> See adalimumab
<b>Golimumab (Simponi, Simponi Aria)</b>	<b>Simponi:</b> 50 mg SQ once monthly <b>Simponi Aria:</b> Induction: 2 mg/kg IV at 0 and 4 wks Maintenance: 2 mg/kg IV q8wks	<b>Side Effects:</b> Positive ANA titer, upper respiratory tract infection (e.g., nasopharyngitis, rhinitis) <b>Comments:</b> See adalimumab
<b>Infliximab (Remicade) Biosimilars: Inflectra, Renflexis</b>	Induction: 3 mg/kg IV at 0, 2, and 6 wks Maintenance: 3 mg/kg IV q8wks	<b>Side Effects:</b> Nausea, diarrhea, abdominal pain, increased ANA titer, upper respiratory tract infection, sinusitis, cough, pharyngitis <b>Comments:</b> See adalimumab

## OTHER BIOLOGIC AGENTS

Name	Dosage	Side Effects/Comments
<b>Abatacept (Orencia)</b>	<b>IV:</b> 500 mg, 750 mg, or 1,000 mg IV at 0, 2, and 4 wks, then q4wks <b>SQ:</b> 125 mg SQ once wkly	<b>Side Effects:</b> Nausea, UTIs, acute exacerbation of COPD, hypertension, headache, dizziness <b>Comments:</b> May increase risk of serious infections (e.g., pneumonia, pyelonephritis, cellulitis, diverticulitis)
<b>Baricitinib (Olumiant)</b>	2 mg PO once daily	<b>Side Effects:</b> Upper respiratory tract infection, nausea. Thrombotic events, malignancy, GI perforation, cytopenias, dyslipidemia, increased hepatic transaminases reported <b>Comments:</b> Screening for tuberculosis recommended
<b>Rituximab (Rituxan)</b>	1,000 mg IV twice, 2 wks apart	<b>Side Effects:</b> Hypotension, peripheral edema, abdominal pain anemia, arthralgia, infusion site reactions <b>Comments:</b> Pts at high risk for hepatitis B virus infection should be screened before beginning therapy
<b>Sarilumab (Kevzara)</b>	<b>SQ:</b> 200 mg q2wks	<b>Side Effects:</b> Neutropenia, increased ALT, injection site reactions (e.g., erythema), upper respiratory tract infections, UTI <b>Comments:</b> Screening for tuberculosis recommended
<b>Tocilizumab (Actemra)</b>	<b>IV:</b> Induction: 4 mg/kg IV q4wks Maintenance: 8 mg/kg q4 wks <b>SQ:</b> Induction: 162 mg SQ every other wk Maintenance: 162 mg once wkly	<b>Side Effects:</b> Hypertension, upper abdominal pain, increased ALT/ AST, injection site reactions, neutropenia, dyslipidemia <b>Comments:</b> Severe complications including GI perforation and hypersensitivity with anaphylaxis have been reported
<b>Tofacitinib (Xeljanz), Xeljanz XR)</b>	5 mg PO bid <b>XR:</b> 11 mg PO once daily	<b>Side Effects:</b> Diarrhea, nasopharyngitis, upper respiratory infections, headache hypertension, increased LFTs, dyslipidemia, cytopenias have been reported <b>Comments:</b> Screening for tuberculosis recommended, increased incidence of solid cancers detected
<b>Upadacitinib (Rinvoq)</b>	15 mg PO once daily	<b>Side Effects:</b> Upper respiratory tract infections, nausea, cough, pyrexia <b>Comments:</b> Screening for tuberculosis recommended

**ALT**, Alanine transaminase; **ANA**, antinuclear antibodies; **CNS**, central nervous system; **COPD**, chronic obstructive pulmonary disease; **GI**, gastrointestinal; **IM**, intramuscular; **IV**, intravenous; **LFT**, liver function test; **PO**, oral; **SQ**, subcutaneous; **UTI**, urinary tract Infection.

# Rhinitis Preparations

## USES

Relieve symptoms associated with allergic rhinitis. These symptoms include rhinorrhea, nasal congestion, pruritus, sneezing, postnasal drip, nasal pain.

Allergic rhinitis or hay fever is an inflammation of the nasal airways occurring when an allergen (e.g., pollen) is inhaled. This triggers antibody production. The antibodies bind to mast cells, which contain histamine. Histamine is released, causing symptoms of allergic rhinitis.

## ACTION

**Intranasal corticosteroids:** Depress migration of polymorphonuclear leucocytes and fibroblasts, reverse capillary permeability, and stabilize nasal membranes to prevent/control inflammation. First-line therapy for moderate to severe symptoms or where nasal congestion is the dominant complaint.

**Intranasal antihistamines:** Reduce histamine-mediated symptoms of allergic rhinitis, including pruritus, sneezing, rhinorrhea, watery eyes. Second-line therapy for intermittent nasal symptoms where congestion is not dominant.

**Intranasal mast cell stabilizers:** Inhibit the mast cell release of histamine and other inflammatory mediators.

**Intranasal anticholinergics:** Block acetylcholine in the nasal mucosa. Effective in treating rhinorrhea associated with allergic rhinitis.

**Intranasal decongestants:** Vasoconstrict the respiratory mucosa, provide short-term relief of nasal congestion. Used only as adjuvant therapy for 3–5 days.

**Oral antihistamines (second generation):** First-line therapy for mild symptoms or where sneezing/itching is primary complaint (see antihistamine classification).

**Oral decongestants:** For primary complaint of nasal congestion.

## CORTICOSTEROIDS—INTRANASAL

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects (Class)
<b>Beclomethasone (Beconase AQ) (Qnasl)</b>	Beconase AQ: 1–2 sprays in each nostril 2 times/day Qnasl: 80 mcg/spray: 2 sprays in each nostril once daily	Beconase AQ: 6–11 yrs: 1–2 sprays in each nostril 2 times/day Qnasl: 4–11 yrs: 40 mcg/spray: 1 spray in each nostril once daily	Mild dryness, irritation, burning, stinging, bleeding of nasal mucosa, throat irritation, epistaxis, headache
<b>Budesonide (Rhinocort Allergy Spray, Rhinocort Aqua)</b>	Rhinocort Aqua: 1–4 sprays in each nostril daily Rhinocort Allergy Spray: 1–2 sprays in each nostril once daily	Rhinocort Allergy Spray, Rhinocort Aqua: 6–11 yrs: 1–2 sprays in each nostril daily	

<b>Ciclesonide (Omnaris, Zetonna)</b>	Omnaris: 2 sprays in each nostril daily Zetonna: 1 spray in each nostril daily	Omnaris: 6–11 yrs: 2 sprays in each nostril daily (seasonal allergic rhinitis only)	
<b>Flunisolide (Nasalide)</b>	2 sprays in each nostril 2 or 3 times/day ( <b>maximum:</b> 8 sprays in each nostril daily)	6–14 yrs: 2 sprays in each nostril 2 times/day or 1 spray in each nostril 3 times/day ( <b>maximum:</b> 4 sprays in each nostril daily)	
<b>Fluticasone (Flonase Sensimist, Flonase Allergy Relief)</b>	Flonase, Flonase Allergy Relief, Flonase Sensimist: 1–2 sprays in each nostril once daily	Flonase Sensimist: 2–11 yrs: 1 spray in each nostril daily Flonase Allergy Relief: 4–11 yrs: 1 spray in each nostril once daily	
<b>Fluticasone/Azelastine (Dymista)</b>	1 spray in each nostril 2 times/day	Not indicated in children younger than 6 yrs	
<b>Mometasone (Nasonex)</b>	2 sprays in each nostril daily	2–11 yrs: 1 spray in each nostril daily	
<b>Triamcinolone (Nasacort Allergy 24 HR, Nasacort AQ)</b>	1–2 sprays in each nostril daily	2–5 yrs: 1 spray in each nostril once daily 6–11 yrs: 1–2 sprays in each nostril daily	

## ANTIHISTAMINES—INTRANASAL

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects (Class)
<b>Azelastine Astepro 0.1%, 0.15%</b>	Azelastine: 1–2 sprays in each nostril 2 times/day Astepro 0.1%, 0.15%: 1–2 sprays in each nostril two times/day or 2 sprays each nostril once daily (for seasonal allergic rhinitis)	Azelastine: 5–11 yrs: 1 spray in each nostril 2 times/day Astepro 0.1%: 2–5 yrs: 1 spray 2 times/day Astepro 0.1% or 0.15%: 6–11 yrs: 1 spray 2 times/day	Nasal discomfort, epistaxis, somnolence, headache
<b>Azelastine/Fluticasone (Dymista)</b>	1 spray in each nostril 2 times/day	Not approved for children younger than 6 yrs	
<b>Olopatadine (Patanase)</b>	2 sprays in each nostril 2 times/day	6–11 yrs: 1 spray in each nostril 2 times/day	

Continued

**MAST CELL STABILIZERS**

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
<b>Cromolyn (NasalCrom)</b>	1 spray in each nostril 3–4 times/day	2–11 yrs: 1 spray in each nostril 3–4 times/day	Nasal irritation, unpleasant taste

**ANTICHOLINERGICS**

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
<b>Ipratropium (Atrovent) 0.03%</b>	2 sprays in each nostril 2–3 times/day	6–12 yrs: 2 sprays in each nostril 2–3 times/day	Nasal irritation, dizziness, headache
<b>Ipratropium (Atrovent) 0.06%</b>	2 sprays in each nostril 3–4 times/day	5–12 yrs: 2 sprays in each nostril 3–4 times/day	

**DECONGESTANTS**

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
<b>Oxymetazoline (Afrin, Neo-Synephrine 12 HR)</b>	2–3 sprays 2 times/day	6–11 yrs: 2–3 sprays 2 times/day	Insomnia, tachycardia, nervousness, nausea, vomiting, transient burning, headache, rebound congestion if used longer than 72 hrs
<b>Phenylephrine (Neo-Synephrine Cold and Sinus, Vicks Sinus)</b>	2–3 drops/sprays q4h as needed (0.25% or 0.5%)	6–11 yrs: 2–3 drops/sprays (0.25%) q4h as needed 1–5 yrs: 2–3 drops/sprays (0.125%) q4h as needed	Restlessness, nervousness, headache, rebound nasal congestion, burning, stinging, dryness

# Sedative-Hypnotics

## USES

Treatment of insomnia (i.e., difficulty falling asleep initially, frequent awakening, awakening too early).

## ACTION

*Benzodiazepines* are the most widely used agents and largely replace barbiturates due to greater safety, lower incidence of drug dependence. Benzodiazepines non-selectively bind to at least three receptor subtypes accounting for sedative, anxiolytic, relaxant, and anticonvulsant properties. Benzodiazepines enhance the effect of the inhibitory neurotransmitter gamma-aminobutyric acid (GABA), which inhibits impulse transmission in the CNS reticular formation in brain. Benzodiazepines

decrease sleep latency, number of nocturnal awakenings, and time spent in awake stage of sleep; increase total sleep time. The *nonbenzodiazepines* zaleplon and zolpidem preferentially bind with one receptor subtype, reducing sleep latency and nocturnal awakenings and increasing total sleep time. Ramelteon is a selective agonist of melatonin receptors (responsible for determining circadian rhythms and synchronizing sleep-wake cycles).

## SEDATIVE-HYPNOTICS

Name	Availability	Dosage Range	Side Effects
Benzodiazepines			
<b>Estazolam</b>	T: 1 mg, 2 mg	A: 1–2 mg E: 0.5–1 mg	Daytime sedation, memory and psychomotor impairment, tolerance, withdrawal reactions, rebound insomnia, dependence
<b>Flurazepam</b>	C: 15 mg, 30 mg	A/E: 15–30 mg E: 15 mg	Headaches, unpleasant taste, dry mouth, dizziness, anxiety, nausea
<b>Temazepam (Restoril)</b>	C: 7.5 mg, 15 mg, 30 mg	A: 15–30 mg E: 7.5–15 mg	Same as flurazepam

Continued

**SEDATIVE-HYPNOTICS—cont'd**

Name	Availability	Dosage Range	Side Effects
<b>Nonbenzodiazepines</b>			
<b>Doxepin (Silenor)</b>	<b>T:</b> 3 mg, 6 mg	<b>A, E:</b> 3–6 mg	Somnolence, dizziness, nausea, upper respiratory tract infections, nasopharyngitis, hypertension, headache
<b>Eszopiclone (Lunesta)</b>	<b>T:</b> 1 mg, 2 mg, 3 mg	<b>A:</b> 1–3 mg <b>E:</b> 1–2 mg	Headaches, unpleasant taste, dry mouth, dizziness, anxiety, nausea
<b>Lemborexant (Dayvigo)</b>	<b>T:</b> 5 mg, 10 mg	<b>A, E:</b> 5–10 mg	Somnolence/fatigue, headache, nightmares, abnormal dreams
<b>Ramelteon (Rozerem)</b>	<b>T:</b> 8 mg	<b>A, E:</b> 8 mg	Headaches, dizziness, fatigue, nausea
<b>Suvorexant (Belsomra)</b>	<b>T:</b> 5 mg, 10 mg, 15 mg, 20 mg	<b>A, E:</b> 10–20 mg	Next day somnolence, leg weakness
<b>Zaleplon (Sonata)</b>	<b>C:</b> 5 mg, 10 mg	<b>A:</b> 10–20 mg <b>E:</b> 5 mg	Headaches, dizziness, myalgia, drowsiness, asthenia, abdominal pain
<b>Zolpidem (Ambien, Ambien CR, Edluar, Intermezzo, Zolpimist)</b>	<b>T:</b> 5 mg, 10 mg <b>CR:</b> 6.25 mg, 12.5 mg <b>SL (Edluar):</b> 5 mg, 10 mg <b>(Intermezzo):</b> 1.75 mg, 3.5 mg <b>OS:</b> 5 mg/actuation	<b>OS, T, SL (Edluar):</b> 5 mg (females, elderly); 5–10 mg (males) (Intermezzo): 1.75 mg (females, elderly); 3.5 mg (males) <b>CR:</b> 6.25 mg (females, elderly); 6.25–12.5 mg (males)	Dizziness, daytime drowsiness, headaches, confusion, depression, hangover, asthenia

**A,** Adults; **C,** capsules; **CR,** controlled-release; **E,** elderly; **OS,** oral solution; **SL,** sublingual; **T,** tablets.

# Skeletal Muscle Relaxants

## USES

*Central acting muscle relaxants:* Adjunct to rest, physical therapy for relief of discomfort associated with acute, painful musculoskeletal disorders (i.e., local spasms from muscle injury).

*Baclofen, dantrolene, diazepam:* Treatment of spasticity characterized by heightened muscle tone, spasm, loss of dexterity caused by multiple sclerosis, cerebral palsy, spinal cord lesions, CVA.

## ACTION

*Central acting muscle relaxants:* Exact mechanism unknown. May act in CNS at various levels to depress polysynaptic reflexes; sedative effect may be responsible for relaxation of muscle spasm.

*Baclofen, diazepam:* May mimic actions of gamma-aminobutyric acid on spinal neurons; do not directly affect skeletal muscles.

*Dantrolene:* Acts directly on skeletal muscle, relieving spasticity.

## SKELETAL MUSCLE RELAXANTS

Name	Indication	Dosage Range	Side Effects/Comments
<b>Baclofen (Lioresal)</b>	Spasticity associated with multiple sclerosis, spinal cord injury	Initially 5 mg 3 times/day Increase by 5 mg 3 times/day q3days <b>Maximum:</b> 20 mg 4 times/day	Drowsiness, dizziness, GI effects Caution with renal impairment, seizure disorders Withdrawal syndrome (e.g., hallucinations, psychosis, seizures)
<b>Carisoprodol (Rela)</b>	Discomfort due to acute, painful, musculoskeletal conditions	250–350 mg 4 times/day	Drowsiness, dizziness, GI effects Hypomania at higher than recommended doses Withdrawal syndrome Hypersensitivity reaction (skin reaction, bronchospasm, weakness, burning eyes, fever) or idiosyncratic reaction (weakness, visual or motor disturbances, confusion) usually occurring within first 4 doses

Continued

### SKELETAL MUSCLE RELAXANTS—cont'd

<b>Chlorzoxazone (Lorzone)</b>	Discomfort due to acute, painful, musculoskeletal conditions	Initially 250–500 mg 3–4 times/day <b>Maximum:</b> 750 mg 3–4 times/day	Drowsiness, dizziness, GI effects, rare hepatotoxicity Hypersensitivity reaction (urticaria, itching) Urine discoloration to orange, red, or purple
<b>Cyclobenzaprine (Flexeril)</b>	Muscle spasm, pain, tenderness, restricted movement due to acute, painful, musculoskeletal conditions	Initially 5–10 mg 3 times/day	Drowsiness, dizziness, GI effects Anticholinergic effects (dry mouth, urinary retention) Quinidine-like effects on heart (QT prolongation) Long half-life
<b>Dantrolene (Dantrium)</b>	Spasticity associated with multiple sclerosis, cerebral palsy, spinal cord injury	Initially 25 mg/day for 1 wk, then 25 mg 3 times/day for 1 wk, then 50 mg 3 times/day for 1 wk, then 100 mg 3 times/day <b>Maximum:</b> 100 mg 4 times/day	Drowsiness, dizziness, GI effects Contraindicated with hepatic disease Dose-dependent hepatotoxicity Diarrhea that is dose dependent and may be severe, requiring discontinuation
<b>Diazepam (Valium)</b>	Spasticity associated with cerebral palsy, spinal cord injury; reflex spasm due to muscle, joint trauma or inflammation	2–10 mg 3–4 times/day	Drowsiness, dizziness, GI effects Abuse potential
<b>Metaxalone (Skelaxin)</b>	Discomfort due to acute, painful, musculoskeletal conditions	800 mg 3–4 times/day	Drowsiness (low risk), dizziness, GI effects Paradoxical muscle cramps Mild withdrawal syndrome Contraindicated in serious hepatic or renal disease
<b>Methocarbamol (Robaxin)</b>	Discomfort due to acute, painful, musculoskeletal conditions	Initially 1,500 mg 4 times/day Maintenance: 1,000 mg 4 times/day	Drowsiness, dizziness, GI effects Urine discoloration to brown, brown-black, or green

Name	Indication	Dosage Range	Side Effects/Comments
<b>Orphenadrine (Norflex)</b>	Discomfort due to acute, painful, musculoskeletal conditions	100 mg 2 times/day	Drowsiness, dizziness, GI effects Long half-life Anticholinergic effects (dry mouth, urinary retention) Rare aplastic anemia Some products may contain sulfites
<b>Tizanidine (Zanaflex)</b>	Spasticity	Initially 4 mg q6–8h ( <b>maximum</b> 3 times/day), may increase by 2–4 mg as needed/tolerated <b>Maximum:</b> 36 mg (limited information on doses greater than 24 mg)	Drowsiness, dizziness, GI effects Hypotension (20% decrease in B/P) Hepatotoxicity (usually reversible) Withdrawal syndrome (hypertension, tachycardia, hypertonia) Effect is short lived (3–6 hrs) Dose cautiously with creatinine clearance less than 25 mL/min

**B/P**, Blood pressure; **GI**, gastrointestinal.

## Smoking Cessation Agents

Tobacco smoking is associated with the development of lung cancer and chronic obstructive pulmonary disease. Smoking is harmful not just to the smoker but also to family members, coworkers, and others breathing cigarette smoke.

Quitting smoking decreases the risk of developing lung cancer, other cancers, heart disease, stroke, and respiratory illnesses. Several medications have proved useful as smoking cessation aids. Nausea and light-headedness are possible signs of overdose of nicotine warranting a reduction in dosage.

### SMOKING CESSATION AGENTS

Name	Availability	Dose Duration	Cautions/Side Effects	Comments
<b>Bupropion (Zyban)</b>	<b>T:</b> 150 mg	150 mg every morning for 3 days, then 150 mg 2 times/day Start 1–2 wks before quit date <b>Duration:</b> 7–12 wks up to 6 mos for maintenance	History of seizure, eating disorder, use of MAOI within previous 14 days, bipolar disorder <b>Side Effects:</b> Insomnia, dry mouth, tremor, rash	Stop smoking during second wk of treatment and use counseling support services along with medication

<b>Nicotine gum (Nicorette)</b>	<b>Squares:</b> 2 mg, 4 mg	1 gum q1–2h for 6 wks, then q2–4h for 3 wks then q4–8h for 3 wks <b>Maximum:</b> 24 pieces/day <b>Duration:</b> up to 12 wks	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris <b>Side Effects:</b> Dyspepsia, mouth soreness, hiccups	2 mg recommended for pts smoking less than 25 cigarettes/day, 4 mg for pts smoking 25 or more cigarettes/day Chew until a peppery or minty taste emerges and then “park” between cheek and gums to facilitate nicotine absorption through oral mucosa Chew slowly and intermittently to avoid jaw ache and achieve maximum benefit Only water should be taken 15 min before and during chewing
<b>Nicotine inhaler (Nicotrol)</b>	<b>Cartridge:</b> 10 mg (delivers 4 mg nicotine)	4–16 cartridges daily; taper frequency of use over the last 6–12 wks <b>Duration:</b> up to 6 mos	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris <b>Side Effects:</b> Local irritation of mouth and throat, coughing, rhinitis	Use at or above room temperature (cold temperatures decrease amount of nicotine inhaled)
<b>Nicotine lozenge (Nicorette Lozenges)</b>	<b>Lozenges:</b> 2 mg, 4 mg	One lozenge q1–2h for 6 wks, then q2–4h for 3 wks, then q4–8h for 3 wks <b>Duration:</b> 12 wks <b>Maximum:</b> 5 lozenges in 6 hrs; 20 lozenges in 1 day	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris <b>Side Effects:</b> Local skin reaction, insomnia, nausea, sore throat	First cigarette smoked within 30 min of waking, use 4 mg; after 30 min of waking, use 2 mg Use at least 9 lozenges/day first 6 wks Only 1 lozenge at a time, 5 per 6 hrs and 20 per 24 hrs Do not chew or swallow
<b>Nicotine nasal spray (Nicotrol NS)</b>	10 mg/ml (delivers 0.5 mg/spray)	8–40 doses/day A dose consists of one 0.5 mg delivery to each nostril; initial dose is 1–2 sprays/hr, increasing as needed <b>Duration:</b> 3–6 mos	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris <b>Side Effects:</b> Nasal irritation	Do not sniff, swallow, or inhale through nose while administering nicotine doses (may increase irritation) Tilt head back slightly for best results

Continued

## SMOKING CESSATION AGENTS—cont'd

<b>Nicotine patch (NicoDerm CQ)</b>	<b>Nicoderm CQ:</b> 7 mg/24 hrs, 14 mg/24 hrs, 21 mg/24 hrs <b>Nicotrol:</b> 5 mg/16 hrs, 10 mg/16 hrs, 15 mg/16 hrs	Apply upon waking on quit date: <b>Nicoderm CQ (greater than 10 cigarettes/day):</b> 21 mg/24 hrs for 4 wks, then 14 mg/24 hrs for 2 wks, then 7 mg/24 hrs for 2 wks <b>(10 or fewer cigarettes/day):</b> 14 mg/24 hrs for 6 wks, then 7 mg/24 hrs for 2 wks	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris <b>Side Effects:</b> Local skin reaction, insomnia	The 16- and 24-hr patches are of comparable efficacy Begin with a lower-dose patch in pts smoking 10 or fewer cigarettes/day Place new patch on relatively hair-free location, usually between neck and waist, in the morning If insomnia occurs, remove the 24-hr patch prior to bedtime or use the 16-hr patch Rotate patch site to diminish skin irritation
<b>Varenicline (Chantix)</b>	<b>T:</b> 0.5 mg, 1 mg	<b>Days 1–3:</b> 0.5 mg daily; <b>days 4–7:</b> 0.5 mg 2 times/day; <b>day 8 to end of treatment:</b> 1 mg 2 times/day <b>Duration:</b> begin 1 wk before set quit date, continue for 12 wks. May use additional 12 wks if failed to quit after first 12 wks	<b>Side Effects:</b> Nausea; sleep disturbances; headaches; may impair ability to drive, operate machinery; depressed mood; altered behavior; suicidal ideation reported	Use lower dosage if not able to tolerate nausea and vomiting Use counseling support services along with medication

*B/P*, Blood pressure; *MAOI*, monoamine oxidase inhibitor; *MI*, myocardial infarction; *T*, tablets.

# Vitamins

## INTRODUCTION

Vitamins are organic substances required for growth, reproduction, and maintenance of health and are obtained from food or supplementation in small quantities (vitamins cannot be synthesized by the body or the rate of synthesis is too slow/inadequate to meet metabolic needs). Vitamins are essential for energy transformation and regulation of metabolic processes. They are catalysts for all reactions using proteins, fats, carbohydrates for energy, growth, and cell maintenance.

## WATER SOLUBLE

Water-soluble vitamins include vitamin C (ascorbic acid), B<sub>1</sub> (thiamine), B<sub>2</sub> (riboflavin), B<sub>3</sub> (niacin), B<sub>5</sub> (pantothenic acid), B<sub>6</sub> (pyridoxine), folic acid, B<sub>12</sub> (cyanocobalamin). Water-soluble vitamins act as coenzymes for almost every cellular reaction in the body. B-complex vitamins differ from one another in both structure and function but are grouped together because they first were isolated from the same source (yeast and liver).

## FAT SOLUBLE

Fat-soluble vitamins include vitamins A, D, E, and K. They are soluble in lipids and are usually absorbed into the lymphatic system of the small intestine and then into the general circulation. Absorption is facilitated by bile. These vitamins are stored in the body tissue when excessive quantities are consumed. May be toxic when taken in large doses (see sections on individual vitamins).

## VITAMINS

Name	Uses	Deficiency	Side Effects
<b>Vitamin A (Aquasol A)</b>	Required for normal growth, bone development, vision, reproduction, maintenance of epithelial tissue	Dry skin, poor tooth development, night blindness	<b>High dosages:</b> Hepatotoxicity, cheilitis, facial dermatitis, photosensitivity, mucosal dryness
<b>Vitamin B<sub>1</sub> (thiamine)</b>	Important in red blood cell formation, carbohydrate metabolism, neurologic function, myocardial contractility, growth, energy production	Fatigue, anorexia, growth retardation	<b>Large parenteral doses:</b> May cause pain on injection
<b>Vitamin B<sub>2</sub> (riboflavin)</b>	Necessary for function of coenzymes in oxidation-reduction reactions, essential for normal cellular growth, assists in absorption of iron and pyridoxine	Numbness in extremities, blurred vision, photophobia, cheilosis	Orange-yellow discoloration in urine

*Continued*

## VITAMINS—cont'd

Name	Uses	Deficiency	Side Effects
<b>Vitamin B<sub>3</sub> (niacin)</b>	Coenzyme for many oxidation-reduction reactions	Pellagra, headache, anorexia, memory loss, insomnia	<b>High dosages (more than 500 mg):</b> Nausea, vomiting, diarrhea, gastritis, hepatotoxicity, skin rash, facial flushing, headaches
<b>Vitamin B<sub>5</sub> (pantothenic acid)</b>	Precursor to coenzyme A, important in synthesis of cholesterol, hormones, fatty acids	Natural deficiency unknown	Occasional GI disturbances (e.g., diarrhea)
<b>Vitamin B<sub>6</sub> (pyridoxine)</b>	Enzyme cofactor for amino acid metabolism, essential for erythrocyte production, Hgb synthesis	Neuritis, anemia, lymphopenia	<b>High dosages:</b> May cause sensory neuropathy
<b>Vitamin B<sub>12</sub> (cyanocobalamin)</b>	Coenzyme in cells, including bone marrow, CNS, and GI tract, necessary for lipid metabolism, formation of myelin	Gastrointestinal disorders, anemias, poor growth	Skin rash, diarrhea, pain at injection site
<b>Vitamin C (ascorbic acid)</b>	Cofactor in various physiologic reactions, necessary for collagen formation, acts as antioxidant	Poor wound healing, bleeding gums, scurvy	<b>High dosages:</b> May cause calcium oxalate crystalluria, esophagitis, diarrhea
<b>Vitamin D (Calciferol)</b>	Necessary for proper formation of bone, calcium, mineral homeostasis, regulation of parathyroid hormone, calcitonin, phosphate	Rickets, osteomalacia	Hypercalcemia, kidney stones, renal failure, hypertension, psychosis, diarrhea, nausea, vomiting, anorexia, fatigue, headaches, altered mental status
<b>Vitamin E (Aquasol E)</b>	Antioxidant, promotes formation, functioning of red blood cells, muscle, other tissues	Red blood cell breakdown	<b>High dosages:</b> GI disturbances, malaise, headaches

**CNS**, Central nervous system; **GI**, gastrointestinal.

## alirocumab

al-i-rok-ue-mab  
(Praluent)

**Do not confuse alicumab with adalimumab or raxibacumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Proprotein convertase subtilisin kexin 9 (PCSK9) inhibitor, monoclonal antibody. **CLINICAL:** Antihyperlipidemic.

### USES

Adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) for treatment of primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH]) to reduce low-density lipoprotein cholesterol (LDL-C). To reduce risk of MI, stroke, and unstable angina requiring hospitalization in adults with established cardiovascular disease.

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to alicumab. **Cautions:** Hepatic impairment.

### ACTION

Prevents binding of PCSK9 to LDL receptors on hepatocytes. Increases hepatic uptake of LDL. **Therapeutic Effect:** Lowers LDL levels.

### PHARMACOKINETICS

Distributed primarily in circulatory system. Metabolized by protein degradation into small peptides, amino acids. Peak plasma concentration: 3–7 days. Steady state reached by 2–3 doses. **Half-life:** 17–20 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cross placental barrier, esp. during second and third trimesters. Unknown if distributed in breast milk. Human immunoglobulin G is

present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May enhance adverse effects/toxicity of **belimumab**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum LDL-C levels. May increase serum ALT, AST.

### AVAILABILITY (Rx)

**Injection Solution:** 75 mg/mL, 150 mg/mL in single-dose, prefilled syringe or pen.

### ADMINISTRATION/HANDLING

#### SQ

- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow.
- Allow pen/syringe to warm to room temperature for 30–40 min prior to use.
- Subcutaneously insert needle into abdomen, thigh, or upper arm region and inject solution. It may take up to 20 sec to fully inject dose.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, or skin infections.
- Rotate injection sites.

**Storage** • Refrigerate unused pens/syringes in outer carton. • Do not freeze. • Discard if pen/syringe has been at room temperature more than 24 hrs or longer. • Protect from light.

### INDICATIONS/ROUTES/DOSAGE

**Hyperlipidemia, Secondary Prevention of Cardiovascular Events**

**SQ; ADULTS, ELDERLY:** 75 mg once every 2 wks or 300 mg every 4 wks. May increase to maximum dose of 150 mg once every 2 wks if response inadequate. If a dose is missed, administer within 7 days of scheduled dose, then resume normal schedule. If missed dose is not within 7 days, wait until next scheduled dose. Less frequent dosing: 300 mg q4wks.

#### Dosage in Renal Impairment

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**SIDE EFFECTS**

**Occasional (11%–7%):** Nasopharyngitis, injection site reactions (e.g., erythema, itching, swelling, pain/tenderness, bruising/contusion). **Rare (5%–2%):** Diarrhea, bronchitis, myalgia, muscle spasm, sinusitis, cough, musculoskeletal pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Serious hypersensitivity reactions (e.g., pruritus, rash, urticaria), including some serious events (e.g., hypersensitivity vasculitis, hypersensitivity reactions requiring hospitalization), have been reported. Infections such as UTI (5% of pts) and influenza (6% of pts) have occurred. Neurologic events such as confusion, memory impairment reported in less than 1% of pts. Immunogenicity (anti-alirocumab antibodies) reported in 5% of pts. Pts who developed neutralizing antibodies had a higher incidence of injection site reactions.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain LDL-C level, LFT. Question history of hypersensitivity reaction, hepatic impairment. Assess skin for sunburns, skin rashes, inflammation, or skin infections.

**INTERVENTION/EVALUATION**

Obtain LDL-C level within 4–8 wks after treatment initiation or with any dose titration. Monitor for hypersensitivity reactions. If hypersensitivity reaction occurs, discontinue therapy and treat symptoms accordingly; monitor until symptoms resolve. Monitor for infections including UTI, influenza.

**PATIENT/FAMILY TEACHING**

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication.
- Treatment may cause serious allergic reactions such as itching, hives, rash, or more serious reactions requiring hospitalization. If allergic reaction occurs, immediately seek medical attention.
- Do not reuse pre-filled pens/syringes.

## azilsartan

a-zil-sar-tan  
(Edarbi)

**■ BLACK BOX ALERT ■** May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse azilsartan with losartan, irbesartan, or valsartan.**

### FIXED-COMBINATION(S)

**Edarbyclor:** azilsartan/chlorthalidone, a diuretic: 40 mg/12.5 mg, 40 mg/25 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor blocker (ARB).

**CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension alone or in combination with other antihypertensives.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to azilsartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, unstented renal artery stenosis, significant aortic/mitral stenosis, severe HF, volume depletion/salt-depleted pts, history of angioedema.

### ACTION

Inhibits vasoconstriction, aldosterone-secreting effects of angiotensin II, blocking the binding of angiotensin II to AT<sub>1</sub> receptors in vascular smooth muscle and adrenal gland tissue. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.

### PHARMACOKINETICS

Hydrolyzed to active metabolite in GI tract. Moderately absorbed (60%). Peak plasma concentration: 1.5–3 hrs. Metabolized in liver. Protein binding: greater

than 99%. Excreted in feces (55%), urine (42%). **Half-life:** 11 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm when administered during third trimester. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Elevated creatinine levels may occur in pts older than 75 yrs.

### INTERACTIONS

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may increase risk of hyperkalemia. **NSAIDs, COX-2 inhibitors (e.g., celecoxib)** may decrease effect. **Hypotensive agents** may increase hypotensive effects. May increase concentration/effect of **lithium**. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine. May decrease Hgb, Hct.

### AVAILABILITY (Rx)

**Tablets:** 40 mg, 80 mg.

### ADMINISTRATION/HANDLING

#### PO

- May give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 40 mg once daily. May increase up to 80 mg once daily.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (2%–0.4%):** Diarrhea, orthostatic hypotension. **Rare (0.3%):** Nausea, fatigue, muscle spasm, cough.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Oliguria, acute renal failure may occur in pts with history of renal artery stenosis, severe HF, volume depletion.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain Hgb, Hct, BMP, LFT. Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy. Assess medication history (esp. diuretics). Question history of hepatic/renal impairment, renal artery stenosis, severe HF.

**INTERVENTION/EVALUATION**

Maintain hydration (offer fluids frequently). Monitor serum electrolytes,

B/P, pulse, hepatic/renal function. Observe for symptoms of hypotension. If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Correct volume or salt depletion prior to treatment.

**PATIENT/FAMILY TEACHING**

- Take measures to avoid pregnancy. If pregnancy occurs, inform physician immediately.
- Low blood pressure is more likely to occur if pt takes diuretics or other medications to control hypertension, consumes low-salt diet, experiences vomiting or diarrhea, or becomes dehydrated.
- Change positions slowly, particularly from lying to standing position.
- Report light-headedness or dizziness; lie down immediately.
- Report swollen extremities or decreased urine output despite fluid intake.

## belatacept

bel-at-a-sept  
(Nulojix)

**■ BLACK BOX ALERT ■** Must be administered by personnel trained in administration/handling of immunosuppression therapy. Increased risk of malignancies, infection. Increased risk of posttransplant lymphoproliferative disorder (PTLD), mainly in central nervous system. Not recommended for hepatic transplants due to increased risk of graft loss, death.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective T-cell costimulation blocker. **CLINICAL:** Immunosuppressive agent.

### USES

Prevention of acute organ rejection in pts receiving kidney transplants (in combination with basiliximab induction, mycophenolate mofetil, corticosteroids). For use in Epstein-Barr virus (EBV) seropositive kidney transplant recipients.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to belatacept. Transplant pts who are Epstein-Barr virus (EBV) seronegative or unknown sero-status. **Cautions:** History of opportunistic infections: bacterial, mycobacterial, invasive fungal, viral, protozoal (e.g., histoplasmosis, aspergillosis, candidiasis, coccidioidomycosis, listeriosis, HIV, tuberculosis, pneumocystosis). Recent open wounds, ulcerations. Not recommended in liver transplants. Avoid use of live vaccines.

### ACTION

Fusion protein acting as a selective T-cell (lymphocyte) costimulation blocker (binds to CD80 and CD86 receptors on antigen presenting cells [APC]). **Therapeutic Effect:** Blocks reaction between APC and T cells needed to activate T lymphocytes. Prevents renal transplant rejection.

### PHARMACOKINETICS

**Half-life:** 8–10 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **natalizumab**, **vaccines (live)**. **HERBAL:** *Echinacea* may reduce therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, cholesterol, uric acid, glucose; urine protein. May decrease serum calcium, magnesium, phosphate, potassium; Hgb, Hct, WBC.

### AVAILABILITY (RX)

**Lyophilized Powder for Injection:** 250 mg per vial.

### ADMINISTRATION/HANDLING

**◀ ALERT ▶** Use only silicone-free disposable syringe provided. Using different syringe may produce translucent particles. Administer via dedicated line only.

**Reconstitution** • Reconstitute vial with 10.5 mL of suitable diluent (0.9% NaCl, D<sub>5</sub>W or Sterile Water for Injection) using provided syringe, 18- to 20-gauge needle. • Direct stream to glass wall (avoids foaming). • Swirl gently (do not shake). • Discard if opaque particles, discoloration, or foreign particles are present. • Infusion bag must match diluent (0.9% NaCl with 0.9% NaCl, D<sub>5</sub>W with D<sub>5</sub>W; may use Sterile Water for Injection with NaCl or D<sub>5</sub>W). • To mix infusion bag, withdraw and discard volume equal to the volume of reconstituted solution. • Using same silicone-free

disposable syringe, gently inject reconstituted solution into 100- to 250-mL bag (based on concentration). • Final concentration of infusion bag should range from 2 mg/mL to 10 mg/mL. • IV infusion stable for 24 hrs at room temperature.

**Rate of administration** • Infuse over 30 min using infusion set with a 0.2- to 1.2-micron low-protein-binding filter.

**Storage** • Refrigerate vials. • Solution should be clear to slightly opalescent and colorless to slightly yellow. • May refrigerate solution up to 24 hrs. • Discard if reconstituted solution remains at room temperature longer than 24 hrs.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Dosage based on actual body weight at time of transplantation. Do not modify dose unless a change in body weight is greater than 10%.

### Prophylaxis of Acute Kidney Transplant Rejection (in Combination With an Immunosuppressant)

**IV: ADULTS, ELDERLY:** Initial phase: 10 mg/kg on day 1 (day of transplantation, prior to implantation), day 5, end of wks 2, 4, 8, and 12 after transplantation. **Maintenance:** 5 mg/kg end of wk 16 following transplantation, then q4wks thereafter (plus or minus 3 days).

### Dosage Modification

Infusion is based on actual body weight at the time of transplantation; modify dose for weight changes greater than 10% during treatment. Prescribed dose must be evenly divisible by 12.5 to match closest increment (0, 12.5, 25, 37.5, 50, 62.5, 75, 87.5, 100) in mg. For example, the actual dose for a 64-kg pt is 637.5 mg or 650 mg, not 640 mg.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (45%–20%):** Anemia, diarrhea, UTI, peripheral edema, constipation,

hypertension, pyrexia, nausea, cough, vomiting, headache. **Occasional (19%–5%):** Abdominal pain, hypotension, arthralgia, hematuria, upper respiratory infection, insomnia, nasopharyngitis, back pain, dyspnea, influenza, dysuria, bronchitis, stomatitis, anxiety, dizziness, abdominal pain, muscle tremor, acne, alopecia, hyperhidrosis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Serious conditions, including malignancies (esp. skin cancer), progressive multifocal leukoencephalopathy (caused by JC virus), cytomegalovirus, polyoma virus nephropathy, viral reactivation (herpes zoster, hepatitis), may occur. Other opportunistic infections (bacterial, fungal, viral, protozoal) may cause tuberculosis, cryptococcal meningitis, Chagas' disease, West Nile encephalitis, Guillain-Barré syndrome, cerebral aspergillosis. Additional complications, including chronic allograft nephropathy, renal tubular necrosis, renal artery necrosis, atrial fibrillation, hematoma at incision site, wound dehiscence, lymphocele, arteriovenous fistula thrombosis, hydronephrosis, urinary incontinence, anti-belatacept antibody formation, were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, serum chemistries, renal function, glomerular filtration rate (GFR). Evaluate pt for active tuberculosis or latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing whether treatment for latent tuberculosis is necessary. Assess baseline mental status to compare any worsening cognitive symptoms. Obtain Epstein-Barr virus (EBV) serology prior to treatment (contraindicated in pts who are EBV seronegative). Note any skin discoloration,

ulcers, excoriation, lesions. Question history of hypertension/hypotension, arrhythmia, diabetes, HIV. Receive full medication history. Question possibility of pregnancy.

#### **INTERVENTION/EVALUATION**

Monitor B/P, vital signs, I&O, weight. Monitor CBC, renal function, serum electrolytes (hypokalemia may result in changes in muscle strength, muscle cramps, altered mental status, cardiac arrhythmias). Routinely monitor serum glucose levels for new-onset diabetes after transplantation, corticosteroid use. Monitor for fever, tenderness over transplantation site, skin lesions, changing characteristics of moles, neurologic deterioration related to PTLD or PML.

#### **PATIENT/FAMILY TEACHING**

- Therapy may increase risk of malignancies and life-threatening infections.
- Treatment is given with immunosuppressive therapy with basiliximab induction, corticosteroids.
- Report history of HIV, opportunistic infections, hepatitis, coughing of blood, or close relatives with active tuberculosis.
- Avoid sunlight, sunlamps.
- Seek immediate attention if toxic reactions occur.
- Do not receive live vaccines.
- Report pregnancy or plans of becoming pregnant.
- Adhere to strict dosing schedule.
- Report chest pain, palpitations, edema, fever, night sweats, weight loss, swollen glands, flu-like symptoms, stomach pain, vomiting, diarrhea, weakness, or urinary changes (color, frequency, odor, concentration, burning, blood).

# buprenorphine

**TOP  
100**

bue-pre-nor-feen

(Belbuca, Buprenex, Butrans, Probuphine)

**BLACK BOX ALERT** **Transdermal, Immediate-Release, Injection:** Prolonged use during pregnancy may result in neonatal abstinence syndrome. Potential for abuse, misuse, and diversion. Do not exceed dose of one 20 mcg/hr patch due to risk of QT interval prolongation. May cause potentially life-threatening respiratory depression. **Implant:** Potential for implant migration, protrusion, expulsion, and nerve damage associated with insertion and removal.

**Do not confuse Buprenex with Bumex, or buprenorphine with buPROPion.**

## FIXED-COMBINATION(S)

**Bunavail:** buprenorphine/naloxone (narcotic antagonist): 2.1 mg/0.3 mg; 4.2 mg/0.7 mg; 6.3 mg/1 mg.

**Suboxone:** buprenorphine/naloxone: 2 mg/0.5 mg, 4 mg/1 mg, 8 mg/2 mg, 12 mg/3 mg. **Zubsolv:** buprenorphine/naloxone: 1.4 mg/0.36 mg; 5.7 mg/1.4 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid agonist, partial agonist (Schedule V). **CLINICAL:** Opioid dependence adjunct, analgesic.

## USES

**Sublingual tablet:** Treatment of opioid dependence. **Implant:** Maintenance treatment of opioid dependence in pts who achieved/sustained prolonged clinical stability on low to moderate doses of a transmucosal buprenorphine product for 3 months or longer with no need for supplemental dosing or adjustments. **Injection:** Relief of moderate to severe pain. **Transdermal, buccal film:** Moderate to severe chronic pain requiring

continuous around-the-clock opioid analgesic for extended period. **OFF-LABEL:** Injection: Heroin/opioid withdrawal in hospitalized pts.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to buprenorphine. **Additional: Transdermal patch, buccal film, immediate-release injection:** Significant respiratory depression, severe asthma in an unmonitored setting or in absence of resuscitative equipment, known or suspected GI obstruction, including paralytic ileus.

**Cautions:** Hepatic/renal impairment, elderly, debilitated, pediatric pts, head injury/increased intracranial pressure, pts at risk for respiratory depression, hyperthyroidism, myxedema, adrenal cortical insufficiency (e.g., Addison's disease), urethral stricture, CNS depression, morbid obesity, toxic psychosis, prostatic hypertrophy, delirium tremens, kyphoscoliosis, biliary tract dysfunction, acute pancreatitis, acute abdominal conditions, acute alcoholism, pts with prolonged QT syndrome, concurrent use of antiarrhythmics, hypovolemia, cardiovascular disease, ileus, bowel obstruction, hx of seizure disorder.

## ACTION

Binds to mu opioid receptors within CNS. **Therapeutic Effect:** Suppresses opioid withdrawal symptoms, cravings. Alters pain perception, emotional response to pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Sublingual	15 min	1 hr	6 hrs
IV	Less than 15 min	Less than 1 hr	6 hrs
IM	15 min	1 hr	6 hrs

Excreted primarily in feces, with lesser amount eliminated in urine. Protein binding: High. **Half-life: Parenteral:** 2–3 hrs; **Sublingual:** 37 hrs (increased in hepatic impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Breast-feeding not recommended. Neonatal withdrawal noted in infant if mother was treated with buprenorphine during pregnancy, with onset of withdrawal symptoms generally noted on day 1, manifested as hypertonia, tremor, agitation, myoclonus. Apnea, bradycardia, seizures occur rarely. **Children:** Safety and efficacy of injection form not established in those 2–12 yrs. Safety and efficacy of tablet, fixed-combination form not established in pts 16 yrs or younger. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., lorazepam, morphine, zolpidem), MAOIs (e.g., phenelzine, selegiline) may increase CNS or respiratory depression, hypotension. **CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase plasma concentration. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may cause increased clearance of buprenorphine. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

**AVAILABILITY (RX)**

**Buccal Film:** 75 mcg, 150 mcg, 300 mcg, 450 mcg, 600 mcg, 750 mcg, 900 mcg. **Implant (Probuphine):** Set of 4 implants, each containing 74.2 mg of buprenorphine (equivalent to 80 mg of buprenorphine hydrochloride). **Injection Solution (Buprenex):** 0.3 mg/1 mL. **Sublingual Tablets:** 2 mg, 8 mg. **Transdermal Weekly Patch (Butrans):** 5 mcg/hr, 7.5 mcg/hr, 10 mcg/hr, 15 mcg/hr, 20 mcg/hr.

**ADMINISTRATION/HANDLING**

IV

**Reconstitution** • May be diluted with lactated Ringer's solution, D<sub>5</sub>W, 0.9% NaCl.

**Rate of administration** • If given as IV push, administer over at least 2 min.

**IM**

• Give deep IM into large muscle mass.

**Buccal Film**

Moisten inside cheek. Apply with dry finger. Press and hold in place for 5 sec. Keep film in place until dissolved (approx 30 min). Do not chew, swallow, touch, or move film. Do not cut/tear. Avoid areas with open sores/lesions.

**Sublingual**

• Instruct pt to dissolve tablet(s) under tongue; avoid swallowing (reduces drug bioavailability). • For doses greater than 2 tablets, either place all tablets at once or 2 tablets at a time under the tongue.

**Storage** • Store parenteral form at room temperature. • Protect from prolonged exposure to light. • Store tablets at room temperature.

**Transdermal**

• Apply to clean, dry, intact, nonirritated, hairless skin of upper outer arm, upper chest, upper back, or side of chest. Hair at application site should be clipped; do not shave. • Clean site with clear water and allow to dry. Do not use soaps, alcohol, oils (may increase absorption). Press patch in place and hold for 15 seconds. • Wait minimum of 21 days before reapplying to same site. • Avoid exposing patch to external heat sources. Incidental exposure to water is acceptable. Patch may be taped in place with first-aid tape. • If patch falls off during 7-day dosing interval, apply new patch to a different skin site.

**IV INCOMPATIBILITIES**

Diazepam (Valium), furosemide (Lasix), LORazepam (Ativan).

**IV COMPATIBILITIES**

Allopurinol (Aloprim, Zyloprim), aztreonam (Azactam), cefepime (Maxipime), diphenhydramine (Benadryl), granisetron (Kytril), haloperidol (Haldol), heparin, linezolid (Zyvox), midazolam

(Versed), piperacillin/tazobactam (Zosyn), promethazine (Phenergan), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Opioid Dependence

**Sublingual: ADULTS, CHILDREN 13 YRS AND OLDER:** 8 mg on day 1, then 16 mg on day 2 and subsequent induction days. Range: 12–16 mg/day (usually over 3–4 days). **Maintenance:** Target dose 12–16 mg/day. Pts should be switched to buprenorphine/naloxone combination for maintenance and unsupervised therapy. **Implant:** Four implants inserted subdermally in upper arm for 6 mos of treatment.

### Moderate to Severe Acute Pain

**IM/IV: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 0.3 mg (1 mL) q6–8h prn; may repeat once 30–60 min after initial dose. **CHILDREN 2–12 YRS:** 2–6 mcg/kg q4–6h prn.

### Moderate to Severe Chronic Pain

**Transdermal: ADULTS, ELDERLY: (OPIOID NAÏVE):** Initial dose 5 mcg/hr once q7days. **(OPIOID EXPERIENCED):** Discontinue all other around-the-clock opioid medications. Initial dose based on morphine equivalent dose: (Less than 30 mg): Initially 5 mcg/hr q7days. (30–80 mg): 10 mcg/hr q7days. (Greater than 80 mg): 20 mcg/hr q7days.

**Buccal: ADULTS, ELDERLY: (OPIOID NAÏVE):** Initially, 75 mcg once or q12h for 4 days, then 150 mcg q12h. **(OPIOID EXPERIENCED):** Taper current opioid to no more than 30 mg oral morphine equivalent. **Based on opioid dose before tapering:** 75 mcg once daily or q12h for less than 30 mg; 150 mcg q12h for 30–89 mg; 300 mcg q12h for 90–160 mg.

### Dosage in Renal Impairment

Use caution.

### Dosage in Hepatic Impairment

**Injection:** Use caution.

**Transdermal:** No adjustment.

## SIDE EFFECTS

**Frequent (67%–10%):** Sedation, dizziness, nausea. **Butrans (more than 5%):** Nausea, headache, pruritus at application site, dizziness, rash, vomiting, constipation, dry mouth. **Implant (more than 5%):** Headache, nausea, vomiting, constipation. **Occasional (5%–1%):** Headache, hypotension, vomiting, miosis, diaphoresis. **Rare (less than 1%):** Dry mouth, pallor, visual abnormalities, injection site reaction.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage results in cold, clammy skin, weakness, confusion, severe respiratory depression, cyanosis, pinpoint pupils, seizures, extreme drowsiness progressing to stupor, coma.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline B/P, pulse rate. Assess mental status, alertness. Assess type, location, intensity of pain. Obtain history of pt's last opioid use. Assess for early signs of withdrawal symptoms before initiating therapy.

### INTERVENTION/EVALUATION

Monitor for change in respirations, B/P, rate/quality of pulse, mental status. Assess lab results. Initiate deep breathing, coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain. Monitor strictly for compliance, signs of abuse or misuse.

### PATIENT/FAMILY TEACHING

- Change positions slowly to avoid dizziness, orthostatic hypotension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, sedatives, anti-depressants, tranquilizers.

## candesartan

kan-de-sar-tan  
(Atacand)

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

### FIXED-COMBINATION(S)

**Atacand HCT:** candesartan/hydrochlorothiazide (a diuretic): 16 mg/12.5 mg, 32 mg/12.5 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor blocker. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension alone or in combination with other antihypertensives, HF: NYHA class II–IV.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to candesartan. Concomitant use with aliskiren in pts with diabetes mellitus. **Cautions:** Significant aortic/mitral stenosis, renal/hepatic impairment, unstented (unilateral/bilateral) renal artery stenosis, HF (may induce hypotension when treatment initiated).

### ACTION

Blocks vasoconstriction, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Produces vasodilation; decreases peripheral resistance, B/P.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2–3 hrs	6–8 hrs	Greater than 24 hrs

Rapidly, completely absorbed. Protein binding: greater than 99%. Undergoes

minor hepatic metabolism to inactive metabolite. Excreted unchanged in urine and in feces through biliary system. Not removed by hemodialysis. **Half-life:** 9 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause fetal/neonatal morbidity/mortality. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase risk of lithium toxicity. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. Aliskiren may increase hyperkalemic effect. May increase adverse/toxicity of ACE inhibitors (e.g., benazepril, lisinopril). **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct.

### AVAILABILITY (RX)

**Tablets:** 4 mg, 8 mg, 16 mg, 32 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**Note:** Antihypertensive effect usually seen in 2 wks. Maximum effect within 4–6 wks.

**PO: ADULTS, ELDERLY:** Initially, 8 mg once daily. Evaluate response q4–6wks. Range: 8–32 mg once daily. **CHILDREN 6–16 YRS WEIGHING MORE THAN 50 KG:** Initially, 8–16 mg/day in 1–2 divided doses. Range: 4–32 mg. **Maximum:** 32 mg/day. **50 KG OR LESS:** Initially, 4–8 mg in 1–2 divided doses. Range: 2–16 mg/day. **Maximum:** 32 mg/day. **CHILDREN 1–5 YRS:** Initially, 0.2 mg/kg/day in 1–2 divided doses.

Range: 0.05–0.4 mg/kg/day. **Maximum:** 0.4 mg/kg/day.

### HF

**PO: ADULTS, ELDERLY:** Initially, 4–8 mg once daily. May double dose at approximately 2-wk intervals up to a target dose of 32 mg/day.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

### SIDE EFFECTS

**Occasional (6%–3%):** Upper respiratory tract infection, dizziness, back/leg pain. **Rare (2%–1%):** Pharyngitis, rhinitis, headache, fatigue, diarrhea, nausea, dry cough, peripheral edema.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdosage may cause hypotension, tachycardia. Bradycardia occurs less often. May increase risk of renal failure, hyperkalemia.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain B/P immediately before each dose in addition to regular monitoring

(be alert to fluctuations). Obtain pregnancy test in females of reproductive potential. Assess medication history (esp. diuretic). Question for history of hepatic/renal impairment, renal artery stenosis. Obtain serum BUN, creatinine, LFT.

#### INTERVENTION/EVALUATION

Maintain hydration (offer fluids frequently). Assess for evidence of upper respiratory infection. Assist with ambulation if dizziness occurs. Monitor electrolytes, renal function, urinalysis. Assess B/P for hypertension/hypotension. If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated.

#### PATIENT/FAMILY TEACHING

- Hypertension requires lifelong control.
- Inform female pts regarding potential for fetal injury, mortality with second- and third-trimester exposure to candesartan.
- Report suspected pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report any sign of infection (sore throat, fever).
- Caution against exercising during hot weather (risk of dehydration, hypertension).

## cefixime

sef-ix-eem  
(Suprax)

**Do not confuse cefixime with cefepime, or Suprax with Sporanox or Surbex.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *M. catarrhalis*, *H. influenzae*, *E. coli*, *P. mirabilis*, including otitis media, acute bronchitis, acute exacerbations of chronic bronchitis, pharyngitis, tonsillitis, uncomplicated UTI.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefixime, cephalosporins. **Cautions:** History of penicillin allergy, renal impairment.

### ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from GI tract. Protein binding: 65%–70%. Widely distributed. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 3–4 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not recommended during labor and delivery. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause a positive direct/indirect Coombs' test.

### AVAILABILITY (RX)

**Oral Suspension:** 100 mg/5 mL, 200 mg/5 mL, 500 mg/5 mL. **Capsules:** 400 mg. **Tablets (Chewable):** 100 mg, 200 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • After reconstitution, oral suspension is stable for 14 days at room temperature or refrigerated. • Shake oral suspension well before administering. Chewable tablets must be chewed or crushed before swallowing.

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage

**PO: ADULTS:** 400 mg/day as a single dose or in 2 divided doses. **INFANTS, CHILDREN, ADOLESCENTS:** 8 mg/kg/day as a single dose or in 2 divided doses. **Maximum:** 400 mg/day.

#### Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
21–60 mL/min	260 mg/day
20 mL/min or less	200 mg/day
Hemodialysis	260 mg/day

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness-like reaction (arthralgia, fever; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function tests. Question for hypersensitivity to cefixime or other cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor renal function tests for evidence of nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Continue medication for full length of treatment; do not skip doses.
- Doses should be evenly spaced.
- May cause GI upset (may take with food or milk).
- Report persistent diarrhea.

# cefepodoxime

sef-poe-dox-eem

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *M. catarrhalis*, *E. coli*, *Proteus*, *Klebsiella* spp., including acute maxillary sinusitis, chronic bronchitis, community-acquired pneumonia, otitis media, pharyngitis, tonsillitis, skin/skin structure infections, UTIs.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefepodoxime, cephalosporins. **Cautions:** Renal impairment, history of penicillin allergy.

## ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Well absorbed from GI tract (food increases absorption). Protein binding: 18%–23%. Widely distributed. Primarily excreted unchanged in urine. Partially removed by hemodialysis. **Half-life:** 2.3 hrs (increased in renal impairment, elderly pts).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** High doses of **antacids containing aluminum**, **H<sub>2</sub> antagonists (e.g., famotidine, ranitidine)** may decrease

absorption. **Probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** **Food** enhances absorption. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

## AVAILABILITY (RX)

**Oral Suspension:** 50 mg/5 mL, 100 mg/5 mL. **Tablets:** 100 mg, 200 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer tablet with food (enhances absorption).
- Administer suspension without regard to food.
- After reconstitution, oral suspension is stable for 14 days if refrigerated.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO: ADULTS, ELDERLY:** 100–400 mg q12h. **CHILDREN:** 10 mg/kg/day in 2 divided doses. **Maximum:** 200 mg/dose.

### Dosage in Renal Impairment

For pts with CrCl less than 30 mL/min, usual dose is given q24h. For pts on hemodialysis, usual dose is given 3 times/wk after dialysis.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness-like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with

preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity,

stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Doses should be evenly spaced.
- Shake oral suspension well before using.
- Take tablets with food (enhances absorption).
- Continue antibiotic therapy for full length of treatment.
- Refrigerate oral suspension.
- Report persistent diarrhea.

## cefprozil

sef-proe-zil  
(Apo-Cefprozil )

**Do not confuse cefprozil with ceFAZolin**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Second-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *M. catarrhalis*, including pharyngitis, tonsillitis, otitis media, secondary bacterial infection of acute bronchitis, acute bacterial exacerbation of chronic bronchitis, uncomplicated skin/skin structure infections, acute sinusitis.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefprozil, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy.

### ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 36%–45%. Widely distributed. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 1.3 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not es-

tablished in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine, alkaline phosphatase, ALT, AST.

### AVAILABILITY (RX)

**Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food; if GI upset occurs, give with food, milk.
- After reconstitution, oral suspension is stable for 14 days if refrigerated.
- Shake oral suspension well before using.

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage Range

**PO: ADULTS, ELDERLY:** 250–500 mg q12h or 500 mg q24h. **CHILDREN, ADOLESCENTS:** 7.5–15 mg/kg/day in 2 divided doses. **Maximum:** 500 mg/dose. Do not exceed adult dose.

#### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** 50% of usual dose at usual interval. **Hemodialysis:** Administer dose after completion of dialysis.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness-like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Assess oral cavity for evidence of stomatitis. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (but increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.
- May cause GI upset (may take with food or milk).
- Report persistent diarrhea.

## doravirine/ lamivudine/ tenofovir

**dor-a-vir-eeen/la-miv-ue-deen/ten-oh-foe-veer**  
(Delstrigo)

■ **BLACK BOX ALERT** ■ Severe exacerbations of hepatitis B virus (HBV) reported in pts coinfecting with HIV-1 and HBV following discontinuation. If discontinuation occurs, monitor hepatic function for at least several mos. Initiate anti-HBV therapy if warranted.

**Do not confuse doravirine/lamivudine/tenofovir (Delstrigo) with efavirenz/lamivudine/tenofovir (Symfi Lo), abacavir/dolutegravir/lamivudine (Triumeq), abacavir/lamivudine/zidovudine (Trizivir), bictegravir/emtricitabine/tenofovir (Biktarvy), efavirenz/emtricitabine/tenofovir (Atripla), or emtricitabine/lopinavir/ritonavir/tenofovir (Kaletra).**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nonnucleoside reverse transcriptase inhibitor, nucleoside reverse transcriptase inhibitor, nucleotide reverse transcriptase inhibitor. **CLINICAL:** Antiretroviral agent (anti-HIV).

### USES

Treatment of HIV-1 infection in adult pts with no antiretroviral treatment history.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to doravirine, lamivudine, or tenofovir. Concomitant use of strong CYP3A inducers (e.g., carbamazepine, phenytoin, mitotane, rifAMPin, St. John's wort), enzalutamide. **Cautions:** Hyperlipidemia, psychiatric illness (e.g., depression, psychosis, suicidal ideation), renal/hepatic

impairment; history of pathologic fracture, osteoporosis, osteopenia. Concomitant use of moderate CYP3A inducers. Not recommended in pts with CrCl less than 50 mL/min, end-stage renal disease requiring dialysis.

### ACTION

Doravirine blocks noncompetitive HIV-1 reverse transcriptase (does not inhibit DNA polymerases or mitochondrial DNA polymerase). Lamivudine inhibits HIV reverse transcription via viral DNA chain termination. Tenofovir interferes with the HIV RNA-dependent DNA polymerase. **Therapeutic Effect:** Interferes with HIV-1 replication.

### PHARMACOKINETICS

Widely distributed. Doravirine metabolized in liver. Tenofovir metabolized by enzymatic hydrolysis, mediated by macrophages and hepatocytes. Protein binding: (doravirine): 76%; (lamivudine): less than 36%, (tenofovir): less than 1%. Peak plasma concentration: (doravirine): 2 hrs; (tenofovir): 1 hr. Doravirine excreted primarily in urine (6%). Lamivudine excreted primarily in urine (71%). Tenofovir excreted primarily in urine (70%–80%). **Half-life:** (doravirine): 15 hrs; (lamivudine): 5–7 hrs; (tenofovir): 17 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of postnatal HIV transmission. Unknown if doravirine is secreted in breast milk. Lamivudine, tenofovir is secreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not specified; use caution.

### INTERACTIONS

**DRUG:** NSAIDS (e.g., ibuprofen, naproxen) may increase nephrotoxic effect of tenofovir. **Strong CYP3A inducers** (e.g., carbamazepine, phenytoin, rifAMPin), enzalutamide, mitotane may decrease concentration/effect; use contraindicated. **Efavirenz,**

etravirine, nevirapine may decrease concentration/effect of doravirine. **Hepatitis C antivirals** (e.g., ledipasvir, sofosbuvir) may increase concentration/effect of tenofovir. **Sorbitol** may decrease concentration/effect of lamivudine. Doravirine may decrease concentration of **ergonovine**. **HERBAL: St. John's wort** may decrease concentration/effect; use contraindicated. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, bilirubin, LDL cholesterol, GGT, creatine kinase, creatinine, lipase, triglycerides. May decrease serum potassium, phosphate; Hgb, Hct, RBCs.

### AVAILABILITY (RX)

**Fixed-Dose Combination Tablets: (doravirine/lamivudine/tenofovir [TDF]):** 100 mg/300 mg/300 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### HIV Infection

**PO: ADULTS:** 1 tablet once daily.

#### Dose Modification

**Concomitant use of rifabutin:** Give additional dose of doravirine 100 mg approx. 12 hrs after fixed-dose combination tablet.

#### Dosage in Renal Impairment

**CrCl greater than 50 mL/min:** No dose adjustment. **CrCl less than 50 mL/min, ESRD requiring HD:** Not recommended.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Occasional (7%–4%):** Dizziness, nausea, abnormal dreams, insomnia. **Rare (3%–2%):** Diarrhea, somnolence, rash.

### ADVERSE EFFECTS/TOXIC REACTIONS

May cause new or worsening renal failure including Fanconi syndrome (renal tubular injury, nonabsorption of essential electrolytes, acids, buffers in renal tubules). Renal tubular injury may lead to rhabdomyolysis, osteomalacia, muscle weakness, myopathy. May decrease bone mineral density, leading to pathologic fractures. Fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) was reported. Fatal cases of hepatitis, fulminant hepatitis, hepatic injury requiring liver transplantation were reported. If therapy is discontinued, pts coinfecting with hepatitis B or C virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. Suicidal ideation, depression, suicide attempt were reported (primarily occurred in pts with prior psychiatric illness). May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis or acceleration of autoimmune disorders including Graves' disease, polymyositis, Guillain-Barre).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain LFT, BUN, serum creatinine, CrCl, eGFR, CD4+ count, viral load, HIV-1 RNA level; urine glucose, urine protein; pregnancy test in female pts of reproductive potential. Obtain serum phosphate level in pts with renal impairment. Test all pts for HBV infection. Receive full medication history (including herbal products) and screen for contraindications/interactions.

Question history of hepatic/renal impairment, hyperlipidemia, hypersensitivity reactions, decreased mineral bone density, osteopenia, psychiatric illness. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor LFT; assess for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). If discontinuation of drug regimen occurs, monitor hepatic function for at least several mos. Initiate anti-HBV therapy if warranted. Obtain serum lactate level if lactic acidosis suspected (confusion, dyspnea, muscle cramps, tachypnea). Monitor renal function as clinically indicated. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC count may be unreliable in pts with uncontrolled HIV infection). Assess skin for toxic skin reactions, rash. Screen for psychiatric symptoms (agitation, delusions, depression, paranoia, psychosis, suicidal ideation).

**PATIENT/FAMILY TEACHING**

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form

if treatment is interrupted; do not run out of supply.

- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Fatal cases of liver inflammation or failure have occurred; report abdominal pain, clay-colored stools, yellowing of skin or eyes, weight loss.
- Report symptoms of kidney inflammation or disease (decreased urine output, flank pain, darkened urine); toxic skin reactions (rash, pustules, skin eruptions).
- Report any psychiatric symptoms (agitation, delusions, depression, mood alteration, paranoia, suicidal ideation).
- Breastfeeding not recommended.
- Decreased bone density may lead to pathologic fractures; report bone/extremity pain, suspected fractures.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk, while also causing decreased body fat in legs, arms, face.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Do not take herbal products, esp. St. John's wort.

## elvitegravir/ cobicistat/ emtricitabine/ tenofovir

el-vye-**teg**-ra-veer/koe-**bik**-i-stat/  
em-trye-**sye**-ta-been/ten-**oh**-foe-veer  
(Stribild, Genvoya)

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, lactic acidosis and severe hepatomegaly with steatosis (fatty liver) have been reported. Severe exacerbations of hepatitis B virus (HBV) infection reported in pts coinfecting with HIV-1 and HBV following discontinuation. If discontinuation of therapy occurs, monitor hepatic function for at least several mos. Initiate anti-HBV therapy if warranted.

**Do not confuse elvitegravir/cobicistat/emtricitabine/tenofovir DF (Stribild) with elvitegravir/cobicistat/emtricitabine/tenofovir TAF (Genvoya), emtricitabine/rilpivirine/tenofovir (Complera), efavirenz/emtricitabine/tenofovir (Atripla), or emtricitabine/tenofovir (Truvada).**

### FIXED-COMBINATION(S)

**Stribild:** elvitegravir (an integrase inhibitor)/cobicistat (an antiretroviral booster, CYP3A inhibitor)/emtricitabine/tenofovir fumarate (DF) (an antiretroviral): 150 mg/150 mg/200 mg/300 mg. **Genvoya:** elvitegravir (an integrase inhibitor)/cobicistat (an antiretroviral booster, CYP3A inhibitor)/emtricitabine/tenofovir (TAF) (nucleoside analog reverse transcriptase inhibitors): 150 mg/150 mg/200 mg/10 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Integrase strand transfer inhibitor, antiretroviral booster, nucleoside reverse transcriptase inhibitor, nucleotide reverse transcriptase inhibitor. **CLINICAL:** Antiretroviral agent (anti-HIV).

### USES

**Stribild:** Complete regimen for treatment of HIV-1 infection in adults and pediatric pts 12 yrs and older weighing at least 35 kg who have no antiretroviral treatment history or to replace the current antiretroviral regimen in those who are virologically suppressed (HIV-1 RNA less than 50 copies/mL) on a stable antiretroviral regimen for at least 6 mos with no history of treatment failure and no known substitutions associated with resistance to the individual drug components. **Genvoya:** Complete regimen for treatment of HIV-1 infection in adults and pediatric pts weighing at least 25 kg who have had no antiretroviral treatment history or to replace the current antiretroviral regimen in those who are virologically suppressed (HIV-1 RNA less than 50 copies/mL) on a stable antiretroviral regimen for at least 6 mos with no history of treatment failure and no known substitutions associated with resistance to the individual drug components.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to elvitegravir, cobicistat, emtricitabine, tenofovir. Concomitant use of alfuzosin, cisapride, ergot derivatives (e.g., ergotamine), lovastatin, nephrotoxic agents, other antiretrovirals, pimozide, rifampin, salmeterol, sildenafil (when used for pulmonary hypertension), simvastatin, St. John's wort; sedative/hypnotics (e.g., alprazolam, midazolam, triazolam, zolpidem) (may produce extreme sedation and/or respiratory depression). **Cautions:** Renal/hepatic impairment, history of pathological fracture, osteoporosis, osteopenia. Not recommended in pts with CrCl less than 70 mL/min (Stribild), severe hepatic impairment, suspected lactic acidosis; pts with CrCl less than 30 mL/min (Genvoya).

### ACTION

Elvitegravir inhibits catalytic activity of HIV-1 integrase (prevents integration of pro-viral gene into human DNA). Cobicistat inhibits enzymes of CYP3A, boosting

exposure of elvitegravir. Emtricitabine and tenofovir interfere with HIV viral RNA-dependent DNA polymerase activities. **Therapeutic Effect:** Interferes with HIV replication.

## PHARMACOKINETICS

Widely distributed. Elvitegravir, cobicistat metabolized in liver. Emtricitabine phosphorylated by cellular enzymes. Tenofovir metabolized by enzymatic hydrolysis, mediated by macrophages and hepatocytes. Protein binding: (elvitegravir): greater than 99%; (cobicistat): 98%; (emtricitabine): less than 4%; (tenofovir): less than 1%. Elvitegravir excreted in feces (95%), urine (7%). Cobicistat excreted in feces (86%), urine (8%). Emtricitabine excreted in urine (70%), feces (14%). Tenofovir excreted primarily in urine (70–80%). **Half-life:** (emtricitabine): 13 hrs; (cobicistat): 4 hrs; (emtricitabine): 10 hrs; (tenofovir): 12–18 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of postnatal HIV transmission. Emtricitabine, tenofovir are secreted in breast milk. Unknown if elvitegravir, cobicistat are secreted in breast milk. **Children:** Safety and efficacy not established in children younger than 12 yrs or weighing less than 35 kg (Stribild), children weighing less than 25 kg (Genvoya). **Elderly:** May have increased risk of adverse reactions/toxic reactions, osteopenia.

## INTERACTIONS

**DRUG:** May increase concentration/effect of axitinib, bortezomib, bosutinib, budesonide, cobimetinib, dabrafenib, elvitegravir, everolimus, ibrutinib, irinotecan, lovastatin, lurasidone, neratinib, palbociclib, pazopanib, ranolazine, regorafenib, rivaroxaban, simvastatin, topotecan, vemurafenib, vorapaxar. CarBAM-azepine, OXcarbazepine may decrease concentration/effect of elvitegravir. **HERBAL:** St. John's wort may decrease

concentration/effect of elvitegravir. **Red yeast** may increase risk of myopathy, rhabdomyolysis. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, amylase, bilirubin, BUN, cholesterol, creatine kinase (CK), creatinine, glucose, phosphorus, triglycerides; urine protein. May decrease CrCl, neutrophils.

## AVAILABILITY (RX)

**Fixed-Dose Combination Tablets: (Stribild):** elvitegravir/cobicistat/emtricitabine/tenofovir (DF): 150 mg/150 mg/200 mg/300 mg. **(Genvoya):** elvitegravir/cobicistat/emtricitabine/tenofovir (TAF): 150 mg/150 mg/200 mg/10 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Administer at least 2 hrs before medications containing aluminum, magnesium (supplements, antacids, laxatives).

## INDICATIONS/ROUTES/DOSAGE

### HIV Infection

**PO: ADULTS: (Stribild):** 1 tablet once daily. **CHILDREN 12 YRS OR OLDER WEIGHING AT LEAST 35 KG:** 1 tablet once daily. **(Genvoya): PO: ADULTS:** 1 tablet once daily. **CHILDREN 12 YRS OR OLDER WEIGHING AT LEAST 25 KG:** 1 tablet once daily.

### Dosage in Renal Impairment

**(Stribild): CrCl less than 70 mL/min before initiation:** Not recommended. **CrCl less than 50 mL/min during treatment:** Recommend discontinuation. **(Genvoya):** Not recommended in pts with CrCl less than 30 mL/min.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (16%–12%):** Nausea, asthenia, cough, diarrhea. **Occasional (10%–4%):** Headache, vomiting, abnormal dreams, abdominal pain, depression, paresthesia, fatigue, dyspepsia, arthralgia, neuropathy,

hyperpigmentation. **Rare (3%–1%):** Dizziness, eczema, insomnia, flatulence, somnolence, pruritus, urticaria.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause new or worsening renal failure including Fanconi syndrome (renal tubular injury, nonabsorption of essential electrolytes, acids, buffers in renal tubules). Renal tubular injury may lead to rhabdomyolysis, osteomalacia, muscle weakness, myopathy. May decrease bone mineral density, leading to pathological fractures. May cause redistribution/accumulation of body fat (lipodystrophy). Fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) were reported. If therapy is discontinued, pts co-infected with hepatitis B or C virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections, such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders, including Graves' disease, polymyositis, Guillain-Barré). Allergic reactions including angioedema were reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, CrCl, eGFR, CD4+ count, viral load, HIV-1 RNA level; urine glucose, urine protein. Obtain serum phosphate level in pts with renal impairment. Test all pts for HBV infection. Receive full medication history (including herbal products) and screen for contraindications/interactions. Concomitant use of other medications may need to be adjusted. Question history of diabetes, hyperlipidemia, decreased mineral bone density. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor

renal function as clinically indicated. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Obtain serum lactate level if lactic acidosis suspected. If other concomitant medications were not discontinued or adjusted, closely monitor for adverse effects/toxic reactions. Assess for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). If discontinuation of drug regimen occurs, monitor hepatic function for at least several months. Initiate anti-HBV therapy if warranted. Monitor for immune recovery syndrome, esp. after initiating treatment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV infection). Monitor daily pattern of bowel activity, stool consistency; I&Os.

### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Take with food (optimizes absorption).
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Report any signs of decreased urine output, abdominal pain, yellowing of skin or eyes, darkened urine, clay-colored stools, weight loss.
- Lactating females should not breastfeed.
- Decreased bone density may lead to pathological fractures; report bone/extremity pain, suspected fractures.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk, while also causing decreased body fat in legs, arms, face.
- Take dose at least 2 hrs before or at least 6 hrs after other medications containing aluminum, magnesium (supplements, antacids, laxatives).
- Do not take newly prescribed medications, including OTC drugs, unless approved by doctor who originally started treatment.

## emtricitabine/ tenofovir

em-trye-sye-ta-been/ten-oh-foe-veer  
(Truvada)

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, lactic acidosis and severe hepatomegaly with steatosis (fatty liver) have been reported. Severe exacerbations of hepatitis B virus (HBV) infection reported in pts co-infected with HIV-1 and HBV following discontinuation. If discontinuation of therapy occurs, monitor hepatic function for at least several mos. Initiate anti-HBV therapy if warranted. HIV-1 PrEP must only be prescribed to pts who are confirmed HIV-1 negative prior to initiation and who are screened periodically during use. Drug-resistant HIV-1 variants have occurred in pts with undetected acute HIV-1 infection. Do not initiate HIV PrEP if symptoms of acute HIV-1 infection are present unless negative status is confirmed.

**Do not confuse emtricitabine/tenofovir DF (Truvada) with bictegravir/emtricitabine/tenofovir (Biktarvy), elvitegravir/cobicistat/emtricitabine/tenofovir (Genvoya, Stribild), emtricitabine/rilpivirine/tenofovir (Complera), efavirenz/emtricitabine/tenofovir (Atripla) or emtricitabine/lopinavir/ritonavir/tenofovir (Kaletra).**

### FIXED-COMBINATION(S)

**Truvada:** emtricitabine/tenofovir (antiretrovirals).

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nucleoside reverse transcriptase inhibitor, nucleoside reverse transcriptase inhibitor. **CLINICAL:** Antiretroviral agent (anti-HIV).

## USES

Treatment of HIV-1 infection in adults and pediatric pts weighing at least 17 kg, in combination with other antiretrovirals. To reduce risk of sexually acquired HIV-1 in at-risk adults and adolescents weighing at least 35 kg, in combination with safer sex practices for pre-exposure prophylaxis (PrEP).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to emtricitabine, tenofovir. Use of HIV-1 PrEP in pts who are HIV-1 positive or unknown infection status. **Cautions:** Renal/hepatic impairment, history of pathological fracture, osteoporosis, osteopenia; depression, diabetes. Not recommended in pts with CrCl less than 30 mL/min, ESRD requiring dialysis (HIV-1 infection); pts with CrCl less than 60 mL/min (HIV-1 PrEP); suspected lactic acidosis.

## ACTION

Emtricitabine and tenofovir interfere with HIV viral RNA-dependent DNA polymerase. **Therapeutic Effect:** Interferes with HIV replication.

## PHARMACOKINETICS

Widely distributed. Emtricitabine phosphorylated by cellular enzymes. Tenofovir metabolized by enzymatic hydrolysis, mediated by macrophages and hepatocytes. Protein binding: (emtricitabine): less than 4%; (tenofovir): less than 1%. Peak plasma concentration: (emtricitabine): 1–2 hrs; (tenofovir): 1 hr. Emtricitabine excreted in urine (86%), feces (13%). Tenofovir excreted primarily in urine (70–80%). **Half-life:** (emtricitabine): 10 hrs; (tenofovir): 17 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of post-natal HIV transmission. Emtricitabine, tenofovir are secreted in breast milk.

**Children:** (HIV-1 infection): Safety and efficacy not established in pts weighing less than 17 kg. (HIV-1 PrEP): Adolescents may exhibit poor compliance with treatment; may benefit with more frequent visits/counseling. **Elderly:** Not specified; use caution.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may enhance nephrotoxic effects of tenofovir. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT/AST, amylase, cholesterol, creatine kinase (CK), creatinine, glucose, phosphorus, triglycerides; urine glucose. May decrease Hgb, neutrophils; CrCl.

## AVAILABILITY (RX)

**Fixed-Dose Combination Tablets:** (*emtricitabine/tenofovir*): 100 mg/150 mg, 133 mg/200 mg, 167 mg/250 mg, 200 mg/300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### HIV-1 Prophylaxis (PrEP)

**PO: ADULTS, ADOLESCENTS WEIGHING AT LEAST 35 KG:** 1 tablet (200 mg/300 mg) once daily.

### HIV-1 Infection (established)

**PO: ADULTS, CHILDREN WEIGHING AT LEAST 35 KG:** 1 tablet (200 mg/300 mg) once daily. **WEIGHING 28–34 KG:** 1 tablet (167 mg/250 mg) once daily. **WEIGHING 22–27 KG:** 1 tablet (133 mg/200 mg) once daily. **WEIGHING 17–21 KG:** 1 tablet (100 mg/150 mg) once daily.

### Dosage in Renal Impairment

**Mild impairment: CrCl 50–80 mL/min:** No dose adjustment. **Moderate**

**impairment: CrCl 30–49 mL/min:** Decrease frequency to q48h. **Severe impairment: CrCl less than 30 mL/min:** Not recommended.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Occasional (9%–5%):** Fatigue, nausea, diarrhea, dizziness, rash (exfoliative, generalized, macular, maculo-papular, vesicular), pruritus, headache, insomnia. **Rare (2%):** Vomiting.

## ADVERSE EFFECTS/TOXIC REACTIONS

If therapy is discontinued, pts co-infected with hepatitis B or C virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May cause new or worsening renal failure including Fanconi syndrome (renal tubular injury, nonabsorption of essential electrolytes, acids, buffers in renal tubules). Renal tubular injury may lead to rhabdomyolysis, osteomalacia, muscle weakness, myopathy. May decrease bone mineral density, leading to pathological fractures. May cause redistribution/accumulation of body fat (lipodystrophy). Fatal lactic acidosis, severe hepatomegaly with steatosis (fatty liver) were reported. May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections, such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders, including Graves' disease, polymyositis, Guillain-Barré). Use of HIV-1 PrEP in pts who are HIV-1 positive may develop HIV-1 resistance substitutions because prophylactic therapy is not a complete treatment regimen. Depression occurred in 9% of pts. Upper respiratory tract infection, sinusitis were reported in 8% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, CrCl, eGFR; urine glucose, urine protein. Obtain CD4+ count, viral load, HIV-1 RNA level (if therapy used to treat known HIV-1 infection). Obtain serum phosphate level in pts with renal impairment. Test all pts for HBV infection. For HIV-1 PrEP, a negative HIV-1 test must be confirmed before initiation. If recent exposure is suspected (less than 1 mo) or if symptoms of acute HIV-1 infection are present (e.g., fatigue, fever, lymphadenopathy, myalgia, rash), delay initiation for at least 1 mo until HIV-1 status is confirmed. When considering HIV-1 PrEP, screen for high-risk factors including HIV-1 infected partners, sexual activity with high-prevalence area or social network and additional risk factors (e.g., drug or alcohol dependence, incarceration, noncompliant condom use, previous STD infections; sexual exchanges for food, money, shelter, drugs; sexual partners with unknown HIV-1 status who are at risk of infection). Question potential exposures (unprotected sexual activity, sexual activity with HIV-1 infected partner, breakage of condom). Question possibility of pregnancy. Question history of diabetes, depression, hyperlipidemia, decreased mineral bone density. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness (if therapy used to treat known HIV-1 infection). Monitor renal function as clinically indicated. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Obtain serum lactate level if lactic acidosis suspected. Assess for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). If discontinuation of drug regimen occurs, monitor hepatic function for at least several months. Initiate anti-HBV therapy if warranted. Monitor

for immune recovery syndrome, esp. after initiating treatment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV infection). Monitor daily pattern of bowel activity, stool consistency; I&Os. Monitor for symptoms of depression (fatigue, flat affect, irritability, feelings of sadness, hopelessness, suicidal ideation). For HIV-1 PrEP, test for HIV-1 infection at least q3mos. If symptoms of acute HIV-1 infection are present or screening indicates possible infection, consider conversion to full treatment regimen until an approved test has confirmed negative status.

### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection or reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- Report any signs of decreased urine output, abdominal pain, yellowing of skin or eyes, darkened urine, clay-colored stools, weight loss.
- Lactating females should not breastfeed.
- Decreased bone density may lead to pathological fractures; report bone/extremity pain, suspected fractures.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk, while also causing decreased body fat in legs, arms, face.
- Do not take newly prescribed medications, including OTC drugs, unless approved by doctor who originally started treatment.
- **HIV-1 Prep:** Despite preventative treatment, safer sex practices with condoms and risk reduction must be used.
- A negative HIV test result must be obtained before initiation.
- HIV status tests will be performed q3mos (or more frequently) after starting treatment.
- If possible transmission or symptoms of HIV infection occur, therapy must be interrupted, and a complete HIV treatment regimen may be started until a negative HIV status test is confirmed.
- Report symptoms of HIV infection such as diarrhea, fatigue, fever,

myalgia, night sweats, rash, swelling of lymph nodes. • Immediately report breakage of condom, sexual activity with partner suspected of HIV infection, diagnosis of STD, sexual practices that increase risk for infection (inconsistent

condom usage, multiple partners, alcohol/drug dependence; sex in exchange for money, shelter, food, drugs). • Stay compliant with preventative treatment regimen. Missing doses may increase risk of HIV transmission/infection.

## entecavir

en-tek-a-veer

(Baraclude, Apo-Entecavir )

**■ BLACK BOX ALERT ■** Serious, sometimes fatal hypersensitivity reaction, lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred. May cause HIV resistance in chronic hepatitis B pts. Severe acute exacerbations of hepatitis B virus infection may occur upon discontinuation of entecavir.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Reverse transcriptase inhibitor, nucleoside.

**CLINICAL:** Antihepadnaviral agent.

### USES

Treatment of chronic hepatitis B virus (HBV) infection in adults and children 2 yrs and older with evidence of active viral replication and evidence of either persistent transaminase elevations or histologically active disease or evidence of decompensated hepatic disease. **OFF-LABEL:** HBV reinfection prophylaxis, post-liver transplant, HIV/HBV coinfection.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to entecavir. **Cautions:** Renal impairment, pts receiving concurrent therapy that may reduce renal function. Pts at risk for hepatic disease. Cross resistance may develop with lamivudine.

### ACTION

Inhibits hepatitis B viral polymerase, an enzyme blocking reverse transcriptase activity. **Therapeutic Effect:** Interferes with viral DNA synthesis.

### PHARMACOKINETICS

Poorly absorbed from GI tract. Protein binding: 13%. Extensively distributed into tissues. Partially metabolized in liver. Excreted primarily in urine. **Half-life:** 5–6 days (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs.

**Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Cladribine may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** Food delays absorption, decreases concentration. **LAB VALUES:** May increase serum amylase, lipase, bilirubin, ALT, AST, creatinine, glucose. May decrease serum albumin; platelets.

### AVAILABILITY (RX)

**Oral Solution:** 0.05 mg/mL. **Tablets:** 0.5 mg, 1 mg.

### ADMINISTRATION/HANDLING

#### PO

- Administer tablets on an empty stomach (at least 2 hrs after a meal and 2 hrs before the next meal).
- Do not dilute, mix oral solution with water or any other liquid.
- Each bottle of oral solution is accompanied by a dosing spoon. Before administering, hold spoon in vertical position, fill it gradually to mark corresponding to prescribed dose.

**Storage** • Store tablets, oral solution at room temperature.

### INDICATIONS/ROUTES/DOSAGE

**Chronic Hepatitis B Virus Infection (No previous nucleoside treatment)**

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** 0.5 mg once daily. **CHILDREN 2 YRS AND OLDER, WEIGHING MORE THAN 30 KG:** 0.5 mg once daily (tablet or solution). **27–30 KG:** 0.45 mg once daily (solution). **24–26 KG:** 0.4 mg once daily (solution). **21–23 KG:** 0.35 mg once daily (solution). **18–20 KG:** 0.3 mg once daily (solution). **15–17 KG:** 0.25 mg once daily (solution). **12–14 KG:** 0.2 mg once daily (solution). **10–11 KG:** 0.15 mg once daily (solution).

**Chronic Hepatitis B Virus Infection**  
(Receiving lamivudine, known lamivudine resistance, decompensated liver disease)

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** 1 mg once daily. **CHILDREN 2 YRS AND OLDER, WEIGHING MORE THAN 30 KG:** 1 mg once daily (tablet or solution).  
**27–30 KG:** 0.9 mg once daily (solution).  
**24–26 KG:** 0.8 mg once daily (solution).  
**21–23 KG:** 0.7 mg once daily (solution).  
**18–20 KG:** 0.6 mg once daily (solution).  
**15–17 KG:** 0.5 mg once daily (solution).  
**12–14 KG:** 0.4 mg once daily (solution).  
**10–11 KG:** 0.3 mg once daily (solution).

**Dosage in Renal Impairment**

**Creatinine**

Clearance	Dosage
50 mL/min and greater	0.5 mg once daily
30–49 mL/min	0.25 mg once daily
10–29 mL/min	0.15 mg once daily
9 mL/min and less	0.05 mg once daily

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (4%–3%):** Headache, fatigue.

**Rare (less than 1%):** Diarrhea, dyspepsia, nausea, vomiting, dizziness, insomnia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Lactic acidosis, severe hepatomegaly with steatosis have been reported. Severe,

acute exacerbations of hepatitis B virus infection have been reported in pts who have discontinued therapy; reinitiation of antihepatitis B therapy may be required. Hematuria occurs occasionally. May cause development of HIV resistance if HIV untreated.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain HIV status. Obtain LFT before beginning therapy and at periodic intervals during therapy. Offer emotional support. Obtain full medication history.

**INTERVENTION/EVALUATION**

should be monitored closely with both clinical and laboratory follow-up for at least several mos in pts who discontinue antihepatitis B therapy. For pts on therapy, closely monitor serum amylase, lipase, bilirubin, ALT, AST, creatinine, glucose, albumin; platelet count. Assess for evidence of GI discomfort.

**PATIENT/FAMILY TEACHING**

- Take medication at least 2 hrs after a meal and 2 hrs before the next meal.
- Avoid transmission of hepatitis B infection to others through sexual contact, blood contamination.
- Immediately report unusual muscle pain, abdominal pain with nausea/vomiting, cold feeling in extremities, dizziness (signs and symptoms signaling onset of lactic acidosis).

## eprosartan

ep-roe-sar-tan  
(Teveten )

**BLACK BOX ALERT**  May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

### FIXED-COMBINATION(S)

**Teveten HCT:** eprosartan/hydro-CHLORothiazide (a diuretic): 400 mg/12.5 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension (alone or in combination with other medications).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to eprosartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Unstented unilateral/bilateral renal artery stenosis, preexisting renal insufficiency. Concomitant use of potassium-sparing medications (e.g., spironolactone), potassium supplements, pts who are volume depleted.

### ACTION

Potent vasodilator. Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT<sub>1</sub> receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

### PHARMACOKINETICS

Widely distributed. Protein binding: 98%. Minimally metabolized in liver. Primarily excreted via urine, biliary system. Minimally removed by hemodialysis. **Half-life:** 5–9 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has caused fetal and neonatal morbidity and mortality. Potential for adverse effects on breastfeeding infant. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase adverse/toxicity of ACE inhibitors (e.g., benazepril, lisinopril). **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct.

### AVAILABILITY (RX)

 **Tablets:** 400 mg, 600 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide tablets.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 600 mg once daily. Titrate up to 800 mg/day in 1-2 divided doses.

#### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment: Maximum:** 600 mg/day.

#### Dosage in Hepatic Impairment

No dose adjustment. **Severe impairment: Maximum:** 600 mg/day.

### SIDE EFFECTS

**Occasional (5%–2%):** Headache, cough, dizziness. **Rare (less than 2%):** Muscle pain, fatigue, diarrhea, upper respiratory tract infection, dyspepsia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for history of hepatic/renal impairment, renal artery stenosis. Obtain urine pregnancy test. Assess medication history (esp. diuretics).

**INTERVENTION/EVALUATION**

Monitor B/P, pulse, serum BUN, creatinine, electrolytes, urinalysis.

**PATIENT/FAMILY TEACHING**

- Avoid pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Restrict sodium, alcohol intake.
- Follow diet, control weight.
- Do not stop taking medication; hypertension requires lifelong control.
- Check B/P regularly.
- Do not chew, crush, dissolve, or divide tablets; take whole.

## fluvoxamine

flu-vox-a-meen  
(Luvox )

**BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. **Do not confuse fluvoxamine with flavoxate or fluoxetine, or Luvox with Lasix, Levoxyl, or Lovonex.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor. **CLINICAL:** Antidepressant.

### USES

**Immediate-Release:** Treatment of obsessive-compulsive disorder (OCD) in adults and children 8–17 yrs of age. **Extended-Release:** Treatment of OCD in adults. **OFF-LABEL:** Treatment of social anxiety disorder (SAD), posttraumatic stress disorder (PTSD).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fluvoxamine. Use of MAOIs concurrently or within 14 days of discontinuing MAOIs or fluvoxamine. Concomitant use with alsetron, pimozide, ramelteon, thioridazine, or tizanidine. Initiation of fluvoxamine in pts receiving linezolid or methylene blue. **Cautions:** Renal/hepatic impairment, elderly, impaired platelet aggregation; concurrent use of NSAIDs, aspirin; seizure disorder; pts that are volume depleted; third trimester of pregnancy; pts with high suicide risk; risk of bleeding or receiving concurrent anticoagulant therapy. May precipitate a shift to mania or hypomania in pts with bipolar disorder.

### ACTION

Selectively inhibits neuronal reuptake of serotonin. **Therapeutic Effect:** Relieves depression, symptoms of obsessive-compulsive disorder (OCD).

### PHARMACOKINETICS

Widely distributed. Protein binding: 77%. Metabolized in liver. Excreted in urine. **Half-life:** 15–20 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses the placenta; distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 8 yrs. **Elderly:** Potential for reduced serum clearance; maintain caution.

### INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may increase risk of serotonin syndrome (hyperthermia, rigidity, myoclonus). **Tricyclic antidepressants** (e.g., amitriptyline) may increase concentration/effect. **Alcohol** may increase adverse effects. May increase concentration/effects of ramelteon, thioridazine, tizanidine. **HERBAL:** Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), glucosamine may increase effect. **St. John's wort** may enhance the serotonergic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease serum sodium.

### AVAILABILITY (Rx)

**Tablets:** 25 mg, 50 mg, 100 mg.

 **Capsules (Extended-Release):** 100 mg, 150 mg.

### ADMINISTRATION/HANDLING

- Do not break, crush, dissolve, or divide extended-release capsules.
- May give with or without food.

### INDICATIONS/ROUTES/DOSAGE

#### Obsessive-Compulsive Disorder (OCD)

**PO: (Immediate-Release): ADULTS:** Initially, 50 mg at bedtime; may increase by 50 mg every 4–7 days. Dosages greater than 100 mg/day should be given in 2 divided doses with larger dose given at bedtime. Usual dose: 100–300 mg/day. **Maximum:** 300 mg/day. **(Extended-Release):** Initially, 100 mg once daily at

bedtime. May increase by 50 mg at no less than 1-wk intervals. Range: 100–300 mg/day. **Maximum:** 300 mg/day. **CHILDREN 8–17 YRS: (*Immediate-Release*):** Initially, 25 mg at bedtime; may increase by 25 mg every 4–7 days. Dosages greater than 50 mg/day should be given in 2 divided doses with larger dose given at bedtime. **Maximum: (CHILDREN 8–11 YRS):** 200 mg/day. **(CHILDREN 12–17 YRS):** 300 mg/day.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (40%–21%):** Nausea, headache, drowsiness, insomnia. **Occasional (14%–8%):** Dizziness, diarrhea, dry mouth, asthenia, dyspepsia, constipation, abnormal ejaculation. **Rare (6%–3%):** Anorexia, anxiety, tremor, vomiting, flatulence, urinary frequency, sexual dysfunction, altered taste.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Agitation, coma, diarrhea, delirium, hallucinations, hyperreflexia, hyperthermia, tachycardia, seizures may indicate life-threatening serotonin syndrome.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT. Receive full medication history in screen for interactions, esp. contraindicated use of concomitant medications. Question history of seizure disorder. Assess hydration status.

### INTERVENTION/EVALUATION

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. Assist with ambulation if dizziness, drowsiness occurs. Monitor daily pattern of bowel activity, stool consistency.

### PATIENT/FAMILY TEACHING

- Maximum therapeutic response may require 4 wks or more of therapy.
- Dry mouth may be relieved by sugarless gum, sips of water.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occur.

## fosinopril

foe-sin-oh-pril

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse fosinopril with Fosamax or lisinopril, or Monopril with Accupril, minoxidil, moexipril, or ramipril.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** ACE inhibitor. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension in adults and children 6 yrs of age and older. Adjunctive treatment of HF.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to fosinopril. History of angioedema from previous treatment with ACE inhibitors. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, pts with sodium depletion or on diuretic therapy, dialysis, hypovolemia, hypertrophic cardiomyopathy with outflow tract obstruction, hyperkalemia, concomitant use of potassium supplements, unstenosed unilateral/bilateral renal stenosis, diabetes, severe aortic stenosis. Before, during, or immediately after major surgery.

### ACTION

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion.

**Therapeutic Effect:** Reduces B/P.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	2–6 hrs	24 hrs

Slowly absorbed from GI tract. Protein binding: 97%–98%. Metabolized in liver and GI mucosa. Primarily excreted in urine. Minimal removal by hemodialysis.

**Half-life:** 11.5 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause fetal or neonatal mortality or morbidity. **Children:** Safety and efficacy not established. Neonates, infants may be at increased risk for oliguria, neurologic abnormalities. **Elderly:** May be more sensitive to hypotensive effects.

### INTERACTIONS

**DRUG:** Potassium-sparing diuretics (e.g., spironolactone), potassium supplements may cause hyperkalemia. May increase lithium concentration/toxicity. **Antacids** may decrease absorption. **Aliskiren** may increase hyperkalemic effect. May increase potential for allergic reactions to **allopurinol**. **Angiotensin receptor blockers (ARBs)** (e.g., losartan, valsartan) may increase adverse effects. May increase adverse effects of **lithium, sacubitril**. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody titer (ANA).

### AVAILABILITY (RX)

**Tablets:** 10 mg, 20 mg, 40 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 10 mg once daily. **Maintenance:** 10–40 mg

once daily. **Maximum:** 80 mg once daily. **CHILDREN 6–16 YRS WEIGHING MORE THAN 50 KG:** Initially, 5 mg once daily. **Maximum:** 40 mg once daily. **WEIGHING 50 KG OR LESS:** Initially, 0.1 mg/kg once daily. May increase up to a maximum of 0.6 mg/kg not to exceed 40 mg/day.

#### HF

**PO: ADULTS, ELDERLY:** Initially, 10 mg once daily. May increase dose over several wks. **Maintenance:** 20–40 mg once daily. **Maximum:** 40 mg once daily.

#### Dosage in Renal Impairment

Reduce initial dose to 5 mg in pts with HF.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (12%–9%):** Dizziness, cough.

**Occasional (4%–2%):** Hypotension, nausea, vomiting, upper respiratory tract infection.

### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (“first-dose syncope”) may occur in pts with HF, severely salt/volume depleted. Angioedema (swelling of face/lips), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment, collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in those with history of renal disease.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P immediately before each dose. Renal function tests should be performed before beginning therapy. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before therapy begins and q2wks for 3 mos, then periodically thereafter. Question medical history as listed in Precautions. Question history of hypersensitivity reaction, angioedema.

### INTERVENTION/EVALUATION

Monitor B/P. Assess for urinary frequency. Auscultate lung sounds for rales, wheezing in pts with HF. Monitor renal function tests, CBC, urinalysis for proteinuria. Observe for angioedema (swelling of face, lips, tongue). Monitor serum potassium in those on concurrent diuretic therapy.

### PATIENT/FAMILY TEACHING

- Report any sign of infection (sore throat, fever).
- Several wks may be needed for full therapeutic effect of B/P reduction.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- To reduce hypotensive effect, go from lying to standing slowly.
- Immediately report swelling of face, lips, tongue, difficulty breathing, vomiting, excessive perspiration, persistent cough.
- Avoid potassium salt substitutes.

## interferon alfa-2b HIGH ALERT

in-ter-feer-on  
(Intron-A)

**BLACK BOX ALERT** May cause or aggravate fatal or life-threatening autoimmune disorders, ischemia, neuropsychiatric symptoms (profound depression, suicidal thoughts/behaviors), infectious disorders.

**Do not confuse interferon alfa-2b with interferon alfa-2a, interferon alfa-n3, or peginterferon alfa-2b, or Intron with Peg-Intron.**

### FIXED-COMBINATION(S)

**Rebetrone:** interferon alfa-2b/ribavirin (an antiviral): 3 million units/200 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Biologic response modifier, immunomodulator. **CLINICAL:** Antineoplastic.

### USES

Treatment of hairy cell leukemia, condylomata acuminata (genital, venereal warts), malignant melanoma, AIDS-related Kaposi's sarcoma, chronic hepatitis C virus infection (including children 3 yrs of age and older), chronic hepatitis B virus infection (including children 1 yr and older), follicular non-Hodgkin's lymphoma. **OFF-LABEL:** Treatment of bladder, cervical, renal carcinoma; chronic myelocytic leukemia; laryngeal papillomatosis; multiple myeloma; cutaneous T-cell lymphoma; mycosis fungoides; West Nile virus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to interferon alfa-2b. Decompensated hepatic disease, autoimmune hepatitis. **In combination with ribavirin:** Women who are pregnant, men with pregnant partners, pts with hemoglobinemias (e.g., sickle cell anemia), CrCl less than 50 mL/min).

**Cautions:** Renal/hepatic impairment, seizure disorder, compromised CNS function, cardiac diseases, myelosuppression, concurrent use of medications causing myelosuppression, pulmonary impairment, multiple sclerosis, diabetes, thyroid disease, coagulopathy, hypertension, preexisting eye disorders, history of psychiatric disorders. History of autoimmune disorders, MI, arrhythmias, cardiac abnormalities.

### ACTION

Binds to a specific receptor on cell membrane to initiate intracellular activity, including suppression of cell proliferation, augmenting specific cytotoxicity of lymphocytes and increasing phagocyte activity. **Therapeutic Effect:** Prevents rapid growth of malignant cells; inhibits hepatitis virus.

### PHARMACOKINETICS

Well absorbed after IM, SQ administration. Undergoes proteolytic degradation during reabsorption in kidneys. **Half-life:** 2–3 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Neurotoxicity, cardiotoxicity may occur more frequently. Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression. May increase concentration/effect of tiZANidine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase PT, aPTT, LDH, serum alkaline phosphatase, ALT, AST. May decrease Hgb, Hct, leukocyte, platelet counts.

### AVAILABILITY (RX)

**Injection, Powder for Reconstitution:** 10 million units, 18 million units, 50 million units.

**Injection, Solution:** 6 million units/mL, 10 million units/mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Prepare immediately before use. • Reconstitute with diluent provided by manufacturer. • Withdraw desired dose and further dilute with 100 mL 0.9% NaCl to provide final concentration of at least 10 million international units/100 mL.

**Rate of administration** • Administer over 20 min.

**Storage** • Refrigerate unopened vials. • Following reconstitution, stable for 24 hrs if refrigerated.

### IM, SQ

**IM** • Rotate sites. Preferred sites are anterior thigh, deltoid, and superolateral buttock. Administer in evening (if possible).

**SQ** • Reconstitute with recommended amount of Sterile Water for Injection. Agitate gently; do not shake. Rotate sites. Preferred sites are anterior thigh, abdomen (except around navel), outer upper arm.

### IV INCOMPATIBILITIES

D<sub>5</sub>W. Do not mix with other medications via Y-site administration.

### IV COMPATIBILITIES

0.9% NaCl, lactated Ringer's.

## INDICATIONS/ROUTES/DOSAGE

### Hairy Cell Leukemia

**IM, SQ: ADULTS:** 2 million units/m<sup>2</sup> 3 times/wk on alternating days for up to 6 mos. May continue treatment for sustained response. If severe adverse reactions occur, modify dose or temporarily discontinue drug. Discontinue for disease progression or failure to respond after 6 months.

### Condylomata Acuminata

**Intralesional: ADULTS:** 1 million units/lesion 3 times/wk on alternating days for

3 wks. May administer a second course at 12–16 wks. Use only 10 million-unit vial, and reconstitute with no more than 1 mL diluent. **Maximum:** 5 lesions per treatment.

### AIDS-Related Kaposi's Sarcoma

**IM, SQ: ADULTS:** 30 million units/m<sup>2</sup> 3 times/wk on alternating days. Use only 50 million-unit vials. Continue until disease progression or maximal response achieved after 16 wks. If severe adverse reactions occur, modify dose or temporarily discontinue drug.

### Chronic Hepatitis B Virus Infection

**IM, SQ: ADULTS:** 30–35 million units/wkly, either as 5 million units/day or 10 million units 3 times/wk for 16 wks.

**SQ: CHILDREN 1–17 YRS:** 3 million units/m<sup>2</sup> 3 times/wk for 1 wk, then 6 million units/m<sup>2</sup> 3 times/wk for 16–24 wks.

**Maximum:** 10 million units 3 times/wk.

### Malignant Melanoma

**IV: ADULTS: Induction:** Initially, 20 million units/m<sup>2</sup> 5 times/wk for 4 wks.

**Maintenance:** 10 million units subcutaneously 3 times/wk for 48 wks.

### Follicular Non-Hodgkin's Lymphoma

**SQ: ADULTS:** 5 million units 3 times/wk for up to 18 mos.

### Dosage in Renal Impairment

Do not use when combined with ribavirin.

### Dosage in Hepatic Impairment

No dose adjustment (see Contraindications).

## SIDE EFFECTS

**Frequent:** Flu-like symptoms (fever, fatigue, headache, myalgia, anorexia, chills), rash (hairy cell leukemia, Kaposi's sarcoma only). **Pts with Kaposi's sarcoma:** All previously mentioned side effects plus depression, dyspepsia, dry mouth or thirst, alopecia, rigors. **Occasional:** Dizziness, pruritus, dry skin, dermatitis, altered taste. **Rare:** Confusion, leg cramps, back pain, gingivitis, flushing, tremor, anxiety, eye pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reactions occur rarely. Severe flu-like symptoms appear dose-related.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

CBC, blood chemistries, urinalysis, renal function, LFT should be performed before initial therapy and routinely thereafter.

**INTERVENTION/EVALUATION**

Offer emotional support. Monitor all levels of clinical function (numerous side effects). Encourage PO intake, particularly during early therapy. Monitor for

worsening depression, suicidal ideation, associated behaviors.

**PATIENT/FAMILY TEACHING**

- Clinical response occurs in 1–3 mos.
- Flu-like symptoms tend to diminish with continued therapy.
- Some symptoms may be alleviated or minimized by bedtime doses.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Sips of tepid water may relieve dry mouth.
- Report depression, thoughts of suicide, unusual behavior.

## ***lidocaine***

TOP  
100

**lye-doe-kane**  
(Lidoderm, Xylocaine)

### **FIXED-COMBINATION(S)**

**EMLA:** lidocaine/prilocaine (an anesthetic): 2.5%/2.5%. **LidoSite:** lidocaine/EPINEPHrine (a sympathomimetic): 10%/0.1%. **Lidocaine with EPINEPHrine:** lidocaine/EPINEPHrine (a sympathomimetic): 2%/1:50,000, 1%/1:100,000, 1%/1:200,000, 0.5%/1:200,000. **Syn-éra:** lidocaine/tetracaine (an anesthetic): 70 mg/70 mg.

### ◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Amide anesthetic. **CLINICAL:** Class 1B antiarrhythmic, anesthetic.

### **USES**

**Antiarrhythmic:** Rapid control of acute ventricular arrhythmias following MI, cardiac catheterization, cardiac surgery. **Local anesthetic:** Infiltration/nerve block for dental/surgical procedures, childbirth. **Topical anesthetic:** Local skin disorders (minor burns, insect bites, prickly heat, skin manifestations of chickenpox, abrasions). Mucous membranes (local anesthesia of oral, nasal, laryngeal mucous membranes; local anesthesia of respiratory, urinary tracts; relief of discomfort of pruritus ani, hemorrhoids, pruritus vulvae). **Dermal patch:** Relief of chronic pain in postherpetic neuralgia, allodynia (painful hypersensitivity).

### **PRECAUTIONS**

**Contraindications:** Hypersensitivity to lidocaine. Adams-Stokes syndrome, hypersensitivity to amide-type local anesthetics, supraventricular arrhythmias, Wolff-Parkinson-White syndrome. Severe degree of SA, AV, or intraventricular heart block (except in pts with functioning

pacemaker). **Cautions:** Hepatic disease, marked hypoxia, severe respiratory depression, hypovolemia, incomplete heart. History of malignant hyperthermia, shock, elderly pts, HF.

### **ACTION**

**Anesthetic:** Inhibits conduction of nerve impulses. **Therapeutic Effect:** Causes temporary loss of feeling/sensation. **Antiarrhythmic:** Suppresses automaticity of conduction tissue; increases electrical stimulation threshold of ventricle, His-Purkinje system; and spontaneous depolarization of ventricle during diastole. Blocks initiation/conduction of nerve impulses by decreasing neuronal membrane's permeability to sodium ions. **Therapeutic Effect:** Inhibits ventricular arrhythmias.

### **PHARMACOKINETICS**

Route	Onset	Peak	Duration
IV	30–90 sec	N/A	10–20 min
Local anesthetic	2.5 min	N/A	30–60 min

Completely absorbed after IV administration. Protein binding: 60%–80%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 1–2 hrs.

### **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** More sensitive to adverse effects. Dose, rate of infusion should be reduced. Age-related renal impairment may require dosage adjustment.

### **INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), CYP1A2 inhibitors (e.g., ciprofloxacin) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort may

decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** IM lidocaine may increase creatine kinase (CK) level. **Therapeutic serum level:** 1.5–6 mcg/mL; **toxic serum level:** greater than 6 mcg/mL.

### AVAILABILITY (RX)

**Cream, Topical:** 4%. **Infusion Premix:** 0.4% (4 mg/mL in 250 mL, 500 mL); 0.8% (8 mg/mL in 250 mL, 500 mL). **Injection, Solution:** 0.5% (5 mg/mL), 1% (10 mg/mL), 2% (20 mg/mL). **Jelly, Topical:** 2%. **Solution, Topical:** 4%. **Solution, Viscous:** 2%. **Transdermal, Topical:** (*Lidoderm*): 4%, 5%.

### ADMINISTRATION/HANDLING

**◀ALERT▶** Resuscitative equipment, drugs (including O<sub>2</sub>) must always be readily available when administering lidocaine by any route.

**◀ALERT▶** Use only lidocaine without preservative, clearly marked **for IV use**. **Reconstitution** • For IV infusion, prepare solution by adding 2 g to 250–500 mL D<sub>5</sub>W or 0.9% NaCl to provide concentration of 8 mg/mL or 4 mg/mL, respectively. • Commercially available preparations of 0.4% and 0.8% may be used for IV infusion. **Maximum concentration:** 4 g/250 mL (16 mg/mL).

**Rate of administration** • For IV push, use 1% (10 mg/mL) or 2% (20 mg/mL). • Administer IV push at rate of 25–50 mg/min. • Administer for IV infusion at rate of 1–4 mg/min (1–4 mL); use volume control IV set.

**Storage** • Store premix solutions at room temperature.

#### Topical

• Not for ophthalmic use. • For skin disorders, apply directly to affected area or put on gauze or bandage, which is then applied to the skin. • For mucous membrane use, apply to desired area per manufacturer's insert. • Administer lowest dosage possible that still provides anesthesia.

#### Dermal Patch

Avoid exposing to external heat source. Patch should not get wet (do not wear while bathing/swimming). Patch may be cut to appropriate size.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

### IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), enalapril (Vasotec), furosemide (Lasix), heparin, insulin, nitroglycerin, potassium chloride.

### INDICATIONS/ROUTES/DOSAGE

#### Ventricular Arrhythmias

**IV: ADULTS, ELDERLY:** Initially, 1–1.5 mg/kg. Refractory ventricular tachycardia, fibrillation: Repeat dose at 0.5–0.75 mg/kg q10–15min after initial dose for a maximum of 3 doses. Total dose not to exceed 3 mg/kg. Follow with continuous infusion (1–4 mg/min) after return of circulation. Reappearance of arrhythmia during infusion: 0.5 mg/kg, reassess infusion. **CHILDREN, INFANTS:** Initially, 1 mg/kg (**Maximum:** 100 mg). May repeat second dose of 0.5–1 mg/kg if start of infusion longer than 15 min. **Maintenance:** 20–50 mcg/kg/min as IV infusion.

#### Local Anesthesia

**Infiltration, nerve block: ADULTS:** Local anesthetic dosage varies with procedure, degree of anesthesia, vascularity, duration. **Maximum:** 4.5 mg/kg or 300 mg. Do not repeat within 2 hrs.

#### Topical Local Anesthesia

**Topical: ADULTS, ELDERLY:** Apply to affected areas as needed.

#### Treatment of Localized Pain

**◀ALERT▶** Transdermal patch may contain conducting metal (e.g., aluminum). Remove patch prior to MRI.

**Topical: (Dermal Patch): ADULTS, ELDERLY:** Apply to intact skin over most painful area. **Maximum:** Up to 3 patches at a time for up to 12 hrs in a 24-hr period.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

Use caution.

### SIDE EFFECTS

CNS effects generally dose-related and of short duration. **Occasional: Infiltration/nerve block:** Pain at injection site.

**Topical:** Burning, stinging, tenderness at application site. **Rare:** Generally associated with high dose: Drowsiness, dizziness, disorientation, light-headedness, tremors, apprehension, euphoria, sensation of heat, cold, numbness; blurred or double vision, tinnitus, nausea.

### ADVERSE EFFECTS/TOXIC REACTIONS

Serious adverse reactions to lidocaine are uncommon, but high dosage by any route may produce cardiovascular depression, bradycardia, hypotension, arrhythmias, heart block, cardiovascular collapse, cardiac arrest. Potential for malignant hyperthermia, CNS toxicity may occur, esp. with regional anesthesia use, progressing rapidly from mild side effects to tremors, drowsiness, seizures, vomiting, respiratory depression. Methemoglobinemia (evidenced by cyanosis) has occurred following topical application of lidocaine for teething discomfort and laryngeal anesthetic spray.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for hypersensitivity to lidocaine, amide anesthetics. Obtain baseline B/P, pulse, respiratory rate, ECG, serum electrolytes.

### INTERVENTION/EVALUATION

Monitor ECG, vital signs during and following drug administration for cardiac performance. If ECG shows arrhythmias, prolongation of PR interval or QRS complex, inform physician immediately. Assess pulse for rhythm, rate, quality. Assess B/P for evidence of hypotension. Monitor for therapeutic serum level (1.5–6 mcg/mL). For lidocaine given by all routes, monitor vital signs, LOC. Drowsiness should be considered a warning sign of high serum levels of lidocaine. **Therapeutic serum level:** 1.5–6 mcg/mL; **toxic serum level:** greater than 6 mcg/mL.

### PATIENT/ FAMILY TEACHING

- **Local anesthesia:** Due to loss of feeling/sensation, protective measures may be needed until anesthetic wears off (no ambulation, including special positions for some regional anesthesia).
- **Oral mucous membrane anesthesia:** Do not eat, drink, chew gum for 1 hr after application (swallowing reflex may be impaired, increasing risk of aspiration; numbness of tongue, buccal mucosa may lead to bite trauma).
- **IV infusions:** Report dizziness, numbness, double vision, nausea, pain/burning, respiratory difficulty.
- **Topical:** Report irritation, pain, numbness, swelling, blurred vision, tinnitus, respiratory difficulty.

## meropenem/ vaborbactam

mer-oh-pen-em/va-bor-bak-tam  
(Vabomere)

**Do not confuse meropenem/vaborbactam with ampicillin/sulbactam, ceftolozane/tazobactam, ceftazidime/avibactam, or piperacillin/tazobactam.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Carbapenem/beta-lactamase inhibitor. **CLINICAL:** Antibacterial.

### USES

Treatment of pts 18 yrs and older with complicated urinary tract infections (UTIs), including pyelonephritis, caused by the following susceptible microorganisms: *E. coli*, *K. pneumoniae*, *Enterobacter cloacae* species.

### PRECAUTIONS

**Contraindications:** Known hypersensitivity to meropenem, cephalosporins, penicillin; anaphylaxis to beta-lactams.

**Cautions:** History of renal impairment, seizure disorder, recent *Clostridioides difficile* infection or antibiotic-associated colitis; prior hypersensitivity to carbapenem, PCN.

### ACTION

Meropenem binds to penicillin-binding proteins, inhibiting cell wall synthesis. Vaborbactam protects meropenem from serine beta-lactamase degradation (vaborbactam has no antibacterial activity). **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Widely distributed into tissues and body fluids. Meropenem metabolized by hydrolysis. Vaborbactam does not undergo metabolism. Protein binding:

(meropenem): less than 2%; (vaborbactam): 33%. Excreted unchanged in urine. **Half-life:** 1–2 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Meropenem is secreted in breast milk. Unknown if vaborbactam is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects in pts with renal impairment.

### INTERACTIONS

**DRUG:** **Probenecid** may increase concentration/effect of meropenem. May decrease concentration/effect of **valproic acid**, **divalproex**. May decrease effect of **BCG (intravesical)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May decrease eosinophils, leukocytes, lymphocytes; serum potassium. May result in positive Coombs' test. May decrease platelets in pts with renal impairment.

### AVAILABILITY (RX)

**◀ ALERT ▶** Meropenem/vaborbactam is a combination product.

**Injection, Powder for Reconstitution:** meropenem/vaborbactam: 1 g/1 g.

### ADMINISTRATION/HANDLING

**Reconstitution** • Calculate the number of vials needed for dose. • Reconstitute each vial with 20 mL 0.9% NaCl (withdrawn from infusion bag) to a final concentration of 0.05 g/mL of meropenem and 0.05 g/mL of vaborbactam. • Final volume of vial equals 21.3 mL. • Gently mix until powder is fully dissolved. • Visually inspect for particulate matter or discoloration. Solution should appear colorless to slightly yellow in color.

**Dilution** • **4-g dose (2 vials):** Dilute volume of each vial (21 mL/vial) in 0.9% NaCl bag with a volume of 250 mL (16 mg/

mL), or 500 mL (8 mg/mL), or 1,000 mL (4 mg/mL). • **2-g dose (1 vial):** Dilute the volume of vial (21 mL) in 0.9% NaCl bag with a volume of 125 mL (16 mg/mL), or 250 mL (8 mg/mL), or 500 mL (4 mg/mL). • **1-g dose (1 vial):** Dilute half of the volume of vial (10.5 mL) in 0.9% NaCl bag with volume of 70 mL (14.3 mg/mL), or 125 mL (8 mg/mL), or 250 mL (4 mg/mL).

**Rate of administration** • Infuse over 3 hrs.

**Storage** • Refrigerate diluted solution for up to 22 hrs or store at room temperature for up to 4 hrs. • Diluted solution must be completely infused within 4 hrs.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B (Fungizone), diazepam (Valium), doxycycline (Vibramycin), metronidazole (Flagyl), ondansetron (Zofran).

## INDICATIONS/ROUTES/DOSAGE

### Complicated Urinary Tract Infections Including Pyelonephritis

**IV: ADULTS, ELDERLY:** 4 g (meropenem 2 g/vaborbactam 2 g) q8h for up to 14 days.

### Dosage in Renal Impairment

**Note:** Infuse after hemodialysis on hemodialysis days. Dosage is modified based on eGFR.

### Estimated Glomerular

Filtration Rate	Dosage
eGFR 30–49 mL/min	2 g q8h
eGFR 15–29 mL/min	2 g q12h
eGFR less than 15 mL/min	1 g q12h

### Dosage in Hepatic Impairment

**Mild to severe impairment:** No dose adjustment.

## SIDE EFFECTS

**Occasional (9%–4%):** Headache, infusion site reactions (phlebitis, erythema, thrombosis). **Rare (3%–2%):** Diarrhea, pyrexia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions, including anaphylaxis, have been reported in pts treated with beta-lactam antibacterial drugs. Blood and lymphatic disorders such as agranulocytosis, hemolytic anemia, leukopenia, lymphocytosis, neutropenia, thrombocytopenia were reported. Seizures may occur in pts with CNS disorders (e.g., brain lesion, history of seizures, bacterial meningitis), renal impairment. Other CNS reactions may include tremor, paresthesia, lethargy. *Clostridioides difficile*-associated diarrhea, with severity ranging from mild diarrhea to fatal colitis, was reported. *C. difficile* infection may occur more than 2 mos after completion of treatment. May increase risk of development of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Skin and SQ reactions including angioedema, erythema multiforme, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis occur rarely. Secondary infections including pharyngitis, oral or vulvovaginal candidiasis may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, CrCl, GFR in pts with renal impairment. Obtain urine culture and sensitivity. Question history of renal impairment, seizure disorder, recent *C. diff* infection; hypersensitivity reaction to beta-lactams, cephalosporins, PCN. Question pt's usual stool characteristics (color, frequency, consistency).

### INTERVENTION/EVALUATION

Monitor BUN, serum creatinine, CrCl, GFR, platelet count in pts with renal impairment. Observe daily pattern of bowel activity, stool consistency (increased

severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed; manage proper fluid levels/PO intake, electrolyte levels, protein intake. Antibacterial drugs that are not directed against *C. difficile* infection may need to be discontinued. Report any signs of hypersensitivity reaction. Assess skin for toxic skin reactions. Monitor for seizure activity, CNS reactions, IV site reactions.

#### PATIENT/FAMILY TEACHING

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacte-

rial resistance or may increase risk of recurrent infection.

- Report any episodes of diarrhea, esp. the following months after last dose. Frequent loose stool, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output; skin problems such as development of sores, rash, skin bubbling/necrosis.
- Report any nervous system changes such as anxiety, confusion, hallucinations, muscle jerking, or seizure-like activity.
- Severe allergic reactions such as hives, palpitations, shortness of breath, rash, tongue swelling may occur.

## milnacipran

mil-nay-sip-ran  
(Savella)

**■ BLACK BOX ALERT ■** Increased risk of suicidal ideation and behavior in children, adolescents, and young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Not approved for use in children.

**Do not confuse Savella with cevimeline or sevelamer.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin, norepinephrine reuptake inhibitor. **CLINICAL:** Fibromyalgia agent.

### USES

Management of fibromyalgia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to milnacipran. Concomitant use of MAOIs to treat psychiatric disorders (concurrently or within 5 days of discontinuing milnacipran or within 2 wks of discontinuing MAOI), initiation of milnacipran in pts receiving linezolid or IV methylene blue.

**Cautions:** Depression, pts at increased risk of suicide, other psychiatric disorders; elevated B/P or heart rate, seizure disorder, pts with substantial alcohol use or chronic hepatic disease, pts with history of dysuria (e.g., prostatic hypertrophy, prostatitis), controlled narrow-angle glaucoma, renal impairment, cardiovascular disease, elderly.

### ACTION

Inhibits serotonin and norepinephrine reuptake at CNS neuronal presynaptic membranes. **Therapeutic Effect:** Reduces chronic pain, fatigue, depression, sleep disorders associated with fibromyalgia syndrome; improves physical function.

### PHARMACOKINETICS

Widely distributed. Protein binding: 13%. Excreted unchanged in urine. Steady

state reached in 36–48 hrs. **Half-life:** 6–8 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Increased risk of fetal complications, including need for respiratory support, if given during third trimester. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Severe renal impairment requires dosage adjustment.

### INTERACTIONS

**DRUG:** Alcohol, clomipramine, metoclopramide may increase adverse effects. May increase adverse effects of **digoxin**. **Linezolid, MAOIs (e.g. phenelzine, selegiline)** may increase serotonergic effect. **EPINEPHRINE, norepinephrine** may produce paroxysmal hypertension, arrhythmias. May inhibit antihypertensive effect of **clonidine**. **HERBAL: Glucosamine, herbals with anticoagulant/antiplatelet activity (e.g., garlic, ginger, ginkgo biloba)** may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

### AVAILABILITY (RX)

 **Tablets, Film-Coated:** 12.5 mg, 25 mg, 50 mg, 100 mg.

### ADMINISTRATION/HANDLING

- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

### INDICATIONS/ROUTES/DOSAGE

#### Fibromyalgia

**PO: ADULTS, ELDERLY: Day 1:** 12.5 mg once. **Days 2–3:** 25 mg/day (12.5 mg twice daily). **Days 4–7:** 50 mg/day (25 mg twice daily). **After Day 7:** 100 mg/day (50 mg twice daily thereafter). Dose may be increased to 200 mg/day (100 mg twice daily).

#### Dosage in Renal Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** Use caution.

**Severe impairment:** Reduce maintenance dose by 50% to 50 mg/day (25 mg twice daily). Based on pt response, dose may be increased to 100 mg/day (50 mg twice daily). Not recommended in end-stage renal disease.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

### SIDE EFFECTS

**Frequent (37%–18%):** Nausea, headache.

**Occasional (16%–5%):** Constipation, insomnia, hot flashes, dizziness, hyperhidrosis, palpitations, vomiting, URI. **Rare (less than 5%):** Dry mouth, increased B/P, anxiety, skin flushing, rash, blurred vision, abdominal pain, chest pain, chills, pruritus, paresthesia, tachycardia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt discontinuation may present withdrawal symptoms (dysphoria, irritability, agitation, dizziness, paresthesia, anxiety, confusion, headache, lethargy, emotional lability, tinnitus, seizures). Serotonin syndrome symptoms may include mental status changes (agitation, hallucinations),

hyperreflexia, incoordination. May increase risk of bleeding events (e.g., ecchymoses, hematomas, epistaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pain intensity, location(s) of pain, tenderness. Obtain baseline B/P, heart rate. Question for history of changes in day-to-day pain intensity.

### INTERVENTION/EVALUATION

Monitor for increase in B/P, pulse. Question for changes in visual acuity. Assess for clinical improvement and record onset of pain control, decreased fatigue, lessening of depressive symptoms, improvement in sleep pattern. Monitor for suicidal ideation.

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication.
- Increase fluids, bulk to prevent constipation.
- Report unusual changes in behavior, suicidal ideation; hot flushing that becomes intolerant, excessive sweating.
- Caution about risk of bleeding associated with concomitant use of NSAIDs, aspirin.

## naldemedine

nal-dem-e-deen  
(Symproic)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid receptor antagonist (peripheral acting) (**Schedule II**). **CLINICAL:** GI agent.

### USES

Treatment of opioid-induced constipation (OIC) in adult pts with chronic non-cancer pain, including pts with chronic pain related to prior cancer or its treatment, who do not require frequent (e.g., weekly) opioid dosage escalation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to naldemedine. Known or suspected mechanical GI obstruction. Pts at risk of recurrent GI obstruction. **Cautions:** Severe hepatic impairment, advanced illness associated with impaired structural integrity of the GI wall or conditions that may impair integrity of GI wall (e.g., Crohn's disease, diverticulitis, GI tract malignancies, intestinal adhesions, Ogilvie's syndrome, peptic ulcers, peritoneal malignancies). Concomitant use of strong CYP3A inducers, other opioid antagonists. Pts with disruption to the blood-brain barrier (may precipitate symptoms of opioid withdrawal).

### ACTION

Blocks opioid binding at the peripheral mu, delta, and kappa opioid receptors in GI tract. Inhibits the delay in GI transit times. **Therapeutic Effect:** Decreases constipating effects of opioids.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 93%–94%. Peak plasma concentration: 45 min (with food: 2.5 hrs). Excreted in urine (57%), feces (35%). Not removed by dialysis. **Half-life:** 11 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cross the placenta and cause fetal opiate withdrawal due to immature blood-brain barrier. Due to risk of opiate withdrawal in nursing infants, breastfeeding not recommended during treatment and for at least 3 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** P-gp/ABC1 inhibitors (e.g., amiodarone), diTIAZem, proton pump inhibitors (e.g., omeprazole, pantoprazole), strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/ effect. **Strong CYP3A inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/ effect. **Methylnaltrexone, opioid antagonists** may increase adverse/toxic effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Tablets:** 0.2 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give with or without food.

### INDICATIONS/ROUTES/DOSAGE

#### Opioid-Induced Constipation

**PO: ADULTS, ELDERLY:** 0.2 mg once daily. (Discontinue if opioid pain medication is discontinued.)

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (21%–12%):** Abdominal pain. **Occasional (9%–3%):** Diarrhea, nausea, flatulence, vomiting, headache, hyperhidrosis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe abdominal pain, diarrhea requiring hospitalization may occur. GI perforation was reported in pts with baseline GI disease (Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie's syndrome, peritoneal malignancies). Symptoms of opiate withdrawal including abdominal pain, anxiety, chills, diarrhea, feeling cold, flushing, hyperhidrosis, increased lacrimation, irritability, nausea were reported, esp. in pts taking methadone or with disruptions to the blood-brain barrier. May increase risk of adverse effects in pts with renal impairment.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Discontinue all maintenance laxative therapy prior to initiation. Laxatives may be restarted if therapy has been ineffective for 3 days. Changes to analgesic dosage prior to initiation is not required. Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, GI perforation, or baseline GI disease. Receive full medication history, including herbal products, and screen for interactions. Assess hydration status.

## INTERVENTION/EVALUATION

Pts may be less responsive to therapy if taking opioids for less than 4 wks. Monitor for opioid withdrawal symptoms, esp. in pts taking methadone or with disruptions to blood-brain barrier. Monitor for severe, persistent, or worsening of abdominal pain; may indicate GI tract obstruction or perforation. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency. Discontinue treatment if opioid pain medication is also discontinued. If dose is increased to 25 mg/day in pts with renal impairment, monitor for adverse effects.

## PATIENT/FAMILY TEACHING

- Do not take laxatives unless approved by prescriber.
- Notify prescriber if opioid pain medication is discontinued.
- Immediately report severe, persistent abdominal pain; may indicate rupture or blockage in GI tract.
- Do not ingest grapefruit products or take herbal supplements.
- Opioid withdrawal may occur in a fetus of pregnant females due to undeveloped fetal blood-brain barrier.
- Do not take newly prescribed medication unless approved by prescriber who originally started treatment.

## naloxegol

nal-ox-ee-gol  
(Movantik)

**Do not confuse naloxegol with naloxone.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Mu-opioid receptor antagonist (Peripherally acting). **CLINICAL:** GI agent.

### USES

Treatment of opioid-induced constipation (OIC) in adult pts with chronic non-cancer pain, including pts with chronic pain related to prior cancer or its treatment who do not require frequent (e.g., weekly) opioid dosage escalation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to naloxegol. Known or suspected mechanical GI obstruction, pts at risk for recurrent GI obstruction. Concomitant use of strong CYP3A inhibitors. **Cautions:** Moderate to severe renal impairment, end-stage renal disease, severe hepatic impairment; pts with risk or reduction of structural wall integrity of GI tract (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie's syndrome, peritoneal metastases). Pts with disruptions to the blood-brain barrier. Concomitant use of moderate CYP3A inhibitors, P-glycoprotein (P-gp) inhibitors. Avoid concomitant use of strong CYP3A inducers, other opioid antagonists.

### ACTION

Blocks opioid binding at peripheral mu-opioid receptors in GI tract. **Therapeutic Effect:** Decreases constipating effects of opioids.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 4.2%. Peak plasma concentration: less than 2 hrs. Excreted

in feces (68%), urine (16%). **Half-life:** 6–11 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Known to cross the placenta. Use during pregnancy may induce fetal opiate withdrawal due to immature blood-brain barrier. Unknown if excreted in breast milk. Breastfeeding not recommended due to risk of opiate withdrawal in nursing infants. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** P-gp/ABC1 inhibitors (e.g., amiodarone, cycloSPORINE), diITIA-Zem, PPIs (e.g., pantoprazole), moderate CYP3A inhibitors (e.g., erythromycin, fluconazole, verapamil), strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect; may increase risk of opiate withdrawal. **Strong CYP3A inducers** (e.g., carbamazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Methylnaltrexone, opioid antagonists** may increase adverse/toxic effects. **HERBAL:** St John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Tablets:** 12.5 mg, 25 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give on empty stomach at least 1 hr prior to first meal or 2 hrs after first meal.
- Administer whole; do not chew.

For pts unable to swallow tablet whole, tablets may be crushed and mixed with 120 mL water for oral administration or mixed with 60 mL for NG tube administration. After administration of crushed tablet, refill container with 120 mL (oral) or 60 mL (NG tube) of water, stir well, and give remaining contents.

- Do not give with grapefruit products.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Discontinue all maintenance laxative therapy prior to use. May reintroduce laxatives if suboptimal response to naloxegol after 3 days.

**Opioid-Induced Constipation**

**PO: ADULTS, ELDERLY:** 25 mg once daily in the morning. May reduce dose to 12.5 mg once daily if 25-mg dose is not tolerated.

**Dose Modification**

**Concomitant use of moderate CYP3A inhibitors:** 12.5 mg daily in the morning. **Strong CYP3A inhibitors:** Contraindicated.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment: ESRD:** Reduce dose to 12.5 mg once daily in the morning. If tolerated, may increase to 25 mg once daily in the morning.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended; avoid use.

**SIDE EFFECTS**

**Frequent (21%–12%):** Abdominal pain. **Occasional (9%–3%):** Diarrhea, nausea, flatulence, vomiting, headache, hyperhidrosis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe abdominal pain, diarrhea requiring hospitalization have occurred. GI perforation was reported in pts with baseline GI disease (Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, Ogilvie's syndrome, peritoneal malignancies). Symptoms of opiate withdrawal, including abdominal pain, anxiety, chills, diarrhea, hyperhidrosis, irritability, yawning, were reported, esp. in pts taking methadone or with disruptions to the blood-brain barrier. May increase

risk of adverse effects in pts with renal impairment who have increased dose to 25 mg/day.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Discontinue all maintenance laxative therapy prior to initiation. Laxatives may be restarted if therapy has been ineffective for 3 days. Changes to analgesic dosage prior to initiation are not required. Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Question history of GI obstruction, perforation, baseline GI disease. Receive full medication history including herbal products and screen for interactions. Assess hydration status.

**INTERVENTION/EVALUATION**

Pts may be less responsive to therapy if taking opioids for less than 4 wks. Monitor for opioid withdrawal symptoms, esp. in pts taking methadone or with disruptions to blood-brain barrier. Monitor for severe, persistent, worsening of abdominal pain; may indicate GI tract obstruction, perforation. Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency. Discontinue treatment if opioid pain medication is also discontinued. If dose is increased to 25 mg/day in pts with renal impairment, monitor for increased adverse effects.

**PATIENT/FAMILY TEACHING**

- Do not take laxatives unless approved by prescriber.
- Tablets may be taken whole or crushed and mixed in water.
- Notify prescriber if opioid pain medication is discontinued.
- Immediately report severe, persistent abdominal pain; may indicate rupture or blockage in GI tract.
- Do not ingest grapefruit products or take herbal supplements.
- Opioid withdrawal may occur in a fetus of pregnant females due to undeveloped fetal blood-brain barrier.
- Do not breastfeed.

# olmesartan

 TOP  
100

ol-me-sar-tan

 (Benicar, Olmetec )

**■ BLACK BOX ALERT ■** May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse Benicar with Mevacor.**

## FIXED-COMBINATION(S)

**Azor:** olmesartan/amLODIPine (calcium channel blocker): 20 mg/5 mg, 40 mg/5 mg, 20 mg/10 mg, 40 mg/10 mg. **Benicar HCT:** olmesartan/hydroCHLOROthiazide (a diuretic): 20 mg/12.5 mg, 40 mg/12.5 mg, 40 mg/25 mg. **Tribenzor:** olmesartan/hydroCHLOROthiazide/amLODIPine: 20 mg/12.5 mg/5 mg, 40 mg/12.5 mg/5 mg, 40 mg/25 mg/5 mg, 40 mg/12.5 mg/10 mg, 40 mg/25 mg/10 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin II receptor antagonist. **CLINICAL:** Antihypertensive.

## USES

Treatment of hypertension alone or in combination with other antihypertensives.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to olmesartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal impairment, unstented unilateral or bilateral renal arterial stenosis, significant aortic/mitral stenosis. Concurrent potassium supplements; pts who are volume depleted.

## ACTION

Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II by inhibiting binding of angiotensin II to AT<sub>1</sub> receptors in vascular smooth muscle. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

## PHARMACOKINETICS

Moderately absorbed after PO administration. Hydrolyzed in GI tract to olmesartan. Protein binding: 99%. Excreted in urine (35%–50%), remainder in feces. Not removed by hemodialysis. **Half-life:** 13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in children younger than 6 yrs of age. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, naproxen) may decrease antihypertensive effect. Aliskiren may increase hyperkalemic effect. May increase adverse effects of ACE inhibitors (e.g., benazepril, lisinopril). **HERBAL:** Herbals with hypotensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May slightly decrease Hgb, Hct. May increase serum BUN, creatinine, bilirubin, ALT, AST.

## AVAILABILITY (RX)

**Tablets:** 5 mg, 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 20 mg/day. May increase to 40 mg/day after 2 wks. Lower initial dose may be necessary in pts receiving volume-depleting medications (e.g., diuretics). **CHILDREN 6–16 YRS, WEIGHING 20 TO LESS THAN 35 KG:** Initially, 10 mg once daily. Range: 10–20 mg once daily. **WEIGHING 35 KG OR MORE:** Initially, 20 mg once daily. Range: 20–40 mg once daily. Use with caution.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Occasional (3%):** Dizziness. **Rare (less than 2%):** Headache, diarrhea, upper respiratory tract infection.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often. Rare cases of rhabdomyolysis have been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain B/P immediately before each dose in addition to regular monitoring

(be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Question for possibility of pregnancy. Assess medication history (esp. diuretics).

**INTERVENTION/EVALUATION**

Assess B/P for hypertension, hypotension. Maintain hydration. Assess for upper respiratory infection. Assist with ambulation if dizziness occurs. Monitor serum potassium level.

**PATIENT/FAMILY TEACHING**

- Maintain adequate hydration.
- Avoid pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
- Report symptoms of infection (sore throat, fever).
- Therapy requires lifelong control, diet, exercise.

## olodaterol

oh-loe-da-ter-ol  
(Striverdi Respimat)

**■ BLACK BOX ALERT ■** Long-acting beta<sub>2</sub>-adrenergic agonists (LABA) increase risk of asthma-related deaths. Not indicated for treatment of asthma.

**Do not confuse olodaterol with albuterol, indacaterol, formoterol, or salmeterol.**

### FIXED-COMBINATION(S)

**Stiolto Respimat:** olodaterol/tiotropium (bronchodilator): 2.5 mcg/2.5 mcg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sympathomimetic (beta<sub>2</sub>-adrenergic agonist). **CLINICAL:** Bronchodilator.

### USES

Long-term, once-daily maintenance bronchodilator treatment of airflow obstruction in pts with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema. Not indicated in asthma, acute deterioration of COPD.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to olodaterol. Asthma without use of long-term asthma control medication, history of hypersensitivity to sympathomimetics. **Cautions:** Diabetes, cardiovascular disorders (e.g., coronary insufficiency, arrhythmias, hypertension, hypertrophic obstructive cardiomyopathy), seizure disorder, hyperthyroidism; history of severe bronchospasm, pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia), electrolyte imbalance.

### ACTION

Stimulates beta<sub>2</sub>-adrenergic receptors in lungs, resulting in relaxation of bronchial

smooth muscle. **Therapeutic Effect:** Relieves bronchospasm, reduces airway resistance, improves bronchodilation.

### PHARMACOKINETICS

Rapidly absorbed following inhalation. Extensively distributed in tissue. Metabolized in liver. Protein binding: 60%. Peak plasma concentration: 10–20 min. Excreted in urine. **Half-life:** 45 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Excretion into breast milk is probable. Breastfeeding not recommended. May interfere with uterine contractility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precaution noted.

### INTERACTIONS

**DRUG:** Beta blockers (e.g., metoprolol) may decrease therapeutic effect, cause bronchospasms. **Beta<sub>2</sub>-adrenergic agonists (e.g., salmeterol)** may potentiate sympathomimetic effects. **Linezolid** may increase hypertensive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose. May decrease serum potassium.

### AVAILABILITY (RX)

**Inhalation Spray (2.5 mcg/actuation):** 28 metered actuations/cartridge with inhaler, 60 metered actuations/cartridge with inhaler.

### ADMINISTRATION/HANDLING

#### Inhalation

- While taking slow, deep breath through the mouth, press and release button and continue slow inhalation as long as possible. (See manufacturer guidelines for priming instructions and further information.)

### INDICATIONS/ROUTES/DOSAGE

#### COPD

**Inhalation: ADULTS, ELDERLY:** Two inhalations (2.5 mcg per inhalation for total of 5 mcg) once daily, at same time each day. **Maximum:** 5 mcg within 24-hr period.

#### Dosage in Renal Impairment

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**SIDE EFFECTS**

**Occasional (11%–4%):** Nasopharyngitis, upper respiratory tract infection, bronchitis, cough, back pain. **Rare (3%–2%):** Dizziness, insomnia, dry mouth, arthralgia, urinary retention.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Life-threatening asthma-related events, bronchospasm, or worsening of COPD-related symptoms have been reported. Serious cardiovascular events including arrhythmias, angina pectoris, cardiac arrest, hypertension, tachycardia; flattening of T wave, prolongation of QTc interval, ST segment depression have occurred. All beta-adrenergic agonists carry risk of hyperglycemia or significant hypokalemia. Pts with severe COPD or hypokalemia have additional increased risk of adverse effects related to hypoxia and concomitant medications.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ABG, capillary glucose, O<sub>2</sub> saturation, serum potassium level, vital signs;

ECG, pulmonary function test if applicable. Assess respiratory rate, depth, rhythm. Assess lung sounds for wheezing, rales. Receive full medication history and screen for drug interactions. Question history of asthma, cardiovascular disease, diabetes, long QT syndrome, seizure disorder. Teach proper inhaler priming and administration techniques.

**INTERVENTION/EVALUATION**

Routinely monitor capillary glucose, O<sub>2</sub> saturation, serum potassium level, vital signs. Auscultate lung sounds. Obtain ECG for palpitation, tachycardia; symptomatic hypokalemia. Recommend discontinuation of short-acting beta<sub>2</sub>-agonists (use only for symptomatic relief of acute respiratory symptoms). Monitor for hypoglycemia.

**PATIENT/FAMILY TEACHING**

- Refill prescription when dose indicator on left of inhaler reaches red area of scale.
- Follow manufacturer guidelines for proper use of inhaler.
- Drink plenty of fluids (decreases lung secretion viscosity).
- Rinse mouth with water after inhalation to decrease mouth/throat irritation.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola).
- Report fever, productive cough, body aches, difficulty breathing; may indicate lung infection or worsening of COPD.

## ombitasvir/ paritaprevir/ ritonavir/dasabuvir

om-**bit**-as-vir/**par**-i-ta-pre-vir/**rit**-oh-na-vir/**da**-sa-bue-vir  
(Viekira Pak, Holkira PAK , Viekira XR)

Test all pts for hepatitis B virus (HBV) infection prior to initiation. HBV reactivation was reported in HBV/HCV coinfectd pts who were undergoing or had completed treatment with hepatitis C virus (HCV) direct-acting antivirals and were not receiving HBV antiviral therapy. HBV reactivation may cause fulminant hepatitis, hepatic failure, and death. Monitor HCV/HBV coinfectd pts for hepatitis flare or HBV reactivation during HCV infection and as clinically indicated.

**Do not confuse ombitasvir with daclatasvir, or paritaprevir with boceprevir or simeprevir, or ritonavir with Retrovir, lopinavir, darunavir, or saquinavir, or dasabuvir with sofosbuvir.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NS5A inhibitor, protease inhibitor, CYP3A inhibitor, nonnucleoside inhibitor.

**CLINICAL:** Antihhepaticviral.

### USES

Treatment of adults with chronic hepatitis C virus (HCV) infection genotype 1a without cirrhosis or with compensated cirrhosis (in combination with ribavirin), and genotype 1b without cirrhosis or with compensated cirrhosis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to any component. Moderate to severe hepatic impairment; decompensated hepatic

cirrhosis; contraindication or known hypersensitivity to ribavirin; concomitant use of strong CYP3A inducers, strong CYP2C8 inducers or strong CYP2C8 inhibitors; drugs highly dependent on CYP3A for clearance and for which elevated plasma concentrations are associated with serious and/or life-threatening events. Concurrent use of alfuzosin, carbamazepine, colchicine, dronedarone, efavirenz, ergotamine, dihydroergotamine, ethinyl estradiol-containing drugs including combined oral contraceptives, gemfibrozil, lovastatin, lurasidone, midazolam (oral), phenytoin, PHENobarbital, pimozide, ranolazine, rifampin, sildenafil (when used for pulmonary arterial hypertension), simvastatin, St. John's wort, triazolam. **Cautions:** History of anemia, hepatitis B virus infection, HIV infection.

### ACTION

Ombitasvir inhibits HCV NS5A needed for essential RNA replication and virion assembly. Paritaprevir inhibits HCV protease needed for cleavage of HCV-encoded polyproteins and viral replication. Ritonavir inhibits CYP3A clearance; increases plasma concentrations of paritaprevir. Dasabuvir inhibits HCV RNA-dependent RNA polymerase needed for replication of viral genome. **Therapeutic Effect:** Inhibits viral replication of hepatitis C virus.

### PHARMACOKINETICS

Readily absorbed. Paritaprevir, ritonavir, dasabuvir metabolized in liver. Ombitasvir metabolized by amide hydrolysis. Protein binding: ombitasvir: greater than 99%, paritaprevir: 97%–99%, ritonavir: 99%, dasabuvir: 99%. Peak plasma concentration: 4–5 hrs. Steady-state concentration: 12 days. Elimination: ombitasvir: feces (92%), urine (2%); paritaprevir: feces (88%), urine (9%); ritonavir: feces (86%), urine (11%); dasabuvir: feces (94%), urine (2%). **Half-life:** Ombitasvir: 21–25 hrs; paritaprevir: 5.5 hrs; ritonavir: 4 hrs; dasabuvir: 5.5–6 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. When administered with ribavirin, therapy is contraindicated in pregnant women and in men whose female partners are pregnant. Unknown if distributed in breast milk. Concomitant use of ethinyl estradiol-containing drugs is contraindicated. Alternative contraception methods including progestin-only drugs, barrier methods, abstinence are recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration/effects of antiarrhythmics (e.g., amiodarone), antifungals (e.g., itraconazole), calcium channel blockers (e.g., amlodipine, nifedipine), corticosteroids (e.g., fluticasone), immunosuppressants (e.g., cyclosporine), digoxin, HIV antiretrovirals (e.g., paritaprevir, rilpivirine), phosphodiesterase-5 inhibitors (e.g., sildenafil), sedative/hypnotics (e.g., temazepam), statins (e.g., atorvastatin, simvastatin), sirolimus, tacrolimus. Anticonvulsants (e.g., carbamazepine, phenytoin), dexamethasone, efavirenz, omeprazole, rifampin may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. Kava kava may increase risk of hepatotoxicity. Red yeast may increase risk of myopathy, rhabdomyolysis. Meals increase absorption. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, INR. May decrease Hct, Hgb.

**AVAILABILITY (RX)**

**Fixed-Dose Combination Tablets (Copakaged with dasabuvir tablets):** (*Viekira Pak*): Ombitasvir 12.5 mg/paritaprevir 75 mg/ritonavir 50 mg; dasabuvir 250 mg. (*Viekira XR*): Ombitasvir 8.33 mg/

paritaprevir 50 mg/ritonavir 33.3 mg/dasabuvir 200 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with food. Do not cut, crush, break, or divide XR tablets.

**INDICATIONS/ROUTES/DOSAGE****Hepatitis C Virus Infection**

**PO: ADULTS, ELDERLY:** (*Viekira Pak*): 2 tablets of ombitasvir, paritaprevir, ritonavir once daily, plus 1 tablet of dasabuvir twice daily with or without ribavirin. (*Viekira XR*): 3 tablets once daily.

**Treatment Regimen and Duration**

**Genotype 1a, without cirrhosis (in combination with ribavirin); genotype 1b without cirrhosis or compensated cirrhosis:** Fixed-combination regimen with ribavirin for 12 wks. **Recommended dose of ribavirin based on weight in kg: LESS THAN 75 KG:** 1,000 mg/day in 2 divided doses. **75 KG OR GREATER:** 1,200 mg/day in 2 divided doses. For ribavirin dose modifications, refer to prescribing information.

**Dose Modification****Liver Transplant Recipients**

**PO: ADULTS, ELDERLY:** 2 tablets of ombitasvir, paritaprevir, ritonavir once daily, plus 1 tablet of dasabuvir twice daily with ribavirin for 24 wks, irrespective of HCV genotype 1 subtype in pts with normal hepatic function and mild fibrosis.

**HCV/HIV-1 Coinfection**

Follow dose recommendations as listed in Treatment Regimen and Duration. Consider suppressive antiretroviral drug therapy during treatment.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Treatment not recommended. **Severe impairment:** Treatment contraindicated.

## SIDE EFFECTS

**Frequent (34%–22%):** Fatigue, nausea.

**Occasional (18%–14%):** Pruritus, rash, erythema, eczema, allergic dermatitis, skin exfoliation, urticaria, photosensitivity reaction, skin ulcer, insomnia, asthenia.

## ADVERSE EFFECTS/TOXIC REACTIONS

HBV reactivation was reported in pts coinfecting with HBV/HVC; may result in fulminant hepatitis, hepatic failure, death. Serum ALT greater than 5 times upper limit of normal (ULN) reported in 1% of pts (usually occurred during the first 4 wks of treatment). Elevations of serum ALT were significantly higher in female pts using ethinyl estradiol-containing drugs such as contraceptive patches, combined oral contraceptives, vaginal rings. May increase risk of drug resistance in HCV/HIV-1 coinfecting pts using HIV-1 protease inhibitors. Hypersensitivity reaction including angioedema may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, HCV-RNA level, pregnancy test in females of reproductive potential. Confirm HCV genotype. Test for hepatitis B virus (HBV) infection prior to initiation. Receive full medication history and screen for contraindications/interactions. Ethinyl estradiol-containing contraceptive drugs should be discontinued prior to initiation. Question history as listed in Precautions. To reduce risk of HIV-1 protease inhibitor drug resistance,

consider suppressive antiretroviral drug therapy upon initiation.

### INTERVENTION/EVALUATION

Monitor LFT periodically during the first 4 wks of treatment, then as clinically indicated thereafter. Discontinue treatment for serum ALT persistently greater than 10 times ULN; serum ALT elevation associated with increase in serum alkaline phosphatase, bilirubin, or INR; hepatic injury. Periodically monitor CBC for anemia, HCV-RNA level for treatment effectiveness. Monitor for abdominal pain, bruising, jaundice, nausea, vomiting; may indicate hepatic injury. Ethinyl estradiol-containing contraceptives may be restarted approx. 2 wks after discontinuation.

### PATIENT/FAMILY TEACHING

- Treatment must be used in combination with ribavirin.
- Take with meals.
- Inform pt of contraindications/adverse effects of therapy.
- Do not take newly prescribed medication unless approved by doctor who originally started treatment. Do not take herbal products.
- Pregnancy should be avoided when combination regimen is given with ribavirin. Use effective contraception to avoid pregnancy. Do not breast-feed.
- Report abdominal pain, bruising easily, dark-colored urine, fatigue, yellowing of the skin or eyes.
- Avoid alcohol.
- Report skin changes such as rash, peeling, ulcers; allergic reactions such as difficulty breathing, itching, hives, tongue swelling.

## plecanatide

ple-kan-a-tide  
(Trulance)

**BLACK BOX ALERT** Contraindicated in pts younger than 6 yrs due to risk of life-threatening dehydration and death. Safety and efficacy not established in pts younger than 18 yrs; avoid use.

**Do not confuse plecanatide with exenatide, lixisenatide, pramlintide or Trulance with Truvada.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Guanylate cyclase-C agonist. **CLINICAL:** GI agent.

### USES

Treatment of adults with chronic idiopathic constipation or irritable bowel syndrome with constipation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to plecanatide. Pts younger than 6 yrs of age, mechanical GI obstruction (known or suspected). **Cautions:** Dehydration. Avoid use in pts younger than 18 yrs of age.

### ACTION

Binds and agonizes guanylate cyclase-C on luminal surface of intestinal epithelium, increasing cyclic guanosine monophosphate (cGMP), resulting in chloride and bicarbonate secretion into the intestinal lumen. **Therapeutic Effect:** Increases intestinal fluid and accelerates GI transit time.

### PHARMACOKINETICS

Minimal absorption systemically; mainly confined to GI tract. Metabolized within GI tract to active metabolite. Undergoes proteolytic degradation within intestinal lumen to smaller peptides and amino acids. **Half-life:** Not specified.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Contraindicated in pts younger than 6 yrs. Safety and efficacy not established in pts aged 6 to less than 18 yrs. Severe, possibly fatal, dehydration may occur in pediatric pts younger than 18 yrs due to increased intestinal fluid secretion; avoid use. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

### AVAILABILITY (RX)

**Tablets:** 3 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- If a dose is missed, skip the dose and give at next regularly scheduled time; do not double dose.
- Give tablet whole; do not break, cut, or divide.
- For pts with dysphagia, tablet may be crushed and mixed in applesauce, or dispersed in 30 mL of water and given orally or via NG tube. After administration of dispersed tablet, refill container with additional 30 mL of water and give remaining contents. Flush NG tube with additional 10 mL of water.

### INDICATIONS/ROUTES/DOSAGE

**Chronic Idiopathic Constipation, Irritable Bowel Syndrome**

**PO: ADULTS, ELDERLY:** 3 mg once daily.

#### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

### SIDE EFFECTS

**Occasional (5%):** Diarrhea. **Rare (less than 2%):** Abdominal pain/tenderness, flatulence.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe diarrhea reported in less than 1% of pts; usually occurred within the first 3 days.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question characteristics of constipation, frequency of bowel movements. Assess bowel sounds. Assess hydration status.

**INTERVENTION/EVALUATION**

Encourage fluid intake. Monitor daily pattern of bowel activity, stool consistency. Monitor for abdominal pain, dehydration.

**PATIENT/FAMILY TEACHING**

- Report severe diarrhea.
- Drink plenty of fluids.
- Do not take laxatives unless approved by prescriber.
- Tablets may be taken whole, dispersed in water, or crushed and mixed in applesauce.
- Securely store tablets away from children; life-threatening dehydration may occur if accidentally ingested by children younger than 6 yrs.

## raltegravir

TOP  
100

ral-teg-ra-veer  
(Isentress, Isentress HD)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Integrase inhibitor. **CLINICAL:** Antiretroviral (anti-HIV).

### USES

Treatment of HIV-1 infection in adults and children and weighing at least 2 kg. Used in combination with at least two other antiretroviral agents. **OFF-LABEL:** Post-exposure prophylaxis for occupational exposure to HIV.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to raltegravir. **Cautions:** Elderly, pts at risk for creatine kinase (CK) elevations and/or skeletal muscle abnormalities.

### ACTION

Inhibits activity of HIV-1 integrase, an enzyme that incorporates viral DNA into host cell. **Therapeutic Effect:** Prevents integration and replication of viral HIV-1.

### PHARMACOKINETICS

Widely distributed. Protein binding: 83%. Metabolized in liver. Excreted in feces (51%), urine (32%). **Half-life:** 9 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cross placenta. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 4 wks. **Elderly:** Age-related hepatic, renal, cardiac impairment requires strict monitoring.

### INTERACTIONS

**DRUG:** Proton pump inhibitors (e.g., omeprazole, pantoprazole) may increase concentration. **Aluminum, magnesium salts, rifAMPin** may decrease levels/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May

increase serum glucose, bilirubin, aminotransferase, alkaline phosphatase, amylase, lipase, creatine kinase. May decrease lymphocytes, neutrophils (ANC), Hgb, platelets.

### AVAILABILITY (Rx)

**Packet, Oral:** 100 mg. **Tablets, Chewable:** 25 mg, 100 mg.

 **Tablets, Film-Coated:** 400 mg, 600 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • Do not break, crush, dissolve, or divide film-coated tablets. • Chewable tablets may be chewed or taken whole. • **Oral Packet:** Mix with 5 mL water to provide a concentration of 20 mg/mL. Once mixed, measure dose with oral syringe. Give within 30 min of mixing.

### INDICATIONS/ROUTES/DOSAGE

#### HIV Infection

**PO: ADULTS, ELDERLY, CHILDREN WEIGHING 40 KG OR MORE: Treatment naïve:** 400 mg twice daily or 1,200 mg once daily. **Treatment experienced:** 400 mg twice daily. (Dosage increased to 800 mg twice daily when given with rifAMPin [treatment naïve or experienced]). **CHILDREN WEIGHING 25 KG OR MORE (WHO CAN SWALLOW A TABLET):** 400 mg twice daily. **CHILDREN 2–11 YRS WEIGHING 40 KG OR MORE (CHEWABLE TABLETS):** 300 mg twice daily. **WEIGHING 28–39 KG:** 200 mg twice daily. **WEIGHING 20–27 KG:** 150 mg twice daily. **WEIGHING 14–19 KG:** 100 mg twice daily. **WEIGHING 11–13 KG:** 75 mg twicedaily. **CHILDREN WEIGHING 14–19 KG (ORAL PACKET):** 100 mg twice daily. **WEIGHING 11–13 KG:** 80 mg twice daily. **WEIGHING 8–10 KG:** 60 mg twice daily. **WEIGHING 6–7 KG:** 40 mg twice daily. **WEIGHING 4–5 KG:** 30 mg twice daily. **WEIGHING 3–4 KG:** 25 mg twice daily. **NEONATES (7 DAYS OR YOUNGER): 4 TO LESS THAN 5 KG:** 7 mg once daily. **3 TO LESS THAN 4 KG:** 5 mg once daily. **2 TO LESS**

**THAN 3 KG:** 4 mg once daily. **(8–28 DAYS): 4 TO LESS THAN 5 KG:** 7 mg twice daily. **3 TO LESS THAN 4 KG:** 5 mg twice daily. **2 TO LESS THAN 3 KG:** 4 mg twice daily.

#### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

### SIDE EFFECTS

**Frequent (17%–10%):** Diarrhea, nausea, headache. **Occasional (5%):** Fever. **Rare (2%–1%):** Vomiting, abdominal pain, fatigue, dizziness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Fatal cutaneous reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis were reported. Hypersensitivity reactions including angioedema, eosinophilia, facial edema, malaise, rash, organ dysfunction, hepatic injury may occur. May induce immune reconstitution syndrome (inflammatory response to dormant opportunistic infections such as herpesvirus, *Mycobacterium avium*, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré). Chewable tablets (contain phenylalanine) may be harmful to pts with phenylketonuria. May increase risk of myopathy, rhabdomyolysis. Nephrolithiasis, renal failure reported in less than 2% of pts. May increase risk of suicidal ideation and behavior.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, BMP, CD4 count, viral load, HIV-1 RNA level; pregnancy test in

females of reproductive potential. Question history of hepatic impairment, depression, suicidal ideation. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CD4 count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor renal function as clinically indicated. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Monitor LFT for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). Obtain CK level if myopathy, rhabdomyolysis (joint/muscle pain, malaise) is suspected. Cough, dyspnea, fever, excess of band cells on CBC may indicate acute infection. (WBC count may be unreliable in pts with uncontrolled HIV infection.) Monitor for immune reconstitution syndrome. Assess skin for toxic skin reactions, rash. Screen for psychiatric symptoms, suicidal ideation and behavior.

#### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection, nor does it reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if therapy is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report body aches, chills, cough, fever, night sweats, shortness of breath.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine), toxic skin reactions (itching, peeling, rash, redness, swelling).
- Do not breastfeed.
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occur.

## ranolazine

ra-noe-la-zeen  
(Ranexa)

**Do not confuse Ranexa with CeleXA.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cardiovascular agent. **CLINICAL:** Antianginal agent.

### USES

Treatment of chronic angina.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ranolazine. Hepatic cirrhosis, concurrent use of strong CYP3A inhibitors (e.g., rifAMPin, carBAMazepine) or CYP3A inducers (e.g., ketoconazole, itraconazole, fluconazole, clarithromycin, erythromycin).

**Cautions:** Renal/hepatic impairment. Pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia).

### ACTION

Inhibits inward current of sodium channel during cardiac repolarization, thereby reducing calcium influx. Decreased influx of calcium reduces ventricular tension, myocardial oxygen demand. Does not reduce heart rate, B/P. **Therapeutic Effect:** Exerts antianginal, anti-ischemic effects on cardiac tissue.

### PHARMACOKINETICS

Absorption highly variable. Peak plasma concentration: 2–5 hrs. Rapidly, extensively metabolized in intestine, liver. Protein binding: 62%. Excreted in urine (75%), feces (25%). **Half-life:** 7 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast

milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** See contraindications. **Strong CYP3A4 inducers** (e.g., carBAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) may increase concentration/effect. May increase concentration/effect of **digoxin, simvastatin, tacrolimus. QT interval–prolonging medications** (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD: Grapefruit products** may increase plasma concentration, risk of QT prolongation. **LAB VALUES:** May slightly elevate serum BUN, creatinine.

### AVAILABILITY (RX)

 **Tablets, Extended-Release:** 500 mg, 1,000 mg.

### ADMINISTRATION/HANDLING

#### PO

- May give without regard to food.
- Do not break, crush, dissolve, or divide extended-release tablets.

### INDICATIONS/ROUTES/DOSAGE

#### Chronic Angina

**PO: ADULTS, ELDERLY:** Initially, 500 mg twice daily. May increase to 1,000 mg twice daily, based on clinical response. Dose should not exceed 500 mg twice daily when used concurrently with moderate CYP3A inhibitors (e.g., fluconazole, dilTIAZem, verapamil).

#### Dosage in Renal/Hepatic Impairment

No dose adjustment (discontinue if acute renal failure develops). Contraindicated in pts with cirrhosis.

**SIDE EFFECTS**

**Occasional (6%–4%):** Dizziness, headache, constipation, nausea. **Rare (2%–1%):** Peripheral edema, abdominal pain, dry mouth, vomiting, tinnitus, vertigo, palpitations.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose manifested as confusion, diplopia, dizziness, paresthesia, syncope.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Receive full medication history and screen for contraindications. Question history of hepatic impairment, long QT syndrome. Record onset, type (sharp,

dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Obtain baseline ECG.

**INTERVENTION/EVALUATION**

Assist with ambulation if dizziness occurs. Give with food if nausea occurs. Assess for relief of anginal pain. Monitor ECG, pulse for irregularities.

**PATIENT/FAMILY TEACHING**

- Avoid grapefruit products.
- Do not chew, crush, dissolve, or divide extended-release tablets.
- Avoid tasks requiring alertness, motor skills until response to drug is established.
- Treatment may affect the electrical properties of the heart; report palpitations, loss of consciousness.

## rolapitant

roe-la-pi-tant  
(Varubi)

**Do not confuse rolapitant with aprepitant, fosaprepitant.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Substance P/neurokinin (P/NK) receptor antagonist. **CLINICAL:** Antinausea, antiemetic.

### USES

Prevention of delayed nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy, including, but not limited to, highly emetogenic chemotherapy, in combination with other antiemetic agents.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to rolapitant. CYP2D6 substrates with a narrow therapeutic index (e.g., thioridazine). Use in pts younger than 2 yrs of age.

**Cautions:** Mild to moderate hepatic impairment, pts at risk for QT interval prolongation or ventricular arrhythmia (congenital long QT syndrome, medications that prolong QT interval, hypokalemia, hypomagnesemia). Not recommended in severe hepatic impairment.

### ACTION

Selectively and competitively inhibits human substance P/NK<sub>1</sub> receptors. **Therapeutic Effect:** Decreases nausea and vomiting associated with chemotherapy.

### PHARMACOKINETICS

Readily absorbed. Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 4 hrs. Excreted in urine (14%), feces (73%). **Half-life:** 158 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Safety and efficacy not established during pregnancy.

Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Thioridazine may increase risk of torsades de pointes, QT interval prolongation (contraindicated). **Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. May increase concentration/effect of **BCRP substrates (e.g., methotrexate, rosuvastatin), CYP2D6 substrates (e.g., pimozone), P-gp substrates (e.g., digoxin).** **QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol)** may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** None significant. **LAB VALUES:** May decrease Hct, Hgb, neutrophils, RBC.

### AVAILABILITY (Rx)

**Tablets:** 90 mg.

### ADMINISTRATION/HANDLING

**Rate of administration** • Infuse over 30 min. Do not dilute. • Solution is compatible with 0.9% NaCl, D5W or Lactated Ringers via Y-site.

**Storage** • Store at room temperature.

### PO

• Administer approx. 1–2 hrs prior to chemotherapy. • Give without regard to food. Administer prior to initiation of each chemotherapy cycle at no less than 2-wk intervals.

### INDICATIONS/ROUTES/DOSAGE

**Chemotherapy-Associated Nausea/Vomiting**

**PO: ADULTS, ELDERLY:** 180 mg once within 2 hrs prior to initiation of chemotherapy on day 1 only. 180 mg once on day 1 (in combination with dexamethasone and

a 5-HT<sub>3</sub> receptor antagonist). Do not give rolapitant at intervals of less than 2 wks.

**IV: ADULTS, ELDERLY:** 166.5 mg given within 2 hrs prior to initiation of chemotherapy on day 1 (in combination with dexamethasone and a 5-HT<sub>3</sub> receptor antagonist).

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Treatment not recommended.

### **SIDE EFFECTS**

**Occasional (9%–6%):** Decreased appetite, hiccups, dizziness. **Rare (4%–3%):** Abdominal pain.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Torsades de pointes, QT prolongation reported in pts taking thioridazine concomitantly; avoid use. Baseline electrolyte imbalance may increase risk of arrhythmias.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain CBC, BMP, serum magnesium. Question history of arrhythmias, hepatic impairment, congenital long QT syndrome. Receive medication history and screen for interactions. Assess hydration status. Obtain ECG in pts taking concomitant drugs that prolong QT interval.

### **INTERVENTION/EVALUATION**

Periodically monitor CBC, BMP. Monitor hydration, nutritional status, I&O. Correct electrolyte imbalances prior to each dose. If CYP2D6 substrate medications cannot be withheld, diligently monitor for QT interval prolongation, ventricular arrhythmias. Assist with ambulation if dizziness occurs. Assess for anemia-related symptoms.

### **PATIENT/FAMILY TEACHING**

- Therapy may alter effectiveness of other drugs. Do not take any newly prescribed medications unless approved by doctor who originally started treatment.
- Report symptoms of arrhythmias such as chest pain, dizziness, fainting, fatigue, palpitations, shortness of breath.
- Do not take herbal products or ingest grapefruit products.
- Report persistent nausea, vomiting despite treatment.

## telavancin

tel-a-van-sin  
(Vibativ)

**■ BLACK BOX ALERT ■** Pts with preexisting renal impairment (CrCl less than 50 mL/min) who are treated for hospital-acquired pneumonia may have increased mortality risk when compared to vancomycin. May cause new or worsening renal impairment. May cause fetal harm (low birth weight, limb malformations). Women of childbearing potential should have pregnancy test before treatment; avoid use during pregnancy unless benefit to pt outweighs fetal risk.

**Do not confuse telavancin with dalbavancin or oritavancin; or Vibativ with Vibra-Tabs or vigabatrin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Lipoglycopeptide antibacterial. **CLINICAL:** Antibiotic.

### USES

Treatment of complicated skin, soft tissue infections (cSSSI) caused by gram-positive microorganisms, including methicillin-susceptible or methicillin-resistant *S. aureus*, vancomycin-susceptible *Enterococcus*. Treatment of hospital-acquired and ventilator-associated bacterial pneumonia (HABP/VABP) caused by susceptible isolates of *S. aureus*.

### PRECAUTIONS

**Contraindications:** Prior hypersensitivity reactions to telavancin. Concomitant use of IV unfractionated heparin. **Cautions:** Renal impairment (CrCl 50 mL/min or less), concomitant use of other nephrotoxic medications (e.g., NSAIDs, ACE inhibitors, aminoglycosides). Avoid use in pts with history of congenital QT syndrome, known prolongation of QT interval, uncompensated HF, severe left ventricular hypertrophy, or receiving treatment with other drugs known to prolong QT interval,

hypokalemia, hypomagnesemia; known vancomycin hypersensitivity.

### ACTION

Inhibits bacterial cell wall synthesis by blocking polymerization and cross-linking of peptidoglycan. Disrupts membrane potential and changes cell wall permeability. **Therapeutic Effect:** Bactericidal. Antibiotic.

### PHARMACOKINETICS

Not metabolized in liver; pathway unspecified. Protein binding: 90%. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 8–9 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm at regular dosage. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may increase risk of nephrotoxicity; dosage adjustment recommended.

### INTERACTIONS

**DRUG:** QT interval-prolonging medications (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol) may increase risk of QTc interval prolongation, cardiac arrhythmias. May decrease therapeutic effect of heparin. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum potassium. May increase serum bilirubin, ALT, AST, BUN, creatinine; PT, aPTT, INR. May decrease Hgb, Hct, WBC count.

### AVAILABILITY (RX)

**Injection, Powder for Reconstitution:** 750 mg.

### ADMINISTRATION/HANDLING

**◀ ALERT ▶** Give by intermittent IV infusion (piggyback). Do not give by IV push (may result in hypotension).

**Reconstitution** • Reconstitute with 45 mL Sterile Water for Injection, D<sub>5</sub>W, or 0.9% NaCl to provide concentration of

15 mg/mL (total volume approximately 50 mL). • Prior to administration, further dilute with D<sub>5</sub>W or 0.9% NaCl to final concentration of 0.6–8 mg/mL. • Do not shake.

**Rate of administration** • Infuse over at least 60 min. Flush line with D<sub>5</sub>W or 0.9% NaCl before and after administration.

**Storage** • Discard if particulate is present. • Diluted solution is stable for 4 hrs at room temperature or 72 hrs if refrigerated in vial or infusion bag.

### **IV INCOMPATIBILITIES**

Amphotericin, colistimethate, levoFLOXacin (Levaquin), micafungin (Mycomine).

### **IV COMPATIBILITIES**

Azithromycin, caspofungin, cefepime, ceftAZidime, ceftRIAXone, ciprofloxacin, doripenem, doxycycline, gentamicin, ertapenem, fluconazole, meropenem, tobramycin, pantoprazole, piperacillin-tazobactam, tigecycline.

## **INDICATIONS/ROUTES/DOSAGE**

### **Usual Parenteral Dosage**

**IV infusion: ADULTS, ELDERLY:** 10 mg/kg once every 24 hrs for 7–14 days (cSSSI); 7–21 days (HABP/VABP). Duration based on severity, infection site, and clinical progress of pt.

### **Dosage in Renal Impairment**

#### **Creatinine**

<b>Clearance</b>	<b>Dosage</b>
50 mL/min or greater	10 mg/kg every 24 hrs
30–49 mL/min	7.5 mg/kg every 24 hrs
10–29 mL/min	10 mg/kg every 48 hrs
Less than 10 mL/min	No dose adjustment (not studied)

### **Dosage in Hepatic Impairment**

No dose adjustment (unless concomitant renal impairment).

## **SIDE EFFECTS**

**Frequent (33%–27%):** Altered taste, nausea. **Occasional (14%–6%):** Vomiting, foamy urine, diarrhea, dizziness, pruritus. **Rare (4%–2%):** Rigors, rash, infusion site pain, anorexia, infusion site erythema.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Nephrotoxicity (acute kidney injury, acute tubular necrosis, renal failure), diarrhea due to *C. difficile* may occur. “Red-man syndrome” (characterized by erythema on face, neck, upper torso), tachycardia, hypotension, myalgia, angioedema may occur from too-rapid rate of infusion. May cause QT interval prolongation.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain pregnancy test in females of reproductive potential. Obtain baseline serum BUN, creatinine, creatinine clearance prior to initiating therapy, every 48–72 hrs, and after treatment is completed. Obtain culture and sensitivity tests before giving first dose (therapy may begin before results are known). Question history of renal impairment, long QT interval syndrome, HE.

### **INTERVENTION/EVALUATION**

Monitor renal function tests, I&O. Assess skin for rash. Avoid rapid infusion (“red-man syndrome”). Monitor daily pattern of bowel activity, stool consistency. Obtain *C. difficile* PCR test if diarrhea occurs. Monitor ECG for QT interval prolongation, cardiac arrhythmias.

### **PATIENT/FAMILY TEACHING**

• Use effective contraception during treatment. • Report rash, signs/symptoms of nephrotoxicity, diarrhea. • Report chest pain, irregular heart rhythm, palpitations, passing out.

## valGANCiclovir

val-gan-sye-kloe-veer  
(Apo-ValGANCiclovir , Valcyte)

**BLACK BOX ALERT** ■ Severe anemia, leukopenia, neutropenia, thrombocytopenia, pancytopenia, and bone marrow failure, including aplastic anemia, were reported. May cause temporary or permanent inhibition of spermatogenesis in males and suppression of fertility in females. May cause birth defects, new malignancies. May adversely affect spermatogenesis, fertility. Risk for granulocytopenia, anemia, thrombocytopenia.

**Do not confuse Valcyte with Valium or Valtrex, or valGANCiclovir with valACYclovir.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic nucleoside. **CLINICAL:** Antiviral.

### USES

**Adults:** Treatment of cytomegalovirus (CMV) retinitis in AIDS. Prevention of CMV disease in high-risk renal, cardiac, renal-pancreas transplant pts. **Children:** Prevention of CMV disease in high-risk renal (4 mos to 16 yrs) and cardiac transplant pts (1 mo to 16 yrs).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to valGANCiclovir, ganciclovir. **Cautions:** Use extreme caution in children due to long-term carcinogenicity, reproductive toxicity. Renal impairment, concurrent nephrotoxic medications, preexisting bone marrow suppression or cytopenias, baseline cytopenias, elderly (at greater risk for renal impairment).

### ACTION

Inhibits binding of deoxyguanosine triphosphate to DNA polymerase. **Therapeutic Effect:** Inhibits viral DNA synthesis.

### PHARMACOKINETICS

Widely distributed including CSF, ocular tissue. Slowly metabolized intracellularly. Primarily excreted in urine. Removed by hemodialysis. **Half-life: Ganciclovir:** 4 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment. Breast-feeding not recommended during treatment and for at least 3 days after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established in pts younger than 1 month. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Bone marrow depressants may (e.g., cladribine) increase myelosuppression. May increase concentration/effect of didanosine, mycophenolate. Probenecid may decrease renal clearance, increase concentration. May increase nephrotoxic effect of amphotericin, cycloSPORINE. May increase adverse effects of zidovudine. Zidovudine (AZT) may increase risk of hematologic toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease creatinine clearance, platelet count, neutrophils, Hgb, Hct. May increase serum creatinine.

### AVAILABILITY (Rx)

**Powder for Oral Solution:** 50 mg/mL (100 mL).

 **Tablets:** 450 mg.

### ADMINISTRATION/HANDLING

#### PO

- Take with meals.
- Do not break, crush, dissolve, or divide tablets; give whole (potential carcinogen).
- Avoid contact with skin.
- Wash skin with soap, water if contact occurs.
- Store oral suspension in refrigerator. Discard after 49 days.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Do not use if absolute neutrophil count (ANC) less than 500 cells/mm<sup>3</sup>, platelets less than 25,000 cells/mm<sup>3</sup>, or Hgb less than 8 g/dL.

**Cytomegalovirus (CMV) Retinitis (AIDS-related)**

**PO: ADULTS: Induction:** 900 mg (two 450-mg tablets) twice daily for 14–21 days. **Maintenance:** 900 mg once daily.

**Prevention of CMV After Transplant**

**PO: ADULTS, ELDERLY:** 900 mg once daily (duration dependent on type of transplant, donor, and recipient serostatus). **CHILDREN 1 MO–16 YRS:** Once daily based on body surface area (BSA) and CrCl using formula: (Dose =  $7 \times \text{BSA} \times \text{CrCl}$ ). **Maximum:** 900 mg/day.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance.

<b>Creatinine Clearance</b>	<b>Induction Dosage</b>	<b>Maintenance Dosage</b>
60 mL/min or higher	900 mg twice daily	900 mg once daily
40–59 mL/min	450 mg twice daily	450 mg once daily
25–39 mL/min	450 mg once daily	450 mg every 2 days
10–24 mL/min	450 mg every 2 days	450 mg twice wkly

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (16%–9%):** Diarrhea, neutropenia, headache. **Occasional (8%–3%):** Nausea.

**Rare (less than 3%):** Insomnia, paresthesia, vomiting, abdominal pain, fever.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hematologic toxicity, including severe neutropenia (most common), anemia, thrombocytopenia, leukopenia, aplastic anemia, pancytopenia, bone marrow suppression may occur. Retinal detachment occurs rarely. Overdose may result in renal toxicity.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function test; pregnancy test in females of reproductive potential. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression. Obtain ophthalmic exam q4–6wks during treatment. Monitor for change of vision (may indicate retinal detachment). Ensure adequate hydration (minimum of 1,500 mL/24 hrs). Monitor I&Os.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Therapy only provides viral suppression and is not a cure.
- Expect frequent eye exams if being treated for CMV retinitis. Report change of vision.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## abacavir/ dolutegravir/ lamivudine

a-bak-a-veer/dae-loo-teg-ra-vir/la-miv-yoo-deen  
(Triumeq)

**BLACK BOX ALERT** Serious, sometimes fatal hypersensitivity reactions, lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred with abacavir-containing products, esp. in pts who carry the HLA-B\*5701 allele. Restarting abacavir following a hypersensitivity reaction may be life-threatening. May cause hepatitis B virus reactivation.

**Do not confuse abacavir with entecavir, or dolutegravir with elvitegravir or raltegravir, or lamivudine with telbivudine or lamotrigine.**

### FIXED-COMBINATION(S)

abacavir/dolutegravir/lamivudine (antiretrovirals): 600 mg/50 mg/300 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Integrase inhibitor (INSTI), reverse transcriptase inhibitor, nucleoside.

**CLINICAL:** Antiretroviral.

### USES

Treatment of HIV-1 infection in adults and children weighing at least 40 kg.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to abacavir, dolutegravir, lamivudine. Pts who test positive for the HLA-B\*5701 allele. Concomitant use of dofetilide. Pts with moderate to severe hepatic impairment. **Cautions:** Diabetes, hepatic/renal impairment, coronary artery disease, history of hepatitis or tuberculosis, prior hypersensitivity reaction to INSTIs. Use in children with history of pancreatitis or risk factors for developing pancreatitis. Not recommended in

pts with resistance-associated integrase substitutions or clinically suspected integrase strand transfer inhibitor resistance; creatinine clearance less than 50 mL/min; mild hepatic impairment; children weighing less than 40 kg.

### ACTION

Abacavir inhibits activity of HIV-1 reverse transcriptase. Dolutegravir inhibits HIV integrase by blocking strand transfer step of retroviral DNA integration (essential for HIV replication cycle). Lamivudine inhibits reverse transcriptase by viral DNA chain termination. **Therapeutic Effect:** Interferes with HIV replication, slowing progression of HIV infection.

### PHARMACOKINETICS

Abacavir, lamivudine rapidly absorbed and widely distributed. Abacavir distributes into cerebrospinal fluid (CSF) and erythrocytes. Abacavir metabolized by alcohol dehydrogenase and glucuronyl transferase. Dolutegravir metabolized in liver. Protein binding: abacavir: 50%; dolutegravir: 98.9%; lamivudine: less than 36%. Peak plasma concentration: dolutegravir: 2–3 hrs. Excretion: abacavir: urine (primary); dolutegravir: feces (53%), urine (31%); lamivudine: urine (70%). **Half-life:** abacavir: 1.5 hrs; dolutegravir: 14 hrs; lamivudine: 5–7 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of postnatal HIV transmission. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts weighing less than 40 kg. **Elderly:** May have increased risk of adverse effects; worsening of hepatic, renal, cardiac function.

### INTERACTIONS

**DRUG:** Dolutegravir may increase concentration/effect of **dofetilide** (contraindicated). **Fosphenytoin, phenytoin, nevirapine, oxcarbazepine, phenobarbital, primidone** may decrease

concentration of dolutegravir. **Lamivudine** may increase adverse/toxic effects of **emtricitabine**. **HERBAL: St. John's wort** may decrease effect of dolutegravir. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, bilirubin, cholesterol, creatine kinase (CK), creatinine, glucose, lipase, triglycerides. May decrease Hgb, Hct, neutrophils.

## AVAILABILITY (Rx)

**Fixed-Dose Combination Tablet:** abacavir 600 mg/dolutegravir 50 mg/lamivudine 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer at least 2 hrs before or at least 6 hrs after giving medications containing aluminum, calcium, iron, magnesium (supplements, antacids, laxatives).

## INDICATIONS/ROUTES/DOSAGE

### HIV Infection

**PO: ADULTS, ELDERLY, CHILDREN WEIGHING 40 KG OR MORE:** 1 tablet once daily.

### Dosage in Renal Impairment

**Creatinine clearance less than 50 mL/min:** Not recommended.

### Dosage in Hepatic Impairment

**Mild impairment:** Consider use of individual components. **Moderate to severe impairment:** Contraindicated.

## SIDE EFFECTS

**Rare (3%–1%):** Insomnia, fatigue, headache, abdominal pain/distension, dyspepsia, flatulence, gastroesophageal reflux disease, fever, lethargy, anorexia, arthralgia, myositis, somnolence, pruritus, depression, abnormal dreams, dizziness, nausea, diarrhea, rash.

## ADVERSE EFFECTS/ TOXIC REACTIONS

Serious and sometimes fatal hypersensitivity reactions including anaphylaxis,

severe diarrhea, dyspnea, hypotension, intractable nausea/vomiting, multi-organ failure, pharyngitis may occur within the first 6 wks of treatment with abacavir (8% of pts). If therapy is discontinued, pts co-infected with hepatitis B or C virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré). Fatal cases of lactic acidosis, severe hepatomegaly with steatosis have been reported. Hepatic failure occurred in 1% of pts taking dolutegravir-containing products. Abacavir-containing products may increase risk of myocardial infarction, erythema multiform, Stevens-Johnson Syndrome, toxic epidermal necrolysis. May increase risk of pancreatitis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, CD4+ count, viral load, HIV-1 RNA level. Obtain weight in kilograms. Screen for HLA-B\*5701 allele, hepatitis B or C virus infection before initiating therapy. Question for prior hypersensitivity reactions (especially to abacavir-containing products); history of diabetes, coronary artery disease, hepatic/renal impairment. Receive full medication history, including herbal products. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT periodically. Immediately discontinue if hypersensitivity reaction is suspected, even when other diagnoses are possible (e.g., pneumonia, bronchitis, pharyngitis, influenza, gastroenteritis, reactions to other

medications). Stop treatment if 3 or more of the following symptoms occur: rash, fever, GI disturbances (diarrhea, nausea, vomiting), flu-like symptoms, respiratory distress. If hypersensitivity reaction is related to abacavir, do not restart treatment (may cause more severe reactions and/or death within hours). Assess for hepatic impairment (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). Screen for immune recovery syndrome, rhabdomyolysis (muscle weakness, myalgia, decreased urinary output). Pediatric pts should be closely monitored for symptoms of pancreatitis (severe, steady abdominal pain often radiating to the back; clammy skin, reduced B/P; nausea and vomiting accompanied by abdominal pain). Monitor daily stool pattern, consistency; I&Os. Assess dietary pattern; monitor for weight loss. Screen for toxic skin reactions. Monitor for symptoms of MI (jaw/chest/left arm pain or pressure, dyspnea, diaphoresis, vomiting).

#### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk; may cause decreased body fat in legs, arms, face.
- Drug resistance can form if therapy is interrupted for even a short time; do not run out of supply.
- Report signs of abdominal pain, darkened urine, decreased urine output, yellowing of skin or eyes, clay colored stools, weight loss.
- Do not breastfeed.
- Small, frequent meals may offset anorexia, nausea.
- Do not take newly prescribed medications, including OTC drugs, unless approved by doctor who originally started treatment.

## abaloparatide

a-bal-oh-par-a-tide  
(Tymlos)

**BLACK BOX ALERT** ■ May cause a dose-dependent increase in the incidence of osteosarcoma. It is unknown whether abaloparatide will cause osteosarcoma in humans. Avoid use in pts at risk for osteosarcoma (e.g., pts with Paget's disease of bone or unexplained elevations of alkaline phosphatase, pediatric and young adults with open epiphyses, pts with bone metastasis or skeletal malignancies, hereditary disorders predisposing to osteosarcoma, or prior history of external beam or implant radiation involving the skeleton. Cumulative use of parathyroid analogs (e.g., teriparatide) for more than 2 yrs during a pt's lifetime is not recommended.

**Do not confuse abaloparatide with teriparatide.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Parathyroid hormone receptor analog.

**CLINICAL:** Osteoporosis agent.

#### USES

Treatment of postmenopausal women with osteoporosis at high risk for fracture, defined as history of osteoporotic fracture, multiple risk factors for fracture, or pts who have failed or are intolerant to other osteoporosis therapy.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to abaloparatide. **Cautions:** Pts at risk for hypercalcemia (e.g., hyperparathyroidism, renal impairment, severe dehydration; history of hypercalciuria, urolithiasis). Avoid use in pts at increased risk for osteosarcoma (e.g., pts with Paget's disease of bone or unexplained elevations of alkaline phosphatase, open epiphyses,

bone or skeletal malignancies, hereditary disorders predisposing to osteosarcoma, prior radiation therapy involving the skeleton). Not recommended in pts with cumulative use of parathyroid analogs greater than 2 yrs during lifetime.

## ACTION

Acts as an agonist at the PTH1 receptor. **Therapeutic Effect:** Stimulates osteoblast function and increases bone mass, decreasing risk of fractures.

## PHARMACOKINETICS

Widely distributed. Metabolism not specified. Degraded into small peptides via proteolytic enzymes. Protein binding: 70%. Peak plasma concentration: 0.51 hrs. Excreted primarily in urine. Not expected to be removed by dialysis. **Half-life:** 1.7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not indicated in females of reproductive potential. Unknown if distributed in breast milk or crosses the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium, uric acid; urine calcium.

## AVAILABILITY (Rx)

**Prefilled Injector Pens:** 3120 mcg/1.56 mL (2000 mcg/mL). Delivers 30 doses of 80 mcg.

## ADMINISTRATION/HANDLING

### SQ

- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Insert needle subcutaneously into the periumbilical region of the abdomen (avoid a 2-inch area around the navel) and inject solution.
- Do not inject into areas of active skin disease or

injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.

- Do not administer IV or intramuscularly.
- Rotate injection sites.

**Storage**

- Refrigerate unused injector pens.
- After first use, store at room temperature for up to 30 days.
- Do not freeze or expose to heating sources.

## INDICATIONS/ROUTES/DOSAGE

### Postmenopausal Osteoporosis

**SQ: ADULTS, ELDERLY:** 80 mcg once daily. Give with supplemental calcium and vitamin D if dietary intake is inadequate.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Frequent (58%):** Injection site reactions (edema, pain, redness). **Occasional (10%–5%):** Dizziness, nausea, headache, palpitations. **Rare (3%–2%):** Fatigue, upper abdominal pain, vertigo.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of osteosarcoma. Hypercalcemia reported in 3% of pts. Tachycardia occurred in 2% of pts (usually within 15 min after injection). Orthostatic hypotension reported in 4% of pts (usually within 4 hrs after injection). Hypercalciuria and urolithiasis reported in 20% and 2% of pts, respectively. Immunogenicity (auto-abaloparatide antibodies) occurred in 49% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain parathyroid hormone level. Screen for risk of osteosarcoma, hypercalcemia (as listed in Precautions); prior use of parathyroid analogs. Assess pt's willingness to self-inject medication.

### INTERVENTION/EVALUATION

Monitor bone mineral density, parathyroid hormone level; serum calcium. Monitor

urinary calcium levels, esp. in pts with pre-existing hypercalciuria or active urolithiasis. Due to risk of orthostatic hypotension, administer the first several doses with the pt in the lying or sitting position. Monitor for orthostatic hypotension (dizziness, palpitations, tachycardia, nausea, syncope). If orthostatic hypotension occurs, place pt in supine position. Assess need for calcium, vitamin D supplementation.

#### PATIENT/FAMILY TEACHING

- Receive the first several injections while lying or sitting down. Slowly go from lying to standing to avoid an unusual drop in blood pressure. Immediately sit or lie down if dizziness, near-fainting, palpitations occur.
- Report symptoms of high calcium levels (e.g., constipation, lethargy, nausea, vomiting, weakness); severe bone pain.
- An increased heart rate may occur after injection and will usually subside within 6 hrs.
- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Vitamin D and calcium supplementation may be required if dietary intake is inadequate.

## abatacept

TOP  
100

a-bay-ta-sept  
(Orencia, Orencia ClickJect)

**Do not confuse Orencia with Orencia ClickJect**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective T-cell co-stimulation modulator.

**CLINICAL:** Antirheumatic; disease modifying.

#### USES

Reduction of signs and symptoms, progression of structural damage in adults with moderate to severe rheumatoid arthritis (RA) alone or in combination with

methotrexate. Treatment of active adult psoriatic arthritis. Treatment of moderate to severe active polyarticular juvenile idiopathic arthritis in pts 2 yrs and older. May use alone or in combination with methotrexate. **Note:** Do not use with anakinra or tumor necrosis factor [TNF] antagonists.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to abatacept. **Cautions:** Chronic, latent, or localized infection; conditions predisposing to infections (diabetes, indwelling catheters, renal failure, open wounds); COPD (higher incidence of adverse effects); elderly, hx recurrent infections.

#### ACTION

Inhibits T-cell (T-lymphocyte) activation (binds to CD80 and CD86 on antigen-presenting cells [APCs]; blocks CD28 interaction between APCs and T-cells). Activated T-cells are found in synovium of rheumatoid arthritic patients. **Therapeutic Effect:** Induces positive clinical response in adult pts with moderate to severely active RA or juvenile idiopathic arthritis.

#### PHARMACOKINETICS

Higher clearance with increasing body weight. Age, gender do not affect clearance. **Half-life:** 8–25 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** Cautious use due to increased risk of serious infection and malignancy.

#### INTERACTIONS

**DRUG:** Anakinra, anti-TNF agents, baricitinib, pimecrolimus, rituximab, tacrolimus (topical), tocilizumab may increase adverse effects. May decrease therapeutic effects of BCG (intravesical), vaccines (live). May increase concentration/effects of belimumab, natalizumab, tofacitinib, vaccines (live). **HERBAL:** Echinacea may decrease

## 6 abatacept

concentration/effect. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**IV Injection, Powder for Reconstitution:** 250 mg. **SQ Injection, Solution:** 50 mg/0.4 mL, 87.5 mg/0.7 mL, 125 mg/mL single-dose prefilled syringe.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute each vial with 10 mL Sterile Water for Injection using the silicone-free syringe provided with each vial and an 18- to 21-gauge needle. • Rotate solution gently to prevent foaming until powder is completely dissolved. • From a 100-mL 0.9% NaCl infusion bag, withdraw and discard an amount equal to the volume of the reconstituted vials (for 2 vials remove 20 mL, for 3 vials remove 30 mL, for 4 vials remove 40 mL), resulting in final volume of 100 mL. • Slowly add the reconstituted solution from each vial into the infusion bag using the same syringe provided with each vial. • Concentration in the infusion bag will be 10 mg/mL or less abatacept.

**Rate of administration** • Infuse over 30 min using a 0.2 to 1.2 micron low protein-binding filter.

**Storage** • Store vials, prefilled syringes in refrigerator. • Any reconstitution that has been prepared by using siliconized syringes will develop translucent particles and must be discarded. • Solution should appear clear and colorless to pale yellow. Discard if solution is discolored or contains precipitate. • Solution is stable for up to 24 hrs after reconstitution. • Reconstituted solution may be stored at room temperature or refrigerated.

**SQ**

• Allow syringe to warm to room temperature (30–60 min). • Inject in front of thigh, outer areas of upper arms, or abdomen. • Avoid areas that are tender, bruised, red, scaly, or hard. • Do

not rub injection site. • Rotate injection sites.

**IV INCOMPATIBILITIES**

Do not infuse concurrently in same IV line as other agents.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Discontinue in pts developing serious infection.

**Rheumatoid Arthritis (RA), Psoriatic Arthritis (PsA)**

**IV: ADULTS, ELDERLY WEIGHING 101 KG OR MORE:** 1 g (4 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter. **WEIGHING 60–100 KG:** 750 mg (3 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter. **WEIGHING 59 KG OR LESS:** 500 mg (2 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter.

**SQ: (RA):** Following a single IV infusion, 125 mg given within 24 hrs of infusion, then 125 mg once a week (SQ administration may be initiated without an IV loading dose). **(PsA):** Give without an IV loading dose. 125 mg once weekly. **Transitioning from IV to SQ:** Give 1st SQ dose instead of next scheduled IV dose.

**Juvenile Idiopathic Arthritis**

**Note:** Dose based on body weight at each administration.

**IV: CHILDREN 6 YRS AND OLDER, WEIGHING LESS THAN 75 KG:** 10 mg/kg. **CHILDREN WEIGHING 75–100 KG:** 750 mg. **WEIGHING MORE THAN 100 KG:** 1,000 mg. Following initial therapy, give 2 wks and 4 wks after first infusion, then q4wks thereafter.

**SQ: CHILDREN 2 YRS AND OLDER, ADOLESCENTS WEIGHING 50 KG OR MORE:** 125 mg once weekly. **WEIGHING 25–49 KG:** 87.5 mg once weekly. **WEIGHING 10–24 KG:** 50 mg once weekly.

**Dosage Adjustment for Toxicity**

Discontinue in pts developing a serious infection.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (18%):** Headache. **Occasional (9%–6%):** Dizziness, cough, back pain, hypertension, nausea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Upper respiratory tract infection, nasopharyngitis, sinusitis, UTI, influenza, bronchitis occur in 5% of pts. Serious infections, including pneumonia, cellulitis, diverticulitis, acute pyelonephritis, occur in 3% of pts. Hypersensitivity reaction (rash, urticaria, hypotension, dyspnea) occurs rarely. May increase risk of malignancies.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joint for immobility, deformities, skin condition. Screen for latent TB infection prior to initiating therapy.

**INTERVENTION/EVALUATION**

Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for hypersensitivity reaction. Diligently screen for infection.

**PATIENT/FAMILY TEACHING**

- Notify physician if infection, hypersensitivity reaction, infusion-related reaction occurs.
- Do not receive live vaccines during treatment or within 3 mos of its discontinuation.
- COPD pts must report worsening of respiratory symptoms.

**abemaciclib**

a-bem-a-sye-klib  
(Verzenio)

**Do not confuse abemaciclib with palbociclib or ribociclib.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Cyclin-dependent kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Used in combination with an aromatase inhibitor as initial endocrine-based therapy for treatment of postmenopausal women with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer. Used in combination with fulvestrant for treatment of women with HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression following endocrine therapy. Used as monotherapy for treatment of adults with HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression following endocrine therapy and prior chemotherapy in the metastatic setting. Adjuvant treatment of HR-positive, HER2-negative, node-positive early breast cancer (in combination with endocrine therapy [e.g., an aromatase inhibitor or tamoxifen]) in adults at high risk of recurrence.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to abemaciclib. **Cautions:** Baseline cytopenias; hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, open wounds), history of venous thromboembolism. Avoid concomitant use of strong CYP3A inhibitors, strong CYP3A inducers.

**ACTION**

Blocks retinoblastoma tumor suppressor protein phosphorylation and prevents progression through cell cycle, resulting in arrest of G1 phase. **Therapeutic Effect:** Inhibits tumor cell growth and decreases tumor size.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 96.3%. Peak plasma con-

centration: 8 hrs. Steady-state reached in 5 days. Excreted in feces (81%), urine (3%). **Half-life:** 18.3 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential should use effective contraception during treatment and up to 3 wks after discontinuation. Unknown if distributed in breast milk. Breast-feeding not recommended during treatment and up to 3 wks after discontinuation. May impair fertility in males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., erythromycin, diltiazem, dronedarone, fluconazole) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease effect of BCG (intravesical), vaccines (live). May enhance adverse/toxic effects of natalizumab, vaccines (live). Pimecrolimus, tacrolimus may enhance adverse/toxic effects. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin, creatinine. May decrease ANC, Hgb, Hct, lymphocytes, leukocytes, neutrophils, platelets.

### AVAILABILITY (Rx)

**Tablets:** 50 mg, 100 mg, 150 mg, 200 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Administer whole; do not crush, cut, or divide tablets. Do not give broken or cracked tablets.
- If a dose is missed or vomiting occurs, do not give extra dose. Administer next dose at regularly scheduled time.

### INDICATIONS/ROUTES/DOSAGE

#### Breast Cancer

**PO: ADULTS, ELDERLY: Monotherapy:** 200 mg twice daily. **In combination with fulvestrant (and a gonadotropin-releasing hormone agonist if pre- or perimenopausal) or an aromatase inhibitor:** 150 mg twice daily. Continue until disease progression or unacceptable toxicity. Recommended dose of fulvestrant is 500 mg once on days 1, 15, 29, then monthly thereafter.

#### Breast Cancer (adjuvant therapy)

**PO: ADULTS, ELDERLY:** 150 mg twice daily (in combination with endocrine therapy [e.g., an aromatase inhibitor or tamoxifen]). Continue until completion of 2 yrs of treatment or until disease recurrence or unacceptable toxicity.

#### Dose Reduction for Adverse Events

**Monotherapy:** Starting dose: 200 mg twice daily. **FIRST DOSE REDUCTION:** 150 mg twice daily. **SECOND DOSE REDUCTION:** 100 mg twice daily. **THIRD DOSE REDUCTION:** 50 mg twice daily. **In combination with fulvestrant or an aromatase inhibitor:** **STARTING DOSE:** 150 mg twice daily. **FIRST DOSE REDUCTION:** 100 mg twice daily. **SECOND DOSE REDUCTION:** 50 mg twice daily.

#### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

#### Diarrhea

**Note:** At first sign of loose stools, recommend treatment with antidiarrheal agents and hydration.

**Grade 1 diarrhea:** No dose adjustment. **Grade 2 diarrhea:** If toxicity does not resolve to Grade 1 or less within 24 hrs, withhold treatment until resolved. Then resume at same dose level. **Recurrent or persistent Grade 2 diarrhea at same dose level despite supportive measures:** Withhold treatment until recovery to Grade 1 or less, then resume at reduced dose level. **Grade 3 or 4 diarrhea or**

**required hospitalization:** Withhold treatment until recovery to Grade 1 or less, then resume at reduced dose level.

#### **Hematologic Toxicity**

**Grade 1 or 2 hematologic toxicity:** No dose adjustment. **Grade 3 hematologic toxicity:** Withhold treatment until recovery to Grade 2 or less, then resume at same dose level. **Grade 3 (recurrent) or Grade 4 hematologic toxicity:** Withhold treatment until recovery to Grade 2 or less, then resume at reduced dose level.

#### **Hepatotoxicity**

**Grade 1 or 2 hepatotoxicity without serum bilirubin elevation greater than 2 times ULN:** No dose adjustment. **Recurrent or persistent Grade 2 hepatotoxicity; Grade 3 hepatotoxicity without serum bilirubin elevation greater than 2 times ULN:** Withhold treatment until recovery to Grade 1 or less, then resume at reduced dose level. **Serum ALT, AST elevation greater than 3 times ULN with serum bilirubin elevation greater than 2 times ULN (in the absence of cholestasis); Grade 4 hepatotoxicity:** Permanently discontinue.

#### **Other Toxicities**

**Any other Grade 1 or 2 toxicities:** No dose adjustment. **Recurrent or persistent Grade 2 toxicity that does not resolve to Grade 1 (or baseline) within 7 days despite supportive measures:** Withhold treatment until recovery to Grade 1 or less, then resume at reduced dose level. **Any other Grade 3 or 4 toxicities:** Withhold treatment until resolved to Grade 1 or less, then resume at reduced dose level.

#### **Concomitant Use of Strong CYP3A Inhibitors**

If strong CYP3A inhibitor cannot be discontinued, reduce initial dose to 100 mg twice daily if pt taking 200 mg or 150 mg twice daily regimen. If dose was already reduced to 100 mg twice daily due to adverse effects, reduce dose to 50 mg twice daily. If CYP3A inhibitor is discontinued, increase dose (after 3–5 half-lives of CYP3A inhibi-

tor have elapsed) to the dose used prior to initiating strong CYP3A inhibitor.

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified.

#### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Reduce dose frequency to once daily.

### **SIDE EFFECTS**

**Note:** Side effects may vary if pt treated concomitantly with an aromatase inhibitor.

**Frequent (90%–35%):** Diarrhea, fatigue, asthenia, nausea, decreased appetite, abdominal pain, vomiting. **Occasional (20%–10%):** Headache, cough, constipation, arthralgia, dry mouth, decreased weight, stomatitis, dysgeusia, alopecia, dizziness, pyrexia, dehydration.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, leukopenia, neutropenia, thrombocytopenia is an expected response to therapy. Diarrhea occurred in 81–90% of pts. Grade 3 diarrhea occurred in 9–20% of pts. Diarrhea may increase risk of dehydration and infection. Neutropenia reported in 37–41% of pts. Grade 3 or 4 hepatotoxicity occurred in up to 4% of pts. Venous thromboembolism including cerebral venous thrombosis, subclavian and axillary vein thrombosis, inferior vena cava thrombosis, DVT, PE, pelvic venous thrombosis reported in 5% of pts taking concomitant aromatase inhibitor therapy. Infections including upper respiratory infection, UTI, pulmonary infection occurred in 39% of pts taking concomitant aromatase inhibitor therapy.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm HR-positive, HER2-negative status. Stress importance of antidiarrheal if diarrhea occurs. Question history of hepatic

impairment, venous thromboembolism. Question usual bowel movement patterns, stool characteristics. Receive full medication history and screen for interactions. Screen for active infection. Assess hydration status. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression; LFT for hepatotoxicity q2wks for first 2 mos, then monthly for 2 mos, then as clinically indicated. Monitor for hepatotoxicity (abdominal pain, ascites, confusion, dark-colored urine, jaundice). Monitor daily pattern of bowel activity, stool consistency. Ensure compliance of antiarrheal therapy if diarrhea occurs. If treatment-related toxicities occur, consider referral to specialist. Be alert for serious infection, opportunistic infection, sepsis. Monitor for venous thromboembolism (arm/leg pain, swelling; chest pain, dyspnea, hypoxia, tachycardia). Ensure adequate hydration, nutrition. Monitor weight, I&Os.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause severe diarrhea, which may lead to dehydration and infection. Drink plenty of fluids. Take antiarrheal medication as prescribed at the first sign of loose stools.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs), lung embolism (difficulty breathing, chest pain, rapid heart rate); liver problems (bruising, contusion; amber, dark, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes).
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Do not ingest grapefruit products.

## abiraterone

TOP  
100

a-bir-a-ter-one  
(Yonsa, Zytiga)

**Do not confuse Zytiga with Zetia or ZyrTEC.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-androgen. **CLINICAL:** Antineoplastic.

#### USES

Treatment of metastatic castration-resistant prostate cancer in combination with prednisone (Zytiga) or methylprednisolone (Yousa). Treatment of metastatic, high-risk castration-sensitive prostate cancer (in combination with prednisone).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to abiraterone. Use in women who are pregnant or may become pregnant. **Cautions:** History of cardiovascular disease (especially HF, recent MI, or ventricular arrhythmia) due to potential for hypertension, hypokalemia, fluid retention; moderate hepatic impairment; adrenal insufficiency. Avoid use with strong CYP3A4 inducers.

#### ACTION

Selectively and irreversibly inhibits CYP17, an enzyme needed for androgen biosynthesis (expressed in testicular, adrenal, or prostatic tumor tissue). Inhibits formation of testosterone precursors DHEA and androstenedione. **Therapeutic Effect:** Lowers serum testosterone to castrate levels.

#### PHARMACOKINETICS

Protein binding: 99%. Primarily excreted in feces. Peak plasma concentration: 2 hrs. **Half-life:** 12 hrs (up to 19 hrs with hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated in women who are or may become pregnant. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **doxorubicin (conventional)**, **thioridazine**. May decrease concentration/effect of **tamoxifen**. **CYP3A4 inducers** (e.g., **carbamazepine**, **ketocoazole**, **ritonavir**), **dabrafenib**, **enzalutamide**, **lorlatinib** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** Do not give with **food** (no **food** should be consumed for at least 2 hrs before or 1 hr after dose). **LAB VALUES:** May increase serum ALT, AST, bilirubin, triglycerides. May decrease serum potassium, phosphate.

## AVAILABILITY (Rx)

 **Tablets:** (*Yonsa*): 125 mg. (*Zytiga*): 250 mg, 500 mg.

## ADMINISTRATION/HANDLING

### PO

- (*Yonsa*): May give without regard to food.
- Do not break, crush, dissolve, or divide tablets. Give whole with water.
- (*Zytiga*): Give on empty stomach only (at least 1 hr before or 2 hrs after food).
- Give with water.
- Administer whole. Do not break, crush, dissolve, or divide tablets. Women who are or may become pregnant should wear gloves if handling the tablets.

## INDICATIONS/ROUTES/DOSAGE

 **ALERT** Consider increased dosage of predniSONE during unusual stress or infection. Interrupting predniSONE therapy may induce adrenocorticoid insufficiency.

### Metastatic Castration-Resistant Prostate Cancer

**PO: ADULTS, ELDERLY:** (*Yonsa*): 500 mg once daily (with methylPREDNISolone 4 mg 2 times/day). (*Zytiga*): 1,000 mg once daily (with predniSONE 5 mg 2 times/day).

## Dosage Modification

### Hepatic Enzymes Greater Than Upper Limit of Normal (ULN) (During Treatment)

Lab Values	Recommendation
ALT, AST elevations greater than 5 × ULN or bilirubin greater than 3 × ULN with 1,000 mg	Interrupt treatment and restart at 750 mg once ALT, AST less than 2.5 × ULN or bilirubin less than 1.5 × ULN.
ALT, AST elevations greater than 5 × ULN or bilirubin greater than 3 × ULN with 750 mg	Interrupt treatment and restart at 500 mg once ALT, AST less than 2.5 × ULN or bilirubin less than 1.5 × ULN.

If hepatotoxicity occurs at reduced dose of 500 mg daily, discontinue treatment.

### Dosage Adjustment for Concomitant Strong CYP3A4 Inducers

Increase abiraterone dose to 1,000 mg twice daily.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dosage adjustment necessary. **Moderate impairment:** Reduce dose to 250 mg daily. Discontinue if serum ALT, AST greater than 5 times ULN or serum bilirubin greater than 3 times ULN. **Severe impairment:** Avoid use.

## SIDE EFFECTS

**Frequent (30%–26%):** Joint swelling/discomfort, peripheral edema, muscle spasm, musculoskeletal pain, hypokalemia. **Occasional (19%–6%):** Hot flashes, diarrhea, UTI, cough, hypertension, urinary frequency, nocturia. **Rare (less than 6%):** Heartburn, upper respiratory tract infection.

## ADVERSE EFFECTS/TOXIC REACTIONS

Mineralocorticoid excess (severe fluid retention, hypokalemia, hypertension) may compromise pts with prior cardiovascular history. Safety not established in pts with left ventricular ejection fraction less than 50%. Tachycardia, atrial fibrillation, supraventricular tachycardia, atrial

## 12 **acalabrutinib**

flutter, complete AV block, bradyarrhythmia reported in 7% of pts. Chest pain, unstable angina, HF reported in less than 4% of pts. Stress, infection, or interruption of daily steroids may cause adrenocortical insufficiency. Hepatotoxicity (serum ALT, AST greater than 5 times ULN) reported in 2% of pts. Pts with hepatic impairment are more likely to develop hepatotoxicity.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain BMP, LFT. Question history of HE, myocardial infarction, arrhythmias, angina pectoris, peripheral edema, hepatic impairment, adrenal or pituitary abnormalities, left ventricular ejection fraction (if applicable). Question history of corticosteroid intolerance if applicable.

#### **INTERVENTION/EVALUATION**

Monitor BMP, LFT. Monitor for mineralocorticoid excess (hypokalemia, hypertension, fluid retention) at least once monthly. Assess for cardiac arrhythmia if hypokalemia occurs. Obtain ECG for palpitations, dyspnea, dizziness. Monitor for symptoms of adrenocortical insufficiency during predniSONE interruption, periods of stress, infection. Measure serum ALT, AST, alkaline phosphatase, bilirubin every 2 wks for 3 mos, then monthly. If hepatotoxicity occurs, dosage modification will be necessary. Pts with moderate hepatic impairment must have LFT every wk for first month, then every 2 wks for 2 mos, then monthly. If serum ALT, AST above 5 times ULN or serum bilirubin above 3 times ULN, treatment should be discontinued.

#### **PATIENT/FAMILY TEACHING**

- Must be taken on empty stomach (no food 2 hrs before and 1 hr after dose).
- If taken with food, toxic levels may result.
- Sexually active men must wear condoms during treatment and for 1 wk after treatment.
- Women who are pregnant or are planning pregnancy may not touch medication without gloves.
- Dizziness, palpitations, headache, confusion, muscle weakness, leg

swelling/discomfort may become more apparent during periods of unusual stress, infection, or interruption of predniSONE therapy.

- Blood tests will be performed routinely.
- Report signs of liver problems (yellowing of skin, bruising, light-colored stool, right upper quadrant pain), chest pain, palpitations.
- An increase in urinary frequency or nocturia is expected as treatment becomes therapeutic.
- Do not chew, crush, dissolve, or divide tablets.

## **acalabrutinib**

a-kal-a-broo-ti-nib  
(Calquence)

**Do not confuse acalabrutinib with afatinib, cabozantinib, ibrutinib, or lenvatinib.**

### **◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bruton tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### **USES**

Treatment of adults with mantle cell lymphoma (MCL) who have received at least one prior therapy. Treatment of adults with chronic lymphocytic leukemia or small lymphocytic lymphoma.

### **PRECAUTIONS**

**Contraindications:** Hypersensitivity to acalabrutinib. **Cautions:** Baseline cytopenias; active infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of atrial fibrillation, atrial flutter; pts at risk for hemorrhage (e.g., history of intracranial/GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, antiplatelets, NSAIDS).

### **ACTION**

Inhibits enzymatic activity of Bruton tyrosine kinase (BTK); a signaling molecule

that activates the pathways necessary for B-cell proliferation. **Therapeutic Effect:** Decreases malignant B-cell proliferation and tumor growth.

## PHARMACOKINETICS

Rapidly absorbed and widely distributed. Metabolized in liver. Protein binding: 97.5%. Peak plasma concentration: 0.75 hrs. Steady-state maintained over 12 hrs. Excreted in feces (84%), urine (12%). **Half-life:** 0.9 hrs (metabolite: 6.9 hrs).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., erythromycin, diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease effect of BCG (intravesical), vaccines (live). May enhance adverse/toxic effects of natalizumab, vaccines (live). Pimecrolimus, tacrolimus may enhance adverse/toxic effects. **HERBAL:** Echinacea may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, platelets, neutrophils.

## AVAILABILITY (Rx)

**Capsules:** 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer whole with a glass of water; do not break, cut, or open capsule.
- If a

dose is missed, may administer dose up to 3 hrs after regularly scheduled time. If more than 3 hrs have elapsed, do not give dose. Administer next dose at regularly scheduled time. • Give at least 2 hrs before aluminum-, magnesium-, or calcium-containing antacids, H2-receptor antagonists.

## INDICATIONS/ROUTES/DOSAGE

### Mantle Cell Lymphoma

**PO: ADULTS, ELDERLY:** 100 mg approximately q12h. Continue until disease progression or unacceptable toxicity.

### Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma

**PO: ADULTS, ELDERLY: (Single-agent therapy):** 100 mg q12h. Continue until disease progression or unacceptable toxicity. **(Combination therapy with obinutuzumab):** 100 mg q12h. Continue until disease progression or unacceptable toxicity. Begin acalabrutinib at cycle 1 (28-day cycle); obinutuzumab given for 6 cycles beginning at cycle 2.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Grade 3 or 4 nonhematologic toxicities; Grade 3 thrombocytopenia with bleeding; Grade 4 thrombocytopenia; Grade 4 neutropenia lasting longer than 7 days: First and second occurrence:** Withhold treatment until recovery to Grade 1 or baseline, then resume at 100 mg twice daily. **Third occurrence:** Withhold treatment until recovery to Grade 1 or baseline, then resume at 100 mg once daily. **Fourth occurrence:** Permanently discontinue.

### Concomitant Use of Strong CYP3A Inhibitors

Avoid use. If short-term treatment with CYP3A inhibitor is unavoidable (e.g., anti-infectives for up to 7 days), withhold acalabrutinib until strong CYP3A inhibitor is discontinued.

### **Concomitant Use of Moderate CYP3A Inhibitors**

Decrease frequency to 100 mg once daily.

### **Concomitant Use of Strong CYP3A Inducers**

If strong CYP3A inducer cannot be discontinued, increase acalabrutinib dose to 200 mg twice daily.

### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### **Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## **SIDE EFFECTS**

**Frequent (39%–18%):** Headache, diarrhea, fatigue, myalgia, bruising, nausea, rash.

**Occasional (15%–13%):** Abdominal pain, constipation, vomiting.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, neutropenia, thrombocytopenia is an expected response to therapy. Serious and sometimes fatal hemorrhagic events including intracranial hemorrhage, GI bleeding, epistaxis occurred in 2% of pts. Petechiae, bruising reported in 50% of pts. Serious bacterial, viral, fungal infections occurred in 18% of pts. Infections due to hepatitis B virus reactivation was reported. New primary malignancies including skin cancer (7% of pts), nonskin carcinomas (11% of pts) have occurred. Progressive Multifocal Leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Atrial fibrillation/atrial flutter reported in 3% of pts.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain ANC, CBC; PT/INR if on anticoagulation; pregnancy test in females of reproductive potential. Screen for active infection. Question history of atrial fibrillation, atrial flutter; intracranial/GI bleed-

ing, coagulation disorders, recent trauma; previous skin cancers. Conduct baseline dermatological exam and assess skin for open/unhealed wounds, lesions, moles. Question current breastfeeding status. Receive full medication history and screen for interactions. Offer emotional support.

### **INTERVENTION/EVALUATION**

Monitor CBC periodically for cytopenias. Closely monitor for HBV reactivation; symptoms of PML (altered mental status, seizures, visual disturbances, generalized or unilateral weakness). Obtain ECG if chest pain, dyspnea, palpitations occur. Be alert for serious infection, opportunistic infection, sepsis; nonskin carcinomas. Monitor for hemorrhagic events including intracranial hemorrhage (altered mental status, aphasia, blindness, hemiparesis, unequal pupils, seizures), GI bleeding (hematemesis, melena, rectal bleeding), epistaxis. Assess skin for new lesions, moles. Ensure adequate hydration.

### **PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities and death. Report symptoms of PML, brain hemorrhage such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- Treatment may cause new cancers, heart arrhythmias (chest pain, dizziness, fainting, palpitations, slow or rapid heart rate, irregular heart rate), reactivation of HBV.
- Immediately report bleeding of any kind.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Do not ingest grapefruit products.

## acetaminophen TOP 100

a-seet-a-min-oh-fen

(Feverall, Mapap, Ofirmev, Tylenol, Tylenol 8HR Arthritis Pain, Tylenol Children's, Tylenol Infants, Tylenol Extra Strength)

**BLACK BOX ALERT** Potential for severe liver injury. Acetaminophen injection associated with acute liver failure.

**Do not confuse Acephen with Aciphex, Feverall with Fiberall, Fioricet with Fiorinal, Percocet with Percodan, Tylenol with atenolol, timolol, Tylenol PM, or Tylox, or Vicodin with Hycodan.**

### FIXED-COMBINATION(S)

**Codeine: Tablet:** acetaminophen/codeine 300 mg/15 mg, 300 mg/30 mg, 300 mg/60 mg. **Hydrocodone: Elixir:** acetaminophen/hydrocodone 300 mg/10 mg/15 mL. **Tablet:** acetaminophen/hydrocodone 300 mg/5 mg, 300 mg/7.5 mg, 300 mg/10 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Central analgesic. **CLINICAL:** Nonnarcotic analgesic, antipyretic.

### USES

**Fever:** Temporary reduction of fever.

**Pain: Injection:** Management of mild to moderate pain in pts greater than or equal to 2 yrs of age; management of moderate to severe pain when combined with an opioid in pts greater than or equal to 2 yrs.

**Oral, Rectal:** Temporary relief of mild to moderate pain and headache.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to acetaminophen, severe hepatic impairment or severe active liver disease.

**Cautions:** Sensitivity to acetaminophen; severe renal impairment; alcohol dependency, hepatic impairment, or active hepatic disease; chronic malnutrition and hypovolemia (Ofirmev); G6PD deficiency (hemolysis may occur). Limit dose to less than 4 g/day.

### ACTION

Analgesic: Activates descending serotonergic inhibitory pathways in CNS. Antipyretic: Inhibits hypothalamic heat-regulating center. **Therapeutic Effect:** Results in antipyresis. Produces analgesic effect.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	Less than 60 min	1–3 hrs	4–6 hrs

Rapidly, completely absorbed from GI tract; rectal absorption variable. Protein binding: 20%–50%. Widely distributed to most body tissues. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 1–4 hrs (increased in pts with hepatic disease, elderly, neonates; decreased in children).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Routinely used in all stages of pregnancy; appears safe for short-term use. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Alcohol (chronic use), hepatotoxic medications (e.g., phenytoin), strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may increase risk of hepatotoxicity with prolonged high dose or single toxic dose. **Dasatinib, probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** Food may decrease rate of absorption. **LAB VALUES:** May increase serum ALT, AST, bilirubin; prothrombin levels (may indicate hepatotoxicity).

### AVAILABILITY (OTC)

**Capsules:** 325 mg, 500 mg. **Elixir:** 160 mg/5 mL. **Injection, Solution (Ofirmev):** 1,000 mg/100 mL glass vial. **Liquid (Oral):** 160 mg/5 mL. **Solution (Oral Drops):** 80 mg/0.8 mL. **Suppository:** 80 mg, 120 mg, 325 mg, 650 mg. **Suspension:** 160 mg/5 mL. **Syrup:** 160 mg/5 mL. **Tablets:** 325 mg, 500 mg. **Tablets (Chewable):** 80 mg.

**Tablets (Extended-Release):** 650 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Does not require further dilution. • Store at room temperature. • Withdraw doses less than 1,000 mg. • Place in separate empty, sterile container.

**Rate of administration** • Infuse over 15 min.

**Stability** • Once opened or transferred, stable for 6 hrs at room temperature.

## PO

• Give without regard to food. • Tablets may be crushed. • Do not crush extended-release caplets. • Suspension: Shake well before use. • Take with full glass of water.

## Rectal

• Moisten suppository with cold water before inserting well up into rectum. • Do not freeze suppositories.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Over-the-counter (OTC) use of acetaminophen should be limited to 3,000 mg/day.

## Analgesia and Antipyresis

**IV: ADULTS, ELDERLY, ADOLESCENTS WEIGHING 50 KG OR MORE:** 1,000 mg q6h or 650 mg q4h. **Maximum single dose:** 1,000 mg; **maximum total daily dose:** 4,000 mg. **ADULTS, ADOLESCENTS WEIGHING LESS THAN 50 KG:** 15 mg/kg q6h or 12.5 mg/kg q4h. **Maximum single dose:** 750 mg; **maximum total daily dose:** 75 mg/kg/day (3,750 mg). **CHILDREN 2-12 YRS:** 15 mg/kg q6h or 12.5 mg/kg q4h. **Maximum single dose:** 750 mg. **Maximum:** 75 mg/kg/day, not to exceed 3,750 mg/day. **INFANTS AND CHILDREN LESS THAN 2 YRS (FEVER ONLY):** 7.5-15 mg/kg q6h. **Maximum:** 60 mg/kg/day. **NEONATES (FEVER ONLY):** (Limited data available) Loading dose: 20 mg/kg. **PMA 37 or greater than 37 wks:** 10 mg/kg/

dose q6h. **Maximum:** 40 mg/kg/day. **PMA 33-36 wks:** 10 mg/kg/dose q8h. **Maximum:** 40 mg/kg/day. **PMA 28-32 wks:** 10 mg/kg/dose q12h or 7.5 mg/kg/dose q8h. **Maximum:** 22.5 mg/kg/day.

**PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** (Regular Strength) 325-650 mg q4-6h. **Maximum:** 3,250 mg/day unless directed by healthcare provider. **Extra Strength:** 1000 mg q6h. **Maximum:** 3,000 mg/day unless directed by healthcare provider. **Extended-Release:** 1300 mg q8h. **Maximum:** 3,900 mg/day. **CHILDREN 12 YRS AND YOUNGER:** (Weight dosing preferred; if not available, use age. Doses may be repeated q4h. **Maximum:** 5 doses/day.)

Age	Weight (Kg)	Dose
11-12 yrs	32.7-43.2	480 mg
9-10 yrs	27.3-32.6	325-400 mg
6-8 yrs	21.8-27.2	320 mg
4-5 yrs	16.4-21.7	240 mg
2-3 yrs	10.9-16.3	160 mg
1-<2 yrs	8.2-10.8	120 mg
4-11 mos	5.4-8.1	80 mg
0-3 mos	2.7-5.3	40 mg

**NEONATES:** Term: 10-15 mg/kg/dose q4-6h. **Maximum:** 75 mg/kg/day. **GA 33-37 wks or term less than 10 days:** 10-15 mg/kg/dose q6h. **Maximum:** 60 mg/kg/day. **GA 28-32 wks:** 10-12 mg/kg/dose q6-8h. **Maximum:** 40 mg/kg/day.

**Rectal: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 325-650 mg q4-6h. **Maximum:** 4 g/24 hrs. **CHILDREN: (7-11 YRS):** 325 mg q4-6h. **Maximum:** 1,625 mg/day. **(4-6 YRS):** 120 mg q4-6h. **Maximum:** 600 mg/day. **(1-3 YRS):** 80 mg q4-6h. **Maximum:** 400 mg/day. **(6-11 mos):** 80 mg q6h. **Maximum:** 320 mg/day. **NEONATES:** Term: Initially, 30 mg/kg/once, then 20 mg/kg/dose q6-8h. **Maximum:** 75 mg/kg/day. **GA 33-37 wks or term less than 10 days:** Initially, 30 mg/kg once, then 15 mg/kg/

dose q8h. **Maximum:** 60 mg/kg/day.  
**GA 28–32 wks:** 20 mg/kg/dose q12h.  
**Maximum:** 40 mg/kg/day.

### Dosage in Renal Impairment

Creatinine Clearance	Frequency
----------------------	-----------

#### Oral

10–50 mL/min	q6h
Less than 10 mL/min	q8h
Continuous renal replacement therapy	q6h

#### IV

30 mL/min or less (use caution, decrease daily dose, extend dosing interval)

### Dosage in Hepatic Impairment

Use with caution. IV contraindicated in pts with severe impairment.

## SIDE EFFECTS

**Rare:** Hypersensitivity reaction.

## ADVERSE EFFECTS/TOXIC REACTIONS

**Early Signs of Acetaminophen Toxicity:** Anorexia, nausea, diaphoresis, fatigue within first 12–24 hrs. **Later Signs of Toxicity:** Vomiting, right upper quadrant tenderness, elevated LFTs within 48–72 hrs after ingestion. **Antidote:** Acetylcysteine (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

If given for analgesia, assess onset, type, location, duration of pain. Effect of medication is reduced if full pain response recurs prior to next dose. Assess for fever. Assess LFT in pts with chronic usage or history of hepatic impairment, alcohol abuse.

### INTERVENTION/EVALUATION

Assess for clinical improvement and relief of pain, fever. **Therapeutic serum level:** 10–30 mcg/mL; **toxic serum level:** greater than 200 mcg/mL. Do not exceed maximum daily recommended dose: 4 g/day.

## PATIENT/FAMILY TEACHING

- Consult physician for use in children younger than 2 yrs, oral use longer than 5 days (children) or longer than 10 days (adults), or fever lasting longer than 3 days.
- Severe/recurrent pain or high/continuous fever may indicate serious illness.
- Do not take more than 4 g/day (3 g/day if using OTC [over-the-counter]). Actual OTC dosing recommendations may vary by product and/or manufacturer. Many nonprescription combination products contain acetaminophen. Avoid alcohol.

## acetylcysteine

a-seet-il-sis-teen  
 (Acetadote, Parvolex )

**Do not confuse acetylcysteine with acetylcholine.**

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Respiratory inhalant, intratracheal. **CLINICAL:** Mucolytic, antidote.

## USES

**Inhalation:** Adjunctive treatment for abnormally viscid mucous secretions present in acute and chronic bronchopulmonary disease and in pulmonary complications of cystic fibrosis and surgery, diagnostic bronchial studies. **Injection, PO:** Antidote in acute acetaminophen toxicity.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to acetylcysteine. **Cautions:** Pts with bronchial asthma; debilitated pts with severe respiratory insufficiency (increases risk of anaphylactoid reaction).

## ACTION

Mucolytic splits linkage of mucoproteins, reducing viscosity of pulmonary

18 **acetylcysteine**

secretions. Acetaminophen toxicity: Hepatoprotective by restoring hepatic glutathione and enhancing nontoxic sulfate conjugation of acetaminophen.

**Therapeutic Effect:** Facilitates removal of pulmonary secretions by coughing, postural drainage, mechanical means. Protects against acetaminophen overdose-induced hepatotoxicity.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Inhalation Solution:** 10% (100 mg/mL), 20% (200 mg/mL). **Injection Solution:** (*Acetadote*): 20% (200 mg/mL).

### ADMINISTRATION/HANDLING

The total dose is 300 mg/kg administered over 21 hrs. Dose preparation is based on pt weight. Total volume administered should be adjusted for pts less than 40 kg and for pts requiring fluid restriction. Store unopened vials at room temperature. Following dilution in D<sub>5</sub>W, solution is stable for 24 hrs at room temperature. Color change of opened vials may occur (does not affect potency).

**Three-Bag Method (as Antidote): Loading, Second, and Third Doses, Pts Weighing 40 kg or More**

Loading dose: 150 mg/kg in 200 mL of diluent administered over 60 min.  
Second dose: 50 mg/kg in 500 mL of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 1,000 mL of diluent administered over 16 hrs.

**Pts Weighing More Than 20 kg but Less Than 40 kg**

Loading dose: 150 mg/kg in 100 mL of diluent administered over 60 min.

Second dose: 50 mg/kg in 250 mL of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 500 mL of diluent administered over 16 hrs.

**Pts Weighing Less Than or Equal to 20 kg**

Loading dose: 150 mg/kg in 3 mL/kg of body weight of diluent administered over 60 min.

Second dose: 50 mg/kg in 7 mL/kg of body weight of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 14 mL/kg of body weight of diluent administered over 16 hrs.

### PO

- For treatment of acetaminophen overdose.
- Give as 5% solution.
- Dilute 20% solution 1:3 with cola, orange juice, other soft drink.
- Give within 1 hr of preparation.

### Inhalation, Nebulization

- 20% solution may be diluted with 0.9% NaCl or sterile water; 10% solution may be used undiluted.

### IV COMPATIBILITIES

Cefepime (Maxipime), cefTAZidime (Fortaz).

### INDICATIONS/ROUTES/DOSAGE

#### Bronchopulmonary Disease

#### Inhalation, Nebulization

**⚠️ ALERT ⚠️** Bronchodilators should be given 10–15 min before acetylcysteine.  
**ADULTS, ELDERLY, CHILDREN:** 3–5 mL (20% solution) 3–4 times/day or 6–10 mL (10% solution) 3–4 times/day.  
Range: 1–10 mL (20% solution) q2–6h

or 2–20 mL (10% solution) q2–6h.  
**INFANTS:** 1–2 mL (20%) or 2–4 mL (10%) 3–4 times/day.

**Intratracheal: ADULTS, CHILDREN:** 1–2 mL of 10% or 20% solution instilled into tracheostomy q1–4h.

### Acetaminophen Overdose

**◀ALERT▶** It is essential to initiate treatment as soon as possible after overdose and, in any case, within 24 hrs of ingestion.

**PO: (Oral Solution 5%): ADULTS, ELDERLY, CHILDREN:** Loading dose of 140 mg/kg, followed in 4 hrs by maintenance dose of 70 mg/kg q4h for 17 additional doses (or until acetaminophen assay reveals nontoxic level). Repeat dose if emesis occurs within 1 hr of administration.

**IV: ADULTS, ELDERLY, CHILDREN:** (Consists of 3 doses. Total Dose: 300 mg/kg.) 150 mg/kg infused over 60 min, then 50 mg/kg infused over 4 hrs, then 100 mg/kg infused over 16 hrs (see Administration/Handling for dilution).

**WEIGHING MORE THAN 100 KG:** (Consists of 3 doses. Total Dose: 30 g.) 15 g over 60 min; 5 g over 4 hrs; 10 g over 16 hrs. Duration of administration may vary depending on acetaminophen levels and LFTs obtained during treatment. Pts who still have detectable levels of acetaminophen or elevated LFT results continue to benefit from additional acetylcysteine administration beyond 24 hrs.

### Diagnostic Bronchial Studies

**Inhalation, Nebulization: ADULTS:** 1–2 mL of 20% solution or 2–4 mL of 10% solution 2–3 times before the procedure.

### SIDE EFFECTS

**IV: (10%):** Nausea, vomiting. (7%–6%): Acute flushing, erythema. (4%): Pruritus. **Frequent: Inhalation:** Stickiness on face, transient unpleasant odor.

**Occasional: Inhalation:** Increased

bronchial secretions, throat irritation, nausea, vomiting, rhinorrhea. **Rare: Inhalation:** Rash. **PO:** Facial edema, bronchospasm, wheezing, nausea, vomiting.

### ADVERSE EFFECTS/TOXIC REACTIONS

Large doses may produce severe nausea/vomiting. (**Less than 2%:**) Serious anaphylactoid reactions including cough, wheezing, stridor, respiratory distress, bronchospasm, hypotension, and death have been known to occur with IV administration.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

**Mucolytic:** Assess pretreatment respirations for rate, depth, rhythm. **IV antidote:** Obtain baseline LFT, PT/INR, and drug screen. For use as antidote, obtain acetaminophen level to determine need for treatment with acetylcysteine.

#### INTERVENTION/EVALUATION

If bronchospasm occurs, discontinue treatment, notify physician; bronchodilator may be added to therapy. Monitor rate, depth, rhythm, type of respiration (abdominal, thoracic). Observe sputum for color, consistency, amount.

**IV antidote:** Administer within 8 hrs of acetaminophen ingestion for maximal hepatic protection; ideally, within 4 hrs after immediate-release and 2 hrs after liquid acetaminophen formulations.

#### PATIENT/FAMILY TEACHING

- Slight, disagreeable sulfuric odor from solution may be noticed during initial administration but disappears quickly.
- Adequate hydration is important part of therapy.
- Follow guidelines for proper coughing and deep breathing techniques.
- Auscultate lung sounds.

## acyclovir

a-sye-klo-veer

(Apo-Acyclovir , Zovirax)

**Do not confuse acyclovir with ganciclovir, Retrovir, or valACYclovir, or Zovirax with Doribax, Valtrex, Zithromax, Zostrix, Zylprim, or Zyvox.**

### FIXED-COMBINATION(S)

**Lipsovir:** acyclovir/hydrocortisone (a steroid): 5%/1%.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic nucleoside. **CLINICAL:** Antiviral.

## USES

### Parenteral

Treatment of initial and prophylaxis of recurrent mucosal and cutaneous herpes simplex virus (HSV-1 and HSV-2) in immunocompromised pts. Treatment of severe initial episodes of herpes genitalis in immunocompetent pts. Treatment of herpes simplex encephalitis including neonatal herpes simplex virus. Treatment of herpes zoster (shingles) in immunocompromised pts.

### Oral

Treatment of initial episodes and prophylaxis of recurrent herpes simplex (HSV-2 genital herpes). Treatment of chickenpox (varicella). Acute treatment of herpes zoster (shingles).

**OFF-LABEL:** (Parenteral/Oral): Prevention of HSV reactivation in HIV-positive pts; hematopoietic stem cell transplant (HSCT); during periods of neutropenia in pts with cancer; prevention of VZV reactivation in allogeneic HSCT; treatment of disseminated HSC or VZV in immunocompromised pts with cancer; empiric treatment of suspected encephalitis in immunocompromised pts with cancer; treatment of initial and prophylaxis of recurrent mucosal and cutaneous herpes simplex infections in immunocompromised pts.

### Topical

**Cream:** Treatment of recurrent herpes labialis (cold sores) in immunocompetent pts. **Ointment:** Management of initial genital herpes. Treatment of mucocutaneous HSV in immunocompromised pts.

## PRECAUTIONS

**Contraindications:** Use in neonates when acyclovir is reconstituted with Bacteriostatic Water for Injection containing benzyl alcohol. Hypersensitivity to acyclovir, valACYclovir. **Cautions:** Immunocompromised pts (thrombocytopenic purpura/hemolytic uremic syndrome reported); elderly, renal impairment, use of other nephrotoxic medications. **IV Use:** Pts with underlying neurologic abnormalities, serious hepatic/electrolyte abnormalities, substantial hypoxia.

## ACTION

Acyclovir is converted to acyclovir triphosphate, which competes for viral DNA polymerase, becoming part of DNA chain. **Therapeutic Effect:** Inhibits DNA synthesis and viral replication. Virustatic.

## PHARMACOKINETICS

15%–30% absorbed from GI tract. Bioavailability: 10%–20%; minimal absorption following topical application. Protein binding: 9%–36%. Widely distributed. Partially metabolized in liver. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 2.5 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs (younger than 1 yr for IV use). **Elderly:** Age-related renal impairment may require decreased dosage. May experience more neurologic effects (e.g., agitation, confusion, hallucinations).

## INTERACTIONS

**DRUG:** **Foscarnet** may increase nephrotoxic effect. May increase

adverse effects of **tizanidine**. May decrease therapeutic effect of **Vari-cella virus vaccine**, **zoster vaccine**. **HERBAL**: None significant. **FOOD**: None known. **LAB VALUES**: May increase serum ALT, AST, BUN, creatinine.

### AVAILABILITY (Rx)

**Cream**: 5%. **Injection, Solution**: 50 mg/mL. **Ointment**: 5%. **Oral Suspension**: 200 mg/5 mL. **Tablets**: 400 mg, 800 mg.

 **Capsules**: 200 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • Dilute with at least 100 mL D<sub>5</sub>W or 0.9 NaCl. Final concentration should be 7 mg/mL or less. (Concentrations greater than 10 mg/mL increase risk of phlebitis.)

**Rate of administration** • Infuse over at least 1 hr (nephrotoxicity due to crystalluria and renal tubular damage may occur with too-rapid rate). • Maintain adequate hydration during infusion and for 2 hrs following IV administration.

**Storage** • Store vials at room temperature. • IV infusion (piggyback) stable for 24 hrs at room temperature.

#### PO

• May give without regard to food. • Do not crush/break capsules. • Store capsules at room temperature.

#### Topical

**Ointment** • Avoid contact with eye. • Use finger cot/rubber glove to prevent autoinoculation.

**Cream** • Apply to cover only cold sores or area with symptoms. • Rub until it disappears.

### IV INCOMPATIBILITIES

Aztreonam (Azactam), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), levoFLOxacina (Levaquin), meropenem (Merrem IV), ondansetron

(Zofran), piperacillin, and tazobactam (Zosyn).

### IV COMPATIBILITIES

Allopurinol (Alloprim), amikacin (Amikin), ampicillin, ceFAZolin (Ancef), cefotaxime (Claforan), ceTAZidime (Fortaz), ceTRIAXone (Rocephin), cimetidine (Tagamet), clindamycin (Cleocin), diphenhydrAMINE (Benadryl), famotidine (Pepcid), fluconazole (Diflucan), gentamicin, heparin, HYDROMorphone (Dilaudid), imipenem (Primaxin), LO-Razepam (Ativan), magnesium sulfate, methylPREDNISolone (SOLU), metoclopramide (Reglan), metroNIDAZOLE (Flagyl), morphine, multivitamins, potassium chloride, propofol (Diprivan), ranITidine (Zantac), vancomycin.

### INDICATIONS/ROUTES/DOSAGE

#### Genital Herpes (Initial Episode)

**IV: ADULTS, ELDERLY**: 5–10 mg/kg q8h for 2–7 days. Followed with oral therapy to complete at least 10 days of therapy.

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER**: 200 mg q4h 5 times/day or 400 mg 3 times/day for 7–10 days. **CHILDREN YOUNGER THAN 12 YRS**: 40–80 mg/kg/day in 3–4 divided doses for 7–10 days.

**Maximum**: 1,200 mg/day.

**Topical: ADULTS: (Ointment)**: 0.5 inch for 4-inch square surface q3h (6 times/day) for 7 days.

#### Genital Herpes (Recurrent)

##### Intermittent Therapy

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER**: 400 mg 3 times/day for 5 days or 800 mg 2 times/day for 5 days or 800 mg 3 times/day for 2 days. **CHILDREN YOUNGER THAN 12 YRS**: 20 mg/kg 3 times/day for 5 days. **Maximum**: 400 mg/dose.

##### Chronic Suppressive Therapy

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER**: 400 mg 2 times/day for up to 12 mos. **CHILDREN YOUNGER THAN 12 YRS**: 20 mg/kg twice daily. **Maximum**: 400 mg/dose.

22 **acyclovir****Herpes Simplex Mucocutaneous**

**PO: ADULTS, ELDERLY:** 400 mg 3 times/day or 200 mg 5 times/day for 7–10 days.

**CHILDREN:** 20 mg/kg 4 times/day for 5–7 days. **Maximum:** 800 mg/dose.

**IV: ADULTS, ELDERLY, CHILDREN:** 5 mg/kg/dose q8h for 7–14 days.

**Topical: ADULTS: (Ointment):** 0.5 inch for 4-inch square surface q3h (6 times/day) for 7 days.

**Herpes Simplex Encephalitis**

**IV: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 10 mg/kg q8h for 14–21 days. **CHILDREN 3 MOS–YOUNGER THAN 12 YRS:** 10–15 mg/kg q8h for 14–21 days.

**Herpes Zoster (Shingles)**

**IV: ADULTS, CHILDREN 12 YRS AND OLDER:** (immunocompromised) 10 mg/kg/dose q8h for 10–14 days. **CHILDREN YOUNGER THAN 12 YRS:** (immunocompromised) 10 mg/kg/dose q8h for 7–10 days.

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 800 mg q4h 5 times/day for 7–10 days.

**Herpes Labialis (Cold Sores)**

**Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Apply to affected area 5 times/day for 4 days. **Buccal Tablet:** 50 mg as a single dose to upper gum region.

**Varicella-Zoster (Chickenpox)**

**◀ALERT▶** Begin treatment within 24 hrs of onset of rash.

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS AND CHILDREN 2–12 YRS, WEIGHING 40 KG OR MORE:** 800 mg 5 times/day for 5–7 days. **CHILDREN 2–12 YRS, WEIGHING LESS THAN 40 KG:** 20 mg/kg 4 times/day for 5 days. **Maximum:** 800 mg/dose.

**Usual Neonatal Dosage**

**HSV (treatment) (IV):** 20 mg/kg/dose q8–12h for 14–21 days.

**HSV (chronic suppression) (PO):** 300 mg/m<sup>2</sup>/dose q8h – (after completing a 14–21 day course of IV therapy) for 6 mos.

**Varicella-Zoster (IV):** 10–15 mg/kg/dose q8h for 5–10 days.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on severity of infection and degree of renal impairment.

**PO:** Normal dose 200 mg q4h, 200 mg q8h, or 400 mg q12h. **Creatinine clearance 10 mL/min and less:** 200 mg q12h.

**PO:** Normal dose 800 mg q4h. **Creatinine clearance greater than 25 mL/min:** Give usual dose and at normal interval, 800 mg q4h. **Creatinine clearance 10–25 mL/min:** 800 mg q8h. **Creatinine clearance less than 10 mL/min:** 800 mg q12h.

**IV:**

**Creatinine Clearance**

Creatinine Clearance	Dosage
Greater than 50 mL/min	100% of normal q8h
25–50 mL/min	100% of normal q12h
10–24 mL/min	100% of normal q24h
Less than 10 mL/min	50% of normal q24h
Hemodialysis (HD)	2.5–5 mg/kg q24h (give after HD)
Peritoneal dialysis (PD)	50% normal dose q24h
Continuous renal replacement therapy (CRRT)	5–10 mg/kg q12–24h (q12h for viral meningoencephalitis/VZV infection)

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

**SIDE EFFECTS**

**Frequent: Parenteral (9%–7%):** Phlebitis or inflammation at IV site, nausea, vomiting. **Topical (28%):** Burning, stinging. **Occasional: Parenteral (3%):** Pruritus, rash, urticaria. **PO (12%–6%):** Malaise, nausea. **Topical (4%):** Pruritus. **Rare: PO (3%–1%):** Vomiting, rash, diarrhea, headache. **Parenteral (2%–1%):** Confusion, hallucinations, seizures,

tremors. **Topical (less than 1%):** Rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Rapid parenteral administration, excessively high doses, or fluid and electrolyte imbalance may produce renal failure. Toxicity not reported with oral or topical use.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, esp. to acyclovir. Assess herpes simplex lesions before treatment to compare baseline with treatment effect.

### INTERVENTION/EVALUATION

Assess IV site for phlebitis (heat, pain, red streaking over vein). Evaluate cutaneous lesions. Ensure adequate ventilation. Manage chickenpox and disseminated herpes zoster with strict isolation. Encourage fluid intake.

### PATIENT/FAMILY TEACHING

- Drink adequate fluids.
- Do not touch lesions with bare fingers to prevent spreading infection to new site.
- Continue therapy for full length of treatment.
- Space doses evenly.
- Use finger cot/rubber glove to apply topical ointment.
- Avoid sexual intercourse during duration of lesions to prevent infecting partner.
- Acyclovir does not cure herpes infections.
- Pap smear should be done at least annually due to increased risk of cervical cancer in women with genital herpes.

infections have occurred. Test for tuberculosis prior to and during treatment. Lymphoma, other malignancies reported in children/adolescents. Hepatosplenic T-cell lymphoma reported primarily in pts with Crohn's disease or ulcerative colitis and concomitant azaTHIO-prine or mercaptopurine.

**Do not confuse Humira with HumaLOG or HumuLIN, or adalimumab with sarilumab.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Monoclonal antibody. **CLINICAL:** Antirheumatic, disease modifying; GI agent; TNF blocking agent.

## USES

Reduces signs/symptoms, progression of structural damage and improves physical function in adults with moderate to severe RA. May be used alone or in combination with other disease-modifying antirheumatic drugs. First-line treatment of moderate to severe RA, treatment of psoriatic arthritis, treatment of ankylosing spondylitis, to induce/maintain remission of moderate to severe active Crohn's disease, moderate to severe plaque psoriasis in pts 6 yrs of age and older. Reduces signs and symptoms of moderate to severe active polyarticular juvenile rheumatoid arthritis in pts 2 yrs and older. Treatment of moderately to severely active ulcerative colitis in adults and pediatric pts 5 yrs of age and older. Treatment of moderate to severe hidradenitis suppurativa. Treatment of uveitis (noninfectious intermediate, posterior and panuveitis) in adults.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to adalimumab. Severe infections (e.g., sepsis, TB). **Cautions:** Pts with chronic infections or pts at risk for infections (e.g., diabetes, indwelling catheters, renal failure, open wounds), elderly, decreased left ventricular function, HF, demyelinating disorders, invasive fungal infections, history of malignancies.

## adalimumab

TOP  
100

a-da-lim-ue-mab  
(Humira)

**BLACK BOX ALERT** ■ Increased risk for serious infections. Tuberculosis, invasive fungal infections, bacterial and viral opportunistic

**ACTION**

Binds specifically to tumor necrosis factor (TNF) alpha cell, blocking its interaction with cell surface TNF receptors and cytokine-driven inflammatory processes.

**Therapeutic Effect:** Decreases signs/symptoms of RA, psoriatic arthritis, ankylosing spondylitis, Crohn's disease, ulcerative colitis. Inhibits progression of rheumatoid and psoriatic arthritis. Reduces epidermal thickness, inflammation of plaque psoriasis.

**PHARMACOKINETICS**

Metabolism not specified. Elimination not specified. **Half-life:** 10–20 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Cautious use due to increased risk of serious infection and malignancy.

**INTERACTIONS**

**DRUG:** May increase the adverse effects of **abatacept, anakinra, belimumab, canakinumab, natalizumab, tofacitinib, vaccines (live), vedolizumab.**

May decrease the therapeutic effect of **BCG (intravesical), vaccines (live).**

May increase the immunosuppressive effects of **certolizumab, infliximab.**

**Tocilizumab** may increase immunosuppressive effect. **HERBAL:** **Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, other lipids, alkaline phosphatase.

**AVAILABILITY (Rx)**

**Injection Solution:** 10 mg/0.2 mL, 20 mg/0.4 mL, 40 mg/0.8 mL, 40 mg/0.4 mL, 80 mg/0.8 mL in prefilled syringes.

**ADMINISTRATION/HANDLING****SQ**

- Refrigerate; do not freeze.
- Discard unused portion.
- Rotate injection sites.

Give new injection at least 1 inch from an old site and never into area where skin is

tender, bruised, red, or hard. • Give in thigh or lower abdomen. • Avoid areas within 2 inches of navel.

**INDICATIONS/ROUTES/DOSAGE****Rheumatoid Arthritis (RA)**

**SQ: ADULTS, ELDERLY:** 40 mg every other wk. Dose may be increased to 40 mg/wk or 80 mg every other wk in pts not taking methotrexate.

**Ankylosing Spondylitis, Psoriatic Arthritis**

**SQ: ADULTS, ELDERLY:** 40 mg every other wk (may continue methotrexate, other nonbiologic DMARDS, corticosteroids, NSAIDs, and/or analgesics).

**Crohn's Disease**

**SQ: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER WEIGHING 40 KG OR MORE:** Initially, 160 mg given as 4 injections on day 1 or 2 injections/day over 2 days, then 80 mg 2 wks later (day 15). **Maintenance:** 40 mg every other wk beginning at day 29. **CHILDREN 6 YRS AND OLDER WEIGHING 17–39 KG:** 80 mg (2 40-mg injections on day 1), then 40 mg 2 wks later. **Maintenance:** 20 mg every other wk beginning at day 29.

**Plaque Psoriasis, Uveitis**

**SQ: ADULTS, ELDERLY:** Initially, 80 mg as a single dose, then 40 mg every other wk starting 1 wk after initial dose.

**Juvenile Rheumatoid Arthritis**

**SQ: CHILDREN 2 YRS AND OLDER, WEIGHING 10–14 KG:** 10 mg every other wk. **WEIGHING 15–29 KG:** 20 mg every other wk. **WEIGHING 30 KG OR MORE:** 40 mg every other wk.

**Ulcerative Colitis**

**SQ: ADULTS, ELDERLY:** Initially, 160 mg (4 injections in 1 day or 2 injections over 2 consecutive days), then 80 mg 2 wks later (day 15), then 40 mg every other wk beginning on day 29. **CHILDREN 5 YRS AND OLDER, WEIGHING 40 KG OR MORE:** Initially, 160 mg on day 1 (administered as full dose on day 1 or as a split dose given over 2 consecutive days), then 80 mg wkly for 2 wks (on day 8 and day 15). **Maintenance**

(beginning day 29): 80 mg q2wks or 40 mg every wk. **WEIGHING 20–39 KG:** Initially, 80 mg on day 1, then 40 mg given wkly for 2 wks (a dose on day 8 and day 15). Maintenance (beginning day 29): 40 mg q2wks or 20 mg every wk.

### Hidradenitis Suppurativa

**SQ: ADULTS, ELDERLY:** Initially, 160 mg (4 injections day 1) or 80 mg (2 injections on days 1 and 2), then 80 mg 2 wks later (day 15), then 40 mg weekly or 80 mg every other wk beginning day 29.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (20%):** Injection site erythema, pruritus, pain, swelling. **Occasional (12%–9%):** Headache, rash, sinusitis, nausea. **Rare (7%–5%):** Abdominal or back pain, hypertension.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions (rash, urticaria, hypotension, dyspnea), infections (primarily upper respiratory tract, bronchitis, urinary tract) occur rarely. May increase risk of serious infections (pneumonia, tuberculosis, cellulitis, pyelonephritis, septic arthritis). May increase risk of reactivation of hepatitis B virus in pts who are chronic carriers. May cause new-onset or exacerbation of central nervous demyelinating disease; worsening and new-onset HE. May increase risk of malignancies. Immunogenicity (anti-adalimumab autoantibodies) occurred in 12% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess onset, type, location, duration of pain or inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Review immunization status/screening for TB. If pt is to self-administer, instruct on SQ injection technique, including areas of the body acceptable for injection sites.

### INTERVENTION/EVALUATION

Monitor lab values, particularly CBC. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

- Injection site reaction generally occurs in first month of treatment and decreases in frequency during continued therapy.
- Do not receive live vaccines during treatment.
- Report rash, nausea.
- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication.

## ado-trastuzumab emtansine

ado-tras-**tooz**-oo-mab  
(Kadcyla)

**BLACK BOX ALERT** Do not substitute ado-trastuzumab for trastuzumab. Hepatotoxicity, hepatic failure may lead to death. Monitor hepatic function prior to each dose. May decrease left ventricular ejection fraction (LVEF). Embryo-fetal toxicity may result in birth defects and/or fetal demise.

**Do not confuse ado-trastuzumab with trastuzumab.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-HER2. Antibody drug conjugate. Antimicrotubular. Monoclonal antibody.  
**CLINICAL:** Antineoplastic.

### USES

Treatment of HER2-positive, metastatic breast cancer in pts who have previously received trastuzumab and a taxane agent separately or in combination, or pts who have developed recurrence within 6 mos of completing adjuvant therapy. Treatment (single agent) of human epidermal growth factor receptor 2 (HER2)-positive

early breast cancer in pts with residual invasive disease after taxane and trastuzumab-based treatment.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to trastuzumab. **Cautions:** History of cardiomyopathy, HE, MI, arrhythmias, hepatic disease, thrombocytopenia, pulmonary disease, peripheral neuropathy, pregnancy.

## ACTION

Binds to HER2 receptor and undergoes receptor-mediated lysosomal degradation, resulting in intracellular release of DM1-containing cytotoxic catabolites. Binding of DM1 to tubulin disrupts microtubule networks in the cell. **Therapeutic Effect:** Inhibits tumor cell survival in HER2-positive breast cancer.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: 93%. Peak plasma concentration: 30–90 min. **Half-life:** 4 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease the therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **belimumab**, **natalizumab**, **vaccines (live)**. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease platelets, serum potassium.

## AVAILABILITY (Rx)

**Lyophilized Powder for Injection:** 100-mg vial, 160-mg vial.

## ADMINISTRATION/HANDLING

**ALERT** Use 0.22-micron in-line filter. Do not administer IV push or bolus.

**Reconstitution** • Use proper chemotherapy precautions. • Slowly inject 5 mL of Sterile Water for Injection into 100-mg vial or 8 mL Sterile Water for Injection for 160-mg vial. • Final concentration: 20 mg/mL. • Gently swirl until completely dissolved. • Do not shake. • Inspect for particulate matter/discoloration. • Calculate dose from 20 mg/mL vial. • Further dilute in 250 mL of 0.9% NaCl only. • Invert bag to mix (do not shake).

**Rate of administration** • Infuse using 0.22-micron in-line filter. • Infuse initial dose over 90 min. • Infuse subsequent doses over 30 min. • Slow or interrupt infusion rate if hypersensitivity reaction occurs.

**Storage** • Refrigerate unused vials. • Reconstituted vials, diluted solutions should be used immediately (may be refrigerated for up to 24 hrs).

## IV INCOMPATIBILITIES

Do not use dextrose-containing solutions.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Do not substitute with conventional trastuzumab (Herceptin).

### Metastatic Breast Cancer

**IV infusion: ADULTS/ELDERLY:** 3.6 mg/kg every 3 wks until disease progression or unacceptable toxicity. **Maximum:** 3.6 mg/kg.

### Breast Cancer, Early, HER2 Positive, Adjuvant Therapy

**IV infusion: ADULTS/ELDERLY:** 3.6 mg/kg q3wks for 14 cycles (in the absence of disease recurrence or unacceptable toxicity). **Maximum:** 3.6 mg/kg.

**Dose Modification****Reduction Schedule for Adverse Effects**

Initial dose: 3.6 mg/kg. First reduction: 3 mg/kg. Second reduction: 2.4 mg/kg.

**Hepatotoxicity**

**Elevated serum ALT, AST:** If less than 5 times upper limit of normal (ULN), continue same dose. If 5–20 times ULN, hold until less than 5 times ULN and reduce by one dose level. If greater than 20 times ULN, discontinue. **Elevated serum bilirubin:** Hold until less than 1.5 times ULN, then continue same dose. If 3–10 times ULN, hold until less than 1.5 times ULN, then reduce by one dose level. If greater than 10 times ULN, discontinue.

**Cardiotoxicity**

**Left ventricular dysfunction:** If LVEF greater than 45%, continue same dose. If LVEF 40%–45% with a decrease less than 10% from baseline, continue dose (or reduce) and repeat LVEF in 3 wks. If LVEF 40%–45% with decrease greater than 10% from baseline, hold and repeat assessment in 3 wks. Discontinue therapy if no recovery within 10% of baseline, LVEF less than 40%, or symptomatic HF.

**Thrombocytopenia**

**Platelet count 25,000–50,000 cells/mm<sup>3</sup>:** Withhold treatment until improved to 75,000 cells/mm<sup>3</sup>, then continue same dose. **Platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until improved to 75,000 cells/mm<sup>3</sup>, then reduce dose level.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (40%–21%):** Nausea, fatigue, musculoskeletal pain, headache, constipation, diarrhea. **Occasional (19%–7%):** Abdominal pain, vomiting, pyrexia, arthralgia, asthenia, cough, dry mouth, stomatitis, myalgia, insomnia, rash, dizziness, dyspepsia, chills, dysgeusia, peripheral edema. **Rare (6%–3%):** Pruritus, blurry vision, dry eye, conjunctivitis, lacrimation.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hepatotoxicity may include elevated transaminase, nodular regenerative hyperplasia, portal hypertension. Left ventricular dysfunction reported in 1.8% of pts. Interstitial lung disease (ILD), including pneumonitis, may lead to ARDS. Hypersensitivity reactions reported in 1.4% of pts. Thrombocytopenia (34% of pts) may increase risk of bleeding. Peripheral neuropathy observed rarely. Approx. 5.3% of pts tested positive for anti-ado-trastuzumab antibodies (immunogenicity).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP; PT/INR if on anticoagulants. Confirm HER2-positive titer. Screen for baseline HF, hepatic impairment, peripheral edema, pulmonary disease, thrombocytopenia. Obtain negative pregnancy test before initiating treatment. Question current breastfeeding status. Obtain baseline echocardiogram for LVEF status.

**INTERVENTION/EVALUATION**

Monitor LFT, potassium levels before and during treatment. Obtain LVEF q3mos or with any dose reduction regarding LVEF status. Observe for hypersensitivity reactions during infusion. Assess for bruising, jaundice, right upper quadrant (RUQ) abdominal pain. Obtain anti-ado-trastuzumab antibody titer if immunogenicity suspected. Obtain stat ECG for palpitations or irregular pulse, chest X-ray for difficulty breathing, cough, fever. Monitor for neurotoxicity (peripheral neuropathy).

**PATIENT/FAMILY TEACHING**

- Report black/tarry stools, RUQ abdominal pain, nausea, bruising, yellowing of skin or eyes, difficulty breathing, palpitations, bleeding.
- Avoid alcohol.
- Treatment may reduce the heart's ability to pump; expect routine echocardiograms.
- Report bleeding of any kind or extremity numbness, tingling, weakness, pain.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## afatinib

a-fa-ti-nib  
(Gilotrif)

**Do not confuse afatinib with ibrutinib, dasatinib, gefitinib, or SUNItinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor. Tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

First-line treatment of metastatic non-small-cell lung cancer (NSCLC) in pts with epidermal growth factor (EGF) exon 19 deletions or exon 21 (L858R) substitution mutations. Treatment of metastatic, squamous NSCLC progressing after platinum-based chemotherapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to afatinib. **Cautions:** Hepatic impairment; severe renal impairment; pts with hx of keratitis, severe dry eye, ulcerative keratitis, or use of contact lenses; hypovolemia; pulmonary disease; ulcerative lesions. Patients with GI disorders associated with diarrhea (e.g., Crohn's disease), cardiac risk factors, and/or decreased left ventricular ejection fraction.

### ACTION

Highly selective blocker of ErbB family (e.g., EGFR, HER2); irreversibly binds to intracellular tyrosine kinase domain. **Therapeutic Effect:** Inhibits tumor growth, causes tumor regression.

### PHARMACOKINETICS

Widely distributed. Enzymatic metabolism is minimal. Protein binding: 95%. Peak plasma concentration: 2–5 hrs. Excreted in feces (85%), urine (4%). **Half-life:** 37 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** P-glycoprotein inhibitors (e.g., amiodarone, cycloSPORINE, ketoconazole) may increase concentration/effect. P-glycoprotein inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** High-fat meals may decrease absorption. **LAB VALUES:** May increase serum ALT, AST. May decrease serum potassium.

### AVAILABILITY (Rx)

**Tablets:** 20 mg, 30 mg, 40 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give at least 1 hr before or 2 hrs after meal. Do not take missed dose within 12 hrs of next dose.

### INDICATIONS/ROUTES/DOSAGE

**Metastatic NSCLC, Metastatic Squamous NSCLC**

**PO: ADULTS/ELDERLY:** Initially, 40 mg once daily until disease progression or no longer tolerated. Do not take missed dose within 12 hrs of next dose.

#### Dose Modification

**Chronic use of P-glycoprotein (P-gp) inhibitors:** Reduce daily dose by 10 mg. Resume previous dose after discontinuation of inhibitor if tolerated. **Chronic use of P-glycoprotein inducers:** Increase daily dose by 10 mg if tolerated. May resume initial dose 2–3 days after discontinuation of P-gp inducer. **Moderate to severe diarrhea (more than 48 hrs):** Withhold dose until resolution to mild diarrhea. **Moderate cutaneous skin reaction (more than**

**7 days):** Withhold dose until reaction resolves, then reduce dose appropriately. **Suspected keratitis:** Withhold until appropriately ruled out. If keratitis confirmed, continue only if benefits outweigh risks.

#### **Permanent Discontinuation**

Discontinue if persistent severe diarrhea, respiratory distress, severe dry eye, or life-threatening bullous, blistering, exfoliating lesions, persistent ulcerative keratitis, interstitial lung disease, symptomatic left ventricular dysfunction occurs.

#### **Dosage in Renal/Hepatic Impairment**

**eGFR 15–29 mL/min:** Decrease dose to 30 mg. **Severe impairment:** Avoid use.

### **SIDE EFFECTS**

**Frequent (96%–58%):** Diarrhea, rash, dermatitis, stomatitis, paronychia (nail infection). **Occasional (31%–11%):** Dry skin, decreased appetite, pruritus, epistaxis, weight loss, cystitis, pyrexia, cheilitis (lip inflammation), rhinorrhea, conjunctivitis.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Diarrhea may lead to severe, sometimes fatal, dehydration or renal impairment. Bullous and exfoliative skin lesions occur rarely. Rash, erythema, acneiform lesions occur in 90% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, has been reported. Interstitial lung disease (ILD), including pulmonary infiltration, pneumonitis, ARDS, allergic alveolitis, reported in 2% of pts. Hepatotoxicity reported in 10% of pts. Keratitis symptoms, such as eye inflammation, lacrimation, light sensitivity, blurred vision, red eye, occurred in 1% of pts.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain CBC, BMP, visual acuity. Obtain negative pregnancy test before initiating therapy. Question current breastfeeding

status. Screen for history/comorbidities, contact lens use. Receive full medication history, including herbal products. Assess skin for lesions, ulcers, open wounds.

#### **INTERVENTION/EVALUATION**

Monitor renal/hepatic function tests, urine output. Encourage PO intake. Assess for hydration status. Offer antidiarrheal medication for loose stool. Report oliguria, dark or concentrated urine. Immediately report skin lesions, vision changes, dry eye, severe diarrhea. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess skin for dermal changes, toxicities.

#### **PATIENT/FAMILY TEACHING**

- Most pts experience diarrhea, and severe cases may lead to dehydration or kidney failure; maintain adequate hydration.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output.
- Minimize exposure to sunlight.
- Immediately report eye problems (pain, swelling, blurred vision, vision changes) or skin blistering/redness.
- Do not wear contact lenses (may increase risk of keratitis).

## **albumin**

#### **al-bue-min**

(Albuked-5, Albuked-25, AlbuRx, Albutein, Flexbumin, Kedbumin, Plasbumin-5, Plasbumin-25)

**Do not confuse albumin or Albutein with albuterol, or Buminate with bumetanide.**

#### **◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Plasma protein fraction. **CLINICAL:** Blood derivative.

## USES

Hypovolemia plasma volume expansion, maintenance of cardiac output in treatment of shock or impending shock. May be useful in treatment of ovarian hyperstimulation syndrome, acute/severe nephrosis, cirrhotic ascites, adult respiratory distress syndrome (ARDS), cardiopulmonary bypass, hemodialysis. **OFF-LABEL:** Large-volume paracentesis. In cirrhotics, with diuretics to help facilitate diuresis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to albumin. Pts at risk for volume overload (e.g., severe anemia, HF, renal insufficiency). Dilution with Sterile Water for Injection may cause hemolysis or acute renal failure. **Cautions:** Pts for whom sodium restriction is necessary, hepatic/renal failure (added protein load). Avoid 25% concentration in preterm infants (risk of intraventricular hemorrhage).

## ACTION

Blood volume expander. **Therapeutic Effect:** Provides increase in intravascular oncotic pressure, mobilizes fluids into intravascular space.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	15 min (in well-hydrated pt)	N/A	Dependent on initial blood volume

Distributed throughout extracellular fluid. **Half-life:** 15–20 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase.

## AVAILABILITY (Rx)

**Injection Solution: (5%):** 50 mL, 250 mL, 500 mL. **(25%):** 20 mL, 50 mL, 100 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • A 5% solution may be made from 25% solution by adding 1 volume 25% to 4 volumes 0.9% NaCl (NaCl preferred). Do not use Sterile Water for Injection (life-threatening hemolysis, acute renal failure can result).

**Rate of administration** • Infusion rate is variable, depending on use, blood volume, concentration of solute. 5%: Do not exceed 2–4 mL/min in pts with normal plasma volume, 5–10 mL/min in pts with hypoproteinemia. 25%: Do not exceed 1 mL/min in pts with normal plasma volume, 2–3 mL/min in pts with hypoproteinemia. 5% is administered undiluted; 25% may be administered undiluted or diluted in 0.9% NaCl. • May give without regard to pt blood group or Rh factor.

**Storage** • Store at room temperature. Appears as clear brownish, odorless, moderately viscous fluid. • Do not use if solution has been frozen, appears turbid, contains sediment, or if not used within 4 hrs of opening vial.

## IV INCOMPATIBILITIES

Lipids, micafungin (Mycamine), midazolam (Versed), vancomycin (Vanco-cin), verapamil (Isoptin).

## IV COMPATIBILITIES

Diltiazem (Cardizem), LORazepam (Ativan).

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** 5% should be used in hypovolemic or intravascularly depleted pts. 25% should be used in pts in whom fluid and sodium intake must be minimized.

### Usual Dosage

**IV: ADULTS, ELDERLY:** Initially, 25 g; may repeat in 15–30 min if response is inadequate.

**Hypovolemia**

**IV: ADULTS, ELDERLY, ADOLESCENTS:** 5% albumin: 12.5–25 g (250–500 mL), repeat after 15–30 min, as needed. **CHILDREN:** 0.5–1 g/kg/dose (10–20 mL/kg/dose of 5% albumin). Repeat in 30-min intervals as needed.

**Hemodialysis**

**IV: ADULTS, ELDERLY:** 50–100 mL (12.5–25 g) of 25% albumin as needed.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional:** Hypotension. **Rare:** High dose in repeated therapy: altered vital signs, chills, fever, increased salivation, nausea, vomiting, urticaria, tachycardia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Fluid overload may occur, marked by increased B/P, distended neck veins. Pulmonary edema may occur, evidenced by labored respirations, dyspnea, rales, wheezing, coughing. Neurologic changes, including headache, weakness, blurred vision, behavioral changes, incoordination, isolated muscle twitching, may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain vital signs. Adequate hydration is required before albumin is administered.

**INTERVENTION/EVALUATION**

Monitor B/P for hypotension/hypertension. Assess frequently for evidence of fluid overload, pulmonary edema (see **Adverse Effects/Toxic Reactions**). Check skin for flushing, urticaria. Monitor I&O ratio (watch for decreased output). Assess for therapeutic response (increased B/P, decreased edema).

**albuterol**TOP  
100

al-bue-ter-ol

(Airmir , ProAir HFA, ProAir RespiClick, Proventil HFA, Ventolin HFA)

**Do not confuse albuterol with albumin or atenolol, Proventil with Bentlyl, PriLOSEC, or Prinivil, or Ventolin with Benlylin or Vantin.**

**FIXED-COMBINATION(S)**

**Combivent Respimat:** albuterol/ipratropium (a bronchodilator): 100 mcg/20 mcg per actuation. **DuoNeb:** albuterol/ipratropium 3 mg/0.5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Sympathomimetic (adrenergic beta<sub>2</sub>-agonist). **CLINICAL:** Bronchodilator.

**USES**

Treatment or prevention of bronchospasm due to reversible obstructive airway disease, prevention of exercise-induced bronchospasm. **OFF-LABEL:** Treatment of asthma in children under 4 yrs of age.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to albuterol. Severe hypersensitivity to milk protein (dry powder inhalation).

**Cautions:** Hypertension, cardiovascular disease, hyperthyroidism, diabetes, HF, convulsive disorders, glaucoma, hypokalemia, arrhythmias.

**ACTION**

Stimulates beta<sub>2</sub>-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle (little effect on HR). **Therapeutic Effect:** Relieves bronchospasm and reduces airway resistance.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15–30 min	2–3 hrs	4–6 hrs
PO (extended-release)	30 min	2–4 hrs	12 hrs
Inhalation	5–15 min	0.5–2 hrs	2–5 hrs

Rapidly, well absorbed from GI tract; rapidly absorbed from bronchi after inhalation. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3.8–6 hrs.

 LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Appears to cross placenta; unknown if distributed in breast milk. May inhibit uterine contractility. **Children:** Safety and efficacy not established in pts younger than 2 yrs (syrup) or younger than 6 yrs (tablets). **Elderly:** May be more sensitive to tremor or tachycardia due to age-related increased sympathetic sensitivity.

## INTERACTIONS

**DRUG:** Beta-blockers (e.g., carvedilol, labetalol, metoprolol) may decrease bronchodilation. **MAOIs** (e.g., phenelzine, selegiline), linezolid, sympathomimetics (e.g., dopamine, norepinephrine) may increase hypertensive effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase blood glucose. May decrease serum potassium.

## AVAILABILITY (Rx)

**Powder Breath Activated Inhalation Aerosol:** (*ProAir RespiClick*): 90 mcg/actuation. **Inhalation Aerosol Solution:** (*ProAir HFA, Proventil HFA, Ventolin HFA*): 90 mcg/spray. **Solution for Nebulization:** 0.63 mg/3 mL (0.021%), 1.25 mg/3 mL (0.042%), 2.5 mg/3 mL (0.084%), 5 mg/mL (0.5%). **Syrup:** 2 mg/5 mL. **Tablets:** 2 mg, 4 mg.

 **Tablets (Extended-Release):** 4 mg, 8 mg.

## ADMINISTRATION/HANDLING

## Inhalation Aerosol

- Shake container well before inhalation.
- Prime prior to first use. A spacer is recommended for use with MDI.
- Wait 2 min before inhaling second dose (allows for deeper bronchial penetration).
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).

## Inhalation Powder

- Device is breath activated.
- Do not use with spacer.
- Do not wash or put any part of inhaler in water.

## Nebulization

- Administer over 5–15 min.

## INDICATIONS/ROUTES/DOSAGE

## Acute Bronchospasm, Exacerbation of Asthma

**Inhalation: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** (*Acute, Severe*): 4–8 puffs q20min for 3 doses, then taper as tolerated. **CHILDREN 12 YRS AND YOUNGER:** (*Acute, Severe*): 4–8 puffs q20min for 3 doses, then q1–4h as needed.

**Nebulization: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** *Acute, Severe:* 2.5 mg q20min for 3 doses, then 2.5–10 mg q1–4h or 10–15 mg/hr continuously. **CHILDREN 12 YRS AND YOUNGER:** 0.15 mg/kg q20min for 3 doses (minimum: 2.5 mg), then 0.15–0.3 mg/kg q1–4h as needed. **Maximum:** 10 mg q1–4h as needed or 0.5 mg/kg/hr by continuous inhalation.

## Bronchospasm

**Nebulization: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 2.5–5 mg as needed. **CHILDREN 2–11 YRS:** (Greater than 15 kg): 0.63–2.5 mg 3 to 4 times/day. **Maximum:** 10 mg/day. (10–15 kg): 0.63–1.25 mg 3–4 times/day as needed. **Maximum:** 10 mg/day.

**Inhalation: ADULTS, ELDERLY, CHILDREN:** 2–3 inhalations as needed.

**Exercise-Induced Bronchospasm**

**Inhalation: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER:** 2 puffs 5–20 min before exercise. **CHILDREN 4 YRS AND YOUNGER:** 1–2 puffs 5–20 min before exercise.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (27%–4%):** Headache, restlessness, nervousness, tremors, nausea, dizziness, throat dryness and irritation, pharyngitis, B/P changes including hypertension, heartburn, transient wheezing. **Occasional (3%–2%):** Insomnia, asthenia, altered taste. **Inhalation:** Dry, irritated mouth or throat; cough, bronchial irritation. **Rare:** Drowsiness, diarrhea, dry mouth, flushing, diaphoresis, anorexia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Excessive sympathomimetic stimulation may produce palpitations, ectopy, tachycardia, chest pain, slight increase in B/P followed by substantial decrease, chills, diaphoresis, blanching of skin. Too-frequent or excessive use may lead to decreased bronchodilating effectiveness and severe, paradoxical bronchoconstriction.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess lung sounds, pulse, B/P, characteristics of sputum. Offer emotional support (high incidence of anxiety due to difficulty in breathing and sympathomimetic response to drug).

**INTERVENTION/EVALUATION**

Monitor rate, depth, rhythm, type of respiration; quality and rate of pulse; ECG; serum potassium, glucose; ABG determinations. Assess lung sounds for wheezing (bronchoconstriction), rales.

**PATIENT/FAMILY TEACHING**

- Follow guidelines for proper use of inhaler.
- Increase fluid intake (de-

creases lung secretion viscosity). • Do not take more than 2 inhalations at any one time (excessive use may produce paradoxical bronchoconstriction or decreased bronchodilating effect). • Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness. • Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).

**alectinib**

al-ek-ti-nib

(Alecensa, Alecensaro )

**Do not confuse alectinib with afatinib, ibrutinib, imatinib, or gefitinib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Tyrosine kinase inhibitor. Anaplastic lymphoma kinase (ALK) inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small-cell lung cancer (NSCLC).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to alectinib. **Cautions:** Baseline cytopenias; bradycardia, bradyarrhythmias, chronic edema, diabetes, dehydration, electrolyte imbalance, hepatic/renal impairment, HF, ocular disease, pulmonary disease, history of thromboembolism.

**ACTION**

Inhibits ALK. ALK gene abnormalities may result in expression of oncogenic fusion proteins, which alter signaling and result in increased cellular proliferation/survival in tumors. **Therapeutic Effect:** Inhibition of ALK decreases tumor cell viability.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: Greater than 99%. Peak plasma concentration: 4 hrs. Steady state reached in 7 days. Excreted in feces (98%), urine (less than 0.5%). **Half-life:** 33 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential must use barrier methods during treatment and up to 3 mos after discontinuation. **Children/Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** Beta blockers (e.g., atenolol, carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil), digoxin may increase risk of bradycardia. **HERBAL:** None significant. **FOOD:** High-fat, high-calorie meals increase absorption/exposure. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, CPK, creatinine, glucose. May decrease serum calcium, potassium, phosphate, sodium; Hgb, Hct, lymphocytes, RBCs.

## AVAILABILITY (Rx)

 **Capsules:** 150 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Administer whole; do not break, crush, cut, or open capsules.
- If a dose is missed or vomiting occurs during administration, give next dose at regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

### Non–Small-Cell Lung Cancer

**PO: ADULTS, ELDERLY:** 600 mg twice daily until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**First dose reduction:** 450 mg twice daily. **Second dose reduction:** 300 mg twice daily. Permanently discontinue if unable to tolerate 300 mg twice daily.

### Dose Modification

#### *Bradycardia*

**Symptomatic bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or to a heart rate of 60 bpm or greater, then resume at reduced dose level (if pt not taking concomitant medications known to cause bradycardia). **Symptomatic bradycardia in pts taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at same dose. If concomitant medication cannot be adjusted or discontinued, then resume at reduced dose level. **Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia:** Permanently discontinue. **Life-threatening bradycardia in pts who are taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at reduced dose level with frequent monitoring. Permanently discontinue if bradycardia recurs despite dose reduction.

#### *CPK Elevation*

**CPK elevation greater than 5 times upper limit of normal (ULN):** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at same dose. **CPK elevation greater than 10 times ULN or second occurrence of CPK elevation**

**greater than 5 times ULN:** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at reduced dose level.

#### **Hepatotoxicity**

**Serum ALT or AST elevation greater than 5 times ULN with total bilirubin less than or equal to 2 times ULN:** Withhold treatment until serum ALT or AST recovers to baseline or less than or equal to 3 times ULN, then resume at reduced dose level. **Serum ALT or AST elevation greater than 3 times ULN with total serum bilirubin greater than 2 times ULN in the absence of cholestasis or hemolysis:** Permanently discontinue. **Total bilirubin elevation greater than 3 times ULN:** Withhold treatment until recovery to baseline or less than or equal to 1.5 times ULN, then resume at reduced dose level.

#### **Pulmonary Toxicity**

**Any grade treatment-related interstitial lung disease/pneumonitis:** Permanently discontinue.

#### **Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

#### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

### **SIDE EFFECTS**

**Frequent (41%–19%):** Fatigue, asthenia, constipation, edema (peripheral, generalized, eyelid, periorbital), myalgia, musculoskeletal pain, cough, generalized rash, papular rash, pruritus, macular rash, maculopapular rash, acneiform dermatitis, erythema, nausea. **Occasional (18%–10%):** Headache, diarrhea, dyspnea, back pain, vomiting, increased weight, blurred vision, vitreous floaters, visual impairment, reduced visual acuity, asthenopia, diplopia, photosensitivity.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Approx. 23% of pts required at least one dose reduction. Median time to first dose reduction was 48 days. Decreased Hgb levels were reported in 56% of pts. Drug-induced hepatotoxicity with elevations of serum ALT/AST greater than 5 times ULN reported in 4%–5% of pts. Most reported cases of hepatotoxicity occurred during first 2 mos of therapy. Grade 3 interstitial lung disease occurred in less than 1% of pts. Symptomatic bradycardia reported in 7.5% of pts. Severe myalgia, musculoskeletal pain occurred in 29% of pts. CPK elevation occurred in 43% of pts. Other serious adverse effects may include endocarditis, hemorrhage (unspecified), intestinal perforation, pulmonary embolism.

### **NURSING CONSIDERATIONS**

#### **BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Obtain baseline ECG in pts with history of arrhythmias, HF, concurrent use of medications known to cause bradycardia. Question history of hepatic/renal impairment, pulmonary embolism, diabetes, cardiac/pulmonary disease. Screen for medications known to cause bradycardia. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation.

#### **INTERVENTION/EVALUATION**

Monitor CBC routinely; LFTs q2wks during first 2 mos of treatment, then periodically thereafter (or more frequently in pts with hepatic impairment). Obtain BMP, serum ionized calcium, magnesium if arrhythmia or severe dehydration occurs. Monitor vital signs (esp. heart rate). Obtain ECG for bradycardia, chest pain, dyspnea. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for hepatotoxicity, hyperglycemia, vision changes, myalgia, musculoskeletal pain.

**PATIENT/FAMILY TEACHING**

- Report history of heart problems including extremity swelling, HF, slow heart rate. Therapy may decrease your heart rate; report dizziness, chest pain, palpitations, or fainting.
- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, black/tarry stools, dark urine.
- Do not take newly prescribed medication unless approved by doctor who originally started treatment.
- Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen and lip balm to protect against sunburn.
- Take with food.
- Avoid alcohol.

**alendronate**

a-len-dro-nate  
(Binosto, Fosamax)

**Do not confuse alendronate with risedronate, or Fosamax with Flomax.**

**FIXED-COMBINATION(S)**

**Fosamax Plus D:** alendronate/cholecalciferol (vitamin D analogue): 70 mg/2,800 international units, 70 mg/5,600 international units.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Bisphosphonate. **CLINICAL:** Bone resorption inhibitor, calcium regulator.

**USES**

**Fosamax:** Treatment of glucocorticoid-induced osteoporosis in men and women with low bone mineral density who are receiving at least 7.5 mg prednisONE (or equivalent). Treatment and prevention of osteoporosis in males and postmenopausal women. Treatment of Paget's

disease of the bone in pts who are symptomatic, at risk for future complications, or with alkaline phosphatase equal to or greater than 2 times ULN. **Binosto:** Treatment of osteoporosis in males and postmenopausal women.

**PRECAUTIONS**

**Contraindications:** Hypocalcemia, abnormalities of the esophagus, inability to stand or sit upright for at least 30 min, sensitivity to alendronate or other bisphosphonates; oral solution or effervescent tablet should not be used in pts at risk for aspiration. **Cautions:** Renal impairment, dysphagia, esophageal disease, gastritis, ulcers, or duodenitis.

**ACTION**

Inhibits bone resorption via actions on osteoclasts or osteoclast precursors. **Therapeutic Effect:** Leads to indirect increase in bone mineral density. **Paget's Disease:** Inhibits bone resorption, leading to an indirect decrease in bone formation, but bone has a more normal architecture.

**PHARMACOKINETICS**

Poorly absorbed after PO administration. Protein binding: 78%. After PO administration, rapidly taken into bone, with uptake greatest at sites of active bone turnover. Excreted in urine, feces (as unabsorbed drug). **Terminal Half-life:** Greater than 10 yrs (reflects release from skeleton as bone is resorbed).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Possible incomplete fetal ossification, decreased maternal weight gain, delay in delivery. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Antacids, calcium, iron, magnesium salts may decrease the concentration/effect. Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase adverse effects (e.g., increased risk of ulcer).

**HERBAL:** None significant. **FOOD:** Concurrent **beverages, dietary supplements, food** may interfere with absorption. **Caffeine** may reduce efficacy. **LAB VALUES:** Reduces serum calcium, phosphate. Significant decrease in serum alkaline phosphatase noted in pts with Paget's disease.

### AVAILABILITY (Rx)

**Oral Solution:** 70 mg/75 mL. **Tablets:** 5 mg, 10 mg, 35 mg, 70 mg. **Effervescent Tablets (Binosto):** 70 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give at least 30 min before first food, beverage, or medication of the day. **Tablets, effervescent:** Dissolve in 4 oz water. Wait at least 5 min after effervescence stops. Stir for 10 sec and drink. **Oral solution:** Follow with at least 2 oz of water.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Consider discontinuing after 3–5 yrs for osteoporosis in pts at low risk for fractures.

#### Osteoporosis (in Men)

**PO: ADULTS, ELDERLY:** 10 mg once daily in the morning or 70 mg weekly.

#### Glucocorticoid-Induced Osteoporosis

**PO: ADULTS, ELDERLY:** 70 mg once weekly or 10 mg once daily.

#### Postmenopausal Osteoporosis

**PO: ADULTS, ELDERLY: Treatment:** 10 mg once daily in the morning or 70 mg weekly. **ADULTS, ELDERLY: Prevention:** 5 mg once daily in the morning or 35 mg weekly.

#### Paget's Disease

**PO: ADULTS, ELDERLY:** 40 mg once daily in the morning for 6 mos.

#### Dosage in Renal Impairment

Not recommended in pts with creatinine clearance less than 35 mL/min.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (8%–7%):** Back pain, abdominal pain. **Occasional (3%–2%):** Nausea, abdominal distention, constipation, diarrhea, flatulence. **Rare (less than 2%):** Rash; severe bone, joint, muscle pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces hypocalcemia, hypophosphatemia, significant GI disturbances. Esophageal irritation occurs if not given with 6–8 oz of plain water or if pt lies down within 30 min of administration. May increase risk of osteonecrosis of the jaw.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain serum calcium, phosphate, alkaline phosphatase. Hypocalcemia, vitamin D deficiency must be corrected before beginning therapy. Assess pt's ability to remain upright for at least 30 minutes.

#### INTERVENTION/EVALUATION

Monitor chemistries (esp. serum calcium, phosphorus, alkaline phosphatase levels).

#### PATIENT/FAMILY TEACHING

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water, first thing in the morning and at least 30 min before first food, beverage, or medication of the day is taken. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
- Do not lie down for at least 30 min after taking medication (potentiates delivery to stomach, reducing risk of esophageal irritation).
- Report new swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises, modify behavioral factors (e.g., cigarette smoking, alcohol consumption).
- Supplemental calcium and vitamin D should be taken if dietary intake inadequate.

## allopurinol

al-oh-pure-i-nol  
(Aloprim, Zyloprim)

**Do not confuse allopurinol with Apresoline or haloperidol, or Zyloprim with Zorprin or Zovirax.**

### FIXED-COMBINATION(S)

**Duzallo:** allopurinol/lesinurad (uric acid transporter-1 inhibitor): 200 mg/200 mg, 300 mg/200 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Xanthine oxidase inhibitor. **CLINICAL:** Anti-gout agent.

### USES

**PO:** Management of primary or secondary gout (e.g., acute attack, nephropathy). Treatment of secondary hyperuricemia that may occur during cancer treatment. Management of recurrent uric acid and calcium oxalate calculi. **Injection:** Management of elevated uric acid in cancer treatment for leukemia, lymphoma, or solid tumor malignancies.

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to allopurinol. **Cautions:** Renal/hepatic impairment; pts taking diuretics, mercaptopurine or azaTHIOprine, other drugs causing myelosuppression. Do not use in asymptomatic hyperuricemia.

### ACTION

Decreases uric acid production by inhibiting xanthine oxidase, an enzyme responsible for converting xanthine to uric acid. **Therapeutic Effect:** Reduces uric acid concentrations in serum and urine.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO, IV	2–3 days	1–3 wks	1–2 wks

Well absorbed from GI tract. Widely distributed. Protein binding: less than 1%.

Metabolized in liver. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 1–3 hrs; metabolite, 12–30 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Angiotensin-converting enzyme (ACE) inhibitors (e.g., enalapril, lisinopril) may increase potential for hypersensitivity reactions. **Antacids** may decrease absorption. May increase concentration/effects of **azaTHIOprine, didanosine, mercaptopurine**. May increase adverse effects of **pegloticase**. May increase anticoagulant effect of **vitamin K antagonists (e.g., warfarin)**. May decrease concentration/effect of **capecitabine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, ALT, AST, creatinine.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution (Aloprim):** 500 mg. **Tablets (Zyloprim):** 100 mg, 300 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 500-mg vial with 25 mL Sterile Water for Injection (concentration of 20 mg/mL). • Further dilute with 0.9% NaCl or D<sub>5</sub>W (50–100 mL) to a concentration of 6 mg/mL or less. • Solution should appear clear and colorless.

**Rate of administration** • Infuse over 15–60 min. Daily doses can be given as a single infusion or in equally divided doses at 6-, 8-, or 12-hr intervals.

**Storage** • Store unconstituted vials at room temperature. • Do not refrigerate reconstituted and/or diluted solution. Must administer within 10 hrs of

preparation. • Do not use if precipitate forms or solution is discolored.

#### PO

- Give after meals with plenty of fluid.
- Fluid intake should yield slightly alkaline urine and output of approximately 2 L in adults. • Dosages greater than 300 mg/day to be administered in divided doses.

#### IV INCOMPATIBILITIES

Amikacin (Amikin), carmustine (BiCNU), cefotaxime (Claforan), clindamycin (Cleocin), cytarabine (Ara-C), dacarbazine (DTIC), diphenhydramine (Benadryl), DOXOrubicin (Adriamycin), doxycycline (Vibramycin), gentamicin, haloperidol (Haldol), hydroxyzine (Vistaril), IDArubicin (Idamycin), imipenem-cilastatin (Primaxin), methylPREDNISolone (SOLU-Medrol), metoclopramide (Reglan), ondansetron (Zofran), streptozocin (Zanosar), tobramycin, vinorelbine (Navelbine).

#### IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), heparin, HYDRORomphone (Dilaudid), LORazepam (Ativan), morphine, potassium chloride.

#### INDICATIONS/ROUTES/DOSAGE

 **ALERT** Doses greater than 300 mg should be given in divided doses.

#### Gout

**PO: ADULTS, ELDERLY:** Initially, 100 mg/day. Increase at 2–4 wk intervals needed to achieve desired serum uric acid level. **Mild:** 200–300 mg/day. **Moderate to severe:** 400–600 mg/day in 2–3 divided doses. **Maximum:** 800 mg/day.

#### Secondary Hyperuricemia Associated With Chemotherapy

**Note:** Begin 1–2 days before initiating induction of chemotherapy. May continue for 3–7 days after chemotherapy. **PO: ADULTS, CHILDREN OLDER THAN 10 YRS:** 600–800 mg/day in 2–3 divided doses. **CHILDREN 6–10 YRS:** 300 mg/day in 2–3 divided doses. **CHILDREN YOUNGER THAN 6 YRS:** 150 mg/day in 3 divided doses.

 **ALERT** **IV:** Daily dose can be given as single infusion or at 6-, 8-, or 12-hr intervals.

**IV: ADULTS, ELDERLY, CHILDREN 10 YRS OR OLDER:** 200–400 mg/m<sup>2</sup>/day. **CHILDREN YOUNGER THAN 10 YRS:** 200 mg/m<sup>2</sup>/day. **Maximum:** 600 mg/day.

#### Recurrent Uric Acid Calcium Oxalate Calculi

**PO: ADULTS:** 300 mg/day in single or 2–3 divided doses.

#### Dosage in Renal Impairment

Dosage is modified based on creatinine clearance. **PO:** Removed by hemodialysis. Administer dose following hemodialysis or administer 50% supplemental dose.

#### IV/PO

#### Creatinine

Clearance	Dosage
10–20 mL/min	200 mg/day
3–9 mL/min	100 mg/day
Less than 3 mL/min	100 mg at extended intervals
HD	100 mg q48h (increase cautiously to 300 mg)

#### Dosage in Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Occasional: PO:** Drowsiness, unusual hair loss. **IV:** Rash, nausea, vomiting. **Rare:** Diarrhea, headache.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Pruritic maculopapular rash, possibly accompanied by malaise, fever, chills, joint pain, nausea, vomiting should be considered a toxic reaction. Severe hypersensitivity reaction may follow appearance of rash. Bone marrow depression, hepatotoxicity, peripheral neuritis, acute renal failure occur rarely.

#### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain BMP, LFT. Instruct pt to drink minimum of 2,500–3,000 mL of fluid daily while taking medication.

**INTERVENTION/EVALUATION**

Discontinue immediately if rash or allergic reaction occurs. Monitor I&O (output should be at least 2,000 mL/day). Assess serum chemistries, uric acid, hepatic function. Assess urine for cloudiness, unusual color, odor. **Gout:** Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

**PATIENT/FAMILY TEACHING**

- May take 1 wk or longer for full therapeutic effect.
- Maintain adequate hydration; drink 2,500–3,000 mL of fluid daily while taking medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol (may increase uric acid).

**almotriptan**al-moe-**trip**-tan

**Do not confuse almotriptan with alvimopan, or Axert with Antivert.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Serotonin receptor agonist (5-HT<sub>1B</sub>). **CLINICAL:** Antimigraine.

**USES**

Acute treatment of migraine headache with or without aura in adults. Acute treatment of migraine headache in adolescents 12–17 yrs with history of migraine with or without aura and having attacks usually lasting 4 or more hrs when left untreated.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to almotriptan. Cerebrovascular disease (e.g., recent stroke, transient ischemic attacks), peripheral vascular disease (e.g., ischemic bowel disease), hemiplegic or basilar migraine, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, and

Prinzmetal's angina), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another 5-HT<sub>1B</sub> agonist. **Cautions:** Mild to moderate renal or hepatic impairment, pt profile suggesting cardiovascular risks, controlled hypertension; history of CVA, sulfonamide allergy.

**ACTION**

Binds selectively to serotonin receptors in cranial arteries producing a vasoconstrictive effect. Decreases inflammation associated with relief of migraine. **Therapeutic Effect:** Produces relief of migraine headache.

**PHARMACOKINETICS**

Well absorbed after PO administration. Protein binding: 35%. Metabolized by liver. Primarily excreted in urine. **Half-life:** 3–4 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Ergot derivatives (e.g., dihydroergotamine, ergotamine) may increase vasoconstrictive effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **MAOIs** (e.g., phenelzine, selegiline) may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

 **Tablets:** 6.5 mg, 12.5 mg.

**ADMINISTRATION/HANDLING****PO**

- Administer whole; do not break, crush, dissolve, or divide tablets.
- Take with full glass of water.
- May give without regard to food.

**INDICATIONS/ROUTES/DOSAGE****Migraine Headache**

**PO: ADULTS, ELDERLY, ADOLESCENTS 12–17 YRS:** Initially, 6.25–12.5 mg as a single dose. If headache returns, dose may be repeated after 2 hrs. **Maximum:** 2 doses/24 hrs (25 mg).

**Concurrent Use of CYP3A4 Inhibitors**

**ADULTS, ELDERLY:** Recommended initial dose is 6.25 mg, maximum daily dose is 12.5 mg. Avoid use in pts with renal or hepatic impairment AND use of CYP3A4 inhibitors.

**Dosage in Renal Impairment**

**Creatinine clearance 30 mL/min or less:** Initially, 6.25 mg in a single dose. **Maximum:** 12.5 mg/day.

**Dosage in Hepatic Impairment**

Initially, 6.25 mg in a single dose. **Maximum:** 12.5 mg/day.

**SIDE EFFECTS**

**Rare (2%–1%):** Nausea, dry mouth, headache, dizziness, somnolence, paresthesia, flushing.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Excessive dosage may produce tremor, redness of extremities, decreased respirations, cyanosis, seizures, chest pain. Serious arrhythmias occur rarely but particularly in pts with hypertension, diabetes, obesity, smokers, and those with strong family history of coronary artery disease.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question history of peripheral vascular disease, cardiac conduction disorders, CVA. Assess onset, location, duration of migraine, and possible precipitating factors.

**INTERVENTION/EVALUATION**

Evaluate for relief of migraine headache and associated photophobia, phonophobia (sound sensitivity), nausea, vomiting.

**PATIENT/FAMILY TEACHING**

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
- Lie down in quiet, dark room for additional benefit after taking medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report immediately if palpitations, pain or tightness in chest or throat, or pain or weakness of extremities occurs.

**alpelisib**

al-pe-lis-ib  
(Piqray)

**Do not confuse alpelisib with duvelisib, copanlisib, or idelalisib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Phosphatidylinositol 3-kinase (PI3K) inhibitor.  
**CLINICAL:** Antineoplastic.

**USES**

Used (in combination with fulvestrant) for the treatment of men and postmenopausal women and with hormone receptor (HR)–positive, human epidermal growth factor receptor 2 (HER2)–negative, PIK3CA-mutated, advanced or metastatic breast cancer following progression on or after an endocrine-based regimen.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to alpelisib. **Cautions:** Baseline cytopenias; history of diabetes, dermatologic disease, pulmonary disease; pts at risk for hyperglycemia (e.g., diabetes, chronic use of corticosteroids); concomitant use of strong CYP3A inducers, BCRP inhibitors, CYP2C9 substrates. Not recommended in pts with history of Stevens-Johnson syndrome, erythema multiforme, toxic epidermal necrolysis.

## ACTION

Alpelisib has selective activity against P13K $\alpha$ . Mutations in the catalytic  $\alpha$ -subunit of P13K (P13KCA) leads to P13K $\alpha$  and Akt signaling, cellular transformation and tumor generation. By inhibiting phosphorylation of P13K downstream, alpelisib shows activity in cell lines with PIK3CA mutation. **Therapeutic Effect:** Inhibits tumor cell activity.

## PHARMACOKINETICS

Widely distributed. Metabolized by enzymatic hydrolysis. Protein binding: 89%. Peak plasma concentration: 2–4 hrs. Steady state reached in 3 days. Excreted in feces (81%), urine (14%). **Half-life:** 8–9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 7 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. May impair fertility in both females and males. **Males:** Males with female partners of reproductive potential must use barrier methods during treatment and for at least 7 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** BCRP inhibitors (e.g., methotrexate, imatinib, rosuvastatin, topotecan) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease concentration/effect of **CYP2C9 substrates** (e.g., warfarin). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, creatinine, GGT, lipase. May decrease lymphocytes, Hgb, platelets; serum albumin, calcium,

magnesium, potassium. May increase or decrease serum glucose. May prolong aPTT.

## AVAILABILITY (Rx)

**Tablets:** 50 mg, 150 mg, 200 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Administer tablets whole; do not break, crush, or divide. Tablets cannot be chewed. Do not give if tablet is broken, cracked, or not intact.
- If vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).
- If a dose is missed, may give within 9 hrs of regularly scheduled time. After more than 9 hrs, skip dose and give next regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

### Breast Cancer

**PO: ADULTS, ELDERLY:** 300 mg once daily (in combination with 500 mg of fulvestrant on days 1, 15, 29, then monthly). Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule for Adverse Events

**First Dose Reduction:** 250 mg once daily. **Second Dose Reduction:** 200 mg once daily.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Diarrhea

**Grade 1 diarrhea:** No dose adjustment. **Grade 2 diarrhea:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose level. **Grade 3 or 4 diarrhea:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level.

### Dermatologic Toxicity

**Grade 1 or 2 rash:** No dose adjustment. **Grade 3 rash:** Withhold treatment until improved to Grade 1 or 0, then

resume at same dose level for first occurrence or reduced dose level for second occurrence. **Grade 4 rash (severe bullous, blistering, or exfoliating skin):** Permanently discontinue.

### Hyperglycemia

**Grade 1 hyperglycemia:** No dose adjustment. **Grade 2 hyperglycemia:** No dose adjustment. If fasting plasma glucose (FPG) does not decrease to less than or equal to 160 mg/dL or 8.9 mmol/L within 21 days, reduce dose level. **Grade 3 hyperglycemia:** Withhold treatment. If FPG decreases to less than or equal to 160 mg/dL or 8.9 mmol/L within 3–5 days, resume at reduced dose level. If FPG does not decrease within 3–5 days, consider referral to specialist to manage hyperglycemia. If FPG does not decrease within 21 days with specialized therapy, permanently discontinue. **Grade 4 hyperglycemia:** Withhold treatment. Recheck FPG after 24 hrs of hyperglycemic treatment. If FPG decreases to less than 500 mg/dL or 27.8 mmol/L, follow guidelines for Grade 3 hyperglycemia. If FPG is remains greater than 500 mg/dL or 27.8 mmol/L, permanently discontinue.

### Other Toxicities

**Any other Grade 1 or 2 toxicities:** No dose adjustment. **Any other Grade 3 toxicities:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. **Any other Grade 4 toxicities:** Permanently discontinue.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (52%–19%):** Diarrhea, rash, nausea, fatigue, asthenia, decreased appetite, stomatitis, mouth ulceration, vomiting, decreased weight, alopecia,

mucosal inflammation. **Occasional (18%–11%):** Dry skin, xerosis, xeroderma, pruritus, dysgeusia, headache, abdominal pain, peripheral edema, pyrexia, mucosal dryness, dyspepsia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, lymphopenia, thrombocytopenia are expected responses to therapy. Severe hypersensitivity reactions, including anaphylaxis, may occur. Grade 3 or 4 hypersensitivity reactions reported in less than 1% of pts. Severe cutaneous reactions, including Stevens-Johnson syndrome and erythema multiforme, reported in 0.4% and 1% of pts, respectively. Hyperglycemia reported in 65% of pts. Grade 3 hyperglycemia and Grade 4 hyperglycemia reported in 33% and 4% of pts, respectively. Ketoacidosis reported in less than 1% of pts. Pneumonitis, interstitial lung disease reported in 2% of pts. Diarrhea reported in 58% of pts. Severe diarrhea may cause dehydration, acute kidney injury. UTI reported in 10% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, fasting plasma glucose; pregnancy test in female pts of reproductive potential. Question history of diabetes, pulmonary disease, dermatologic diseases. Recommend adequate glycemic control before initiation. Assess usual bowel movement patterns, stool characteristics. Assess hydration status. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor plasma blood glucose levels as clinically indicated. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Monitor for hyperglycemia (blurred vision, confusion, excessive thirst, Kussmaul respirations, polyuria). Monitor for skin toxicities, cutaneous reactions; hypersensitivity reactions,

anaphylaxis (dyspnea, fever, hypotension, rash, tachycardia). If treatment-related toxicities occur, consider referral to specialist. Monitor daily pattern of bowel activity, stool consistency; I&Os, hydration status. If dermatologic toxicities occur, consider topical corticosteroid; addition of oral antihistamine. If hyperglycemia occurs, start or adjust antidiabetic/hyperglycemic treatment as appropriate.

#### PATIENT/FAMILY TEACHING

- Severe allergic reactions such as dizziness, hives, palpitations, rash, shortness of breath, tongue swelling may occur.
- Treatment may cause severe rashes, peeling, or blistering of the skin.
- Severe diarrhea may cause dehydration, kidney injuries. Drink plenty of fluids.
- Report symptoms of high blood sugar levels (blurred vision, excessive thirst/hunger, headache, frequent urination); lung inflammation (excessive coughing, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling); UTI (fever, urinary frequency, burning during urination, foul-smelling urine).
- Females and males of childbearing potential must use reliable contraception during treatment and for at least 7 days after last dose. Do not breastfeed.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## ALPRAZolam

al-praz-oh-lam

(ALPRAZolam Intensol, ALPRAZolam XR, Apo-Alpraz , Xanax, Xanax XR)

**BLACK BOX ALERT** ■ Concomitant use of benzodiazepines and opioids may result in profound sedation, respiratory depression, coma, and death. Reserve concomitant of these drugs for use in pts for whom alternative treatment options are inadequate. Limit dosages and durations to the minimum required. Follow pts for signs and symptoms of respiratory depression and sedation.

**Do not confuse ALPRAZolam with LORazepam, or Xanax with Tenex, Tylox, Xopenex, Zantac, or ZyrTEC.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Antianxiety.

#### USES

Management of generalized anxiety disorders (GAD). Short-term relief of symptoms of anxiety, panic disorder, with or without agoraphobia. Anxiety associated with depression. **OFF-LABEL:** Anxiety in children. Preoperative anxiety.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to ALPRAZolam. Acute narrow angle-closure glaucoma, concurrent use with ketoconazole or itraconazole or other strong CYP3A4 inhibitors. **Cautions:** Renal/hepatic impairment, predisposition to urate nephropathy, obesity. Concurrent use of CYP3A4 inhibitors/inducers and major CYP3A4 substrates; debilitated pts, respiratory disease, pts at high risk for suicide and ideation; history of drug abuse and misuse, drug-seeking behavior, dependency; elderly (increased risk of severe toxicity).

#### ACTION

Enhances the inhibitory effects of the neurotransmitter gamma-aminobutyric acid in the brain. **Therapeutic Effect:** Produces anxiolytic effect due to CNS depressant action.

#### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 80%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 6–27 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Chronic ingestion

during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children:** Safety and efficacy not established. **Elderly:** Use small initial doses with gradual increase to avoid ataxia (muscular incoordination) or excessive sedation. May have increased risk of falls, delirium.

## INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, zolpidem) may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may decrease effects. **FOOD:** Grapefruit products may increase level, effects. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Oral Solution: (Alprazolam Intensol):** 1 mg/mL. **Tablets (Orally Disintegrating):** 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Tablets (Immediate-Release): (Xanax):** 0.25 mg, 0.5 mg, 1 mg, 2 mg.

**Tablets (Extended-Release): (Xanax XR):** 0.5 mg, 1 mg, 2 mg, 3 mg.

## ADMINISTRATION/HANDLING

### PO, Immediate-Release

- May give without regard to food.
- Tablets may be crushed.
- If oral intake is not possible, may be given sublingually.

### PO, Extended-Release

- Administer once daily.
- Do not break, crush, dissolve, or divide extended-release tablets. Swallow whole.

### PO, Orally Disintegrating

- Place tablet on tongue, allow to dissolve.
- Swallow with saliva.
- Administration with water not necessary.
- If using ½ tab, discard remaining ½ tab.

## INDICATIONS/ROUTES/DOSAGE

### Anxiety Disorders

**PO: (Immediate-Release, Oral Concentrate, ODT): ADULTS:** Initially, 0.25–0.5 mg 3 times/day. May titrate q3–4days. **Maximum:** 4 mg/day in divided doses. **CHILDREN, YOUNGER THAN 18 YRS:** 0.125 mg 3 times/day. May increase by 0.125–0.25 mg/dose. **Maximum:** 0.06 mg/kg/day or 0.02 mg/kg/dose. Range: 0.375–3 mg/day. **ELDERLY, DEBILITATED PTS, PTS WITH HEPATIC DISEASE OR LOW SERUM ALBUMIN:** Initially, 0.25 mg 2–3 times/day. Gradually increase to optimum therapeutic response.

### Panic Disorder

**PO: (Immediate-Release, Oral Concentrate, ODT): ADULTS:** Initially, 0.5 mg 3 times/day. May increase at 3- to 4-day intervals in increments of 1 mg or less a day. Range: 5–6 mg/day. **Maximum:** 10 mg/day. **ELDERLY:** Initially, 0.125–0.25 mg twice daily. May increase in 0.125-mg increments until desired effect attained.

**PO: (Extended-Release):**

**◀ALERT▶** To switch from immediate-release to extended-release form, give total daily dose (immediate-release) as a single daily dose of extended-release form.

**ADULTS:** Initially, 0.5–1 mg once daily. May titrate at 3- to 4-day intervals. Range: 3–6 mg/day. **ELDERLY:** Initially, 0.5 mg once daily.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Severe disease: (Immediate-Release):** 0.25 mg 2–3 mg times/day. **(Extended-Release):** 0.5 mg once daily.

## SIDE EFFECTS

**Frequent (41%–20%):** Ataxia, light-headedness, drowsiness, slurred speech (particularly in elderly or debilitated pts).

**Occasional (15%–5%):** Confusion, depression, blurred vision, constipation, diarrhea, dry mouth, headache, nausea. **Rare (4% or less):** Behavioral problems such as anger, impaired memory; paradoxical reactions (insomnia, nervousness, irritability).

## ADVERSE EFFECTS/TOXIC REACTIONS

Concomitant use with opioids may result in profound sedation, respiratory depression, coma, and death. Abrupt or too-rapid withdrawal may result in restlessness, irritability, insomnia, hand tremors, abdominal/muscle cramps, diaphoresis, vomiting, seizures. Overdose results in drowsiness, confusion, diminished reflexes, coma. Blood dyscrasias noted rarely. **Antidote:** Flumazenil (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess degree of anxiety; assess for drowsiness, dizziness, light-headedness. Assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis). Initiate fall precautions. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

### INTERVENTION/EVALUATION

For pts on long-term therapy, perform hepatic/renal function tests, CBC periodically. Assess for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response: calm facial expression, decreased restlessness, insomnia. Monitor respiratory and cardiovascular status. Diligently screen for suicidal ideation and behavior; new-onset or worsening of anxiety, depression, mood disorder.

### PATIENT/FAMILY TEACHING

- Drowsiness usually disappears during continued therapy.
- If dizziness occurs, change positions slowly from recumbent to sitting position before standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Smoking reduces drug effectiveness.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occur.
- Do not

abruptly withdraw medication after long-term therapy.

- Avoid alcohol.
- Do not take other medications without consulting physician.

## alteplase

**HIGH ALERT**

al-te-plase

(Activase, Cathflo Activase)

**Do not confuse alteplase or Activase with Altace, or Activase with Cathflo Activase or TNKase.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tissue plasminogen activator (tPA). **CLINICAL:** Thrombolytic.

### USES

Treatment of ST-elevation MI (STEMI) for lysis of thrombi in coronary arteries, acute ischemic stroke (AIS), acute massive pulmonary embolism (PE). Treatment of occluded central venous catheters. **OFF-LABEL:** Acute peripheral occlusive disease, prosthetic valve thrombosis. Acute ischemic stroke presenting 3–4½ hrs after onset of symptoms.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to alteplase. Active internal bleeding, AV malformation or aneurysm, bleeding diathesis CVA, intracranial neoplasm, intracranial or intraspinal surgery or trauma, recent (within past 2 mos), severe uncontrolled hypertension, suspected aortic dissection. **Cautions:** Recent (within 10 days) major surgery or GI bleeding, OB delivery, organ biopsy, recent trauma or CPR, left heart thrombus, endocarditis, severe hepatic disease, pregnancy, elderly, cerebrovascular disease, diabetic retinopathy, thrombophlebitis, occluded AV cannula at infected site.

**ACTION**

Binds to fibrin in a thrombus and converts entrapped plasminogen to plasmin, initiating local fibrinolysis. **Therapeutic Effect:** Degrades fibrin clots, fibrinogen, other plasma proteins.

**PHARMACOKINETICS**

Rapidly metabolized in liver. Primarily excreted in urine. **Half-life:** 35 min.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Use only when benefit outweighs potential risk to fetus. Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of bleeding; monitor closely.

**INTERACTIONS**

**DRUG:** Heparin, low molecular weight heparins, medications altering platelet function (e.g., clopidogrel, NSAIDs), oral anticoagulants (e.g., warfarin) increase risk of bleeding. May increase anticoagulant effect of desirudin. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase adverse effects. **FOOD:** None known. **LAB VALUES:** Decreases plasminogen, fibrinogen levels during infusion, decreases clotting time (confirms the presence of lysis). May decrease Hgb, Hct.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** (*Cathflo Activase*): 2 mg, (*Activase*): 50 mg, 100 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • (*Activase*): Reconstitute immediately before use with Sterile Water for Injection. • Reconstitute 100-mg vial with 100 mL Sterile Water for Injection (50-mg vial with 50 mL sterile water) without preservative to provide a concentration of 1 mg/mL. • (*Activase Cathflo*): Add 2.2 mL Sterile Water for

Injection to provide concentration of 1 mg/mL. • Avoid excessive agitation; gently swirl or slowly invert vial to reconstitute.

**Rate of administration** • (*Activase*): Give by IV infusion via infusion pump (see Indications/Routes/Dosage). • If minor bleeding occurs at puncture sites, apply pressure for 30 sec; if unrelieved, apply pressure dressing. • If uncontrolled hemorrhage occurs, discontinue infusion immediately (slowing rate of infusion may produce worsening hemorrhage). • Avoid undue pressure when drug is injected into catheter (can rupture catheter or expel clot into circulation). • Instill dose into occluded catheter. • After 30 min, assess catheter function by attempting to aspirate blood. • If still occluded, let dose dwell an additional 90 min. • If function not restored, a second dose may be instilled.

**Storage** • (*Activase*): Store vials at room temperature. • After reconstitution, solution appears colorless to pale yellow. • Solution is stable for 8 hrs after reconstitution. Discard unused portions.

 **IV INCOMPATIBILITIES**

DOBUTamine (Dobutrex), DOPamine (Intropin), heparin.

 **IV COMPATIBILITIES**

Lidocaine, metoprolol (Lopressor), morphine, nitroglycerin, propranolol (Inderal).

**INDICATIONS/ROUTES/DOSAGE****Acute MI**

**IV infusion: ADULTS WEIGHING MORE THAN 67 KG: Total dose:** 100 mg over 90 min, starting with 15-mg bolus over 1–2 min, then 50 mg over 30 min, then 35 mg over 60 min. **ADULTS WEIGHING 67 KG OR LESS: Total dose:** Start with 15-mg bolus over 1–2 min, then 0.75 mg/kg over 30 min (**maximum:** 50 mg), then 0.5 mg/kg over 60 min (**maximum:** 35 mg). **Maximum total dose:** 100 mg.

**Acute Pulmonary Emboli**

**IV infusion: ADULTS:** 100 mg over 2 hrs. Institute or reinstitute heparin near end or immediately after infusion when activated partial thromboplastin time (aPTT) or thrombin time (TT) returns to twice normal or less.

**Acute Ischemic Stroke**

◀**ALERT**▶ Dose should be given within the first 3 hrs of the onset of symptoms. Recommended total dose: 0.9 mg/kg. **Maximum:** 90 mg.

**IV infusion: ADULTS WEIGHING 100 KG OR LESS:** 0.09 mg/kg as IV bolus over 1 min, then 0.81 mg/kg as continuous infusion over 60 min. **WEIGHING MORE THAN 100 KG:** 9 mg bolus over 1 min, then 81 mg as continuous infusion over 60 min.

**Central Venous Catheter Clearance**

**IV: ADULTS, ELDERLY:** Up to 2 mg; may repeat after 2 hrs. If catheter functional, withdraw 4–5 mL blood to remove drug and residual clot.

**Usual Neonatal Dosage**

**Occluded IV catheter:** Use 1 mg/mL conc (**maximum:** 2 mg/2 mL) leave in lumen up to 2 hrs, then aspirate.

**Sytemic thrombolysis:** 0.1–0.6 mg/kg/hr for 6 hrs. Usual dose: 0.5 mg/kg/hr.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Superficial bleeding at puncture sites, decreased B/P. **Occasional:** Allergic reaction (rash, wheezing, bruising).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe internal hemorrhage, intracranial hemorrhage may occur. Lysis of coronary thrombi may produce atrial or ventricular arrhythmias or stroke.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess for contraindications to therapy. Obtain B/P, apical pulse. Record weight.

Evaluate 12-lead ECG, cardiac enzymes, serum electrolytes. Assess Hct, platelet count, prothrombin time (PT), activated partial thromboplastin time (aPTT), fibrinogen level before therapy is instituted. Type and screen blood.

**INTERVENTION/EVALUATION**

Perform continuous cardiac monitoring for arrhythmias. Check B/P, pulse, respirations q15min until stable, then hourly. Check peripheral pulses, heart and lung sounds. Monitor for chest pain relief and notify physician of continuation or recurrence (note location, type, intensity). Assess for bleeding: overt blood, occult blood in any body substance. Monitor aPTT per protocol. Maintain B/P; avoid any trauma that might increase risk of bleeding (e.g., injections, shaving). Assess neurologic status frequently.

**amikacin**

am-i-kay-sin

■ **BLACK BOX ALERT** ■ May cause neurotoxicity, nephrotoxicity, and/or neuromuscular blockade and respiratory paralysis. Ototoxicity usually is irreversible; nephrotoxicity usually is reversible.

**Do not confuse amikacin with Amicar, or anakinra.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Aminoglycoside. **CLINICAL:** Antibiotic.

**USES**

Treatment of serious infections (e.g., bone infections, respiratory tract infections, septicemia) due to *Pseudomonas*, other gram-negative organisms (*Proteus*, *Serratia*, *E. coli*, *Enterobacter*, *Klebsiella*).

**OFF-LABEL:** *Mycobacterium avium* complex (MAC).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to amikacin, other aminoglycosides. **Cautions:**

Preexisting renal impairment, auditory or vestibular impairment, hypocalcemia, elderly, neuromuscular disorder, dehydration, concomitant use of neurotoxic or nephrotoxic medications.

## ACTION

Inhibits protein synthesis in susceptible bacteria by binding to 30S ribosomal unit. **Therapeutic Effect:** Interferes with protein synthesis of susceptible microorganisms.

## PHARMACOKINETICS

Rapid, complete absorption after IM administration. Protein binding: 0%–10%. Widely distributed (penetrates blood-brain barrier when meninges are inflamed). Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in renal impairment, neonates; decreased in cystic fibrosis, burn pts, febrile pts).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; small amounts distributed in breast milk. May produce fetal nephrotoxicity. **Children:** Neonates, premature infants may be more susceptible to toxicity due to immature renal function. **Elderly:** Higher risk of toxicity due to age-related renal impairment, increased risk of hearing loss.

## INTERACTIONS

**DRUG:** Fosfarnet, mannitol may increase nephrotoxic effect. Penicillin may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, BUN, ALT, AST, bilirubin, LDH. May decrease serum calcium, magnesium, potassium, sodium. **Therapeutic levels:** Peak: life-threatening infections: 25–40 mcg/mL; serious infections: 20–25 mcg/mL; urinary tract infections: 15–20 mcg/mL. **Trough:** Less than 8 mcg/mL. **Toxic levels:** Peak: greater than 40 mcg/mL; **trough:** greater than 10 mcg/mL.

## AVAILABILITY (Rx)

**Injection Solution:** 250 mg/mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute to concentration of 0.25–5 mg/mL in 0.9% NaCl or D<sub>5</sub>W. **Rate of administration** • Infuse over 30–60 min.

**Storage** • Store vials at room temperature. • Solution appears clear but may become pale yellow (does not affect potency). • Intermittent IV infusion (piggyback) is stable for 24 hrs at room temperature, 2 days if refrigerated. • Discard if precipitate forms or dark discoloration occurs.

## IM

• To minimize discomfort, give deep IM slowly. • Less painful if injected into gluteus maximus rather than in lateral aspect of thigh.

## IV INCOMPATIBILITIES

Amphotericin, azithromycin (Zithromax), propofol (Diprivan).

## IV COMPATIBILITIES

Amiodarone (Cordarone), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), clindamycin (Cleocin), dexmedetomidine (Precedex), diltiazem (Cardizem), diphenhydramine (Benadryl), enalapril (Vasotec), esmolol (BreviBloc), fluconazole (Diflucan), furosemide (Lasix), levofloxacin (Levaquin), lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, ondansetron (Zofran), potassium chloride, ranitidine (Zantac), vancomycin.

## INDICATIONS/ROUTES/DOSAGE

### Usual Parenteral Dosage

**Note:** Individualization of dose is critical due to low therapeutic index. Initial and periodic peak and trough levels should be determined.

**IV, IM: ADULTS, ELDERLY, CHILDREN, INFANTS:** 5–7.5 mg/kg/dose q8h.

50 **amiodarone**

**NEONATES:** 15 mg/kg/dose (interval based on disease, age, weight).

**Dosage in Renal Impairment**

Dosage and frequency are modified based on degree of renal impairment and serum drug concentration. After a loading dose of 5–7.5 mg/kg, maintenance dose and frequency are based on serum creatinine levels and creatinine clearance.

**Adults**

<b>Creatinine Clearance</b>	<b>Dosing Interval</b>
50 mL/min or greater	No dose adjustment
10–50 mL/min	q24–72h
Less than 10 mL/min	q48–72h
Hemodialysis	q48–72h (give after HD on dialysis days)
Continuous renal replacement therapy (CRRT)	Initially, 10 mg/kg, then 7.5 mg/kg q24–48h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Phlebitis, thrombophlebitis.  
**Occasional:** Rash, fever, urticaria, pruritus.  
**Rare:** Neuromuscular blockade (difficulty breathing, drowsiness, weakness).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Serious reactions include nephrotoxicity (increased thirst, decreased appetite, nausea, vomiting, increased BUN and serum creatinine levels, decreased creatinine clearance); neurotoxicity (muscle twitching, visual disturbances, seizures, paresthesia); ototoxicity (tinnitus, dizziness, loss of hearing).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain BUN, serum creatinine. Dehydration must be treated prior to aminoglycoside therapy. Establish baseline hearing acuity before beginning therapy. Question for history of allergies, esp. to aminoglycosides and sulfite. Obtain specimen for culture, sensitivity before giving first dose (therapy may begin before results are known).

**INTERVENTION/EVALUATION**

Monitor I&O (maintain hydration), urinalysis. Monitor results of serum peak/trough levels. Be alert to ototoxic, neurotoxic, nephrotoxic symptoms (see Adverse Effects/Toxic Reactions). Check IM injection site for pain, induration. Evaluate IV site for phlebitis. Assess for skin rash, diarrhea, superinfection (particularly genital/anal pruritus), changes of oral mucosa. When treating pts with neuromuscular disorders, assess respiratory response carefully. **Therapeutic levels:** Peak: life-threatening infections: 25–40 mcg/mL; serious infections: 20–25 mcg/mL; urinary tract infections: 15–20 mcg/mL. **Trough:** Less than 8 mcg/mL. **Toxic levels:** Peak: greater than 40 mcg/mL; **trough:** greater than 10 mcg/mL.

**PATIENT/FAMILY TEACHING**

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- IM injection may cause discomfort.
- Report any hearing, visual, balance, urinary problems, even after therapy is completed.
- Do not take other medications without consulting physician.

**amiodarone****HIGH ALERT**

a-mi-oh-da-rone  
(Nexterone, Pacerone)

**BLACK BOX ALERT** Pts should be hospitalized when amiodarone is initiated. Alternative therapies should be tried first before using amiodarone. Only indicated for pts with life-threatening arrhythmias due to risk of toxicity. Pulmonary toxicity may occur without symptoms. Hepatotoxicity is common, usually mild (rarely possible). Can exacerbate arrhythmias.

**Do not confuse amiodarone with aMILoride, dronedarone, or Cordarone with Cardura.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Cardiac agent. **CLINICAL:** Antiarrhythmic. Class III.

## USES

Management of life-threatening recurrent ventricular fibrillation (VF) or recurrent hemodynamically unstable ventricular tachycardia (VT) unresponsive to other therapy.

**OFF-LABEL:** Treatment of atrial fibrillation, paroxysmal supraventricular tachycardia (SVT); ventricular tachyarrhythmias.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to amiodarone, iodine. Bradycardia-induced syncope (except in the presence of a pacemaker), second- and third-degree AV block (except in presence of a pacemaker); severe sinus node dysfunction, causing marked sinus bradycardia; cardiogenic shock. **Cautions:** May prolong QT interval. Thyroid disease, electrolyte imbalance, hepatic disease, hypotension, left ventricular dysfunction, pulmonary disease. Pts taking warfarin, surgical pts.

## ACTION

Inhibits adrenergic stimulation; affects Na, K, Ca channels; prolongs action potential and refractory period in myocardial tissue. Decreases AV conduction and sinus node function. **Therapeutic Effect:** Suppresses arrhythmias.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	3 days–3 wks	1 wk–5 mos	7–50 days after discontinuation

Slowly, variably absorbed from GI tract. Protein binding: 96%. Extensively metabolized in liver. Excreted via bile; not removed by hemodialysis. **Half-life:** 26–107 days; metabolite: 61 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. May adversely affect fetal development. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to effects on thyroid function. May experience increased incidence of ataxia, other neurotoxic effects.

## INTERACTIONS

**DRUG:** May increase QT interval—prolonging effect of **citalopram, clarithromycin, erythromycin, nilotinib, quetiapine, ribociclib, thioridazine, voriconazole.** **Fingolimod, levofloxacin** may enhance QT interval-prolonging effect. **Beta blockers** (e.g., **atenolol, carvedilol, metoprolol**), **calcium channel blockers** (e.g., **diltiazem, verapamil**), **digoxin, sofosbuvir** may increase the bradycardic effect. **HERBAL:** **Herbals with hypotensive properties** (e.g., **garlic, ginger, ginkgo biloba**) may increase concentration/effects. **St. John's wort** may decrease concentration/effect. May increase concentration/effect of **red yeast rice.** **FOOD:** **Grapefruit products** may alter effect. Avoid use during therapy. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, ANA titer. May cause changes in ECG, thyroid function test results. **Therapeutic serum level:** 0.5–2.5 mcg/mL; toxic serum level not established.

## AVAILABILITY (Rx)

**Infusion (Pre-Mix):** Nexterone: 150 mg/100 mL; 360 mg/200 mL. **Injection, Solution:** 150 mg/3 mL, 450 mg/9 mL, 900 mg/18 mL. **Tablets (Pacerone):** 100 mg, 200 mg, 400 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Infusions longer than 2 hrs must be administered/diluted in glass or polyolefin bottles. • Dilute loading dose (150 mg) in 100 mL D<sub>5</sub>W (1.5 mg/mL). • Dilute maintenance dose (900 mg) in 500 mL D<sub>5</sub>W (1.8 mg/mL). Concentrations greater than 3 mg/mL cause peripheral vein phlebitis.

**Rate of administration** • Does not need protection from light during administration. • Administer through central venous catheter (CVC) if possible, using in-line filter. • Bolus over 10 min (15 mg/min) not to exceed 30 mg/min; then 1 mg/min over 6 hrs; then 0.5 mg/min over 18 hrs. • Infusions longer than 1

hr, concentration not to exceed 2 mg/mL unless CVC used.

**Storage** • Store at room temperature. • Stable for 24 hrs when diluted in glass or polyolefin containers; stable for 2 hrs when diluted in PVC containers.

#### PO

• Give consistently with regard to meals to reduce GI distress. • Tablets may be crushed. • Do not give with grapefruit products.

#### IV INCOMPATIBILITIES

CeFAZolin (Ancef), heparin, sodium bicarbonate.

#### IV COMPATIBILITIES

Dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), insulin (regular), labetalol (Normodyne), lidocaine, LO-Razepam (Ativan), midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), phenylephrine (Neo-Synephrine), potassium chloride, vancomycin.

#### INDICATIONS/ROUTES/DOSAGE

##### Ventricular Arrhythmias

**PO: ADULTS, ELDERLY:** Initially, 400 mg q8–12h for 1–2 wks, then decrease to 200–400 mg once daily. **Maintenance:** 200–400 mg/day.

**IV infusion: ADULTS, ELDERLY:** Initially, 150 mg over 10 min, then 1 mg/min over 6 hrs; then 0.5 mg/min. Continue this rate over at least 18 hrs or until complete transition or oral. Breakthrough stable VT: 150 mg in 100 mL D<sub>5</sub>W or NS over 10 min. 1–6 mg/mL.

##### Dosage in Renal Impairment

No dose adjustment.

##### Dosage in Hepatic Impairment

Use caution.

#### SIDE EFFECTS

**Expected:** Corneal microdeposits noted in almost all pts treated for more than 6 mos (can lead to blurry vision). **Occasional (greater than 3%): PO:** Constipation, head-

ache, decreased appetite, nausea, vomiting, paresthesia, photosensitivity, muscular incoordination. **Parenteral:** Hypotension, nausea, fever, bradycardia. **Rare (less than 3%): PO:** Bitter or metallic taste, decreased libido, dizziness, facial flushing, blue-gray coloring of skin (face, arms, and neck), blurred vision, bradycardia, asymptomatic corneal deposits, rash, visual disturbances, halo vision.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Serious, potentially fatal pulmonary toxicity (alveolitis, pulmonary fibrosis, pneumonitis, acute respiratory distress syndrome) may begin with progressive dyspnea and cough with crackles, decreased breath sounds, pleurisy, HF, or hepatotoxicity. May worsen existing arrhythmias or produce new arrhythmias.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain serum ALT, AST, alkaline phosphatase; ECG; CXR in pts with pulmonary disease. Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician).

##### INTERVENTION/EVALUATION

Monitor for symptoms of pulmonary toxicity (progressively worsening dyspnea, cough). Dosage should be discontinued or reduced if toxicity occurs. Assess pulse for quality, rhythm, bradycardia. Monitor ECG for cardiac changes (e.g., widening of QRS, prolongation of PR and QT intervals). Assess for nausea, fatigue, paresthesia, tremor. Monitor for signs of hypothyroidism (periorbital edema, lethargy, pudgy hands/feet, cool/pale skin, vertigo, night cramps) and hyperthyroidism (hot/dry skin, bulging eyes [exophthalmos], frequent urination, eyelid edema, weight loss, difficulty breathing). Monitor serum ALT, AST, alkaline phosphatase for evidence of hepatic toxicity. If elevated hepatic enzymes

occur, dosage reduction or discontinuation is necessary. Monitor thyroid function test results. Monitor for therapeutic serum level (0.5–2.5 mcg/mL). Toxic serum level not established.

#### PATIENT/FAMILY TEACHING

- Protect against photosensitivity reaction on skin exposed to sunlight.
- Report shortness of breath, cough.
- Outpatients should monitor pulse before taking medication.
- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control arrhythmias.
- Restrict salt, alcohol intake.
- Avoid grapefruit products.
- Recommend ophthalmic exams q6mos.
- Report any vision changes, signs/symptoms of cardiac arrhythmias.

## amitriptyline

a-mi-**trip**-ti-leen  
(Levate )

**BLACK BOX ALERT** Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse amitriptyline with aminophylline, imipramine, or nortriptyline.**

#### FIXED-COMBINATION(S)

**Limbitrol:** amitriptyline/chlordiazepoxide (an anti-anxiety): 12.5 mg/5 mg, 25 mg/10 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tricyclic.  
**CLINICAL:** Antidepressant.

#### USES

Treatment of unipolar, major depression. **OFF-LABEL:** Neuropathic pain,

related to diabetic neuropathy or postherpetic neuralgia; treatment of migraine. Treatment of depression in children, posttraumatic stress disorder (PTSD).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to amitriptyline. Acute recovery period after MI, coadministered with or within 14 days of MAOIs. **Cautions:** Prostatic hypertrophy, history of urinary retention or obstruction, narrow-angle glaucoma, diabetes, seizures, hyperthyroidism, cardiac/hepatic/renal disease, schizophrenia, xerostomia, visual problems, constipation or bowel obstruction, elderly, increased intraocular pressure (IOP), hiatal hernia, suicidal ideation.

#### ACTION

Blocks reuptake of neurotransmitters (norepinephrine, serotonin) at presynaptic membranes, increasing synaptic concentration in the CNS. **Therapeutic Effect:** Antidepressant effect.

#### PHARMACOKINETICS

Rapidly and well absorbed from GI tract. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 10–26 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; minimally distributed in breast milk. **Children:** More sensitive to increased dosage, toxicity, increased risk of suicidal ideation, worsening of depression. **Elderly:** Increased risk of toxicity. Increased sensitivity to anticholinergic effects. Caution in pts with cardiovascular disease.

#### INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, zolpidem) may increase CNS depression. May increase

CNS depressant effect of **azelastine**. **Acclidinium, ipratropium, tiotropium, umeclidinium** may increase anticholinergic effect. May increase arrhythmogenic effect of **dronedarone**. **MAOIs (e.g., phenelzine, selegiline)** may increase the serotonergic effect. **HERBAL: Herbs with sedative properties (e.g., chamomile, kava kava, valerian)** may increase CNS depression. **St. John's wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May alter ECG readings (flattened T wave), serum glucose (increase or decrease). **Therapeutic serum level:** Peak: 120–250 ng/mL; **toxic serum level:** greater than 500 ng/mL.

### AVAILABILITY (Rx)

**Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give with food or milk if GI distress occurs.

### INDICATIONS/ROUTES/DOSAGE

#### Depression

**PO: ADULTS:** Initially, 25–50 mg/day as a single dose at bedtime, or in divided doses. May gradually increase in increments of 25–50 mg at 1-wk (or greater) intervals up to 100–300 mg/day. Titrate to lowest effective dosage.

**ELDERLY:** Initially, 10–25 mg once daily at bedtime. **ADOLESCENTS:** Initially, 10 mg 3 times/day and 20 mg at bedtime. **Maximum:** 200 mg/day.

#### Pain Management

**PO: ADULTS, ELDERLY:** Initially, 10–25 mg once daily at bedtime. May increase gradually in 10–25 mg increments over at least 1 wk up to 150 mg/day. **CHILDREN:** Initially, 0.1 mg/kg. May increase over 2 wks to 0.5–2 mg/kg at bedtime.

#### Dosage in Renal/Hepatic Impairment

Use with caution.

### SIDE EFFECTS

**Frequent:** Dizziness, drowsiness, dry mouth, orthostatic hypotension, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste. **Occasional:** Blurred vision, confusion, constipation, hallucinations, delayed micturition, eye pain, arrhythmias, fine muscle tremors, parkinsonian syndrome, anxiety, diarrhea, diaphoresis, heartburn, insomnia. **Rare:** Hypersensitivity, alopecia, tinnitus, breast enlargement, photosensitivity.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce confusion, seizures, severe drowsiness, changes in cardiac conduction, fever, hallucinations, agitation, dyspnea, vomiting, unusual fatigue, weakness. Abrupt withdrawal after prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams. Blood dyscrasias, cholestatic jaundice occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Observe and record behavior. Assess psychological status, thought content, suicidal ideation, sleep patterns, appearance, interest in environment. For pts on long-term therapy, hepatic/renal function tests, blood counts should be performed periodically.

#### INTERVENTION/EVALUATION

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor B/P for hypotension, pulse, arrhythmias. **Therapeutic serum level:** Peak: 120–250 ng/mL; **toxic serum level:** greater than 500 ng/mL. **Maximum:** 200 mg/day.

#### PATIENT/FAMILY TEACHING

- Go slowly from lying to standing.
- Tolerance to postural hypotension, sedative and anticholinergic effects usually develops

during early therapy. • Maximum therapeutic effect may be noted in 2–4 wks. • Sensitivity to sun may occur. • Report visual disturbances. • Do not abruptly discontinue medication. • Avoid tasks that require alertness, motor skills until response to drug is established. • Avoid alcohol. • Sips of water may relieve dry mouth.

## amivantamab-vmjw

am-ee-van-ti-mab  
(Rybrevant)

**Do not confuse amivantamab with afatinib, avapritinib, or belantamab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor, MET inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with locally advanced or metastatic non–small-cell lung cancer (NSCLC) with EGFR exon 20 insertion mutations whose disease has progressed after platinum-based chemotherapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to amivantamab-vmjw. **Cautions:** Hepatic impairment, pts at risk for interstitial lung disease (e.g., COPD, sarcoidosis, connective tissue disease), ocular disease; conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); prior infusion-related reactions.

### ACTION

Binds to the EGFR and MET extracellular domains and disrupts EGFR and MET signaling by blocking ligand binding (in exon 20 insertion mutation models, degrading EGFR and MET). The presence of EGFR and MET on tumor cell surfaces also allows for

targeted cell destruction by immune effector cells, such as natural killer cells and macrophages, via antibody-dependent cellular cytotoxicity and trogocytosis mechanisms. **Therapeutic Effect:** Inhibits tumor growth.

### PHARMACOKINETICS

Widely distributed. Steady-state reached by 9th infusion. Excretion not specified. **Half-life:** 11.3 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, GGT, glucose. May decrease serum albumin, phosphate, magnesium, sodium, potassium; lymphocytes.

### AVAILABILITY (RX)

**Injection Solution:** 350 mg/7 mL (50 mg/mL).

### ADMINISTRATION/HANDLING

**Premedication** • Premedicate with an antipyretic (acetaminophen 650–1,000 mg) and an antihistamine (diphenhydramine 25–50 mg [or equivalent]) prior to each dose. A glucocorticoid (dexamethasone 10 mg or methylprednisolone 40 mg [or equivalent]) should be given on days 1 and 2 of first week, then PRN for subsequent doses.

**Infusion Guidelines** • Infusion bag must be made of polyethylene, polypropylene, polyolefin blend, or polyvinyl chloride. • Infuse via dedicated IV line

using a sterile, nonpyrogenic, low-protein-binding 0.2 micron in-line filter. • Do not administer as IV push or bolus.

**Preparation** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for dose based on weight in kg. • Visually inspect for particulate matter or discoloration. Solution should appear colorless to pale yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Remove a volume from a 250 mL NaCl or D<sub>5</sub>W infusion bag that is equal to the required volume of vial for dose. • Dilute in 250 mL NaCl or D<sub>5</sub>W infusion bag. • Gently invert to mix. Do not shake or agitate.

**Rate of Administration** • (1,050 mg dose): **Week 1 (day 1 and 2):** Infuse at 50 mL/hr. May increase to 75 mL/hr if no infusion reactions occur. **Week 2:** Infuse at 85 mL/hr. **Week 3, 4, and subsequent wks:** Infuse at 125 mL/hr. • (1,400 mg dose): **Week 1 (day 1):** Infuse at 50 mL/hr. May increase to 75 mL/hr if no infusion reactions occur. **Week 1 (day 2):** Infuse at 35 mL/hr. May increase to 50 mL/hr if no infusion reactions occur. **Week 2:** Infuse at 65 mL/hr. **Week 3:** Infuse at 85 mL/hr. **Week 4 and subsequent wks:** Infuse at 125 mL/hr.

**Infusion Reactions** • **Grade 1 or 2 infusion reactions:** Interrupt infusion until symptoms resolve, then resume at 50% of the infusion rate prior to interruption. If symptoms do not recur after 30 min, may increase infusion rate per guidelines. Premedicate with a corticosteroid prior to subsequent infusions. • **Grade 3 infusion reactions:** Interrupt infusion and treat symptoms until resolved. May resume at 50% of the infusion rate prior to interruption. If symptoms do not recur after 30 min, may increase infusion rate per guidelines. Premedicate with a corticosteroid prior to subsequent infusions. If Grade 4 infusion-related reactions occur, discontinue infusion and

treat symptoms. • **Grade 4 infusion reactions or recurrence of Grade 3 reactions:** Permanently discontinue and treat symptoms until resolved.

**Storage** • Refrigerate unused vials in original carton. • Protect from light. • Diluted solution must be infused within 10 hrs of preparation at room temperature.

## IV INCOMPATIBILITIES

Do not mix with other IV solutions or medications.

## INDICATIONS/ROUTES/DOSAGE

### NSCLC (with EGFR exon 20 mutations)

**Note:** Give initial dose as a split infusion on day 1 (350 mg) and on day 2 (700 mg or 1,050 mg) of first week.

**IV: Adults (Weighing Less Than 80 Kg):** 1,050 mg weekly for 4 wks, then q2wks until disease progression or unacceptable toxicity. **(WEIGHING 80 KG OR GREATER):** 1,400 mg weekly for 4 wks, then q2wks until disease progression or unacceptable toxicity.

**Dose Reduction Schedule (WEIGHING LESS THAN 80 KG):** **First dose reduction:** 700 mg. **Second dose reduction:** 350 mg. **Unable to tolerate 350-mg dose:** Permanently discontinue.

**(WEIGHING 80 KG OR GREATER):** **First dose reduction:** 1,050 mg. **Second dose reduction:** 700 mg. **Unable to tolerate 700-mg dose:** Permanently discontinue.

### Dose Modification

(Based on Common Terminology for Adverse Events [CTCAE]).

### Dermatological Toxicity (dermatitis, dry skin, pruritus)

**Grade 2 toxicity:** Start supportive measures. Consider dose reduction if not improved after 2 wks. **Grade 3 toxicity:** Withhold treatment and start supportive measures until improved to Grade 2 or less, then resume at reduced dose. Permanently discontinue if not improved within 2 wks. **Grade 4 toxicity:** Permanently discontinue.

### **Pulmonary Toxicity**

**Any Grade interstitial lung disease (ILD)/pneumonitis:** Withhold treatment if ILD/pneumonitis suspected. Permanently discontinue if ILD/pneumonitis is confirmed.

### **Other Toxic Reactions**

**Other Grade 3 toxicities:** Withhold treatment until improved to Grade 1 or 0. If symptoms improve within 1 wk, resume at same dose. If symptoms improve in more than 1 wk but within 4 wks, resume at reduced dose. Permanently discontinue if not improved within 4 wks. **Other Grade 4 toxicities:** Withhold treatment until improved to Grade 1 or 0. If symptoms improve within 4 wks, resume at reduced dose. Permanently discontinue if not improved within 4 wks or Grade 4 toxicity recurs.

### **Dosage in Renal Impairment**

**Mild to Moderate Impairment:** No dose adjustment. **Severe Impairment:** Not specified; use caution.

### **Dosage in Hepatic Impairment**

**Mild Impairment:** No dose adjustment. **Moderate to Severe Impairment:** Not specified; use caution.

## **SIDE EFFECTS**

**Frequent (84%–25%):** Rash, skin exfoliation, eczema, arthralgia, musculoskeletal pain, back/neck pain, myalgia, dyspnea, nausea, fatigue, asthenia, edema (facial, lip, periorbital, peripheral), stomatitis, cough.

**Occasional (23%–10%):** Constipation, vomiting, pruritus, diarrhea, decreased appetite, dry skin, pyrexia, hypoesthesia, neuralgia, paresthesia, peripheral neuropathy, dizziness, abdominal pain, headache.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Infusion related-reactions, including chest discomfort, chills, dyspnea, hypotension, nausea, vomiting reported in 66% of pts. ILD/pneumonitis reported in 3% of pts. Dermatological toxicities, including dermatitis, dry skin, pruritus,

may occur. Severe cutaneous reactions, including toxic epidermal necrolysis, reported in less than 1% of pts. Ocular toxicities, including blurred vision, conjunctival redness, dry eye, keratitis, uveitis, visual impairment, may occur. Infections, including paronychia (50% of pts), pneumonia (10% of pts), were reported. Hemorrhagic events, including epistaxis, gingival bleeding, hematuria, hemoptysis, mouth/mucosal hemorrhage, reported in 19% of pts. Immunogenicity (auto-amivantamab antibodies) reported in 1% of pts.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Obtain weight in kilograms. Verify presence of EGFR exon 20 mutations by approved test. Screen for active infection. Administer in an environment equipped to monitor for and manage infusion-related reactions. Question for prior infusion reactions before each infusion. Question history of hepatic impairment, pulmonary/ocular disease. Conduct dermatological exam for baseline status. Offer emotional support.

### **INTERVENTION/EVALUATION**

Obtain BMP, LFT as clinically indicated. Diligently monitor for infusion reactions during each infusion. If infusion reactions occur, interrupt infusion and manage symptoms. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Assess skin for cutaneous toxicities, sloughing, rash, nail beds for paronychia. Monitor for ocular toxicities, change of vision; oral lesions, mucosal inflammation; bleeding events of any kind. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

• Immediately report symptoms of infusion-related reactions such as chills, cough, difficulty breathing, nausea, vomiting. • Pretreatment with acetaminophen, antihistamines, steroidal anti-inflammatories may help reduce infusion reactions. • Due to pretreatment with a corticosteroid, pts with diabetes may experience a transient rise in blood sugar levels. • Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark-colored urine, yellowing of the skin or eyes), eye problems (eye dryness/itching/pain/redness, excessive tearing, change of vision, sensitivity to light; infection of the skin around the nailbeds (swelling, redness, pain, pus). • Use effective contraception to avoid pregnancy. Do not breastfeed. • Avoid prolonged sun exposure/tanning beds. Use high-SPF sunscreen, lip balm, clothing to protect against sunburn/skin irritation.

**amLODIPine**TOP  
100

am-loe-di-peen

(Katerzia, Norvasc)

**Do not confuse amLODIPine with aMILoride, or Norvasc with Navane or Vasacor.**

**FIXED-COMBINATION(S)**

**Amturnide:** amLODIPine/aliskiren (a renin inhibitor)/hydroCHLORothiazide (a diuretic): 5 mg/150 mg/12.5 mg, 5 mg/300 mg/12.5 mg, 5 mg/300 mg/25 mg, 10 mg/300 mg/12.5 mg, 10 mg/300 mg/25 mg. **Azor:** amLODIPine/olmesartan (an angiotensin II receptor antagonist): 5 mg/20 mg, 10 mg/20 mg, 5 mg/40 mg, 10 mg/40 mg. **Caduet:** amLODIPine/atorvastatin (hydroxymethylglutaryl-CoA [HMG-CoA] reductase inhibitor): 2.5 mg/10 mg, 2.5 mg/20 mg, 2.5 mg/40 mg,

5 mg/10 mg, 10 mg/10 mg, 5 mg/20 mg, 10 mg/20 mg, 5 mg/40 mg, 10 mg/40 mg, 5 mg/80 mg, 10 mg/80 mg.

**Exforge:** amLODIPine/valsartan (an angiotensin II receptor antagonist): 5 mg/160 mg, 10 mg/160 mg, 5 mg/320 mg, 10 mg/320 mg. **Exforge HCT:**

amLODIPine/valsartan/hydroCHLORothiazide (a diuretic): 5 mg/160 mg/12.5 mg, 5 mg/160 mg/25 mg, 10 mg/160 mg/12.5 mg, 10 mg/160 mg/25 mg, 10 mg/320 mg/25 mg.

**Lotrel:** amLODIPine/benazepril (an angiotensin-converting enzyme [ACE] inhibitor): 2.5 mg/10 mg, 5 mg/10 mg, 5 mg/20 mg, 5 mg/40 mg, 10 mg/20 mg, 10 mg/40 mg. **Prestalia:** amLO-

DIPine/perindopril (an ACE inhibitor): 2.5 mg/3.5 mg; 5 mg/7 mg; 10 mg/14 mg. **Tekamlo:** amLODIPine/aliskiren

(a renin inhibitor): 5 mg/150 mg, 5 mg/300 mg, 10 mg/150 mg, 10 mg/300 mg. **Tribenzor:** amLODIPine/

olmesartan/hydroCHLORothiazide: 5 mg/20 mg/12.5 mg, 5 mg/40 mg/12.5 mg, 5 mg/40 mg/25 mg, 10 mg/40 mg/12.5 mg, 10 mg/40 mg/25 mg.

**Twynsta:** amLODIPine/telmisartan (an angiotensin II receptor antagonist): 5 mg/40 mg, 5 mg/80 mg, 10 mg/40 mg, 10 mg/80 mg.

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Calcium channel blocker (dihydropyridine).

**CLINICAL:** Antihypertensive, antian-ginal.

**USES**

**Angina:** Treatment of symptomatic chronic stable angina. Treatment of confirmed or suspected vasospastic angina (previously referred to as Prinzmetal or variant angina). **Hypertension:** Management of hypertension in adults and children greater than or equal to 6 yrs of age.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to amLODIPine. **Cautions:** Hepatic impairment, severe aortic stenosis, hypertrophic cardiomyopathy with outflow tract obstruction.

## ACTION

Inhibits calcium movement across cardiac and vascular smooth muscle cell membranes during depolarization. **Therapeutic Effect:** Dilates coronary arteries, peripheral arteries/arterioles. Decreases total peripheral vascular resistance and B/P by vasodilation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–1 hr	N/A	24 hrs

Slowly absorbed from GI tract. Protein binding: 95%–98%. Metabolized in liver. Excreted primarily in urine. Not removed by hemodialysis. **Half-life:** 30–50 hrs (increased in elderly, pts with hepatic cirrhosis).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Half-life may be increased, more sensitive to hypotensive effects.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Anti-hepatic viral combination products may increase concentration/effect. May increase concentration/effect of fosphenytoin, lomitapide, phenytoin, simvastatin. **HERBAL:** St. John's wort may decrease concentration/effect. Herbs with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of hypotension. **FOOD:** Grapefruit products may increase concentration, hypotensive effects. **LAB VALUES:** May increase hepatic enzyme levels.

## AVAILABILITY (Rx)

**Oral Suspension:** 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

- May give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS:** Initially, 2.5–5 mg/day as a single dose. May titrate every 7–14 days. **Maximum:** 10 mg/day. **SMALL-FRAME, FRAGILE, ELDERLY, ADDITION TO OTHER ANTIHYPERTENSIVES:** 2.5 mg/day as a single dose. May titrate q7–14 days. **Maximum:** 10 mg/day. **CHILDREN 6–17 YRS:** 2.5–5 mg/day.

### CAD (Angina)

**PO: ADULTS:** 5–10 mg/day as a single dose. **ELDERLY, PTS WITH HEPATIC INSUFFICIENCY:** 5 mg/day as a single dose.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**ADULTS, ELDERLY: Hypertension:** Initially, 2.5 mg/day. **Angina:** Initially, 5 mg/day. Titrate slowly in pts with severe impairment.

## SIDE EFFECTS

**Frequent (greater than 5%):** Peripheral edema, headache, flushing. **Occasional (5%–1%):** Dizziness, palpitations, nausea, unusual fatigue or weakness (asthenia). **Rare (less than 1%):** Chest pain, bradycardia, orthostatic hypotension.

## ADVERSE EFFECTS/ TOXIC REACTIONS

Overdose may produce excessive peripheral vasodilation, marked hypotension with reflex tachycardia, syncope.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess renal/hepatic function tests, B/P, apical pulse.

**INTERVENTION/EVALUATION**

Assess B/P (if systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Assess skin for flushing. Question for headache, asthenia.

**PATIENT/FAMILY TEACHING**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not ingest grapefruit products.

**amoxicillin**

a-mox-i-sil-in  
(Novamoxin )

**Do not confuse amoxicillin with amoxapine or Atarax.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Penicillin.

**CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to streptococci, *E. coli*, *E. faecalis*, *P. mirabilis*, *H. influenzae*, *N. gonorrhoeae*, including ear, nose, and throat; lower respiratory tract; skin and skin structure; UTIs; acute uncomplicated gonorrhea; *H. pylori*. **OFF-LABEL:** Treatment of Lyme disease and typhoid fever. Postexposure prophylaxis for anthrax exposure.

**PRECAUTIONS**

**Contraindications:** Serious hypersensitivity to amoxicillin, other beta-lactams.

**Cautions:** History of allergies (esp. cephalosporins), infectious mononucleosis, renal impairment, asthma.

**ACTION**

Inhibits bacterial cell wall synthesis by binding to PCN-binding proteins. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

**PHARMACOKINETICS**

Well absorbed from GI tract. Protein binding: 20%. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta, appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant.

**Children:** Immature renal function in neonate/young infant may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Allopurinol may increase incidence of rash. Probenecid may increase concentration, toxicity risk. **Tetracyclines** may decrease therapeutic effect.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, BUN, creatinine, LDH. May cause positive Coombs' test.

**AVAILABILITY (Rx)**

**Capsules:** 250 mg, 500 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. **Tablets:** 500 mg, 875 mg. **Tablets (Chewable):** 125 mg, 250 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Instruct pt to chew/crush chewable tablets thoroughly before swallowing.
- Oral suspension dose may be mixed with formula, milk, fruit juice, water, cold drink.
- Give immediately after mixing.
- After reconstitution, oral suspension is stable for 14 days at either room temperature or refrigerated.

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**PO: ADULTS, ELDERLY:** 500–1000 mg q8–12h. **INFANTS OLDER THAN 3 MOS,**

**CHILDREN, ADOLESCENTS:** 25–50 mg/kg/day in divided doses q8h. **Maximum Dose:** 500 mg. **INFANTS 3 MOS AND YOUNGER:** 25–50 mg/kg/day in divided doses q8h. **NEONATE:** 20–30 mg/kg/day in divided doses q12h.

#### Dosage in Renal Impairment

**◀ALERT▶** Immediate-release 875-mg tablet should not be used in pts with creatinine clearance less than 30 mL/min. Dosage interval is modified based on creatinine clearance. **Creatinine clearance 10–30 mL/min: ADULTS:** 250–500 mg q12h. **CHILDREN:** 8–20 mg/kg/dose q12h. **Creatinine clearance less than 10 mL/min: ADULTS:** 250–500 mg q24h. **CHILDREN:** 8–20 mg/kg/dose q24h.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** GI disturbances (mild diarrhea, nausea, vomiting), headache, oral/vaginal candidiasis. **Occasional:** Generalized rash, urticaria.

### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question for history of allergies (esp. penicillins, cephalosporins), renal impairment.

#### INTERVENTION/EVALUATION

Promptly report rash, diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, black “hairy” tongue, oral mucosal

changes (ulceration, pain, erythema). Monitor renal/hepatic function tests.

#### PATIENT/FAMILY TEACHING

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Take with meals if GI upset occurs.
- Thoroughly crush or chew the chewable tablets before swallowing.
- Report rash, diarrhea, other new symptoms.

## amoxicillin/ clavulanate

a-mox-i-sil-in/klav-yoo-la-nate  
(Augmentin, Augmentin ES 600,  
Clavulin )

**Do not confuse Augmentin with amoxicillin or Azulfidine.**

#### ◆CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *streptococci*, *E. coli*, *E. faecalis*, *P. mirabilis*, beta-lactamase producing *H. influenzae*, *Klebsiella* spp., *M. catarrhalis*, and *S. aureus* (not methicillin-resistant *Staphylococcus aureus* [MRSA]), including lower respiratory, skin and skin structure, UTIs, otitis media, sinusitis. **OFF-LABEL:** Chronic antimicrobial suppression of prosthetic joint infection.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to amoxicillin, clavulanate, any penicillins; history of cholestatic jaundice or hepatic impairment with amoxicillin/clavulanate therapy. **Extended-Release:** (additional): Severe renal impairment (creatinine clearance less than 30 mL/min), hemodialysis pt. **Cautions:** History of allergies, esp. cephalosporins; renal impairment, infectious mononucleosis.

**ACTION**

Amoxicillin inhibits bacterial cell wall synthesis by binding to PCN-binding proteins. Clavulanate inhibits bacterial beta-lactamase protecting amoxicillin from degradation. **Therapeutic Effect:** Amoxicillin is bactericidal in susceptible microorganisms. Clavulanate protects amoxicillin from enzymatic degradation.

**PHARMACOKINETICS**

Well absorbed from GI tract. Protein binding: 20%. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta, appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Immature renal function in neonate/young infant may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. **Tetracyclines** may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May cause positive Coombs' test.

**AVAILABILITY (Rx)**

**Powder for Oral Suspension:** (*Amoclan, Augmentin*): 125 mg–31.25 mg/5 mL, 200 mg–28.5 mg/5 mL, 250 mg–62.5 mg/5 mL, 400 mg–57 mg/5 mL, 600 mg–42.9 mg/5 mL. **Tablets:** (*Augmentin*): 250 mg–125 mg, 500 mg–125 mg, 875 mg–

125 mg. **Tablets (Chewable):** (*Augmentin*): 200 mg–28.5 mg, 400 mg–57 mg.

**Tablets (Extended-Release):** 1,000 mg–62.5 mg.

**ADMINISTRATION/HANDLING****PO**

- Store tablets at room temperature.
- After reconstitution, oral suspension is stable for 10 days but should be refrigerated.
- May mix dose of suspension with milk, formula, or juice and give immediately.
- Give without regard to meals.
- Give with food to increase absorption, decrease stomach upset.
- Instruct pt to chew/crush chewable tablets thoroughly before swallowing.
- Do not break, crush, dissolve, or divide extended-release tablets.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Dosage based on amoxicillin component.

**Usual Adult Dosage**

**PO: ADULTS, ELDERLY:** 250 mg q8h or 500 mg q8–12h or 875 mg q12h or (*Extended-Release*) 2,000 mg q12h.

**Usual Pediatric Dosage**

**Note:** Dosing determined by formulation's amoxicillin/clavulanate ratio.

**Immediate-Release: INFANTS, CHILDREN, ADOLESCENTS:** (4:1 formulation): 20–40 mg amoxicillin/kg/day 3 times daily. **Maximum:** 1500 mg/day. (7:1 formulation): 25–45 mg amoxicillin/kg/day twice daily. **Maximum:** 1,750 mg/day. (14:1 formulation): 90 mg amoxicillin/kg/day twice daily; **Maximum:** 4,000 mg/day. **NEONATES:** 30 mg/kg/day (using 125 mg/5 mL suspension) in divided doses q12h.

**Extended-Release: CHILDREN AND ADOLESCENTS WEIGHING GREATER THAN 40 KG:** 2,000 mg amoxicillin q12h.

**Dosage in Renal Impairment**

▶ **ALERT** ▶ Do not use 875-mg tablet or extended-release tablets for creatinine clearance less than 30 mL/min. Dosage and frequency are modified based on creatinine clearance. **Creatinine clearance 10–30 mL/min:** 250–500 mg q12h. **Creatinine clearance less than 10 mL/min:** 250–500 mg q24h. **HD:** 250–500 mg q24h, give dose during and after dialysis. **PD:** 250 mg q12h.

**Dosage in Hepatic Impairment**

No dose adjustment (see Contraindications).

**SIDE EFFECTS**

**Occasional (9%–4%):** Diarrhea, loose stools, nausea, skin rashes, urticaria.

**Rare (less than 3%):** Vomiting, vaginitis, abdominal discomfort, flatulence, headache.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of allergies, esp. penicillins, cephalosporins, renal impairment.

**INTERVENTION/EVALUATION**

Promptly report rash, diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Be alert for signs of superinfection, including fever, vomiting, diarrhea, black “hairy” tongue, ulceration or changes of oral mucosa, anal/genital pruritus. Monitor renal/hepatic tests with prolonged therapy.

**PATIENT/FAMILY TEACHING**

• Continue antibiotic for full length of treatment. • Space doses evenly. • Take

with meals if GI upset occurs. • Thoroughly crush or chew the chewable tablets before swallowing. • Notify physician if rash, diarrhea, other new symptoms occur.

**amphotericin B****HIGH ALERT**

am-foe-ter-i-sin

(Abelcet, AmBisome, Fungizone )

■ **BLACK BOX ALERT** ■ (Nonliposomal) To be used primarily for pts with progressive, potentially fatal fungal infection. Not to be used for noninvasive forms of fungal disease (oral thrush, vaginal candidiasis).

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Polyene antifungal. **CLINICAL:** Antifungal, antiprotozoal.

**USES**

**Abelcet:** Treatment of invasive fungal infections refractory or intolerant to Fungizone. **AmBisome:** Empiric treatment of fungal infection in febrile neutropenic pts. *Aspergillus*, *Candida* species, *Cryptococcus* infections refractory to Fungizone or pt with renal impairment or toxicity with Fungizone. Treatment of cryptococcal meningitis in HIV-infected pts. Treatment of visceral leishmaniasis. **Fungizone:** Treatment of life-threatening fungal infections caused by susceptible fungi, including *Candida* spp., *Histoplasma*, *Cryptococcus*, *Aspergillus*, *Blastomyces*. **OFF-LABEL:** **Abelcet:** Serious *Candida* infections. **AmBisome:** Treatment of systemic histoplasmosis infection.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to amphotericin B. **Cautions:** Concomitant use with other nephrotoxic drugs; renal impairment.

**ACTION**

Generally fungistatic but may become fungicidal with high dosages or very

susceptible microorganisms. Binds to sterols in fungal cell membrane. **Therapeutic Effect:** Alters fungal cell membrane permeability, allowing loss of potassium, other cellular components, resulting in cell death.

## PHARMACOKINETICS

Protein binding: 90%. Widely distributed. Metabolism not specified. Cleared by nonrenal pathways. Minimal removal by hemodialysis. Amphotec and Abelcet are not dialyzable. **Half-life:** Fungizone, 24 hrs (increased in neonates and children); Abelcet, 7.2 days; AmBisome, 100–153 hrs; Amphotec, 26–28 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established, but use the least amount for therapeutic regimen. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Fosfarnet may increase nephrotoxic effect. May decrease therapeutic effect of *Saccharomyces boulardii*.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, BUN, creatinine. May decrease serum calcium, magnesium, potassium.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (*AmBisome, Fungizone*): 50 mg. **Injection, Suspension:** (*Abelcet*): 5 mg/mL (20 mL).

## ADMINISTRATION/HANDLING

• Use strict aseptic technique; no bacteriostatic agent or preservative is present in diluent.

**Reconstitution** • (*Abelcet*): Shake 20-mL (100-mg) vial gently until contents are dissolved. Withdraw required dose using 5-micron filter needle (supplied by manufacturer). • Dilute

with D<sub>5</sub>W to 1–2 mg/mL. • (*AmBisome*): Reconstitute each 50-mg vial with 12 mL Sterile Water for Injection to provide concentration of 4 mg/mL. • Shake vial vigorously for 30 sec. Withdraw required dose and inject syringe contents through a 5-micron filter into an infusion of D<sub>5</sub>W to provide final concentration of 1–2 mg/mL (0.2–0.5 mg/mL for infants and small children). • (*Fungizone*): Add 10 mL Sterile Water for Injection to each 50-mg vial. • Further dilute with 250–500 mL D<sub>5</sub>W. • Final concentration should not exceed 0.1 mg/mL (0.25 mg/mL for central infusion).

**Rate of administration** • Give by slow IV infusion. Infuse conventional amphotericin over 4–6 hrs; Abelcet over 2 hrs (shake contents if infusion longer than 2 hrs); AmBisome over 1–2 hrs.

**Storage** • (*Abelcet*): Refrigerate un-reconstituted solution. Reconstituted solution is stable for 48 hrs if refrigerated, 6 hrs at room temperature.

• (*AmBisome*): Refrigerate un-reconstituted solution. Reconstituted vials are stable for 24 hrs when refrigerated. Concentration of 1–2 mg/mL is stable for 6 hrs. • (*Fungizone*): Refrigerate unused vials. • Once reconstituted, vials stable for 24 hrs at room temperature, 7 days if refrigerated. • Diluted solutions stable for 24 hrs at room temperature, 2 days if refrigerated.

## IV INCOMPATIBILITIES

**Note:** Abelcet, AmBisome, Amphotec: Do not mix with any other drug, diluent, or solution. Fungizone: Allopurinol (Aloprim), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), dexmedetomidine (Precedex), diphenhydramine (Benadryl), DOPamine (Intropin), enalapril (Vasotec), filgrastim (Neupogen), flucanazole (Diflucan), fosfarnet (Foscavir), magnesium sulfate, meropenem (Merrem IV), ondansetron (Zofran), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

## IV COMPATIBILITIES

LORazepam (Ativan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Abelcet Dose

**IV infusion: ADULTS, CHILDREN:** 5 mg/kg once daily.

### Usual AmBisome Dose

**IV infusion: ADULTS:** 3–6 mg/kg/day.  
**CHILDREN:** 3–5 mg/kg/day.

### Fungizone, Usual Dose

**IV infusion: ADULTS, ELDERLY:** Dosage based on pt tolerance and severity of infection. Initially, 1-mg test dose is given over 20–30 min (some clinicians believe a test dose is unnecessary). If tolerated, usual dose is 0.3–1.5 mg/kg/day. Once therapy established, may give q48h at 1–1.5 mg/kg q48h. **Maximum:** 1.5 mg/kg/day. **CHILDREN:** Test dose of 0.1 mg/kg/dose (**maximum:** 1 mg) is infused over 30–60 min. If test dose is tolerated, usual initial dose is 0.25–0.5 mg/kg/day. Gradually increase dose until desired dose achieved. **Maximum:** 1.5 mg/kg/day. Once therapy is established, may give 1–1.5 mg/kg q48h. **NEONATES:** Initially, 1 mg/kg/dose once daily up to 1.5 mg/kg/day for short term. Once therapy established, may give 1–1.5 mg/kg q48h.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (greater than 10%): Abelcet:** Chills, fever, increased serum creatinine, multiple organ failure. **AmBisome:** Hypokalemia, hypomagnesemia, hyperglycemia, hypocalcemia, edema, abdominal pain, back pain, chills, chest pain, hypotension, diarrhea, nausea, vomiting, headache, fever, rigors, insomnia, dyspnea, epistaxis, increased hepatic/renal function

test results. **Amphotec:** Chills, fever, hypotension, tachycardia, increased serum creatinine, hypokalemia, bilirubinemia. **Amphocin:** Fever, chills, headache, anemia, hypokalemia, hypomagnesemia, anorexia, malaise, generalized pain, nephrotoxicity.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cardiovascular toxicity (hypotension, ventricular fibrillation), anaphylaxis occur rarely. Altered vision/hearing, seizures, hepatic failure, coagulation defects, multiple organ failure, sepsis may occur. Each alternative formulation is less nephrotoxic than conventional amphotericin (Amphocin).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, LFT, serum magnesium, ionized calcium. Question for history of allergies, esp. to amphotericin B, sulfite. Avoid, if possible, other nephrotoxic medications. Obtain premedication orders (antipyretics, antihistamines, antiemetics, corticosteroids) to reduce adverse reactions during IV therapy.

### INTERVENTION/EVALUATION

Monitor vital signs. Assess for adverse reactions (fever, tremors, chills, anorexia, nausea, vomiting, abdominal pain) q15min twice, then q30min for 4 hrs of initial infusion. If symptoms occur, slow infusion, administer medication for symptomatic relief. For severe reaction, stop infusion and notify physician. Evaluate IV site for phlebitis. Monitor I&O, renal function tests for nephrotoxicity. Monitor CBC, BMP (esp. potassium), LFT, serum magnesium.

### PATIENT/FAMILY TEACHING

- Prolonged therapy (wks or mos) is usually necessary.
- Fever reaction may decrease with continued therapy.
- Muscle weakness may be noted during therapy (due to hypokalemia).

## ampicillin

am-pi-sil-in

**Do not confuse ampicillin with aminophylline.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin.

**CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to streptococci, *S. pneumoniae*, staphylococci (non-penicillinase-producing), meningococci, *Listeria*, some *Klebsiella*, *E. coli*, *H. influenzae*, *Salmonella*, *Shigella*, including GI, GU, respiratory infections, meningitis, endocarditis prophylaxis. **OFF-LABEL:** Surgical prophylaxis for liver transplantation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ampicillin or any penicillin. Infections caused by penicillinase-producing organisms. **Cautions:** History of allergies, esp. cephalosporins, renal impairment, asthmatic pts, infectious mononucleosis.

### ACTION

Inhibits cell wall synthesis in susceptible microorganisms by binding to PCN binding protein. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

### PHARMACOKINETICS

Moderately absorbed from GI tract. Protein binding: 15%–25%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.5 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin

rash in infant. **Children:** Immature renal function in neonates/young infants may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. **Tetracyclines** may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May cause positive Coombs' test.

### AVAILABILITY (Rx)

**Capsules:** 500 mg. **Injection, Powder for Reconstitution:** 125 mg, 250 mg, 500 mg, 1 g, 2 g. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • For IV injection, dilute each vial with 5 mL Sterile Water for Injection or 0.9% NaCl (10 mL for 1- and 2-g vials). **Maximum concentration:** 100 mg/mL for IV push. • For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl. **Maximum concentration:** 30 mg/mL.

**Rate of administration** • For IV injection, give over 3–5 min (125–500 mg) or over 10–15 min (1–2 g). For intermittent IV infusion (piggyback), infuse over 15–30 min. • Due to potential for hypersensitivity/anaphylaxis, start initial dose at few drops per min, increase slowly to ordered rate; stay with pt first 10–15 min, then check q10min.

**Storage** • IV solution, diluted with 0.9% NaCl, is stable for 8 hrs at room temperature or 2 days if refrigerated. • If diluted with D<sub>5</sub>W, is stable for 2 hrs at room temperature or 3 hrs if refrigerated. • Discard if precipitate forms.

### IM

• Reconstitute each vial with Sterile Water for Injection or Bacteriostatic Water for

Injection (consult individual vial for specific volume of diluent). • Stable for 1 hr. • Give deeply in large muscle mass.

### PO

• Oral suspension, after reconstitution, is stable for 7 days at room temperature, 14 days if refrigerated. • Shake oral suspension well before using. • Give orally 1–2 hrs before meals for maximum absorption.

### IV INCOMPATIBILITIES

Diltiazem (Cardizem), midazolam (Versed), ondansetron (Zofran).

### IV COMPATIBILITIES

Calcium gluconate, cefepime (Maxipime), dexmedetomidine (Precedex), DOPamine (Intropin), famotidine (Pepcid), furosemide (Lasix), heparin, HYDROMORPHONE (Dilaudid), insulin (regular), levoFLOXacin (Levaquin), lipids, magnesium sulfate, morphine, multivitamins, potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage

**PO: ADULTS, ELDERLY:** 250–500 mg q6h. **CHILDREN:** 50–100 mg/kg/day in divided doses q6h. **Maximum:** 2 g/day.

**IV, IM: ADULTS, ELDERLY:** 1–2 g q4–6h or 50–250 mg/kg/day in divided doses.

**Maximum:** 12 g/day. **CHILDREN:** 50–200 mg/kg/day in divided doses q6h.

**Maximum:** 8 g/day. **NEONATES:** 50 mg/kg/dose q6–12h or 75 mg/kg/dose q12h.

### Dosage in Renal Impairment

#### Creatinine

Clearance	Dosage
10–50 mL/min	Administer q6–12h
Less than 10 mL/min	Administer q12–24h
Hemodialysis	1–2 g q12–24h
Peritoneal dialysis	250 mg q12h
Continuous renal replacement therapy (CRRT)	2g, then 1–2 g q6–8h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Pain at IM injection site, GI disturbances (mild diarrhea, nausea, vomiting), oral or vaginal candidiasis. **Occasional:** Generalized rash, urticaria, phlebitis, thrombophlebitis (with IV administration), headache. **Rare:** Dizziness, seizures (esp. with IV therapy).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, esp. penicillins, cephalosporins; renal impairment.

### INTERVENTION/EVALUATION

Promptly report rash (although common with ampicillin, may indicate hypersensitivity) or diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Evaluate IV site for phlebitis. Check IM injection site for pain, induration. Monitor I&O, urinalysis, renal function tests. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

• Continue antibiotic for full length of treatment. • Space doses evenly. • More effective if taken 1 hr before or 2 hrs after food/beverages. • Discomfort may occur with IM injection. • Report rash, diarrhea, or other new symptoms.

## ampicillin/ sulbactam

amp-i-sil-in/sul-bak-tam  
(Unasyn)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Penicillin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections, including intra-abdominal, skin/skin structure, gynecologic infections, due to beta-lactamase-producing organisms, including *H. influenzae*, *E. coli*, *Klebsiella*, *Acinetobacter*, *Enterobacter*, *S. aureus*, and *Bacteroides* spp. **OFF-LABEL:** Endocarditis, community-acquired pneumonia, surgical prophylaxis, pelvic inflammatory disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ampicillin, any penicillins, or sulbactam. Hx of cholestatic jaundice, hepatic impairment associated with ampicillin/sulbactam. **Cautions:** History of allergies, esp. cephalosporins; renal impairment; infectious mononucleosis; asthmatic pts.

### ACTION

Ampicillin inhibits bacterial cell wall synthesis by binding to PCN-binding proteins. Sulbactam inhibits bacterial beta-lactamase, protecting ampicillin from degradation. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

### PHARMACOKINETICS

Protein binding: 28%–38%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; appears in cord blood, amniotic

fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. **Tetracyclines** may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, LDH, creatinine. May cause positive Coombs' test.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1.5 g (ampicillin 1 g/sulbactam 0.5 g), 3 g (ampicillin 2 g/sulbactam 1 g).

### ADMINISTRATION/HANDLING

**Reconstitution** • For IV injection, dilute with Sterile Water for Injection to provide concentration of 375 mg/mL. • For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl.

**Rate of administration** • For IV injection, give slowly over minimum of 10–15 min. • For intermittent IV infusion (piggyback), infuse over 15–30 min. • Due to potential for hypersensitivity/anaphylaxis, start initial dose at few drops per min, increase slowly to ordered rate; stay with pt first 10–15 min, then check q10min.

**Storage** • IV solution, diluted with 0.9% NaCl, is stable for up to 72 hrs if refrigerated (4 hrs if diluted with D<sub>5</sub>W). • Discard if precipitate forms.

### IM

• Reconstitute each 1.5-g vial with 3.2 mL Sterile Water for Injection or lidocaine to provide concentration of 250 mg

ampicillin/125 mg sulbactam/mL. • Give deeply into large muscle mass within 1 hr after preparation.

### IV INCOMPATIBILITIES

Amiodarone (Cardarone), diltiazem (Cardizem), IDArubicin (Idamycin), ondansetron (Zofran).

### IV COMPATIBILITIES

Famotidine (Pepcid), heparin, insulin (regular), morphine.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**IV, IM: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 1.5–3 g q6h. **Maximum:** 12 g/day. **IV: CHILDREN 12 YRS AND YOUNGER: (Mild to moderate infection):** 100–200 mg ampicillin/kg/day in divided doses q6h. **Maximum dose:** 2,000 mg ampicillin/dose. **(Severe infection):** 200–400 mg ampicillin/kg/day divided q6h. **Maximum dose:** 2,000 mg ampicillin/dose. **NEONATES:** 100 mg (ampicillin)/kg/day in divided doses q8–12h.

### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

#### Creatinine

Clearance	Dosage
Greater than 30 mL/min	No dose adjustment
15–30 mL/min	1.5–3 g q12h
5–14 mL/min	1.5–3 g q24h
Hemodialysis	1.5–3 g q12–24h (after HD on dialysis days)
Peritoneal dialysis	1.5–3 g q12–24h
Continuous renal replacement therapy (CRRT)	3 g, then 1.5–3 g q6–12h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Diarrhea, rash (most common), urticaria, pain at IM injection site, thrombophlebitis with IV administration, oral or vaginal candidiasis.

**Occasional:** Nausea, vomiting, headache, malaise, urinary retention.

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps; severe, watery diarrhea; fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, blood dyscrasias may occur. High dosage may produce seizures.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, esp. penicillins, cephalosporins; renal impairment.

### INTERVENTION/EVALUATION

Promptly report rash (although common with ampicillin, may indicate hypersensitivity) or diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Evaluate IV site for phlebitis. Check IM injection site for pain, induration. Monitor I&O, urinalysis, renal function tests. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Discomfort may occur with IM injection.
- Report rash, diarrhea, or other new symptoms.

## anastrozole

**HIGH ALERT**

an-as-troe-zole  
(Arimidex)

**Do not confuse anastrozole with letrozole, or Arimidex with Imitrex.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aromatase inhibitor. **CLINICAL:** Antineoplastic hormone.

## USES

Treatment of advanced breast cancer in postmenopausal women who have developed progressive disease while receiving tamoxifen therapy. First-line therapy in advanced or metastatic breast cancer in postmenopausal women. Adjuvant treatment in early hormone receptor-positive breast cancer in postmenopausal women. **OFF-LABEL:** Treatment of recurrent or metastatic endometrial or uterine cancers; treatment of ovarian cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to anastrozole. Pregnancy, women who may become pregnant. **Cautions:** Preexisting ischemic cardiac disease, osteopenia (higher risk of developing osteoporosis), hyperlipidemia. May increase fall risk with fractures during therapy in pts with history of osteoporosis.

## ACTION

Inhibits aromatase, preventing conversion of androstenedione to estrone, and testosterone to estradiol. **Therapeutic Effect:** Decreases tumor mass or delays tumor progression.

## PHARMACOKINETICS

Well absorbed into systemic circulation (absorption not affected by food). Protein binding: 40%. Metabolized in liver. Eliminated by biliary system and, to a lesser extent, kidneys. **Mean Half-life:** 50 hrs in postmenopausal women. Steady-state plasma levels reached in approximately 7 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; may cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Estrogen therapies may reduce concentration/effects. **Tamoxi-**

**fen** may reduce plasma concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May elevate serum GGT level in pts with liver metastases. May increase serum ALT, AST, alkaline phosphatase, total cholesterol, LDL.

## AVAILABILITY (Rx)

**Tablets:** 1 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Breast Cancer (Advanced)

**PO: ADULTS, ELDERLY:** 1 mg once daily (continue until tumor progresses).

### Breast Cancer (Early, Adjuvant)

**PO: ADULTS, ELDERLY:** 1 mg once daily.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (16%–8%):** Asthenia, nausea, headache, hot flashes, back pain, vomiting, cough, diarrhea. **Occasional (6%–4%):** Constipation, abdominal pain, anorexia, bone pain, pharyngitis, dizziness, rash, dry mouth, peripheral edema, pelvic pain, depression, chest pain, paresthesia. **Rare (2%–1%):** Weight gain, diaphoresis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Thrombophlebitis, anemia, leukopenia occur rarely. Vaginal hemorrhage occurs rarely (2%).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain bone mineral density, total cholesterol, LDL, mammogram, clinical breast exam.

### INTERVENTION/EVALUATION

Monitor for asthenia, dizziness; assist with ambulation if needed. Assess for headache, pain. Offer antiemetic for nausea,

vomiting. Monitor for onset of diarrhea; offer antidiarrheal medication.

#### PATIENT/FAMILY TEACHING

- Notify physician if nausea, asthenia, hot flashes become unmanageable.

## anidulafungin

a-nid-ue-la-fun-jin  
(Eraxis)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Echinocandin. **CLINICAL:** Antifungal.

#### USES

Treatment of candidemia, other forms of *Candida* infections (e.g., intra-abdominal abscess, peritonitis), esophageal candidiasis.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to anidulafungin, other echinocandins. **Cautions:** Hepatic impairment.

#### ACTION

Inhibits synthesis of the enzyme glucan (vital component of fungal cell formation), preventing fungal cell wall formation. **Therapeutic Effect:** Fungistatic.

#### PHARMACOKINETICS

Distributed in tissue. Moderately bound to albumin. Protein binding: 84%–99%. Slow chemical degradation; 30% excreted in feces over 9 days. Not removed by hemodialysis. **Half-life:** 40–50 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Crosses placental barrier. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease effect of *Saccharomyces boulardii*. **HERBAL:** None

significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, bilirubin, calcium, creatinine, CPK, LDH, lipase. May decrease serum albumin, bicarbonate, magnesium, protein, potassium; Hgb, Hct, WBCs, neutrophils, platelet count. May prolong prothrombin time (PT).

#### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 50-mg vial, 100-mg vial.

#### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 50-mg vial with 15 mL Sterile Water for Injection (100 mg with 30 mL). Swirl, do not shake. • Further dilute 50 mg with 50 mL D<sub>2</sub>W or 0.9% NaCl (100 mg with 100 mL, 200 mg with 200 mL).

**Rate of administration** • Do not exceed infusion rate of 1.1 mg/min. Not for IV bolus injection.

**Storage** • Refrigerate unused vials. Reconstituted vials are stable for 24 hrs at room temperature. Infusion solution is stable for 48 hrs at room temperature.

#### IV INCOMPATIBILITIES

Amphotericin B (Abelcet, AmBisome), eripenem (INVanz), sodium bicarbonate.

#### IV COMPATIBILITIES

Dexamethasone (Decadron), famotidine (Pepcid), furosemide (Lasix), HYDROMORPHONE (Dilaudid), LORAZEPAM (Ativan), methylPREDNISOLONE (SOLU), morphine. Refer to IV Compatibility Chart in front of book.

#### INDICATIONS/ROUTES/DOSAGE

**◀ ALERT ▶** Duration of treatment based on pt's clinical response. In general, treatment is continued for at least 14 days after last positive culture.

#### Candidemia, Other *Candida* Infections

**IV: ADULTS, ELDERLY:** Give single 200-mg loading dose on day 1, followed by 100 mg/day thereafter for at least 14 days after last positive culture.

**Esophageal Candidiasis**

**IV: ADULTS, ELDERLY:** 200 mg daily for 14–21 days. May transition to fluconazole (oral).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Rare (3%–1%):** Diarrhea, nausea, headache, rigors, peripheral edema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypokalemia occurs in 4% of pts. Hypersensitivity reaction characterized by facial flushing, hypotension, pruritus, urticaria, rash occurs rarely. Hepatitis, elevated LFT, hepatic failure was reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT. Obtain specimens for fungal culture prior to therapy. Treatment may be instituted before results are known.

**INTERVENTION/EVALUATION**

Monitor for evidence of hepatic dysfunction, hypokalemia. Monitor daily pattern of bowel activity, stool consistency. Assess for rash, urticaria.

**PATIENT/FAMILY TEACHING**

- For esophageal candidiasis, maintain diligent oral hygiene.

**apalutamide**

ap-a-loot-a-mide  
(Erleada)

**Do not confuse apalutamide with bicalutamide, enzalutamide, or nilutamide.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-androgen. **CLINICAL:** Antineoplastic.

**USES**

Treatment of nonmetastatic castration-resistant prostate cancer (NM-CRPC), metastatic, castration-sensitive prostate cancer.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to apalutamide. Use in women who are pregnant or may become pregnant. **Cautions:** History of cardiovascular disease (HF, ischemic heart disease), hypothyroidism, conditions predisposing to seizure activity (traumatic brain injury, brain tumor, prior CVA, seizure disorder). Pts at risk for fractures (frequent falls, osteoporosis, chronic corticosteroid therapy), hyperglycemia (e.g., diabetes, recent surgery, chronic use of corticosteroids).

**ACTION**

Binds directly to ligands of androgen receptor, preventing androgen-receptor translocation, DNA binding, and receptor-mediated transcription. **Therapeutic Effect:** Decreases proliferation of tumor cells, increases apoptosis, resulting in decreased tumor volume.

**PHARMACOKINETICS**

Rapidly absorbed and widely distributed. Metabolized in liver. Protein binding: 96%. Peak plasma concentration: 2 hrs. Steady-state reached in 4 wks. Excreted in urine (65%), feces (24%). **Half-life:** 3 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Not indicated in female population. Males with female partners of reproductive potential must use effective contraception during treatment and up to 3 mos after discontinuation. May cause fetal harm if administered in pregnant females. May cause decreased fertility in males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), strong CYP2C8 inhibitors (e.g., gemfibrozil, trimethoprim), P-gp inhibitors (e.g., amiodarone, azithromycin, captopril, carvedilol, cyclosporine, felodipine, ticagrelor) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, leukocytes, lymphocytes, RBCs. May increase serum cholesterol, glucose, potassium, triglycerides.

## AVAILABILITY (Rx)

**Tablets:** 60 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Swallow tablets whole; do not break, cut, crush, or divide.

## INDICATIONS/ROUTES/DOSAGE

**Non-Metastatic Castration-Resistant Prostate Cancer, Metastatic Castration-Sensitive Prostate Cancer**

**PO: ADULTS, ELDERLY:** 240 mg once daily (in combination with a gonadotropin-releasing hormone analog agonist or antagonist [if not received orchiectomy]). Continue until disease progression or unacceptable toxicity.

### Dose Modification

Based on Common Terminology Criteria for Adverse Effects (CTCAE).

### Toxicities or Intolerable Side Effects

**Any Grade 3 toxicity or intolerable side effect:** Withhold treatment until resolved to Grade 1 or less, then resume at same dose. If applicable, may decrease dose to 180 mg or 120 mg once daily.

**Seizures:** Permanently discontinue.

## Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** ESRD: Not specified; use caution.

## SIDE EFFECTS

**Frequent (39%–16%):** Fatigue, asthenia, hypertension, rash, urticaria, conjunctivitis, stomatitis, diarrhea, nausea, arthralgia, decreased weight. **Occasional (14%–6%):** Hot flush, decreased appetite, early satiety, hypophagia, peripheral edema, penile/scrotal edema, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, lymphopenia are expected responses to therapy. Increased incidence of falls (16% of pts) and fractures (12% of pts) was reported. Seizures reported in less than 1% of pts. Hypothyroidism reported in 8% of pts. Higher incidence of ischemic heart disease (4% of pts), HF (2% of pts) has occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, TSH; B/P. Question history of cardiovascular disease (HF, ischemic heart disease), hypothyroidism, seizure disorder. Assess risk for falls and fractures. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, TSH; B/P periodically. Monitor for symptoms of hypothyroidism (bradycardia, constipation, depression, fatigue, muscle weakness, weight gain), hyperglycemia, seizure activity. Assess skin for rash. Question for any incidence of falls, suspected fractures.

### PATIENT/FAMILY TEACHING

- Sexually active men must wear condoms with sexual activity during treatment and for at least 3 mos after last dose.

- Women who are pregnant or who plan on becoming pregnant should not handle medication.
- Treatment may increase risk of falls and fractures. Go slowly from lying to standing. Use caution during strenuous activity.
- Slow heart rate, constipation, depression, fatigue may indicate low thyroid levels.
- Immediately report symptoms of seizure activity (confusion, convulsions, loss of consciousness).
- Report symptoms of elevated blood sugar levels (blurred vision, headache, increased thirst, frequent urination).
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## apixaban

a-pix-a-ban  
(Eliquis)

**BLACK BOX ALERT** ■ Discontinuation in absence of alternative anticoagulation increases risk for thrombotic events. Spinal or epidural hematoma resulting in paralysis may occur with neuraxial anesthesia or spinal/epidural puncture.

**Do not confuse apixaban with rivaroxaban, argatroban, or dabigatran.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Factor Xa inhibitor. **CLINICAL:** Anticoagulant.

### USES

Reduces risk for stroke, systemic embolism in pts with nonvalvular atrial fibrillation. Prophylaxis of DVT following hip or knee replacement surgery. Treatment of DVT and PE. Reduces risk of recurrent DVT/PE following initial therapy. **OFF-LABEL:** Prevention of recurrent stroke or TIA.

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to apixaban. Active pathologic bleeding. **Cautions:** Mild to moderate hepatic impairment, severe renal impairment

(may increase bleeding risk). Avoid use in pts with severe hepatic impairment, prosthetic heart valve, significant rheumatic heart disease.

### ACTION

Selectively, directly, and reversibly inhibits free and clot-bound factor Xa, a key factor in the intrinsic and extrinsic pathway of blood coagulation cascade. **Therapeutic Effect:** Inhibits clot-induced platelet aggregation, fibrin clot formation.

### PHARMACOKINETICS

Readily absorbed after PO administration. Peak plasma concentration: 3–4 hrs. Protein binding: 87%. Metabolized in liver. Excreted primarily in urine, feces. **Half-life:** 12 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease level/effect. Anticoagulants (e.g., dabigatran, heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., diclofenac, ibuprofen, naproxen), strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase concentration, bleeding risk. **HERBAL:** St. John's wort may decrease concentration/effect. Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease platelet count, Hgb, LFT.

### AVAILABILITY (Rx)

**Tablets:** 2.5 mg, 5 mg.

### ADMINISTRATION/HANDLING

**ALERT** ■ Discontinuation in absence of alternative anticoagulation increases risk for thrombotic events.

**PO**

• Give without regard to food. • If elective surgery or invasive procedures with moderate or high risk for bleeding, discontinue apixaban at least 24–48 hrs prior to procedure.

**INDICATIONS/ROUTES/DOSAGE****Nonvalvular Atrial Fibrillation**

**PO: ADULTS, ELDERLY:** 5 mg twice daily. In pts with at least 2 of the following characteristics: age 80 yrs or older, body weight 60 kg or less, serum creatinine 1.5 mg/dL or greater, concurrent use with CYP3A4, or P-gp inhibitors (e.g., ketoconazole, ritonavir), reduce dose to 2.5 mg twice daily.

**DVT/PE Treatment**

**PO: ADULTS, ELDERLY:** 10 mg twice daily for 7 days, then 5 mg twice daily.

**DVT Prophylaxis (Hip/Knee Replacement)**

**Note:** Begin 12–24 hrs postoperatively.

**ADULTS, ELDERLY:** 2.5 mg twice daily (approx. 30 days for hip; 10–14 days for knee).

**DVT Prophylaxis, Reduce Risk Recurrent DVT/PE**

**PO: ADULTS, ELDERLY:** 2.5 mg twice daily (after at least 6 mos of treatment).

**Dosage in Renal Impairment**

**DVT/PE/Reduce risk recurrent DVT, postoperative:** No adjustment. **Non-valvular A-fib, HD: SCR LESS THAN 1.5:** No adjustment. **SCR 1.5 OR GREATER, OLDER THAN 80 YRS, WEIGHING 60 KG OR LESS:** 2.5 mg 2 times/day.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Use caution. **Severe impairment:** Not recommended.

**SIDE EFFECTS**

**Rare (3%–1%):** Nausea, ecchymosis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Increased risk for bleeding/hemorrhagic events. May cause serious, potentially fatal bleeding, accompanied by one or more of the following: a decrease in Hgb of 2 g/dL or more; a need for 2 or more units of packed RBCs; bleeding occurring at one of the following sites: intracranial, intraspinal, intraocular, pericardial, intra-articular, intramuscular with compartment syndrome, retroperitoneal. Serious reactions include jaundice, cholestasis, cytolytic hepatitis, Stevens-Johnson syndrome, hypersensitivity reaction, anaphylaxis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC. Question history of bleeding disorders, recent surgery, spinal punctures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, hepatic impairment. Obtain full medication history including herbal products.

**INTERVENTION/EVALUATION**

Periodically monitor CBC, stool for occult blood. Be alert for complaints of abdominal/back pain, headache, confusion, weakness, vision change (may indicate hemorrhage). Question for increased menstrual bleeding/discharge. Assess for any sign of bleeding: bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, ecchymosis.

**PATIENT/FAMILY TEACHING**

• Do not take/discontinue any medication except on advice from physician. • Avoid alcohol, aspirin, NSAIDs, herbal supplements, grapefruit products. • Consult physician before surgery, dental work. • Use electric razor, soft toothbrush to prevent bleeding. • Report blood-tinged mucus from coughing, heavy menstrual bleeding, headache, vision problems, weakness, abdominal pain, frequent bruising, bloody urine or stool, joint pain or swelling.

## apremilast

a-pre-mi-last  
(Otezla)

**Do not confuse apremilast with roflumilast.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Phosphodiesterase 4 (PDE4) enzyme inhibitor.

**CLINICAL:** Antipsoriatic arthritis agent.

### USES

Treatment of adult pts with active psoriatic arthritis, moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy. Treatment of oral ulcers associated with Behcet's disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to apremilast. **Cautions:** History of depression, severe renal impairment, suicidal ideation. Pts with latent infections (e.g., TB, viral hepatitis).

### ACTION

Selectively inhibits PDE4, increasing cyclic AMP (cAMP) and regulation of inflammatory mediators. **Therapeutic Effect:** Reduces psoriatic arthritis exacerbations.

### PHARMACOKINETICS

Widely distributed. Protein binding: 68%. Peak plasma concentration: 2.5 hrs. Metabolized in liver. Excreted in urine (58%), feces (39%). **Half-life:** 6–9 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Not recommended for nursing mothers. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant.

**FOOD:** None significant. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

 **Tablets:** 10 mg, 20 mg, 30 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. Administer whole; do not crush, cut, dissolve, or divide.

### INDICATIONS/ROUTES/DOSAGE

**Behcet's Disease, Psoriatic Arthritis, Plaque Psoriasis**

**PO: ADULTS/ELDERLY:** Initially, titrate dose from day 1–day 5. **Day 1:** 10 mg in AM only. **Day 2:** 10 mg in AM; 10 mg in PM. **Day 3:** 10 mg in AM; 20 mg in PM. **Day 4:** 20 mg in AM; 20 mg in PM. **Day 5:** 20 mg in AM; 30 mg in PM. **Day 6/maintenance:** 30 mg twice daily.

**Dosage in Renal Impairment (Creatinine Clearance less than 30 mL/min)**

**Days 1–3:** 10 mg in AM. **Days 4–5:** 20 mg in AM, using only AM schedule. **Day 6/maintenance:** 30 mg once daily.

**Dosage in Hepatic Impairment**

No dose adjustment.

### SIDE EFFECTS

**Occasional (9%–4%):** Nausea, diarrhea, headache, upper respiratory tract infection. **Rare (3% or less):** Vomiting, nasopharyngitis, upper abdominal pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Increased risk of depression reported in less than 1% of pts. Weight decrease of 5%–10% of body weight occurred in 10% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain baseline weight, vital signs. Question history of depression, severe renal impairment, suicidal ideations. Screen for prior allergic reactions to drug class. Receive full medication history including herbal products. Assess degree of joint pain, range of motion, mobility.

**INTERVENTION/EVALUATION**

Monitor for worsening depression, suicidal ideation. Monitor for weight loss. Assess for dehydration if diarrhea occurs. Assess improvement of joint pain, range of motion, mobility.

**PATIENT/FAMILY TEACHING**

- Report changes in mood or behavior, thoughts of suicide, self-destructive behavior. Report weight loss of any kind.
- Increase fluid intake if dehydration suspected.
- Immediately notify physician if pregnancy suspected.
- Do not chew, crush, dissolve, or divide tablets.

## aprepitant/ fosaprepitant

a-prep-i-tant/fos-a-prep-i-tant  
(Cinvanti, Emend)

**Do not confuse fosaprepitant with aprepitant, fosamprenavir, or fospropofol.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Neurokinin receptor antagonist. **CLINICAL:** Antinausea, antiemetic.

**USES**

**PO/IV:** Prevention of nausea, vomiting associated with repeat courses of moderately to highly emetogenic cancer chemotherapy.

**PO:** Prevention of postop nausea, vomiting.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to aprepitant or fosaprepitant. Concurrent use with pimozide. **Cautions:** Severe hepatic impairment. Concurrent use of medications metabolized through CYP3A4 (e.g., docetaxel, etoposide, ifosfamide, imatinib, irinotecan, PACLitaxel, vinblastine, vinCRISTine, vinorelbine).

**ACTION**

Inhibits substance P receptor, augments antiemetic activity of 5-HT<sub>3</sub> receptor

antagonists. **Therapeutic Effect:** Prevents acute and delayed phases of chemotherapy-induced emesis.

**PHARMACOKINETICS**

Moderately absorbed from GI tract. Crosses blood-brain barrier. Extensively metabolized in liver. Protein binding: greater than 95%. Eliminated primarily by liver metabolism (not excreted renally). **Half-life:** 9–13 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease concentration/effect. May decrease effectiveness of hormonal contraceptives, warfarin. May increase concentration/effects of bosutinib, budesonide, combimetinib, neratinib, simeprevir. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, BUN, creatinine, glucose. May produce proteinuria.

**AVAILABILITY (Rx)**

**Capsules (Emend):** 40 mg, 80 mg, 125 mg. **Injection, Emulsion (Cinvanti):** 130 mg/18 mL. **Injection, Powder for Reconstitution (Fosaprepitant):** 150 mg. **Oral Suspension:** 125 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Administer whole; do not cut, crush, or open capsules.
- Suspension (prepared by healthcare provider in oral dispenser). Dispense in pt's mouth along inner cheek. Suspension is stable for 72 hrs if refrigerated or up to 3 hrs at room temperature.

### IV (Emend)

**Reconstitution** • Reconstitute each vial with 5 mL 0.9% NaCl. • Add to 145 mL 0.9% NaCl to provide a final concentration of 1 mg/mL.

**Rate of administration** • Infuse over 20–30 min 30 min prior to chemotherapy.

**Storage** • Refrigerate unconstituted vials. • After reconstitution, solution is stable at room temperature for 24 hrs.

### IV Emulsion (Cinvanti)

**Reconstitution** • For 130-mg dose, dilute 18 mL of Cinvanti into 100 mL 0.9% NaCl or D<sub>5</sub>W infusion bag. • For 100-mg dose, dilute 14 mL of Cinvanti into 100 mL 0.9% NaCl or D<sub>5</sub>W infusion bag. • Mix by gentle inversion (4–5 times). • Do not shake.

**Rate of administration** • Infuse over 30 minutes. Use only non-DEHP tubing for administration. For IV injection, no further dilution is necessary. Inject over 2 min.

### IV INCOMPATIBILITIES

Do not infuse with any solutions containing calcium or magnesium.

### INDICATIONS/ROUTES/DOSAGE

#### Prevention of Chemotherapy-Induced Nausea, Vomiting

**Note:** Administer in combination with a 5-HT<sub>3</sub> antagonist on day 1 and dexamethasone on days 1 through 4.

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS OR YOUNGER WEIGHING 30 KG OR MORE:** 125 mg 1 hr before chemotherapy on day 1 and 80 mg once daily in the morning on days 2 and 3.

**IV: ADULTS, ELDERLY (SINGLE-DOSE REGIMEN): (Emend):** 150 mg over 20–30 min 30 min before chemotherapy. **(Cinvanti):** 100–130 mg over 30 min or IV injection over 2 min approx. 30 min before chemotherapy.

#### Prevention of Postop Nausea, Vomiting

**PO: ADULTS, ELDERLY:** 40 mg once within 3 hrs prior to induction of anesthesia.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment. Caution in severe hepatic impairment.

### SIDE EFFECTS

**Frequent (17%–10%):** Fatigue, nausea, hiccups, diarrhea, constipation, anorexia.

**Occasional (8%–4%):** Headache, vomiting, dizziness, dehydration, heartburn. **Rare (3% or less):** Abdominal pain, epigastric discomfort, gastritis, tinnitus, insomnia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Neutropenia, mucous membrane disorders occur rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue).

#### INTERVENTION/EVALUATION

Monitor hydration, nutritional status, I&O. Assess bowel sounds for peristalsis. Assist with ambulation if dizziness occurs. Provide supportive measures. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Report persistent vomiting, headache.
- May decrease effectiveness of oral contraceptives.

## argatroban

HIGH ALERT

ar-gat-roe-ban

**Do not confuse argatroban with Aggrastat.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Direct thrombin inhibitor. **CLINICAL:** Anti-coagulant.

### USES

Prophylaxis or treatment of thrombosis in heparin-induced thrombocytopenia (HIT) in pts with HIT or at risk of

developing HIT undergoing percutaneous coronary procedures. **OFF-LABEL:** Maintain extracorporeal circuit patency of continuous renal replacement therapy (CRRT) in pts with HIT.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to argatroban, active major bleeding. **Cautions:** Severe hypertension, immediately following lumbar puncture, spinal anesthesia, major surgery, pts with congenital or acquired bleeding disorders, gastrointestinal ulcerations, hepatic impairment, critically ill pts.

## ACTION

Direct thrombin inhibitor that reversibly binds to thrombin-active sites of free and clot-associated thrombin. Inhibits thrombin-catalyzed or thrombin-induced reactions, including fibrin formation, activation of coagulant factors V, VIII, and XIII; inhibits protein C formation, platelet aggregation. **Therapeutic Effect:** Produces anticoagulation.

## PHARMACOKINETICS

Distributed primarily in extracellular fluid. Protein binding: 54%. Metabolized in liver. Primarily excreted in the feces, presumably through biliary secretion. **Half-life:** 39–51 min (prolonged in hepatic failure).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Anticoagulants (e.g., dabigatran, heparin, rivaroxaban, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., diclofenac, ibuprofen, naproxen) may increase anticoagulant effect. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may

increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** Prolongs prothrombin time (PT), activated partial thromboplastin time (aPTT), international normalized ratio (INR). May decrease Hgb, Hct.

## AVAILABILITY (Rx)

**Infusion (Pre-Mix):** 125 mg/125 mL, 250 mg/250 mL. **Injection Solution:** 250 mg/2.5 mL vial.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute each 250-mg vial with 250 mL 0.9% NaCl, D<sub>5</sub>W to provide a final concentration of 1 mg/mL.

**Rate of administration** • Initial rate of administration is based on body weight at 2 mcg/kg/min (e.g., 50-kg pt infuse at 6 mL/hr). Dosage should not exceed 10 mcg/kg/min.

**Storage** • Discard if solution appears cloudy or an insoluble precipitate is noted. • Following reconstitution, stable for 96 hrs at room temperature or refrigerated. • Avoid direct sunlight.

## IV INCOMPATIBILITIES

Amiodarone (Cordarone).

## IV COMPATIBILITIES

DiphenhydrAMINE (Benadryl), DOBU-Tamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), midazolam (Versed), morphine, vasopressin (Pitressin). Refer to IV Compatibility Chart in front of book.

## INDICATIONS/ROUTES/DOSAGE

### Heparin-Induced Thrombocytopenia (HIT)

**IV infusion: ADULTS, ELDERLY:** Initially, 2 mcg/kg/min administered as a continuous infusion. After initial infusion, dose may be adjusted until steady-state aPTT is 1.5–3 times initial baseline value, not to exceed 100 sec. Dosage should not exceed 10 mcg/kg/min.

**Percutaneous Coronary Intervention**

**IV infusion: ADULTS, ELDERLY:** Initially, administer bolus of 350 mcg/kg over 3–5 min, and begin infusion at 25 mcg/kg/min. Check ACT (activated clotting time) 5–10 min following bolus. If ACT is less than 300 sec, give additional bolus 150 mcg/kg, increase infusion to 30 mcg/kg/min. If ACT is greater than 450 sec, decrease infusion to 15 mcg/kg/min. Recheck ACT in 5–10 min. Once ACT of 300–450 sec achieved, continue dose through duration of procedure.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment****Moderate to severe impairment:**

**ADULTS, ELDERLY:** Initially, 0.5 mcg/kg/min. **CHILDREN:** Initially, 0.2 mcg/kg/min. Adjust dose in increments of 0.05 mcg/kg/min or less.

**SIDE EFFECTS**

**Frequent (8%–3%):** Dyspnea, hypotension, fever, diarrhea, nausea, pain, vomiting, infection, cough.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Ventricular tachycardia, atrial fibrillation occur occasionally. Major bleeding, sepsis occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, PT, aPTT. Determine initial B/P. Minimize need for multiple injection sites, blood draws, catheters.

**INTERVENTION/EVALUATION**

Assess for any sign of bleeding: bleeding at surgical site, hematuria, melena, bleeding from gums, petechiae, ecchymoses, bleeding from injection sites. Assess for decreased B/P, increased pulse rate, complaint of abdominal/back pain, severe headache (may indicate hemorrhage). Monitor ACT, PT, aPTT, platelet count, Hgb, Hct. Question for increase

in discharge during menses. Assess for hematuria. Observe skin for any occurring ecchymoses, petechiae, hematoma. Use care in removing any dressing, tape.

**PATIENT/FAMILY TEACHING**

- Use electric razor, soft toothbrush to prevent cuts, gingival trauma.
- Report any sign of bleeding, including red/dark urine, black/red stool, coffee-ground vomitus, blood-tinged mucus from cough.

**ARIPiprazole**TOP  
100

ar-i-pip-ra-zole

(Abilify, Abilify Maintena, Aristada Initio)

■ **BLACK BOX ALERT** ■ Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF. Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse Abilify with Ambien, or ARIPIprazole with esomeprazole, omeprazole, pantoprazole, or RABeprazole (proton pump inhibitors).**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Quinolinone antipsychotic. **CLINICAL:** Second-generation (atypical) antipsychotic agent.

**USES**

**PO:** Treatment of schizophrenia. Treatment of bipolar disorder. Adjunct treatment in major depressive disorder. Treatment of irritability associated with autism in children 6–17 yrs of age. Treatment of Tourette disorder. **IM: (Extended-Release): Abilify Maintena:** Treatment of schizophrenia in adults. Maintenance monotherapy treatment of bipolar 1 disorder in adults. **Aristada Initio:** In combination with oral aripiprazole for initiation of Aristada when used for

treatment of schizophrenia. **OFF-LABEL:** Schizoaffective disorder, depression with psychotic features, aggression, bipolar disorder (children), conduct disorder (children), psychosis/agitation related to Alzheimer's dementia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to Aripiprazole. **Cautions:** Concurrent use of CNS depressants (including alcohol), disorders in which CNS depression is a feature, cardiovascular or cerebrovascular diseases (may induce hypotension), Parkinson's disease (potential for exacerbation), history of seizures or conditions that may lower seizure threshold (Alzheimer's disease), diabetes mellitus. Pts at risk for pneumonia. Elderly with dementia.

## ACTION

Provides partial agonist activity at DOPamine (D<sub>2</sub>, D<sub>3</sub>) and serotonin (5-HT<sub>1A</sub>) receptors and antagonist activity at serotonin (5-HT<sub>2A</sub>) receptors. **Therapeutic Effect:** Improves symptoms associated with schizophrenia, bipolar disorder, autism, depression.

## PHARMACOKINETICS

Well absorbed through GI tract. Protein binding: 99% (primarily albumin). Reaches steady levels in 2 wks. Metabolized in liver. Excreted in feces (55%), urine (25%). Not removed by hemodialysis. **Half-life:** 75 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta. May be distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** May increase risk of mortality in pts with dementia-related psychosis.

## INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease concentration/effect. CYP3A4 inhibitors

(e.g., erythromycin, ketoconazole, ritonavir) may increase concentration/effect. CNS depressants (e.g., alcohol, morphine, oxycodone, zolpidem) may increase CNS depression. Strong CYP2D6 inhibitors (e.g., fluoxetine, paroxetine) may increase concentration/effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose. May decrease neutrophils, leukocytes.

## AVAILABILITY (Rx)

**Injection, Prefilled Syringe:** (Abilify Maintena): 300 mg, 400 mg. **Injection, Suspension (Extended-Release [Aristada Initio]):** 675 mg. **Oral Solution:** 1 mg/mL. **Tablets:** 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Orally Disintegrating Tablets:** 10 mg, 15 mg.

## ADMINISTRATION/HANDLING

### IM (Abilify Maintena)

**Vial** • Reconstitute 400-mg vial with 1.9 mL Sterile Water for Injection (300-mg vial with 1.5 mL) to provide a concentration of 100 mg/0.5 mL. Once reconstituted, administer in gluteal muscle. Do not administer via IV or subcutaneously.

**Prefilled syringe** • Reconstitute at room temperature by rotating syringe plunger to release diluent. Shake until suspension is uniform. • Inject full syringe content immediately following reconstitution.

### PO

- Give without regard to food.

### Orally Disintegrating Tablet

- Remove tablet, place entire tablet on tongue. • Do not break, split tablet. • May give without liquid.

## INDICATIONS/ROUTES/DOSAGE

**Note:** May substitute oral solution/tablet mg per mg up to 25 mg. For 30-mg tablets, give 25 mg oral solution.

**Strong CYP3A4 inducers:** Aripiprazole dose should be doubled. **Strong CYP3A4 inhibitors:** Aripiprazole dose should be reduced by 50%.

### Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 10–15 mg once daily. May increase up to 30 mg/day. Titrate dose by 5 mg/day at minimum of 2-wk intervals. **CHILDREN 13–17 YRS:** Initially, 2 mg/day for 2 days, then 5 mg/day for 2 days. May further increase to target dose of 10 mg/day. May then increase in increments of 5 mg up to maximum of 30 mg/day. **IM: ADULTS, ELDERLY: (*Abilify Maintenance*):** Initially, 400 mg monthly (separate doses by at least 26 days). (*Aristada Initial*): 675 mg once (single dose) with 30 mg aripiprazole with first IM dose of Aristada.

### Bipolar Disorder

**PO: ADULTS, ELDERLY: Monotherapy:** Initially, 10–15 mg once daily. May increase in increments of 5–10 mg/day of at least 1-wk intervals to 30 mg/day. **Adjunct to lithium or valproic acid:** Initially, 10–15 mg. May increase to 30 mg/day based on pt tolerance. **CHILDREN 10–17 YRS:** Initially, 2 mg/day for 2 days, then 5 mg/day for 2 days. May further increase to a target of 10 mg/day. Give subsequent dose increases of 5 mg/day. **Maximum:** 30 mg/day. **IM: ADULTS, ELDERLY: (*Abilify Maintenance*):** Initially, 400 mg monthly (separate doses by at least 26 days). Tolerability should be established using oral therapy before initiation of parenteral therapy. Continue oral therapy for 14 days during initiation of parenteral therapy.

### Major Depressive Disorder (Adjunct to Antidepressants)

**PO: ADULTS, ELDERLY: (*Abilify*):** Initially, 2–5 mg/day. May increase up to maximum of 15 mg/day. Titrate dose in 5-mg increments of at least 1-wk intervals.

### Irritability With Autism

**PO: CHILDREN 6–17 YRS:** Initially, 2 mg/day for 7 days followed by increase to 5 mg/day. Subsequent increases made in 5-mg increments at intervals of at least 1 wk. **Maximum:** 15 mg/day.

### Tourette Disorder

**PO: CHILDREN 6–17 YRS WEIGHING 50 KG OR MORE:** 2 mg/day for 2 days; then 5 mg/day for 5 days with target dose of 10 mg on day 8. **Maximum:** 20 mg/day. **LESS THAN 50 KG:** 2 mg/day for 2 days, then 5 mg/day. **Maximum:** 10 mg/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (11%–5%):** Weight gain, headache, insomnia, vomiting. **Occasional (4%–3%):** Light-headedness, nausea, akathisia, drowsiness. **Rare (2% or less):** Blurred vision, constipation, asthenia (loss of strength, energy), anxiety, fever, rash, cough, rhinitis, orthostatic hypotension.

### ADVERSE EFFECTS/TOXIC REACTIONS

Extrapyramidal symptoms, neuroleptic malignant syndrome, tardive dyskinesia, hyperglycemia, ketoacidosis, hyperosmolar coma, CVA, TIA occur rarely. Prolonged QT interval occurs rarely. May cause leukopenia, neutropenia, agranulocytosis.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Correct dehydration, hypovolemia. Assess for suicidal tendencies. Question history (or family history) of diabetes. Obtain serum blood glucose level.

#### INTERVENTION/EVALUATION

Periodically monitor weight. Monitor for extrapyramidal symptoms (abnormal movement), tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of the mouth). Periodically monitor B/P, pulse (particularly in pts with preexisting cardiovascular disease). Monitor serum blood glucose levels during therapy. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

**PATIENT/FAMILY TEACHING**

- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior, extrapyramidal effects.

**aspirin**TOP  
100 HIGH  
ALERT

as-pir-in

(Ascriptin, Bayer, Bufferin, Durlaza, Ecotrin)

**Do not confuse aspirin or Ascriptin with Afrin, Aricept, or Ecotrin with Epogen.**

**FIXED-COMBINATION(S)**

**Aspirin/dipyridamole:** (an antiplatelet agent): 25 mg/200 mg. **Fiornal:** aspirin/butalbital/caffeine (a barbiturate): 325 mg/50 mg/40 mg. **Lortab/ASA:** aspirin/HYDROcodone (an analgesic): 325 mg/5 mg. **Percodan:** aspirin/oxyCODONE (an analgesic): 325 mg/2.25 mg, 325 mg/4.5 mg. **Pravigard:** aspirin/pravastatin (a cholesterol-lowering agent): 81 mg/20 mg, 81 mg/40 mg, 81 mg/80 mg, 325 mg/20 mg, 325 mg/40 mg, 325 mg/80 mg. **Yosprala:** aspirin/omeprazole (a proton pump inhibitor [PPI]) 325 mg/40 mg, 81 mg/40 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Non-steroidal anti-inflammatory drug (NSAID). **CLINICAL:** Anti-inflammatory, antipyretic, analgesic, anti-platelet.

**USES**

Treatment of mild to moderate pain, fever. Reduces inflammation related to rheumatoid arthritis (RA), juvenile arthritis, osteoarthritis, rheumatic fever. Used as platelet aggregation inhibitor in the prevention of transient ischemic attacks (TIAs), cerebral thromboembolism, MI

or reinfarction. **Durlaza:** Reduce risk of MI in pts with CAD or stroke in pts who have had TIA or ischemic stroke. **OFF-LABEL:** Prevention of preeclampsia; alternative therapy for preventing thromboembolism associated with atrial fibrillation when warfarin cannot be used; pericarditis associated with MI; prosthetic valve thromboprophylaxis. Adjunctive treatment of Kawasaki's disease. Complications associated with autoimmune disorders, colorectal cancer.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to NSAIDs. Pts with asthma, rhinitis, nasal polyps; use in children (younger than 16 yrs) for viral infections with or without fever. **Cautions:** Platelet/bleeding disorders, severe renal/hepatic impairment, dehydration, erosive gastritis, peptic ulcer disease, sensitivity to tartrazine dyes, elderly (chronic use of doses 325 mg or greater). Avoid use in pregnancy, especially third trimester.

**ACTION**

Irreversibly inhibits cyclo-oxygenase enzyme, resulting in a decreased formation of prostaglandin precursors. Irreversibly inhibits formation of thromboxane, resulting in inhibiting platelet aggregation. **Therapeutic Effect:** Reduces inflammatory response, intensity of pain; decreases fever; inhibits platelet aggregation.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	1 hr	2-4 hrs	4-6 hrs

Rapidly and completely absorbed from GI tract; enteric-coated absorption delayed; rectal absorption delayed and incomplete. Protein binding: High. Widely distributed. Rapidly hydrolyzed to salicylate. **Half-life:** 15-20 min (aspirin); 2-3 hrs (salicylate at low dose); more than 20 hrs (salicylate at high dose).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. May prolong gestation and labor, decrease fetal birth weight, increase incidence of stillbirths, neonatal mortality, hemorrhage. Avoid use during last trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Caution in pts with acute febrile illness (Reye's syndrome). **Elderly:** May be more susceptible to toxicity; lower dosages recommended.

## INTERACTIONS

**DRUG:** Alcohol, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of GI effects (e.g., ulceration). **Antacids, urinary alkalinizers** increase excretion. **Anticoagulants, (e.g. enoxaparin, warfarin), heparin, thrombolytics, ticagrelor** increase risk of bleeding. **Apixaban, dabigatran, edoxaban, rivaroxaban** may increase anticoagulant effect. **HERBAL:** Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May alter serum ALT, AST, alkaline phosphatase, uric acid; prolongs prothrombin time (PT) platelet function assay. May decrease serum cholesterol, potassium, T<sub>3</sub>, T<sub>4</sub>.

## AVAILABILITY (OTC)

**Caplets:** 325 mg, 500 mg. **Suppositories:** 300 mg, 600 mg. **Tablets:** 325 mg. **Tablets (Chewable):** 81 mg.

 **Extended-Release Capsule: (Durlaza)** 162.5 mg. **Tablets (Enteric-Coated):** 81 mg, 325 mg, 650 mg.

## ADMINISTRATION/HANDLING

### PO

- Do not break, crush, dissolve, or divide enteric-coated tablets or extended-release capsule.
- May give with water, milk, meals if GI distress occurs.

### Rectal

- Refrigerate suppositories; do not freeze.
- If suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper.
- Moisten suppository with cold water before inserting well into rectum.

## INDICATIONS/ROUTES/DOSAGE

### Analgesia, Fever

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER AND WEIGHING 50 KG OR MORE:** 325–1,000 mg q4–6h prn. **Maximum:** 4 g/day. **RECTAL:** 300–600 mg q4h prn. **INFANTS, CHILDREN WEIGHING LESS THAN 50 KG:** 10–15 mg/kg/dose q4–6h. **Maximum:** 4 g/day or 90 mg/kg/day.

### Revascularization

**PO: ADULTS, ELDERLY:** 75–325 mg/day.

### Kawasaki's Disease

**PO: CHILDREN:** 80–100 mg/kg/day in divided doses q6h up to 14 days (until fever resolves for at least 48 hrs). After fever resolves, 1–5 mg/kg once daily for at least 6–8 wks.

### MI, Stroke (Risk Reduction)

**PO: ADULTS, ELDERLY: (Durlaza):** 162.5 mg once daily.

### Dosage in Renal/Hepatic Impairment

Avoid use in severe impairment.

## SIDE EFFECTS

**Occasional:** GI distress (including abdominal distention, cramping, heartburn, mild nausea); allergic reaction (including bronchospasm, pruritus, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

High doses of aspirin may produce GI bleeding and/or gastric mucosal lesions. Dehydrated, febrile children may experience aspirin toxicity quickly. Reye's syndrome, characterized by persistent vomiting, signs of brain dysfunction, may occur in children taking aspirin with

recent viral infection (chickenpox, common cold, or flu). Low-grade aspirin toxicity characterized by tinnitus, generalized pruritus (may be severe), headache, dizziness, flushing, tachycardia, hyperventilation, diaphoresis, thirst. Marked toxicity characterized by hyperthermia, restlessness, seizures, abnormal breathing patterns, respiratory failure, coma.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Do not give to children or teenagers who have or have recently had viral infections (increases risk of Reye's syndrome). Do not use if vinegar-like odor is noted (indicates chemical breakdown). Assess history of GI bleed, peptic ulcer disease, OTC use of products that may contain aspirin. Assess type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. **Therapeutic serum level for antiarthritic effect:** 20–30 mg/dL (toxicity occurs if level is greater than 30 mg/dL).

### INTERVENTION/EVALUATION

Monitor urinary pH (sudden acidification, pH from 6.5 to 5.5, may result in toxicity). Assess skin for evidence of ecchymosis. If given as antipyretic, assess temperature directly before and 1 hr after giving medication. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

- Do not, chew, crush, dissolve, or divide enteric-coated tablets.
- Avoid alcohol, OTC pain/cold products that may contain aspirin.
- Report ringing of the ears or persistent abdominal GI pain, bleeding.
- Therapeutic anti-inflammatory effect noted in 1–3 wks.
- Behavioral changes, persistent vomiting may be early signs of Reye's syndrome; contact physician.

## atenolol

**HIGH ALERT**

a-ten-oh-lol  
(Tenormin)

**BLACK BOX ALERT** Do not abruptly discontinue; taper gradually to avoid acute tachycardia, hypertension, ischemia.

**Do not confuse atenolol with albuterol, timolol, or Tylenol, or Tenormin with Imuran, Norpramin, or thiamine.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta<sub>1</sub>-adrenergic blocker. **CLINICAL:** Antihypertensive, antianginal, antiarrhythmic.

### USES

Treatment of hypertension, alone or in combination with other agents; management of angina pectoris; management of pts with definite/suspected MI to reduce CV mortality. **OFF-LABEL:** Arrhythmia (esp. supraventricular and ventricular tachycardia), thyrotoxicosis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to atenolol. Cardiogenic shock, uncompensated HF, second- or third-degree heart block (except with functioning pacemaker), sinus bradycardia. **Cautions:** Elderly, renal impairment, peripheral vascular disease, diabetes, thyroid disease, bronchospastic disease, compensated HF, myasthenia gravis, psychiatric disease, history of anaphylaxis to allergens, concurrent use with digoxin, verapamil, or diltiazem.

### ACTION

Blocks beta<sub>1</sub>-adrenergic receptors in cardiac tissue. **Therapeutic Effect:** Slows sinus node heart rate, decreasing cardiac output, B/P. Decreases myocardial oxygen demand.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	2–4 hrs	24 hrs

Incompletely absorbed from GI tract. Protein binding: 6%–16%. Minimal liver metabolism. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 6–9 hrs (increased in renal impairment).

 LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery; low birth-weight infants. **Children:** No age-related precautions noted. **Elderly:** Age-related peripheral vascular disease, renal impairment require caution.

## INTERACTIONS

**DRUG:** Alpha<sub>2</sub> agonists (e.g., clonidine) may increase AV-blocking effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration/effect. **Dronedarone, fingolimod, rivastigmine** may increase bradycardic effect. May increase vasoconstriction of **ergot derivatives** (e.g., dihydroergotamine, ergotamine). **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum ANA titer, serum BUN, creatinine, potassium, uric acid, lipoprotein, triglycerides.

## AVAILABILITY (Rx)

**Tablets:** 25 mg, 50 mg, 100 mg.

## ADMINISTRATION/HANDLING

## PO

- Give without regard to food.
- Tablets may be crushed.

## INDICATIONS/ROUTES/DOSAGE

## Hypertension

**PO: ADULTS:** Initially, 25 mg once or twice daily. After 1–2 wks, may increase dose at 1-wk or longer intervals up to 100 mg/day in 1 or 2 divided doses. **ELDERLY:** Usual initial dose, 25 mg/day. **CHILDREN:** Initially, 0.5–1 mg/kg/dose given once daily. Range: 0.5–1.5 mg/kg/day. **Maximum:** 2 mg/kg/day up to 100 mg/day.

## Angina Pectoris

**PO: ADULTS:** Initially, 50 mg once daily. May increase dose at wkly intervals. Usual dosage range: 50–100 mg once daily. **ELDERLY:** Usual initial dose, 25 mg/day.

## Post-MI

**PO: ADULTS:** Initially, 25 mg or 50 mg twice daily. Begin within first 24 hrs post-MI, then continue indefinitely. **Maximum:** 100 mg/day in 1 or 2 divided doses.

## Dosage in Renal Impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance	Maximum Dosage
15–35 mL/min	50 mg/day
Less than 15 mL/min	25 mg/day
Hemodialysis (HD)	Give dose post-HD or give 25–50 mg supplemental dose

## Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

Atenolol is generally well tolerated, with mild and transient side effects. **Frequent:** Hypotension manifested as cold extremities, constipation or diarrhea, diaphoresis, dizziness, fatigue, headache, nausea. **Occasional:** Insomnia, flatulence, urinary frequency, impotence or decreased libido, depression. **Rare:** Rash, arthralgia, myalgia, confusion (esp. in the elderly), altered taste.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal may result in diaphoresis, palpitations,

headache, tremors. May precipitate HF, MI in pts with cardiac disease; thyroid storm in pts with thyrotoxicosis; peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in previously controlled diabetes. Thrombocytopenia (unusual bruising, bleeding) occurs rarely. **Antidote:** Glucagon (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less, or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Antianginal:** Record onset, quality (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Assess baseline renal/hepatic function tests.

### INTERVENTION/EVALUATION

Monitor B/P for hypotension, pulse for bradycardia, respiration for difficulty in breathing, ECG. Monitor daily pattern of bowel activity, stool consistency. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), nocturnal cough, peripheral edema, distended neck veins. Monitor I&O (increased weight, decreased urinary output may indicate HF). Assess extremities for pulse quality, changes in temperature (may indicate worsening peripheral vascular disease). Assist with ambulation if dizziness occurs.

### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue medication.
- Compliance with therapy essential to control hypertension, angina.
- To reduce hypotensive effect, go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Advise diabetic pts to monitor blood glucose carefully (may mask signs of hypoglycemia).
- Report dizziness, depression, confusion, rash, unusual bruising/bleeding.
- Outpatients should monitor B/P, pulse before taking medication, following

correct technique.

- Restrict salt, alcohol intake.
- Therapeutic antihypertensive effect noted in 1–2 wks.

## atezolizumab

a-te-zoe-liz-ue-mab  
(Tecentriq)

**Do not confuse atezolizumab with daclizumab, certolizumab, eculizumab, omalizumab, or tocilizumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Programmed death-ligand 1 (PD-L1) blocking antibody. Monoclonal antibody. **CLINICAL:** Antineoplastic.

## USES

Treatment of pts with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy. First-line treatment of metastatic non–small-cell lung cancer (NSCLC) as first-line monotherapy for certain pts, in combination with bevacizumab, paclitaxel, and carboplatin; or in combination with paclitaxel (protein bound) and carboplatin in pts with no EGFR or ALK genome tumor aberrations. Treatment of metastatic NSCLC in pts with disease progression during or following platinum-containing chemotherapy. Pts should have disease progression on approved therapy for EGFR or ALK genomic tumor mutation before receiving atezolizumab. Adjuvant treatment (as a single agent) following resection and platinum-based chemotherapy in adults with stage II to IIIA NSCLC. Treatment of unresectable locally advanced or metastatic triple-negative breast cancer (in combination with paclitaxel [protein bound]) in pts whose tumors express PD-L1. First-line treatment of extensive-stage small-cell lung cancer (in combination

with carboplatin and etoposide). Treatment of hepatocellular carcinoma (in combination with bevacizumab). Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with cobimetinib and vemurafenib).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to atezolizumab. **Cautions:** Active infection; baseline cytopenias; pts at risk for hyperglycemia (e.g., diabetes, chronic use of corticosteroids); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); pts at risk for dehydration, electrolyte imbalance; hepatic impairment, peripheral or generalized edema, neuropathy, optic disorders, interstitial lung disease; history of venous thromboembolism, intestinal obstruction, pancreatitis.

## ACTION

Binds to PD-L1 to selectively prevent the interaction between PD-L1 and B7.1 receptors. PD-L1 is an immune checkpoint protein expressed on tumor cells. **Therapeutic Effect:** Restores anti-tumor T-cell function. Suppresses tumor growth and improves tumor immunogenicity.

## PHARMACOKINETICS

Metabolism not specified. Steady state reached in 6–9 wks. Elimination not specified. **Half-life:** 27 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Unknown if distributed in breast milk; however, human immunoglobulin G is present in breast milk. Breastfeeding not recommended during treatment and for at least 5 mos after discontinuation. Females of reproductive potential should use effective contraception during treatment and up to 5 mos after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, glucose. May decrease serum albumin, sodium; lymphocytes, Hgb, Hct, RBCs.

## AVAILABILITY (Rx)

**Injection Solution:** 840 mg/14 mL, 1,200 mg/20 mL (60 mg/mL).

## ADMINISTRATION/HANDLING

**Reconstitution** • Visually inspect solution for particulate matter or discoloration. Solution should appear clear to slightly yellow. Discard if solution is cloudy or discolored or if visible particles are present. • Do not shake vial. • Withdraw 20 mL of solution from vial and dilute into a 250-mL polyvinyl chloride, polyethylene, or polyolefin infusion bag containing 0.9% NaCl. Dilute with 0.9% NaCl only. • Mix by gentle inversion. • Do not shake. • Discard partially used or empty vials.

**Rate of administration** • Infuse over 60 min using sterile, nonpyrogenic, low protein-binding, 0.2- to 0.22-micron in-line filter. • If first infusion is tolerated, all subsequent infusions may be delivered over 30 mins. • Do not administer as IV bolus.

**Storage** • Refrigerate diluted solution up to 24 hrs or store at room temperature for no more than 6 hrs (includes time of preparation and infusion). • Do not freeze. • Do not shake.

## IV INCOMPATIBILITIES

Do not administer with other medications. Infuse via dedicated line.

## INDICATIONS/ROUTES/DOSAGE

### NSCLC

**IV; ADULTS, ELDERLY:** 1,200 mg on day 1 q3wks (in combination with bevacizumab, paclitaxel [protein bound], or carboplatin) for 4–6 cycles, then 1,200 mg on day 1 (followed by bevacizumab) q3wks. Following

combination chemotherapy, may continue atezolizumab as single agent at 800 mg q2wks or 1,200 mg q3wks or 1,680 mg q4wks. Continue until disease progression or unacceptable toxicity.

#### NSCLC (adjuvant treatment)

**IV: ADULTS, ELDERLY:** 1,200 mg q3wks (as a single agent). Continue for up to 1 yr unless disease recurrence or unacceptable toxicity occurs.

#### Urothelial Carcinoma

**IV: ADULTS, ELDERLY:** 840 mg q2wks or 1,200 mg q3wks or 1,680 mg q4wks until disease progression or unacceptable toxicity. No dose reductions are recommended.

#### Breast Cancer (Triple-Negative), Locally Advanced or Metastatic

**IV: ADULTS, ELDERLY:** 840 mg on days 1 and 15 q4wks (in combination with paclitaxel [protein bound]) until disease progression or unacceptable toxicity.

#### Small-Cell Lung Cancer (Extensive-Stage), First-Line Treatment

**IV: ADULTS, ELDERLY:** Induction: 1,200 mg on day 1 q3wks (in combination with carboplatin and etoposide) for 4 cycles, followed by single-agent maintenance therapy of 840 mg once q2wks; or 1,200 mg once q3wks; or 1,680 mg once q4wks. Continue until disease progression or unacceptable toxicity.

#### Hepatocellular Carcinoma

**IV: ADULTS, ELDERLY:** 1,200 mg (followed by bevacizumab 15 mg/kg on same day) q3wks. If bevacizumab is discontinued, continue atezolizumab as single agent at 800 mg q2wks or 1,200 mg q3wks or 1,680 mg q4wks.

#### Melanoma (Unresectable or Metastatic)

**Note:** Prior to initiating atezolizumab, pts should receive a 28-day treatment cycle of cobimetinib and vemurafenib.

**IV: ADULTS, ELDERLY:** 840 mg q2wks (in combination with cobimetinib and vemurafenib). Continue until disease progression or unacceptable toxicity.

#### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). **Withhold treatment for any of the following toxic reactions:** Grade 2 or 3 diarrhea or colitis; Grade 2 pneumonitis; serum AST or ALT elevation 3–5 times upper limit of normal (ULN) or serum bilirubin elevation 1.5–3 times ULN; symptomatic hypophysitis, adrenal insufficiency, hypothyroidism, hyperthyroidism; Grade 3 or 4 hyperglycemia; Grade 3 rash; Grade 2 ocular inflammatory toxicity, Grade 2 or 3 pancreatitis, Grade 3 or 4 infection, Grade 2 infusion-related reactions. **Restarting treatment after interruption of therapy:** Resume treatment when adverse effects return to Grade 0 or 1. **Permanently discontinue for any of the following toxic reactions:** Grade 3 or 4 diarrhea or colitis; Grade 3 or 4 pneumonitis; serum AST or ALT elevation greater than 5 times ULN or serum bilirubin elevation 3 times ULN; Grade 4 hypophysitis; Grade 4 rash; Grade 3 or 4 ocular inflammatory toxicity; Grade 4 or any grade recurrent pancreatitis; Grade 3 or 4 infusion-related reactions; any occurrence of encephalitis, Guillain-Barré, meningitis, meningoencephalitis, myasthenic syndrome/myasthenia gravis.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not specified; use caution.

#### SIDE EFFECTS

**Frequent (52%–18%):** Fatigue, decreased appetite, nausea, pyrexia, constipation, diarrhea, peripheral edema. **Occasional (17%–13%):** Abdominal pain, vomiting, dyspnea, back/neck pain, rash, arthralgia, cough, pruritus.

#### ADVERSE EFFECTS/TOXIC REACTIONS

May cause severe immune-mediated events including adrenal insufficiency (0.4% of pts), interstitial lung disease or

pneumonitis (3% of pts), colitis or diarrhea (20% of pts), hepatitis (2%–3% of pts), hypophysitis (0.2% of pts), hyperthyroidism (1% of pts), hypothyroidism (4% of pts), rash (up to 37% of pts), new-onset diabetes with ketoacidosis (0.2% of pts), pancreatitis (0.1% of pts); meningoencephalitis, myasthenic syndrome/myasthenia gravis, Guillain-Barré, ocular inflammatory toxicity (less than 1% of pts). Severe, sometimes fatal infections, including sepsis, herpes encephalitis, mycobacterial infection, occurred in 38% of pts. Urinary tract infections were the most common cause of Grade 3 or higher infection, occurring in 7% of pts. Severe infusion-related reactions reported in less than 1% of pts. Other adverse events, including acute kidney injury, dehydration, dyspnea, encephalitis, hematuria, intestinal obstruction, meningitis, neuropathy, pneumonia, urinary obstruction, venous thromboembolism, were reported. Immunogenicity (auto-atezolizumab antibodies) occurred in 42% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, thyroid panel, pregnancy test in females of reproductive potential. Screen for history of pituitary/pulmonary/thyroid disease, autoimmune disorders, diabetes, hepatic impairment, venous thromboembolism. Conduct full dermatologic/neurologic/ophthalmologic exam. Screen for active infection. Assess hydration status.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT, thyroid panel, vital signs. Diligently monitor for immune-mediated adverse events as listed in Adverse Effects/Toxic Reactions. Notify physician if any CTCAE toxicities occur and initiate proper treatment. Obtain chest X-ray if interstitial lung disease, pneumonitis suspected. Due to high risk for dehydration/diarrhea, strictly monitor I&O. Encourage PO intake. If corticosteroid therapy is initiated for immune-mediated events, monitor capillary blood

glucose and screen for corticosteroid side effects. Report any changes in neurologic status, including nuchal rigidity with fever, positive Kernig's sign, positive Brudzinski's sign, altered mental status, seizures. Diligently monitor for infection.

### PATIENT/FAMILY TEACHING

- Treatment may cause serious or life-threatening inflammatory reactions. Report signs and symptoms of treatment-related inflammatory events in the following body systems: colon (severe abdominal pain or diarrhea); eye (blurry vision, double vision, unequal pupil size, sensitivity to light, eyelid drooping); lung (chest pain, cough, shortness of breath); liver (bruising easily, amber-colored urine, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]), neurologic (confusion, headache, seizures, neck rigidity with fever, severe nerve pain or loss of motor function).
- Immediately report allergic reactions, bleeding of any kind, signs of infection.
- Treatment may cause severe diarrhea. Drink plenty of fluids. Use effective contraception to avoid pregnancy. Do not breastfeed.

## atoMOXetine

at-oh-mox-e-teen

(Apo-Atomoxetine , Strattera)

**BLACK BOX ALERT** Increased risk of suicidal thinking and behavior in children and adolescents with attention-deficit hyperactivity disorder (ADHD).

**Do not confuse atomoxetine with atorvastatin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Norepinephrine reuptake inhibitor. **CLINICAL:** Psychotherapeutic agent.

## USES

Treatment of ADHD.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to atomoxetine. Narrow-angle glaucoma, use with or within 14 days of MAOIs. Pheochromocytoma or history of pheochromocytoma. Severe cardiovascular or vascular disease. **Cautions:** Hypertension, tachycardia, cardiovascular disease (e.g., structural abnormalities, cardiomyopathy), urinary retention, moderate or severe hepatic impairment, suicidal ideation, emergent psychotic or manic symptoms, comorbid bipolar disorder, renal impairment, poor metabolizers of CYP2D6 metabolized drugs (e.g., FLUoxetine, PARoxetine). Pts predisposed to hypotension.

## ACTION

Selectively inhibits reuptake of norepinephrine. **Therapeutic Effect:** Improves symptoms of ADHD.

## PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 98% (primarily to albumin). Excreted in urine (80%), feces (17%). Not removed by hemodialysis. **Half-life:** 4–5 hrs (increased in moderate to severe hepatic insufficiency).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. May produce suicidal thoughts in children and adolescents. **Elderly:** Age-related hepatic/renal impairment, cardiovascular or cerebrovascular disease may increase risk of adverse effects.

## INTERACTIONS

**DRUG:** MAOIs may increase concentration/effect. **Strong CYP2D6 inhibitors (e.g., FLUoxetine, paroxetine)** may increase concentration/effect.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase hepatic enzymes, serum bilirubin.

## AVAILABILITY (Rx)

**Capsules:** 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Swallow capsules whole, do not break or open (powder in capsule is ocular irritant). Give as single daily dose in the morning or 2 evenly divided doses in morning and late afternoon/early evening.

## INDICATIONS/ROUTES/DOSAGE

**Note:** May discontinue without tapering dose.

### Attention-Deficit Hyperactivity Disorder (ADHD)

**PO: ADULTS, CHILDREN 6 YRS AND OLDER WEIGHING 70 KG OR MORE:** Initially, 40 mg once daily. May increase after at least 3 days to 80 mg daily. May further increase to 100 mg/day after 2–4 additional wks to achieve optimal response. **Maximum:** 100 mg. **CHILDREN 6 YRS AND OLDER WEIGHING LESS THAN 70 KG:** Initially, 0.5 mg/kg/day. May increase after at least 3 days to 1.2 mg/kg/day. **Maximum:** 1.4 mg/kg/day or 100 mg, whichever is less.

### Dosage in Hepatic Impairment

Expect to administer 50% of normal atomoxetine dosage to pts with moderate hepatic impairment and 25% of normal dosage to pts with severe hepatic impairment.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage With Strong CYP2D6 Inhibitors

**ADULTS:** Initially, 40 mg/day. May increase to 80 mg/day after minimum of 4 wks. **CHILDREN:** Initially, 0.5 mg/kg/day. May increase to 1.2 mg/kg/day only after minimum 4-wk interval.

## SIDE EFFECTS

**Frequent:** Headache, dyspepsia, nausea, vomiting, fatigue, decreased appetite, dizziness, altered mood. **Occasional:** Tachycardia, hypertension, weight loss, delayed growth in children, irritability. **Rare:** Insomnia, sexual dysfunction in adults, fever.

## ADVERSE EFFECTS/TOXIC REACTIONS

Urinary retention, urinary hesitancy may occur. In overdose, gastric lavage, activated charcoal may prevent systemic absorption. Severe hepatic injury occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess pulse, B/P before therapy, following dose increases, and periodically during therapy. Assess attention span, interactions with others.

### INTERVENTION/EVALUATION

Monitor urinary output; complaints of urinary retention/hesitancy may be a related adverse reaction. Monitor B/P, pulse periodically and following dose increases. Monitor for growth, attention span, hyperactivity, unusual changes in behavior, suicidal ideation. Assist with ambulation if dizziness occurs. Be alert to mood changes. Monitor fluid and electrolyte status in pts with significant vomiting.

### PATIENT/FAMILY TEACHING

- Take last dose early in evening to avoid insomnia.
- Report palpitations, fever, vomiting, irritability.
- Monitor growth rate, weight.
- Report changes in behavior, suicidal ideation, chest pain, palpitations, dyspnea.

## atorvaSTATin

TOP  
100

a-tor-va-sta-tin  
(Lipitor)

**Do not confuse atorvastatin with atomoxetine, lovastatin, nystatin, pitavastatin, pravastatin,**

**or simvastatin, or Lipitor with labetalol, Levatol, lisinopril, Mevacor, or Zocor.**

## FIXED-COMBINATION(S)

**Caduet:** atorvastatin/amLODIPine (calcium channel blocker): 10 mg/2.5 mg, 10 mg/5 mg, 10 mg/10 mg, 20 mg/2.5 mg, 20 mg/5 mg, 20 mg/10 mg, 40 mg/2.5 mg, 40 mg/5 mg, 40 mg/10 mg, 80 mg/5 mg, 80 mg/10 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Hydroxymethylglutaryl CoA (HMG-CoA) reductase inhibitor. **CLINICAL:** Anti-hyperlipidemic.

## USES

**Dyslipidemias:** Primary prevention of cardiovascular disease in high-risk pts. Reduces risk of stroke and heart attack in pts with type 2 diabetes with or without evidence of heart disease. Reduces risk of stroke in pts with or without evidence of heart disease with multiple risk factors other than diabetes. Adjunct to diet therapy in management of hyperlipidemias (reduces elevations in total cholesterol, LDL-C, apolipoprotein B, triglycerides in pts with primary hypercholesterolemia), homozygous familial hypercholesterolemia, heterozygous familial hypercholesterolemia in pts 10–17 yrs of age, females more than 1 yr postmenarche. **OFF-LABEL:** Secondary prevention in pts who have experienced a noncardioembolic stroke/TIA or following an acute coronary syndrome (ACS) event.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to atorvastatin. Active hepatic disease, breastfeeding, pregnancy or women who may become pregnant, unexplained elevated LFT results. **Cautions:** Anticoagulant therapy; history of hepatic disease; substantial alcohol consumption; pts with prior stroke/TIA; concomitant use of potent CYP3A4 inhibitors; elderly (predisposed to myopathy).

## ACTION

Inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. Results in an increase of expression in LDL receptors on hepatocyte membranes and a stimulation of LDL catabolism. **Therapeutic Effect:** Decreases LDL and VLDL, plasma triglyceride levels; increases HDL concentration.

## PHARMACOKINETICS

Poorly absorbed from GI tract. Protein binding: greater than 98%. Metabolized in liver. Primarily excreted in feces (biliary). **Half-life:** 14 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. Contraindicated during pregnancy. May produce fetal skeletal malformation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration, risk of rhabdomyolysis. CycloSPORINE may increase concentration. Gemfibrozil, fibrates, niacin, colchicine may increase risk of myopathy, rhabdomyolysis. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. Red yeast rice may increase concentration/effect. (2.4 mg lovastatin per 600 mg rice). **LAB VALUES:** May increase serum transaminase, creatinine kinase concentrations.

## AVAILABILITY (Rx)

 **Tablets:** 10 mg, 20 mg, 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food or time of day.
- Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

Do not use in pts with active hepatic disease.

**Note:** Individualize dosage based on baseline LDL/cholesterol, goal of therapy, pt response. **Maximum dose with strong CYP3A4 inhibitors:** 20 mg/day.

### Dyslipidemias

**PO: ADULTS, ELDERLY:** Initially, 10–20 mg/day (40 mg in pts requiring greater than 45% reduction in LDL-C). Range: 10–80 mg/day.

### Heterozygous Hypercholesterolemia

**PO: ADULTS:** Initially, 40–80 mg once daily. **Maximum:** 80 mg/day. **CHILDREN 10–17 YRS:** Initially, 10 mg/day. May increase incrementally by doubling dose at monthly intervals. **Maximum:** 80 mg/day.

### Homozygous Familial Hypercholesterolemia

**PO: ADULTS, ELDERLY:** 80 mg once daily.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

See contraindications.

## SIDE EFFECTS

**Common:** Atorvastatin is generally well tolerated. Side effects are usually mild and transient. **Frequent (16%):** Headache. **Occasional (5%–2%):** Myalgia, rash, pruritus, allergy. **Rare (less than 2%–1%):** Flatulence, dyspepsia, depression.

## ADVERSE EFFECTS/TOXIC REACTIONS

Potential for cataracts, photosensitivity, myalgia, rhabdomyolysis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain cholesterol, triglyceride level, LFT. Question for possibility of pregnancy before initiating therapy. Obtain dietary history.

### INTERVENTION/EVALUATION

Monitor for headache. Assess for rash, pruritus, malaise. Monitor cholesterol,

triglyceride lab values for therapeutic response. Monitor LFTs, CPK.

#### PATIENT/FAMILY TEACHING

- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Do not take other medications without consulting physician.
- Do not chew, crush, dissolve, or divide tablets.
- Report dark urine, muscle fatigue, bone pain.
- Avoid excessive alcohol intake, large quantities of grapefruit products.

## avapritinib

a-va-pri-ti-nib  
(Ayvakit)

**Do not confuse avapritinib with acalabrutinib, afatinib, alectinib, axitinib, enasidenib, ibrutinib, or imatinib.**

#### ◆ Classification

**PHARMACOTHERAPEUTIC:** PDGFR- $\alpha$  blocker. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

#### USES

Treatment of adults with unresectable or metastatic GI stromal tumor (GIST) harboring a platelet-derived growth factor receptor alpha (PDGFR $\alpha$ ) exon 18 mutation, including PDGFR $\alpha$  D842V mutations. Treatment of advanced systemic mastocytosis (not recommended if platelet count is less than 50,000 cells/mm<sup>3</sup>).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to avapritinib. **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia. Severe hepatic/renal impairment; conditions predisposing to infection (e.g., diabetes, immunocompromised, open wounds). History of intracranial/GI bleeding; anxiety, depression, suicidal ideation/behavior. Avoid concomitant use

of strong or moderate CYP3A inhibitors, strong or moderate CYP3A inducers.

#### ACTION

Blocks PDGFR $\alpha$  targeting PDGFR $\alpha$ , PDGFR, and KIT mutants, which may result in autophosphorylation/activation of these receptors and lead to tumor cell proliferation. Avapritinib inhibits autophosphorylation of PDGFR $\alpha$ , KIT exon mutations. **Therapeutic Effect:** Inhibits tumor growth and survival associated with bowel, esophagus, stomach cancer.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 2–4 hrs. Steady state reached in 15 days. Excreted in feces (70%), urine (18%). **Half-life:** 32–57 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males of reproductive potential must use effective contraception during treatment and for at least 6 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** Alcohol, hydroxyzine, lorazepam, opioids (e.g., oxycodone), zolpidem may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin), **moderate CYP3A inducers** (e.g., bosentan, nafcillin) may decrease concentration/effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:**

**Grapefruit products** may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine. May decrease Hgb, leukocytes, neutrophils, platelets; serum albumin, magnesium, phosphate, potassium, sodium. May increase or decrease serum glucose. May prolong aPTT, PT; increase INR.

## AVAILABILITY (Rx)

 **Tablets:** 100 mg, 200 mg, 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give on empty stomach, at least 1 hr before or 2 hrs after meal.
- Administer tablets whole; do not break, crush, or divide. Tablet cannot be chewed.
- If vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).
- If a dose is missed, do not give within 8 hrs of next scheduled dose.

## INDICATIONS/ROUTES/DOSAGE

### GI Stromal Tumor

**PO: ADULTS, ELDERLY:** 300 mg once daily. Continue until disease progression or unacceptable toxicity. If unable to discontinue moderate CYP3A inhibitor, reduce starting dose to 100 mg once daily.

### Systemic Mastocytosis (Advanced)

**PO: ADULTS, ELDERLY:** 200 mg once daily. Continue until disease progression or unacceptable toxicity.

### Dose Reduction Schedule for Adverse Events (GI Stromal Tumor)

**First dose reduction:** 200 mg once daily. **Second dose reduction:** 100 mg once daily. **Unable to tolerate 100 mg dose:** Permanently discontinue.

### Dose Reduction Schedule for Adverse Events (Systemic Mastocytosis)

**First dose reduction:** 100 mg once daily. **Second dose reduction:** 50 mg once daily. **Third dose reduction:** 25 mg once daily. **Unable to tolerate 25-mg dose:** Permanently discontinue.

## Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Central Nervous System (CNS) Effects

**Grade 1 effects:** Continue at same dose or withhold treatment until resolved or improved to baseline, then resume at same dose or reduced dose level. **Grade 2 or 3 effects:** Withhold treatment until resolved, or improved to Grade 1 or baseline, then resume at same dose or reduced dose level. **Grade 4 effects:** Permanently discontinue.

### Intracranial Hemorrhage

**Grade 1 or 2 intracranial hemorrhage:** For first occurrence, withhold treatment until resolved, then resume at reduced dose level. For second occurrence, permanently discontinue. **Grade 3 or 4 intracranial hemorrhage:** Permanently discontinue.

### Other Toxicities

**Any other Grade 3 or 4 toxicities:** Withhold treatment until improved to Grade 2 or less, then resume at same dose or reduced dose level.

### Dosage in Renal Impairment

**Mild to moderate impairment (CrCl 30–89 mL/min):**

No dose adjustment.

**Severe impairment (CrCl 15–29 mL/min), ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:**

No dose adjustment.

**Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (72%–22%):** Edema (conjunctival, face, eye, eyelid, generalized, periorbital, peripheral, localized, orbital, testicular), nausea, fatigue, asthenia, cognitive impairment, vomiting, decreased appetite, diarrhea, increased lacrimation, abdominal pain, constipation, rash, dizziness. **Occasional (17%–8%):** Headache, dyspepsia, sleep disorder.

ders, insomnia, somnolence, dysgeusia, ageusia, hair color changes, dyspnea, pyrexia, alopecia, decreased weight, hypertension.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, neutropenia, thrombocytopenia is an expected response to therapy. Intracranial hemorrhage, subdural hematoma reported in 1%–3% of pts. CNS effects including dizziness, hallucinations, cognitive impairment (e.g., amnesia, confusion, dementia, encephalopathy, memory/mental impairment), mood disorders (e.g., agitation, anxiety, depression, dysphoria, personality change, suicidal ideation) reported in 58% of pts. Median onset of CNS effects was 6 wks. Grade 1 or 2 nausea and vomiting has occurred. Other serious reactions including pleural effusion, sepsis (3% of pts); GI hemorrhage, acute kidney injury (2% of pts); pneumonia, tumor hemorrhage (1% of pts) has occurred. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet reported in 1% of pts. Hyperthyroidism, hypothyroidism reported in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in female pts of reproductive potential. Question history of anxiety, depression, mood disorder, suicidal ideation and behavior; hepatic/renal impairment, intracranial/GI hemorrhage. Assess usual bowel movement patterns, stool characteristics. Assess hydration status. Screen for active infection. Receive full medication history and screen for interactions. Conduct baseline neurologic exam. Offer emotional support.

### INTERVENTION/EVALUATION

Obtain CBC, BMP, LFT as clinically appropriate. Conduct regular neurologic exams to assess CNS effects, symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Assess skin for dermal toxicities, PPES. Diligently screen for suicidal ideation and behavior; new-onset or worsening of anxiety, depression, mood disorder. Consult mental health professional if mood disorder suspected. Monitor daily pattern of bowel activity, stool consistency; I&Os, hydration status. Monitor for GI bleeding, infections (cough, fatigue, fever); drug toxicities if discontinuation of CYP3A inhibitor is unavoidable.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occur.
- Nervous system changes including altered memory, confusion, delirium, difficulty speaking, gait disturbance, numbness, tremors may occur. Avoid tasks that require alertness, motor skills if neurologic effects are occurring.
- Report symptoms of liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes); hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness, loss of vision).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Treatment may cause diarrhea, dehydration. Drink plenty of fluids.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## avelumab

a-vel-ue-mab  
(Bavencio)

**Do not confuse avelumab with atezolizumab, durvalumab, nivolumab, or olaratumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Programmed death ligand-1 (PD-L1) blocking antibody. Monoclonal antibody.  
**CLINICAL:** Antineoplastic.

### USES

Treatment of adults and pediatric pts 12 yrs and older with metastatic Merkel cell carcinoma. Treatment of pts with locally advanced or metastatic urothelial carcinoma as first-line maintenance treatment or who have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy. First-line treatment of advanced renal cell carcinoma (in combination with axitinib).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to avelumab. **Cautions:** Acute infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); corticosteroid intolerance, hematologic cytopenias, hepatic impairment, interstitial lung disease, renal insufficiency; history of autoimmune disorders (Crohn's disease, demyelinating polyneuropathy, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, rheumatoid arthritis, Type I diabetes, vasculitis); CVA, diabetes, intestinal obstruction, pancreatitis.

### ACTION

Binds to PD-L1 and blocks interaction with both PD-L1 and B7.1 receptors while still

allowing interaction between PD-L2 and PD-L1. PD-L1 is an immune check point protein expressed on tumor cells, down regulating anti-tumor T-cell function. **Therapeutic Effect:** Restores immune responses, including T-cell anti-tumor function.

### PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. Steady state reached in 4–6 wks. Excretion not specified. **Half-life:** 6.1 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Axitinib may increase concentration/effect. **Corticosteroids (e.g., dexamethasone, prednisONE)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs. May increase serum alkaline phosphatase, ALT, AST, amylase, bilirubin, glucose, GGT, lipase.

### AVAILABILITY (Rx)

**Injection:** 200 mg/10 mL (20 mg/mL).

### ADMINISTRATION/HANDLING

**Preparation** • Visually inspect for particulate matter or discoloration. Solution

should appear clear and colorless to slightly yellow in color. • Do not use if solution is cloudy, discolored, or if visible particles are observed. • Withdraw proper volume from vial and inject into a 250-mL bag of 0.9% NaCl or 0.45% NaCl. • Gently invert to mix; avoid foaming. • Do not shake. • Diluted solution should be clear, colorless, and free of particles.

**Rate of administration** • Infuse over 60 min via dedicated IV line using a sterile, nonpyrogenic, low protein-binding in-line filter.

**Storage** • Refrigerate unused vials. • May refrigerate diluted solution for no more than 24 hrs or store at room temperature for no more than 4 hrs. If refrigerated, allow diluted solution to warm to room temperature before infusing. • Do not freeze or shake. • Protect from light.

## IV INCOMPATIBILITIES

Do not mix or infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Premedicate with acetaminophen and an antihistamine prior to the first 4 infusions. Consider premedication for subsequent infusions based on prior infusion reactions.

### **Urothelial Carcinoma**

**IV; ADULTS, ELDERLY:** 800 mg once q2wks or 10 mg/kg every 2 wks. Continue until disease progression or unacceptable toxicity.

### **Renal Cell Carcinoma (Advanced)**

**IV; ADULTS, ELDERLY:** 800 mg once q2wks or 10 mg/kg q2wks (in combination with axitinib) until disease progression or unacceptable toxicity.

### **Merkel Cell Carcinoma**

**IV; ADULTS, ELDERLY, ADOLESCENTS:** 800 mg once q2wks or 10 mg/kg q2wks.

Continue until disease progression or unacceptable toxicity.

### **Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### **Infusion-Related Reactions**

**Grade 1 or 2:** Interrupt or decrease rate of infusion. **Grade 3 or 4:** Permanently discontinue.

### **Endocrine Toxicity**

**Grade 3 or 4 endocrinopathies:** Withhold treatment until resolved to Grade 1 or 0, then resume therapy after corticosteroid taper. Consider hormone replacement therapy if hypothyroidism occurs.

### **Colitis (Treatment-Induced)**

**Grade 2 or 3 diarrhea or colitis:** Withhold treatment until resolved to Grade 1 or 0, then resume therapy after corticosteroid taper. **Grade 4 diarrhea or colitis; recurrent Grade 3 diarrhea or colitis:** Permanently discontinue.

### **Hepatic Toxicity**

**Serum ALT/AST greater than 3 and up to 5 times upper limit normal (ULN) or serum bilirubin greater than 1.5 and up to 3 times ULN:** Withhold treatment until resolved to Grade 1 or 0, then resume therapy. **Serum ALT/AST greater than 5 times upper limit normal (ULN) or serum bilirubin greater than 3 times ULN:** Permanently discontinue.

### **Renal Toxicity**

**Serum creatinine greater than 1.5 and up to 6 times ULN:** Withhold treatment until resolved to Grade 1 or 0, then resume therapy after corticosteroid taper. **Serum creatinine greater than 6 times ULN:** Permanently discontinue.

**Other moderate or severe symptoms of treatment-induced reactions (e.g.,**

arthritis, bullous dermatitis, encephalitis, erythema multiform, exfoliative dermatitis, demyelination, Guillain-Barré syndrome, hemolytic anemia, histiocytic necrotizing lymphadenitis, hypophysitis, hypopituitarism, iritis, myasthenia gravis, myocarditis, myositis, pancreatitis, pemphigoid, psoriasis, Stevens Johnson Syndrome/toxic epidermal necrolysis, rhabdomyolysis, uveitis, vasculitis): Withhold treatment until resolved to Grade 1 or 0, then resume therapy after corticosteroid taper. **Life-threatening adverse effects, recurrent severe immune-mediated reactions; requirement of prednisone 10 mg/day or greater (or equivalent) for more than 2 wks; persistent Grade 2 or 3 immune-mediated reaction lasting 12 wks or longer:** Permanently discontinue.

#### **Pulmonary Toxicity**

**Grade 2 pneumonitis:** Withhold treatment until resolved to Grade 1 or 0, then resume therapy after corticosteroid taper. **Grade 3 or 4 or recurrent Grade 2 pneumonitis:** Permanently discontinue.

#### **Dosage in Renal/Hepatic Impairment**

Not specified; use caution.

### **SIDE EFFECTS**

**Note:** Percentage of side effects may vary depending on indication of treatment.

**Frequent (50%–18%):** Fatigue, musculoskeletal pain, diarrhea, rash, infusion reactions (back pain, chills, pyrexia, hypotension), nausea, decreased appetite, peripheral edema, cough. **Occasional (17%–10%):** Constipation, arthralgia, abdominal pain, decreased weight, dizziness, vomiting, hypertension, dyspnea, pruritus, headache.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, neutropenia, thrombocytopenia is an expected response to therapy. May cause severe, sometimes fatal cases of immune-mediated reactions such as

pneumonitis (1% of pts), hepatitis (1% of pts), colitis (2% of pts), adrenal insufficiency (1% of pts), hypothyroidism, hyperthyroidism (6% of pts), type 1 diabetes mellitus including ketoacidosis (less than 1% of pts), nephritis (less than 1% of pts), other immune-mediated effects (less than 1%). Cellulitis, CVA, dyspnea, ileus, pericardial effusion, small bowel/intestinal obstruction, renal failure, respiratory failure, septic shock, transaminitis, urosepsis may occur. Immunogenicity (auto-avelumab antibodies) reported in 4% of pts.

## **NURSING CONSIDERATIONS**

### **BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP (esp. serum creatinine, creatinine clearance; BUN), TSH, vital signs; pregnancy test in females of reproductive potential. Question history of prior hypersensitivity reaction, infusion-related reactions, allergy to corticosteroids/prednisone. Screen for history of autoimmune disorders, diabetes, pituitary/pulmonary/thyroid disease, renal insufficiency. Obtain nutrition consult. Offer emotional support.

### **INTERVENTION/EVALUATION**

Monitor ANC, CBC, BMP, creatinine clearance, thyroid panel (if applicable); vital signs. Diligently monitor for infusion-related reactions, treatment-related toxicities, esp. during initial infusions. If immune-mediated reactions occur, consider referral to specialist; pt may require treatment with corticosteroids. Screen for allergic reactions, acute infections (cellulitis, sepsis, UTI), hepatitis, pulmonary events (dyspnea, pneumonitis, pneumonia). Monitor strict I&O, hydration status, stool frequency and consistency. Encourage proper calorie intake and nutrition. Assess skin for rash, lesions, dermal toxicities.

### **PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urina-

tion, chills, cough, fatigue, fever. Avoid those with active infection. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Serious adverse reactions may affect lungs, liver, intestines, kidneys, hormonal glands, nervous system, which may require anti-inflammatory medication. • Immediately report any serious or life-threatening inflammatory symptoms in the following body systems: colon (severe abdominal pain/swelling, diarrhea); kidneys (decreased or dark-colored urine, flank pain); lung (chest pain, severe cough, shortness of breath); liver (bruising, dark-colored urine, clay-colored/tarry stools, nausea, yellowing of the skin or eyes); nervous system (paralysis, weakness); pituitary (persistent or unusual headaches, dizziness, extreme weakness, fainting, vision changes); skin (blisters, bubbling, inflammation, rash); thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]); fatigue, goiter, weight gain [underactive thyroid]; vascular (low blood pressure, vein/artery pain or irritation). • Do not take any over-the-counter anti-inflammatory medications unless approved by your doctor.

## axitinib

ax-i-ti-nib  
(Inlyta)

**Do not confuse axitinib with afatinib, ibrutinib, or imatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Tyrosine kinase inhibitor.

**CLINICAL:** Antineoplastic.

### USES

Treatment (as a single agent) of advanced renal cell carcinoma after failure of one prior systemic chemotherapy. First-line treatment of advanced renal cell carcinoma (in combination with avelumab or pembrolizumab).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to axitinib. **Cautions:** Pts with increased risk or history of thrombotic events (CVA, MI), GI perforation or fistula formation, renal/hepatic impairment, hypertension, HF. Do not use in pts with untreated brain metastasis or recent active GI bleeding.

### ACTION

Inhibits vascular endothelial growth factor receptors. **Therapeutic Effect:** Blocks tumor growth and angiogenesis.

### PHARMACOKINETICS

Metabolized in liver. Protein binding: greater than 99%. Excreted primarily in feces with a lesser amount excreted in urine. **Half-life:** 2.5–6 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown whether distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) may significantly increase concentration; do not use concurrently. If used, reduce dose by 50%. Coadministration with strong CYP3A4 inducers (e.g., rifAMPin, phenytoin, carbamazepine, phenobarbital) may significantly decrease concentration/effect, do not use concurrently. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May decrease Hgb, WBC count, platelets, lymphocytes; serum calcium, alkaline phosphatase, albumin, sodium, phosphate, bicarbonate. May increase serum ALT, AST, bilirubin, BUN, creatinine, serum potassium, lipase, amylase; urine protein. May alter serum glucose.

**AVAILABILITY (Rx)**

**Film-Coated Tablets:** 1 mg, 5 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Swallow tablets whole with full glass of water.

**INDICATIONS/ROUTES/DOSAGE**

**Renal Cell Carcinoma (Advanced, Second-Line, Single-Agent Therapy)**

**PO: ADULTS, ELDERLY:** Initially, 5 mg twice daily, given approximately 12 hrs apart. If tolerated (no adverse events above Grade 2, B/P normal, and no antihypertension use for at least 2 consecutive wks), may increase to 7 mg twice daily, then 10 mg twice daily. For adverse effects, may decrease to 3 mg twice daily, then 2 mg twice daily if adverse effects persist.

**Renal Cell Carcinoma (Advanced, First-Line Combination Therapy)**

**With avelumab:** Initially, 5 mg q12h. If tolerated for 2 wks or longer, may increase to 7 mg q12h, then 10 mg q12h, or reduce to 3 mg and then 2 mg q12h. **With pembrolizumab:** Initially, 5 mg q12h. If tolerated for 6 wks or longer, may increase to 7 mg q12h, then 10 mg q12h, or reduce to 3 mg and then 2 mg q12h. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Dosage with concomitant strong CYP3A4 inhibitors:** Reduce dose by 50%. (Avoid concomitant use if possible.)

**Dosage in Renal Impairment**

No dose adjustment. Use caution in ESRD.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate impairment:** Reduce initial dose by 50%. **Severe impairment:** Not recommended.

**SIDE EFFECTS**

**Frequent (55%–20%):** Diarrhea, hypertension, fatigue, decreased appetite, nausea, dysphonia, palmar-plantar erythrodysesthesia (hand-foot) syndrome, weight

loss, vomiting, asthenia, constipation. **Occasional (19%–11%):** Hypothyroidism, cough, stomatitis, arthralgia, dyspnea, abdominal pain, headache, peripheral pain, rash, proteinuria, dysgeusia. **Rare (10%–2%):** Dry skin, dyspepsia, dizziness, myalgia, pruritus, epistaxis, alopecia, hemorrhoids, tinnitus, erythema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Arterial and venous thrombotic events (MI, CVA), GI perforation, fistula, hemorrhagic events (including cerebral hemorrhage, hematuria, hemoptysis, GI bleeding), hypertensive crisis, cardiac failure have been observed and can be fatal. Hypothyroidism requiring thyroid hormone replacement has been noted. Reversible posterior leukoencephalopathy syndrome (RPLS) has been observed.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain BMP, LFT, renal function test, urine protein, serum amylase, lipase, phosphate before initiation of, and periodically throughout, treatment. Offer emotional support. Assess medical history, esp. hepatic function abnormalities. B/P should be well controlled prior to initiating treatment. Stop medication at least 24 hrs prior to scheduled surgery. Monitor thyroid function before and periodically throughout treatment.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT, renal function test, urine protein, serum amylase, lipase, phosphate, thyroid tests. Monitor daily pattern of bowel activity, stool consistency. Assess for evidence of bleeding or hemorrhage. Assess for hypertension. For persistent hypertension despite use of antihypertensive medications, dose should be reduced. Permanently discontinue if signs or symptoms of RPLS occur (extreme lethargy, increased B/P from pt baseline, pyuria). Contact physician if changes in voice, redness of skin, or rash is noted.

**PATIENT/FAMILY TEACHING**

• Avoid crowds, those with known infection. • Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations. • Swallow tablet whole; do not chew, crush, dissolve, or divide. • Avoid grapefruit products. • Report persistent diarrhea, extreme fatigue, abdominal pain, yellowing of skin or eyes, bruising easily; bleeding of any kind, esp. bloody stool or urine; confusion, seizure activity, vision loss, trouble speaking, chest pain; difficulty breathing, leg pain or swelling.

**azithromycin**

a-zith-roe-mye-sin  
(AzaSite, Zithromax)

**Do not confuse azithromycin with azaTHIOprine or erythromycin, or Zithromax with Fosamax or Zovirax.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Macrolide. **CLINICAL:** Antibiotic.

**USES**

**IV/PO:** Treatment of susceptible infections due to *Chlamydia pneumoniae*, *C. trachomatis*, *H. influenzae*, *Legionella*, *M. catarrhalis*, *Mycoplasma pneumoniae*, *N. gonorrhoeae*, *S. aureus*, *S. pneumoniae*, *S. pyogenes*, including mild to moderate infections of upper respiratory tract (pharyngitis, tonsillitis), lower respiratory tract (acute bacterial exacerbations, COPD, pneumonia), uncomplicated skin and skin-structure infections, sexually transmitted diseases (nongonococcal urethritis, cervicitis due to *C. trachomatis*), chancroid. Prevents disseminated *Mycobacterium avium* complex (MAC). Treatment of mycoplasma pneumonia, community-acquired pneumo-

nia, pelvic inflammatory disease (PID). Prevention/treatment of MAC in pts with advanced HIV infection. **OFF-LABEL:** Prophylaxis of endocarditis. Prevention of pulmonary exacerbations in pts with cystic fibrosis. **Ophthalmic:** Treatment of bacterial conjunctivitis caused by susceptible infections due to *H. influenzae*, *S. aureus*, *S. mitis*, *S. pneumoniae*. Prevention of pulmonary exacerbations in pts with cystic fibrosis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to azithromycin, erythromycin, or other macrolide antibiotics. History of cholestatic jaundice/hepatic impairment associated with prior azithromycin therapy. **Cautions:** Hepatic/renal impairment, myasthenia gravis, hepatocellular and/or cholestatic hepatitis (with or without jaundice), hepatic necrosis. May prolong QT interval.

**ACTION**

Binds to ribosomal receptor sites of susceptible organisms, inhibiting RNA-dependent protein synthesis. **Therapeutic Effect:** Bacteriostatic or bactericidal, depending on drug dosage.

**PHARMACOKINETICS**

Rapidly absorbed from GI tract. Protein binding: 7%–50%. Widely distributed. Metabolized in liver. Excreted primarily by biliary excretion. **Half-life:** 68 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs for IV use and younger than 6 mos for oral use. **Elderly:** No age-related precautions in those with normal renal function.

**INTERACTIONS**

**DRUG:** Aluminum/magnesium-containing antacids may decrease concentration (give 1 hr before or 2 hrs after antacid). May increase concentration/effect of **amiodarone, colchicine, cyclo-**

**SPORINE**, dabigatran, dronedarone, edoxaban, pazopanib, **QT-prolonging medications**, topotecan, toremifene, **QUetiapine** may increase concentration. **HERBAL**: None significant. **FOOD**: None known. **LAB VALUES**: May increase serum creatine phosphokinase (CPK), ALT, AST, bilirubin, LDH, potassium.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution (Zithromax)**: 500 mg. **Ophthalmic Solution (AzaSite)**: 1%. **Oral Packet**: 1g. **Oral Suspension (Zithromax)**: 100 mg/5 mL, 200 mg/5 mL. **Tablets**: 250 mg, 500 mg, 600 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 500-mg vial with 4.8 mL Sterile Water for Injection to provide concentration of 100 mg/mL. • Shake well to ensure dissolution. • Further dilute with 250 or 500 mL 0.9% NaCl or D<sub>5</sub>W to provide final concentration of 2 mg/mL with 250 mL diluent or 1 mg/mL with 500 mL diluent. **Rate of administration** • Infuse over 60 min (2 mg/mL). Infuse over 3 hrs (1 mg/mL).

**Storage** • Store vials at room temperature. • Following reconstitution, diluted solution is stable for 24 hrs at room temperature or 7 days if refrigerated.

### PO

• Give without regard to food. • May store suspension at room temperature. Stable for 10 days after reconstitution.

### Ophthalmic

• Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid. • Place prescribed number of drops into pocket. • Instruct pt to close eye gently for 1 to 2 min (so that medication will not be squeezed out of sac) and to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.

## IV INCOMPATIBILITIES

CefTRIAxone (Rocephin), ciprofloxacin (Cipro), famotidine (Pepcid), furosemide (Lasix), ketorolac (Toradol), levofLOxacin (Levaquin), morphine, piperacillin/tazobactam (Zosyn), potassium chloride.

## IV COMPATIBILITIES

Ceftaroline (Teflaro), doripenem (Doribax), ondansetron (Zofran), tigecycline (Tygacil), diphenhydramine (Benadryl).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO: ADULTS, ELDERLY**: 500 mg once, then 250 mg daily for 4 days or 500 mg daily for 3 days. **ADOLESCENTS, CHILDREN, INFANTS**: 5–12 mg/kg/dose (usually 10–12 mg/kg on day 1, then 5–6 mg/kg thereafter). **Usual maximum total course**: 1,500–2,000 mg. **NEONATES**: 10–20 mg/kg once daily.

**IV: ADULTS, ELDERLY**: 250–500 mg once daily. **ADOLESCENTS, CHILDREN, INFANTS, NEONATES**: 10 mg/kg once daily. **Maximum**: 500 mg/dose.

### Mild to Moderate Respiratory Tract, Skin, Soft Tissue Infections

**PO: ADULTS, ELDERLY**: 500 mg day 1, then 250 mg days 2–5.

### MAC Prevention

**PO: ADULTS, ELDERLY, ADOLESCENTS**: 1,200 mg once weekly or 600 mg twice weekly. **CHILDREN**: 20 mg/kg once weekly. **Maximum**: 1,200 mg/dose or 5 mg/kg once daily. **Maximum**: 250 mg/dose.

### MAC Treatment

**PO: ADULTS, ELDERLY**: 500–600 mg/day. **CHILDREN**: 10–12 mg/kg/day (**maximum**: 500 mg).

### Otitis Media

**PO: CHILDREN 6 MOS AND OLDER**: 30 mg/kg as single dose (**maximum**: 1,500 mg) or 10 mg/kg/day for 3 days (**maximum**: 500 mg) or 10 mg/kg on day 1 (**maximum**: 500 mg), then 5 mg/kg on days 2–5 (**maximum**: 250 mg).

**Pharyngitis, Tonsillitis**

**PO: ADULTS, ELDERLY, CHILDREN:** 12 mg/kg (**maximum:** 500 mg) on day 1, then 6 mg/kg (**maximum:** 250 mg) on days 2–5.

**Pneumonia, Community-Acquired**

**PO: (Zmax): ADULTS, ELDERLY:** 2 g as single dose.

**PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER:** 500 mg on day 1, then 250 mg on days 2–5 or 500 mg/day IV for 2 days, then 500 mg/day PO to complete course of therapy. **CHILDREN 6 MOS–15 YRS:** 10 mg/kg on day 1 (**maximum:** 500 mg), then 5 mg/kg (**maximum:** 250 mg) on days 2–5.

**Bacterial Conjunctivitis**

**Ophthalmic: ADULTS, ELDERLY:** 1 drop in affected eye twice daily for 2 days, then 1 drop once daily for 5 days.

**Dosage in Renal/Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Occasional: Systemic:** Nausea, vomiting, diarrhea, abdominal pain. **Ophthalmic:** Eye irritation. **Rare: Systemic:** Headache, dizziness, allergic reaction.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections may result from altered bacterial balance in GI tract. Acute interstitial nephritis, hepatotoxicity occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of hepatitis, allergies to azithromycin, erythromycins. Assess for infection (WBC count, appearance of wound, evidence of fever).

**INTERVENTION/EVALUATION**

Check for GI discomfort, nausea, vomiting. Monitor daily pattern of bowel activity and stool consistency. Monitor LFT, CBC. Assess for hepatotoxicity: malaise, fever, abdominal pain, GI disturbances. Be alert

for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

- Continue therapy for full length of treatment.
- Avoid concurrent administration of aluminum- or magnesium-containing antacids.
- Bacterial conjunctivitis: Do not wear contact lenses.

**aztreonam**

az-tree-o-nam  
(Azactam, Cayston)

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Monobactam. **CLINICAL:** Antibiotic.

**USES**

**Injection:** Treatment of infections caused by susceptible gram-negative microorganisms *P. aeruginosa*, *E. coli*, *S. marcescens*, *K. pneumoniae*, *P. mirabilis*, *H. influenzae*, *Enterobacter*, *Citrobacter* spp., including lower respiratory tract, skin/skin structure, intra-abdominal, gynecologic, complicated/uncomplicated UTIs; septicemia; cystic fibrosis. **Oral inhalation: (Cayston):** Improve respiratory symptoms in cystic fibrosis pts with *P. aeruginosa*. **OFF-LABEL:** Surgical prophylaxis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to aztreonam. **Cautions:** History of allergy, esp. cephalosporins, penicillins; renal impairment; bone marrow transplant pts with risk factors for toxic epidermal necrolysis (TEN).

**ACTION**

Binds to penicillin-binding proteins, which inhibits bacterial cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Completely absorbed after IM administration. Protein binding: 56%–60%. Partially metabolized by hydrolysis. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 1.4–2.2 hrs (increased in renal/hepatic impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta, distributed in amniotic fluid; low concentration in breast milk. **Children:** Safety and efficacy not established in pts younger than 9 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, creatinine, LDH, ALT, AST levels. Produces a positive Coombs' test. May prolong partial thromboplastin time (PTT), prothrombin time (PT).

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** (*Azactam*): 1 g, 2 g. **Oral Inhalation, Powder for Reconstitution:** (*Cayston*): 75 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • For IV push, dilute each gram with 6–10 mL Sterile Water for Injection. • For intermittent IV infusion, further dilute with 50–100 mL D<sub>5</sub>W or 0.9% NaCl. Final concentration not to exceed 20 mg/mL.

**Rate of administration** • For IV push, give over 3–5 min. • For IV infusion, administer over 20–60 min.

**Storage** • Store vials at room temperature. • Solution appears colorless to light yellow. • Following reconstitution, solution is stable for 48 hrs at room temperature or 7 days if refrigerated. • Discard if precipitate forms. Discard unused portions.

## IM

• Reconstitute with at least 3 mL diluent per gram of aztreonam. • Shake immediately, vigorously after adding diluent. • Inject deeply into large muscle mass. • Following reconstitution, solution is stable for 48 hrs at room temperature or 7 days if refrigerated.

## Inhalation

• Administer only with an Altera nebulizer system. • Nebulize over 2–3 min. • Give bronchodilator 15 min–4 hrs (short-acting) or 30 min–12 hrs (long-acting) before administration. • Reconstituted solution must be used immediately.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin (Fungizone), LORazepam (Ativan), metroNIDAZOLE (Flagyl), vancomycin (Vancocin).

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, cimetidine (Tagamet), diltiazEM (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), famotidine (Pepcid), furosemide (Lasix), heparin, HYDROMORPHONE (Dilaudid), insulin (regular), magnesium sulfate, morphine, potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Severe Infections

**IV: ADULTS, ELDERLY:** 2 g q6–8h. **Maximum:** 8 g/day. **CHILDREN:** 30 mg/kg q6–8h. **Maximum:** 8 g/day (120 mg/kg/day).

### Mild to Moderate Infections

**IV: ADULTS, ELDERLY:** 1–2 g q8–12h. **Maximum:** 8 g/day. **CHILDREN:** 30 mg/kg q8h. **Maximum:** 3,000 mg/day.

## UTI

**IM/IV: ADULTS, ELDERLY:** 0.5–1 g q8–12h.

## Usual Neonatal Dosage

**IV:** 30 mg/kg/dose q6–12h.

**Cystic Fibrosis**

**Note:** Pretreatment with a bronchodilator is recommended.

**Inhalation (nebulizer): ADULTS, CHILDREN 7 YRS OR OLDER:** 75 mg 3 times/day (at least 4 hrs apart) for 28 days, then off for 28-day cycle.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance and severity of infection:

**Creatinine**

<b>Clearance</b>	<b>Dosage</b>
10–30 mL/min	50% usual dose at usual intervals
Less than 10 mL/min	25% usual dose at usual intervals
Hemodialysis	500 mg–2 g, then 25% of initial dose at usual interval
Continuous renal replacement therapy (CRRT)	2 g, then 1 g q8–12h or 2g q12h

**Dosage in Hepatic Impairment**

Use with caution.

**SIDE EFFECTS**

**Frequent (greater than 5%): Cayston:** Cough, nasal congestion, wheezing, pharyngolaryngeal pain, pyrexia, chest dis-

comfort, abdominal pain, vomiting. **Occasional (less than 3%):** Discomfort and swelling at IM injection site, nausea, vomiting, diarrhea, rash. **Rare (less than 1%):** Phlebitis or thrombophlebitis at IV injection site, abdominal cramps, headache, hypotension.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of allergies, esp. to aztreonam, other antibiotics.

**INTERVENTION/EVALUATION**

Evaluate for phlebitis, pain at IM injection site. Assess for GI discomfort, nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor renal/hepatic function.

**PATIENT/FAMILY TEACHING**

- Report nausea, vomiting, diarrhea, rash.

## baclofen

**bak-loe-fen**

(Gablofen, Lioresal, Ozobax)

**■ BLACK BOX ALERT ■** Abrupt withdrawal of intrathecal form has resulted in severe hyperpyrexia, obtundation, rebound or exaggerated spasticity, muscle rigidity, leading to organ failure, death.

**Do not confuse baclofen with Bactroban or Beclovent, or Lioresal with lisinopril or Lotensin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Skeletal muscle relaxant. **CLINICAL:** Antispastic, analgesic in trigeminal neuralgia.

### USES

**Oral:** Management of reversible spasticity associated with multiple sclerosis, spinal cord lesions. **Intrathecal:** Management of severe spasticity of spinal cord or cerebral origin in pts 4 yrs of age and older. **OFF-LABEL:** Treatment of bladder spasms, spasticity in cerebral palsy, intractable hiccups or pain, Huntington's chorea, trigeminal neuralgia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to baclofen. **Intrathecal:** IV, IM, SQ, or epidural administration in addition to intrathecal use. **Cautions:** Renal impairment, seizure disorder, elderly, autonomic dysreflexia, reduced GI motility, GI or urinary obstruction; respiratory, pulmonary, peptic ulcer disease.

### ACTION

Inhibits transmission of monosynaptic or polysynaptic reflexes at spinal cord level possibly by hyperpolarization of primary afferent fiber terminals. **Therapeutic Effect:** Relieves muscle spasticity.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 30%. Partially metabolized in liver. Primarily excreted in urine. **Half-life:** 2.5–4 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. Limited published data in children. **Elderly:** Increased risk of CNS toxicity (hallucinations, sedation, confusion, mental depression); age-related renal impairment may require decreased dosage.

### INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depressant effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, glucose.

### AVAILABILITY (Rx)

**Intrathecal Injection Solution:** 500 mcg/mL, 1,000 mcg/mL, 2,000 mcg/mL. **Oral Solution:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg, 20 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give with food or milk.
- Tablets may be crushed.

#### Intrathecal

- For screening, a 50 mcg/mL concentration should be used for injection.
- For maintenance therapy, solution should be diluted for pts who require concentrations other than 500 mcg/mL or 2,000 mcg/mL.

### INDICATIONS/ROUTES/DOSAGE

◀ **ALERT** ▶ Avoid abrupt withdrawal.

**Spasticity**

**PO: ADULTS, CHILDREN 12 YRS AND OLDER:** Initially, 5 mg 3 times daily. May increase by 15 mg/day (5 mg/dose) at 3-day intervals until optimal response achieved. Range: 40–80 mg/day. **Maximum:** 80 mg/day. **ELDERLY:** Initially, 5 mg 2–3 times daily. May gradually increase dosage.

**Intrathecal Dose**

**ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER:** Initially, 50 mcg as screening dose (25 mcg in very small pediatric pts) for 1 dose; observe pt for 4–8 hrs for positive response (decrease in muscle tone and/or frequency and/or severity of spasm). If response is inadequate, give 75 mcg 24h after 1st dose. If response is still inadequate, give 100 mcg 24h after 2nd dose. Initial pump dose: give double screening dose (unless efficacy of bolus maintained greater than 8 hrs, then screening dose). After 24h, dose may be increased/decreased only once q24h until satisfactory response.

**Dosage in Renal Impairment**

Use caution.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (greater than 10%):** Transient drowsiness, asthenia, dizziness, nausea, vomiting. **Occasional (10%–2%):** Headache, paresthesia, constipation, anorexia, hypotension, confusion, nasal congestion. **Rare (less than 1%):** Paradoxical CNS excitement or restlessness, slurred speech, tremor, dry mouth, diarrhea, nocturia, impotence.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Abrupt discontinuation may produce hallucinations, seizures. Overdose results in blurred vision, seizures, myosis, mydriasis, severe muscle weakness, strabismus, respiratory depression, vomiting.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Record onset, type, location, duration of muscular spasm, pain. Check for immobility, stiffness, swelling.

**INTERVENTION/EVALUATION**

For pts on long-term therapy, BMP, LFT, CBC should be performed periodically. Assess for paradoxical reaction. Observe for drowsiness, dizziness, ataxia. Assist with ambulation at all times. Evaluate for therapeutic response: decreased intensity of skeletal muscle spasm, pain.

**PATIENT/FAMILY TEACHING**

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly withdraw medication after long-term therapy (may result in muscle rigidity, rebound spasticity, high fever, altered mental status).
- Avoid alcohol, CNS depressants.

**baricitinib**

bar-i-sye-ti-nib  
(Olumiant)

**BLACK BOX ALERT** Increased risk for developing bacterial, viral, invasive fungal infections including tuberculosis, cryptococcosis, pneumocystosis, that may lead to hospitalization or death. Infections often occurred in combination with immunosuppressants (methotrexate, other disease-modifying antirheumatic drugs). Closely monitor for development of infection. Test for latent tuberculosis prior to treatment and during treatment, regardless of initial result. Treatment of latent TB should be initiated before initiation. Lymphomas, other malignancies were reported. Thromboembolic events including DVT, pulmonary embolism, arterial thrombosis have occurred.

**Do not confuse baricitinib with ceritinib, gefitinib, tofacitinib, or sunitinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Janus-associated kinase inhibitor. **CLINICAL:** Antirheumatic agent. Disease modifying.

### USES

Treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response to one or more TNF antagonist therapies. May be used alone or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs).

### PRECAUTIONS

Hypersensitivity to baricitinib. **Cautions:** Baseline cytopenias; hepatic/renal impairment, elderly, hypercholesterolemia; history of arterial or venous thromboembolic events (CVA, DVT, MI, PE), pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, underlying atherosclerosis, genetic hypercoagulable conditions); recent travel or residence in TB or mycosis endemic areas; history of chronic opportunistic infections (esp. bacterial, invasive fungal, mycobacterial, protozoal, viral, TB); history of HIV, herpes zoster, hepatitis B or C virus infection; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), pts at risk for GI perforation (e.g., Crohn's disease, diverticulitis, GI tract malignancies, peptic ulcers, peritoneal malignancies), pts who reside or travel to where TB is endemic. Concomitant use of strong organic anion transporter 2 (OAT3) inhibitors (e.g., probenecid), JAK inhibitors, biologic DMARDs, potent immunosuppressants (e.g., azathioprine or cyclosporine) not recommended.

### ACTION

Inhibits JAK enzymes, which are intracellular enzymes involved in stimulating hematopoiesis and immune cell function via a signaling pathway. **Therapeutic Effect:** Reduces inflammation, tenderness, swelling of joints; slows or prevents progressive joint destruction in rheumatoid arthritis (RA).

### PHARMACOKINETICS

Rapidly absorbed and widely distributed. Metabolized in liver. Protein binding: 50%. Peak plasma concentration: 1 hr. Excreted in urine (75%), feces (20%). **Half-life:** 12 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased risk for serious infections, malignancy.

### INTERACTIONS

**DRUG:** May diminish therapeutic effects of **live vaccines, BCG (intravesical). Immunosuppressants (e.g., azathioprine, cyclosporine)** may increase risk for added immunosuppression, infection. May enhance adverse/toxic effects of **biologic disease-modifying drugs (DMARDs), natalizumab, tacrolimus, tofacitinib, vaccines (live). Probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, CPK, cholesterol (HDL, LDL, total), triglycerides; platelets. May decrease ANC, Hgb, absolute lymphocyte count.

### AVAILABILITY (Rx)

**Tablets:** 1 mg, 2 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

**INDICATIONS/ROUTES/DOSAGE**

◀**ALERT**▶ Do not initiate in pts with severe, active infection (systemic/localized), absolute lymphocyte count less than 500 cells/mm<sup>3</sup>, ANC less than 1000 cells/mm<sup>3</sup>, Hgb less than 8 g/dL. Do not use in combination with biologic DMARDs or with strong immunosuppressants (e.g., azathioprine or cyclosporine).

**Rheumatoid Arthritis**

**PO: ADULTS, ELDERLY:** 2 mg once daily.

**Dose Modification****Anemia**

**Hgb less than 8 g/dL:** Withhold treatment until Hgb is greater than or equal to 8 gm/dL.

**Lymphopenia**

**Absolute lymphocyte count (ALC) less than 500 cells/mm<sup>3</sup>:** Withhold treatment until ALC is greater than or equal to 500 cells/mm<sup>3</sup>.

**Neutropenia**

**ANC less than 1000 cells/mm<sup>3</sup>:** Withhold treatment until ANC is greater than or equal to 1000 cells/mm<sup>3</sup>.

**Serious Infection**

Withhold treatment until serious infection is resolved, then resume as clinically indicated.

**Dosage in Renal Impairment**

**eGFR less than 60 mL/min:** Not recommended.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

**SIDE EFFECTS**

**Rare (2%–1%):** Nausea, acne.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Neutropenia, lymphopenia may increase risk of infection. Serious and sometimes fatal infections (bacterial,

mycobacterial, viral, invasive fungal, other opportunistic infection) may occur. Serious infections may include aspergillosis, BK virus, cellulitis, cryptococcosis, cytomegalovirus, esophageal candidiasis, herpes zoster histoplasmosis, listeriosis, pneumocystosis, pneumonia, tuberculosis, UTI, sepsis. Upper respiratory tract infections including epiglottitis, laryngitis, nasopharyngitis, pharyngitis, pharyngotonsillitis, sinusitis, tracheitis, tonsillitis reported in 16% of pts. May increase risk of new malignancies. May induce viral reactivation of hepatitis B or C virus infection, herpes zoster, HIV. Thrombosis including DVT, pulmonary embolism, arterial thrombosis have occurred. May increase risk of GI perforation. Platelet count greater than 600,000 cells/mm<sup>3</sup> occurred in 1% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT, lipid panel; pregnancy test in females of reproductive potential. Assess onset, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with purified protein derivative (PPD) is considered a positive result when assessing for latent TB. Consider treatment with antimycobacterial therapy in pts with latent TB. Question history of arterial/venous thrombosis, hepatic/renal impairment, HIV infection, hepatitis B or C virus infection, diverticulitis, malignancies. Screen for active infection. Assess skin for open wounds. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tender-

ness; improved grip strength. Monitor CBC, LFT periodically. Monitor for TB regardless of baseline PPD. Consider discontinuation if acute infection, opportunistic infection, sepsis occurs; initiate appropriate antimicrobial therapy. Immediately report any hemorrhaging, melena, abdominal pain, hemoptysis (may indicate GI perforation). Monitor for symptoms of DVT (leg or arm pain/swelling), CVA (aphasia, altered mental status, headache, hemiplegia, vision loss), MI (chest pain, dyspnea, syncope, diaphoresis, arm/jaw pain), PE (chest pain, dyspnea, tachycardia).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect routine tuberculosis screening. Report any travel plans to possible endemic areas.
- Do not receive live vaccines.
- Report symptoms of DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate), stroke (confusion, one-sided weakness or paralysis, difficulty speaking).
- Treatment may cause life-threatening arterial blood clots; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the arm or jaw, sweating), stroke (blindness, confusion, one-sided weakness, loss of consciousness, trouble speaking, seizures).
- Report symptoms of liver problems such as bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes.
- Immediately report severe or persistent abdominal pain, bloody stool, fever; may indicate tear in GI tract.
- Treatment may cause reactivation of chronic viral infections, new cancers.

## basiliximab

ba-si-lik-si-mab  
(Simulect)

■ **BLACK BOX ALERT** ■ Must be prescribed by a physician experienced in immunosuppression therapy and organ transplant management.

**Do not confuse basiliximab with daclizumab or brentuximab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Monoclonal antibody. **CLINICAL:** Immunosuppressive.

#### USES

Adjunct with cycloSPORINE, corticosteroids in prevention of acute organ rejection in pts receiving renal transplant.

**OFF-LABEL:** Treatment of refractory graft-vs-host disease, prevention of liver or cardiac transplant rejection.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to basiliximab. **Cautions:** Re-exposure to subsequent courses of basiliximab.

#### ACTION

Binds to and blocks receptor of interleukin-2, a protein that stimulates proliferation of T lymphocytes, which play a major role in organ transplant rejection.

**Therapeutic Effect:** Impairs response of immune system to antigens, prevents acute renal transplant rejection.

#### PHARMACOKINETICS

**Half-life:** 4–10 days (adults); 5–17 days (children).

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. Breastfeeding not recommended.

**Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical), vaccines (live)**. May increase adverse effects of **belimumab, natalizumab, vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May alter serum calcium, glucose, potassium; Hgb, Hct. May increase serum cholesterol, BUN, creatinine, uric acid. May decrease serum magnesium, phosphate; platelet count.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 10-mg vial with 2.5 mL or 20-mg vial with 5 mL Sterile Water for Injection. • Shake gently to dissolve. • May further dilute with 25–50 mL 0.9% NaCl or D<sub>5</sub>W to a final concentration of 0.4 mg/mL. • Gently invert to avoid foaming. • Do not shake. **Rate of administration** • Give as IV bolus over 10 min or as IV infusion over 20–30 min. **Storage** • Refrigerate unused vials. • After reconstitution, use within 4 hrs (24 hrs if refrigerated). • Discard if precipitate forms.

## IV INCOMPATIBILITIES

Specific information not available. Do not add other medications simultaneously through same IV line.

## INDICATIONS/ROUTES/DOSAGE

### Prophylaxis of Organ Rejection

**IV: ADULTS, ELDERLY, CHILDREN WEIGHING 35 KG OR MORE:** 20 mg within 2 hrs before transplant surgery and 20 mg 4 days after transplant. **CHILDREN WEIGHING LESS THAN 35 KG:** 10 mg within 2 hrs before transplant surgery and 10 mg 4 days after transplant.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (greater than 10%):** GI disturbances (constipation, diarrhea, dyspepsia), CNS effects (dizziness, headache, insomnia, tremor), respiratory tract infection, dysuria, acne, leg or back pain, peripheral edema, hypertension. **Occasional (10%–3%):** Angina, neuropathy, abdominal distention, tachycardia, rash, hypotension, urinary disturbances (urinary frequency, genital edema, hematuria), arthralgia, hirsutism, myalgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe, acute hypersensitivity reactions including anaphylaxis characterized by bronchospasm, capillary leak syndrome, cytokine release syndrome, dyspnea, HF, hypotension, pulmonary edema, pruritus, respiratory failure, tachycardia, rash, urticaria, wheezing have been reported. May increase risk of cytomegalovirus infection.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, serum ionized calcium, phosphate, uric acid; vital signs, particularly B/P, pulse rate. Question current breastfeeding status.

### INTERVENTION/EVALUATION

Monitor CBC, electrolytes, renal function. Assess B/P for hypertension/hypotension, pulse for evidence of tachycardia. Question for GI disturbances, CNS effects, urinary changes. Monitor for presence of wound infection, signs of infection (fever, sore throat, unusual bleeding/bruising), hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- Report difficulty in breathing or swallowing, palpitations, bruising/bleeding, rash, itching, swelling of lower extremities, weakness.
- Use effective contraception to avoid pregnancy. Do not breastfeed. Female pts should take measures to avoid pregnancy; avoid breastfeeding.

## beclomethasone

be-kloe-meth-a-sonē  
(Beconase AQ, QNASL, QVAR  
RediHaler)

**Do not confuse beclomethasone with betamethasone or dexamethasone, or Beconase with baclofen.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenocorticosteroid. **CLINICAL:** Anti-inflammatory, immunosuppressant.

### USES

**Inhalation:** Maintenance and prophylactic treatment of asthma in pts 5 yrs and older. **Intranasal: Beconase AQ:** Relief of seasonal/perennial rhinitis; prevention of nasal polyp recurrence after surgical removal; treatment of nonallergic rhinitis. **QNASL:** Treatment of seasonal and perennial allergic rhinitis in pts 4 yrs and older. **OFF-LABEL:** Prevention of seasonal rhinitis (nasal form).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to beclomethasone. **Oral Inhalation:** Acute exacerbation of asthma, status asthmaticus. **Cautions:** Cardiovascular disease, cataracts, diabetes, elderly, glaucoma, hepatic/renal impairment, myasthenia gravis, risk for osteoporosis, peptic ulcer disease, seizure disorder, thyroid disease, ulcerative colitis; following acute MI. Avoid use in pts with untreated viral, fungal, or bacterial systemic infections.

### ACTION

Controls or prevents inflammation by altering rate of protein synthesis; depresses migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability. **Therapeutic Effect: Inhalation:** Inhibits bronchoconstriction, produces smooth muscle relaxation, decreases mucus secretion. **Intranasal:**

Decreases response to seasonal, perennial rhinitis.

### PHARMACOKINETICS

Rapidly absorbed from pulmonary, nasal, GI tissue. Metabolized in liver. Protein binding: 87%. Excreted in feces (60%), urine (12%). **Half-life:** 2–4.5 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. **Children:** Prolonged treatment/high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May enhance hyponatremic effect of **desmopressin**. May decrease effect of **aldesleukin**. May increase adverse effects of **loxapine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Oral Inhalation:** 40 mcg/inhalation, 80 mcg/inhalation. **Nasal Inhalation: (Beconase AQ):** 42 mcg/inhalation. **(QNASL):** 40 mcg/actuation, 80 mcg/actuation.

### ADMINISTRATION/HANDLING

#### Inhalation

- Shake container well.
- Instruct pt to exhale completely, place mouthpiece between lips, inhale, hold breath as long as possible before exhaling.
- Allow at least 1 min between inhalations.
- Rinse mouth after each use (decreases dry mouth, hoarseness, thrush).

#### Intranasal

- Instruct pt to clear nasal passages as much as possible before use.
- Tilt pt's head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds the other nostril closed, concurrently inhaling through nose to permit medication as high into nasal passages as possible.

**INDICATIONS/ROUTES/DOSAGE****Asthma**

**Oral inhalation:** (*QVAR*): **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** (Pts not on inhaled corticosteroids): Initially 40–80 mcg twice daily. (Previously on inhaled corticosteroids): Initially, 40–320 mcg twice daily. **Maximum:** 320 mcg twice daily. **CHILDREN 5–11 YRS:** Initially, 40 mcg twice daily. **Maximum:** 80 mcg twice daily.

**Allergic Rhinitis, Prevention of Recurrence of Nasal Polyps**

**Nasal inhalation:** (*Beconase AQ*): **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 1–2 sprays (42 or 84 mcg) in each nostril twice daily. **Maximum:** 336 mcg/day. **CHILDREN 6–11 YRS:** 1 spray (42 mcg) in each nostril twice daily (total dose: 168 mcg daily). May increase to 2 sprays (84 mcg) 2 times/day (total dose 336 mcg daily). Once adequate control achieved, decrease to 1 spray (42 mcg) in each nostril twice daily (total dose: 168 mcg daily).

**Allergic Rhinitis**

**Nasal inhalation:** (*QNASL*): **ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 80 mcg/spray; 2 sprays in each nostril daily. **Maximum:** 320 mcg (4 sprays/day). **CHILDREN 4–11 YRS:** 40 mcg/spray; 1 spray each nostril once daily. **Maximum:** 80 mcg/day.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent Inhalation (14%–4%):** Throat irritation, dry mouth, hoarseness, cough. **Intranasal:** Nasal burning, mucosal dryness. **Occasional Inhalation (3%–2%):** Localized fungal infection (thrush). **Intranasal:** Nasal-crusting epistaxis, sore throat, ulceration of nasal mucosa. **Rare:** **Inhalation:** Transient bronchospasm, esophageal candidiasis. **Intranasal:** Nasal and pharyngeal candidiasis, eye pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) oc-

curs rarely. Change from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Establish baseline history for asthma, rhinitis. Question for hypersensitivity to corticosteroids.

**INTERVENTION/EVALUATION**

Monitor respiratory status. Auscultate lung sounds. Observe for signs of oral candidiasis. In pts receiving bronchodilators by inhalation concomitantly with inhaled steroid therapy, advise use of bronchodilator several minutes before corticosteroid aerosol (enhances penetration of steroid into bronchial tree).

**PATIENT/FAMILY TEACHING**

- Do not change dose schedule or stop taking drug; must taper off gradually under medical supervision.
- **Inhalation:** Maintain diligent oral hygiene.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness, fungal infection of mouth).
- Report sore throat or mouth.
- **Intranasal:** Report symptoms that do not improve; or if sneezing, nasal irritation occurs.
- Clear nasal passages prior to use.
- Improvement may take days to several weeks.

**belantamab mafodotin-blmf**

bel-an-ta-mab ma-foe-doe-tin  
(Blenrep)

**BLACK BOX ALERT** May cause blurry vision, corneal ulceration, dry eye, severe vision loss. Ophthalmic examination is recommended at baseline, prior to each dose, or with worsening of corneal symptoms. **Do not confuse belantamab with belimumab, belinostat, blinatumomab, brentuximab, or enfortumab.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-B-cell maturation antigen (BCMA)-directed antibody, antibody drug conjugate. Monoclonal antibody. **CLINICAL:** Anti-neoplastic.

## USES

Treatment of adults with relapsed or refractory multiple myeloma who have received at least 4 prior therapies, including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory agent.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to belantamab mafodotin-blmf. **Cautions:** Baseline cytopenias, ocular disease, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

## ACTION

An antibody-drug conjugate directed against B-cell maturation antigen (BCMA), which is expressed on multiple myeloma. After binding to BCMA, belantamab is internalized and MMAF is released via proteolytic cleavage into cells. **Therapeutic Effect:** Causes cell cycle arrest and apoptosis, tumor cell lysis through antibody-dependent cellular cytotoxicity, and antibody-dependent cellular phagocytosis.

## PHARMACOKINETICS

Widely distributed. Monoclonal antibody is metabolized into small peptides and amino acids via catabolic pathway. MMAF metabolized via hydrolysis. Peak plasma concentration: Shortly after end of infusion. Steady state reached in 70 days. Excretion not specified. **Half-life:** 12 days (after first dose), 14 days (at steady state).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective

contraception during treatment and for at least 4 mos after discontinuation. Breast-feeding not recommended during treatment and for at least 3 mos after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. **Fertility:** May impair fertility in both females and males. **Children:** Safety and efficacy not established. **Elderly:** Not specified; use caution.

## INTERACTIONS

**DRUG:** May diminish therapeutic effect of vaccines, BCG (intravesical). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, CPK, creatinine, GGT, glucose; urine albumin. May decrease Hgb, lymphocytes, neutrophils, platelets; serum sodium, potassium.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 100 mg.

## ADMINISTRATION/HANDLING

**Infusion Guidelines** • Infusion bag must be made of polyvinylchloride (PVC) or polyolefin. • Infuse via dedicated IV line using an infusion set made of PVC or polyolefin. If diluted solution is filtered, use a 0.2-micron in-line filter made of polyethersulfone. • Do not administer as IV push or bolus.

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for dose based on weight in kg (more than 1 vial may be needed). Doses in partial vials should not be rounded down. • Allow vial to warm to room temperature. • Reconstitute each vial with 2 mL Sterile Water for Injection to a final concentration of 50 mg/mL. • Gently swirl vial until powder is completely dissolved. Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear clear

to opalescent, colorless to yellow or brown. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute in 250 mL 0.9% NaCl infusion bag to a final concentration of 0.2–2 mg/mL. • Mix by gentle inversion. Do not shake.

**Rate of Administration** • Infuse over 30 min.

**Infusion Reactions** • **Grade 2 or 3 infusion reactions:** Interrupt infusion and treat symptoms until resolved. May resume at 50% of the infusion rate prior to interruption. **Grade 4 infusion reactions or recurrence of Grade 3 reactions:** Permanently discontinue and treat symptoms until resolved.

**Storage** • Refrigerate unused vials in original carton. • Protect from light. • Do not shake, agitate, or freeze. • May refrigerate reconstituted vial solution for up to 4 hrs. • May refrigerate diluted solution for up to 24 hrs. If refrigerated, allow diluted solution to warm to room temperature. Diluted solution at room temperature must be infused within 6 hrs (includes infusion time).

## IV INCOMPATIBILITIES

Do not mix with other solutions or medications.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma (Relapsed or Refractory)

**IV; ADULTS:** 2.5 m/kg once q3wks until disease progression or unacceptable toxicity.

### Dose Reduction Schedule

**First dose reduction:** 1.9 mg/kg once q3wks. **Unable to tolerate 1.9 mg/kg dose:** Permanently discontinue.

### Dose Modification

(Based on Common Terminology for Adverse Events [CTCAE]).

### Corneal Toxicities

**Grade 1 keratopathy; decline from baseline of 1 line on Snellen Visual acuity:** Continue same dose. **Grade 2 keratopathy; decline from baseline of 2–3 on Snellen Visual acuity and not worse than 20/200:** Withhold treatment

until corneal symptoms and visual acuity improve to Grade 1 or 0, then resume at reduced dose. **Grade 3 keratopathy; decline from baseline of more than 3 lines on Snellen Visual acuity and not worse than 20/200:** Withhold treatment until corneal symptoms and visual acuity improve to Grade 1 or 0, then resume at reduced dose. **Grade 4 keratopathy; Snellen Visual acuity and not worse than 20/200:** Consider permanent discontinuation or withholding treatment until corneal symptoms and visual acuity improve to Grade 1 or 0, then resume at reduced dose.

### Thrombocytopenia

**Platelet count 25,000–50,000 cells/mm<sup>3</sup>:** Consider withholding treatment and/or reduce dose. **Platelet count 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count improves to Grade 3 or less, then consider resuming at reduced dose.

### Other Toxic Reactions

**Any other Grade 3 toxicities:** Withhold treatment until improved to Grade 1 or 0, then consider resuming at reduced dose. **Any other Grade 4 toxicities:** Consider permanent discontinuation or withholding treatment until improved to Grade 1 or 0, then resume at reduced dose.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment.

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (24%–22%):** Nausea, pyrexia. **Occasional (20%–10%):** Fatigue, asthenia, dry eye, eye discomfort/pruritus, constipation, diarrhea, arthralgia, decreased appetite, back pain, vomiting, photophobia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, lymphopenia, neutropenia, thrombocytopenia) is

an expected response to therapy. Ocular toxicities, including blurred vision, changes in visual acuity, keratopathy, reported in 77% of pts. A decrease of visual acuity worse than 20/40 reported in 19% of pts. A decrease of visual acuity worse than 20/200 reported in 1% of pts. Infective and/or ulcerative keratitis reported in less than 10% of pts. Treatment-induced thrombocytopenia causing Grade 3 or 4 bleeding reported in 6% of pts. Fatal cerebral hemorrhage occurs rarely. Infusion reactions, including asthenia, chills, diarrhea, hypertension, lethargy, nausea, pyrexia, tachycardia, reported in 21% of pts. Infections, including upper respiratory tract infection, pneumonia, reported in 11%–10% of pts. Immunogenicity (auto–belantamab mafodotin antibodies) reported in less than 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC; pregnancy test in females of reproductive potential. Confirm compliance with effective contraception. Obtain weight in kilograms. Obtain ophthalmic examination at baseline (within 3 wks of first dose), at least 1 wk after previous dose, and within 2 wks of next dose. Obtain baseline visual acuity. Screen for active infection. Administer in an environment equipped to monitor for and manage infusion-related reactions. Question for prior infusion-related reactions before each infusion. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for myelosuppression as clinically indicated. Diligently monitor for infusion reactions during each infusion. If infusion reactions occur, interrupt infusion and manage symptoms. Consider premedication regimen for all subsequent infusions. Obtain ophthalmic examination, visual acuity with any corneal symptoms (blurred vision, changes in visual acuity, dry eye, eye pain). Verify compliance with preservative-free lubricating eye drops as directed.

Monitor for infections (cough, fatigue, fever), bleeding of any kind.

### PATIENT/FAMILY TEACHING

- Treatment may depress immune system response and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Immediately report symptoms of infusion-related reactions such as chills, cough, difficulty breathing, itching, palpitations.
- Pre-treatment with acetaminophen, antihistamines, steroidal anti-inflammatories may help reduce infusion reactions.
- Use preservative-free lubricating eye drops at least 4 times/day. Avoid contact lens unless approved by ophthalmologist.
- Changes of vision may impair driving or reading. Use caution when driving or operating machinery.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## belinostat

beh-**lih**-noh-**stat**  
(Beleodaq)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histone deacetylase (HDAC) inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to belinostat. **Cautions:** Pts with high tumor burden, hx of hepatic impairment, thrombocytopenia. Avoid use in pts with active infection.

**ACTION**

Inhibits enzymatic activity of histone deacetylases by catalyzing removal of acetyl groups from lysine residues of histones and non-histone proteins, resulting in accumulation of acetyl groups, leading to cell cycle arrest and apoptosis. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis; causes tumor cellular death.

**PHARMACOKINETICS**

Limited tissue distribution. Metabolized in liver. Protein binding: 93%–95%. Excreted primarily in urine. **Half-life:** 1.1 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 6 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. May impair fertility. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong UGT1A1 inhibitors (e.g., atazanavir) may increase concentration/effect. May decrease therapeutic effect of BCG (intravesical). **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May decrease ANC, Hgb/Hct, lymphocytes, platelets, WBC; serum potassium. May increase blood lactic dehydrogenase, serum creatinine.

**AVAILABILITY (Rx)**

**Lyophilized Powder for Injection:** 500 mg vial.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations

and admixing of cytotoxic drugs. • Reconstitute each vial with 9 mL of Sterile Water for Injection, using suitable syringe for final concentration of 50 mg/mL. • Gently swirl contents until completely dissolved. • Visually inspect for particulate matter. • Do not use if cloudiness or particulate matter observed. • Withdraw required dosage and mix into infusion bag containing 250 mL of 0.9% NaCl.

**Rate of administration** • Infuse over 30 min using 0.22-micron in-line filter. • May extend infusion time to 45 min if infusion site pain or other infusion-related symptoms occur.

**Storage** • Reconstituted vial may be stored at room temperature (max 77°F/25°C) for up to 12 hrs. • Infusion bag may be stored at room temperature (max 77°F/25°C) for up to 36 hrs.

**INDICATIONS/ROUTES/DOSAGE****Peripheral T-Cell Lymphoma**

**IV infusion: ADULTS/ELDERLY:** 1,000 mg/m<sup>2</sup> once daily on days 1–5 of a 21-day cycle. Cycles may be repeated every 21 days until disease progression or unacceptable toxicity.

**Dose Modification**

ANC should be greater than or equal to 1,000 cells/mm<sup>3</sup> and platelet count greater than or equal to 50,000 cells/mm<sup>3</sup> prior to start of each cycle or prior to resuming treatment following toxicity. Discontinue treatment if ANC nadir less than 500 cells/mm<sup>3</sup> or recurrent platelet count nadir less than 25,000 cells/mm<sup>3</sup> after two dose reductions. Other toxicities must be Grade 2 or less prior to resuming treatment.

**Hematologic Toxicities**

**Platelet count greater than 25,000 cells/mm<sup>3</sup> or ANC greater than 500 cells/mm<sup>3</sup>:** No change. **Platelet count less than 25,000 cells/mm<sup>3</sup> or ANC less than 500 cells/mm<sup>3</sup>:** Decrease dose by 25% (750 mg/m<sup>2</sup>).

**Nonhematologic Toxicities**

**Any Grade 3 or 4:** Decrease dose by 25% (750 mg/m<sup>2</sup>). **Recurrence of**

**Grade 3 or 4 adverse reaction after two dosage reductions:** Discontinue treatment. **Nausea, vomiting, diarrhea:** Only modify dose if duration is greater than 7 days with supportive management. **Pts with reduced UGT1A1 activity:** Reduce starting dose to 750 mg/m<sup>2</sup> in pts known to be homozygous for UGT1A1\*28 allele.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (47%–29%):** Nausea, fatigue, pyrexia, vomiting, anemia. **Occasional (23%–10%):** Constipation, diarrhea, dyspepsia, rash, peripheral edema, cough, pruritus, chills, decreased appetite, headache, infusion site pain, abdominal pain, hypotension, phlebitis, dizziness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Serious and sometimes fatal infections including pneumonia, sepsis have occurred. May cause hepatotoxicity, LFT abnormalities, tumor lysis syndrome. GI toxicities including severe diarrhea, nausea, vomiting may require use of antiemetic and antidiarrheal medication or result in dosage reduction. Nineteen percent of pts required treatment discontinuation related to toxic anemia, febrile neutropenia, multiorgan failure, ventricular fibrillation (rare).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain ANC, CBC, BMP, LFT, vital signs; pregnancy test in females of reproductive potential. Question history of anemia, arrhythmias, hepatic impairment, peripheral edema, or if pt homozygous for UGT1A1 allele (may require reduced starting dose). Screen for active infection. Receive full medication history including herbal products.

### INTERVENTION/EVALUATION

Monitor blood counts (esp. ANC, Hgb/Hct, WBC, platelet count) weekly; hepatic/renal function prior to start of first dose of each cycle, vital signs. Monitor for symptoms of hypokalemia. Screen for tumor lysis syndrome (electrolyte imbalance, uric acid nephropathy, acute renal failure). Obtain ECG if arrhythmia, palpitations occur. Monitor for infections (cough, fatigue, fever). If serious infection or sepsis occurs, initiate appropriate antimicrobial therapy. Offer antiemetics if nausea, vomiting occurs.

### PATIENT/FAMILY TEACHING

- Report any abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes, dark urine, decreased urine output.
- Severe diarrhea may lead to dehydration.
- Body aches, burning with urination, chills, cough, difficulty breathing, fever may indicate an acute infection.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## bempedoic acid (Nexletol)

bem-pe-doe-ik-as-id  
(Nexletol)

**Do not confuse Nexletol with Tegretol or nadolol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adenosine triphosphate–citrate lyase (ACL) inhibitor. **CLINICAL:** Antihyperlipidemic agent.

### USES

Adjunct to diet and maximally tolerated statin therapy for the treatment of adults with heterozygous familial hypercholesterolemia (HeFH) or established atherosclerotic cardiovascular disease who require additional lowering of LDL-C.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to bempedoic acid. **Cautions:** History of hyperuricemia, gout; pts at risk for tendon rupture (e.g., renal failure, previous tendon rupture, concomitant use of corticosteroids or fluoroquinolone drugs; pts older than 60 yrs of age). Avoid concomitant use of simvastatin dose greater than 20 mg; pravastatin dose greater than 40 mg.

## ACTION

Inhibits cholesterol synthesis in the liver. Interferes with hepatic cholesterol biosynthesis by inhibiting adenosine triphosphate–citrate lyase and HMG-COA reductase. **Therapeutic Effect:** Lowers LDL-C.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 3.5 hrs. Steady state reached in 7 days. Excreted in urine (70%), feces (30%). **Half-life:**  $21 \pm 11$  hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. May possibly affect the synthesis of biologically active substances in breast milk that are derived from cholesterol, which may cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of tendon rupture.

## INTERACTIONS

**DRUG:** May increase concentration/risk of myopathy of pravastatin, simvastatin. May increase concentration/effects of elagolix, eluxadoline, grazoprevir, revefenacin, voxilaprevir. **HERBAL:** Red yeast may increase risk of myopathy. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, BUN, creatine kinase, creatinine, uric acid; platelets. May decrease Hgb, leukocytes.

## AVAILABILITY (Rx)

**Tablets:** 180 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### HeFH, Hyperlipidemia

**PO: ADULTS, ELDERLY:** 180 mg once daily.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Rare (3%):** Muscle spasm, back pain, abdominal pain, extremity pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hyperuricemia reported in 26% of pts. Tendon rupture (e.g., Achilles tendon, biceps tendon, rotator cuff), tendonitis reported in less than 1% of pts. Tendon rupture may occur more frequently in pts with renal failure, previous tendon rupture; pts taking concomitant corticosteroids or fluoroquinolone drugs; pts older than 60 yrs of age. Upper respiratory tract infection reported in 5% of pts. Bronchitis reported in 3% of pts. Atrial fibrillation, gout reported in 2% of pts. Benign prostatic hyperplasia reported in 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain lipid levels; pregnancy test in female pts of reproductive potential. Obtain dietary history, esp. fat consumption. Question history of gout, tendon rupture, tendonitis. Question use of concomitant corticosteroids or fluoroquinolones (due to increased risk of tendon rupture).

### INTERVENTION/EVALUATION

Obtain lipid levels within 8–12 wks after initiation. Monitor for tendon rupture,

tendonitis (joint pain, swelling, inflammation, popping). Obtain CK level if myopathy (muscle atrophy/pain/weakness, dyspnea, gait disturbance) is suspected. Monitor for hyperuricemia (joint pain/inflammation/redness).

#### PATIENT/FAMILY TEACHING

- Maintain proper diet and exercise.
- Tendon inflammation/swelling, tendon rupture may occur; report bruising, pain, swelling, snapping, or popping of joints/tendons. Certain antibiotics/steroids may increase risk of tendon rupture.
- Report signs of myopathy (e.g., muscle pain/weakness, shortness of breath, difficulty rising from chair or walking upstairs), gout (e.g., joint pain/swelling/redness/warmth).
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## benazepril

ben-ay-ze-pril  
(Lotensin)

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse benazepril with enalapril, lisinopril, or Benadryl, or Lotensin with Lioresal.**

#### FIXED-COMBINATION(S)

**Lotensin HCT:** benazepril/hydrochlorothiazide (a diuretic): 5 mg/6.25 mg, 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg. **Lotrel:** benazepril/amlO-DiPine (a calcium blocker): 2.5 mg/10 mg, 5 mg/10 mg, 5 mg/20 mg, 5 mg/40 mg, 10 mg/20 mg, 10 mg/40 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-converting enzyme (ACE) inhibitor. **CLINICAL:** Antihypertensive.

#### USES

Treatment of hypertension. Used alone or in combination with other antihypertensives.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to benazepril. History of angioedema with or without previous treatment with ACE inhibitors. Use with aliskiren in pts with diabetes. Coadministration with or within 36 hrs of switching to or from a neprilysin inhibitor (e.g., sacubitril). **Cautions:** Renal impairment; hypertrophic cardiomyopathy without flow tract obstruction; severe aortic stenosis; before, during, or immediately following major surgery; unstented renal artery stenosis; diabetes mellitus, pregnancy, breastfeeding. Concomitant use of potassium-sparing diuretics, potassium supplements.

#### ACTION

Decreases rate of conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Results in lower levels of angiotensin II, causing an increase in plasma renin activity and decreased aldosterone secretion. **Therapeutic Effect:** Lowers B/P.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	2–4 hrs	24 hrs

Partially absorbed from GI tract. Protein binding: 97%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 35 min; metabolite, 10–11 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. May cause fetal, neonatal mortality or morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

#### INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase potential for allergic reactions to allopurinol. **Angiotensin II receptor blockers (ARB)** (e.g., losartan, valsartan) may increase adverse effects. May increase adverse effects of lithium, sacubitril. **HERBAL:** Herb-

als with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, ALT, AST, alkaline phosphatase, bilirubin, BUN, creatinine, glucose. May decrease serum sodium; Hgb, Hct. May cause positive ANA titer.

### AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg.

### ADMINISTRATION/HANDLING

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension (Monotherapy)

**PO: ADULTS, ELDERLY:** Initially, 5–10 mg/day. Titrate based on pt response up to 40 mg daily in 1 or 2 divided doses. **CHILDREN 6 YRS AND OLDER:** Initially, 0.2 mg/kg/day (up to 10 mg/day). Maintenance: 0.1–0.6 mg/kg/day. **Maximum:** 0.6 mg/kg or 40 mg/day.

#### Hypertension (Combination Therapy)

**PO: ADULTS:** Discontinue diuretic 2–3 days before initiating benazepril, then dose as noted above. If unable to discontinue diuretic, begin benazepril at 5 mg/day.

#### Dosage in Renal Impairment

**CrCl less than 30 mL/min: ADULTS:** Initially, 5 mg/day titrated up to maximum of 40 mg/day. **CHILDREN:** Not recommended. **HD, PD:** 25%–50% of usual dose; supplement dose not necessary.

#### Dosage in Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Frequent (6%–3%):** Cough, headache, dizziness. **Occasional (2%):** Fatigue, drowsiness, nausea. **Rare (less than 1%):** Rash, fever, myalgia, diarrhea, loss of taste.

### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (“first-dose syncope”) may occur in pts with HF, severe

salt or volume depletion. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment, collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may occur in pts with history of renal disease.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC before therapy begins and q2wks for 3 mos, then periodically thereafter. Obtain B/P immediately before each dose, in addition to regular monitoring (be alert to fluctuations).

### INTERVENTION/EVALUATION

Assist with ambulation if dizziness occurs. Monitor B/P, renal function, urinary protein, serum potassium. Monitor CBC with differential if pt has collagen vascular disease or renal impairment. If excessive reduction in B/P occurs, place pt in supine position with legs elevated. Increased surveillance is recommended in pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response.

### PATIENT/FAMILY TEACHING

- To reduce hypotensive effect, go from lying to standing slowly.
- Full therapeutic effect may take 2–4 wks.
- Skipping doses or noncompliance with drug therapy may produce severe rebound hypertension.
- Report dizziness, persistent cough.

## bendamustine

ben-da-mus-teen  
(Belrapzo, Bendeka, Treanda)

**Do not confuse bendamustine with carmustine or lomustine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

## USES

Treatment of chronic lymphocytic leukemia (CLL). Treatment of indolent B-cell non-Hodgkin's lymphoma (NHL) that has progressed during or within 6 mos of treatment with ritUXimab or a ritUXimab-containing regimen. **OFF-LABEL:** Treatment of mantle cell lymphoma, relapsed multiple myeloma. First-line treatment for follicular lymphoma. Treatment of Waldenström's macroglobulinemia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to bendamustine. (Bendeka only): polyethylene glycol 400, or propylene glycol mono-thioglycerol. **Cautions:** Baseline cytopenias, hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); dermatologic disease, HF, dehydration; pts at high risk for tumor lysis syndrome (high tumor burden); history of hepatitis B virus infection, herpes zoster infection.

## ACTION

Alkylates and cross-links double-stranded DNA. **Therapeutic Effect:** Inhibits tumor cell growth, causes cell death.

## PHARMACOKINETICS

Metabolized in liver and via hydrolysis to metabolites. Protein binding: 94%–96%. Excreted in urine (50%), feces (25%). **Half-life:** 40 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. Impaired spermatogenesis, azoospermia have been reported in male pts. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CYP1A2 inducers (e.g., carbamazepine, rifampicin) may decrease concentration/effect. CYP1A2 inhibitors (e.g., ciprofloxacin, fluvoxamine) may increase concentration/effect. **Allopurinol** may increase risk of severe skin

toxicities. May decrease therapeutic effect of **BCG (intravesical)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum AST, bilirubin, creatinine, glucose, uric acid. May decrease WBCs, neutrophils, Hgb, platelets; serum potassium, sodium, calcium.

## AVAILABILITY (Rx)

**Injection Powder for Reconstitution:** (*Treanda*): 25 mg, 100 mg. **Injection:** (*Belrapzo, Bendeka*): 100 mg/4 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 100-mg vial with 20 mL Sterile Water for Injection (25-mg vial with 5 mL) for final concentration of 5 mg/mL. • Powder should completely dissolve in 5 min. • Discard if particulate matter is observed. • Withdraw volume needed for required dose (based on 5 mg/mL concentration) and immediately transfer to 500-mL infusion bag of 0.9% NaCl for final concentration of 0.2–0.6 mg/mL. • Reconstituted solution must be transferred to infusion bag within 30 min of reconstitution. • After transferring, thoroughly mix contents of infusion bag. **Rate of administration** • Infuse over 30 min for CLL or 60 min for NHL. **Storage** • Reconstituted solution should appear clear and colorless to pale yellow. • Final solution is stable for 24 hrs if refrigerated or 3 hrs at room temperature. • Administration must be completed within these stability time frames.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Antiemetics are recommended to prevent nausea and vomiting.

### Chronic Lymphocytic Leukemia

**IV infusion: ADULTS/ELDERLY:** 100 mg/m<sup>2</sup> given over 30 min daily on days 1 and 2 of a 28-day cycle as a single agent, up to 6 cycles.

### Non-Hodgkin's Lymphoma

**IV infusion: ADULTS/ELDERLY:** 120 mg/m<sup>2</sup> on days 1 and 2 of a 21-day cycle as a single agent, up to 8 cycles.

**Dose Modification**

**Hematologic toxicity Grade 4 or greater:** Withhold until ANC 1,000 cells/mm<sup>3</sup> or greater, platelet 75,000 cells/mm<sup>3</sup> or greater. **CLL: toxicity Grade 3 or greater:** Reduce dose to 50 mg/m<sup>2</sup> on days 1 and 2 of each treatment cycle. **Recurrence:** Reduce dose to 25 mg/m<sup>2</sup> on days 1 and 2 of each cycle. **NHL: hematologic toxicity Grade 4 or nonhematologic toxicity Grade 3 or greater:** Reduce dose to 90 mg/m<sup>2</sup> on days 1 and 2 of each cycle. **Recurrence:** Reduce dose to 60 mg/m<sup>2</sup> on days 1 and 2 of each treatment cycle.

**Dosage in Renal Impairment**

Not recommended in pts with CrCl less than 30 mL/min.

**Dosage in Hepatic Impairment**

Not recommended in pts with serum ALT/AST 2.5–10 times ULN and total bilirubin 1.5–3 times ULN, or total bilirubin greater than 3 times ULN.

**SIDE EFFECTS**

**Note:** Frequency and occurrence of side effects may vary depending on indication of treatment.

**Frequent (75%–21%):** Nausea, fatigue, vomiting, anorexia, diarrhea, pyrexia, constipation, decreased appetite, cough, headache. **Occasional (18%–6%):** Decreased weight, rash, dyspnea, stomatitis, dehydration, back pain, dizziness, chills, peripheral edema, abdominal pain, insomnia, dyspepsia, asthenia, pharyngeal pain, anxiety, dysgeusia, tachycardia, depression, chest pain, infusion site pain, catheter site pain, arthralgia, pruritus, hypotension. **Rare (5%):** Extremity pain, bone pain, abdominal distension, wheezing, nasal congestion, dry skin, night sweats, hyperhidrosis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Grade 3–4 myelosuppression reported in 98% of pts. Infections including sepsis, septic shock, herpes zoster, upper respiratory tract infection, UTI, sinusitis, pneumonia,

febrile neutropenia, oral candidiasis, nasopharyngitis were reported. Reactivation of cytomegalovirus, hepatitis B virus, mycobacterium tuberculosis, herpes zoster was reported. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Infusion reactions (e.g., chills, fever, pruritus, rash), anaphylaxis were reported. Fatal skin reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis, DRESS syndrome (drug reaction with eosinophilia and systemic symptoms, also known as multiorgan hypersensitivity) have been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis. Serious, sometimes fatal, hepatotoxicity may occur. Premalignant and malignant disease including myelodysplastic syndrome, myeloproliferative disorders, acute myeloid leukemia, bronchial carcinoma were reported. Skin and soft tissue infusion site extravasation with secondary cellulitis, exfoliation may occur. Other reactions may include acute renal failure, cardiac failure, pulmonary fibrosis, hemolysis, dermatitis, skin necrosis, atrial fibrillation, myocardial infarction, pneumonitis.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Screen for active infection. Assess usual bowel movement patterns, stool characteristics. Ensure adequate hydration in pts at risk for tumor lysis syndrome. Question history of hepatic/renal impairment; history of hepatitis B virus infection, herpes zoster infection. Conduct baseline dermatologic exam. Receive full medication history and screen for interactions. Ensure patency of IV access. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression; BMP; LFT for hepatotoxicity; renal func-

tion (CrCl, GFR). Hematologic nadirs usually occur in 3rd wk of therapy. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal injury. Obtain serum calcium, phosphate, uric acid if tumor lysis syndrome is suspected (presents as acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures). Monitor for infusion-related reactions, hypersensitivity reactions (anaphylaxis, chills, fever, rash), renal toxicity (anuria, hypertension, generalized edema, flank pain), extravasation injuries (redness, swelling, pain, necrosis of injection site), secondary malignancies, HBV reactivation (amber- to orange-colored urine, fatigue, jaundice, nausea, vomiting). Assess skin for dermal toxicities, DRESS. Monitor daily pattern of bowel activity, stool consistency; I&Os. Ensure adequate hydration, nutrition. Monitor for infections (cough, fatigue, fever). If serious infection, sepsis occurs, initiate appropriate antimicrobial therapy.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Therapy may cause life-threatening tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure. Report decreased urination, amber-colored urine; confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Treatment may cause diarrhea, dehydration. Drink plenty of fluids.
- Use effective contraception. Do not breastfeed.
- Report symptoms of liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine), skin

reactions (rash, skin eruptions); UTI (fever, urinary frequency, burning during urination, foul-smelling urine), skin problems (rash, sloughing, necrotic tissue, dermal toxicity).

- Report symptoms of drug-induced hypersensitivity syndrome (fever, swollen face/lymph nodes, skin rash/peeling/inflammation).
- Allergic reactions such as chills, fever, rash may occur during infusion. Anaphylaxis (difficulty breathing, low blood pressure, severe rash, swelling of lips and tongue, rapid heart rate, can be life threatening. If allergic reaction occurs, seek immediate medical attention.
- Treatment may cause reactivation of chronic viral infections, new cancers.

## benralizumab

**ben-ra-liz-ue-mab**  
(Fasenra)

**Do not confuse benralizumab with certolizumab, daclizumab, eculizumab, efalizumab, mepolizumab, natalizumab, omalizumab, pembrolizumab, reslizumab, tocilizumab, or vedolizumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-5 receptor alpha-directed cytolytic. Monoclonal antibody. **CLINICAL:** Antiasthmatic.

#### USES

Add-on maintenance treatment of pts with severe asthma, aged 12 yrs and older, and with an eosinophilic phenotype.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to benralizumab. **Cautions:** History of helminth (parasite) infection; long-term use of corticosteroids. Not indicated for treatment of other eosinophilic conditions; relief of acute bronchospasm or status asthmaticus.

#### ACTION

Inhibits signaling of interleukin-5 cytokine, reducing production and survival of

eosinophils responsible for asthmatic inflammation and pathogenesis. **Therapeutic Effect:** Prevents inflammatory process; relieves signs/symptoms of asthma.

## PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. **Half-life:** 15 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

## AVAILABILITY (Rx)

**Injection Solution (Prefilled Syringe, Auto-Injector):** 30 mg/mL.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Follow manufacturer guidelines regarding use of plunger. • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscularly. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. Once

warmed to room temperature, do not place back into refrigerator. • Do not freeze or expose to heating sources. • Do not shake. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Asthma (Severe)

**SQ: ADULTS, ELDERLY, CHILDREN:** 30 mg once q4wks for the first 3 doses, then once q8wks thereafter.

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Occasional (8%–3%):** Headache, pyrexia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including anaphylaxis, angioedema, bronchospasm, hypotension, urticaria, rash were reported. Hypersensitivity reactions typically occurred hrs to days after administration. Infections including bacterial/viral pharyngitis may occur. Unknown if treatment will influence the immunological response to helminth (parasite) infection. Immunogenicity (auto-benralizumab antibodies) reported in 13% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain apical pulse, oxygen saturation. Auscultate lung fields. Question history of parasitic infection, hypersensitivity reaction. Pts with preexisting helminth (parasite) infection should be treated prior to initiation. Inhaled or systemic corticosteroids should not be suddenly discontinued upon initiation. Corticosteroids that are not gradually reduced may cause withdraw symptoms or unmask conditions that were originally suppressed with corticosteroid therapy.

### INTERVENTION/EVALUATION

Monitor rate, depth, rhythm of respirations. Assess lungs for wheezing, rales. Monitor oxygen saturation. Interrupt or discontinue treatment if hypersensitivity reaction, opportunistic infection (esp. parasite infection, her-

pes zoster infection); worsening of asthma-related symptoms (esp. in pts tapering off corticosteroids) occurs. Obtain pulmonary function test to assess disease improvement. Monitor for increased use of rescue inhalers; may indicate deterioration of asthma.

#### PATIENT/FAMILY TEACHING

- Treatment not indicated for relief of acute asthmatic episodes.
- Have a rescue inhaler readily available.
- Increased use of rescue inhaler may indicate worsening of asthma.
- Seek medical attention if asthma symptoms worsen or remain uncontrolled after starting therapy.
- Immediately report allergic reactions such as difficulty breathing, itching, hives, rash, swelling of the face or tongue.
- Report infections of any kind.
- Do not stop corticosteroid therapy unless directed by prescriber.

## bethanechol

be-**than**-e-kole  
(Duvoid )

**Do not confuse bethanechol with betaxolol.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Parasympathomimetic choline ester. **CLINICAL:** Cholinergic.

#### USES

Treatment of acute postoperative and postpartum nonobstructive urinary retention, neurogenic atony of urinary bladder with retention. **OFF-LABEL:** Treatment of gastroesophageal reflux.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to bethanechol. Mechanical obstruction of GI/GU tract, GI or bladder wall instability, hyperthyroidism, asthma, peptic ulcer disease, epilepsy, pronounced bradycardia or hypotension, parkinsonism, CAD, vasomotor instability, bladder neck obstruction, spastic GI disturbances,

acute inflammatory lesions of the GI tract, peritonitis, marked vagotonia.

**Cautions:** Bladder reflux infection.

#### ACTION

Stimulates parasympathetic nervous system, increasing bladder muscle tone and causing contractions, which initiates urination. Also stimulates gastric motility, increasing gastric tone, and may restore peristalsis. **Therapeutic Effect:** May initiate urination, bladder emptying. Stimulates gastric, intestinal motility.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30–90 min	60 min	6 hrs

Poorly absorbed following PO administration. Does not cross blood-brain barrier. **Half-life:** Unknown.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if crosses placenta or distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** Beta blockers (e.g., labetalol, metoprolol), anticholinesterase inhibitors (e.g., donepezil, rivastigmine) may increase effect/toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase, ALT, AST.

#### AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 25 mg, 50 mg.

#### ADMINISTRATION/HANDLING

##### PO

- Administer 1 hr before or 2 hrs after meals.

#### INDICATIONS/ROUTES/DOSAGE

**Nonobstructive Urinary Retention, Neurogenic Bladder**

**PO: ADULTS, ELDERLY:** Usual dose: 10–50 mg 3–4 times/day. Minimum effective dose determined by giving 5–10 mg initially,

repeating same amount at 1-hr intervals until desired response is achieved or a maximum of 50 mg is reached.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional:** Belching, changes in vision, blurred vision, diarrhea, urinary urgency or frequency. **Rare:** Dyspnea, chest tightness, bronchospasm.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces CNS stimulation (insomnia, anxiety, orthostatic hypotension), cholinergic stimulation (headache, increased salivation/diaphoresis, nausea, vomiting, flushed skin, abdominal pain, seizures).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Ensure pt has emptied bladder prior to procedure.

#### INTERVENTION/EVALUATION

Monitor urine output. Palpate bladder for evidence of urinary retention.

#### PATIENT/FAMILY TEACHING.

- Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, irregular heartbeat, muscle weakness, severe abdominal pain, difficulty breathing.

## bevacizumab

TOP  
100 HIGH  
ALERT

be-va-siz-ue-mab

(Avastin, Mvasi, Zirabev)

**BLACK BOX ALERT** May result in development of GI perforation, presented as intra-abdominal abscess, fistula, wound dehiscence, wound healing complications. Severe, sometimes fatal, hemorrhagic events including central nervous system/GI/vaginal bleeding, epistaxis, hemoptysis, pulmonary hemorrhage have occurred.

**Do not confuse Avastin with Astelin, or bevacizumab with cetuximab or riTUXimab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Vascular endothelial growth factor (VEGF) inhibitor. Monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

First- or second-line combination chemotherapy with 5-fluorouracil (5-FU) for treatment of pts with colorectal cancer. Second-line treatment of colorectal cancer after progression of first-line treatment with bevacizumab. Treatment with CARBOplatin and PACLitaxel for nonsquamous, non-small-cell lung cancer (NSCLC). Treatment of renal cell carcinoma (metastatic) with interferon alfa, brain cancer (glioblastoma) that has progressed following prior therapy. Treatment of platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with PACLitaxel, DOXOrubicin [liposomal] or topotecan). Treatment of stage III or IV epithelial ovarian, fallopian tube, or primary peritoneal cancer following initial surgical resection (in combination with carboplatin and paclitaxel), then single-agent bevacizumab. Treatment of platinum-sensitive ovarian cancer. Treatment of persistent, recurrent, or metastatic cervical cancer (in combination with PACLitaxel and either CISplatin or topotecan). **OFF-LABEL:** Adjunctive therapy in malignant mesothelioma, ovarian cancer, prostate cancer, age-related macular degeneration. Treatment of metastatic breast cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to bevacizumab. **Cautions:** Cardiovascular disease, acquired coagulopathy, pre-existing hypertension, pts at risk of thrombocytopenia. Pts with CNS metastasis. Do not administer within 28 days of major surgery or active bleeding. Pts at risk for hemorrhage (e.g., history of

GI bleeding, fistulas, coagulation disorders, recent trauma; concomitant use of anticoagulants, NSAIDs, antiplatelets), history of thromboembolism (CVA, DVT, MI), transient ischemic attack [TIA], GI perforation or hemorrhage; pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, genetic hypercoagulable conditions).

## ACTION

Binds to and neutralizes vascular endothelial growth factor, preventing association with endothelial receptors. **Therapeutic Effect:** Inhibition of microvascular growth retards growth of all tissue, including metastatic tissue.

## PHARMACOKINETICS

Clearance varies by body weight, gender, tumor burden. **Half-life:** 20 days (range: 11–50 days).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May possess teratogenic effects. Potential for fertility impairment. May decrease maternal and fetal body weight, increase risk of skeletal fetal abnormalities. Breastfeeding not recommended.

**Children:** Safety and efficacy not established. **Elderly:** Higher incidence of severe adverse reactions in pts older than 65 yrs.

## INTERACTIONS

**DRUG:** May increase cardiotoxic effect of **anthracyclines**. May decrease therapeutic effect of **BCG (intravesical)**.

**Sunitinib** may increase adverse effects.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, platelet count, WBC; serum potassium, sodium. May increase urine protein.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mg/4 mL, 400 mg/16 mL vials.

## ADMINISTRATION/HANDLING

**◀ALERT▶** Do not give by IV push or bolus.

**Reconstitution** • Dilute prescribed dose in 100 mL 0.9% NaCl. • Avoid dextrose-containing solutions. • Discard any unused portion.

**Rate of administration** • Usually given following other chemotherapy. Infuse initial dose over 90 min. • If first infusion is well tolerated, second infusion may be administered over 60 min. • If 60-min infusion is well tolerated, all subsequent infusions may be administered over 30 min.

**Storage** • Diluted solution may be stored for up to 8 hrs if refrigerated.

## IV INCOMPATIBILITIES

Do not mix with dextrose solutions.

## INDICATIONS/ROUTES/DOSAGE

### Colorectal Cancer (With Fluorouracil-Based Chemotherapy)

**IV: ADULTS, ELDERLY:** 5 mg/kg q2wks (in combination with bolus-IFL) or 10 mg/kg q2wks in combination with FOLFOX4).

### Colorectal Cancer Progression (Following Initial Bevacizumab/Fluorouracil-Based Chemotherapy)

**IV: ADULTS, ELDERLY:** 5 mg/kg q2wks or 7.5 mg/kg q3wks (in combination with fluoropyrimidine-irinotecan- or fluoropyrimidine-oxaliplatin-based regimen).

### Non-Small-Cell Lung Cancer (NSCLC)

**IV: ADULTS, ELDERLY:** 15 mg/kg q3wks (in combination with CARBOplatin and PACLitaxel) for 6 cycles.

### Metastatic Renal Cell Carcinoma

**IV: ADULTS, ELDERLY:** 10 mg/kg once q2wks (with interferon alfa).

### Brain Cancer

**IV: ADULTS, ELDERLY:** 10 mg/kg q2wks (as monotherapy).

### Ovarian Cancer (Platinum-Resistant)

**IV: ADULTS, ELDERLY:** 10 mg/kg q2wks with PACLitaxel, DOXOrubicin (liposomal), or wkly topotecan or 15 mg/kg q3wks (with topotecan q3wks).

**Ovarian Cancer (Platinum-Sensitive)**

**IV: ADULTS, ELDERLY:** 15 mg/kg q3wks with CARBOplatin/PACLitaxel for 6–8 cycles, then 15 mg/kg q3wks as a single agent or 15 mg/kg with CARBOplatin/gemcitabine for 6–10 cycles, then 15 mg/kg q3wks as a single agent. Continue until disease progression or unacceptable toxicity.

**Ovarian Cancer (Following Initial Surgery)**

**IV: ADULTS, ELDERLY:** 15 mg/kg q3wks with CARBOplatin/PACLitaxel for 6 cycles, then 15 mg/kg q3wks as a single agent for total of up to 22 cycles. Continue until disease progression.

**Cervical Cancer**

**IV: ADULTS, ELDERLY:** 15 mg/kg q3wks (in combination with PAACLitaxel and either CISplatin or topotecan). Continue until disease progression or unacceptable toxicity.

**Dose Adjustment for Toxicity**

**Temporary suspension:** Mild to moderate proteinuria, severe hypertension not controlled with medical management.

**Permanent discontinuation:** Wound dehiscence requiring intervention, GI perforation, tracheoesophageal fistula, Grade 4 fistula, fistula formation involving any internal organ, hypertensive crisis, serious bleeding, nephrotic syndrome, arterial or venous thromboembolism, hypertensive encephalopathy, posterior reversible encephalopathy syndrome, severe infusion reaction, HF.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (73%–25%):** Asthenia, vomiting, anorexia, hypertension, epistaxis, stomatitis, constipation, headache, dyspnea.

**Occasional (21%–15%):** Altered taste, dry skin, exfoliative dermatitis, dizziness, flatulence, excessive lacrimation, skin discoloration, weight loss, myalgia.

**Rare (8%–6%):** Nail disorder, skin ulcer,

alopecia, confusion, abnormal gait, dry mouth.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Fatal GI perforations reported in up to 3% of pts. Serious fistula formations in bladder, biliary, bronchopleural, tracheoesophageal, renal, vaginal sites may occur. Necrotizing fasciitis due to poor wound healing complications, GI perforation may occur. Severe bleeding events including CNS hemorrhage, GI bleeding, epistaxis, hemoptysis, hematemesis, pulmonary hemorrhage, vaginal bleeding were reported. Thromboembolic events including CVA, DVT, MI, TIA. Posterior reversible encephalopathy syndrome (PRES) reported in less than 1% of pts. Renal injury, proteinuria, nephrotic syndrome may occur. Infusion-related reactions including altered mental status, chest pain, diaphoresis, hypertension crisis, hypoxia, rigors, wheezing may occur. Palmar-plantar erythrodysesthesia (redness, swelling, numbness, skin sloughing of the hands and feet) reported in 5% of pts. Other reactions may include ovarian failure, HF.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, serum potassium, sodium levels at regular intervals during therapy. Assess for proteinuria with urinalysis. For pts with 2+ or greater urine dipstick reading, a 24-hr urine collection is advised. Question history as listed in PRECAUTIONS. Screen for active infection. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC for myelosuppression; renal function (CrCl, GFR). Monitor for GI perforation, GI bleeding, bloody stool; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures); symptoms of MI (chest pain, diaphoresis, left arm/jaw pain,

increased serum troponin, ST segment elevation), CVA (aphasia, altered mental status, facial droop, hemiplegia, vision loss), DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia), HF (dyspnea, peripheral edema, palpitations, exercise intolerance). Monitor B/P for hypertension. Persistent hypertension despite medical management may indicate hypertensive crisis. Reversible posterior leukoencephalopathy syndrome should be considered in pts with seizure, headache, visual disturbances, confusion, altered mental status. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal injury. Monitor for infusion-related reactions. Assess proteinuria with urinalysis. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Treatment may worsen high blood pressure.
- Therapy may cause life-threatening blood clots or bleeding; report symptoms of heart attack (chest pain, difficulty breathing, jaw pain, nausea, pain that radiates to the left arm, sweating), DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision).
- Stomach/pelvic pain, vomiting, fever may indicate GI perforation (tear).
- Neurologic changes including altered mental status, seizures, headache, blurry vision, trouble speaking, one-sided weakness may indicate stroke, high blood pressure crisis, or life-threatening brain swelling.
- Report abdominal pain, vomiting, constipation, headache.
- Do not receive immunizations without physician's approval (lowers body's resistance).
- Avoid pregnancy.

## bictegravir/emtricitabine/tenofovir

bik-teg-ra-vir/em-trye-sye-ta-been/ten-oh-foe-veer

(Biktarvy)

**BLACK BOX ALERT** ■ Serious, sometimes fatal lactic acidosis and severe hepatomegaly with steatosis (fatty liver) have been reported. Severe exacerbations of hepatitis B virus (HBV) reported in pts co-infected with HIV-1 and HBV following discontinuation. If discontinuation occurs, monitor hepatic function for at least several months. Initiate anti-HBV therapy if warranted.

**Do not confuse bictegravir/emtricitabine/tenofovir (Biktarvy) with elvitegravir/cobicistat/emtricitabine/tenofovir (Stribild), emtricitabine/rilpivirine/tenofovir (Complera), efavirenz/emtricitabine/tenofovir (Atripla), or emtricitabine/tenofovir (Truvada).**

#### FIXED-COMBINATION(S)

**Biktarvy:** bictegravir/emtricitabine/tenofovir: 50 mg/200 mg/25 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Integrase inhibitor, nucleoside reverse transcriptase inhibitor, nucleotide reverse transcriptase inhibitor. **CLINICAL:** Antiretroviral.

#### USES

Indicated as complete regimen for treatment of HIV-1 infection in adults and pediatric pts weighing 14 kg or more who are antiretroviral naïve or to replace the current antiretroviral regimen in pts who are virologically suppressed (HIV-1 RNA less than 50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and no known substitutions associated with resistance to the individual components of bictegravir/emtricitabine/tenofovir.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to bictegravir/emtricitabine/tenofovir. Concomitant use of dofetilide, rifampin. **Cautions:** Mild to moderate hepatic/renal impairment. History of depression, suicidal ideation; hepatitis B or C virus infection. Concomitant use of nephrotoxic medications. Not recommended in pts with creatinine clearance less than 30 mL/min; severe hepatic impairment.

## ACTION

Bictegravir inhibits strand transfer activity of HIV-1 integrase, essential for viral replication. Emtricitabine inhibits HIV-1 reverse transcriptase by competing with natural substrates, resulting in chain termination. Tenofovir inhibits HIV reverse transcriptase by interfering with HIV viral RNA-dependent DNA polymerase. **Therapeutic Effect:** Interferes with HIV replication, slowing progression of HIV infection.

## PHARMACOKINETICS

Widely distributed. Bictegravir metabolized in liver. Emtricitabine phosphorylated by cellular enzymes. Tenofovir metabolized by enzymatic hydrolysis, mediated by macrophages and hepatocytes. Protein binding: (bictegravir): greater than 99%; (emtricitabine): less than 4%; (tenofovir): 80%. Peak plasma concentration: (bictegravir): 2–4 hrs; (emtricitabine): 1.5–2 hrs; (tenofovir): 0.5–2 hrs. Bictegravir excreted in feces (60%), urine (35%). Emtricitabine excreted in urine (70%), feces (14%). Tenofovir excreted in urine, feces (32%), (less than 1%). **Half-life:** (bictegravir): 17 hrs; (emtricitabine): 10 hrs; (tenofovir): 0.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of postnatal HIV transmission. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not specified; use caution.

## INTERACTIONS

**DRUG:** May significantly increase concentration/effect of **dofetilide** (contraindicated). **Rifampin** may significantly decrease concentration/effect (contraindicated). **Carbamazepine, oxcarbazepine, phenobarbital, primidone** may decrease concentration of tenofovir. **Adefovir, fosphenytoin, phenytoin** may decrease therapeutic effect of tenofovir. **HERBAL:** **St. John's wort** may decrease concentration/effect of bictegravir, tenofovir. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, cholesterol, creatine kinase, creatinine. May decrease neutrophils.

## AVAILABILITY (Rx)

**Fixed-Dose Combination Tablets:** bictegravir 50 mg/emtricitabine 200 mg/tenofovir 25 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer at least 2 hrs before medications containing aluminum, calcium, iron, magnesium (supplements, antacids, laxatives).

## INDICATIONS/ROUTES/DOSAGE

### HIV Infection

**PO: ADULTS, ELDERLY:** 1 tablet once daily.

### Dosage in Renal Impairment

**CrCl greater than or equal to 30 mL/min:** No dose adjustment. **CrCl less than or equal to 30 mL/min:** Not recommended.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Occasional (6%–2%):** Diarrhea, nausea, headache, fatigue, abnormal dreams, dizziness, insomnia, vomiting, flatulence, dyspepsia, abdominal pain, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

If therapy is discontinued, pts coinfecting with hepatitis B virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May induce immune reconstitution syndrome (inflammatory response to dormant opportunistic infections, such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré). Acute renal failure, Fanconi syndrome (renal tubular injury with severe hypophosphatemia) were reported. Fatal cases of lactic acidosis, severe hepatomegaly with steatosis have occurred. Suicidal ideation, depression, suicide attempt reported in less than 1% of pts (primarily occurred in pts with prior psychiatric illness).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, creatinine clearance, GFR; CD4+ count, viral load, HIV-1 RNA level; urine glucose, urine protein. Obtain serum phosphate level in pts with chronic kidney disease. Test all pts for hepatitis B virus infection. Question history of depression, suicidal ideation. Receive full medication history (including herbal products); screen for contraindications/interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor renal function as clinically indicated. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. If discontinuation of drug regimen occurs, monitor hepatic function for at least several months. Initiate anti-HBV therapy if

warranted. Cough, dyspnea, fever, excess of band cells on CBC may indicate acute infection (WBC count may be unreliable in pts with uncontrolled HIV infection). Screen for immune reconstitution syndrome. Monitor daily pattern of bowel activity, stool consistency; I&Os.

### PATIENT/FAMILY TEACHING

- Drug resistance can form if therapy is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report body aches, chills, cough, fever, night sweats, shortness of breath.
- Treatment may cause kidney failure. Report flank pain, darkened urine, decreased urine output.
- Practice safe sex with barrier methods or abstinence.
- Do not breastfeed.

## binimetinib

bin-i-me-ti-nib  
(Mektovi)

**Do not confuse binimetinib with alectinib, bosutinib, brigatinib, cobimetinib, encorafenib, neratinib or trametinib, or Mektovi with Mekinist.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Mitogen-activated extracellular (MEK) kinase inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of pts with unresectable or metastatic melanoma with a BRAF V600E or V600K mutation (in combination with encorafenib).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to binimetinib. **Cautions:** Baseline cytopenias; pts at risk for hemorrhage (e.g., history

of GI bleeding, coagulation disorders, recent trauma; concomitant use of anticoagulants, NSAIDs, antiplatelets), hepatic/renal impairment, pulmonary disease, cardiovascular disease, HF. History of thromboembolism (deep vein thrombosis [DVT], pulmonary embolism [PE]); pts at risk for thrombosis (immobility, indwelling venous catheter/access device, morbid obesity, genetic hypercoagulable conditions).

## ACTION

Potent and selective inhibitor of mitogen-activated extracellular kinase (MEK) pathway. Reversibly inhibits MEK1 and MEK2, which are upstream regulators of the ERK pathway. The ERK pathway promotes cellular proliferation. MEK1 and MEK2 are part of the BRAF pathway. **Therapeutic Effect:** Increases apoptosis and reduces tumor growth.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 97%. Peak plasma concentration: 1.6 hrs. Excreted in feces (62%), urine (31%). **Half-life:** 3.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for up to 4 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 3 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatine phosphokinase, creatinine, GGT. May decrease Hct, Hgb, leukocytes, lymphocytes, neutrophils, RBCs; serum sodium.

## AVAILABILITY (Rx)

**Tablets:** 15 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- If a dose is missed or vomiting occurs after administration, give next dose at regularly scheduled time.
- Do not give a missed dose within 6 hrs of next dose.

## INDICATIONS/ROUTES/DOSAGE

### Metastatic Melanoma

**PO: ADULTS, ELDERLY:** 45 mg twice daily (in combination with encorafenib). Continue until disease progression or unacceptable toxicity.

### Dose Reduction for Adverse Reactions

**First dose reduction:** 30 mg twice daily. **Unable to tolerate 30 mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). See prescribing information for encorafenib for recommended dose modification. If encorafenib is discontinued, binimetinib must also be discontinued.

### Cardiomyopathy

**Asymptomatic, absolute decrease in left ventricular ejection fraction (LVEF) greater than 10% from baseline and below lower limit of normal (LLN):** Withhold treatment for up to 4 wks. If LVEF is at or above LLN, and the decrease from baseline is 10% or less, and pt is asymptomatic, then resume at reduced dose. If LVEF does not recover within 4 wks, permanently discontinue. **Symptomatic HF or absolute decrease in LVEF of greater than 20% from baseline that is also below LLN:** Permanently discontinue.

### Dermatologic Reactions

**Grade 2 skin reaction:** If not improved within 2 wks, withhold treatment until improved to Grade 1 or 0. Resume

at same dose for first occurrence or reduce dose if reaction is recurrent. **Grade 3 skin reaction:** Withhold treatment until improved to Grade 1 or 0. Resume at same dose for first occurrence or reduce dose if reaction is recurrent. **Grade 4 skin reaction:** Permanently discontinue.

#### *Hepatotoxicity*

**Grade 2 serum ALT, AST elevation:** Maintain dose. If not improved within 2 wks, withhold treatment until improved to Grade 1 or 0 (or to pretreatment baseline), then resume at same dose. **Grade 3 or 4 serum ALT, AST elevation:** See Other Adverse Reactions.

#### *Ocular Toxicities*

**Symptomatic serious retinopathy; retinal pigment epithelial detachment:** Withhold treatment for up to 10 days. If symptoms improve and become asymptomatic, resume at same dose. If not improved, resume at reduced dose or permanently discontinue. **Retinal vein occlusion:** Permanently discontinue.

#### *Pulmonary Toxicity*

**Grade 2 interstitial lung disease:** Withhold treatment for up to 4 wks. If improved to Grade 1 or 0, resume at reduced dose. If not resolved within 4 wks, permanently discontinue. **Grade 3 or 4 interstitial lung disease:** Permanently discontinue.

#### *Rhabdomyolysis, Elevated Serum CPK*

**Grade 4 asymptomatic CPK elevation; any CPK elevation with symptoms or with renal impairment:** Withhold treatment for up to 4 wks. If improved to Grade 1 or 0, resume at reduced dose. If not resolved within 4 wks, permanently discontinue.

#### *Uveitis*

**Grade 1–3 uveitis:** Withhold treatment for up to 6 wks if Grade 1 or 2 uveitis does not respond to medical therapy or if Grade 3 uveitis occurs. If improved,

resume at same dose or reduced dose. If not improved, permanently discontinue. **Grade 4 uveitis:** Permanently discontinue.

#### *Other Adverse Reactions (Including Hemorrhage)*

**Any recurrent Grade 2 reaction; first occurrence of any Grade 3 reaction:** Withhold treatment for up to 4 wks. If improved to Grade 1 or 0 (or to pretreatment baseline), resume at reduced dose. If not improved, permanently discontinue. **First occurrence of any Grade 4 reaction:** Permanently discontinue or withhold treatment for up to 4 wks. If improved to Grade 1 or 0 (or to pretreatment baseline), resume at reduced dose. If not improved, permanently discontinue. **Recurrent Grade 3 reaction:** Consider permanent discontinuation. **Recurrent Grade 4 reaction:** Permanently discontinue.

#### *Thromboembolism*

**Uncomplicated deep vein thrombosis (DVT); pulmonary embolism (PE):** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose. **Life-threatening PE:** Permanently discontinue.

#### *Dosage in Renal Impairment*

**Mild to severe impairment:** Not specified; use caution.

#### *Dosage in Hepatic Impairment*

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** 30 mg twice daily.

### SIDE EFFECTS

**Frequent (43%–20%):** Fatigue, nausea, diarrhea, vomiting, abdominal pain, constipation, rash, visual impairment. **Occasional (18%–13%):** Pyrexia, dizziness, peripheral edema.

### ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, lymphopenia, neutropenia is an expected response to

therapy. Cardiomyopathy reported in 7% of pts. DVT reported in 6% of pts. PE reported in 3% of pts. Ocular toxicities including serious retinopathy, retinal detachment, macular edema, retinal vein occlusion may occur. Uveitis, including iritis and iridocyclitis, occurred in 4% of pts. Interstitial lung disease, pneumonitis reported in less than 1% of pts. Grade 3 or 4 hepatotoxicity reported in 3%–6% of pts. Rhabdomyolysis occurs rarely. Serious hemorrhagic events including GI bleeding, rectal bleeding (4% of pts), hematochezia (3% of pts) may occur. Fatal intracranial hemorrhage reported in 2% of pts in the setting of new or progressive brain metastases. Colitis, panniculitis reported in less than 10% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Confirm presence of BRAF V600E or V600K mutation in tumor specimen before initiation. Obtain baseline CBC, BMP, LFT, CPK; pregnancy test in females of reproductive potential. Question history of cardiovascular disease, genetic hypercoagulable conditions, hypersensitivity reactions, HF, pulmonary disease, thrombosis. Obtain echocardiogram for LVEF. Screen for active infection. Verify use of effective contraception in females of reproductive potential. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for cytopenias; LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss); CPK for rhabdomyolysis (amber-colored urine, flank pain, decreased urine output, muscle aches). Assess skin for dermal toxicities. Assess for eye pain/redness, visual changes at each office visit. Assess LVEF by echocardiogram

1 mo after initiation, then q2–3mos thereafter during treatment. If treatment withheld due to change in LVEF, monitor LVEF q2wks. Monitor for symptoms of DVT (leg or arm pain/swelling), PE (chest pain, dyspnea, tachycardia), HF (dyspnea, peripheral edema, palpitations, exercise intolerance). Monitor for GI bleeding, bloody stool; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Obtain ABG, radiologic test if interstitial lung disease or pneumonitis suspected. Diligently screen for infections.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect frequent cardiac function tests, eye exams, skin exams.
- Therapy may cause toxic skin reactions, vision changes, or decrease the heart's ability to pump blood.
- Report GI bleeding such as bloody stools or rectal bleeding.
- Report symptoms of liver problems (bruising, confusion; amber, dark, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); lung problems (severe cough, difficulty breathing, lung pain, shortness of breath), DVT (swelling, pain, hot feeling in the arms or legs; discoloration of extremity), lung embolism (difficulty breathing, chest pain, rapid heart rate), hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision), HF (shortness of breath, palpitations; swelling of legs, ankle, feet); rhabdomyolysis (dark-colored urine, decreased urinary output, fatigue, muscle aches).
- Report any vision changes, eye redness.
- Use effective contraception to avoid pregnancy. Do not breastfeed.

# bisoprolol

**HIGH ALERT**bi-soe-proe-lol  
(Apo-Bisoprolol )**Do not confuse bisoprolol with metoprolol.**

## FIXED-COMBINATION(S)

**Ziac:** bisoprolol/hydroCHLOROthiazide (a diuretic): 2.5 mg/6.25 mg, 5 mg/6.25 mg, 10 mg/6.25 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta<sub>1</sub> selective adrenergic blocker. **CLINICAL:** Antihypertensive.

## USES

Management of hypertension, alone or in combination with other medications.

**OFF-LABEL:** Chronic stable angina pectoris, premature ventricular contractions, supraventricular arrhythmias, HF.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to bisoprolol. Cardiogenic shock, marked sinus bradycardia, overt HF, second- or third-degree heart block (except in pts with pacemaker). **Cautions:** Concurrent use of digoxin, verapamil, diltiazem, HF, history of severe anaphylaxis to allergens, renal/hepatic impairment, hyperthyroidism, diabetes, bronchospastic disease, myasthenia gravis, psychiatric disease, peripheral vascular disease, Raynaud's disease.

## ACTION

Selectively blocks beta<sub>1</sub>-adrenergic receptors. **Therapeutic Effect:** Slows sinus heart rate, decreases B/P.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 26%–33%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 9–12 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery, low-birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase risk of decreased peripheral circulation.

## INTERACTIONS

**DRUG:** Alpha<sub>2</sub> agonists (e.g., clonidine) may increase AV-blocking effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Dronedarone, fingolimod, rivastigmine** may increase bradycardic effect. May increase vasoconstriction of **ergot derivatives** (e.g., dihydroergotamine, ergotamine). **HERBAL:** Herbals with **hypertensive properties** (e.g., licorice, yohimbe) or **hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may alter effects. **St John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase ANA titer, serum BUN, creatinine, potassium, uric acid, lipoproteins, triglycerides.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg once daily. May increase to 10 mg, then to 20 mg once daily. Usual dose: 2.5–10 mg once daily.

### Dosage in Renal Impairment

**CrCl less than 40 mL/min: ADULTS, ELDERLY:** Initially, give 2.5 mg.

**Dosage in Hepatic Impairment**

**Cirrhosis, hepatitis:** Initially, 2.5 mg.

**SIDE EFFECTS**

**Frequent (11%–8%):** Fatigue, headache.

**Occasional (4%–2%):** Dizziness, arthralgia, peripheral edema, URI, rhinitis, pharyngitis, diarrhea, nausea, insomnia. **Rare (less than 2%):** Chest pain, asthenia, dyspnea, vomiting, bradycardia, dry mouth, diaphoresis, decreased libido, impotence.

**ADVERSE EFFECTS/  
TOXIC REACTIONS**

Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremors. May precipitate HF, MI in pts with cardiac disease, thyroid storm in pts with thyrotoxicosis, peripheral ischemia in those with existing peripheral vascular disease. Hypoglycemia may occur in previously controlled diabetes. Thrombocytopenia, unusual bruising/bleeding occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess BUN, serum creatinine; GFR. Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician).

**INTERVENTION/EVALUATION**

Monitor B/P, pulse for quality, irregular rate, bradycardia. Assist with ambulation if dizziness occurs. Assess for peripheral edema. Monitor daily pattern of bowel activity, stool consistency. Assess neurologic status.

**PATIENT/FAMILY TEACHING**

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension.
- If dizziness occurs, sit or lie down immediately.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Take pulse properly before each dose and report excessively slow pulse rate

(less than 60 beats/min). Report numbness of extremities, dizziness. • Do not use nasal decongestants, OTC cold preparations (stimulants) without physician's approval. • Restrict salt, alcohol intake.

**blinatumomab**

**blin-a-toom-oh-mab**  
(Blinicyto)

**BLACK BOX ALERT** Cytokine release syndrome (CRS) or neurologic toxicities, which may be life threatening or fatal, have occurred. Interrupt or discontinue treatment as recommended.

**Do not confuse blinatumomab with ibritumomab or tositumomab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-CD19/CD3 bispecific T-cell engager. Monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL) in adults and children. Treatment of B-cell precursor ALL in first or second complete remission with minimal residual disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to blinatumomab. **Cautions:** Baseline cytopenias; active infection or pts at increased risk of infection (diabetes, indwelling catheters), hepatic/renal impairment, high tumor burden, history of cognitive or seizure disorders, syncope, elderly.

**ACTION**

Binds to CD19 expressed on B cells and CD3 expressed on T cells. Activates endogenous T cells, forming a cytolytic synapse between a cytotoxic T cell and the

cancer target B cell. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis in ALL.

## PHARMACOKINETICS

Widely distributed. Metabolized into small peptides and amino acids via catabolic pathway. Protein binding: Not specified. Steady state reached within 24 hrs. Excretion not specified; negligible amounts excreted in urine. **Half-life:** 2.1 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Avoid pregnancy. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of neurologic toxicities, including cognitive disorder, encephalopathy, confusion, seizure; serious infections, hepatic impairment.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical), vaccines (live)**. May increase adverse effects of **natalizumab, vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease immunoglobulins, Hgb, Hct, neutrophils, leukocytes, platelets; serum albumin, magnesium, phosphate, potassium. May increase serum ALT, AST, bilirubin, GGT, glucose; body weight.

## AVAILABILITY (Rx)

**Injection, Lyophilized Powder for Reconstitution:** 35 mcg/vial.

## ADMINISTRATION/HANDLING

- Hospitalization is recommended for the first 9 days of the first cycle and the first 2 days of the second cycle. For all subsequent cycle starts and reinitiation (e.g., if treat-

ment is interrupted for 4 or more hrs), supervision by a healthcare professional or hospitalization is recommended. • Do not flush infusion line after administration, esp. when changing infusion bags. Flushing of infusion line can result in excess dosage and complications. • At end of infusion, any used solution in IV bag and IV lines should be disposed of in accordance with local requirements.

**Premedication** • Premedicate with dexamethasone 20 mg IV 1 hr prior to the first dose of each cycle, prior to step dose (such as cycle 1 on day 8), or when restarting an infusion after an interruption of 4 or more hrs.

**Reconstitution** • Reconstitution guidelines are highly specific. Infusion bags must be prepared by personnel trained in aseptic preparations and admixing of oncologic drugs following strict environmental specifications at a USP 797 compliant facility using ISO Class 5 laminar flow hood or better. • See manufacturer guidelines for details.

**Rate of administration** • Administer as continuous IV infusion at a constant flow rate using an infusion pump. The pump should be programmable, lockable, nonelastomeric, and have an alarm. • Infusion bags should be infused over 24–48 hrs. Infuse the total 240-mL solution according to the instructions on the pharmacy label of the bag at one of the following constant rates: 10 mL/hr over 24 hrs, or 5 mL/hr over 48 hrs. • Infuse via dedicated line. • Use sterile, nonpyrogenic, low protein-binding, 0.2-micron in-line filter. **Storage** • Refrigerate unused vials and IV solution stabilizer until time of use. • Protect from light. • Do not freeze. • Reconstituted vials may be stored at room temperature up to 4 hrs or refrigerated up to 24 hrs. • Prepared IV bag solutions may be stored at room temperature up to 48 hrs or refrigerated up to 8 days. • If prepared IV bag solution is not administered with the infusion time frame and temperature

indicated, it must be discarded; do not refrigerate again.

## INDICATIONS/ROUTES/DOSAGE

**Note:** See Administration/Handling.

### Acute Lymphoblastic Leukemia (ALL)

**IV: ADULTS, ELDERLY, CHILDREN:** A treatment course consists of up to 2 cycles for induction followed by 3 additional cycles for consolidation and up to 4 additional cycles of continued therapy. Cycles 1–5 consist of 4 wks of continuous IV infusion followed by a 2-wk treatment-free interval. Cycles 6–9 consist of 4 wks of continuous IV infusion followed by an 8-wk treatment-free interval. **PTS WEIGHING 45 KG OR MORE:** (Induction cycle 1): Administer 9 mcg/day on days 1–7, then at 28 mcg/day on days 8–28 as continuous infusion. (Induction cycle 2, consolidation cycles 3–5, continued therapy cycles 6–9): Administer 28 mcg/day on days 1–28. **PTS WEIGHING LESS THAN 45 KG:** (Cycle 1): 5 mcg/m<sup>2</sup>/day (not to exceed 9 mcg/day) on days 1–7 and 15 mcg/m<sup>2</sup>/day (**Maximum:** 28 mcg/day) on days 8–28 as continuous infusion. (Induction cycle 2, consolidation cycles 3–5, continued therapy cycles 6–9): Administer 15 mcg/m<sup>2</sup>/day (**Maximum:** 28 mcg/day) on days 1–28.

### Acute Lymphoblastic Leukemia, Minimal Residual Disease (MRD)-Positive

**IV: ADULTS, ELDERLY, CHILDREN:** A treatment course consists of 1 induction cycle followed by up to 3 additional cycles for consolidation. Each cycle consists of 4 wks of continuous infusion followed by a 2-wk treatment-free interval. **PTS WEIGHING 45 KG OR MORE:** Administer 28 mcg/day on days 1–28. **PTS WEIGHING LESS THAN 45 KG:** Administer 15 mcg/m<sup>2</sup>/day (**Maximum:** 28 mcg/day) on days 1–28.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). **Note:** If interruption after an adverse event is no longer than 7 days, continue the same cycle to a total of 28 days of infusion inclusive of the days

before and after the interruption in that cycle. If interruption due to an adverse event is longer than 7 days, start new cycle.

### Cytokine Release Syndrome

**Grade 3:** Withhold until resolved, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not occur. **Grade 4:** Permanently discontinue.

### Neurological Toxicity

**Grade 3:** Withhold until no more than Grade 1 for at least 3 days, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not recur. If toxicity occurred at 9 mcg/day, or if toxicity takes more than 7 days to resolve, permanently discontinue. **Grade 4:** Permanently discontinue.

### Seizure

Permanently discontinue if more than one seizure occurs.

### Other Clinically Relevant Adverse Reactions

**Grade 3:** Withhold until no more than Grade 1, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not recur. If toxicity takes more than 14 days to resolve, permanently discontinue. **Grade 4:** Consider permanent discontinuation.

### Elevated Hepatic Enzymes

Interrupt treatment if ALT/AST rise to greater than 5 times upper limit of normal (ULN) or bilirubin rises to more than 3 times ULN. Consider dose recommendation as listed in other clinically relevant adverse reactions or as ordered by prescriber.

### Dosage in Renal Impairment

**CrCl equal to or greater than 30 mL/min:** No dose adjustment. **CrCl less than 30 mL/min or hemodialysis:** Not specified; use caution.

### Dosage in Hepatic Impairment

Not specified; use caution. Hepatic toxicity during treatment: see dose modification.

## SIDE EFFECTS

**Frequent (62%–36%):** Pyrexia, headache. **Occasional (25%–5%):** Peripheral edema, nausea, tremor, constipation, diarrhea, cough, fatigue, dyspnea, insomnia, chills, abdominal pain, dizziness, back pain, extremity pain, vomiting, bone pain, chest pain, decreased appetite, arthralgia, hypotension, hypertension, tachycardia, confusion, pares-thesia. **Rare (4%–2%):** Aphasia, memory impairment.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, neutropenia, thrombocytopenia) is an expected outcome of treatment. Cytokine release syndrome (CRS) may be life threatening or fatal. Symptoms of CRS may include asthenia, hypotension, nausea, pyrexia; elevated ALT/AST, bilirubin; disseminated intravascular coagulation (DIC), capillary leak syndrome, hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLH/MAS). Infusion reactions have occurred and may be clinically indistinguishable from CRS. Neurologic toxicities such as altered level of consciousness, balance disorders, confusion, disorientation encephalopathy, seizures, speech disorders, syncope occurred in approx. 50% of pts and may affect ability to drive or operate machinery. Median time to onset of neurologic toxicity was 7 days. CTCAE Grade 3 toxicities or higher occurred in 15% of pts. Serious infections such as opportunistic infections, bacterial/viral/fungal infections, sepsis, pneumonia, catheter-site infections occurred in 25% of pts. Other life-threatening or fatal events may include tumor lysis syndrome, neutropenia/febrile neutropenia, leukoencephalopathy. Medication preparation and administration errors have occurred, resulting in underdose or overdose. Immunogenicity (anti-blinatumomab antibodies) occurred in less than 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, serum magnesium, phosphate, ionized calcium, vital signs. Consider electrolyte correction before starting treatment. Screen for home medications requiring narrow therapeutic index. Screen for active infection, history of seizures, hepatic/renal impairment, cognitive disorders. Verify pregnancy status in women of childbearing potential. Assess plans of breastfeeding. Conduct full neurologic assessment. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, serum electrolytes (correct as indicated), vital signs. Monitor closely for cytokine release syndrome, neurologic toxicities, serious infection, tumor lysis syndrome, hepatic impairment. Keep area around IV site clean to reduce risk of infection. Do not adjust setting of infusion pump. Pump changes may result in dosing errors. Do not flush IV line after infusion completion. Initiate fall precautions. Monitor I&O.

### PATIENT/FAMILY TEACHING

- Treatment may cause life-threatening side effects that must be immediately treated by medical personnel.
- Report symptoms of cytokine release syndrome, such as chills, facial swelling, fever, low blood pressure, nausea, vomiting, weakness; any infusion-related reactions, such as difficulty breathing or skin rash.
- Report any neurologic problems, such as confusion, difficulty speaking or slurred speech, loss of consciousness, loss of balance, or seizures.
- Treatment may lower your white blood cell count and increase your risk of infection. Report any signs of infection, such as fever, cough, fatigue, or burning with urination. Keep area around IV catheter clean at all times to reduce risk of infection.
- Do not change or alter settings on infusion pump, even if the pump alarm sounds. Any changes made to the infusion pump by anyone other than trained medical personnel can result in a dose that is too high or too low and may be life threat-

ening. • Report symptoms of liver problems, such as bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes. • Avoid tasks that require alertness, motor skills until response to drug is established. Do not drive or operate machinery. • Hospitalization is required when starting therapy.

## bortezomib

HIGH  
ALERT

bor-tez-oh-mib  
(Velcade)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Proteasome inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of relapsed or refractory mantle cell lymphoma. Treatment of multiple myeloma. **OFF-LABEL:** Treatment of Waldenström's macroglobulinemia; peripheral or cutaneous T-cell lymphoma; systemic light-chain amyloidosis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to bortezomib, boron, or mannitol; intrathecal administration. **Cautions:** Concomitant use of CYP3A4 inhibitors, history of syncope, concomitant use of antihypertensives; dehydration, diabetes, hepatic impairment, preexisting cardiac disease, neuropathy.

### ACTION

Inhibits proteasomes (enzyme complexes regulating protein homeostasis within the cell). **Therapeutic Effect:** Produces cell-cycle arrest, apoptosis.

### PHARMACOKINETICS

Widely distributed. Protein binding: 83%. Primarily metabolized by enzymatic action. Significant biliary excretion, with lesser amount excreted in urine. **Half-life:** 9–15 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May induce degenerative effects in ovary, degenerative changes in testes. May affect male/female fertility. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of Grade 3 or 4 thrombocytopenia.

### INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., itraconazole, ketoconazole) may increase concentration/toxicity. CYP3A4 inducers (e.g., rifAMPin) may decrease concentration/effect (avoid use). **HERBAL:** Green tea, green tea extracts may diminish effect. St. John's wort may decrease level/effect. Herbs with hypotensive effects (e.g., garlic, ginkgo biloba, ginger) may enhance the hypotensive effect. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May significantly decrease WBC, Hgb, Hct, platelet count, neutrophils.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 3.5 mg.

### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute vial with 3.5 mL 0.9% NaCl to provide a concentration of 1 mg/mL.

**Rate of administration** • Give as bolus IV injection over 3–5 sec.

**Storage** • Store unopened vials at room temperature. • Once reconstituted, solution may be stored at room temperature for up to 3 days or for 5 days if refrigerated.

### SQ

**Reconstitution** • Reconstitute vial with 1.4 mL 0.9% NaCl to provide a concentration of 2.5 mg/mL.

### INDICATIONS/ROUTES/DOSAGE

#### Mantle Cell Lymphoma (Initial Treatment)

**IV; ADULTS, ELDERLY:** 1.3 mg/m<sup>2</sup> days 1, 4, 8, 11 of a 21-day cycle for 6 cycles (in combination with ritUXimab, cyclophosphamide,

DOXOrubicin, and predniSONE). If response is seen at cycle 6, may continue for 2 additional cycles.

#### Mantle Cell Lymphoma (Relapsed)

**IV, SQ: ADULTS, ELDERLY:** Treatment cycle consists of 1.3 mg/m<sup>2</sup> twice wkly on days 1, 4, 8, and 11 for 2 wks of a 21-day treatment for 8 cycles. Therapy extending beyond 8 cycles may be given by standard schedule.

#### Multiple Myeloma (Initial Treatment)

**IV, SQ: ADULTS, ELDERLY:** (with melphalan and predniSONE) 1.3 mg/m<sup>2</sup> on days 1, 4, 8, 11, 22, 25, 29, 32 of a 42-day cycle for 4 cycles, then 1.3 mg/m<sup>2</sup> on days 1, 8, 22, 29 of a 42-day cycle for 5 cycles.

#### Multiple Myeloma (Relapsed)

**IV, SQ: ADULTS, ELDERLY:** 1.3 mg/m<sup>2</sup> twice wkly for 2 wks on days 1, 4, 8, 11 of a 21-day treatment cycle for up to 17 cycles.

#### Dosage Adjustment Guidelines

Withhold therapy at onset of CTCAE Grade 3 nonhematologic or Grade 4 hematologic toxicities, excluding neuropathy. When symptoms resolve, resume therapy at a 25% reduced dosage.

#### Dosage Adjustment Guidelines With Neuropathic Pain, Peripheral Sensory Neuropathy

For CTCAE Grade 1 toxicity with pain or Grade 2 (interfering with function but not activities of daily living [ADL]), 1 mg/m<sup>2</sup>. For Grade 2 toxicity with pain or Grade 3 (interfering with ADL), withhold drug until toxicity is resolved, then reinstate with 0.7 mg/m<sup>2</sup>. For Grade 4 toxicity (permanent sensory loss that interferes with function), discontinue bortezomib.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild impairment:** No initial adjustment.  
**Moderate (bilirubin greater than 1.5–3 times upper limit of normal [ULN]) to severe (bilirubin greater than 3 times**

**ULN) impairment:** Decrease initial dose to 0.7 mg/m<sup>2</sup> (based on tolerance may increase to 1 mg/m<sup>2</sup> or decrease to 0.5 mg/m<sup>2</sup>).

#### SIDE EFFECTS

**Expected (65%–36%):** Fatigue, malaise, asthenia, nausea, diarrhea, anorexia, constipation, fever, vomiting. **Frequent (28%–21%):** Headache, insomnia, arthralgia, limb pain, edema, paresthesia, dizziness, rash. **Occasional (18%–11%):** Dehydration, cough, anxiety, bone pain, muscle cramps, myalgia, back pain, abdominal pain, taste alteration, dyspepsia, pruritus, hypotension (including orthostatic hypotension), rigors, blurred vision.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Thrombocytopenia occurs in 40% of pts. GI, intracerebral hemorrhage are associated with drug-induced thrombocytopenia. Anemia occurs in 32% of pts. New onset or worsening of existing neuropathy occurs in 37% of pts. Symptoms may improve in some pts upon drug discontinuation. Pneumonia occurs occasionally.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain CBC. Ensure adequate hydration prior to initiation of therapy. Antiemetics, antidiarrheals may be effective in preventing, treating nausea, vomiting, diarrhea. Offer emotional support.

##### INTERVENTION/EVALUATION

Routinely assess B/P; monitor pt for orthostatic hypotension. Maintain strict I&O. Monitor CBC, esp. platelet count, throughout treatment. Monitor renal, hepatic, pulmonary function throughout therapy. Encourage adequate fluid intake to prevent dehydration. Monitor temperature and be alert to high potential for fever. Monitor for peripheral neuropathy (burning sensation, neuropathic pain, paresthesia, hyperesthesia). Avoid IM injections, rectal temperatures, other traumas that may induce bleeding.

**PATIENT/FAMILY TEACHING**

- Report new/worsening vomiting, bruising/bleeding, breathing difficulties.
- Discuss importance of pregnancy testing, avoidance of pregnancy, measures to prevent pregnancy.
- Increase fluid intake.
- Avoid tasks that require mental alertness, motor skills until response to drug is established.

**bosutinib**

boe-sue-ti-nib  
(Bosulif)

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** BCR-ABL tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of chronic, accelerated, or blast phase Philadelphia chromosome-positive chronic myelogenous leukemia (Ph+CML) with resistance or intolerance to prior therapy. Treatment of newly diagnosed chronic phase Ph+CML.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to bosutinib. **Cautions:** Baseline cytopenias; hepatic impairment, recent diarrhea, pulmonary edema, HF, fluid retention. History of pancreatitis, moderate to severe renal impairment. Avoid concurrent use of CYP3A4 inducers/inhibitors.

**ACTION**

Inhibits Bcr-Abl tyrosine kinase, a translocation-created enzyme, created by the Philadelphia chromosome abnormality noted in chronic myelogenous leukemia (CML). Inhibits Src-family kinase, including Src, Lyn, and Hck. **Therapeutic Effect:** Inhibits tumor cell growth and proliferation in chronic, accelerated, or blast phase CML.

**PHARMACOKINETICS**

Well absorbed following oral administration. Protein binding: 94%. Metabolized in liver. Excreted in feces (91%), urine (3%). **Half-life:** 22.5 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A inhibitors and/or P-glycoprotein (P-gp) inhibitors (e.g., clarithromycin, ketoconazole, ritonavir, miSOPROStol, nafcillin, salmeterol), moderate CYP3A4 inhibitors (e.g., ciprofloxacin, diltiazem, erythromycin, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., rifampin, phenytoin, PHENobarbital), moderate CYP3A4 inducers (e.g., bosentan, nafcillin, modafinil) may decrease concentration/effect. Proton pump inhibitors (e.g., omeprazole, pantoprazole) may reduce absorption, concentration. **HERBAL:** St. John's wort may decrease effectiveness. Bitter orange, pomegranate, star fruit may increase concentration/effect. **FOOD:** Grapefruit products may decrease concentration/effect. **LAB VALUES:** May decrease Hgb, platelets, WBCs, serum phosphate. May increase serum ALT, AST, bilirubin, lipase.

**AVAILABILITY (Rx)**

 **Tablets:** 100 mg, 400 mg, 500 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with food. Do not break, crush, dissolve, or divide tablets.

## INDICATIONS/ROUTES/DOSAGE

### Ph+CML (Resistant or Intolerant to Prior Therapy)

**PO: ADULTS, ELDERLY:** 500 mg once daily. Continue until disease progression or unacceptable toxicity. If complete hematologic response not achieved by wk 8 or complete cytogenetic response not achieved by wk 12, in absence of Grade 3 or higher adverse reactions, may increase to 600 mg once daily.

### Ph+CML (Newly Diagnosed Chronic Phase)

**PO: ADULTS, ELDERLY:** 400 mg once daily. Continue until disease progression or unacceptable toxicity.

### CML With Baseline Renal Impairment

**Ph+CML (intolerant): CrCl less than 30 mL/min:** 300 mg once daily. **CrCl 30–50 mL/min:** 400 mg once daily. **Ph+CML (newly diagnosed): CrCl less than 30 mL/min:** 200 mg once daily. **CrCl 30–50 mL/min:** 300 mg once daily.

### CML With Baseline Hepatic Impairment

**PO: ADULTS:** 200 mg once daily with food.

### Dosage Modification

**Hepatotoxicity:** Withhold treatment until serum ALT, AST less than or equal to 2.5 times ULN. Then, resume at 400 mg once daily with food. Discontinue if recovery lasts longer than 4 wks or hepatotoxicity, including elevated serum bilirubin levels greater than 2 times ULN. **Severe diarrhea:** Withhold until recovery to low-grade diarrhea. Then, resume at 400 mg once daily with food. **Myelosuppression:** Withhold until absolute neutrophil count greater than 1,000 cells/mm<sup>3</sup> and platelet count greater than 50,000 cells/mm<sup>3</sup>. Then, resume at same dose if recovery occurs within 2 wks. May reduce dose to 400 mg for recovery lasting greater than 2 wks.

## SIDE EFFECTS

**Frequent (82%–35%):** Diarrhea, nausea, vomiting, abdominal pain, rash.

**Occasional (26%–10%):** Pyrexia, fatigue,

headache, cough, peripheral edema, arthralgia, anorexia, upper respiratory infection, asthenia, back pain, nasopharyngitis, dizziness, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Severe fluid retention may result in pleural effusion, pericardial effusion, pulmonary edema, ascites. Neutropenia, thrombocytopenia, anemia is an expected response of drug therapy. Severe diarrhea may result in fluid loss, electrolyte imbalance, hypotension. Hepatotoxicity occurred in 7%–9% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential, baseline weight. Obtain full medication history, including vitamins, herbal products. Screen for peripheral edema, signs/symptoms of HE, anemia. Offer emotional support.

### INTERVENTION/EVALUATION

Weigh daily and monitor for unexpected rapid weight gain, edema. Monitor for changes in serum electrolytes, LFT during treatment. Offer antiemetics for nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Monitor CBC for neutropenia, thrombocytopenia, anemia. Assess for bruising, hematuria, jaundice, right upper abdominal pain, weight loss, or acute infection (fever, diaphoresis, lethargy, productive cough).

### PATIENT/FAMILY TEACHING

- Take with meals.
- Drink plenty of fluids (diarrhea may result in dehydration).
- Swallow whole; do not break, chew, crush, dissolve, or divide tablets.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report urine changes, bloody or clay-colored stools, upper abdominal pain, nausea, vomiting, bruising, persistent diarrhea, fever, cough, difficulty breathing, chest pain.
- Immediately report any newly prescribed medica-

tions. • Avoid alcohol, grapefruit products. • Discuss using antacids for indigestion, heartburn, upset stomach (omeprazole, lansoprazole, pantoprazole may reduce absorption, concentration of bosutinib). • Separate antacid dosing by more than 2 hrs before and after medication.

## brentuximab vedotin

bren-tux-i-mab ve-doe-tin  
(Adcetris)

■ **BLACK BOX ALERT** ■ JC virus infection resulting in progressive multifocal leukoencephalopathy and death can occur.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Monoclonal antibody, anti-CD30. **CLINICAL:** Antineoplastic.

### USES

Treatment of relapsed or refractory classical Hodgkin's lymphoma after failure of autologous hematopoietic stem cell transplant (HSCT) or after failure of at least two prior multiagent chemotherapy regimens or in pts who are not transplant candidates. Treatment of classical Hodgkin's lymphoma, previously untreated stage III or IV. Treatment of classical Hodgkin's lymphoma in pts at high risk of relapse or progression as post autologous HSCT consolidation. Treatment of systemic anaplastic large-cell lymphoma (ALCL) after failure of at least one prior multiagent chemotherapy regimen. Treatment of previously untreated systemic ALCL, peripheral T-cell lymphoma (CD30-expressing) in combination with cyclophosphamide, DOXorubicin, and predniSONE. Treatment of primary cutaneous ALCL in pts receiving prior systemic therapy. Treatment of CD30-expressing mycosis fungoides.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to brentuximab. Avoid use with bleomycin (increased risk for pulmonary toxicity).

**Cautions:** Renal/hepatic impairment, peripheral neuropathy, infusion reactions, neutropenia, tumor lysis syndrome, Stevens-Johnson syndrome, pregnancy.

### ACTION

Binds to CD30-expressing cells, allowing the antibody to direct the drug to a target on lymphoma cells, disrupting the microtubule network within the cell. **Therapeutic Effect:** Induces cell cycle arrest, cell death.

### PHARMACOKINETICS

Minimally metabolized. Protein binding: 68%–82%. Excreted primarily in feces (72%). **Half-life:** 4–6 days.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm (embryo-fetal toxicities). Unknown if distributed in breast milk. **Children/Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, ketoconazole) may increase concentration/effect. CYP3A4 inducers (e.g., rifAMPin) may reduce concentration/effect. May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of belimumab, bleomycin, natalizumab, vaccines (live). **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, WBC, RBC, platelets. May increase serum bicarbonate, lactate dehydrogenase, glucose, albumin, magnesium, sodium.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 50-mg single-use vial.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute each 50-mg vial with 10.5 mL Sterile Water for Injection, directing the stream toward wall of vial and not at powder. • Gently swirl (do not shake). • This will yield a concentration of 5 mg/mL. • The dose for pts weighing over 100 kg should be calculated for 100 kg. • Reconstituted solution must be transferred to infusion bag with a minimum 100 mL diluent, yielding a final concentration of 0.4–1.8 mg/mL brentuximab. • Gently invert bag to mix solution.

**Rate of administration** • Infuse over 30 min.

**Storage** • Discard if solution contains particulate or is discolored; solution should appear clear to slightly opalescent, colorless. • May store solution at 36°–46°F. • Use within 24 hrs after reconstitution.

**IV COMPATIBILITIES**

0.9% NaCl, D<sub>5</sub>W, lactated Ringer's.

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Do not give by IV bolus or IV push.

**Hodgkin's Lymphoma (Relapsed or Refractory)**

**IV infusion: ADULTS, ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min q3wks. Continue treatment until disease progression or unacceptable toxicity.

**Hodgkin's Lymphoma (After HSCT)**

**IV infusion: ADULTS/ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min every 3 wks. Continue treatment until a maximum of 16 cycles, disease progression, or unacceptable toxicity occurs. Begin within 4–6 wks post HSCT or upon recovery from HSCT.

**Hodgkin's Lymphoma (Previously Untreated)**

**IV infusion: ADULTS, ELDERLY:** 1.2 mg/kg (**Maximum:** 120 mg) q2wks (in combination with doxorubicin, vinblastine, and dacarbazine [AVD]). Begin within 1 hr after completion of AVD until a maximum of 12 doses, disease progression, or unacceptable toxicity occurs.

**Mycosis Fungoides**

**IV infusion: ADULTS, ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) q3wks. Continue until a maximum of 16 cycles, disease progression, or unacceptable toxicity.

**Systemic Anaplastic Large-Cell Lymphoma (ALCL) (Relapsed)**

**IV infusion: ADULTS/ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min q3wks. Continue treatment until disease progression or unacceptable toxicity occurs.

**Systemic ALCL, Peripheral T-Cell Lymphoma (CD30-Expressing) (Previously Untreated)**

**IV infusion: ADULTS/ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) q3wks for 6–8 doses (in combination with cyclophosphamide, DOXOrubicin, and predniSONE).

**Primary Cutaneous ALCL (Relapsed)**

**IV infusion: ADULTS/ELDERLY:** 1.8 mg/kg (**Maximum:** 180 mg) q3wks for up to 16 cycles.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** Avoid use.

**Dosage in Hepatic Impairment**

**Mild impairment:** Initial dose 1.2 mg/kg (**Maximum:** 120 mg) q3wks. **Moderate to severe impairment:** Avoid use.

**SIDE EFFECTS**

**◀ALERT▶** Effects present as mild, manageable.

**Frequent (52%–22%):** Peripheral neuropathy, fatigue, respiratory tract infection,

nausea, diarrhea, fever, rash, abdominal pain, cough, vomiting. **Occasional (19%–11%):** Headache, dizziness, constipation, chills, bone/muscle pain, insomnia, peripheral edema, alopecia. **Rare (10%–5%):** Anxiety, muscle spasm, decreased appetite, dry skin.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression characterized as neutropenia (54% of pts), peripheral neuropathy (52% of pts), thrombocytopenia (28% of pts), anemia (19% of pts) have occurred. Infusion reactions (including anaphylaxis), Stevens-Johnson syndrome have been reported. Tumor lysis syndrome may lead to acute renal failure. Progressive multifocal leukoencephalopathy (changes in mood, confusion, loss of memory, decreased strength or weakness on one side of body, changes in speech, walking, and vision) has been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC prior to initiation and before each dosing cycle. Question for evidence of peripheral neuropathy (hypoesthesia, hyperesthesia, paresthesia, burning sensation, neuropathic pain or weakness). Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC as clinically indicated. Offer antiemetics to control nausea, vomiting. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, bruising, unusual bleeding), symptoms of anemia (excessive fatigue, weakness). Monitor and report nausea, vomiting, diarrhea. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash. Pts experiencing new or worsening neuropathy may require a delay, dose change, or discontinuation of treatment.

### PATIENT/FAMILY TEACHING

- Treatment may depress immune system response and reduce ability to fight

infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool). • Do not receive immunizations without physician's approval (drug lowers body resistance). • Report neurologic changes, neuropathy, or stroke-like symptoms (confusion, difficulty speaking, altered gait).

## brexpiprazole

brex-**pip**-ra-zole  
(Rexulti)

■ **BLACK BOX ALERT** ■ Elderly pts with dementia-related psychosis are at increased risk of death, mainly due to HF, pneumonia. Increased risk of suicidal thoughts and behaviors in patients aged 24 yrs and younger with major depression, other psychiatric disorders.

**Do not confuse brexpiprazole with ARIPIprazole, esomeprazole, omeprazole, or pantoprazole, or RABEprazole.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DOPa-mine agonist. **CLINICAL:** Second-generation (atypical) antipsychotic agent.

## USES

Adjunctive therapy to antidepressants for the treatment of major depressive disorder. Treatment of schizophrenia. **OFF-LABEL:** Psychosis/agitation associated with dementia.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to brexpiprazole. **Cautions:** Concurrent use of CNS depressants (including alcohol), antihypertensives; disorders in which

CNS depression is a feature; cardiovascular or cerebrovascular disease (may induce hypotension), Parkinson's disease, Parkinson's disease dementia, Lewy body dementia, history of seizures or conditions that may lower seizure threshold (Alzheimer's disease). Pts at risk for aspiration pneumonia, elderly, HF, diabetes. Pts at high risk for suicide. Preexisting low WBC/ANC, history of drug-induced leukopenia/neutropenia, dehydration.

## ACTION

Provides partial agonist activity at DOPamine and serotonin (5-HT<sub>1A</sub>) receptors and antagonist activity at serotonin (5-HT<sub>2A</sub>) receptors. **Therapeutic Effect:** Diminishes schizophrenic, depressive behavior.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 4 hrs. Steady state reached in 10–12 days. Excreted in urine (25%), feces (46%). **Half-life:** 86–91 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May cause extrapyramidal and/or withdrawal symptoms in neonates if given in third trimester. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk for adverse effects due to age-related hepatic, renal, cardiac disease. May increase risk of death in elderly pts with dementia-related psychosis.

## INTERACTIONS

**DRUG:** Alcohol may potentiate cognitive and motor effects. **Strong CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., itraconazole, ketoconazole), **strong CYP2D6 inhibitors** (e.g., fluoxetine, paroxetine) may increase concentration/effect. **Metoclopramide** may increase adverse effects. **HERBAL:** St John's wort

may decrease concentration. **Gotu kola, kava kava, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease leukocytes, neutrophils. May increase serum blood glucose, lipid levels.

## AVAILABILITY (Rx)

**Tablets:** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Major Depressive Disorder (MDD)

**PO: ADULTS, ELDERLY:** Initially, 0.5–1 mg once daily. May increase at weekly intervals up to 1 mg (if initial dose is 0.5 mg) once daily, then up to target dose of 2 mg once daily. **Maximum:** 3 mg once daily.

### Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 1 mg once daily on days 1–4. May increase to 2 mg once daily on days 5–7, then to 4 mg once daily on day 8 based on clinical response and tolerability. **Maximum:** 4 mg once daily.

### Dosage in Renal Impairment

**CrCl less than 60 mL/min: Maximum:** 2 mg once daily for MDD, or 3 mg once daily for schizophrenia.

### Dosage in Hepatic Impairment

**Maximum:** 2 mg once daily for MDD, or 3 mg once daily for schizophrenia.

**CYP2D6 poor metabolizers or pts taking strong CYP2D6 inhibitors or strong CYP3A4 inhibitors:** Administer half of the usual dose. **CYP2D6 poor metabolizers taking strong/moderate CYP3A4 inhibitors or pts taking strong/moderate CYP2D6 inhibitors with strong/moderate CYP3A4 inhibitors:** Administer a quarter of the usual dose. **Pts taking strong CYP3A4 inducers:** Double the usual dose over 1–2 wks.

## SIDE EFFECTS

**Occasional (9%–4%):** Headache, nasopharyngitis, dyspepsia, akathisia, somnolence, tremor. **Rare (3%–1%):** Constipation, fatigue, increased appetite, weight gain, anxiety, restlessness, dizziness, diarrhea, blurry vision, dry mouth, salivary hypersecretion, abdominal pain, flatulence, myalgia, abnormal dreams, insomnia, hyperhidrosis.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of death in elderly pts with dementia-related psychosis. Most deaths appeared to be cardiovascular (e.g., HF, sudden death) or infectious (e.g., pneumonia) in nature. Increased incidence of suicidal thoughts and behaviors in pts 24 yrs and younger was reported. May increase risk of neuroleptic malignant syndrome (NMS). Symptoms of NMS may include hyperpyrexia, muscle rigidity, altered mental status, autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac dysrhythmia), elevated creatinine, phosphokinase, myoglobinuria (rhabdomyolysis), acute renal failure. Metabolic changes such as hyperglycemia, ketoacidosis, hyperosmolar coma, diabetes, dyslipidemia, dystonia, and weight gain may occur. Other adverse effects may include leukopenia, neutropenia, agranulocytosis, orthostatic hypotension, syncope, cerebrovascular events (e.g., CVA, transient ischemic attack), seizures, hyperthermia, dysphagia, cognitive or motor impairment, tardive dyskinesia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, capillary blood glucose, vital signs; CBC in pts with preexisting low WBC or history of leukopenia or neutropenia. Receive full medication history and screen for drug interactions. Assess behavior, appearance, emotional state, response to environment, speech pattern, thought content. Correct dehydration, hypovolemia. Assess for suicidal

tendencies, history of dementia-related psychosis, HF, CVA, NMS, diabetes.

### INTERVENTION/EVALUATION

Monitor weight, BMP, capillary blood glucose, vital signs. Diligently monitor for extrapyramidal symptoms, tardive dyskinesia, hypotension, syncope, cerebrovascular or cardiovascular dysfunction, NMS. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

### PATIENT/FAMILY TEACHING

- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, abnormal changes in behavior.
- Treatment may cause life-threatening conditions such as involuntary, uncontrollable movements, elevated body temperature, altered mental status, high or low blood pressure, seizures.
- Pts with HF or active pneumonia are at increased risk of sudden death.
- Immediately report fever, cough, increased sputum production, palpitations, fainting, or signs of HF.

## brigatinib

bri-ga-ti-nib  
(Alunbrig)

**Do not confuse brigatinib with axitinib, cabozantinib, ceritinib, crizotinib, erlotinib, imatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anaplastic lymphoma tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

First-line treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small-cell lung cancer (NSCLC).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to brigatinib. **Cautions:** Baseline cytopenias. History of symptomatic bradycardia, bradyarrhythmias, diabetes, hepatic/renal impairment, hypertension, ocular disease, pancreatitis, pulmonary disease. Concomitant use of strong CYP3A inhibitors, beta blockers, calcium channel blockers (see Interactions).

## ACTION

A broad-spectrum kinase inhibitor (activity against EGFR, ALK, ROSI, IGF-1R and FLT-3). Inhibits ALK downstream signaling proteins. Has activity against cells expressing EML4-ALK. **Therapeutic Effect:** Expresses anti-tumor activity against EML-ALK mutant forms shown in NSCLC in pts progressed with crizotinib.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 66%. Peak plasma concentration: 1–4 hrs. Excreted in feces (65%), urine (25%). **Half-life:** 25 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective nonhormonal contraception during treatment and for at least 4 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential should use barrier methods during sexual activity during treatment for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers**

(e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease effectiveness of hormonal contraceptives. Concomitant use of **beta blockers** (e.g., atenolol, carvedilol, metoprolol), **calcium channel blockers** (e.g., diltiazem, verapamil), **digoxin** may increase risk of symptomatic bradycardia. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, amylase, bilirubin, CPK, glucose, lipase. May decrease Hct, Hgb, lymphocytes, RBCs; serum phosphate. May prolong aPTT.

## AVAILABILITY (Rx)

**Tablets:** 30 mg, 90 mg, 180 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with or without food.
- Administer tablets whole; do not break, crush, cut, or divide.
- If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

## INDICATIONS/ROUTES/DOSAGE

**Non-Small-Cell Lung Cancer (Metastatic, ALK-Positive)**

**PO: ADULTS, ELDERLY:** 90 mg once daily for 7 days. If 90-mg dose is tolerated, then increase to 180 mg once daily. Continue until disease progression or unacceptable toxicity. **Note:** If treatment is interrupted for 14 days (or more) for reasons other than toxic reactions, restart at 90 mg once daily for 7 days before increasing to the dose that was previously tolerated.

### Dose Reduction Schedule

**First dose reduction: 90 MG ONCE DAILY:** Reduce to 60 mg once daily. **180 MG ONCE DAILY:** Reduce to 120 mg once daily. **Second dose reduction: 90 MG ONCE DAILY:** Permanently discontinue. **180 MG**

**ONCE DAILY:** Reduce to 90 mg once daily. **Third dose reduction: 90 MG ONCE DAILY:** N/A. **180 MG ONCE DAILY:** Reduce to 60 mg once daily. **Note:** Once dose has been reduced, do not subsequently increase dose. If pt is unable to tolerate 60-mg dose, permanently discontinue.

#### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

#### Symptomatic Bradycardia

Withhold treatment until recovery to asymptomatic bradycardia or to a heart rate of 60 bpm or greater, then resume at reduced dose level (if pt not taking concomitant medications known to cause bradycardia). **Symptomatic bradycardia in pts taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at same dose. If concomitant medication cannot be adjusted or discontinued, then resume at reduced dose level. **Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia:** Permanently discontinue. **Life-threatening bradycardia in pts who are taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at reduced dose level with frequent monitoring. Permanently discontinue if symptomatic bradycardia recurs despite dose reduction.

#### CPK Elevation

**Grade 3 CPK elevation (greater than 5 times upper limit of normal [ULN]):** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at same dose.

**Grade 4 CPK elevation (greater than 10 times ULN) or recurrence of Grade 3 CPK elevation:** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at reduced dose level.

#### Hyperglycemia

**Grade 3 serum glucose elevation (greater than 250 mg/dL or 13.9 mmol/L):** If adequate medical management of hyperglycemia cannot be achieved, withhold treatment until adequately controlled. Consider dose reduction or permanent discontinuation.

#### Hypertension

**Grade 3 hypertension (systolic B/P greater than or equal to 160 mm Hg or diastolic B/P greater than or equal to 100 mm Hg); concomitant use of more than one antihypertensive drug; required medical intervention; requirement of aggressive hypertensive therapy:** Withhold treatment until recovery to Grade 1 or 0, then resume at reduced dose level. **Grade 4 hypertension (first occurrence) or recurrence of Grade 3 hypertension:** Withhold treatment until recovery to Grade 1 or 0, then either resume at reduced dose level or permanently discontinue. **Recurrence of Grade 4 hypertension:** Permanently discontinue.

#### Lipase/Amylase Elevation

**Grade 3 serum amylase or lipase elevation (greater than 2 times upper limit of normal [ULN]):** Withhold treatment until recovery to Grade 1 or 0 (or baseline), then resume at same dose. **Grade 4 serum amylase or lipase elevation (greater than 5 times ULN) or recurrence of Grade 3 serum lipase or amylase elevation:** Withhold treatment until recovery to Grade 1 or 0, then resume at reduced dose level.

**Pulmonary Toxicity**

**Grade 1 pulmonary symptoms during the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at same dose level. Do not increase dose if interstitial lung disease (ILD)/pneumonitis suspected. **Grade 1 pulmonary symptoms after the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at same dose level. **Grade 2 pulmonary symptoms during the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at reduced dose level. Do not increase dose if ILD/pneumonitis suspected. **Grade 2 pulmonary symptoms after the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at same dose level. If ILD/pneumonitis is suspected, resume at reduced dose level. With any recurrence of ILD/pneumonitis or any Grade 3 or 4 pulmonary symptoms, permanently discontinue.

**Visual Disturbance**

**Grade 2 or 3 visual disturbance:** Withhold treatment until recovery to baseline, then resume at reduced dose level. **Grade 4 visual disturbance:** Permanently discontinue.

**Other Toxicities**

**Any other Grade 3 toxicity:** Withhold treatment until recovery to baseline, then resume at same dose level. **Recurrence of any other Grade 3 toxicity:** Withhold treatment until recovery to baseline, then either resume at reduced dose level or permanently discontinue. **First occurrence of any other Grade 4 toxicity:** Withhold treatment until recovery to baseline, then either resume at reduced dose level or permanently discontinue. **Recurrence of any other Grade 4 toxicity:** Permanently discontinue. **Concomitant use of strong CYP3A inhibitors:** Reduce daily dose by 50% if strong CYP3A inhibitor cannot be discontinued. If strong CYP3A inhibitor is

discontinued, then resume the dose that was previously tolerated before starting CYP3A inhibitor.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (33%–19%):** Nausea, fatigue, headache, dyspnea, vomiting, decreased appetite, diarrhea, constipation. **Occasional (18%–9%):** Cough, abdominal pain, rash (acneiform dermatitis, exfoliative rash, pruritic rash, pustular rash), pyrexia, arthralgia, peripheral neuropathy, muscle spasm, extremity pain, hypertension, back pain, myalgia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, leukopenia are expected responses to therapy. Serious events, such as ILD/pneumonitis (3%–9% of pts), hypertension (6%–21% of pts), symptomatic bradycardia (6%–7% of pts), visual disturbance (blurred vision, diplopia, reduced visual acuity, macular edema, vitreous floaters, visual field defect, vitreous detachment, cataract [7%–10% of pts]), CPK elevation (27%–48% of pts), pancreatic enzyme elevation (27%–39%), hyperglycemia (43% of pts), may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Obtain baseline ECG in pts with history of arrhythmia, HE. Question plans for breast-feeding. Question history of hepatic/renal impairment, diabetes, cardiac/pulmonary disease, hypertension, pancreatitis. Receive full medication history and screen

for interactions. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation. Obtain nutritional consult. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC, CPK, BMP, LFT; vital signs (esp. heart rate) periodically. Obtain serum amylase, lipase in pts with severe abdominal pain, nausea, periumbilical ecchymosis (Cullen's sign), flank ecchymosis (Grey Turner's sign). Monitor for hepatotoxicity, hyperglycemia, vision changes, myalgia, musculoskeletal pain, interstitial lung disease/pneumonitis. If treatment-related toxicities occur, consider referral to specialist; pt may require treatment with corticosteroids. Screen for acute infections. Monitor I&O, hydration status, stool frequency and consistency. Encourage proper calorie intake and nutrition. Assess skin for rash, lesions.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection, such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Therapy may decrease your heart rate, which may be life threatening; report dizziness, chest pain, palpitations, or fainting.
- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report abdominal pain, bruising around belly button or flank bruising, black/tarry stools, dark-colored urine, decreased urine output, severe muscle aches, yellowing of the skin or eyes.
- Do not take newly prescribed medication unless approved by the doctor who originally started treatment.
- Do not ingest grapefruit products.

## brivaracetam

briv-a-ra-se-tam  
(Briviact, Brivlera )

**Do not confuse brivaracetam with levETIRAcetam.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synaptic vesicle protein 2A ligand. **CLINICAL:** Anticonvulsant, miscellaneous.

#### USES

**PO:** Monotherapy or adjunctive therapy in the treatment of partial-onset seizures in pts 1 mo and older with epilepsy.

**IV:** Treatment in pts 16 yrs and older.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to brivaracetam. **Cautions:** Baseline neutropenia, hepatic impairment; pts at high risk for suicide; history of depression, mood disorder, psychiatric disorder; history of drug abuse.

#### ACTION

Exact mechanism unknown. Has high affinity for synaptic vesicle protein 2A in the brain. **Therapeutic Effect:** Prevents seizure activity.

#### PHARMACOKINETICS

Widely distributed. Metabolized primarily by enzymatic hydrolysis, mediated by hepatic and extrahepatic amidase. Protein binding: less than or equal to 20%. Peak plasma concentration: 1 hr. Primarily excreted in urine (95%). **Half-life:** 9 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** Not specified; use caution.

## INTERACTIONS

**DRUG:** RifAMPin may decrease concentration/effect. May increase concentration/effect of carBAMazepine. **CNS depressants** (e.g., alcohol, morphine, oxycodone, zolpidem) may increase CNS depressant effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, WBCs. May increase serum phenytoin (free and total) levels.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg. **Oral Solution:** 10 mg/mL. **Injection Solution:** 50 mg/5 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Visually inspect for particulate matter or discoloration. Do not use if particulate matter or discoloration observed. • May be given without further dilution or may be mixed with 0.9% NaCl, 5% dextrose injection.

**Rate of administration** • Give over 2–15 min.

**Storage** • Injection solution should appear clear and colorless. • Diluted solution should not be stored more than 4 hrs at room temperature. Do not freeze.

### PO

• Give without regard to food. • Administer tablets whole; do not crush, cut, dissolve, or divide. • Oral solution should appear slightly viscous, clear, colorless to yellowish in color, and have a raspberry flavor. • Store oral solution at room temperature. • Discard unused oral solution remaining after 5 mos of first opening bottle. • Do not freeze oral solution. Oral solution should be delivered using calibrated measuring device (does not require dilution). May give oral solution via nasogastric tube or gastrostomy tube.

## INDICATIONS/ROUTES/DOSAGE

### Partial-Onset Seizures (Monotherapy or Adjunctive Therapy)

**PO/IV: ADULTS, ADOLESCENTS 16 YRS AND OLDER:** Initially, 50 mg twice daily. May either decrease to 25 mg twice daily or increase to 100 mg twice daily. **Maintenance:** 25–100 mg twice daily. **Maximum:** 200 mg/day. When initiating treatment, gradual dose escalation is not required. Injection solution should be administered at same dose and same frequency as tablets and oral solution. Gradually taper dose to discontinue treatment (50 mg/day on a weekly basis with final week of treatment at dose of 20 mg/day). **ELDERLY:** Consider initiating at lower end of the dosage range. **PO: CHILDREN 4–15 YRS WEIGHING 50 KG OR MORE:** Initially, 25–50 mg twice daily. May increase up to maximum of 100 mg twice daily. **WEIGHING 20–49 KG:** Initially, 0.5–1 mg/kg twice daily. May increase up to maximum of 2 mg/kg twice daily. **WEIGHING 11–19 KG:** Initially, 0.5–1.25 mg/kg twice daily. May increase up to maximum of 2.5 mg/kg twice daily. **WEIGHING LESS THAN 11 KG:** Initially, 0.75–1.5 mg/kg twice daily. May increase up to maximum of 3 mg/kg twice daily.

### Dose Modification

**Concomitant use with rifAMPin:** May need to increase brivaracetam dosage by 100% (double dose).

### Dosage in Renal Impairment

No dosage adjustment. Not recommended in pts with ESRD undergoing dialysis (not studied).

### Dosage in Hepatic Impairment

**Mild to severe impairment:** Initially, 25 mg twice daily. **Maintenance:** 25–75 mg twice daily. **Maximum:** 75 mg twice daily.

## SIDE EFFECTS

**Occasional (16%–9%):** Somnolence, sedation, dizziness, fatigue. **Rare (5%–2%):** Nausea, vomiting, ataxia, balance disorder,

abnormal coordination, nystagmus, irritability, constipation.

### ADVERSE EFFECTS/TOXIC REACTIONS

Sudden discontinuation may increase risk of seizure frequency and status epilepticus. May increase risk of suicidal thoughts or behavior. Psychiatric events including nonpsychotic behavior (anger, agitation, aggression, anxiety, apathy, depression, hyperactivity, irritability, mood swings, nervousness, restlessness, tearfulness) and psychotic symptoms (psychotic behavior with acute psychosis, delirium, hallucinations, paranoia) occurred in 13% of pts. Hypersensitivity reactions including bronchospasm, angioedema were reported. Clinically significant decreased WBC count (less than 3,000 cells/mm<sup>3</sup>) and decreased neutrophil count (less than 1,000 cells/mm<sup>3</sup>) occurred in 1.8% and 0.3% of pts, respectively.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC in pts with baseline neutropenia. Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions, fall precautions. Question history of hypersensitivity reaction, hepatic impairment, psychiatric disorder; history of suicidal thoughts or behavior. Obtain urine pregnancy in female pts of reproductive potential.

#### INTERVENTION/EVALUATION

Periodically monitor CBC in pts with neutropenia. Monitor phenytoin levels in pts taking concomitant phenytoin (treatment may increase phenytoin levels). Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Diligently monitor for depression, changes in behavior, psychosis, suicidal ideation. Assist with ambulation if dizziness occurs.

#### PATIENT/FAMILY TEACHING

• Drowsiness usually diminishes with continued therapy. • Avoid tasks that

require alertness, motor skills until response to drug is established. • Do not abruptly discontinue medication (may precipitate seizures). • Strict maintenance of drug therapy is essential for seizure control. • Report anxiety, anger, depression, mood swings, hostile behavior, thoughts of suicide, unusual changes in behavior. • Difficulty breathing, swelling of tongue or throat may indicate emergent allergic reaction. • Avoid alcohol.

## brodalumab

broe-dal-ue-mab  
(Siliq)

**BLACK BOX ALERT** ■ Suicidal ideation and behavior, including completed suicides, were reported with brodalumab. Screen for history of depression, suicidal ideation. Recommend mental health consultation for pts with suicidal ideation and behavior. Pts must seek immediate medical attention if new-onset suicidal ideation, anxiety, depression, mood change occur.

**Do not confuse brodalumab with avelumab, dupilumab, durvalumab, nivolumab, or sarilumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-interleukin 17-receptor antibody. Monoclonal antibody. **CLINICAL:** Anti-psoriasis agent.

### USES

Treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to brodalumab. Crohn's disease. **Cautions:**

Baseline neutropenia; history of anxiety, depression, suicidal ideation and behavior, mood disorder; concomitant immunosuppressant therapy, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), prior exposure to tuberculosis. Concomitant use of live vaccines not recommended. Not recommended in pts with active TB.

## ACTION

Selectively binds to the IL-17A receptor, inhibiting the release of pro-inflammatory cytokines (involved in the pathogenesis of immune-mediated diseases, including plaque psoriasis). **Therapeutic Effect:** Blocks cytokine-induced responses.

## PHARMACOKINETICS

Widely distributed. Metabolized into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 3 days. Steady-state reached in 4 wks. Excretion not specified. **Half-life:** Not specified.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **belimumab**, **natalizumab**, **vaccines (live)**. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils.

## AVAILABILITY (Rx)

**Injection Solution:** 210 mg/1.5 mL in prefilled single-dose syringe.

## ADMINISTRATION/HANDLING

### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscularly. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • May store at room temperature for up to 14 days. Once warmed to room temperature, do not place back into refrigerator. • Do not freeze or expose to heating sources. • Do not shake. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Plaque Psoriasis

**SQ: ADULTS, ELDERLY:** Initially, 210 mg once at wks 0, 1, 2, followed by 210 mg once q2wks thereafter. **Permanent discontinuation:** Consider discontinuation in pts who have not achieved an adequate response after 12–16 wks.

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Occasional (5%–4%):** Arthralgia, headache. **Rare (3%–1%):** Fatigue, diarrhea, oropharyngeal pain, nausea, myalgia, injection site reactions (bruising, erythema, hemorrhage, pain, pruritus), conjunctivitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Suicidal ideation and behavior, including completed suicides, were reported. May increase risk of tuberculosis. Infections such as bronchitis, influenza, nasopharyngitis, pharyngitis, upper respiratory tract infection, tinea infections, UTI may occur. May cause exacerbation of Crohn's disease and ulcerative colitis. Immunogenicity (auto-broadalumab antibodies) occurred in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC in pts with known history of neutropenia. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Verify pt has not received live vaccines prior to initiation. Question history of Crohn's disease, ulcerative colitis, hypersensitivity reaction; anxiety, depression, mood disorder, suicidal ideation and behavior. Conduct dermatological exam; record characteristics of psoriatic lesions. Assess pt's willingness to self-inject medication.

### INTERVENTION/EVALUATION

Diligently monitor for suicidal ideation and behavior, new onset or worsening of anxiety, depression, mood disorder. Consult mental health professional if mood disorder suspected. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiation. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Monitor for hypersensitivity reaction, symptoms of inflammatory bowel disease. Assess skin for improvement of lesions.

## PATIENT/FAMILY TEACHING

- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occurs.
- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection, such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening.
- Report travel plans to possible endemic areas.
- Treatment may cause worsening of Crohn's disease or cause inflammatory bowel disease. Report abdominal pain, diarrhea, weight loss.

## budesonide

TOP  
100

bue-des-oh-nide

(Entocort EC, Ortikos, Pulmicort Flexhaler, Pulmicort, Rhinocort Allergy, Uceris)

**Do not confuse budesonide with Budeprion.**

### FIXED-COMBINATION(S)

**Symbicort:** budesonide/formoterol (bronchodilator): 80 mcg/4.5 mcg, 160 mcg/4.5 mcg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Glucocorticosteroid. **CLINICAL:** Anti-inflammatory, antiallergy.

## USES

**Nasal: (Rx):** Management of seasonal or perennial allergic rhinitis in adults and children 6 yrs and older. **(OTC):** Relief of hay fever, other upper respiratory allergies in adults and children 6 yrs and

older. **Nebulization, oral inhalation:** Maintenance or prophylaxis therapy for asthma in pts 6 yrs and older (dry powder inhaler) or 12 mos to 8 yrs (nebulization). **PO:** Treatment of mild to moderate active Crohn's disease. Maintenance of clinical remission of mild to moderate Crohn's disease. Induction of remission in active, mild to moderate ulcerative colitis. **OFF-LABEL: PO:** Treatment of eosinophilic esophagitis. **Nebulization/inhalation:** Acute exacerbation of COPD.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to budesonide (nebulization/inhalation), primary treatment of status asthmaticus, acute episodes of asthma. Not for relief of acute bronchospasms. **Nasal:** Use in children younger than 6 yrs of age. **Cautions:** Thyroid disease, hepatic impairment, renal impairment, cardiovascular disease, diabetes, glaucoma, cataracts, myasthenia gravis, pts at risk for osteoporosis, seizures, GI disease, post acute MI, elderly.

## ACTION

Inhibits accumulation of inflammatory cells; controls rate of protein synthesis; decreases migration of polymorphonuclear leukocytes (reverses capillary permeability and lysosomal stabilization at cellular level). **Therapeutic Effect:** Relieves symptoms of allergic rhinitis, asthma, Crohn's disease.

## PHARMACOKINETICS

Form	Onset	Peak	Duration
Pulmicort Respules	2–8 days	4–6 wks	—
Rhinocort Aqua	10 hrs	2 wks	—

Minimally absorbed from nasal tissue; moderately absorbed from inhalation. Protein binding: 88%. Primarily metabolized in liver. **Half-life:** 2–3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast

milk. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. May decrease effect of aldesleukin. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase systemic exposure. **LAB VALUES:** May decrease serum potassium.

## AVAILABILITY (Rx)

**Oral Inhalation Powder:** (*Pulmicort Flex-haler*): 90 mcg per inhalation; 180 mcg per inhalation. **Inhalation Suspension for Nebulization:** (*Pulmicort*): 0.25 mg/2 mL; 0.5 mg/2 mL; 1 mg/2 mL. **Nasal Spray:** (*Rhinocort Allergy*): 32 mcg/spray.

**Delayed-Release Capsules:** (*Entocort EC*): 3 mg. **Extended-Release Capsules:** (*Uceris*): 9 mg. (*Ortikos*): 6 mg, 9 mg.

## ADMINISTRATION/HANDLING

### Inhalation

- Hold inhaler in upright position to load dose. Do not shake prior to use. Prime prior to first use only.
- Place mouthpiece between lips and inhale forcefully and deeply. Do not exhale through inhaler; do not use a spacer.
- Rinsing mouth after each use decreases incidence of candidiasis.

### Intranasal

- Instruct pt to clear nasal passages before use.
- Tilt pt's head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds other nostril closed and concurrently inspires through nostril to allow medication as high into nasal passages as possible.

### Nebulization

- Shake well before use.
- Administer with mouthpiece or face mask.
- Rinse mouth following treatment.

**PO**

- May take with or without food. Swallow whole. Do not break, crush, dissolve, or divide capsule or tablet.

**INDICATIONS/ROUTES/DOSAGE****Rhinitis**

**Intranasal: (Rx): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 1 spray (32 mcg) in each nostril once daily. **Maximum:** 4 sprays in each nostril once daily for adults and children 12 yrs and older; 2 sprays in each nostril once daily for children 6–11 yrs.

**Intranasal: (OTC): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER:** 2 sprays in each nostril once daily. May decrease to 1 spray in each nostril once daily.

**Bronchial Asthma**

**Nebulization: CHILDREN 12 MOS–8 YRS: (Previous therapy with bronchodilators alone):** 0.5 mg/day as single dose or 2 divided doses. **Maximum:** 0.5 mg/day. **(Previous therapy with inhaled corticosteroids):** 0.5 mg/day as single dose or 2 divided doses. **Maximum:** 1 mg/day. **(Previous therapy of oral corticosteroids):** 1 mg/day as single dose in 2 divided doses. **Maximum:** 1 mg/day.

**Oral inhalation: (Pulmicort Flexhaler): ADULTS, ELDERLY:** Initially, 360 mcg 2 times/day. **Maximum:** 720 mcg 2 times/day. **CHILDREN 6 YRS AND OLDER:** 180 mcg 2 times/day. **Maximum:** 360 mcg 2 times/day.

**Crohn's Disease**

**PO (capsule): ADULTS, ELDERLY:** 9 mg once daily for up to 8 wks. Recurring episodes may be treated with a repeat 8-wk course of treatment. **Maintenance of remission:** 6 mg once daily for up to 3 mos.

**Ulcerative Colitis**

**PO (tablet): ADULTS, ELDERLY:** 9 mg once daily in morning for up to 8 wks.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (greater than 3%): Nasal:** Mild nasopharyngeal irritation, burning, stinging, dryness; headache, cough. **Inhalation:** Flu-like symptoms, headache, pharyngitis. **Occasional (3%–1%): Nasal:** Dry mouth, dyspepsia, rebound congestion, rhinorrhea, loss of taste. **Inhalation:** Back pain, vomiting, altered taste, voice changes, abdominal pain, nausea, dyspepsia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) occurs rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for hypersensitivity to any corticosteroids, components. Auscultate lung sounds.

**INTERVENTION/EVALUATION**

Monitor for relief of symptoms. Auscultate lung sounds. Observe proper use of medication delivery device to ensure correct technique.

**PATIENT/FAMILY TEACHING**

- Improvement noted in 24 hrs, but full effect may take 3–7 days.
- Report if no improvement in symptoms or if sneezing, nasal irritation occurs.

**bumetanide**

bue-met-a-nide  
(Bumex, Burinex )

**BLACK BOX ALERT** Excess dosage can lead to profound diuresis with fluid and electrolyte loss. **Do not confuse bumetanide with Buminate.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Loop diuretic. **CLINICAL:** Diuretic.

**USES**

Management of edema associated with HF, renal disease, or hepatic disease.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to bumetanide. Anuria, hepatic coma, severe electrolyte depletion (until condition improves or is corrected). **Cautions:** Severe hypersensitivity to sulfonamides; hypotension.

**ACTION**

Enhances excretion of sodium, chloride, and, to lesser degree, potassium by direct action at ascending limb of loop of Henle and in proximal tubule. **Therapeutic Effect:** Produces diuresis.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	30–60 min	60–120 min	4–6 hrs
IV	Rapid	15–30 min	2–3 hrs

Completely absorbed from GI tract (absorption decreased in HF, nephrotic syndrome). Protein binding: 94%–96%. Partially metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–1.5 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotension/electrolyte effects. Increased risk for circulatory collapse or thrombolytic episode. Age-related renal impairment may require reduced or extended dosage interval.

**INTERACTIONS**

**DRUG:** Agents inducing hypokalemia (e.g., metolazone, hydrochlorothiazide) may increase risk of hypokalemia. NSAIDs (e.g., diclofenac, naproxen) may increase effect. May increase hyponatremic effect of desmopressin. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive prop-

erties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, BUN, uric acid; urinary phosphate. May decrease serum calcium, chloride, magnesium, potassium, sodium.

**AVAILABILITY (Rx)**

**Injection Solution:** 0.25 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg.

**ADMINISTRATION/HANDLING**

**Rate of administration** • May give undiluted but is compatible with D<sub>5</sub>W, 0.9% NaCl, or lactated Ringer's solution. • Administer IV push over 1–2 min. • May give through Y tube or 3-way stopcock. • May give as continuous infusion.

**Storage** • Store at room temperature. • Stable for 24 hrs if diluted.

**PO**

• Give with food to avoid GI upset, preferably with breakfast (may prevent nocturia).

**IV INCOMPATIBILITIES**

Midazolam (Versed).

**IV COMPATIBILITIES**

Aztreonam (Azactam), cefepime (Maxipime), dexmedetomidine (Precedex), dilTIAzem (Cardizem), DOBUTamine (Dobutrex), furosemide (Lasix), LORazepam (Ativan), milrinone (Primacor), morphine, piperacillin and tazobactam (Zosyn), propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Edema, HF**

**Note:** Maximum recommended dose is 10 mg/day to avoid toxicity.

**PO, IV: ADULTS, ELDERLY:** Initially, 0.5–1 mg once, then titrate PRN to an effective dose. **Refractory edema; acute decompensation in pts taking PO loop diuretics:**

**IV:** (Bolus/intermittent dosing): Initially, administer 1–2.5 times the total daily oral effective dose, then titrate PRN to an effective dose. **Continuous infusion:** Initially, 0.5–1 mg/hr; if diuretic response is not adequate, repeat IV bolus dose and increase continuous infusion up to 2 mg/hr.

#### Usual Pediatric Dosage

**IV, IM, PO: CHILDREN:** 0.015–0.1 mg/kg/dose q6–24h. **Maximum:** 10 mg/day. **NEONATES:** 0.01–0.05 mg/kg/dose q12–48h.

#### Dosage in Renal/Hepatic Impairment

Use caution; contraindicated in anuria, hepatic coma.

### SIDE EFFECTS

**Expected:** Increased urinary frequency and urine volume. **Frequent (5%):** Muscle cramps, dizziness, hypotension, headache, nausea. **Occasional (3%–1%):** Impaired hearing, pruritus, ECG changes, weakness, hives, abdominal pain, dyspepsia, musculoskeletal pain, rash, nausea, vomiting. **Rare (less than 1%):** Chest pain, ear pain, fatigue, dry mouth, premature ejaculation, impotence, nipple tenderness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration, coma, circulatory collapse. Ototoxicity manifested as deafness, vertigo, tinnitus may occur, esp. in pts with severe renal impairment or those taking other ototoxic drugs. Blood dyscrasias, acute hypotensive episodes have been reported.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain vital signs, esp. B/P for hypotension, before administration. Assess for

edema. Observe skin turgor, mucous membranes for hydration status. Initiate I&O, obtain baseline weight.

#### INTERVENTION/EVALUATION

Continue to monitor B/P, vital signs, electrolytes, I&O, weight. Note extent of diuresis. Watch for changes from initial assessment (hypokalemia may result in muscle weakness, tremor, muscle cramps, altered mental status, cardiac arrhythmias; hyponatremia may result in confusion, thirst, cold/clammy skin).

#### PATIENT/FAMILY TEACHING

- Expect increased urinary frequency/volume.
- Report auditory abnormalities (e.g., sense of fullness in ears, tinnitus).
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Rise slowly from sitting/lying position.

## buPROPion

bue-proe-pee-on

(Aplenzin, Forfivo XL, Wellbutrin SR, Wellbutrin XL)

#### BLACK BOX ALERT

Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Agitation, hostility, depressed mood also reported. Use in smoking cessation may cause serious neuropsychiatric events.

**Do not confuse Aplenzin with Relpenza, buPROPion with busPIRone, Wellbutrin SR with Wellbutrin XL.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Dopamine/norepinephrine reuptake inhibitor. **CLINICAL:** Antidepressant, smoking cessation aid.

## USES

Treatment of major depressive disorder (MDD), seasonal affective disorder (SAD). Assists in smoking cessation.

**OFF-LABEL:** Treatment of ADHD in adults, children. Depression associated with bipolar disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to buPROPion. Current or prior diagnosis of anorexia nervosa or bulimia, seizure disorder, use of MAO inhibitors (concurrently or within 14 days of discontinuing either bupropion or the MAOI); pts undergoing abrupt discontinuation of alcohol or sedatives. Initiation of buPROPion in pts receiving linezolid or IV methylene blue. **Aplenzin, Forfivo XL, Wellbutrin XL (additional):** Conditions increasing seizure risk, severe head injury, stroke, CNS tumor/infection. **Forfivo XL (additional):** Pts receiving other dosage forms of bupropion. **Cautions:** History of seizure, cranial or head trauma, cardiovascular disease, history of hypertension or coronary artery disease, elderly, pts at high risk for suicide, renal/hepatic impairment. Concurrent use of antipsychotics, antidepressants, theophylline, steroids, stimulants, hypoglycemic agents, excessive use of alcohol, sedatives/hypnotics, opioids.

## ACTION

Blocks reuptake of neurotransmitters, (DOPamine, norepinephrine) at CNS presynaptic membranes. **Therapeutic Effect:** Relieves depression. Eliminates nicotine withdrawal symptoms.

## PHARMACOKINETICS

Rapidly absorbed from GI tract. Protein binding: 84%. Crosses the blood-brain barrier. Metabolized in liver. Primarily excreted in urine. **Half-life:** 14 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** More sensitive to

increased dosage, toxicity; increased risk of suicidal ideation, worsening of depression. Safety and efficacy not established.

**Elderly:** More sensitive to anticholinergic, sedative, cardiovascular effects. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depressant effect. **MAOIs (e.g., phenelzine, selegiline)** may increase hypertensive effect. May decrease concentration of **tamoxifen**. May increase concentration of **aripiprazole, brexpiprazole, iloperidone, metoclopramide, thioridazine**. May increase adverse effects of **citalopram, vortioxetine**. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease WBC.

## AVAILABILITY (Rx)

**Tablets:** 75 mg, 100 mg.

 **Extended-Release Tablets: (24 hr):** (*Aplenzin*): 174 mg, 348 mg, 522 mg (*Forfivo XL*): 450 mg (*Wellbutrin XL*): 150 mg, 300 mg. **Sustained-Release Tablets: (12 hr):** (*Wellbutrin SR*): 100 mg, 150 mg, 200 mg; (*Zyban*): 150 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food (give with food if GI irritation occurs).
- Give at least 4-hr interval for immediate onset and 8-hr interval for sustained-release tablet to avoid seizures.
- Give *Aplenzin* once daily in the morning.
- Avoid bedtime dosage (decreases risk of insomnia).
- Do not break, crush, dissolve, or divide sustained-, extended-release preparations.

## INDICATIONS/ROUTES/DOSAGE

### Depression

**PO: (Immediate-Release):** ADULTS, ELDERLY: Initially, 100 mg twice daily.

May increase to 100 mg 3 times/day no sooner than 3 days after beginning therapy. **Maximum:** 150 mg 3 times/day.

**PO: (Sustained-Release): ADULTS, ELDERLY:** Initially, 150 mg/day as a single dose in the morning. May increase to 150 mg twice daily as early as day 4 after beginning therapy. **Maximum:** 400 mg/day in 2 divided doses.

**PO: (Extended-Release): ADULTS, ELDERLY:** 150 mg once daily. May increase to 300 mg once daily as early as day 4. If no clinical improvement after 2 wks, may increase to 450 mg once daily. **Maximum:** 450 mg/day. **(Aplenzin):** Initially, 174 mg once daily in morning; may increase as soon as 4 days to 348 mg/day.

#### Smoking Cessation

**PO: ADULTS, ELDERLY: (Zyban):** Initially, 150 mg/day for 3 days, then 150 mg twice daily for 7–12 wks.

#### SAD

**PO: ADULTS, ELDERLY: (Wellbutrin XL):** 150 mg/day for 1 wk, then 300 mg/day. Begin in autumn (Sept–Nov). End of treatment begins in spring (Mar–Apr) by decreasing dose to 150 mg/day for 2 wks before discontinuation. **(Aplenzin):** 174 mg once daily. May increase after 1 wk to 348 mg once daily.

#### Dosage in Renal Impairment

Use caution.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Use caution, reduce dosage. **Severe impairment:** Use extreme caution. **Maximum: (Aplenzin):** 174 mg every other day. **(Wellbutrin):** 75 mg/day. **(Wellbutrin SR):** 100 mg/day or 150 mg every other day. **(Wellbutrin XL):** 150 mg every other day. **(Zyban):** 150 mg every other day.

#### SIDE EFFECTS

**Frequent (32%–18%):** Constipation, weight gain or loss, nausea, vomiting, anorexia, dry mouth, headache, diaphoresis,

tremor, sedation, insomnia, dizziness, agitation. **Occasional (10%–5%):** Diarrhea, akinesia, blurred vision, tachycardia, confusion, hostility, fatigue.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Risk of seizures increases in pts taking more than 150 mg/dose; in pts with history of bulimia, seizure disorders, discontinuing drugs that may lower seizure threshold.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Assess psychological status, thought content, suicidal tendencies, appearance. For pts on long-term therapy, hepatic/renal function tests should be performed periodically.

##### INTERVENTION/EVALUATION

Supervise suicidal-risk pt closely during early therapy and dose changes (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood changes.

##### PATIENT/FAMILY TEACHING

- Full therapeutic effect may be noted in approx. 4 wks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report signs/symptoms of seizure, worsening depression, suicidal ideation, unusual behavioral changes.
- Avoid alcohol.
- Do not chew, crush, dissolve, or divide sustained-, extended-release tablets.

## busPIRone

bue-spye-rone

**Do not confuse busPIRone with buPROPion.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Nonbarbiturate. **CLINICAL:** Antianxiety.

## USES

Management of anxiety disorders. Short-term relief of symptoms of anxiety.

**OFF-LABEL:** Augmenting medication for antidepressants.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to busPIRone. Concomitant use of MAOIs intended to treat depression or within 14 days of discontinuing MAOIs intended to treat depression. Concomitant use of MAOIs within 14 days of discontinuing buspirone. Initiation of buspirone in pts receiving IV methylene blue or linezolid.

**Cautions:** Concurrent use of MAOIs, severe hepatic/renal impairment (not recommended).

## ACTION

Exact mechanism of action unknown. Binds to serotonin, DOPamine at presynaptic neurotransmitter receptors in CNS.

**Therapeutic Effect:** Produces anxiolytic effect.

## PHARMACOKINETICS

Rapidly and completely absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depressant effect. May increase adverse effects of MAOIs (e.g., phenelzine, selegiline). May increase serotonergic effects of SSRIs (e.g., citalopram, FLUoxetine, sertraline). CYP3A4 inhibitors (e.g., erythromycin, ketoconazole)

may increase concentration/effect. CYP3A4 inducers (e.g., rifAMPin) may decrease concentration/effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration, risk of toxicity. **LAB VALUES:** May produce false-positive urine metanephrine/catecholamine assay test.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. Must be consistent.

## INDICATIONS/ROUTES/DOSAGE

### Anxiety Disorders

**PO: ADULTS, ELDERLY:** Initially, 10–15 mg/day in 2–3 divided doses. May increase every 2–3 days in increments of 2.5 mg twice daily. **Maintenance:** 10–15 mg twice daily. **Maximum:** 30 mg twice daily.

### Dosage in Renal/Hepatic Impairment

Not recommended in severe impairment.

## SIDE EFFECTS

**Frequent (12%–6%):** Dizziness, drowsiness, nausea, headache. **Occasional (5%–2%):** Nervousness, fatigue, insomnia, dry mouth, light-headedness, mood swings, blurred vision, poor concentration, diarrhea, paresthesia. **Rare:** Muscle pain/stiffness, nightmares, chest pain, involuntary movements.

## ADVERSE EFFECTS/TOXIC REACTIONS

No evidence of drug tolerance, psychological or physical dependence, withdrawal syndrome. Overdose may produce severe nausea, vomiting, dizziness, drowsiness, abdominal distention, excessive pupil constriction.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess degree/manifestations of anxiety. Offer emotional support. Assess motor responses (agitation, trembling, tension), autonomic responses (cold, clammy hands; diaphoresis).

**INTERVENTION/EVALUATION**

For pts on long-term therapy, CBC, LFT, renal function tests should be performed periodically. Assist with ambulation if drowsiness, dizziness occur. Evaluate for therapeutic response: calm facial expres-

sion, decreased restlessness, lessened insomnia, mental status.

**PATIENT/FAMILY TEACHING**

- Improvement may be noted in 7–10 days, but optimum therapeutic effect generally takes 3–4 wks.
- Drowsiness usually disappears during continued therapy.
- If dizziness occurs, slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, grapefruit products.
- Be consistent in taking with regard to food.

## cabazitaxel

ka-**baz-i-tax-el**  
(Jevtana)

**BLACK BOX ALERT** All pts should be premedicated with a corticosteroid, an antihistamine, and an H<sub>2</sub> serum antagonist prior to infusion. Severe hypersensitivity reactions have occurred. Immediately discontinue infusion and give appropriate treatment if hypersensitivity reaction occurs. Neutropenic deaths reported. CBC, particularly ANC, should be obtained prior to and during treatment. Do not administer with neutrophil count 1,500 cells/mm<sup>3</sup> or less.

**Do not confuse cabazitaxel with PAclitaxel or Paxil, or Jevtana with Januvia, Levitra, or Sentra.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Microtubule inhibitor. **CLINICAL:** Antineoplastic.

### USES

Used in combination with predniSONE for treatment of castration-resistant metastatic prostate cancer previously treated with a DOCEtaxel-containing regimen.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to cabazitaxel. Severe hepatic impairment (total serum bilirubin greater than 3 times upper limit of normal [ULN]). Neutrophil count of 1,500 cells/mm<sup>3</sup> or less, history of hypersensitivity to polysorbate 80. **Cautions:** Mild to moderate hepatic impairment (bilirubin equal to or less than 3 times ULN), elderly, pregnancy, renal impairment (CrCl less than 30 mL/min). Pts at risk for developing GI complications (e.g., GI ulceration, concomitant use of NSAIDs).

### ACTION

Binds to tubulin to promote assembly into microtubules and inhibits disassembly,

which stabilizes microtubules. Inhibits microtubule depolymerization/cell division. **Therapeutic Effect:** Arrests the cell cycle, inhibiting tumor proliferation.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 89%–92%. Excreted in feces (76%), urine (3.7%). **Half-life:** 95 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Crosses placental barrier. Breast-feeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Pts 65 yrs and older have 5% greater risk of developing neutropenia, fatigue, dizziness, fever, urinary tract infection, dehydration.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, ketoconazole, ritonavir) may increase concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., carbamazepine, PHE-Nobarbital, phenytoin, rifAMPin) may decrease cabazitaxel concentration effects. Live virus vaccine may potentiate virus replication, increase vaccine's side effects, decrease response to vaccine. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** May increase serum bilirubin. May decrease Hgb, Hct, neutrophils, platelets.

### AVAILABILITY (Rx)

**Injection:** 60 mg/1.5 mL

### ADMINISTRATION/HANDLING

**◀ALERT▶** Wear gloves during preparation, handling. Two-step dilution process must be performed under aseptic conditions to prepare second (final) infusion solution. Medication undergoes two dilutions. After second dilution, administration should be initiated within 30 min.

**Reconstitution**

**Step 1, first dilution** • Each vial of cabazitaxel contains 60 mg/1.5 mL; must first be mixed with entire contents of supplied diluent. • Once reconstituted, solution contains 10 mg/mL of cabazitaxel. • When transferring diluent, direct needle onto inside vial wall and inject slowly to limit foaming. • Remove syringe and needle, then gently mix initial diluted solution by repeated inversions for at least 45 sec to ensure full mixing of drug and diluent. • Do not shake. • Allow any foam to dissipate.

**Step 2, final dilution** • Withdraw recommended dose and further dilute with 250 mL 0.9% NaCl or D<sub>5</sub>W. • If dose greater than 65 mg is required, use larger volume of 0.9% NaCl or D<sub>5</sub>W so that concentration of 0.26 mg/mL is not exceeded. • Concentration of final diluted solution should be between 0.10 and 0.26 mg/mL.

**Rate of administration** • Infuse over 1 hr using in-line 0.22-micron filter.

**Storage** • Store vials at room temperature. • First dilution solution stable for 30 min. • Final diluted solution stable for 8 hrs at room temperature or 24 hrs if refrigerated.

**INDICATIONS/ROUTES/DOSAGE**

◀**ALERT**▶ Antihistamine (dexchlorpheniramine 5 mg, diphenhydramine 25 mg, or equivalent antihistamine), corticosteroid (dexamethasone 8 mg or equivalent), and H<sub>2</sub> antagonist (ranitidine 50 mg or equivalent H<sub>2</sub> antagonist) should be given at least 30 min prior to each dose to reduce risk/severity of hypersensitivity.

**Metastatic Prostate Cancer**

◀**ALERT**▶ Monitoring of CBC is essential on wkly basis during cycle 1 and before each treatment cycle thereafter so that the dose can be adjusted.

**IV infusion: ADULTS, ELDERLY:** 20–25 mg/m<sup>2</sup> given as 1-hr infusion q3wks in combination with prednisone.

**Dose Modification**

**Grade 3 neutropenia, febrile neutropenia, Grade 3 or persistent diarrhea,**

**neuropathy:** Reduce dosage to 20 mg/m<sup>2</sup> after treatment interruption.

**Dosage With Strong CYP3A Inhibitors**  
Consider dose reduction by 25%.

**Dosage in Renal Impairment**

**CrCl less than 15 mL/min:** Use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** 20 mg/m<sup>2</sup>. **Moderate impairment:** 15 mg/m<sup>2</sup>. **Severe impairment:** Contraindicated.

**SIDE EFFECTS**

**Frequent (47%–16%):** Diarrhea, fatigue, nausea, vomiting, constipation, esthesia, abdominal pain, anorexia, back pain. **Occasional (13%–5%):** Peripheral neuropathy, fever, dyspnea, cough, arthralgia, dysgeusia, dyspepsia, alopecia, peripheral edema, weight decrease, urinary tract infection, dizziness, headache, muscle spasm, dysuria, hematuria, mucosal inflammation, dehydration.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression is an expected response to therapy, but more severe reactions including severe neutropenia, febrile neutropenia may be life threatening. Hypersensitivity reaction may include generalized rash, erythema, hypotension, bronchospasm. 94% of pts develop Grade 1–4 neutropenia and associated complications including anemia, thrombocytopenia, sepsis. GI abnormalities, hypertension, arrhythmias, renal failure may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ANC, CBC, BMP, LFT, serum testosterone. Assess ANC, CBC prior to each infusion. Question history of hypersensitivity reaction; renal/hepatic impairment; intolerance to corticosteroids. Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor CBC, ANC on wkly basis during cycle 1 and before each treatment cycle

thereafter; do not administer if ANC less than 1,500 cells/mm<sup>3</sup>. Monitor serum ALT, AST, renal function. Monitor for hypersensitivity reaction (rash, erythema, dyspnea). Encourage adequate fluid intake. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetics if nausea, vomiting occur. Closely monitor for signs/symptoms of neutropenia.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report fever, chills, persistent sore throat, unusual bruising/bleeding, pale skin, fatigue.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Maintain strict oral hygiene.
- Do not have immunizations without physician approval (drug lowers body's resistance).
- Avoid those who have received a live virus vaccine.
- Avoid grapefruit products.
- Diarrhea may cause dehydration; drink plenty of fluids.

## calcitonin

kal-si-toe-nin

(Calcimar , Miacalcin)

**Do not confuse calcitonin with calcitriol, or Miacalcin with Micatin.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Synthetic hormone. **CLINICAL:** Calcium regulator, bone resorption inhibitor.

#### USES

**Parenteral:** Treatment of Paget's disease of bone, hypercalcemia, postmenopausal osteoporosis in women greater than 5 yrs

postmenopause. **Intranasal:** Postmenopausal osteoporosis in women more than 5 yrs postmenopause.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to calcitonin, salmon. **Cautions:** None known.

#### ACTION

Antagonizes effects of parathyroid hormone. Increases jejunal secretion of water, sodium, potassium, chloride. Inhibits osteoclast bone resorption. Promotes renal excretion of calcium, phosphate, sodium, magnesium, potassium by decreasing tubular reabsorption. **Therapeutic Effect:** Regulates serum calcium concentrations.

#### PHARMACOKINETICS

Nasal form rapidly absorbed. Injection form rapidly metabolized primarily in kidneys. Primarily excreted in urine. **Half-life:** **Nasal:** 43 min; **Injection:** 70–90 min.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Does not cross placenta; unknown if distributed in breast milk. Safe usage during lactation not established (inhibits lactation in animals). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease concentration/effect of **lithium**. May increase concentration/effect of **zoledronic acid**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

#### AVAILABILITY (Rx)

**Injection Solution: (Miacalcin):** 200 units/mL. **Nasal Spray:** 200 units/activation.

#### ADMINISTRATION/HANDLING

##### IM, SQ

- IM route preferred if injection volume greater than 2 mL. Subcutaneous injection for outpatient self-administration unless volume greater than 2 mL.
- Skin test should be performed before therapy

in pts suspected of sensitivity to calcitonin. • Bedtime administration may reduce nausea, flushing.

#### Intranasal

- Refrigerate unopened nasal spray. Store at room temperature after initial use.
- Instruct pt to clear nasal passages.
- Tilt head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds other nostril closed and concurrently inspires through nose to deliver medication as high into nasal passage as possible. Spray into one nostril daily.
- Discard after 30 doses.

#### INDICATIONS/ROUTES/DOSAGE

##### Skin Testing Before Treatment in Pts With Suspected Sensitivity to Calcitonin-Salmon

**Note:** A detailed skin testing protocol is available from the manufacturer.

#### Paget's Disease

**IM, SQ: ADULTS, ELDERLY:** 100 units/day.

#### Postmenopausal Osteoporosis

**IM, SQ: ADULTS, ELDERLY:** 100 units daily with adequate calcium and vitamin D intake.

**Intranasal: ADULTS, ELDERLY:** 200 units/day as a single spray in one nostril, alternating nostrils daily.

#### Hypercalcemia

**IM, SQ: ADULTS, ELDERLY:** Initially, 4 units/kg q12h; may increase to 8 units/kg q12h if no response in 2 days; may further increase to 8 units/kg q6–12h.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent: IM, SQ (10%):** Nausea (may occur soon after injection; usually diminishes with continued therapy); inflammation at injection site. **Nasal (12%–10%):** Rhinitis, nasal irritation, redness, mucosal lesions.

**Occasional: IM, SQ (5%–2%):** Flushing of face, hands. **Nasal (5%–3%):** Back pain, arthralgia, epistaxis, headache.

**Rare: IM, SQ:** Epigastric discomfort, dry

mouth, diarrhea, flatulence. **Nasal:** Itching of earlobes, pedal edema, rash, diaphoresis.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Pts with a protein allergy may develop a hypersensitivity reaction (rash, dyspnea, hypotension, tachycardia).

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain serum calcium, phosphate level.

##### INTERVENTION/EVALUATION

Ensure rotation of injection sites; check for inflammation. Assess vertebral bone mass (document stabilization/improvement). Assess for allergic response: rash, urticaria, swelling, dyspnea, tachycardia, hypotension. Monitor serum electrolytes, calcium, alkaline phosphatase.

##### PATIENT/FAMILY TEACHING

- Instruct pt/family on aseptic technique, proper injection method of subcutaneous medication, including rotation of sites, proper administration of nasal medication.
- Nausea is transient and usually decreases over time.
- Immediately report rash, itching, shortness of breath, significant nasal irritation.
- Improvement in biochemical abnormalities and bone pain usually occurs in the first few months of treatment.
- Improvement of neurologic lesions may take more than a year.

## calcium acetate

(Eliphos, PhosLo)

## calcium carbonate

(Apo-Cal , Caltrate 600 , OsCal , Titalac, Tums)

## calcium chloride

(Cal-Citrate, Citracal, Osteocit )

## calcium glubionate

## calcium gluconate

kal-si-um

**Do not confuse Citracal with Citrucel, OsCal with Asacol, or PhosLo with Prosom.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Electrolyte replenisher. **CLINICAL:** Antacid, antihypocalcemic, antihyperkalemic, antihypermagnesemic, antihyperphosphatemic.

### USES

**Parenteral (calcium chloride):** Treatment of hypocalcemia and conditions secondary to hypocalcemia (e.g., seizures, arrhythmias), emergency treatment of severe hypermagnesemia; **(calcium gluconate):** Treatment of hypocalcemia and conditions secondary to hypocalcemia (e.g., seizures, arrhythmias). **Calcium carbonate:** Antacid, dietary supplement. **Calcium acetate:** Controls hyperphosphatemia in end-stage renal disease. **OFF-LABEL (Calcium chloride):** Calcium channel blocker overdose, severe hyperkalemia, malignant arrhythmias associated with hypermagnesemia.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to calcium formulation. **All preparations:** Calcium-based renal calculi, hypercalcemia, ventricular fibrillation. **Calcium chloride:** Digoxin toxicity. **Calcium gluconate: Neonates:** Concurrent IV use with ceftriaxone. **Cautions:** Chronic renal impairment, hypokalemia, concurrent use with digoxin.

### ACTION

Essential for function, integrity of nervous, muscular, skeletal systems. Plays an important role in normal cardiac/renal function, respiration, blood coagulation, cell membrane and capillary permeability. Assists in

regulating release/storage of hormones/neurotransmitters. Neutralizes/reduces gastric acid (increases pH). **Calcium acetate:** Binds with dietary phosphate, forming insoluble calcium phosphate. **Calcium chloride, calcium gluconate:** Moderates nerve and muscle performance by regulating action potential excitation threshold. **Therapeutic Effect:** Replaces calcium in deficiency states; controls hyperphosphatemia in end-stage renal disease; relieves heartburn, indigestion.

### PHARMACOKINETICS

Moderately absorbed from small intestine (absorption depends on presence of vitamin D metabolites, pH). Primarily eliminated in feces.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. Unknown whether calcium chloride or calcium gluconate is distributed in breast milk. **Children:** Risk of extreme irritation, possible tissue necrosis or sloughing with IV calcium preparations. Restrict IV use due to small vasculature. **Elderly:** Oral absorption may be decreased.

### INTERACTIONS

**DRUG:** Hypercalcemia may increase digoxin toxicity. Oral form may decrease absorption of bisphosphonates (e.g., risedronate), calcium channel blockers (e.g., amlodipine, diltiazem, verapamil), tetracycline derivatives, thyroid products. **HERBAL:** None significant. **FOOD:** Food may increase calcium absorption. **LAB VALUES:** May increase serum pH, calcium, gastrin. May decrease serum phosphate, potassium.

### AVAILABILITY (Rx)

**Calcium Acetate (667 mg = 169 mg calcium)**

**Capsules:** 667 mg. **Tablets (Eliphos):** 667 mg.

**Calcium Carbonate (1 g = 400 mg calcium)**

**Tablets:** 500 mg, 600 mg, 1,250 mg, 1,500 mg. **Tablets (Chewable):** 500 mg, 750 mg, 1,000 mg.

**Calcium Chloride**

**Injection Solution:** 10% (100 mg/mL) equivalent to 27.2 mg elemental calcium per mL.

**Calcium Gluconate (1 g = 93 mg calcium)**

**Injection Solution:** 10%.

**ADMINISTRATION/HANDLING**

**Dilution:** (*Calcium Chloride*): May give undiluted or may dilute with 0.9% NaCl or Sterile Water for Injection. (*Calcium Gluconate*): May give undiluted or may dilute with 100 mL 0.9% NaCl or D5W.

**Rate of administration:** (*Calcium Chloride*): **Note:** Rapid administration may produce bradycardia, metallic/chalky taste, hypotension, sensation of heart, peripheral vasodilation. • **IV push:** Infuse slowly at maximum rate of 50–100 mg/min (in cardiac arrest, may administer over 10–20 sec). • **IV infusion:** Dilute to maximum final concentration of 20 mg/mL and infuse over 1 hr or no faster than 45–90 mg/kg/hr. Give via a central line. Do **NOT** use scalp, small hand or foot veins. Stop infusion if pt complains of pain or discomfort. (*Calcium Gluconate*): **Note:** Rapid administration may produce vasodilation, hypotension, arrhythmias, syncope, cardiac arrest. • **IV push:** Infuse slowly over 3–5 min or at maximum rate of 50–100 mg/min (in cardiac arrest, may administer over 10–20 sec). • **IV infusion:** Dilute 1–2 g in 100 mL 0.9% NaCl or D<sub>5</sub>W and infuse over 1 hr.

**Storage** • Store at room temperature. • Once diluted, stable for 24 hrs at room temperature.

**PO**

(*Calcium Acetate*): Administer with plenty of fluids during meals to optimize effectiveness. (*Calcium Carbonate*): Administer with or immediately following meals with plenty of water (give with meals if used for phosphate binding). Instruct pt to thoroughly chew chewable tablets before swallowing.

**IV INCOMPATIBILITIES**

**Calcium chloride:** Amphotericin B complex (Abelcet, AmBisome, Amphotec), pantoprazole (Protonix), phosphate-containing solutions, propofol (Diprivan), sodium bicarbonate. **Calcium gluconate:** Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan).

**IV COMPATIBILITIES**

**Calcium chloride:** Amikacin (Amikin), DOBUTamine (Dobutrex), lidocaine, milrinone (Primacor), morphine, norepinephrine (Levophed). **Calcium gluconate:** Ampicillin, aztreonam (Azactam), ceFAZolin (Ancef), cefepime (Maxipime), ciprofloxacin (Cipro), DOBUTamine (Dobutrex), enalapril (Vasotec), famotidine (Pepcid), furosemide (Lasix), heparin, lidocaine, lipids, magnesium sulfate, meropenem (Merrem IV), midazolam (Versed), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Hyperphosphatemia**

**PO:** (*Calcium Acetate*): **ADULTS, ELDERLY:** Initially, 1334 mg 3 times/day with meals. May increase gradually (q2–3wks) to decrease serum phosphate level to less than 6 mg/dL as long as hypercalcemia does not develop. Usual dose: 2,001–2,668 mg with each meal.

**Hypocalcemia**

**IV:** (*Calcium Chloride*): **ADULTS, ELDERLY:** (Acute, symptomatic): 200–1,000 mg at intervals of q1–3days. (Severe, symptomatic): 1 g over 10 min; may repeat q60min until symptoms resolve. **CHILDREN, NEONATES:** 10–20 mg/kg/dose, repeat q4–6h, if needed. (**Maximum dose:** 1,000 mg).

**IV:** (*Calcium Gluconate*): **ADULTS, ELDERLY:** (Mild): 1–2 g over 2 hrs; (Moderate to severe, asymptomatic): 4 g over 4 hrs; (Severe, symptomatic): 1–2 g over 10 min; may repeat q60min until symptoms resolve. **CHILDREN:** 200–500

mg/kg/day as a continuous infusion or in 4 divided doses. (**Maximum dose:** 1,000 mg). **NEONATES:** 200 mg/kg q6–12h or 400 mg/kg/day as a continuous infusion.

#### Antacid

**PO: (Calcium Carbonate): ADULTS, ELDERLY:** 1–4 tabs as needed. **Maximum:** 8,000 mg/day. **CHILDREN 12 YRS AND OLDER:** 500–3,000 mg for up to 2 wks. **Maximum:** 7,500 mg/day. **CHILDREN 6–11 YRS:** 750–800 mg/day for up to 2 wks. **Maximum:** 3,000 mg/day. **CHILDREN 2–5 YRS:** 375–400 mg/day for up to 2 wks. **Maximum:** 1,500 mg/day.

#### Cardiac Arrest

**IV: (Calcium Chloride): ADULTS, ELDERLY:** 500–1,000 mg over 2–5 min. May repeat as necessary. **CHILDREN, NEONATES:** 20 mg/kg. May repeat in 10 min if necessary. If effective, consider IV infusion of 20–50 mg/kg/hr. **Maximum:** 2,000 mg/dose.

#### Supplement

**PO: (Calcium Carbonate): ADULTS, ELDERLY:** 500 mg–4 g/day in 1–3 divided doses. **CHILDREN OLDER THAN 4 YRS:** 750 mg 3 times/day. **CHILDREN 2–4 YRS:** 750 mg 2 times/day. (**Calcium Citrate): ADULTS, ELDERLY:** 0.5–2 g 2–4 times/day. **CHILDREN:** 45–65 mg/kg/day in 4 divided doses.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent: PO:** Chalky taste. **Parenteral:** Pain, rash, redness, burning at injection site; flushing, nausea, vomiting, diaphoresis, hypotension. **Occasional: PO:** Mild constipation, fecal impaction, peripheral edema, metabolic alkalosis (muscle pain, restlessness, slow respirations, altered taste). **Calcium carbonate:** Milk-alkali syndrome (headache, decreased appetite, nausea, vomiting, unusual fatigue). **Rare:** Urinary urgency, painful urination.

#### ADVERSE EFFECTS/TOXIC REACTIONS

**Hypercalcemia: Early signs:** Constipation, headache, dry mouth, increased thirst, irritability, decreased appetite, metallic taste, fatigue, weakness, depression. **Later signs:** Confusion, drowsiness, hypertension, photosensitivity, arrhythmias, nausea, vomiting, painful urination.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Assess B/P, ECG and cardiac rhythm, renal function, serum magnesium, phosphate, calcium, ionized calcium.

##### INTERVENTION/EVALUATION

Monitor serum BMP, calcium, ionized calcium, magnesium, phosphate; B/P, cardiac rhythm, renal function. Monitor for signs of hypercalcemia.

##### PATIENT/FAMILY TEACHING

- Do not take within 1–2 hrs of other oral medications, fiber-containing foods.
- Avoid excessive use of alcohol, tobacco, caffeine.

## canagliflozin

kan-a-gli-floe-zin  
(Invokana)

**Do not confuse canagliflozin with dapagliflozin, empagliflozin, or ertugliflozin.**

#### FIXED-COMBINATION(S)

**Invokamet:** canagliflozin/metFORMIN (an antidiabetic): 50 mg/500 mg, 50 mg/1,000 mg, 150 mg/500 mg, 150 mg/1,000 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sodium-glucose cotransporter 2 (SGLT2) inhibitor. **CLINICAL:** Antidiabetic.

#### USES

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type

2 diabetes mellitus; risk reduction of major cardiovascular events (cardiovascular death, nonfatal MI, and nonfatal stroke) in adults with type 2 diabetes and established CV disease; reduce risk of end-stage kidney disease, doubling of serum creatinine, cardiovascular death, and hospitalization for HF in pts with type 2 diabetes mellitus and diabetic nephropathy with albuminuria.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to canagliflozin; pts on dialysis. **Cautions:** Concomitant use of loop diuretics, other hypoglycemic agents (e.g., insulin, insulin secretagogues), baseline systolic hypotension, renal impairment, hypovolemia/dehydration, recent genital mycotic infection; pts at risk for diabetic ketoacidosis (insulin dose reduction, acute febrile illness, reduced calorie intake, surgery, alcohol abuse, history of pancreatitis). Not recommended in pts with active bladder cancer, diabetic ketoacidosis, type 1 diabetes mellitus, severe renal impairment (eGFR less than 30 mL/min) when used for glycemic control.

## ACTION

Inhibits SGLT2 in proximal renal tubule, reducing reabsorption of filtered glucose from tubular lumen and lowering renal threshold for glucose. Reduces reabsorption of sodium and increases delivery of sodium to the distal tubule. **Therapeutic Effect:** Increases urinary excretion of glucose; lowers serum glucose levels. Reduces cardiac preload and afterload; downregulates sympathetic activity.

## PHARMACOKINETICS

Rapidly absorbed and widely distributed. Metabolized in liver. Peak plasma concentration: 1–2 hrs. Protein binding: 99%. Excreted in feces (42%), urine (33%). **Half-life:** 11–13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not recommended during second or third trimester. Unknown if distributed in breast milk. Breast-feeding not recommended. **Children:** Safety and efficacy not established. **Elderly:**

May have increased risk for adverse reactions (e.g., hypotension, syncope, dehydration).

## INTERACTIONS

**DRUG:** Fosphenytoin, PHENobarbital, phenytoin may decrease concentration/effect. May increase hypotensive effect of loop diuretics (e.g., bumetanide, furosemide). Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of hypoglycemia. May increase concentration/effects of digoxin. **HERBAL:** Fenugreek, garlic, ginkgo, ginger, ginseng may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum low-density lipoprotein-cholesterol (LDL-C), Hgb, creatinine, magnesium, phosphate, potassium. May decrease glomerular filtration rate. Expected to result in positive urine glucose test. May interfere with 1,5-anhydroglucitol (1,5-AG) assay.

## AVAILABILITY (Rx)

**Tablets:** 100 mg, 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give before first meal of the day.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes Mellitus

**PO; ADULTS/ELDERLY:** 100 mg daily before first meal. May increase to 300 mg daily if glomerular filtration rate (GFR) greater than 60 mL/min.

### Atherosclerotic Cardiovascular Disease

**PO, ADULTS, ELDERLY:** 100–300 mg once daily.

### Diabetic Kidney Disease

**PO; ADULTS, ELDERLY:** 100 mg once daily prior to the first meal of day in pts with urinary albumin excretion greater than 300 mg/day. No further dose titration is necessary.

### Dose Modification

**Concomitant use of insulin, insulin secretagogue:** Consider lowering dose of insulin or insulin secretagogue to reduce hypoglycemic events.

### Concomitant Use of UGT Inducers (e.g., Rifampin, Phenytoin, Ritonavir)

**eGFR 60 mL/min or greater:** Increase dose to 200 mg once daily in pts taking concurrent 100-mg dose. May increase dose to 300 mg once daily in pts tolerating 200-mg dose who require additional glycemic control. **eGFR less than 60 mL/min:** Increase dose to 200 mg once daily in pts taking concurrent 100 mg dose. Consider additional antihyperglycemic agents who require additional glycemic control.

### Dosage in Renal Impairment

**GFR 30–59 mL/min:** 100 mg daily (maximum). **GFR less than 30 mL/min:** Permanently discontinue.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (5%):** Increased urination. **Rare (3%–2%):** Thirst, nausea, constipation.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of lower limb amputations. Symptomatic hypotension (orthostatic hypotension, postural dizziness, syncope) may occur, esp. in pts who are elderly, use concomitant loop diuretics, or have baseline systolic hypotension. Intravascular volume depletion/contraction may cause acute kidney injury requiring dialysis. Fatal cases of ketoacidosis were reported. Hypoglycemic events were reported in pts using concomitant insulin, insulin secretagogues. Infections including influenza, nasopharyngitis, pyelonephritis, urosepsis, UTI, genital mycotic infections (male and female), upper respiratory tract infection may occur. Necrotizing fasciitis of the perineum (Fournier's gangrene), a life-threatening necrotizing infection of the genital and perineum region that requires urgent surgical intervention, has been reported. An increased risk of bone fracture was reported. Hypersensitivity reactions including anaphylaxis, angioedema, urticaria have occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P. Assess hydration status. Correct volume depletion before initiation. Assess pt's understanding of diabetes management, routine home glucose monitoring. Obtain dietary consult for nutritional education. Question history of renal impairment, type 1 diabetes, ketoacidosis. In pts requiring surgery, consider suspending treatment at least 3 days before surgery.

### INTERVENTION/EVALUATION

Monitor BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P periodically. Monitor for ketoacidosis (e.g., dehydration, confusion, extreme thirst, sweet-smelling breath, Kussmaul respirations, nausea), hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (fatigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting). Pts presenting with metabolic acidosis should be screened for ketoacidosis, regardless of serum glucose levels. Concomitant use of beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Monitor for acute kidney injury (dark-colored urine, flank pain, decreased urine output, muscle aches), infections (cough, fatigue, fever), urinary tract infections (dysuria, fever, flank pain, malaise), mycotic infections, Fournier's gangrene (perineal necrosis). Screen for glucose-altering conditions (fever, increased activity or stress, surgical procedures). Monitor weight, I&Os. Monitor for hypersensitivity reactions (anaphylaxis, angioedema, urticaria). Diligently monitor for new leg ulcers, sores, pain; wound may lead to amputation.

### PATIENT/FAMILY TEACHING

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay

meals. Test blood sugar regularly. Monitor daily calorie intake. • When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose). • Genital itching or discharge may indicate yeast infection. • Report symptoms of perineal necrosis (e.g., discoloration, pain, swelling of the scrotum, penis, or perineum). • Therapy may increase risk for dehydration, low blood pressure, which may cause kidney failure. Report decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet. Drink enough fluids to maintain adequate hydration. Pts with HF should be cautious of overhydration. • Report symptoms of UTI, kidney infection (back pain, pelvic pain, burning while urinating, cloudy or foul-smelling urine), allergic reactions (difficulty breathing, rash, wheezing; swelling of the face or tongue). • Go slowly from lying to standing. • Do not breastfeed. • Treatment may cause loss of limbs; immediately report new leg ulcers, pain, tenderness.

## capecitabine

TOP  
100 HIGH  
ALERT

kap-e-sye-ta-bine  
(Xeloda)

■ **BLACK BOX ALERT** ■ May increase anticoagulant effect of warfarin. Fatal hemorrhagic events have occurred.

**Do not confuse capecitabine with decitabine or emtricitabine, or Xeloda with Xenical.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic.

### USES

Treatment of metastatic breast cancer as monotherapy or in combination with docetaxel after failure of prior anthracycline-

containing regimen. Treatment of metastatic colorectal cancer. Adjuvant (postsurgical) treatment of Dukes C colon cancer. **OFF-LABEL:** Gastric cancer, pancreatic cancer, esophageal cancer, ovarian cancer, neuroendocrine tumors, hepatobiliary cancer.

### PRECAUTIONS

**Contraindications:** Severe renal impairment (CrCl less than 30 mL/min), dihydropyrimidine dehydrogenase (DPD) deficiency, hypersensitivity to capecitabine, 5-fluorouracil (5-FU). **Cautions:** Existing bone marrow depression, hepatic impairment, mild to moderate renal impairment, previous cytotoxic therapy/radiation therapy, elderly (60 yrs of age or older).

### ACTION

Enzymatically converted to 5-fluorouracil (5-FU). Inhibits enzymes necessary for synthesis of essential cellular components. **Therapeutic Effect:** Inhibits thymidylate synthetase; blocks methylation of deoxyuridylic acid to thymidylic acid, interfering with DNA, RNA synthesis. Specific for the G<sub>1</sub> and S phases of the cell cycle.

### PHARMACOKINETICS

Readily absorbed from GI tract. Protein binding: less than 60%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 45 min.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to GI side effects.

### INTERACTIONS

**DRUG:** May increase concentration, toxicity of **warfarin**. Myelosuppression may be enhanced when given concurrently with **bone marrow depressants**. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May decrease therapeutic effect of **BCG (intravesical)**. **Allopurinol** may decrease concentration/effect. **HERBAL:** **Echinacea** may decrease

therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. May decrease Hgb, Hct, WBC. May increase PT/INR.

## AVAILABILITY (Rx)

**Tablets:** 150 mg, 500 mg.

## ADMINISTRATION/HANDLING

- Give within 30 min after meals with water.
- Administer whole; do not cut, crush.

## INDICATIONS/ROUTES/DOSAGE

**Metastatic Breast Cancer (as Monotherapy or in Combination With Docetaxel), Metastatic Colorectal Cancer, Adjuvant (Postsurgery) Treatment of Dukes C Colon Cancer**

**PO: ADULTS, ELDERLY:** Initially, 2,500 mg/m<sup>2</sup>/day in 2 equally divided doses approximately q12h apart for 2 wks. Follow with a 1-wk rest period; given in 3-wk cycles.

### Dosage in Renal Impairment

**CrCl 51–80 mL/min:** No adjustment. **CrCl 30–50 mL/min:** 75% of normal dose. **CrCl less than 30 mL/min:** Contraindicated.

### Dosage in Hepatic Impairment

No dose adjustment at start of therapy; interrupt therapy for Grade 3 or 4 hyperbilirubinemia until bilirubin is 3 times ULN or less.

## SIDE EFFECTS

**Frequent (55%–25%):** Diarrhea, nausea, vomiting, stomatitis, fatigue, anorexia, dermatitis. **Occasional (24%–10%):** Constipation, dyspepsia, headache, dizziness, insomnia, edema, myalgia, pyrexia, dehydration, dyspnea, back pain. **Rare (less than 10%):** Mood changes, depression, sore throat, epistaxis, cough, visual abnormalities.

## ADVERSE EFFECTS/TOXIC REACTIONS

Serious reactions include myelosuppression (neutropenia, thrombocytopenia, anemia), cardiovascular toxicity (angina, cardiomyopathy, DVT), respiratory tox-

icity (dyspnea, epistaxis, pneumonia), lymphedema. Palmar-plantar erythrodysesthesia syndrome (PPES), presenting as redness, swelling, numbness, skin sloughing of hands and feet, may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess sensitivity to capecitabine or 5-fluorouracil. Obtain baseline Hgb, Hct, serum chemistries, renal function. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for severe diarrhea, nausea, vomiting; if dehydration occurs, fluid and electrolyte replacement therapy should be initiated. Assess hands/feet for PPES. Monitor CBC for evidence of bone marrow depression. Monitor renal/hepatic function. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

### PATIENT/FAMILY TEACHING

- Report nausea, vomiting, diarrhea, hand-and-foot syndrome, stomatitis.
- Do not have immunizations without physician's approval (drug lowers body's resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever higher than 100.5°F, sore throat, signs of local infection, unusual bruising/bleeding from any site.

## capmatinib

kap-ma-ti-nib  
(Tabrecta)

**Do not confuse capmatinib with cabozantinib, capecitabine, certinib, cobimetinib, crizotinib, or imatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Mesenchymal-epithelial transition (MET) tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with metastatic non–small-cell lung cancer (NSCLC) whose tumors have a mutation that leads to MET exon 14 skipping.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to capmatinib. **Cautions:** Baseline cytopenias; hepatic impairment, pulmonary disease; concomitant use of CYP3A inhibitors, CYP1A2 substrates, P-glycoprotein substrates, breast cancer resistance protein (BCRP) substrates. Avoid concomitant use of strong or moderate CYP3A inducers.

**ACTION**

Inhibits MET phosphorylation (including the mutant variant produced by exon 14 skipping), which increases downstream MET signaling. **Therapeutic Effect:** Decreases tumor cell growth.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver and by aldehyde oxidase. Protein binding: 96%. Peak plasma concentration: 1–2 hrs. Steady state reached in 3 days. Excreted in feces (78%), urine (22%). **Half-life:** 6.5 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Female and male pts of reproductive potential must use effective contraception during treatment and for at least 7 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 7 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inducers (e.g., carBAMazepine, phenytoin, rifAMPin), moderate CYP3A inducers (e.g., bosentan, efavirenz, nafcillin) may decrease concentration/effect. May increase concentration/effect of alpelisib, cladribine, pazopanib, topotecan,

vinCRISTine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, amylase, creatinine, GGT, lipase, potassium. May decrease serum albumin, glucose, phosphate, sodium, magnesium; Hgb, leukocytes, lymphocytes.

**AVAILABILITY (Rx)**

**Tablets:** 150 mg, 200 mg.

**ADMINISTRATION/HANDLING****PO**

- Give with or without regard to food.
- Administer tablets whole; do not break, crush, or divide. Tablet cannot be chewed.
- If vomiting occurs after administration, give next dose at regularly scheduled time (do not give additional dose).

**INDICATIONS/ROUTES/DOSAGE****Non–Small-Cell Lung Cancer**

**PO: ADULTS, ELDERLY:** 400 mg twice daily. Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule for Adverse Events**

**First dose reduction:** 300 mg twice daily. **Second dose reduction:** 200 mg twice daily. **Unable to tolerate 200 mg dose:** Permanently discontinue.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Serum ALT/AST elevation**

**Grade 3 serum ALT/AST elevation (without total bilirubin elevation):** Withhold treatment until improved to baseline. If improved within 7 days, resume at same dose. If not improved within 7 days, resume at reduced dose level. **Grade 4 serum ALT/AST elevation (without total bilirubin elevation):** Permanently discontinue. **Serum ALT/AST elevation greater than 3 times ULN (with total bilirubin elevation greater than 2 times ULN):** Permanently discontinue.

**Hyperbilirubinemia**

**Grade 2 increased total bilirubin (without ALT/AST elevation):** Withhold treatment until improved to baseline. If improved within 7 days, resume at same dose. If not improved within 7 days, resume at reduced dose level. **Grade 3 increased total bilirubin (without ALT/AST elevation):** Withhold treatment until improved to baseline. If improved within 7 days, resume at reduced dose level. If not improved within 7 days, permanently discontinue. **Grade 4 increased total bilirubin (without ALT/AST elevation):** Permanently discontinue.

**Interstitial Lung Disease (ILD)**

**Any grade treatment-related ILD:** Permanently discontinue.

**Other Toxicities**

**Any Grade 2 toxicities:** No dose adjustment. If intolerable, consider withholding treatment until resolved, then resume at reduced dose level. **Any Grade 3 toxicity:** Withhold treatment until resolved, then resume at reduced dose level. **Any Grade 4 toxicities:** Permanently discontinue.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (52%–18%):** Peripheral edema, fatigue, asthenia, nausea, vomiting, dyspnea, decreased appetite, constipation, diarrhea, cough. **Occasional (15%–less than 10%):** Noncardiac chest pain, back pain, pyrexia, decreased weight, pruritus, urticaria.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, leukopenia, lymphopenia is an expected response to therapy. Pneumonitis, ILD reported in 5% of pts. Hepatotoxicity reported in 13% of pts. Photosen-

sitivity reactions from UV exposure may increase risk of sunburn, skin erythema. Acute kidney injury, cellulitis reported in less than 10% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFTs; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Confirm presence of mutation that leads to MET exon 14 skipping in tumor expression. Question history of hepatic impairment, pulmonary disease. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor LFTs q2wks for 3 mos, then monthly thereafter (or more frequently in pts with hepatotoxicity). Monitor BUN, CrCl, serum creatinine periodically for acute kidney injury. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Monitor for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor, P-glycoprotein inhibitor, CYP1A2 inhibitor is unavoidable.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling); liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine).
- Females and males of childbearing potential must use reliable contraception during treatment and for at

least 7 days after last dose. Do not breast-feed. • Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen, lip balm, clothing to protect against sunburn. • There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy. • Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## captopril

kap-toe-pril

**BLACK BOX ALERT** ■ May cause injury/death to developing fetus. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse captopril with calcitriol, Capitrol, carvedilol, enalapril, fosinopril, lisinopril, Monopril, or quinapril.**

### FIXED-COMBINATION(S)

**Capozide:** captopril/hydroCHLORothiazide (a diuretic): 25 mg/15 mg, 25 mg/25 mg, 50 mg/15 mg, 50 mg/25 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-converting enzyme (ACE) inhibitor. **CLINICAL:** Antihypertensive, vasodilator.

### USES

Treatment of heart failure. Management of hypertension. Treatment of diabetic nephropathy (proteinuria greater than 500 mg/day) in pts with type 1 diabetes mellitus and retinopathy. Improve survival following myocardial infarction (MI), including pts with left ventricular dysfunction manifested as an ejection fraction of less than or equal to 40%.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to captopril. History of angioedema from previous treatment with ACE inhibitors,

concomitant use with aliskiren in pts with diabetes mellitus. Coadministration with or within 36 hrs of switching to or from a neprilysin inhibitor (e.g., sacubitril). **Cautions:** Renal impairment; hypertrophic cardiomyopathy with outflow obstruction before, during, or immediately after major surgery. Unstented unilateral/bilateral renal artery stenosis. Concomitant use of potassium-sparing diuretics, potassium supplements.

### ACTION

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular and renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Lowers BP. Improves HE, diabetic neuropathy.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.25 hr	0.5–1.5 hrs	Dose-related

Rapidly, well absorbed from GI tract (absorption decreased in presence of food). Protein binding: 25%–30%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** Less than 3 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. May cause fetal/neonatal mortality/morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

### INTERACTIONS

**DRUG:** Aliskiren may increase hyperkalemic effect. May increase potential for allergic reactions to allopurinol. **Angiotensin II receptor blockers (ARBs)** (e.g., losartan, valsartan) may increase adverse effects. May increase adverse effects of lithium, sacubitril. **HERBAL:** Herbs with hypertensive properties (e.g., licorice,

yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Licorice may cause sodium and water retention, hypokalemia. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

### AVAILABILITY (Rx)

**Tablets:** 12.5 mg, 25 mg, 50 mg, 100 mg.

### ADMINISTRATION/HANDLING

#### PO

- Administer 1 hr before or 2 hrs after meals for maximum absorption (food may decrease drug absorption).
- Tablets may be crushed.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 12.5–25 mg 2–3 times/day. May increase by 12.5–25 mg/dose at 1–2-wk intervals up to 50 mg 3 times/day. Add diuretic before further increase in dose. **CHILDREN, ADOLESCENTS:** 0.3–0.5 mg 3 times/day. **Maximum:** 6 mg/kg/day in 3 divided doses. **INFANTS:** 0.05–0.3 mg/kg/dose. May titrate up to maximum of 6 mg/kg/day in 3 divided doses. Usual range: 2.5–6 mg/kg/day in 3 divided doses. **NEONATES:** 0.01–0.1 mg/kg/dose q8–24h. **Maximum:** 0.5 mg/kg/dose q6–24h.

#### HF

**PO: ADULTS, ELDERLY:** Initially, 6.25 mg 3 times/day. **Target dose:** 50 mg 3 times/day.

#### Post-MI

**PO: ADULTS, ELDERLY:** Initially, 6.25 mg. If tolerated, then 12.5 mg 3 times/day. Increase to 25 mg 3 times/day over several days, up to target dose of 50 mg 3 times/day over several wks.

#### Diabetic Nephropathy

**PO: ADULTS, ELDERLY:** 25 mg 3 times/day.

#### Dosage in Renal Impairment

**CrCl 10–50 mL/min:** 75% of normal dosage. **CrCl less than 10 mL/min:** 50% of normal dosage.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent (7%–4%):** Rash. **Occasional (4%–2%):** Pruritus, dysgeusia. **Rare (less than 2%):** Headache, cough, insomnia, dizziness, fatigue, paresthesia, malaise, nausea, diarrhea or constipation, dry mouth, tachycardia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypotension (“first-dose syncope”) may occur in pts with HF and in those who are severely sodium/volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia noted in those with collagen vascular disease (scleroderma, systemic lupus erythematosus), renal impairment. Nephrotic syndrome noted in those with history of renal disease.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain B/P immediately before each dose in addition to regular monitoring (be alert to fluctuations). In pts with prior renal disease or receiving dosages greater than 150 mg/day, test urine for protein by dipstick method with first urine of day before therapy begins and periodically thereafter. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, obtain CBC before beginning therapy, q2wks for 3 mos, then periodically thereafter.

#### INTERVENTION/EVALUATION

Assess skin for rash, pruritus. Assist with ambulation if dizziness occurs. Monitor urinalysis for proteinuria. Monitor serum potassium levels in pts on concurrent diuretic therapy. Monitor B/P, serum BUN, creatinine, CBC. Discontinue medication, contact physician if angioedema occurs.

#### PATIENT/FAMILY TEACHING

- Full therapeutic effect of B/P reduction may take several wks.
- Skipping doses or voluntarily discontinuing drug may

produce severe rebound hypertension. • Limit alcohol intake. • Immediately report if swelling of face, lips, or tongue, difficulty breathing, vomiting, diarrhea, excessive perspiration, dehydration, persistent cough, sore throat, fever occur. • Inform physician if pregnant or planning to become pregnant. • Rise slowly from sitting/lying position.

## carBAMazepine

kar-ba-maz-e-peen  
(Carbatrol, Epitol, Equetro,  
TEGretol, TEGretol XR)

**BLACK BOX ALERT** ■ Potentially fatal aplastic anemia, agranulocytosis reported. Potentially fatal, severe dermatologic reactions (e.g., Stevens-Johnson syndrome, toxic epidermal necrolysis) may occur. Risk increased in pts with the variant HLA-β\* 1502 allele, almost exclusively in pts of Asian ancestry.

**Do not confuse carBAMazepine with OXcarbazepine, eslicarbazepine, or TEGretol with Mebaral, Toprol XL, Toradol, or TRENtal.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Iminostilbene derivative. **CLINICAL:** Anticonvulsant.

### USES

**Carbatrol, Epitol, TEGretol, TEGretol XR:** Treatment of partial seizures with complex symptomatology, generalized tonic-clonic seizures, mixed seizure patterns, pain relief of trigeminal, glossopharyngeal neuralgia. **Equetro:** Acute manic and mixed episodes associated with bipolar disorder. **OFF-LABEL:** Neuropathic pain in critically ill pts.

### PRECAUTIONS

**Contraindications:** Concomitant use or within 14 days of use of MAOIs, myelosuppression. Concomitant use of delavirdine or other NNRT inhibitors that are

substrates of CYP3A4. Hypersensitivity to carBAMazepine, tricyclic antidepressants. **Cautions:** High risk of suicide, increased IOP, hepatic or renal impairment, history of cardiac impairment, ECG abnormalities, elderly.

### ACTION

Decreases sodium ion influx into neuronal membranes (may depress activity in thalamus, decreasing synaptic transmission or decreasing temporal stimulation, leading to neural discharge). **Therapeutic Effect:** Produces anticonvulsant effect.

### PHARMACOKINETICS

Slowly, completely absorbed from GI tract. Protein binding: 75%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 25–65 hrs (decreased with chronic use).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. Accumulates in fetal tissue. **Children:** Behavioral changes more likely to occur. **Elderly:** More susceptible to confusion, agitation, AV block, bradycardia, syndrome of inappropriate antidiuretic hormone (SIADH).

### INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., cimetidine, clarithromycin, azole antifungals, protease inhibitors) may increase concentration. CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effects. May decrease concentration/effects of hormonal contraceptives, warfarin, trazodone. May decrease concentration/effects of abemaciclib, apixaban, axitinib, bosutinib, brigatinib, dronedarone, nifedipine, ranolazine, regorafenib, vorapaxar, voriconazole. May decrease therapeutic effect of BCG (intravesical). **HERBAL:** Gotu kola, kava kava, valerian may increase CNS depression. **FOOD:** Grapefruit prod-

**ucts** may increase concentration/effect. **LAB VALUES:** May increase serum BUN, glucose, alkaline phosphatase, bilirubin, ALT, AST, cholesterol, HDL, triglycerides. May decrease serum calcium, thyroid hormone (T<sub>3</sub>, T<sub>4</sub> index) levels. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

### AVAILABILITY (Rx)

**Oral Suspension:** 100 mg/5 mL. **Tablets:** 200 mg. **Tablets: (Chewable):** 100 mg.

 **Capsules: (Extended-Release):** 100 mg, 200 mg, 300 mg. **Tablets: (Extended-Release):** 100 mg, 200 mg, 400 mg.

### ADMINISTRATION/HANDLING

#### PO

- Store oral suspension, tablets at room temperature.
- To reduce GI distress, give tablets or extended-release tablets with food. May give extended-release capsules without regard to food. Give extended-release capsules whole; do not cut or crush. Capsules may be opened and beads sprinkled on food (e.g., applesauce).
- Give extended-release tablets whole; do not break, cut, or crush. Extended-release formulations cannot be chewed.
- Shake oral suspension well. Do not administer simultaneously with other liquid medicine.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Suspension must be given on a 3–4 times/day schedule; tablets on a 2–4 times/day schedule; extended-release capsules 2 times/day. (**Carnexiv**): 70% of total oral dose given as four 30-min infusions separated by 6 hrs.

#### Seizure Control

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** Initially, 2–3 mg/kg/day (100–200 mg/day). May increase dose by 200 mg or less per day in time increments of at least q5days. Usual dose: 800–1,200 mg/day in 2–4 divided doses. **Maximum: ADULTS, ELDERLY:** 1,600 mg/day; **CHILDREN OLDER THAN 15 YRS:** 1,200 mg/day; **CHILDREN 13–15 YRS:** 1,000 mg/day. **CHILDREN 6–12 YRS:** Initially, 100 mg

twice daily (tablets) or 4 times/day (oral suspension). May increase by 100 mg/day at wkly intervals. **Usual dose:** 400–800 mg/day. **Maximum:** 1,000 mg/day. **CHILDREN YOUNGER THAN 6 YRS:** Initially, 10–20 mg/kg/day 2–3 times/day (tablets) or 4 times/day (suspension). May increase at wkly intervals until optimal response and therapeutic levels are achieved. **Maximum:** 35 mg/kg/day.

#### Trigeminal, Glossopharyngeal Neuralgia, Diabetic Neuropathy

**PO: ADULTS, ELDERLY:** Initially, 200–400 mg/day, gradually increasing (e.g., over several weeks) in increments of 200 mg/day as needed. **Usual dose:** 600–800 mg daily. **Maximum:** 1,200 mg/day.

#### Bipolar Disorder

**PO: ADULTS, ELDERLY:** Initially, 100–400 mg/day in 2 divided doses. May adjust dose in 200-mg increments q1–4 days. **Usual range:** 600–1,200 mg/day. **Maximum:** 1,600 mg/day in divided doses.

#### Dosage in Renal Impairment

**CrCl less than 10 mL/min:** 75% of normal dose. **HD:** 75% of normal dose. **CRRT:** 75% of normal dose.

#### Dosage in Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Frequent (greater than 10%):** Vertigo, somnolence, ataxia, fatigue, leukopenia, rash, urticaria, nausea, vomiting. **Occasional (10%–1%):** Headache, diplopia, blurred vision, thrombocytopenia, dry mouth, edema, fluid retention, increased weight. **Rare (less than 1%):** Tremors, visual disturbances, lymphadenopathy, jaundice, involuntary muscle movements, nystagmus, dermatitis.

### ADVERSE EFFECTS/TOXIC REACTIONS

Toxic reactions appear as blood dyscrasias (aplastic anemia, agranulocytosis, thrombocytopenia, leukopenia, leukocytosis, eosinophilia), cardiovascular

disturbances (HF, hypotension/hypertension, thrombophlebitis, arrhythmias), dermatologic effects (rash, urticaria, pruritus, photosensitivity). Abrupt withdrawal may precipitate status epilepticus.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

CBC, serum iron determination, urinalysis, BUN should be performed before therapy begins and periodically during therapy. **Seizures:** Review history of seizure disorder (intensity, frequency, duration, level of consciousness [LOC]). Initiate seizure precautions. **Neuralgia:** Assess facial pain, stimuli that may cause facial pain. **Bipolar:** Assess mental status, cognitive abilities.

### INTERVENTION/EVALUATION

**Seizures:** Observe frequently for recurrence of seizure activity. Monitor therapeutic levels. Assess for clinical improvement (decrease in intensity, frequency of seizures). Assess for clinical evidence of early toxicity (fever, sore throat, mouth ulcerations, unusual bruising/bleeding, joint pain). **Neuralgia:** Avoid triggering tic douloureux (draft, talking, washing face, jarring bed, hot/warm/cold food or liquids). **Bipolar:** Monitor for suicidal ideation, behavioral changes. Observe for excessive sedation. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue medication after long-term use (may precipitate seizures).
- Strict maintenance of therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report visual disturbances.
- Blood tests should be repeated frequently during first 3 mos of therapy and at monthly intervals thereafter for 2–3 yrs.
- Do not take oral suspension simultaneously with other liquid medicine.
- Do not ingest grapefruit products.
- Report serious skin reactions.

## carbidopa/levodopa

kar-bi-doe-pa/lee-voe-doe-pa  
(Apo-Levocarb , Duopa, Rytary, Sinemet)

**Do not confuse Sinemet with Serevent.**

### FIXED-COMBINATION(S)

**Stalevo:** carbidopa/levodopa/entacapone (antiparkinson agent): 12.5 mg/50 mg/200 mg, 18.75 mg/75 mg/200 mg, 25 mg/100 mg/200 mg, 31.25 mg/125 mg/200 mg, 37.5 mg/150 mg/200 mg, 50 mg/200 mg/200 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** DOPA-mine precursor. Decarboxylase inhibitor. **CLINICAL:** Antiparkinson agent.

### USES

Treatment of Parkinson's disease, post-encephalitic parkinsonism, symptomatic parkinsonism following CNS injury by carbon monoxide poisoning, manganese intoxication. **Duopa:** Treatment of motor fluctuations in advanced Parkinson's disease. **OFF-LABEL:** Restless legs syndrome.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to carbidopa/levodopa. Concurrent use with MAOIs or use within 14 days. (Tablets only): Narrow-angle glaucoma. **Cautions:** History of MI, arrhythmias, bronchial asthma, emphysema, severe cardiac, pulmonary, renal/hepatic impairment; active peptic ulcer, treated open-angle glaucoma, seizure disorder, pts at risk for hypotension; elderly.

### ACTION

Levodopa is converted to DOPamine in basal ganglia, increasing DOPamine concentration in brain, inhibiting hyperactive cholinergic activity. Carbidopa prevents peripheral breakdown of levodopa, making more levodopa available for transport into brain. **Therapeutic Effect:** Treats

symptoms associated with Parkinson's disease.

## PHARMACOKINETICS

Widely distributed. Excreted primarily in urine. Levodopa is converted to DOPamine. Excreted primarily in urine. **Half-life:** 1–2 hrs (carbidopa); 1–3 hrs (levodopa).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. May inhibit lactation. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** More sensitive to effects of levodopa. Anxiety, confusion, nervousness more common when receiving anticholinergics.

## INTERACTIONS

**DRUG:** Antipsychotics, pyridoxine may decrease therapeutic effect. May increase adverse effects of MAOIs (e.g., phenelzine, selegiline). **HERBAL:** None significant. **FOOD:** High-protein diets may cause decreased or erratic response to levodopa. **LAB VALUES:** May increase serum BUN, LDH, alkaline phosphatase, bilirubin, ALT, AST. May decrease Hgb, Hct, WBC.

## AVAILABILITY (Rx)

**Enteral Suspension:** (*Duopa*): 100-mL cassette containing 4.63 mg carbidopa and 20 mg levodopa per mL. **Tablets:** (*Immediate-Release [Sinemet]*): 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Tablets:** (*Orally Disintegrating Immediate-Release*): 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa.

**Capsules:** (*Extended-Release [Rytary]*): carbidopa/levodopa: 23.75 mg/95 mg, 36.25 mg/145 mg, 48.75 mg/195 mg, 61.25 mg/245 mg. **Tablets:** (*Extended-Release*): 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa.

## ADMINISTRATION/HANDLING

**Note:** Space doses evenly over waking hours.

### Enteral Suspension

- Refrigerate. Remove 20 min prior to administration.

### PO

- Scored tablets may be crushed.
- Give with meals to decrease GI upset.
- Do not crush or chew extended-release tablets.

### PO

- (*Parcopa*): Place orally disintegrating tablet on top of tongue. Tablet will dissolve in seconds; pt to swallow with saliva. Not necessary to administer with liquid.

## INDICATIONS/ROUTES/DOSAGE

### Parkinsonism

**PO: ADULTS, ELDERLY:** (*Immediate-Release Orally Disintegrating Tablet*): Initially, 25/100 mg 3 times/day. May increase daily or every other day by 1 tablet up to 200/2,000 mg daily. (*Extended-Release*): 50/200 mg 2 times/day at least 6 hrs apart. Intervals between doses of Sinemet CR should be 4–8 hrs while awake, with smaller doses at end of day if doses are not equal. May adjust q3days. **Maximum:** 8 tablets/day. (*Rytary*): Initially, 23.75/95 mg 3 times/day for 3 days, then to 36.25/145 mg 3 times/day. Frequency may be increased to maximum of 5 times/day if needed and tolerated. **Maximum daily dose:** 612.5/2450 mg/day. (*Enteral Suspension*): **Maximum:** 2000 mg (1 container) over 16 hrs through NJ or PEG tube via infusion pump. Also take oral immediate-release in evening after disconnecting pump. Refer to manufacturer's guidelines for morning dose, continuous dose escalation, titration instructions.

### Dosage in Renal/Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent (80%–50%):** Involuntary movements of face, tongue, arms, upper body; nausea/vomiting; anorexia. **Occa-**

**signal:** Depression, anxiety, confusion, nervousness, urinary retention, palpitations, dizziness, light-headedness, decreased appetite, blurred vision, constipation, dry mouth, flushed skin, headache, insomnia, diarrhea, unusual fatigue, darkening of urine and sweat. **Rare:** Hypertension, ulcer, hemolytic anemia (marked by fatigue).

## ADVERSE EFFECTS/TOXIC REACTIONS

High incidence of involuntary choreiform, dystonic, dyskinetic movements may occur in pts on long-term therapy. Numerous mild to severe CNS and psychiatric disturbances may occur (reduced attention span, anxiety, nightmares, daytime drowsiness, euphoria, fatigue, paranoia, psychotic episodes, depression, hallucinations).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess symptoms of Parkinson's disease (e.g., muscular rigidity, pen rolling motion, gait disturbance, tremors), emotional state. Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Be alert to neurologic effects (headache, lethargy, mental confusion, agitation). Monitor for evidence of dyskinesia (difficulty with movement). Assess for clinical reversal of symptoms (improvement of tremor of head and hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Monitor B/P (standing, sitting, supine).

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Take with food to minimize GI upset.
- Effects may be delayed from several wks to mos.
- May cause darkening of urine or sweat (not harmful).
- Report any uncontrolled movement of face, eyelids, mouth, tongue, arms, hands, legs; mental changes; palpitations; severe or persistent nausea/vomiting; difficulty urinating.
- Report exacerbations of asthma, underlying depression, psychosis.

## CARBOplatin

**HIGH  
ALERT**

kar-boe-plat-in  
(Paraplatin)

**BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents (high potential for severe reactions, including anaphylaxis [may occur within minutes of administration] and sudden death). Profound myelosuppression (anemia, thrombocytopenia) has occurred. Vomiting may occur.

**Do not confuse CARBOplatin with CISplatin or oxaliplatin, or with Platinol.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent. Platinum analog. **CLINICAL:** Antineoplastic.

## USES

Treatment of advanced ovarian carcinoma. Palliative treatment of recurrent ovarian cancer. **OFF-LABEL:** Brain tumors, Hodgkin's and non-Hodgkin's lymphomas, malignant melanoma, retinoblastoma; treatment of breast, bladder, cervical, endometrial, esophageal, small-cell lung, non-small-cell lung, head and neck, testicular carcinomas; germ cell tumors, osteogenic sarcoma.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to CARBOplatin. History of severe allergic reaction to CISplatin, platinum compounds, mannitol; severe bleeding, severe myelosuppression. **Cautions:** Moderate bone marrow depression, renal impairment, elderly.

## ACTION

Inhibits DNA synthesis by cross-linking with DNA strands, preventing cell division. **Therapeutic Effect:** Interferes with DNA function.

## PHARMACOKINETICS

Protein binding: Low. Hydrolyzed in solution to active form. Primarily excreted in urine. **Half-life:** 2.6–5.9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Peripheral neurotoxicity increased, myelotoxicity may be more severe. Age-related renal impairment may require decreased dosage, careful monitoring of blood counts.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., cladribine) may increase myelosuppression. May increase adverse effects of clozapine, natalizumab, leflunomide. May increase immunosuppressive effect of baricitinib, fingolimod. May increase concentration/effect of bexarotene. May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of vaccines (live). **HERBAL:** None significant. Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, magnesium, potassium, sodium. May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, AST.

## AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL (5 mL, 15 mL, 45 mL, 60 mL).

## ADMINISTRATION/HANDLING

**⚠️ ALERT** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

### IV

**Reconstitution** • Dilute with D<sub>5</sub>W or 0.9% NaCl to a final concentration as low as 0.5 mg/mL.

**Rate of administration** • Infuse over 15–60 min. • Rarely, anaphylactic reaction occurs minutes after administration. Use of epinephrine, corticosteroids alleviates symptoms.

**Storage** • Store vials at room temperature. • After dilution, solution is stable for 8 hrs.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Etoposide (VePesid), granisetron (Kytril), ondansetron (Zofran), PAclitaxel (Taxol), palonosetron (Aloxi).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Doses commonly calculated by target AUC.

### Ovarian Carcinoma

**IV: ADULTS:** Target AUC 5–6 over 1 hr on day 1; repeat q3 wks for 3–6 cycles (in combination with paclitaxel). Do not repeat dose until neutrophil and platelet counts are within acceptable levels.

### Dose Modification

**Platelets less than 50,000 cells/mm<sup>3</sup> or ANC less than 500 cells/mm<sup>3</sup>:** Give 75% of dose.

### Dosage in Renal Impairment

Initial dosage is based on creatinine clearance; subsequent dosages are based on pt's tolerance, degree of myelosuppression.

#### Creatinine Clearance

#### Dosage Day 1

60 mL/min or greater	360 mg/m <sup>2</sup>
41–59 mL/min	250 mg/m <sup>2</sup>
16–40 mL/min	200 mg/m <sup>2</sup>

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (80%–65%):** Nausea, vomiting. **Occasional (17%–4%):** Generalized pain, diarrhea/constipation, peripheral neuropathy. **Rare (3%–2%):** Alopecia, asthenia, hypersensitivity reaction (erythema, pruritus, rash, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression may be severe, resulting in anemia, infection (sepsis, pneumonia), major bleeding. Prolonged treatment may result in peripheral neurotoxicity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ECG, CBC, serum chemistries, renal function test. Offer emotional support. Do not repeat treatment until WBC recovers from previous therapy. Transfusions may be needed in pts receiving prolonged therapy (myelosuppression increased in those with previous therapy, renal impairment).

### INTERVENTION/EVALUATION

Monitor pulmonary function studies, hepatic/renal function tests, CBC, serum electrolytes. Monitor for fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness).

### PATIENT/FAMILY TEACHING

- Nausea, vomiting generally abate within 24 hrs.
- Do not have immunizations without physician's approval (drug lowers body's resistance).
- Avoid contact with those who have recently received live virus vaccine.

## carfilzomib

kar-fil-zoh-mib  
(Kyprolis)

**Do not confuse carfilzomib with crizotinib, ixazomib, PAZopanib.**

### ♦ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Proteasome inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment (monotherapy) of relapsed or refractory multiple myeloma in adults who have received 1 or more lines of therapy. Treatment of relapsed or refractory multiple myeloma (in combination with dexamethasone, or with lenalidomide and dexamethasone, or with daratumumab

and dexamethasone) in adults who have received 1–3 prior lines of therapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to carfilzomib. **Cautions:** Preexisting HF; decreased left ventricular ejection fraction, myocardial abnormalities, complications of pulmonary hypertension (e.g., dyspnea), hepatic impairment, thrombocytopenia.

### ACTION

Blocks action of proteasomes (responsible for intracellular protein homeostasis). **Therapeutic Effect:** Produces cell cycle arrest and apoptosis.

### PHARMACOKINETICS

Protein binding: 97%. Rapidly, extensively metabolized. Excreted primarily extrahepatically. Minimal removal by hemodialysis. **Half-life:** Equal to or less than 1 hr on day 1 of cycle 1. Proteasome inhibition was maintained for 48 hrs or longer following first dose of carfilzomib for each week of dosing.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy. May cause fetal harm. Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease levels/effect of **BCG (intravesical)**. May increase myelosuppressive effect of **myelosuppressants (e.g., cladribine)**. **Oral contraceptives** may increase risk of thrombosis. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, glucose, creatinine, ALT, AST, bilirubin, calcium. May decrease RBC, Hgb, Hct, absolute neutrophil count (ANC), platelet count; serum magnesium, phosphate, potassium, sodium.

### AVAILABILITY (Rx)

**Injection Powder for Reconstitution (Single-Use Vial):** 10 mg, 30 mg, 60 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 60-mg vial with 29 mL Sterile Water for Injection (30-mg vial with 15 mL, 10 mg with 5 mL), directing solution to inside wall of vial (minimizes foaming). • Swirl and invert vial slowly for 1 min or until completely dissolved. • Do not shake. • If foaming occurs, rest vial for 2–5 min until subsided. • Withdraw calculated dose from vial and dilute into 50–100 mL D<sub>5</sub>W (depending on dose and infusion duration). • Final concentration of reconstituted solution: 2 mg/mL.

**Rate of administration** • Infuse over 10–30 min (depending on the dose regimen) via dedicated IV line. Flush line before and after with NaCl or D<sub>5</sub>W. • Do not administer as a bolus.

**Storage** • Refrigerate unused vials. • Reconstituted solution may be refrigerated up to 24 hrs. • At room temperature, use diluted solution within 4 hrs.

## IV INCOMPATIBILITIES

Do not mix with other IV medications or additives. Flush IV administration line with NaCl or D<sub>5</sub>W immediately before and after carfilzomib administration.

## INDICATIONS/ROUTES/DOSAGE

**⚠️ ALERT** Dose is calculated using pt's actual body surface area at baseline. Pts with a body surface area greater than 2.2 m<sup>2</sup> should receive dose based on a body surface area of 2.2 m<sup>2</sup>. No dose adjustment needed for weight changes of less than or equal to 20%.

**⚠️ ALERT** Prior to each dose in cycle 1, give 250 mL to 500 mL NaCl bolus. Give an additional 250 mL to 500 mL IV fluid following administration. Continue IV hydration in subsequent cycles (reduces risk of renal toxicity, tumor lysis syndrome). Premedicate with dexamethasone 4 mg PO or IV prior to all doses during cycle 1 and prior to all doses during first cycle of dose escalation to 27 mg/m<sup>2</sup> (reduces incidence, severity of

infusion reactions). Reinstatement dexamethasone premedication (4 mg PO or IV) if symptoms develop or reappear during subsequent cycles.

### Multiple Myeloma, Relapsed/Refractory (Single-Agent 20/27 mg/m<sup>2</sup> Regimen)

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> over 10 min on days 1 and 2. If tolerated, increase to 27 mg/m<sup>2</sup> over 10 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 27 mg/m<sup>2</sup> over 10 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13 and beyond: 27 mg/m<sup>2</sup> over 10 min on days 1, 2, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

### Multiple Myeloma, Relapsed/Refractory (Single-Agent 20/56 mg/m<sup>2</sup> Regimen)

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> over 30 min on days 1 and 2. If tolerated, increase to 56 mg/m<sup>2</sup> over 30 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 56 mg/m<sup>2</sup> over 30 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13 and beyond: 56 mg/m<sup>2</sup> over 30 min on days 1, 2, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

### Multiple Myeloma, Relapsed/Refractory (in Combination With Lenalidomide and Dexamethasone)

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> over 10 min on days 1 and 2. If tolerated, increase to 27 mg/m<sup>2</sup> over 10 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 27 mg/m<sup>2</sup> over 10 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13–18: 27 mg/m<sup>2</sup> over 10 min on days 1, 2, 15, and 16 of a 28-day cycle. Beginning with cycle 19, lenalidomide and dexamethasone may be continued (until disease progression or unacceptable toxicity) without carfilzomib.

### Multiple Myeloma, Relapsed/Refractory (in Combination With Dexamethasone)

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> over 30 min on days 1 and 2. If

tolerated, increase to 56 mg/m<sup>2</sup> over 30 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycle 2 and beyond: 56 mg/m<sup>2</sup> over 30 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

**Multiple Myeloma, Relapsed/Refractory (in Combination With Dexamethasone; 20/70 mg/m<sup>2</sup> Regimen [once-wkly dosing])**

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> over 30 min on day 1. Increase dose to 70 mg/m<sup>2</sup> over 30 min on days 8 and 15 of a 28-day treatment cycle. Cycle 2 and beyond: 70 mg/m<sup>2</sup> over 30 min on days 1, 8, and 15 of a 28-day treatment cycle. Continue until disease progression or unacceptable toxicity.

**Multiple Myeloma, Relapsed/Refractory (in Combination With Daratumumab and Dexamethasone; 20/56 mg/m<sup>2</sup> Regimen [twice-wkly dosing])**

**IV infusion: ADULTS, ELDERLY:** Cycle 1: 20 mg/m<sup>2</sup> on days 1 and 2; if tolerated, increase to 56 mg/m<sup>2</sup> on days 8, 9, 15, and 16 of a 28-day cycle. **Cycles 2 and thereafter:** 56 mg/m<sup>2</sup> on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle; continue until disease progression or unacceptable toxicity.

**Multiple Myeloma, Relapsed/Refractory (in Combination With Daratumumab and Dexamethasone; 20/70 mg/m<sup>2</sup> Regimen [once-wkly dosing])**

**IV infusion: Cycle 1:** 20 mg/m<sup>2</sup> on day 1; if tolerated, increase dose to 70 mg/m<sup>2</sup> on days 8 and 15 of a 28-day cycle. **Cycles 2 and thereafter:** 70 mg/m<sup>2</sup> over on days 1, 8, and 15 of a 28-day cycle; continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Hematologic Toxicity**

**Grade 3 or 4 neutropenia:** Withhold dose. Continue at same dose if fully recovered prior to next scheduled dose. If recovered to Grade 2, reduce dose by one dose level. If dose tolerated, may escalate to previous dose. **Grade 4 thrombocytopenia:** Withhold dose. Continue at same dose if fully recovered prior to next

scheduled dose. If recovered to Grade 3, reduce dose by one dose level. If dose tolerated, may escalate to previous dose.

**Cardiotoxicity**

**Grade 3 or 4, new onset or worsening of HF, decreased LVEF, myocardial ischemia:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

**Hepatotoxicity**

**Grade 3 or 4 elevation of bilirubin, transaminases:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

**Peripheral Neuropathy**

**Grade 3 or 4:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

**Pulmonary Toxicity**

**Pulmonary hypertension:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose. **Grade 3 or 4 pulmonary complications:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

**Renal Toxicity**

**Serum creatinine 2 times or greater from baseline:** Withhold dose until renal function improves to Grade 1 or baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (56%–20%):** Fatigue, anemia, nausea, exertional dyspnea, diarrhea, fever, headache, cough, peripheral edema, vomiting, constipation, back pain. **Occasional**

(18%–14%): Insomnia, chills, arthralgia, muscle spasms, hypertension, asthenia, extremity pain, dizziness, hypoesthesia (decreased sensitivity to touch), anorexia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Pneumonia (10% of pts), acute renal failure (4% of pts), pyrexia (3% of pts), and HF (3% of pts) were reported. Adverse reactions leading to discontinuation occurred in 15% of pts. Upper respiratory tract infection reported in 28% of pts. HF, pulmonary edema, decrease in ejection fraction were reported in 7% of pts. Infusion reaction characterized by chills, fever, wheezing, facial flushing, dyspnea, vomiting, chest tightness can occur immediately following or up to 24 hrs after administration. Tumor lysis syndrome occurs rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain accurate height and weight. Obtain full history of home medications including vitamins, herbal products. Ensure hydration status and maintain throughout treatment. Obtain CBC, BMP, LFT. Assess vital signs, O<sub>2</sub> saturation. Platelet nadirs occur around day 8 of each 28-day cycle and recover to baseline by start of the next 28-day cycle. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for fluid overload. Monitor platelet count frequently; adjust dose according to grade of thrombocytopenia. Obtain serum ALT, AST, bilirubin for evidence of hepatotoxicity. Monitor vital signs, O<sub>2</sub> saturation routinely. Monitor cardiac function and manage as needed. Assess for palpitations, tachycardia. Assess for anemia-related dizziness, exertional dyspnea, fatigue, weakness, syncope. Monitor for acute infection (fever, diaphoresis, lethargy, oral mucosal changes, productive cough), bloody stools, bruising, hematuria, DVT, pulmonary embolism. Encour-

age nutritional intake and assess anorexia, weight loss. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetics if nausea, vomiting occur. Monitor for symptoms of neutropenia.

### PATIENT/FAMILY TEACHING

- Immediately report any newly prescribed medications.
- May alter taste of food or decrease appetite.
- Report bloody stool/urine, increased bruising, difficulty breathing, weakness, dizziness, palpitations, weight loss.
- Maintain strict oral hygiene.
- Do not have immunizations without physician approval (drug lowers body's resistance).
- Avoid those who have recently taken live virus vaccine.
- Avoid crowds, those with symptoms of viral illness.

## cariprazine

kar-**ip**-ra-zeen  
(Vraylar)

**BLACK BOX ALERT** Elderly pts treated with antipsychotic drugs are at an increased risk of death. Treatment not approved in pts with dementia-related psychosis. Increased risk of suicidal thoughts and behavior in pediatric and young adult pts.

**Do not confuse cariprazine with Compazine or mirtazapine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin receptor antagonist. **CLINICAL:** Second-generation (atypical) antipsychotic.

## USES

Treatment of schizophrenia. Acute treatment of manic or mixed episodes and major depression associated with bipolar I disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to cariprazine. **Cautions:** Baseline cytopenias; debilitated, diabetes mellitus, dyslipidemia, elderly, hepatic impairment,

Parkinson's disease, pts at risk for hypotension (dehydration, hypovolemia, concomitant use of antihypertensives), pts at risk for aspiration, dysphagia; history of cardiovascular disease (e.g., ischemic heart disease, HF, cardiac arrhythmias); pts at risk for CVA, TIA; hx of seizures. Concomitant use of medications that lower seizure threshold. Avoid concomitant use of CYP3A inducers.

## ACTION

Partial agonist of central DOPamine D<sub>2</sub> and serotonin 5-HT<sub>1A</sub> receptors and antagonist of serotonin 5-HT<sub>2A</sub> receptors. **Therapeutic Effect:** Diminishes symptoms of psychotic behavior.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 91%–97%. Peak plasma concentration: 3–6 hrs. Mean plasma concentrations decrease approx. 50% after 1 wk from last dose. Excreted primarily in urine (21%). **Half-life:** 2–4 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. May increase risk of extrapyramidal symptoms and/or withdrawal syndrome in neonates. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May increase risk of adverse effects due to age-related cardiac/hepatic/renal impairment.

## INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, rifampin), moderate CYP3A inducers (e.g., nafcillin) may decrease concentration/effect; avoid use. Alcohol, antidepressants (e.g., sertraline, nortriptyline), benzodiazepines (e.g., diazepam, loraz-

epam), opioids (e.g., morphine), phenothiazines (e.g., thioridazine), sedative/hypnotics (e.g., zolpidem) may increase CNS depression. Metoclopramide may increase adverse effects. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, CPK. May decrease serum sodium.

## AVAILABILITY (Rx)

 **Capsules:** 1.5 mg, 3 mg, 4.5 mg, 6 mg.

## ADMINISTRATION/HANDLING

### PO

Give without regard to food. Administer whole; do not break, crush, cut, or open capsule.

## INDICATIONS/ROUTES/DOSAGE

### Schizophrenia

**PO: ADULTS, ELDERLY:** Initially, 1.5 mg once daily. May increase to 3 mg on day 2 if tolerated. May further increase in increments of 1.5–3 mg based on clinical response and tolerability. **Note:** Due to long half-life, changes in dosage will not be reflected in plasma for several wks. Range: 1.5–6 mg once daily.

### Bipolar I Disorder (Manic or Mixed Episodes)

**PO: ADULTS, ELDERLY:** 1.5 mg once on day 1, then increase to 3 mg once daily on day 2. May further increase in increments of 1.5–3 mg based on clinical response and tolerability. Range: 3–6 mg once daily.

### Concomitant Use of Strong CYP3A Inhibitors

**Pts starting strong CYP3A inhibitor while on stable dose of cariprazine:** Reduce maintenance cariprazine dose by 50%. Pts taking cariprazine 4.5 mg/day should reduce dosage to 1.5 mg/day or 3 mg/day. Pts taking 1.5 mg/day, adjust dosing to every other day. If the

strong CYP3A inhibitor is discontinued, cariprazine may need to be increased. **Pts starting cariprazine while on CYP3A inhibitor:** 1.5 mg once on day 1; no dose on day 2; 1.5 mg once on day 3. After day 3, increase dose to 3 mg once daily as tolerated. If strong CYP3A inhibitor is discontinued, cariprazine may need to be increased.

### Bipolar I (Major Depression)

**PO: ADULTS, ELDERLY:** Initially: 0.5–1.5 mg once daily; increase based on response and tolerability to 3 mg on day 15. **Maximum:** 3 mg/day.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Treatment not recommended.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Treatment not recommended.

## SIDE EFFECTS

**Frequent (26%–11%):** Bradykinesia, cogwheel rigidity, drooling, dyskinesia, masked faces, muscle rigidity, dystonia, tremor, salivary hypersecretion, torticollis, trismus, insomnia, akathisia, headache. **Occasional (5%–3%):** Nausea, constipation, restlessness, vomiting, dizziness, agitation, anxiety, dyspepsia, abdominal pain, diarrhea, fatigue, asthenia, back pain, toothache, hypertension, decreased appetite. **Rare (2%–1%):** Dry mouth, weight gain, extremity pain, somnolence, sedation, cough, tachycardia, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of hypotension, orthostatic hypotension, syncope; diabetes mellitus, DKA, hyperglycemia, hyperglycemic hyperosmolar nonketotic coma; leukopenia, neutropenia, febrile neutropenia; aspiration, dysphagia, gastritis, gastric reflux; extrapyramidal symptoms including akathisia, dystonia, parkin-

sonism, tardive dyskinesia; suicidal ideation. May cause neuroleptic malignant syndrome (NMS), manifested by altered mental status, cardiac arrhythmias, diaphoresis, labile blood pressure, malignant hyperthermia, muscle rigidity, rhabdomyolysis, renal failure. May increase risk of death in pts with dementia-related psychosis. Cognitive and motor impairment reported in 7% of pts. May increase seizure-like activity related to decrease in seizure threshold. Infectious processes including nasopharyngitis, urinary tract infection reported in 1% of pts. Hypersensitivity reactions including angioedema, rash, pruritus have occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain fasting lipid profile, fasting plasma glucose level, vital signs; Hgb A1c in pts with diabetes; ANC, CBC in pts with baseline leukopenia, neutropenia. Receive full medication history, including herbal products, and screen for interactions. Assess appearance, behavior, speech pattern, levels of interest. Verify pregnancy status. Question history of diabetes, cardiovascular disease, CVA, dysphagia, hepatic impairment, hypersensitivity reaction, TIA, seizures.

### INTERVENTION/EVALUATION

Monitor ANC, CBC, fasting lipid profile, fasting plasma glucose levels periodically. Assess mental status for anxiety, depression, suicidal ideation (esp. at initiation and with change in dosage), social function. Due to long half-life, any change in dosage will not be fully reflected for several wks; monitor closely for adverse effects during the following wks. Monitor for hypersensitivity reaction, dysphagia, tardive dyskinesia, extrapyramidal symptoms, metabolic changes including hyperglycemia. Screen for infection. Monitor for neuroleptic malignant syndrome.

### PATIENT/FAMILY TEACHING

- Immediately report thoughts of suicide or plans to commit suicide.
- Avoid tasks

that require alertness until response to drug is established. • Therapy may increase blood sugar levels. Monitor for blurry vision, confusion, frequent urination, fruity-smelling breath, thirst, weakness. • Treatment may cause fetal harm. Avoid pregnancy. Do not breast-feed. • Treatment may lower ability to fight infection. • Swallow capsules whole; do not chew, crush, cut, or open capsules. • Do not ingest grapefruit products or herbal products. Report drooling, muscle rigidity, lockjaw, tremors, or inability to control muscle movements. • Treatment may increase risk of seizures. • Report confusion, palpitations, profuse sweating, fluctuating blood pressure, unusually high core body temperature, muscle rigidity, dark-colored urine or decreased urine output; may indicate life-threatening neurologic event called neuroleptic malignant syndrome (NMS).

## carvedilol

TOP  
100 HIGH  
ALERT

kar-ve-dil-ole

(Apo-Carvedilol , Coreg, Coreg CR)

**Do not confuse carvedilol with atenolol or carteolol, or Coreg with Corgard, Cortef, or Cozaar.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta-adrenergic blocker. **CLINICAL:** Anti-hypertensive.

### USES

Treatment of mild to severe HF, left ventricular dysfunction following MI, hypertension. **OFF-LABEL:** Treatment of angina pectoris, idiopathic cardiomyopathy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to carvedilol. Bronchial asthma or related bronchospastic conditions,

cardiogenic shock, decompensated HF requiring intravenous inotropic therapy, severe hepatic impairment, second- or third-degree AV block, severe bradycardia, or sick sinus syndrome (except in pts with pacemaker). **Cautions:** Diabetes, myasthenia gravis, mild to moderate hepatic impairment. Withdraw gradually to avoid acute tachycardia, hypertension, and/or ischemia. Pts suspected of having Prinzmetal's angina, pheochromocytoma, hx of severe anaphylaxis to allergens.

### ACTION

Possesses nonselective beta-blocking and alpha-adrenergic blocking activity. Causes vasodilation. **Therapeutic Effect:** **Hypertension:** Reduces cardiac output, exercise-induced tachycardia, reflex orthostatic tachycardia; reduces peripheral vascular resistance. **HF:** Decreases pulmonary capillary wedge pressure, heart rate, systemic vascular resistance; increases stroke volume index.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	1–2 hrs	24 hrs

Rapidly, extensively absorbed from GI tract. Protein binding: 98%. Metabolized in liver. Excreted primarily via bile into feces. Minimally removed by hemodialysis. **Half-life:** 7–10 hrs. Food delays rate of absorption.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery; may contribute to low birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** Incidence of dizziness may be increased.

## INTERACTIONS

**DRUG:** Calcium channel blockers (e.g., diltiazem, verapamil), digoxin, CYP2C9 inhibitors (e.g., amiodarone, fluconazole) increase risk of cardiac conduction disturbances. CYP2D6 inhibitors (e.g., fluoxetine, paroxetine) may increase concentration/side effects; may enhance slowing of HR or cardiac conduction. May decrease bronchodilation effect of **beta<sub>2</sub> agonists** (e.g., albuterol, salmeterol). May increase concentration/effects of **pazopanib, topotecan. Rivastigmine** may increase risk of bradycardia. **HERBAL:** Herbals with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, bilirubin, ALT, AST, PT.

## AVAILABILITY (Rx)

**Tablets (Immediate-Release):** 3.125 mg, 6.25 mg, 12.5 mg, 25 mg.

 **Capsules: (Extended-Release [Core CR]):** 10 mg, 20 mg, 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food (slows rate of absorption, reduces risk of orthostatic effects).
- Do not crush or cut extended-release capsules.
- Capsules may be opened and sprinkled on applesauce for immediate use.

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 6.25 mg twice daily. May double at intervals of 1–2 wks to 12.5 mg twice daily, then to 25 mg twice daily. **Maximum:** 25 mg twice daily. **(Extended-Release):** Initially, 20 mg once daily. May increase to 40 mg once daily after 1–2 wks, then to 80 mg once daily. **Maximum:** 80 mg once daily.

### HF (With Reduced Ejection Fraction, Including Left Ventricular Dysfunction Following MI)

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 3.125 mg twice daily. May double at 2-wk intervals to highest tolerated dosage. **Maximum: WEIGHING MORE THAN 85 KG:** 50 mg twice daily; **LESS THAN 85 KG:** 25 mg twice daily. **(Extended-Release):** Initially, 10 mg once daily for 2 wks. May increase to 20 mg, 40 mg, and 80 mg over successive intervals of at least 2 wks. **Maximum:** 80 mg/day.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Contraindicated in severe impairment.

## SIDE EFFECTS

**Frequent (6%–4%):** Fatigue, dizziness. **Occasional (2%):** Diarrhea, bradycardia, rhinitis, back pain. **Rare (less than 2%):** Orthostatic hypotension, drowsiness, UTI, viral infection.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce profound bradycardia, hypotension, bronchospasm, cardiac insufficiency, cardiogenic shock, cardiac arrest. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremors. May precipitate HF, MI in pts with cardiac disease; thyroid storm in pts with thyrotoxicosis; peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes. May mask symptoms of hypoglycemia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60 beats/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Receive full medication history and screen for interactions.

**INTERVENTION/EVALUATION**

Monitor B/P for hypotension, respirations for dyspnea. Take standing systolic B/P 1 hr after dosing as guide for tolerance. Assess pulse for quality, regularity, rate; monitor for bradycardia. Monitor ECG for cardiac arrhythmias. Assist with ambulation if dizziness occurs. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), night cough, peripheral edema, distended neck veins. Monitor I&O (increase in weight, decrease in urine output may indicate HF).

**PATIENT/FAMILY TEACHING**

- Full therapeutic effect of B/P may take 1–2 wks.
- Take with food.
- Abruptly stopping treatment or missing multiple doses may cause beta-blocker withdrawal symptoms (fast heart rate, high blood pressure, palpitations, sweating, tremors).
- Compliance with therapy regimen is essential to control hypertension.
- Report excessive fatigue, prolonged dizziness.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician's approval.
- Monitor B/P, pulse before taking medication.
- Restrict salt, alcohol intake.

## casprofungin

kas-poe-fun-jin  
(Candidas)

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Echinocandin antifungal. **CLINICAL:** Antifungal.

**USES**

Treatment of invasive aspergillosis, candidemia, *Candida* infection (intra-abdominal abscess, peritonitis, esophageal, pleural space) in pts aged 3 months and older. Empiric therapy for presumed fungal infections in febrile neutropenia.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to casprofungin. **Cautions:** Concurrent use of cycloSPORINE, hepatic impairment.

**ACTION**

Inhibits synthesis of glucan, a vital component of fungal cell wall formation, damaging fungal cell membrane. **Therapeutic Effect:** Fungistatic.

**PHARMACOKINETICS**

Distributed in tissue. Protein binding: 97%. Metabolized in liver. Excreted in urine (50%), feces (30%). Not removed by hemodialysis. **Half-life:** 40–50 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** May be embryotoxic. Crosses placental barrier. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related moderate renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** CycloSPORINE may increase concentration. RifAMPin may decrease concentration. May decrease therapeutic effect of *Saccharomyces boulardii*. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatinine, ALT, AST, urine protein. May decrease serum albumin, bicarbonate, potassium, magnesium; Hgb, Hct.

**AVAILABILITY (Rx)**

**Injection Powder for Reconstitution:** 50-mg, 70-mg vials.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute 50-mg or 70-mg vial with 0.9% NaCl, Sterile Water for Injection, or Bacteriostatic Water for Injection. Further dilute in 0.9% NaCl or D<sub>5</sub>W to maximum concentration of 0.5 mg/mL.

**Rate of administration** • Infuse over 60 min.

**Storage** • Refrigerate vials but warm to room temperature before preparing with diluent. • Reconstituted solution, diluted solution, may be stored at room temperature for 1 hr before infusion. • Final infusion solution can be stored at room temperature for 24 hrs or 48 hrs if refrigerated. • Discard if solution contains particulate or is discolored.

**IV INCOMPATIBILITIES**

Cefepime (Maxipime), ceftaroline (Teflaro), ceftAZidime (Fortaz), ceftRIAXone (Rocephin), furosemide (Lasix).

**IV COMPATIBILITIES**

Aztreonam (Azactam), DAPTOmycin (Cubicin), fluconazole (Diflucan), linezolid (Zyvox), meropenem (Merrem IV), piperacillin/tazobactam (Zosyn), vancomycin.

**INDICATIONS/ROUTES/DOSAGE**

**Aspergillosis**

**Note:** Continue for minimum of 6–12 wks.

**IV: ADULTS, ELDERLY:** Give single 70-mg loading dose on day 1, followed by 50 mg/day thereafter. **CHILDREN 3 MOS–17 YRS:** 70 mg/m<sup>2</sup> on day 1, then 50 mg/m<sup>2</sup> daily. **Maximum:** 70 mg loading dose or daily dose.

**Candidemia**

**Note:** Continue for at least 14 days after last positive culture.

**IV: ADULTS, ELDERLY:** Initially, 70 mg on day 1, followed by 50 mg daily. **CHILDREN 3 MOS–17 YRS:** 70 mg/m<sup>2</sup> on day 1, then 50 mg/m<sup>2</sup> daily. **Maximum:** 70-mg loading dose, 50-mg daily dose.

**Esophageal Candidiasis**

**Note:** Continue for 14–21 days after symptom resolution.

**IV: ADULTS, ELDERLY:** 50 mg/day. **CHILDREN 3 MOS–17 YRS:** 50 mg/m<sup>2</sup> daily. **Maximum:** 50 mg.

**Empiric Therapy**

**Note:** Continue for minimum 14 days if fungal infection confirmed (continue for 7 days after resolution of neutropenia/clinical symptoms).

**IV: ADULTS, ELDERLY:** Initially 70 mg, then 50 mg/day. May increase to 70 mg/day. **CHILDREN 3 MOS–17 YRS:** 70 mg/m<sup>2</sup> on day 1, then 50 mg/m<sup>2</sup> daily. **Maximum:** 70 mg loading dose or daily dose.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild:** No adjustment. **Moderate: CHILD-PUGH SCORE 7–9:** Decrease dose to 35 mg/day. **Severe:** No clinical experience.

**SIDE EFFECTS**

**Frequent (26%):** Fever. **Occasional (11%–4%):** Headache, nausea, phlebitis. **Rare (3% or less):** Paresthesia, vomiting, diarrhea, abdominal pain, myalgia, chills, tremor, insomnia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reaction (rash, facial edema, pruritus, sensation of warmth), including anaphylaxis, may occur. May cause hepatic dysfunction, hepatitis (drug-induced), or hepatic failure.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT, serum magnesium. Determine baseline temperature. Question history of prior hypersensitivity reaction.

**INTERVENTION/EVALUATION**

Assess for signs/symptoms of hepatic dysfunction. Monitor LFT in pts with preexisting hepatic impairment. Monitor CBC, serum potassium. Monitor for fever, hypersensitivity reaction.

**PATIENT/FAMILY TEACHING**

- Report rash, facial swelling, itching, difficulty breathing, abdominal pain, yellowing of skin or eyes, dark-colored urine, nausea.

## ceftiofur

sef-a-klor

**Do not confuse ceftiofur with cephalexin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Second-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *E. coli*, *M. catarrhalis*, *Klebsiella* spp., *P. mirabilis*, including acute otitis media, bronchitis, pharyngitis/tonsillitis, respiratory tract, skin/skin structure, UTIs.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to ceftiofur, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. Extended release not approved in children younger than 16 yrs.

### ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 25%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 0.6–0.9 hr (increased in renal impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted in pts older than 1 mo. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

### AVAILABILITY (Rx)

 **Capsules:** 250 mg, 500 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL. **Tablets (Extended-Release):** 500 mg.

### ADMINISTRATION/HANDLING

#### PO

- After reconstitution, oral solution is stable for 14 days if refrigerated.
- Shake oral suspension well before using.
- Give without regard to food; if GI upset occurs, give with food, milk.

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage

**PO: ADULTS, ELDERLY:** 250–500 mg q8h or 500 mg q12h (extended-release). **CHILDREN:** 20–40 mg/kg/day divided q8–12h. **Maximum:** 1 g/day.

#### Otitis Media

**PO: CHILDREN:** 40 mg/kg/day divided q12h. **Maximum:** 1 g/day.

#### Pharyngitis

**CHILDREN:** 20 mg/kg/day divided q8–12h. **Maximum:** 1 g/day.

#### Dosage in Renal Impairment

Use caution.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis (abdominal cramps, severe watery diarrhea, fever), other superinfections may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- May cause GI upset (may take with food, milk).
- Chewable tablets must be chewed; do not swallow whole.
- Refrigerate oral suspension.
- Report persistent diarrhea.

## cefadroxil

sef-a-drox-il  
(Apo-Cefadroxil )

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** First-generation cephalosporin. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to group A streptococci, staphylococci, *S. pneumoniae*, *H. influenzae*, *Klebsiella* spp., *E. coli*, *P. mirabilis*, including impetigo, pharyngitis/tonsillitis, skin/skin structure, UTIs. **OFF-LABEL:** Chronic suppression of prosthetic joint infection.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefadroxil, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. History of GI disease (colitis).

## ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 15%–20%. Widely distributed. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1.2–1.5 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

## AVAILABILITY (Rx)

 **Capsules:** 500 mg. **Powder for Oral Suspension:** 250 mg/5 mL, 500 mg/5 mL. **Tablets:** 1 g.

**ADMINISTRATION/HANDLING****PO**

• After reconstitution, oral solution is stable for 14 days if refrigerated. • Shake oral suspension well before using. • Give without regard to food; if GI upset occurs, give with food, milk.

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**PO: ADULTS, ELDERLY:** 1–2 g/day as single dose or in 2 divided doses. **CHILDREN:** 30 mg/kg/day in 2 divided doses. **Maximum:** 2 g/day.

**Dosage in Renal Impairment**

After initial 1-g dose, dosage and frequency are modified based on creatinine clearance and severity of infection.

<b>Creatinine Clearance</b>	<b>Dosage</b>
26–50 mL/min	q12h
10–25 mL/min	q24h
Less than 10 mL/min	q36h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, unusual bruising/bleeding, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued).

**Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

**INTERVENTION/EVALUATION**

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

• Continue therapy for full length of treatment. • Doses should be evenly spaced. • May cause GI upset (may take with food, milk). • Refrigerate oral suspension. • Report persistent diarrhea.

**ceFAZolin**

sef-a-zoe-lin

**Do not confuse ceFAZolin with cefOXitin, cefprozil, cefTRIAxone, or cephalixin.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** First-generation cephalosporin. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to *S. aureus*, *S. epidermidis*, group A beta-hemolytic streptococci, *S. pneumoniae*, *E. coli*, *P. mirabilis*, *Klebsiella* spp., *H. influenzae*, including biliary tract, bone and joint, genital, respiratory tract, skin/skin structure infections; UTIs, endocarditis, perioperative prophylaxis, septi-

cemia. **OFF-LABEL:** Prophylaxis against infective endocarditis.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to ceFAZolin, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy, history of seizures.

## ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Widely distributed. Protein binding: 85%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 1.4–1.8 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta; distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require reduced dosage.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 500 mg, 1 g. **Ready-to-Hang Infusion:** 1 g/50 mL, 2 g/100 mL.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 1 g with at least 10 mL Sterile Water for Injection or 0.9% NaCl. • May further dilute in 50–100 mL D<sub>5</sub>W or 0.9% NaCl (decreases incidence of thrombophlebitis).

**Rate of administration** • For IV push, administer over 3–5 min (**maximum concentration:** 100 mg/mL). • For intermittent IV infusion (piggyback), infuse over 30–60 min (**maximum concentration:** 20 mg/mL).

**Storage** • Solution appears light yellow to yellow in color. • Reconstituted solution stable for 24 hrs at room temperature or for 10 days if refrigerated. • IV infusion (piggyback) stable for 48 hrs at room temperature or for 14 days if refrigerated.

## IM

• To minimize discomfort, inject deep IM slowly. • Less painful if injected into gluteus maximus rather than lateral aspect of thigh.

## IV INCOMPATIBILITIES

Amikacin (Amikin), amiodarone (Coronarone), HYDROMorphone (Dilaudid).

## IV COMPATIBILITIES

Calcium gluconate, dexamethasone (Decadron), dilTIAZem (Cardizem), famotidine (Pepcid), heparin, insulin (regular), lidocaine, LORazepam (Ativan), magnesium sulfate, meperidine (Demerol), metoclopramide (Reglan), midazolam (Versed), morphine, multivitamins, ondansetron (Zofran), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**IV, IM; ADULTS:** 1–1.5 g q6–12h (usually q8h). **Maximum:** 12 g/day. **CHILDREN OLDER THAN 1 MO:** 25–100 mg/kg/day divided q6–8h. **Maximum:** 6 g/day. **NEONATES:** 50–150 mg/kg/day in 2–4 divided doses.

### Dosage in Renal Impairment

Dosing frequency is modified based on creatinine clearance.

### Creatinine

Clearance	Dosage
11–34 mL/min	50% usual dose q12h

**Creatinine**

Clearance	Dosage
10 mL/min or less	50% usual dose q18–24h
HD	500 mg–1 g q24h
PD	500 mg q12h
CRRT	
CVVH	Loading dose 2 g, then 1–2 g q12h
CVVHD/CVVHDF	Loading dose 2 g, then 1 g q8h or 2 g q12h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

**INTERVENTION/EVALUATION**

Evaluate IM site for induration and tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset

of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

- Discomfort may occur with IM injection.

**cefdinir**

sef-di-neer  
(Omnicef )

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to *S. pyogenes*, *S. pneumoniae*, *H. influenzae*, *H. parainfluenzae*, *M. catarrhalis*, including community-acquired pneumonia, acute exacerbation of chronic bronchitis, acute maxillary sinusitis, pharyngitis, tonsillitis, uncomplicated skin/skin structure infections, otitis media.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cefdinir. History of anaphylactic reaction to cephalosporins. **Cautions:** Hypersensitivity to penicillins; renal impairment.

**ACTION**

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Moderately absorbed from GI tract. Protein binding: 60%–70%. Widely distributed. Not appreciably metabolized. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 1–2 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Not detected in breast milk.

**Children:** Newborns, infants may have lower renal clearance. **Elderly:** Age-related renal impairment may require decreased dosage or increased dosing interval.

## INTERACTIONS

**DRUG:** Antacids, iron preparations may interfere with absorption. **Probenecid** increases concentration/effect.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May produce false-positive reaction for urine ketones. May increase serum alkaline phosphatase, bilirubin, LDH, ALT, AST.

## AVAILABILITY (Rx)

 **Capsules:** 300 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. Give at least 2 hrs before or after antacids or iron supplements.
- Twice-daily doses should be given 12 hrs apart.
- Shake oral suspension well before administering.
- Store mixed suspension at room temperature for 10 days.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO: ADULTS, ELDERLY:** 300 mg q12h or 600 mg once daily. **CHILDREN 6 MOS–12 YRS:** 7 mg/kg q12h or 14 mg/kg once daily. **Maximum:** 600 mg/day.

### Dosage in Renal Impairment

**CrCl less than 30 mL/min:** 300 mg/day or 7 mg/kg as single daily dose. **Maximum:** 300 mg. **Hemodialysis pts:** 300 mg or 7 mg/kg/dose every other day. **Maximum:** 300 mg.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for hypersensitivity to cefdinir or other cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Observe for rash. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor hematology reports.

### PATIENT/FAMILY TEACHING

- Take antacids 2 hrs before or following medication.
- Continue medication for full length of treatment; do not skip doses.
- Doses should be evenly spaced.
- Report persistent severe diarrhea, rash, muscle aches, fever, enlarged lymph nodes, joint pain.

## cefepime

sef-e-PEEM

**Do not confuse cefepime with cefixime or ceftazidime.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fourth-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Susceptible infections due to aerobic gram-negative organisms including *P. aeruginosa*, gram-positive organisms including *S. aureus*. Treatment of empiric febrile neutropenia, intra-abdominal infections, skin/skin structure infections, UTIs, pneumonia. **OFF-LABEL:** Brain abscess, malignant otitis externa, septic lateral/cavernous sinus thrombus.

### PRECAUTIONS

**Contraindications:** History of anaphylactic reaction to penicillins, hypersensitivity to cefepime, cephalosporins.

**Cautions:** Renal impairment, history of seizure disorder, GI disease (colitis), elderly.

### ACTION

Binds to bacterial cell wall membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Well absorbed after IM administration. Protein binding: 20%. Widely distributed. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 2–2.3 hrs (increased in renal impairment, elderly pts).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** No age-related precautions noted in pts

older than 2 mos. **Elderly:** Age-related renal impairment may require reduced dosage or increased dosing interval. Elderly pts with renal insufficiency may have an increased risk of encephalopathy, seizures.

### INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. May increase aminoglycoside concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1 g, 2 g. **Injection, Premix:** 1 g (50 mL), 2 g (100 mL).

### ADMINISTRATION/HANDLING

**Reconstitution** • Add 10 mL of diluent for 1-g and 2-g vials. • Further dilute with 50–100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • For intermittent IV infusion (piggyback), infuse over 30 min. For direct IV, administer over 5 min.

**Storage** • Solution is stable for 24 hrs at room temperature, 7 days if refrigerated.

### IM

• Add 2.4 mL Sterile Water for Injection, 0.9% NaCl, or D<sub>5</sub>W to 1-g and 2-g vials. • Inject into a large muscle mass (e.g., upper gluteus maximus).

### ⚠ IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin (Fungizone), cimetidine (Tagamet), ciprofloxacin (Cipro), CISplatin (Platinol), dacarbazine (DTIC), DAUNOrubicin (Cerubidine), diazepam (Valium), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), droperidol

(Inapsine), famotidine (Pepcid), ganciclovir (Cytovene), haloperidol (Haldol), magnesium, magnesium sulfate, mannitol, metoclopramide (Reglan), morphine, ofloxacin (Floxin), ondansetron (Zofran), vancomycin (Vancocin).

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), HYDROMorphone (Dilaudid), LORazepam (Ativan), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**IV: ADULTS, ELDERLY:** 1–2 g q8–12h. **CHILDREN:** 50 mg/kg q8–12h. **Maximum:** 2,000 mg/dose. **NEONATES:** 30 mg/kg q12h up to 50 mg/kg q8–12h.

### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

### Creatinine Clearance Dosage

30–60 mL/min	500 mg q24h–2 g q12h
11–29 mL/min	500 mg–2 g q24h
10 mL/min or less	250 mg–1 g q24h
Hemodialysis	Initially, 1 g, then 0.5–1 g q24h or 1–2 g q48–72h
Peritoneal dialysis	Normal dose q48h
Continuous renal replacement therapy	Initially, 2 g, then 1 g q8h or 2 g q12h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Evaluate IM site for induration and tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, CBC, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

### PATIENT/FAMILY TEACHING

- Discomfort may occur with IM injection.
- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Report persistent diarrhea.

## cefotaxime

sef-oh-tax-eeem

**Do not confuse cefotaxime with cefOXitin, ceftizoxime, or cefuroxime.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections (active vs. most gram-negative [not *Pseudomonas*] and gram-positive cocci [not *Enterococcus*]), including bone, joint, GU, gynecologic, intra-abdominal, lower respiratory tract, skin/skin structure infections; septicemia, meningitis, perioperative prophylaxis. **OFF-LABEL:** Surgical prophylaxis.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefotaxime, cephalosporins. **Cautions:** History of penicillin allergy, colitis, renal impairment with CrCl less than 30 mL/min.

## ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Widely distributed to CSF. Protein binding: 30%–50%. Partially metabolized in liver. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 1 hr (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine, ALT, AST, alkaline phosphatase.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 500 mg, 1 g.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute with 10 mL Sterile Water for Injection or 0.9% NaCl to provide a maximum concentration of 100 mg/mL. • May further dilute with 50–100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • For IV push, administer over 3–5 min. • For intermittent IV infusion (piggyback), infuse over 15–30 min.

**Storage** • Solution appears light yellow to amber. • IV infusion (piggyback) is stable for 24 hrs at room temperature, 5 days if refrigerated. • Discard if precipitate forms.

## IM

• Reconstitute with Sterile Water for Injection or Bacteriostatic Water for Injection to provide a concentration of 230–330 mg/mL. • To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh. For 2-g IM dose, give at 2 separate sites.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), filgrastim (Neupogen), fluconazole (Diflucan), vancomycin (Vancocin).

## IV COMPATIBILITIES

dilTIAZem (Cardizem), famotidine (Pepcid), HYDROMorphone (Dilaudid), LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**IV, IM; ADULTS, ELDERLY: Uncomplicated infection:** 1 g q12h. **Moderate to severe infection:** 1–2 g q8h. **Life-threatening infection:** 2 g q4h. **INFANTS, CHILDREN, ADOLESCENTS:** 150–180 mg/kg/day in divided doses q8h.

**Maximum:** 8 g/day. **NEONATES:** 50 mg/kg/dose q8–12h.

### Dosage in Renal Impairment

Creatinine Clearance	Dosage Interval
10–50 mL/min	6–12 hrs
Less than 10 mL/min	24 hrs
Hemodialysis	1–2g q24h
Peritoneal dialysis	1g q24h
CVVH	1–2 g q8–12h
CVVHD	1–2g q8h
CVVHDF	1–2g q6–8h

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, particularly cephalosporins, penicillins.

## INTERVENTION/EVALUATION

Check IM injection sites for induration, tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

## PATIENT/FAMILY TEACHING

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.

## ceftaroline

sef-tar-o-leen  
(Teflaro)

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fifth-generation cephalosporin. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to gram-positive and gram-negative organisms, including *S. pneumoniae*, *S. aureus* (methicillin-susceptible only), *H. influenzae*, *Klebsiella pneumoniae*, *E. coli*, including acute bacterial skin and skin structure infections, community-acquired bacterial pneumonia.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to ceftaroline, cephalosporins. **Cautions:** History of allergy to penicillin, severe renal impairment with CrCl less than 50 mL/min, elderly.

**ACTION**

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Protein binding: 20%. Widely distributed in plasma. Not metabolized. Primarily excreted in urine. Hemodialyzable. **Half-life:** 1.6 hrs (increased in renal impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dose adjustment.

**INTERACTIONS**

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine. May decrease serum potassium.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 400-mg, 600-mg single-use vial.

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Give by intermittent IV infusion (piggyback). Do not give IV push.

**Reconstitution** • Reconstitute either 400-mg or 600-mg vial with 20 mL Sterile Water for Injection. • Mix gently to dissolve powder. • Further dilute with 50–250 mL D<sub>5</sub>W, 0.9% NaCl.

**Rate of administration** • Infuse over 5–60 min.

**Storage** • Discard if particulate is present. • Following reconstitution, solution should appear clear, light to dark yellow. • Solution is stable for 6 hrs at room temperature or 24 hrs if refrigerated.

**IV INCOMPATIBILITIES**

Fluconazole (Diflucan), vancomycin (Vancocin).

**IV COMPATIBILITIES**

Famotidine (Pepcid), HYDROMORPHONE (Dilaudid), LORAZEPAM (Ativan), magnesium sulfate, midazolam (Versed), morphine, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**IV: ADULTS, ELDERLY:** 600 mg q12h.  
**CHILDREN 2–18 YRS (WEIGHING MORE THAN 33 KG):** 400 mg q8h or 600 mg q12h.  
**(WEIGHING 33 KG OR LESS):** 12 mg/kg q8h.  
**CHILDREN 2 MOS TO LESS THAN 2 YRS:** 8 mg/kg q8h.

**Dosage in Renal Impairment****Creatinine**

Clearance	Dosage
30–50 mL/min	400 mg q12h
15–29 mL/min	300 mg q12h
End-stage renal disease, hemodialysis	200 mg every 12 hrs (give after dialysis)

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (5%–4%):** Diarrhea, nausea.

**Rare (3%–2%):** Allergic reaction (rash, pruritus, urticaria), phlebitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. with pre-existing renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function test. Question for hypersensitivity to other cephalosporins, penicillins. For pts on hemodialysis, administer medication after dialysis.

**INTERVENTION/EVALUATION**

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Monitor I&O, renal function tests for evidence of nephrotoxicity. Be alert for superinfection: fever, vomiting, severe genital/anal pruritus, moderate to severe diarrhea, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

- Continue medication for full length of treatment.
- Doses should be evenly spaced.

**ceftAZidime**

sef-taz-i-deem  
(Fortaz, Tazicef)

**Do not confuse ceftAZidime with ceFAZolin, cefepime, or ceFTRIAXone.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to gram-negative organisms (including *Pseudomonas* and *Enterobacteriaceae*), including bone, joint, CNS (including meningitis), gynecologic, intra-abdominal, lower respiratory tract, skin/skin structure infections; UTI, septicemia. Treatment of CNS infections due to *H. influenzae*, *N. meningitidis*, including meningitis. **OFF-LABEL:** Bacterial endophthalmitis.

**PRECAUTIONS**

**Contraindications:** History of hypersensitivity/anaphylactic reaction to ceftAZi-

dime, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy, seizure disorder.

**ACTION**

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Widely distributed, including to CSF. Protein binding: 5%–17%. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 2 hrs (increased in renal impairment).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

**AVAILABILITY (Rx)**

**Injection Powder for Reconstitution:** (*Fortaz, Tazicef*): 500 mg, 1 g, 2 g. **Injection Premix:** 1 g/50 mL.

**ADMINISTRATION/HANDLING**

**◀ ALERT ▶** Give by IM injection, direct IV injection (IV push), or intermittent IV infusion (piggyback).

**Reconstitution** • Add 10 mL Sterile Water for Injection to each 1 g to provide concentration of 90 mg/mL. • May further dilute with 50–100 mL 0.9% NaCl, D<sub>5</sub>W, or other compatible diluent.

**Rate of administration** • For IV push, administer over 3–5 min (**maximum concentration:** 180 mg/mL). • For in-

termittent IV infusion (piggyback), infuse over 15–30 min.

**Storage** • Solution appears light yellow to amber, tends to darken (color change does not indicate loss of potency). • IV infusion (piggyback) stable for 12 hrs at room temperature or 3 days if refrigerated. • Discard if precipitate forms.

### IM

**Reconstitution** • Add 1.5 mL Sterile Water for Injection or lidocaine 1% to 500-mg vial or 3 mL to 1-g vial to provide a concentration of 280 mg/mL. • To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan), IDArubicin, midazolam (Versed), vancomycin (Vancocin).

### IV COMPATIBILITIES

Diltiazem (Cardizem), famotidine (Pepcid), heparin, HYDROMORPHONE (Dilaudid), lipids, morphine, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage Range

**IV, IM: ADULTS, ELDERLY:** 1–2 g q8–12h. **IV: CHILDREN 1 MO–12 YRS:** **Mild to moderate infection:** 90–150 mg/kg/day in divided doses q8h. **Maximum:** 6 g/day. **Severe infection:** 200–300 mg/kg/day in divided doses q8h. **Maximum:** 12 g/day. **NEONATES 0–4 WKS:** 50 mg/kg/dose q8–12h.

#### Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

#### Creatinine

Clearance	Dosage
31–50 mL/min	1g q12h
16–30 mL/min	1g q24h
6–15 mL/min	500 mg q24h

#### Creatinine

Clearance	Dosage
Less than 6 mL/min	500 mg q48h
Hemodialysis	0.5–1 g q24h or 1–2 g q48–72h (give post hemodialysis on dialysis days)
Peritoneal dialysis	Initially, 1 g, then 0.5 g q24h
Continuous renal replacement therapy	Initially, 2 g, then 1 g q8h or 2 g q12h

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

#### INTERVENTION/EVALUATION

Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess IM in-

jection sites for induration, tenderness. Check oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

#### PATIENT/FAMILY TEACHING

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.

## ceftAZidime/ avibactam

sef-taz-i-deem/a-vi-bak-tam  
(Avycaz)

**Do not confuse ceftAZidime with ceFAZolin or cefepime, or avibactam with sulbactam or tazobactam.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cephalosporin/beta-lactamase inhibitor.  
**CLINICAL:** Antibacterial.

#### USES

Used in combination with metroNI-DAZOLE for treatment of complicated intra-abdominal infections caused by the following susceptible microorganisms: *E. cloacae*, *E. coli*, *K. pneumoniae*, *K. oxytoca*, *P. mirabilis*, *P. stuartii*, and *P. aeruginosa* in adults and pediatric pts 3 mos and older. Treatment of complicated urinary tract infections, including pyelonephritis, caused by the following susceptible microorganisms: *C. freundii*, *C. koseri*, *E. aerogenes*, *E. cloacae*, *E. coli*, *K. pneumoniae*, *Proteus* spp., and *P. aeruginosa* in adults and pediatric pts 3 mos and older.

Treatment of hospital-acquired bacterial pneumonia and ventilator-associated bacterial pneumonia (HAP/VAP) caused by the following susceptible microorganisms: *K. pneumoniae*, *E. cloacae*, *E. coli*, *Serratia marcescens*, *P. mirabilis*, *P. aeruginosa*, and *Haemophilus influenzae*.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to avibactam-containing products, ceftAZidime, cephalosporins. **Cautions:** History of renal impairment, seizure disorder, encephalopathy, recent *C. difficile* (C-diff) infection or antibiotic-associated colitis. Hypersensitivity to penicillins, other beta-lactams.

#### ACTION

Inhibits cell wall synthesis by binding to bacterial cell membrane. Bacterial action of ceftAZidime is mediated through binding to essential penicillin-binding proteins. Avibactam inactivates some beta-lactamases and protects ceftAZidime from degradation by certain beta-lactamases. **Therapeutic Effect:** Bactericidal.

#### PHARMACOKINETICS

Widely distributed. Excreted unchanged as parent drug; not significantly metabolized in liver. Protein binding: less than 10%. Removed extensively by hemodialysis (55% of dose). Eliminated in urine (80%–90% unchanged). **Half-life:** 2.7 hrs (dependent on dose and severity of renal impairment).

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** CefTAZidime is excreted in breast milk in low concentrations. Unknown if avibactam is excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (due to renal impairment).

#### INTERACTIONS

**DRUG:** May decrease therapeutic effect of BCG (intravesical). **Probenecid** may increase concentration of avibactam. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum

alkaline phosphatase, ALT, GGT, LDH. May decrease platelets, eosinophils, leukocytes, lymphocytes, serum potassium. May result in positive Coombs' test or false-positive elevated urine glucose.

### AVAILABILITY (Rx)

**◀ALERT▶** CefTAZidime/avibactam is a combination product.

**Injection, Powder for Reconstitution:** 2 gm cefTAZidime/0.5 gm avibactam.

### ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute vial with 10 mL of one of the following solutions: 0.9% NaCl, Sterile Water for Injection or 5% Dextrose Injection. • Shake gently until powder is completely dissolved. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly yellow in color. • Final concentration of vial will equal approx. 0.167 g/mL of cefTAZidime and 0.042 g/mL of avibactam. • Further dilute with 50 mL to 250 mL 0.9% NaCl or 5% Dextrose Injection.

**Rate of administration** • Infuse over 2 hrs.

**Storage** • Diluted solution may be stored at room temperature up to 12 hrs or refrigerated up to 24 hrs. • Infuse within 12 hrs once removed from refrigerator. • Do not freeze.

### INDICATIONS/ROUTES/DOSAGE

#### Complicated Intra-Abdominal Infections

**IV: ADULTS, ELDERLY:** 2.5 g (cefTAZidime 2 g/avibactam 0.5 g) q8h for 5–14 days (in combination with metroNIDAZOLE).

**INFANTS 6 MOS AND OLDER, CHILDREN, ADOLESCENTS YOUNGER THAN 18 YRS:** 50 mg cefTAZidime/kg/dose q8h; **Maximum:** 2g cefTAZidime/dose. **INFANTS 3 MOS TO LESS THAN 6 MOS:** 40 mg cefTAZidime/kg/dose q8h.

#### Complicated Urinary Tract Infections Including Pyelonephritis

**IV: ADULTS, ELDERLY:** 2.5 g (2 g cefTAZidime/0.5 g avibactam) q8h for 7–14 days. **INFANTS 6 MOS AND OLDER, CHILDREN, ADO-**

**LESCENTS YOUNGER THAN 18 YRS:** 50 mg cefTAZidime/kg/dose q8h. **Maximum:** 2 g cefTAZidime/dose. **INFANTS 3 MOS TO LESS THAN 6 MOS:** 40 mg cefTAZidime/kg/dose q8h.

### HAP/VAP

**IV: ADULTS, ELDERLY:** 2.5 g (2 g cefTAZidime/0.5 g avibactam) q8h for 7–14 days.

### Dosage in Renal Impairment

**Note:** Infuse after hemodialysis on hemodialysis days. Dosage is modified based on creatinine clearance.

#### Creatinine

Clearance	Dosage
Greater than 50 mL/min	2.5 g (2 g/0.5 g) q8h
31–50 mL/min	1.25 g (1 g/0.25 g) q8h
16–30 mL/min	0.94 g (0.75 g/0.19 g) q12h
6–15 mL/min	0.94 g (0.75 g/0.19 g) q24h
Less than or equal to 5 mL/min	0.94 g (0.75 g/0.19 g) q48h

### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (14%–5%):** Vomiting, nausea, abdominal pain, anxiety, rash. **Rare (4%–2%):** Constipation, dizziness.

### ADVERSE EFFECTS/TOXIC REACTIONS

May cause worsening of renal function or acute renal failure in pts with renal impairment. Clinical cure rates were lower in pts with CrCl 30–50 mL/min compared with those with CrCl greater than 50 mL/min, and in pts receiving metroNIDAZOLE combination therapy. Blood and lymphatic disorders such as agranulocytosis, hemolytic anemia, leukopenia, lymphocytosis, neutropenia, thrombocytopenia were reported. Hypersensitivity reactions, including anaphylaxis or severe skin reactions, have been reported in pts treated with beta-lactam antibacterial drugs. *C. difficile* (C-diff)—associated diarrhea, with severity ranging from mild diarrhea to fatal colitis, was reported. C-diff infection may occur more than 2 mos after

treatment completion. Central nervous system reactions including asterixis, coma, encephalopathy, neuromuscular excitability, myoclonus, nonconvulsive status epilepticus, seizures have been reported in pts receiving ceftAZidime, esp. in pts with renal impairment. May increase risk of development of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Skin and subcutaneous tissue disorders such as angioedema, erythema multiforme, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis were reported in pts receiving ceftAZidime. Other reported adverse effects, including infusion site inflammation/hematoma/thrombosis, jaundice, candidiasis, dysgeusia, paresthesia, tubulointerstitial nephritis, vaginal inflammation, occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BUN, serum creatinine, potassium; CrCl, GFR, LFT; bacterial culture and sensitivity; vital signs. Question history of recent *C. difficile* infection, renal impairment, seizure disorder; hypersensitivity reaction to beta-lactams, carbapenem, cephalosporins, PCN. Assess skin for wounds; assess hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

### INTERVENTION/EVALUATION

Monitor CBC, BMP, renal function periodically. For pts with changing renal function, monitor renal function test daily and adjust dose accordingly. Diligently monitor I&Os. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed; manage proper fluids levels/PO intake, electrolyte levels, protein intake. Antibacterial drugs that are not directed against *C. difficile* infection may need to be discontinued. Report any sign of hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increased risk of recurrent infection.
- Report any episodes of diarrhea, esp. in the mos following treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output; skin problems such as development of sores, rash, skin bubbling/necrosis.
- Drink plenty of fluids.
- Report any nervous system changes such as anxiety, confusion, hallucinations, muscle jerking, or seizure-like activity.
- Severe allergic reactions such as hives, palpitations, shortness of breath, rash, tongue-swelling may occur.

## ceftolozane/ tazobactam

cef-tol-oh-zane/tay-zoe-bak-tam  
(Zerbaxa)

**Do not confuse ceftolozane with ceftAZidime, or tazobactam with avibactam or sulbactam.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cephalosporin/beta-lactamase inhibitor.  
**CLINICAL:** Antibacterial.

### USES

Used in combination with metroNIDAZOLE for treatment of complicated intra-abdominal infections caused by the following susceptible gram-negative and gram-positive microorganisms: *B. fragilis*, *E. cloacae*, *E. coli*, *K. oxytoca*, *K. pneumoniae*, *P. mirabilis*, *P. aeruginosa*, *S. anginosus*, *S. constellatus*, and *S. salivarius* in pts 18 yrs or older.

Treatment of complicated urinary tract infections, including pyelonephritis, caused by the following susceptible gram-negative microorganisms: *E. coli*, *K. pneumoniae*, *P. mirabilis*, and *P. aeruginosa* in pts 18 yrs or older. Treatment of hospital-acquired pneumonia and ventilator-associated bacterial pneumonia in pts 18 yrs and older caused by *E. cloacae*, *E. coli*, *Haemophilus influenzae*, *K. oxytoca*, *K. pneumoniae*, *P. mirabilis*, *P. aeruginosa*, and *Serratia marcescens*.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ceftolozane/tazobactam, piperacillin/tazobactam, or other beta-lactams. **Cautions:** History of atrial fibrillation, electrolyte imbalance-associated arrhythmias, recent *C. difficile* (C-diff) infection or antibiotic-associated colitis, renal/hepatic impairment, seizure disorder; prior hypersensitivity to penicillins, other cephalosporins.

## ACTION

Inhibits cell wall synthesis by binding to bacterial cell membrane. Bacterial action of ceftolozane is mediated through binding to essential penicillin-binding proteins. Tazobactam inactivates certain beta-lactamases and binds to certain chromosomal and plasmid-mediated bacterial beta-lactamases. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Widely distributed. Excreted unchanged as parent drug; not significantly metabolized in liver. Protein binding: 16%–30%. Eliminated in urine (95% unchanged). Removed extensively by hemodialysis. **Half-life:** 2.7 hrs (dependent on dose and severity of renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (due to renal impairment).

## INTERACTIONS

**DRUG:** **Probenecid** may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, GGT. May decrease Hgb, Hct, platelets; serum potassium, magnesium, phosphate. May result in positive Coombs' test.

## AVAILABILITY (Rx)

**◀ALERT▶** Ceftolozane/tazobactam is a combination product.

**Injection Powder for Reconstitution:** 1 g ceftolozane/0.5 g tazobactam.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute vial with 10 mL of Sterile Water for Injection or 0.9% NaCl. • Shake gently until powder is completely dissolved. • Final volume of vial will equal approx. 11.4 mL. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. • Withdraw required volume from reconstituted vial and inject into diluent bag containing 100 mL 0.9% NaCl or 5% dextrose injection as follows:

Ceftolozane/ Tazobactam	Volume to Withdraw From Reconstituted Vial
1.5 g (1 g/0.5 g)	11.4 mL
750 mg (500 mg/250 mg)	5.7 mL
375 mg (250 mg/125 mg)	2.9 mL
150 mg (100 mg/50 mg)	1.2 mL

**Rate of administration** • Infuse over 60 min.

**Storage** • Refrigerate intact vials. • Reconstituted vial may be held for 1 hr prior to transfer to diluent bag. • May refrigerate diluted solution up to 7 days or store at room temperature up to 24 hrs. • Do not freeze.

## INDICATIONS/ROUTES/DOSAGE

### Complicated Intra-Abdominal Infections

**IV; ADULTS, ELDERLY:** 1.5 g (ceftolozane 1 g/tazobactam 0.5 g) q8h for 4–14

days (in combination with metroNIDAZOLE).

### Complicated Urinary Tract Infections Including Pyelonephritis

**IV: ADULTS, ELDERLY:** 1.5 g (ceftolozane 1 g/tazobactam 0.5 g) q8h for 7 days.

### Pneumonia, Hospital-Acquired or Ventilator-Associated

**IV: ADULTS, ELDERLY:** 3 g (ceftolozane) q8h for 7 days (longer course may be required).

### Dosage in Renal Impairment

**CrCl 30–50 mL/min:** 750 mg (500 mg/250 mg) q8h. **CrCl 15–29 mL/min:** 375 mg (250 mg/125 mg) q8h. **End-stage renal disease or on hemodialysis:** 750 mg (500 mg/250 mg) loading dose, then 150 mg (100 mg/50 mg) maintenance dose q8h for the remainder of the treatment period. **Note:** Administer after hemodialysis on hemodialysis days.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (6%–3%):** Nausea, diarrhea, pyrexia, insomnia, headache, vomiting.

**Rare (2%–1%):** Constipation, anxiety, hypotension, rash, abdominal pain, dizziness, tachycardia, dyspnea, urticaria, gastritis, abdominal distention, dyspepsia, flatulence.

## ADVERSE EFFECTS/TOXIC REACTIONS

Clinical cure rates were lower in pts with CrCl 30–50 mL/min compared with those with CrCl greater than 50 mL/min, and in pts receiving metroNIDAZOLE combination therapy. Hypersensitivity reactions including anaphylaxis or severe skin reactions have been reported with use of beta-lactam antibacterial drugs. *Clostridium difficile* (C-diff)—associated diarrhea, with severity ranging from mild diarrhea to fatal colitis, was reported. C-diff infection may occur more than 2 mos after treatment completion. May increase risk of develop-

ment of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Atrial fibrillation reported in 1.2% of pts. Other reported adverse events such as angina pectoris, infections (candidiasis, oropharyngeal infection, fungal urinary tract infection), paralytic ileus, venous thrombosis occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, serum BUN, creatinine; CrCl, GFR, LFT; bacterial culture and sensitivity; vital signs. Question history of atrial fibrillation, recent *C. difficile* infection, hepatic/renal impairment, hypersensitivity reaction to beta-lactams, cephalosporins, penicillins, carbapenem. Assess skin for wounds; assess hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

### INTERVENTION/EVALUATION

Monitor CBC, BMP, renal function test periodically; serum magnesium, ionized calcium in pts at risk for arrhythmias. For pts with changing renal function, monitor renal function test daily and adjust dose accordingly. Diligently monitor I&Os. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed; manage proper fluids levels/PO intake, electrolyte levels, protein intake. Antibacterial drugs that are not directed against C-diff infection may need to be discontinued. Report any signs of hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increased risk of recurrent infection.
- Report any episodes of diarrhea, esp. the following mos after treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool

may indicate infectious diarrhea and may be contagious to others. • Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output. • Drink plenty of fluids. • Severe allergic reactions such as hives, palpitations, rash, shortness of breath, tongue swelling may occur.

## cefTRIAxone

sef-trye-ax-own

**Do not confuse cefTRIAxone with ceFAZolin, ceFOXitin, or ceftazidime.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Third-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to gram-negative aerobic organisms, some gram-positive organisms, including respiratory tract, GU tract, skin and skin structure, bone and joint, intra-abdominal, pelvic inflammatory disease (PID), biliary tract/urinary tract infections; bacterial septicemia, meningitis, perioperative prophylaxis, acute bacterial otitis media. **OFF-LABEL:** Complicated gonococcal infections, STDs, Lyme disease, salmonellosis, shigellosis, atypical community-acquired pneumonia.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefTRIAxone, cephalosporins. Hyperbilirubinemic neonates, esp. premature infants, should not be treated with cefTRIAxone (can displace bilirubin from its binding to serum albumin, causing bilirubin encephalopathy). Do not administer with calcium-containing IV solutions, including continuous calcium-containing infusion such as parenteral nutrition (in neonates) due to the risk of precipitation of cefTRIAxone-calcium salt. **Cautions:** Hepatic impair-

ment, history of GI disease (esp. ulcerative colitis, antibiotic-associated colitis). History of penicillin allergy.

### ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Widely distributed, including to CSF. Protein binding: 83%–96%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life: IV:** 4.3–4.6 hrs; **IM:** 5.8–8.7 hrs (increased in renal impairment).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** May displace bilirubin from serum albumin. Contraindicated in hyperbilirubinemic neonates. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Probenecid may increase excretion/effect. Calcium salts may increase adverse/toxic effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 250 mg, 500 mg, 1 g, 2 g. **Intravenous Solution:** 1 g/50 mL, 2 g/50 mL.

### ADMINISTRATION/HANDLING

**Reconstitution** • Add 2.4 mL Sterile Water for Injection to each 250 mg to provide concentration of 100 mg/mL. • May further dilute with 50–100 mL 0.9% NaCl, D<sub>5</sub>W.

**Rate of administration** • For IV push, administer over 1–4 min (**maximum concentration:** 40 mg/mL). • For

intermittent IV infusion (piggyback), infuse over 30 min.

**Storage** • Solution appears light yellow to amber. • IV infusion (piggyback) is stable for 2 days at room temperature, 10 days if refrigerated. • Discard if precipitate forms.

### IM

• Add 0.9 mL Sterile Water for Injection, 0.9% NaCl, D<sub>5</sub>W, or lidocaine to each 250 mg to provide concentration of 250 mg/mL. • To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), famotidine (Pepcid), fluconazole (Diflucan), labetalol (Normodyne), Lactated Ringer's injection, vancomycin (Vancocin).

### IV COMPATIBILITIES

Diltiazem (Cardizem), heparin, lidocaine, metronIDAZOLE (Flagyl), morphine, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage Range

**IM/IV: ADULTS, ELDERLY:** 1–2 g q12–24h. **CHILDREN: Mild to moderate infection:** 50–75 mg/kg/day in 1–2 divided doses. **Maximum:** 1 g/day. **Severe infection:** 100 mg/kg/day divided q12–24h. **Maximum:** 4 g/day. **NEONATES:** 50 mg/kg/dose given once daily.

#### Dosage in Renal/Hepatic Impairment

Dosage modification is usually unnecessary, but hepatic/renal function test results should be monitored in pts with renal and hepatic impairment or severe renal impairment.

### SIDE EFFECTS

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course

of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

#### INTERVENTION/EVALUATION

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity, CBC. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

#### PATIENT/FAMILY TEACHING

• Discomfort may occur with IM injection. • Doses should be evenly spaced. • Continue antibiotic therapy for full length of treatment.

## cefuroxime

sef-ue-rox-eem

**Do not confuse cefuroxime with cefotaxime, cefprozil, or deferoxamine.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Second-generation cephalosporin. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to group B streptococci, pneumococci, staphylococci, *H. influenzae*, *E. coli*, *Enterobacter*, *Klebsiella*, including acute/chronic bronchitis, gonorrhea, impetigo, early Lyme disease, otitis media, pharyngitis/tonsillitis, sinusitis, skin/skin structure, UTI, perioperative prophylaxis.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cefuroxime, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. Pts with hx of colitis, GI malabsorption, seizures.

## ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

## PHARMACOKINETICS

Rapidly absorbed from GI tract. Protein binding: 33%–50%. Widely distributed, including in CSF. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 1.3 hrs (increased in renal impairment).

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **Antacids, H<sub>2</sub>-receptor antagonists (e.g., cimetidine, famotidine), proton pump inhibitors (e.g., pantoprazole)** may decrease absorption. May decrease therapeutic effect

of BCG (intravesical). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

## AVAILABILITY (Rx)

**Injection Powder for Reconstitution:** 750 mg, 1.5 g. **Tablets:** 250 mg, 500 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 750 mg in 8 mL (1.5 g in 14 mL) Sterile Water for Injection to provide a concentration of 100 mg/mL. • For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl or D<sub>5</sub>W.

**Rate of administration** • For IV push, administer over 3–5 min. • For intermittent IV infusion (piggyback), infuse over 15–30 min.

**Storage** • Solution appears light yellow to amber (may darken, but color change does not indicate loss of potency). • IV infusion (piggyback) is stable for 24 hrs at room temperature, 7 days if refrigerated. • Discard if precipitate forms.

## IM

• To minimize discomfort, inject deep IM slowly in large muscle mass.

## PO

• Give tablets without regard to food (give 400-mg dose with food). • If GI upset occurs, give with food, milk. • Avoid crushing tablets due to bitter taste.

## ⚠ IV INCOMPATIBILITIES

Fluconazole (Diflucan), midazolam (Versed), vancomycin (Vancocin).

## ⚠ IV COMPATIBILITIES

Diltiazem (Cardizen), HYDROMorphone (Dilaudid), morphine, propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**IV, IM: ADULTS, ELDERLY:** 750 mg–1.5 g q8h up to 1.5 g q6h for severe infections.

**INFANTS, CHILDREN, ADOLESCENTS: Mild to moderate infection:** 75–100 mg/kg/day divided q8h. **Maximum:** 1,500 mg/dose. **Severe infection:** 100–200 mg/kg/day divided into 3–4 doses. **Maximum:** 1,500 mg/dose. **NEONATES:** 50 mg/kg/dose q8–12h.

**PO: ADULTS, ELDERLY:** 250–500 mg twice daily **INFANTS, CHILDREN, ADOLESCENTS:** 20–30 mg/kg/day in 2 divided doses. **Maximum:** 1 g/day (500 mg/dose).

**Dosage in Renal Impairment**

Adult dosage frequency is modified based on creatinine clearance and severity of infection.

**Creatinine Clearance Dosage****IV**

Greater than 20 mL/min	q8h
10–20 mL/min	q12h
Less than 10 mL/min	q24h
Peritoneal dialysis	Dose q24h
Continuous renal replacement therapy	1 g q12h

**PO**

Greater than 30 mL/min	No adjustment
10–29 mL/min	q24h
Less than 10 mL/min	q48h

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery

diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm anaphylaxis).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

**INTERVENTION/EVALUATION**

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.
- May cause GI upset (may take with food, milk).

**celecoxib**TOP  
100

sel-e-kox-ib  
(CeleBrex)

**BLACK BOX ALERT** Increased risk of serious cardiovascular thrombotic events, including MI, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines. **Do not confuse CeleBrex with CeleXA, Cerebyx, or Clarinex.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** NSAID, COX-2 selective. **CLINICAL:** Anti-inflammatory.

**USES**

Relief of signs/symptoms of osteoarthritis, rheumatoid arthritis (RA) in adults. Treatment of acute pain, primary dysmenorrhea. Relief of signs/symptoms associated with ankylosing spondylitis. Treatment of juvenile rheumatoid arthritis (JRA) in pts 2 yrs and older and weighing 10 kg or more.

**PRECAUTIONS**

**◀ALERT▶** May increase cardiovascular risk when high doses are given to prevent colon cancer.

**Contraindications:** Hypersensitivity to celecoxib, sulfonamides, aspirin, other NSAIDs. Active GI bleeding. Pts experiencing asthma, urticaria, or allergic reactions to aspirin, other NSAIDs. Treatment of perioperative pain in coronary artery bypass graft (CABG) surgery. **Cautions:** History of GI disease (bleeding/ulcers); concurrent use with aspirin, anticoagulants, smoking; alcohol, elderly, debilitated pts, hypertension, asthma, renal/hepatic impairment. Pts with edema, cerebrovascular disease, ischemic heart disease, HF, known or suspected deficiency of cytochrome P450 isoenzyme 2C9. Pediatric pts with systemic-onset juvenile idiopathic arthritis.

**ACTION**

Inhibits cyclooxygenase-2, the enzyme responsible for prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammation, relieves pain.

**PHARMACOKINETICS**

Rapidly absorbed from GI tract. Widely distributed. Protein binding: 97%. Metabolized in liver. Primarily eliminated in feces. **Half-life:** 11.2 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Avoid use during third trimester (may adversely affect fetal car-

diovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration/effect of **lithium, methotrexate**. **Aspirin** may increase adverse effects. May increase nephrotoxic effects of **cycloSPORINE, tenofovir**. **HERBAL:** Herbals with **anticoagulant/antiplatelet properties** (e.g., **garlic, ginger, ginkgo biloba**) may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, creatinine, BUN. May decrease serum phosphate.

**AVAILABILITY (Rx)**

 **Capsules:** 50 mg, 100 mg, 200 mg, 400 mg.

**ADMINISTRATION/HANDLING****PO**

- May give without regard to food.
- Capsules may be swallowed whole or opened and mixed with applesauce.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Consider reduced initial dose of 50% in poor CYP2C9 metabolizers.

**Osteoarthritis**

**PO: ADULTS, ELDERLY:** 200 mg/day as a single dose or 100 mg twice daily.

**Rheumatoid Arthritis (RA)**

**PO: ADULTS, ELDERLY:** 100–200 mg twice daily.

**Juvenile Rheumatoid Arthritis (JRA)**

**PO: CHILDREN 2 YRS AND OLDER, WEIGHING MORE THAN 25 KG:** 100 mg twice daily. **WEIGHING 10–25 KG:** 50 mg twice daily.

**Acute Pain, Primary Dysmenorrhea**

**PO: ADULTS, ELDERLY:** Initially, 400 mg with additional 200 mg on day 1, if needed. **Maintenance:** 200 mg twice daily as needed.

**Ankylosing Spondylitis**

**PO: ADULTS, ELDERLY:** 200 mg/day as a single dose or in 2 divided doses. May increase to 400 mg/day if no effect is seen after 6 wks.

**Dosage in Renal Impairment**

Not recommended in severe renal impairment.

**Dosage in Hepatic Impairment**

Decrease dose by 50% in pts with moderate hepatic impairment. Not recommended in severe hepatic impairment.

**SIDE EFFECTS**

**Frequent (16%–5%):** Diarrhea, dyspepsia, headache, upper respiratory tract infection. **Occasional (less than 5%):** Abdominal pain, flatulence, nausea, back pain, peripheral edema, dizziness, insomnia, rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Increased risk of cardiovascular events (MI, CVA), serious, potentially life-threatening GI bleeding.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformity, skin condition. Assess for allergy to sulfa, aspirin, or NSAIDs (contraindicated).

**INTERVENTION/EVALUATION**

Assess for therapeutic response: pain relief; decreased stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Observe for bleeding, bruising, weight gain.

**PATIENT/FAMILY TEACHING**

- If GI upset occurs, take with food.
- Avoid aspirin, alcohol (increases risk of GI bleeding).
- Immediately report chest pain, jaw pain, sweating, confusion, difficulty speaking, one-sided weakness (may indicate heart attack or stroke).

**cenobamate**

sen-oh-bam-ate  
(Xcopri)

**Do not confuse cenobamate with carisbamate, felbamate, or meprobamate.**

**Classification**

**PHARMACOTHERAPEUTIC:** Voltage-gated sodium channel inhibitor, gamma-aminobutyric acid (GABA<sub>A</sub>) modulator. **CLINICAL:** Anticonvulsant.

**USES**

Treatment of partial-onset (focal) seizures in adults.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cenobamate. Familial short-QT syndrome.

**Cautions:** Hepatic/renal impairment; pts at high risk for suicide ideation and behavior, substance abuse (e.g., history of depression, mood disorder, psychiatric disorder; history of drug abuse). Concomitant use of QT interval–shortening drugs.

**ACTION**

Inhibits voltage-gated sodium channels, reducing repetitive neuronal firing. Acts as a positive allosteric modulator of the gamma-aminobutyric acid (GABA<sub>A</sub>) ion channel. **Therapeutic Effect:** Prevents seizure activity.

**PHARMACOKINETICS**

Widely distributed. Extensively metabolized in liver. Protein binding: 60% (primarily to albumin). Peak plasma concentration: 1–4 hrs. Excreted in urine (88%), feces (5%). **Half-life:** 50–60 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Oral contraceptives may become ineffective with therapy. Females of reproductive potential should use additional or alternative nonhormonal contraception during treatment. Unknown if distributed in breast milk. **Children:** Safety

and efficacy not established. **Elderly:** Not specified; use caution.

## C

## INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, lorazepam, morphine, zolpidem) may increase CNS effects. May decrease concentration/effect of antihepaciviral combination products, avapritinib, axitinib, bosutinib, capmatinib, cobimetinib, neratinib, olaparib, oral contraceptives, ranolazine. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, potassium.

## AVAILABILITY (Rx)

 **Tablets:** 12.5 mg, 25 mg, 50 mg, 100 mg, 150 mg, 200 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Tablets cannot be chewed or crushed.

## INDICATIONS/ROUTES/DOSAGE

### Partial-Onset Seizures

**PO: ADULTS:** Initially, 12.5 mg once daily on wks 1 and 2, then increase based on clinical response and tolerability. **Titration: Weeks 3 and 4:** 25 mg once daily. **Weeks 5 and 6:** 50 mg once daily. **Weeks 7 and 8:** 100 mg once daily. **Weeks 9 and 10:** 150 mg once daily. **Maintenance dose (week 11 and thereafter):** 200 mg once daily. **Maximum:** May increase dose above 200 mg by increments of 50 mg once daily q2wks up to 400 mg based on clinical response and tolerability. **Discontinuation:** Gradually reduce over a period of 2 wks.

### Concomitant Use of Other Medications

**Carbamazepine, lamotrigine, CYP2B6 substrates, CYP3A substrates:** Because of potential of reduced efficacy, consider increasing dose of carBAMazepine, lamotrigine, CYP2B6 substrates, CYP3A substrates as needed. **Clobazam, phenobarbital, phenytoin, CYP2C19**

**substrates:** Because of potential of increased concentration/effect, consider reducing dose of clobazam, phenobarbital, phenytoin, CYP2C19 substrates as needed.

### Dosage in Renal Impairment

**Mild to severe impairment:** Use caution. Consider dose reduction. **ESRD, HD:** Not recommended.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Maximum dose is 200 mg once daily. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Note:** Frequency of side effects is dose dependent. **Frequent (22%-14%):** Somnolence, dizziness, fatigue. **Occasional (12%-5%):** Headache, nystagmus, diplopia, nausea, balance disorder. **Rare (4%-1%):** Constipation, vomiting, gait disturbance, tremor, diarrhea, ataxia, dysgeusia, abdominal pain, palpitations, blurry vision, decreased weight, back pain, dyspepsia, dysmenorrhea, memory impairment, decreased appetite, musculoskeletal chest pain, sedation, aphasia, asthenia, dry mouth, pollakiuria, dysarthria, vertigo, hiccups, vertigo, rash.

## ADVERSE EFFECTS/TOXIC REACTIONS

Sudden discontinuance may increase risk of seizure frequency, status epilepticus; physical withdrawal symptoms (decreased appetite, depressed mood, insomnia, muscle aches, tremor). Drug reaction with eosinophilia and systemic symptoms (DRESS), also known as multiorgan hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, rash, which may be associated with other organ systems, such as hepatitis, hematologic abnormalities, myocarditis, nephritis. Shortening of QT interval of greater than 20 msec reported in 6%-17% of pts. Pts with familial short QT syndrome have an increased risk of sudden death, ventricular fibrillation. May increase risk of suicidal behavior and ideation. Other psychological disorders may include confusion, euphoria, irritability. Increased incidence of appendicitis

was reported. Infections including nasopharyngitis (4% of pts), pharyngitis, (2% of pts), UTI (5% of pts) have occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Review history of seizure disorder (intensity, frequency, duration). Initiate seizure precautions, fall precautions. Question history of familial short-QT syndrome, hepatic/renal impairment. Question history of anxiety, depression, mood disorder, suicidal ideation and behavior. Obtain pregnancy test in females of reproductive potential. Assess for potential of abuse/misuse (e.g., drug seeking behavior, mental health conditions, history of substance abuse). Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity, frequency of seizures). Monitor for CNS effects during titration or discontinuation. Monitor for symptoms of DRESS; cardiac effects (palpitations, syncope), esp. during titration. Diligently assess for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Consult mental health professional if mood disorder suspected.

### PATIENT/FAMILY TEACHING

- Strict maintenance of drug therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication (may cause seizures; symptoms of withdrawal syndrome).
- Treatment may affect the electrical properties of the heart; report palpitations, loss of consciousness.
- Seek immediate medical attention if thoughts of suicide or new onset or worsening of anxiety, depression, or changes in mood occur.
- Avoid alcohol, nervous system depressants.
- Report symptoms of drug-induced hypersensitivity syndrome (e.g., fever, swollen face/lymph nodes, skin rash/peeling/inflammation).
- There is a high risk of interactions with

other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy. • Oral contraceptives may become ineffective. Additional or alternative contraceptive measures are recommended.

## cephalexin

sef-a-lex-in  
(Keflex)

**Do not confuse cephalexin with cefaclor, ceFAZolin, or ciprofloxacin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** First-generation cephalosporin. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to staphylococci, group A *streptococcus*, *K. pneumoniae*, *E. coli*, *P. mirabilis*, *H. influenzae*, *M. catarrhalis*, including respiratory tract, genitourinary tract, skin, soft tissue, bone infections; otitis media; follow-up to parenteral therapy. **OFF-LABEL:** Suppression of prosthetic joint infection.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity/anaphylactic reaction to cephalexin, cephalosporins. **Cautions:** Renal impairment, history of GI disease (esp. ulcerative colitis, antibiotic-associated colitis), history of penicillin allergy.

### ACTION

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

### PHARMACOKINETICS

Rapidly absorbed from GI tract (delayed in young children). Protein binding: 10%–15%. Widely distributed. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 0.9–1.2 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

## AVAILABILITY (Rx)

**Capsules:** 250 mg, 500 mg, 750 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

## ADMINISTRATION/HANDLING

### PO

- After reconstitution, oral suspension is stable for 14 days if refrigerated.
- Shake oral suspension well before using.
- Give without regard to food. If GI upset occurs, give with food, milk.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO: ADULTS, ELDERLY:** 250–1,000 mg q6h or 500 mg q12h. **Maximum:** 4 g/day. **INFANTS, CHILDREN, ADOLESCENTS: (Mild to moderate infections):** 25–50 mg/kg/day divided q6–12h. **Maximum:** 2 g/day. **(Severe infections):** 75–100 mg/kg/day divided q6–8h. **Maximum:** 4 g/day.

### Dosage in Renal Impairment

After usual initial dose, dosing frequency is modified based on creatinine clearance and severity of infection.

### Creatinine

Clearance	Dosage
60 mL/min or greater	No adjustment
30–59 mL/min	Maximum: 1,000 mg/day
15–29 mL/min	250 mg q8–12h
5–14 mL/min	250 mg q24h
1–4 mL/min	250 mg q48–60h
Hemodialysis	250–500 mg q12–24h (administer after dialysis session)

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, renal function test. Question for history of allergies, particularly cephalosporins, penicillins.

### INTERVENTION/EVALUATION

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). With prolonged therapy, monitor renal/hepatic function tests.

### PATIENT/FAMILY TEACHING

- Doses should be evenly spaced.
- Continue therapy for full length of

treatment. • May cause GI upset (may take with food, milk). • Refrigerate oral suspension. • Report persistent diarrhea.

## ceritinib

se-ri-ti-nib  
(Zykadia)

**Do not confuse ceritinib with crizotinib, gefitinib, imatinib, or lapatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anaplastic lymphoma kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small-cell lung cancer (NSCLC).

### PRECAUTIONS

**Contraindications:** Hypersensitivity to ceritinib. **Cautions:** Bradyarrhythmias/ventricular arrhythmias, diabetes, dehydration, electrolyte imbalance (e.g., hypomagnesemia, hypokalemia), hepatic impairment, HF, ocular disease, pulmonary disease. Medications that prolong QT interval. Not recommended in pts with congenital long QT syndrome. Avoid use of medications that cause bradycardia.

### ACTION

Potent inhibitor of ALK involved in the pathogenesis of NSCLC. ALK gene abnormalities may result in expression of oncogenic fusion proteins, resulting in increased cell proliferation/survival in tumor cells. **Therapeutic Effect:** Reduces proliferation of tumor cells expressing the genetic abnormality.

### PHARMACOKINETICS

Well absorbed after PO administration. Metabolized in liver. Peak plasma con-

centration: 4–6 hrs. Protein binding: 97%. Eliminated in feces (92%), urine (1.3%). **Half-life:** 41 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Contraception recommended during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect; avoid use. **QT interval-prolonging medications** (e.g., amiodarone, azithromycin, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **Amiodarone, dronedarone** may increase risk of bradycardia. May increase concentration/effects of **aprepitant, bosutinib, budesonide, cobimetinib, colchicine, eletriptan, ivabradine**. **HERBAL:** None significant. **FOOD:** All food may increase absorption/effect. **Grapefruit products** may increase concentration/effect; avoid use. **LAB VALUES:** May decrease Hgb, phosphate. May increase serum ALT, AST, bilirubin, creatinine, glucose, lipase.

### AVAILABILITY (Rx)

 **Tablets:** 150 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give with food. • Administer whole; do not break, cut, or open. • If a dose is missed, take dose unless next dose due

within 12 hrs. If vomiting occurs, do not administer an additional dose.

## INDICATIONS/ROUTES/DOSAGE

### Non–Small-Cell Lung Cancer

**PO: ADULTS/ELDERLY:** 450 mg once daily until disease progression or unacceptable toxicity.

### Dosage in Renal Impairment

**Mild to moderate impairment: CrCl 30–90 mL/min:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Decrease dose by 1/3 (round to nearest 150 mg).

### Dose Modification

#### Cardiotoxicity

**QTc interval greater than 500 msec on at least 2 separate ECGs:** Withhold until QTc interval is less than 481 msec, or recovery to baseline (if baseline QTc interval is greater than or equal to 481 msec), then resume with a 150-mg dose reduction.

**QTc prolongation in combination with torsades de pointes or polymorphic ventricular tachycardia or serious arrhythmia:** Permanently discontinue.

**Symptomatic, non–life-threatening bradycardia:** Withhold until recovery to asymptomatic bradycardia or heart rate of 60 beats/min or greater. Evaluate concomitant medications known to cause bradycardia and adjust dose as tolerated (reduction not specified).

**Clinically significant, life-threatening bradycardia requiring intervention or life-threatening bradycardia in pts taking concomitant medications known to cause bradycardia or hypotension:** Withhold until recovery to asymptomatic bradycardia or heart rate of 60 beats/min or greater. If con-

comitant medication can be adjusted or discontinued, then resume with a 150-mg dose reduction.

**Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia or hypotension:** Permanently discontinue.

**Concomitant use of strong CYP3A inhibitors:** If concomitant use unavoidable, reduce ceritinib dose by one third, rounded to the nearest 150-mg dose strength. After discontinuation of a strong CYP3A inhibitor, resume ceritinib dose that was taken prior to initiating strong CYP3A inhibitor.

#### Gastrointestinal Toxicity

**Severe or intolerable diarrhea, nausea, vomiting despite optimal antiemetic or antidiarrheal therapy:** Withhold until improved, then resume with a 150-mg dose reduction.

#### Hepatotoxicity

**ALT, AST greater than 5 times upper limit of normal (ULN) with total bilirubin elevation less than or equal to 2 times ULN:** Withhold until recovery to baseline or less than or equal to 2 times ULN, then resume with a 150-mg dose reduction.

**ALT, AST greater than 3 times ULN with total bilirubin elevation greater than or equal to 2 times ULN in the absence of cholestasis or hemolysis:** Permanently discontinue.

#### Hyperglycemia

**Persistent hyperglycemia greater than 250 mL/dL despite optimal antihyperglycemic therapy:** Withhold until hyperglycemia is adequately controlled, then resume with a 150-mg dose reduction. If adequate control cannot be achieved with optimal medical management, then permanently discontinue.

#### Pulmonary Toxicity

**Any grade treatment related to interstitial lung disease/pneumonitis:** Permanently discontinue.

**Intolerability/Toxicity**

**If unable to tolerate 300-mg dose:** Permanently discontinue.

**SIDE EFFECTS**

**Frequent (86%–52%):** Diarrhea, nausea, vomiting, abdominal pain, fatigue, asthenia. **Occasional (34%–9%):** Decreased appetite, constipation, paresthesia, muscular weakness, gait disturbance, peripheral motor/sensory neuropathy, hypotonia, polyneuropathy, dyspepsia, gastric reflux disease, dysphagia, rash, maculopapular rash, acneiform dermatitis, vision impairment, blurred vision, photopsia, presbyopia, reduced visual acuity.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Approximately 60% of pts required at least one dose reduction. Median time to first dose reduction was approximately 7 wks. Decreased Hgb levels reported in 84% of pts. Severe or persistent GI toxicity including nausea, vomiting, diarrhea occurred in 96% of pts; severe cases reported in 14% of pts. Drug-induced hepatotoxicity with elevation of serum ALT 5 times ULN occurred in 27% of pts. Bradycardia, severe interstitial lung disease (ILD), QT interval prolongation, ILD reported in 3% of pts. Grade 3–4 hyperglycemia reported in 13% of pts; diabetics have a sixfold increase in risk; pts receiving corticosteroids have twofold increase in risk. Fatal adverse reactions including pneumonia, respiratory failure, ILD/pneumonitis, pneumothorax, gastric hemorrhage, general physical health deterioration, tuberculosis, cardiac tamponade, sepsis occurred in 5% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Obtain baseline ECG in pts with history of arrhythmias, HF, electrolyte imbalance, or concurrent use of medications known to prolong QTc interval. Question possibility of pregnancy or plans of

breastfeeding. Assess hydration status. Screen for history/comorbidities. Receive full medication history including herbal products, esp. CYP3A inhibitors or inducers, medications that prolong QT interval. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation.

**INTERVENTION/EVALUATION**

Monitor CBC routinely; LFT monthly (or more frequently in pts with elevated hepatic enzymes). Obtain BMP, serum ionized calcium, magnesium if arrhythmia or dehydration occurs. Monitor vital signs (esp. heart rate). Obtain ECG for bradycardia, chest pain, dyspnea; chest X-ray if ILD, pneumonitis, pneumothorax suspected. Worsening cough, fever, or shortness of breath may indicate pneumonitis. Monitor for hepatic dysfunction, hyperglycemia, sepsis, vision changes. Assess hydration status. Encourage PO intake. Offer antidiarrheal medication for loose stool, antiemetic for nausea, vomiting.

**PATIENT/FAMILY TEACHING**

- Most pts experience diarrhea, nausea, vomiting, which may lead to dehydration; drink plenty of fluids.
- Report history of heart problems, including extremity swelling, HF, congenital long QT syndrome, palpitations, syncope. Therapy may decrease your heart rate; report dizziness, chest pain, palpitations, or fainting.
- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Avoid pregnancy; contraception recommended during treatment and up to 2 wks after final dose. Do not breastfeed.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, black/tarry stools, dark urine.
- Immediately report any newly prescribed medications.
- Take on empty stomach only; do not eat 2 hrs before or 2 hrs after any dose.
- Avoid alcohol. Do not consume grapefruit products.

## certolizumab pegol

ser-toe-**liz**-ue-mab  
(Cimzia)

**BLACK BOX ALERT** Serious, sometimes fatal cases of tuberculosis, invasive fungal infections, or other opportunistic infections, including viral and bacterial infection, have been reported. Lymphoma reported in children/adolescents receiving other TNF-blocking medications.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-rheumatic, disease modifying. GI agent. Tumor necrosis factor (TNF) blocker. **CLINICAL:** Anti-inflammatory agent.

### USES

Treatment of moderate to severe active rheumatoid arthritis, moderate to severe active Crohn's disease, active ankylosing spondylitis, active psoriatic arthritis, moderate to severe plaque psoriasis, axial spondyloarthritis, non-radiographic.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to certolizumab. **Cautions:** Chronic, latent, or localized infection; preexisting or recent-onset CNS demyelinating disorders, moderate to severe HF, underlying hematologic disorders, elderly. Pts who have resided in regions where TB is endemic, pts who are hepatitis B virus carriers. Use of live vaccines.

### ACTION

Binds to and neutralizes human TNF-alpha activity. Elevated levels of TNF-alpha play a role in inflammation (Crohn's disease) and joint destruction (RA). **Therapeutic Effect:** Reduces signs and symptoms of Crohn's disease and joint destruction associated with rheumatoid arthritis.

### PHARMACOKINETICS

Higher clearance with increasing body weight. Peak plasma concentrations: 54–171 hrs. **Half-life:** 14 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use cautiously due to higher risk of infection.

### INTERACTIONS

**DRUG:** May increase adverse effects of abatacept, anakinra, canakinumab, natalizumab, vaccines (live), vedolizumab. May decrease therapeutic effects of BCG (intravesical), vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin; aPTT.

### AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 200 mg. **Injection, Solution:** 200 mg/mL in a single-use prefilled syringe.

### ADMINISTRATION/HANDLING

#### SQ

**Reconstitution** • Bring to room temperature before reconstitution. • Reconstitute with 1 mL Sterile Water for Injection. • Gently swirl without shaking, using syringe with 20-gauge needle. • Leave undisturbed to fully reconstitute (may take as long as 30 min). • Using a new 20-gauge needle, withdraw reconstituted solution into syringe for final concentration of 1 mL (200 mg). Use separate syringes for multiple vials. • Switch each 20-gauge needle to a 23-gauge needle and inject full contents of each syringe subcutaneously into separate sites on the abdomen or thigh.

**Storage** • Store vial in refrigerator. • Once powder reconstituted, solution should appear clear to opalescent, colorless to pale yellow. • Discard if solution is discolored or contains precipitate. • Reconstituted solution is

stable for up to 2 hrs at room temperature or 24 hrs if refrigerated.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Each 400-mg dose is given as two injections of 200 mg each.

### Crohn's Disease

**SO:** Initially, 400 mg (given as two subcutaneous injections of 200 mg) and at weeks 2 and 4. **Maintenance:** In pts who obtain a therapeutic response, 400 mg q4wks.

### Rheumatoid Arthritis, Ankylosing Spondylitis, Psoriatic Arthritis

**SO: ADULTS, ELDERLY:** Initially, 400 mg and at weeks 2 and 4. **Maintenance:** 200 mg q2wks or 400 mg q4wks.

### Plaque Psoriasis

**SO: ADULTS, ELDERLY:** 400 mg every other week. **PTS WEIGHING 90 KG OR LESS:** 400 mg at wks 0, 2, and 4, then 200 mg q every other wk may be used.

### Axial Spondyloarthritis, Nonradiographic

**SO: ADULTS, ELDERLY:** Initially, 400 mg, repeat dose 2 and 4 wks after initial dose. **Maintenance:** 200 mg q2wks or 400 mg q4wks.

### Dosage Modification

Discontinue for hypersensitivity reaction, lupus-like syndrome, serious infection, sepsis, hepatitis B virus reactivation.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional (6%):** Arthralgia. **Rare (less than 1%):** Abdominal pain, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Upper respiratory tract infection occurs in 20% of pts. UTI occurs in 7% of pts. Serious infections such as pneumonia, pyelonephritis occur in 3% of pts. Hypersensitivity reaction (rash, urticaria, hypotension, dyspnea) occurs rarely. May increase risk of malignancies (e.g., lymphoma).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline CBC, urinalysis, C-reactive protein. Do not initiate treatment in pts with active infections, including chronic or localized infection. TB test should be obtained before initiation.

### INTERVENTION/EVALUATION

Monitor pts for infection during and after treatment. If pt develops an infection, treatment should be discontinued. Monitor lab results, especially WBC count, urinalysis, C-reactive protein for evidence of infection.

### PATIENT/FAMILY TEACHING

- Report cough, fever, flu-like symptoms.
- Do not receive live virus vaccine during treatment or within 3 mos after last dose.

## cetirizine

se-teer-i-zeen

(Apo-Cetirizine , Quzzytir, Reactine , Zerviate, ZyrTEC ALLERGY)

**Do not confuse cetirizine with levocetirizine, or ZyrTEC with Xanax, Zantac, Zocor, or ZyPREXA.**

### FIXED-COMBINATION(S)

**ZyrTEC D 12 Hour Tablets:** cetirizine/pseudoephedrine: 5 mg/120 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histamine H<sub>1</sub> antagonist (second generation). **CLINICAL:** Antihistamine.

## USES

Relief of symptoms (sneezing, rhinorrhea, postnasal discharge, nasal pruritus, ocular pruritus, tearing) of upper respiratory allergies; relieves itching due to urticaria. **Quzzytir:** Treatment of acute urticaria. **Zerviate:** Treatment of ocular itching associated with allergic conjunctivitis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to cetirizine, hydrOXYzine. **Cautions:** Elderly, hepatic/renal impairment.

## ACTION

Competes with histamine for H<sub>1</sub>-receptor sites on effector cells in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Prevents allergic response, produces mild bronchodilation, blocks histamine-induced bronchitis.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	Less than 1 hr	4–8 hrs	Less than 24 hrs

Well absorbed from GI tract. Protein binding: 93%. Undergoes low first-pass metabolism; not extensively metabolized. Primarily excreted in urine. **Half-life:** 6.5–10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not recommended during first trimester of pregnancy. Distributed in breast milk. Breastfeeding not recommended. **Children:** Less likely to cause anticholinergic effects. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth, urinary retention). Dizziness, sedation, confusion may occur.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. **Anticholinergics** (e.g., acclidinium, ipratropium, umeclidinium) may increase anticholinergic effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May suppress wheal and flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

## AVAILABILITY (Rx)

 **Capsules:** 10 mg. **Injection:** 10 mg/mL. **Ophthalmic:** 0.24%. **Oral Solution:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg. **Tablets (Chewable):** 5 mg, 10 mg. **Tablets (Dispersible):** 10 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

### IV

- Administer IV push over 1–2 min.

### Ophthalmic

• Remove contact lenses before administration (wait at least 10 min before inserting contact lenses). • Use immediately after opening. Wash hands; do not touch dropper tip to eyelids.

## INDICATIONS/ROUTES/DOSAGE

**⚠️ ALERT** May cause drowsiness at dosage greater than 10 mg/day.

### Upper Respiratory Allergies, Urticaria

**PO: ADULTS, CHILDREN OLDER THAN 5 YRS:** Initially, 5–10 mg/day as single dose. **Maximum:** 10 mg/day. **ELDERLY:** 5 mg once daily. **Maximum:** 5 mg/day. **CHILDREN 2–5 YRS:** 2.5 mg/day. May increase up to 5 mg/day as a single dose or in 2 divided doses. **CHILDREN 12–23 MOS:** Initially, 2.5 mg/day. May increase up to 5 mg/day in 2 divided doses. **CHILDREN 6–11 MOS:** 2.5 mg once daily.

### Acute Urticaria

**IV: ADULTS, ELDERLY:** Initially, 10 mg once daily. May increase to 10 mg twice daily. **CHILDREN 12 YRS AND OLDER, ADOLESCENTS:** 10 mg q24h. **CHILDREN 6–11 YRS:** 5–10 mg q24h. **CHILDREN 6 MOS TO 5 YRS:** 2.5 mg q24h.

### Allergic Conjunctivitis

**OPHTH: ADULTS, ELDERLY, ADOLESCENTS, CHILDREN 2 YRS AND OLDER:** Instill 1 drop in affected eye twice daily (about 8 hrs apart).

### Dosage in Renal Impairment

**ADULTS:** GFR 50 mL/min or less: 5 mg once daily. **CHILDREN:** GFR 10–29 mL/min: reduce dose by 50%. GFR <10 mL/min: Not recommended.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (10%–2%):** Pharyngitis, dry mucous membranes, nausea, vomiting, abdominal pain, headache, dizziness, fatigue, thickening of mucus, drowsiness, photosensitivity, urinary retention.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Children may experience paradoxical reaction (restlessness, insomnia, euphoria, nervousness, tremor). Dizziness, sedation, confusion more likely to occur in elderly.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess lung sounds. Assess severity of rhinitis, urticaria, other symptoms.

**INTERVENTION/EVALUATION**

For upper respiratory allergies, increase fluids to maintain thin secretions and offset thirst. Monitor symptoms for therapeutic response.

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.

***cetuximab*****HIGH ALERT**

se-tux-i-mab  
(Erbitux)

■ **BLACK BOX ALERT** ■ Severe infusion reactions (bronchospasm, stridor, urticaria, hypotension, cardiac arrest) have occurred, especially with first infusion in pts with head and neck cancer. Cardiopulmonary arrest reported in pts receiving radiation in combination with cetuximab. **Do not confuse cetuximab with bevacizumab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR)

inhibitor, monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

**Colorectal cancer, metastatic:** Treatment of KRAS wild type, EGFR-expressing, metastatic colorectal cancer as first-line treatment (in combination with FOLFIRI [irinotecan, fluorouracil, and leucovorin]); in combination with irinotecan in pts refractory or intolerant to irinotecan-based chemotherapy; or as a single agent in pts who failed irinotecan- and oxaliplatin-based chemotherapy or who are intolerant to irinotecan. **Head and neck cancer, squamous cell:** Treatment of advanced squamous cell cancer of head/neck (with radiation). Treatment of recurrent or metastasized squamous cell carcinoma of head/neck progressing after platinum-based therapy. First-line treatment of squamous cell carcinoma of head and neck in combination with platinum-based therapy with 5-FU. **OFF-LABEL:** EGFR-expressing advanced non-small-cell lung cancer (NSCLC). Treatment of unresectable squamous cell skin cancer.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cetuximab. **Cautions:** Preexisting IgE antibodies to cetuximab, coronary artery disease, HF, arrhythmias, pulmonary disease.

**ACTION**

Specifically binds to and inhibits epidermal growth factor receptor (EGFR), blocking phosphorylation/activation of receptor-associated kinases. **Therapeutic Effect:** Inhibits tumor cell growth, inducing apoptosis (cell death).

**PHARMACOKINETICS**

Reaches steady-state levels by the third wkly infusion. Clearance decreases as dose increases. **Half-life:** 114 hrs (range: 75–188 hrs).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placental barrier; may cause fetal harm; abortifacient. Breastfeeding not recom-

mended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease WBCs; serum calcium, magnesium, potassium.

## AVAILABILITY (Rx)

**Injection Solution:** 2 mg/mL (50 mL, 100 mL).

## ADMINISTRATION/HANDLING

**ALERT** Do not give by IV push or bolus.

**Reconstitution** • Does not require reconstitution. • Solution should appear clear, colorless; may contain a small amount of visible, white particulates. • Do not shake or dilute. • Infuse with a low protein-binding 0.22-micron in-line filter.

**Rate of administration** • First dose should be given as a 120-min infusion. • Maintenance infusion should be infused over 60 min. • Maximum infusion rate should not exceed 5 mL/min.

**Storage** • Refrigerate vials. • Infusion containers are stable for up to 12 hrs if refrigerated, up to 8 hrs at room temperature. • Discard unused portions.

## IV COMPATIBILITIES

Irinotecan (Camptosar).

## INDICATIONS/ROUTES/DOSAGE

### Metastatic Colorectal Cancer

Cetuximab single-agent therapy or in combination with irinotecan or FOLFIRI (irinotecan, fluorouracil, and leucovorin): **Note:** When given in combination with irinotecan or FOLFIRI, complete cetuximab dose 1 hr prior to chemotherapy.

**IV: ADULTS, ELDERLY:** Initially, 400 mg/m<sup>2</sup> as a loading dose. **Maintenance:** 250 mg/m<sup>2</sup> infused over 60 min wkly or 500 mg/m<sup>2</sup> infused over 120 min q2wks. Continue until disease progression or unacceptable toxicity.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## Head and Neck Cancer (Squamous Cell)

**(Note):** When given in combination with platinum/fluorouracil chemotherapy, complete cetuximab dose 1 hr prior to chemotherapy.

**IV: ADULTS, ELDERLY: With radiation therapy:** Initially, 400 mg/m<sup>2</sup> 1 wk prior to initiation of radiation therapy course. Then 250 mg/m<sup>2</sup> once wkly for duration of radiation therapy (6–7 weeks). Complete cetuximab 1 hr prior to radiation therapy. **Single-agent cetuximab or in combination with a platinum-based therapy with fluorouracil:** **Weekly dosing:** Initially, 400 mg/m<sup>2</sup>, then 250 mg/m<sup>2</sup> wkly. **Biweekly dosing:** (Initial and subsequent doses): 500 mg/m<sup>2</sup> once q2wks. Continue until disease progression or unacceptable toxicity.

## SIDE EFFECTS

**Frequent (90%–25%):** Acneiform rash, malaise, fever, nausea, diarrhea, constipation, headache, abdominal pain, anorexia, vomiting. **Occasional (16%–10%):** Nail disorder, back pain, stomatitis, peripheral edema, pruritus, cough, insomnia. **Rare (9%–5%):** Weight loss, depression, dyspepsia, conjunctivitis, alopecia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia occurs in 10% of pts. Severe infusion reaction (rapid onset of airway obstruction, hypotension, severe urticaria) occurs rarely. Dermatologic toxicity, pulmonary embolus, leukopenia, renal failure occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, pregnancy test in females of reproductive potential. Question history of hypersensitivity reaction. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for evidence of infusion reaction (rapid onset of bronchospasm, stridor, hoarseness, urticaria, hypotension) during

infusion and for at least 1 hr postinfusion. Pts may experience first severe infusion reaction during later infusions. Assess skin for evidence of dermatologic toxicity (development of inflammatory sequelae, dry skin, exfoliative dermatitis, rash). Monitor CBC, serum electrolytes, acute onset or worsening pulmonary symptoms.

#### PATIENT/FAMILY TEACHING

- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with anyone who recently received a live virus vaccine.
- Avoid crowds, those with infection.
- Wear sunscreen, limit sun exposure (sunlight can exacerbate skin reactions).
- Avoid pregnancy.
- Report cardiac or lung symptoms, severe rash.

## chlorambucil

**HIGH ALERT**

klor-am-bue-sil  
(Leukeran)

**BLACK BOX ALERT** May cause myelosuppression. Affects fertility; potential for carcinogenic, mutagenic, teratogenic effects. May cause azoospermia.

**Do not confuse Leukeran with Alkeran, Leukine, or Myleran.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent, nitrogen mustard. **CLINICAL:** Antineoplastic.

#### USES

Treatment of chronic lymphocytic leukemia (CLL), Hodgkin's and non-Hodgkin's lymphomas (NHL). **OFF-LABEL:** Nephrotic syndrome in children, Waldenström's macroglobulinemia.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to chlorambucil. Previous allergic reaction to other alkylating agents, prior resistance to chlorambucil, pregnancy. **Extreme Cautions:** Treatment within 4 wks after full-course radiation therapy or myelosup-

pressive drug regimen. **Cautions:** History of bone marrow suppression, head trauma, hepatic impairment, nephrotic syndrome, seizure disorder; administration of live vaccines to immunocompromised pts.

#### ACTION

Inhibits DNA, RNA synthesis by cross-linking with DNA strands. **Therapeutic Effect:** Interferes with DNA replication and RNA transcription.

#### PHARMACOKINETICS

Rapidly, completely absorbed from GI tract. Protein binding: 99%. Metabolized in liver to active metabolite. Not removed by hemodialysis. **Half-life:** 1.5 hrs; metabolite, 2.5 hrs.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children:** No age-related precautions noted. When taken for nephrotic syndrome, may increase risk of seizures. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** May decrease therapeutic effect of BCG (intravesical), vaccines (live). May increase adverse effects of vaccines (live). May increase myelosuppressive effect of myelosuppressants (e.g., cladribine). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Acidic foods, spicy foods may delay absorption. **LAB VALUES:** May increase serum alkaline phosphatase, AST, uric acid.

#### AVAILABILITY (Rx)

**Tablets:** 2 mg.

#### ADMINISTRATION/HANDLING

**PO**

- Give 30–60 min before food.

#### INDICATIONS/ROUTES/DOSAGE

**Chronic Lymphocytic Leukemia (CLL)**

**PO: ADULTS, ELDERLY:** 0.1 mg/kg/day for 3–6 wks or 0.4 mg/kg pulsed doses administered intermittently, biweekly or

monthly (increased by 0.1 mg/kg/dose until response/toxicity observed).

### Hodgkin's Lymphoma (HL)

**PO: ADULTS, ELDERLY, ADOLESCENTS, CHILDREN, INFANTS 7 MOS OR OLDER:** 6 mg/m<sup>2</sup> once daily (maximum: 10 mg) on days 1–14 of 28-day cycle for 6–10 cycles.

### Non-Hodgkin's Lymphoma (NHL)

**PO: ADULTS, ELDERLY:** 0.1 mg/kg/day for 3–6 wks.

### Dosage in Renal Impairment

**CrCl 10–50 mL/min:** 75% of dose. **CrCl less than 10 mL/min:** 50% of dose.

### Dosage in Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Expected:** GI effects (nausea, vomiting, anorexia, diarrhea, abdominal distress), generally mild, last less than 24 hrs, occur only if single dose exceeds 20 mg.

**Occasional:** Rash, dermatitis, pruritus, oral ulcerations. **Rare:** Alopecia, urticaria, erythema, hyperuricemia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hematologic toxicity due to severe myelosuppression occurs frequently, manifested as neutropenia, anemia, thrombocytopenia. After discontinuation of therapy, thrombocytopenia, neutropenia usually last for 1–2 wks but may persist for 3–4 wks. Neutrophil count may continue to decrease for up to 10 days after last dose. Toxicity appears to be less severe with intermittent drug administration. Overdosage may produce seizures in children. Excessive serum uric acid level, hepatotoxicity occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC before therapy and wkly during therapy, WBC count 3–4 days following each wkly, CBC during first 3–6 wks of therapy (4–6 wks if pt on intermittent dosing schedule).

## INTERVENTION/EVALUATION

Monitor CBC, serum uric acid, LFT. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess skin for rash, pruritus, urticaria.

## PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Increase fluid intake (may protect against hyperuricemia).
- Avoid acidic or spicy foods; may delay absorption of medication.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.

## cinacalcet

sin-a-kal-set  
(Sensipar)

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcium receptor agonist. **CLINICAL:** Calcimimetic.

## USES

Treatment of severe hypercalcemia in pts with primary parathyroid carcinoma. Treatment of secondary hyperparathyroidism in pts with chronic renal disease on dialysis. Treatment of severe hypercalcemia in pts with primary hyperparathyroidism unable to undergo parathyroidectomy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to cinacalcet. Serum calcium lower than the lower

limit of normal range. **Cautions:** Cardiovascular disease, moderate to severe hepatic impairment, seizure disorder.

## ACTION

Increases sensitivity of calcium-sensing receptor on parathyroid gland to activation by extracellular calcium, thus lowering parathyroid hormone (PTH), calcium, and phosphorus levels. **Therapeutic Effect:** Prevents progressive bone disease and adverse effects associated with disorders of mineral metabolism.

## PHARMACOKINETICS

Extensively distributed after PO administration. Protein binding: 93%–97%. Metabolized in liver. Excreted in urine (80%), feces (15%). **Half-life:** 30–40 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cross placental barrier; unknown if distributed in breast milk. Safe usage during lactation not established (potential adverse reaction in infants). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) increase concentration/effect. May increase concentration/effect of thioridazine. May decrease concentration/effect of tamoxifen. **HERBAL:** None significant. **FOOD:** High-fat meals increase plasma concentration. **LAB VALUES:** May decrease serum calcium, phosphorus.

## AVAILABILITY (Rx)

**Tablets:** 30 mg, 60 mg, 90 mg.

## ADMINISTRATION/HANDLING

### PO

- Store at room temperature.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Administer with food or shortly after a meal.

## INDICATIONS/ROUTES/DOSAGE

### Hypercalcemia in Parathyroid Carcinoma; Primary Hyperparathyroidism

**PO: ADULTS, ELDERLY:** Initially, 30 mg twice daily. Titrate dosage sequentially (60 mg twice daily, 90 mg twice daily, and 90 mg 3–4 times/day) every 2–4 wks as needed to normalize serum calcium level. **Maximum:** 360 mg/day (as 90 mg 4 times/day).

### Secondary Hyperparathyroidism

**PO: ADULTS, ELDERLY:** Initially, 30 mg once daily. Titrate dosage sequentially (60, 90, 120, and 180 mg once daily) every 2–4 wks to maintain iPTH level between 150 and 300 pg/mL. **Maximum:** 180 mg/day.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Moderate to severe impairment:** Use caution.

## SIDE EFFECTS

**Frequent (31%–21%):** Nausea, vomiting, diarrhea. **Occasional (15%–10%):** Myalgia, dizziness. **Rare (7%–5%):** Asthenia, hypertension, anorexia, noncardiac chest pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may lead to hypocalcemia, seizures, worsening of HF.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain electrolyte levels (esp. serum calcium, phosphate, ionized calcium).

### INTERVENTION/EVALUATION

Monitor serum calcium, phosphate, ionized calcium for hyperparathyroidism. Monitor daily pattern of bowel activity, stool consistency. Obtain order for antidiarrhea, antiemetic medication to prevent serum electrolyte imbalance. Assess for evidence of dizziness; institute fall risk precautions.

**PATIENT/FAMILY TEACHING**

• Take with food or shortly after a meal. • Do not chew, crush, dissolve, or divide film-coated tablets. • Notify physician if vomiting, diarrhea, cramping, muscle pain, numbness occurs.

**ciprofloxacin**

sip-roe-flox-a-sin  
(Cetraxal, Ciloxan, Cipro)

■ **BLACK BOX ALERT** ■ May increase risk of tendonitis, tendon rupture. May exacerbate myasthenia gravis.

**Do not confuse Ciloxan with Cytoxan, or Cipro with Cefitin, or ciprofloxacin with cephalexin.**

**FIXED-COMBINATION(S)**

**Cipro HC Otic:** ciprofloxacin/hydrocortisone (a steroid): 0.2%/1%. **CiproDex Otic:** ciprofloxacin/dexamethasone (a corticosteroid): 0.3%/0.1%.

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Fluoroquinolone. **CLINICAL:** Antibiotic.

**USES**

Treatment of susceptible infections due to *E. coli*, *K. pneumoniae*, *E. cloacae*, *P. mirabilis*, *P. vulgaris*, *P. aeruginosa*, *H. influenzae*, *M. catarrhalis*, *S. pneumoniae*, *S. aureus* (methicillin susceptible), *S. epidermidis*, *S. pyogenes*, *C. jejuni*, *Shigella* spp., *S. typhi* including intra-abdominal, bone, joint, lower respiratory tract, skin/skin structure infections; UTIs, infectious diarrhea, prostatitis, sinusitis, typhoid fever, febrile neutropenia. **Ophthalmic:** Treatment of superficial ocular infections. **Otic:** Treatment of acute otitis externa due to susceptible strains of *P. aeruginosa* or *S. aureus*. **OFF-LABEL:** Treatment of chancroid. Acute pulmonary exacerbations in cystic fibrosis, disseminated gonococcal infections, prophylaxis to *Neisseria meningitidis* following close

contact with infected person. Infectious diarrhea (children); periodontitis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to ciprofloxacin, other quinolones. Concurrent use of tIZANidine. **Cautions:** Renal impairment, CNS disorders, seizures, rheumatoid arthritis, history of QT prolongation, uncorrected hypokalemia, hypomagnesemia, myasthenia gravis. Suspension not used through feeding or gastric tubes. Use in children (due to adverse events to joints/surrounding tissue).

**ACTION**

Inhibits enzyme, DNA gyrase, in susceptible bacteria, interfering with bacterial cell replication. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Well absorbed from GI tract. Protein binding: 20%–40%. Widely distributed including to CSF. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 3–5 hrs (increased in renal impairment, elderly).

⌚ **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. If possible, do not use during pregnancy/lactation (risk of arthropathy to fetus/infant). **Children:** Arthropathy may occur. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** Antacids, calcium, magnesium, zinc, iron preparations, sucralfate may decrease absorption. May increase effects of caffeine, oral anticoagulants (e.g., warfarin). May increase concentration/effect of pimozone, tizanidine. May increase concentration, toxicity of theophylline. **HERBAL:** Dong quai, St. John's wort may increase photosensitization. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, creatine kinase (CK), LDH, ALT, AST.

**AVAILABILITY (Rx)**

**Infusion Solution:** 200 mg/100 mL, 400 mg/200 mL. **Ophthalmic Ointment (Ciloxan):** 0.3%. **Ophthalmic Solution (Ciloxan):** 0.3%. **Otic Solution (Cetraxal):** 0.2% (single-dose container: 0.25 mL). **Suspension, Oral:** 250 mg/5 mL, 500 mg/5 mL. **Tablets:** 100 mg, 250 mg, 500 mg, 750 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Available prediluted in infusion container ready for use. Final concentration not to exceed 2 mg/mL.

**Rate of administration** • Infuse over 60 min (reduces risk of venous irritation).

**Storage** • Store at room temperature. • Solution appears clear, colorless to slightly yellow.

**PO**

• May be given with food to minimize GI upset. • Give at least 2 hrs before or 6 hrs after antacids, calcium, iron, zinc-containing products. • Do not administer suspension through feeding or gastric tubes. • **NG tube:** Crush immediate-release tablet and mix with water. Flush tube before/after administration.

**Ophthalmic**

• Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid. • Place ointment or drops into pocket. • Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac). • Instruct pt using ointment to roll eyeball to increase contact area of drug to eye. • Instruct pt using solution to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption. • Do not use ophthalmic solution for injection.

**IV INCOMPATIBILITIES**

Ampicillin and sulbactam (Unasyn), cefepime (Maxipime), dexamethasone (Decadron), furosemide (Lasix), heparin, hydrocortisone (Solu-Cortef), methylPREDNISolone (Solu-Medrol), phenytoin (Dilantin), sodium bicarbonate.

**IV COMPATIBILITIES**

Calcium gluconate, diltiazem (Cardizem), DOBUtamine (Dobutrex), DO-Pamine (Intropin), lidocaine, LORazepam (Ativan), magnesium, midazolam (Versed), potassium chloride.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Not recommended as first choice in pregnancy/lactation or in children younger than 18 yrs due to adverse events related to joints/surrounding tissue.

**Usual Dosage Range**

**PO: ADULTS, ELDERLY:** 250–750 mg q12h. **CHILDREN: Mild to moderate infections:** 10 mg/kg twice daily. **Maximum:** 500 mg/dose. **Severe infections:** 15–20 mg/kg twice daily. **Maximum:** 750 mg/dose.

**IV: ADULTS, ELDERLY:** 200–400 mg q12h. **CHILDREN:** 10 mg/kg q8–12h. **Maximum:** 400 mg/dose.

**Usual Ophthalmic Dosage**

**ADULTS, ELDERLY, CHILDREN: (Solution):** 1–2 drops q2h while awake for 2 days, then 1–2 drops q4h while awake for 5 days. **(Ointment):** Apply 3 times/day for 2 days, then 2 times/day for 5 days.

**Usual Otic Dosage**

**ADULTS, ELDERLY, CHILDREN:** Otic solution 0.2%. Instill 0.25 mL (0.5 mg) 2 times/day for 7 days.

**Dosage in Renal Impairment**

Dosage and frequency are modified based on creatinine clearance and the severity of the infection.

**Creatinine Clearance Dosage**

Immediate-Release	Dosage
30–50 mL/min	PO: 250–500 mg q12h
5–29 mL/min	250–500 mg q18h
ESRD, HD, PD	250–500 mg q24h
Extended-Release	
< 30 mL/min	500 mg q24h
ESRD, HD, PD	500 mg q24h
IV 5–29 mL/min	200–400 mg q18–24h

**Dosage in Hepatic Impairment**

No dose adjustment.

C

**SIDE EFFECTS**

**Frequent (5%–2%):** Nausea, diarrhea, dyspepsia, vomiting, constipation, flatulence, confusion, crystalluria. **Ophthalmic:** Burning, crusting in corner of eye. **Occasional (less than 2%):** Abdominal pain/discomfort, headache, rash. **Ophthalmic:** Altered taste, sensation of foreign body in eye, eyelid redness, itching. **Rare (less than 1%):** Dizziness, confusion, tremors, hallucinations, hypersensitivity reaction, insomnia, dry mouth, paresthesia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Superinfection (esp. enterococcal, fungal), nephropathy, cardiopulmonary arrest, cerebral thrombosis may occur. Hypersensitivity reaction (rash, pruritus, blisters, edema, burning skin), photosensitivity have occurred. Sensitization to ophthalmic form may contraindicate later systemic use of ciprofloxacin. May exacerbate muscle weakness in pts with myasthenia gravis. Dermatologic conditions such as toxic epidermal necrolysis, Stevens-Johnson syndrome have been reported. Cases of severe hepatotoxicity have occurred. May increase risk of tendonitis, tendon rupture.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of hypersensitivity to ciprofloxacin, quinolones; myasthenia gravis, renal/hepatic impairment.

**INTERVENTION/EVALUATION**

Obtain urinalysis for microscopic analysis for crystalluria prior to and during treatment. Evaluate food tolerance. Monitor daily pattern of bowel activity, stool consistency. Encourage hydration (reduces risk of crystalluria). Monitor for dizziness, headache, visual changes, tremors. Assess for chest, joint pain. **Ophthalmic:** Observe therapeutic response.

**PATIENT/FAMILY TEACHING**

- It is essential to complete drug therapy despite improvement of symptoms. Early discontinuation may result in antibacterial resistance or increase the risk of recurrent infection.
- Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Maintain adequate hydration.
- Do not take antacids within 2 hrs of ciprofloxacin (reduces/destroys effectiveness).
- Shake suspension well before using; do not chew microcapsules in suspension.
- Report tendon pain or swelling.
- Avoid exposure to sunlight/artificial light (may cause photosensitivity reaction).

**CISplatin****HIGH ALERT**sis-**pla**-tin

**BLACK BOX ALERT** Cumulative renal toxicity may be severe. Dose-related toxicities include myelosuppression, nausea, vomiting. Ototoxicity, especially pronounced in children, noted by tinnitus, loss of high-frequency hearing, deafness. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Anaphylactic reaction can occur within minutes of administration. Avoid confusion between CISplatin and CARBOplatin.

**Do not confuse CISplatin with CARBOplatin or oxaliplatin.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

**USES**

Treatment of metastatic testicular cancers, metastatic ovarian cancers, advanced bladder cancer. **OFF-LABEL:** Breast, cervical, endometrial, esophageal, gastric, head and neck, lung (small-cell, non-small-cell) carcinomas; Hodgkin's and non-Hodgkin's lymphomas;

malignant melanoma, neuroblastoma, osteosarcoma, soft tissue sarcoma, Wilms' tumor.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to CISplatin. **Cautions:** Hearing impairment, myelosuppression, preexisting renal impairment. Elderly, renal impairment.

## ACTION

Inhibits DNA synthesis by cross-linking with DNA strands. Cell cycle–phase non-specific. **Therapeutic Effect:** Prevents cellular division.

## PHARMACOKINETICS

Widely distributed. Protein binding: greater than 90%. Undergoes rapid nonenzymatic conversion to inactive metabolite. Excreted in urine. Removed by hemodialysis. **Half-life:** 58–73 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children:** Ototoxic effects may be more severe. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bone marrow depressants (e.g., PACLitaxel) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid, AST. May decrease CrCl, serum calcium, magnesium, phosphate, potassium, sodium. May cause positive Coombs' test.

## AVAILABILITY (Rx)

**Injection Solution:** 1 mg/mL (50 mL, 100 mL, 200 mL).

## ADMINISTRATION/HANDLING

**◀ALERT▶** Wear protective gloves during handling. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

**Dilution** • Dilute desired dose in 250–1,000 mL 0.9% NaCl, D<sub>5</sub>/0.45% NaCl, or D<sub>5</sub>/0.9% NaCl to concentration of 0.05–2 mg/mL. Solution should have final NaCl concentration of 0.2% or greater.

**Rate of administration** • Infuse over 6–8 hrs (per protocol). • Avoid rapid infusion (increases risk of nephrotoxicity, ototoxicity). • Monitor for anaphylactic reaction during first few minutes of infusion.

**Storage** • Protect from sunlight. • Do not refrigerate (may precipitate). Discard if precipitate forms. IV infusion: Stable for 72 hrs at 39°F–77°F.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), piperacillin and tazobactam (Zosyn), sodium bicarbonate.

## IV COMPATIBILITIES

Etoposide (VePesid), granisetron (Kytril), heparin, HYDROMorphone (Dilaudid), lipids, LORazepam (Ativan), magnesium sulfate, mannitol, morphine, ondansetron (Zofran), palonosetron (Aloxi).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Pretreatment hydration with 1–2 liters of fluid recommended. Adequate hydration, urine output greater than 100 mL/hr should be maintained for 24 hrs after administration. Verify any cisplatin dose exceeding 100 mg/m<sup>2</sup>/course.

### Bladder Cancer

**IV: ADULTS, ELDERLY:** (Single agent): 50–70 mg/m<sup>2</sup> q3–4wks.

**Ovarian Cancer**

**IV: ADULTS, ELDERLY:** 75–100 mg/m<sup>2</sup> q3–4wks.

**Testicular Cancer**

**IV: ADULTS, ELDERLY:** 20 mg/m<sup>2</sup> daily for 5 days repeated q3wks (in combination with bleomycin and etoposide).

**Dosage in Renal Impairment**

Dosage is modified based on CrCl, BUN.

◀ **ALERT** ▶ Repeated courses of CISplatin should not be given until serum creatinine is less than 1.5 mg/100 mL and/or BUN is less than 25 mg/100 mL.

**Creatinine Clearance Dosage**

10–50 mL/min	75% of normal dose
Less than 10 mL/min	50% of normal dose
Hemodialysis	50% of dose post dialysis
Peritoneal dialysis	50% of dose
Continuous renal replacement therapy	75% of dose

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Nausea, vomiting (occurs in more than 90% of pts, generally beginning 1–4 hrs after administration and lasting up to 24 hrs); myelosuppression (affecting 25%–30% of pts, with recovery generally occurring in 18–23 days). **Occasional:** Peripheral neuropathy (with prolonged therapy [4–7 mos]). Pain/redness at injection site, loss of taste, appetite. **Rare:** Hemolytic anemia, blurred vision, stomatitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anaphylactic reaction (angioedema, wheezing, tachycardia, hypotension) may occur in first few minutes of administration in pt previously exposed to CISplatin. Nephrotoxicity occurs in 28%–36% of pts treated with a single dose, usually during second wk of therapy. Ototoxicity (tinnitus, hearing loss) occurs in 31% of pts treated with a single dose (more severe in children). Symptoms may become more frequent, severe with repeated doses.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT. Pts should be well hydrated before and 24 hrs after medication to ensure adequate urinary output (100 mL/hr), decrease risk of nephrotoxicity.

**INTERVENTION/EVALUATION**

Measure all emesis, urine output (general guideline requiring immediate notification of physician: 750 mL/8 hrs, urinary output less than 100 mL/hr). Monitor I&O q1–2h beginning with pretreatment hydration, continue for 48 hrs after dose. Assess vital signs q1–2h during infusion. Monitor urinalysis, serum electrolytes, LFT, renal function tests, CBC, platelet count for changes from baseline.

**PATIENT/FAMILY TEACHING**

- Report signs of ototoxicity (tinnitus, hearing loss).
- Do not have immunizations without physician's approval (lowers body's resistance).
- Avoid contact with those who have recently taken oral polio vaccine.
- Report if nausea/vomiting continues at home.
- Report signs of peripheral neuropathy.

**citalopram**

sy-e-tal-o-pram  
(CeleXA)

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse CeleXA with CeleBrex, Cerebyx, Ranexa, or ZYPREXA.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor. **CLINICAL:** Antidepressant.

## USES

Treatment of unipolar major depression.

**OFF-LABEL:** Treatment of alcohol abuse, diabetic neuropathy, obsessive-compulsive disorder, smoking cessation, GAD, panic disorder.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to citalopram, use of MAOIs intended to treat psychiatric disorders (concurrently or within 14 days of discontinuing either citalopram or MAOI), initiation in pts receiving linezolid or methylene blue. Concurrent use with pimozide. **Cautions:** Elderly, hepatic/renal impairment, seizure disorder. Not recommended in pts with congenital long QT syndrome, bradycardia, recent MI, uncompensated HF, hypokalemia, or hypomagnesemia; pts at high risk of suicide.

## ACTION

Blocks uptake of the neurotransmitter serotonin at CNS presynaptic neuronal membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves symptoms of depression.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 80%. Extensively metabolized in liver. Excreted in urine. **Half-life:** 35 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** May cause increased anticholinergic effects, hyperexcitability. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth), more likely to experience dizziness, sedation, confusion, hypotension, hyperexcitability.

## INTERACTIONS

**DRUG:** CYP2C19 inhibitors (e.g., fluconazole), other medications prolonging QT interval (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol) may increase risk of QT

prolongation. **Linezolid, MAOIs (e.g., phenelzine, selegiline), triptans** may cause serotonin syndrome (excitement, diaphoresis, rigidity, hyperthermia, autonomic hyperactivity, coma). **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

## AVAILABILITY (Rx)

**Oral Solution:** 10 mg/5 mL. **Tablets:** 10 mg, 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Doses greater than 40 mg not recommended.

### Depression

**PO: ADULTS YOUNGER THAN 60 YRS:** Initially, 20 mg once daily in the morning or evening. May increase in 20-mg increments at intervals of no less than 1 wk. **Maximum:** 40 mg/day. **ELDERLY 60 YRS OR OLDER:** 20 mg once daily. **Maximum:** 20 mg/day.

### Dose Modification

**Hepatic impairment; poor metabolizers of CYP2C19; concomitant use of CYP2C19 inhibitors:** 20 mg once daily. **Maximum:** 20 mg/day.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

## SIDE EFFECTS

**Frequent (21%–11%):** Nausea, dry mouth, drowsiness, insomnia, diaphoresis. **Occasional (8%–4%):** Tremor, diarrhea, abnormal ejaculation, dyspepsia, fatigue, anxiety, vomiting, anorexia. **Rare (3%–2%):** Sinusitis, sexual dysfunction,

menstrual disorder, abdominal pain, agitation, decreased libido.

## C

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose manifested as dizziness, drowsiness, tachycardia, confusion, seizures, torsades de pointes, ventricular tachycardia, sudden death. Serotonin syndrome or neuroleptic malignant syndrome (NMS)–like reactions have been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

CBC, LFT should be performed periodically for pts on long-term therapy. Observe, record behavior. Assess psychological status, thought content, sleep pattern, appearance, interest in environment. Screen for bipolar disorder.

### INTERVENTION/EVALUATION

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood.

### PATIENT/FAMILY TEACHING

- Do not stop taking medication or increase dosage.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

## clarithromycin

HIGH ALERT

kla-rith-roe-mye-sin  
(Apo-Clarithromycin , PMS-Clarithromycin )

**Do not confuse clarithromycin with Claritin, clindamycin, or erythromycin.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Macrolide. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to *C. pneumoniae*, *H. influenzae*, *H. parainfluenzae*, *H. pylori*, *M. catarrhalis*, *M. avium*, *M. pneumoniae*, *S. aureus*, *S. pneumoniae*, *S. pyogenes*, including bacterial exacerbation of bronchitis, otitis media, acute maxillary sinusitis, *Mycobacterium avium* complex (MAC), pharyngitis, tonsillitis, *H. pylori* duodenal ulcer, community-acquired pneumonia, skin and soft tissue infections. Prevention of MAC disease. **OFF-LABEL:** Prophylaxis of infective endocarditis, pertussis, Lyme disease.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to clarithromycin, other macrolide antibiotics. History of QT prolongation or ventricular arrhythmias, including torsades de pointes. History of cholestatic jaundice or hepatic impairment with prior use of clarithromycin. Concomitant use with colchicine (in pts with renal/hepatic impairment), statins, pimozone, ergotamine, dihydroergotamine. **Cautions:** Hepatic/renal impairment, elderly with severe renal impairment, myasthenia gravis, coronary artery disease. Pts at risk of prolonged cardiac repolarization. Avoid use with uncorrected electrolytes (e.g., hypokalemia, hypomagnesemia), clinically significant bradycardia, class IA or III antiarrhythmics (see Classification).

## ACTION

Binds to ribosomal receptor sites of susceptible organisms, inhibiting protein synthesis of bacterial cell wall. **Therapeutic Effect:** Bacteriostatic; may be bactericidal with high dosages or very susceptible microorganisms.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 65%–75%. Widely distributed (except CNS). Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs; metabolite, 5–9 hrs (increased in renal impairment).

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

**INTERACTIONS**

**DRUG:** May increase concentration/effects of **acalabrutinib, ado-trastuzumab, axitinib, bosutinib, budesonide, eletriptan, lovastatin.** May increase QT-prolonging effects of **dronedarone.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, ALT, AST, alkaline phosphatase, LDH, creatinine, PT. May decrease WBC.

**AVAILABILITY (Rx)**

**Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

 **Tablets (Extended-Release):** 500 mg.

**ADMINISTRATION/HANDLING****PO**

- Give immediate-release tablets, oral suspension without regard to food.
- Give q12h (rather than twice daily).
- Shake suspension well before each use.
- Extended-release tablets should be given with food.
- Do not break, crush, dissolve, or divide extended-release tablets.

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage Range**

**PO: ADULTS, ELDERLY:** 250–500 mg q12h or 1,000 mg once daily (2 × 500-mg extended-release tablets). **CHILDREN 6 MOS AND OLDER:** (**Immediate-Release**): 7.5 mg/kg q12h. **Maximum:** 500 mg/dose.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** Reduce dose by 50% and administer once or twice daily. **HD:** Administer dose after dialysis complete.

**Combination With Atazanavir or Ritonavir**

CrCl 30–60 mL/min	Decrease dose by 50%
CrCl less than 30 mL/min	Decrease dose by 75%

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Occasional (6%–3%):** Diarrhea, nausea, altered taste, abdominal pain. **Rare (2%–1%):** Headache, dyspepsia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Hepatotoxicity, thrombocytopenia occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question pt for allergies to clarithromycin, erythromycins.

**INTERVENTION/EVALUATION**

Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

- It is essential to complete drug therapy despite improvement of symptoms. Early discontinuation may result in antibacterial resistance or increase the risk of recurrent infection.
- Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Biaxin may be taken without regard to food. Take Biaxin XL with food.

## clevidipine

clev-eye-di-peen  
(Cleviprex)

**Do not confuse clevidipine with amlodipine, cladribine, clofarabine, clozapine, or Cleviprex with Claravis.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Dihydropyridine calcium channel blocker.

**CLINICAL:** Antihypertensive.

### USES

Management of hypertension when oral therapy is not feasible or not desirable.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to clevidipine. Allergy to soy or egg products; abnormal lipid metabolism (e.g., acute pancreatitis, lipoid nephrosis, pathologic hyperlipidemia if accompanied by hyperlipidemia), severe aortic stenosis. **Cautions:** HF; pt with disorders of lipid metabolism.

### ACTION

Causes potent arterial vasodilation by inhibiting the influx of calcium during depolarization in arterial smooth muscle. **Therapeutic Effect:** Decreases mean arterial pressure (MAP) by reducing systemic vascular resistance.

### PHARMACOKINETICS

Widely and rapidly distributed. Full recovery of therapeutic B/P occurs 5–15 min. after discontinuation. Onset of effects: 2–4 min. Metabolized via hydrolysis by esterases in blood and extravascular tissue. Protein binding: 99.5%. Excreted in urine (74%), feces (22%). **Half-life:** 15 min.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. May depress

uterine contractions during labor and delivery. **Children:** Safety and efficacy not established. **Elderly:** Start at low end of dosing range. May experience greater hypotensive effect.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** Herbs with hypotensive properties (e.g., garlic, ginger, hawthorn) may enhance effect. **Yohimbe** may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, potassium, triglycerides, uric acid.

### AVAILABILITY (Rx)

**Injection, Emulsion:** 50 mL (0.5 mg/mL), 100 mL (0.5 mg/mL).

### ADMINISTRATION/HANDLING

**Preparation** • Do not dilute. • To ensure uniformity of emulsion, gently invert vial several times before use. • Visually inspect for particulate matter or discoloration. Emulsion should appear milky white. Discard if discoloration or particulate matter is observed.

**Rate of administration** • Titrate to desired effect using infusion pump via peripheral or central line.

**Storage** • Refrigerate unused vial in original carton. • May store at controlled room temperature (77°F) for up to 2 mos. • Do not freeze. • Do not return to refrigerator once warmed to room temperature. Once the stopper is punctured, use within 12 hrs. • Discard unused portions.

### IV INCOMPATIBILITIES

May be administered with, but not diluted in, solutions including Sterile Water for Injection, 0.9% NaCl, dextrose-containing solutions, lactated Ringer's, 10% amino acid. Do not administer with other medications.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Individualize dosage depending on desired B/P and pt response. See manufacturer guidelines for dose conversion.

### Hypertension

**IV; ADULTS, ELDERLY:** Initiate infusion at 1–2 mg/hr. **Titration:** Initially, dosage may be doubled at short (90-sec) intervals. As B/P approaches goal, an increase in dosage should be less than double, and time intervals between dose adjustments should be lengthened to q5–10 min. **Maintenance:** Desired therapeutic effect generally occurs at a rate of 4–6 mg/hr (pts with severe hypertension may require limited doses up to 32 mg/hr). **Maximum:** 16 mg/hr (no more than 21 mg/hr or 1000 mL is recommended per 24 hrs due to lipid load).

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Occasional (6%–3%):** Headache, insomnia, nausea, vomiting. **Rare (less than 1%):** Syncope, dyspnea.

## ADVERSE EFFECTS/TOXIC REACTIONS

May cause atrial fibrillation, hypotension, reflex tachycardia. Rebound hypertension may occur in pts who are not transitioned to oral antihypertensives after discontinuation. Dihydropyridine calcium channel blockers are known to have negative inotropic effects, which may exacerbate HF. Rebound hypertension may cause emergent hypertensive crisis, which may cause CVA, myocardial infarction, renal failure, HF, seizures.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Screen for history of defective lipid metabolism, pancreatitis, hypertriglyceridemia, severe aortic stenosis; allergy to soy

products, eggs products. Assess B/P, apical pulse immediately before initiation.

### INTERVENTION/EVALUATION

Monitor B/P, pulse rate. Generally, an increase of 1–2 mg/hour will produce an additional 2–4 mm Hg decrease in systolic B/P. If an oral antihypertensive is required to wean off infusion, consider the delay of onset of oral medication's effect. Pts who receive prolonged IV infusions and are not changed to other antihypertensives should be monitored for rebound hypertension for at least 8 hrs after discontinuation. Obtain serum triglyceride level in pts receiving prolonged infusions. Monitor for atrial fibrillation, hypotension, reflex tachycardia; exacerbation of HF in pts with history of HF. Beta blockers should be discontinued only after a gradual reduction in dose.

### PATIENT/FAMILY TEACHING

- In some pts, an oral blood pressure medication may need to be started; compliance is essential to control high blood pressure.
- Life-threatening high blood pressure crisis may occur up to 8 hrs after stopping infusion; report severe anxiety, chest pain, difficulty breathing, headache, stroke-like symptoms (confusion, difficulty speaking, paralysis, one-sided weakness, vision loss).

## clindamycin

klin-da-mye-sin  
(Cleocin, Cleocin T, Clindagel, Clindesse)

**BLACK BOX ALERT** May cause severe, potentially fatal colitis characterized by severe, persistent diarrhea, severe abdominal cramps, passage of blood and mucus.

**Do not confuse Cleocin with Clinoril or Cubicin, or clindamycin with clarithromycin, Claritin, or vancomycin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Lincosamide. **CLINICAL:** Antibiotic.

## USES

**Systemic:** Treatment of aerobic gram-positive staphylococci and streptococci (not enterococci), *Fusobacterium*, *Bacteroides* spp., and *Actinomyces* for treatment of respiratory tract infections, skin/soft tissue infections, sepsis, intra-abdominal infections, infections of female pelvis and genital tract, bacterial endocarditis prophylaxis for dental and upper respiratory procedures in penicillin-allergic pts, perioperative prophylaxis. **Topical:** Treatment of acne vulgaris. **Intravaginal:** Treatment of bacterial vaginosis. **OFF-LABEL:** Treatment of actinomycosis, babesiosis, erysipelas, malaria, otitis media, *Pneumocystis jiroveci* pneumonia (PCP), sinusitis, toxoplasmosis. **PO:** Bacterial vaginosis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to clindamycin. **Cautions:** Severe hepatic dysfunction; history of GI disease (especially colitis).

## ACTION

Inhibits protein synthesis of bacterial cell wall by binding to bacterial ribosomal receptor sites. Topically, decreases fatty acid concentration on skin. **Therapeutic Effect:** Bacteriostatic or bactericidal.

## PHARMACOKINETICS

Rapidly absorbed from GI tract. Protein binding: 92%–94%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1.6–5.3 hrs (increased in renal/hepatic impairment, premature infants).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. **Topical/Vaginal:** Unknown if distributed in breast milk. **Children:** Caution

in pts younger than 1 mo. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

## AVAILABILITY (Rx)

 **Capsules:** 75 mg, 150 mg, 300 mg. **Vaginal Cream:** 2%. **Topical Gel:** 1%. **Infusion, Premix:** 300 mg/50 mL, 600 mg/50 mL, 900 mg/50 mL. **Injection Solution:** 150 mg/mL. **Lotion:** 1%. **Oral Solution:** 75 mg/5 mL. **Vaginal Suppositories:** 100 mg. **Topical Swabs:** 1%.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute 300–600 mg with 50 mL D<sub>5</sub>W or 0.9% NaCl (900–1,200 mg with 100 mL).

**Rate of administration** • Infuse over at least 10–60 min at rate not exceeding 30 mg/min. Severe hypotension, cardiac arrest can occur with rapid administration. • No more than 1.2 g should be given in a single infusion.

**Storage** • Reconstituted IV infusion (piggyback) is stable for 16 days at room temperature, 32 days if refrigerated.

### IM

• Do not exceed 600 mg/dose. • Administer deep IM.

### PO

• Store capsules at room temperature. • After reconstitution, oral solution is stable for 2 wks at room temperature. • Do not refrigerate oral solution (avoids thickening). • Give with at least 8 oz water (minimizes esophageal ulceration). • Give without regard to food.

### Topical

• Wash skin; allow to dry completely before application. • Shake topical lotion

well before each use. • Apply liquid, solution, or gel in thin film to affected area. • Avoid contact with eyes or abraded areas.

#### Vaginal, Cream or Suppository

• Use one applicatorful or suppository at bedtime. • Fill applicator that comes with cream or suppository to indicated level. • Instruct pt to lie on back with knees drawn upward and spread apart. • Insert applicator into vagina and push plunger to release medication. • Withdraw, wash applicator with soap and warm water. • Wash hands promptly to avoid spreading infection.

#### IV INCOMPATIBILITIES

Allopurinol (Aloprim), fluconazole (Diflucan).

#### IV COMPATIBILITIES

Amiodarone (Cordarone), diltiazem (Cardizem), heparin, HYDROMORPHONE (Dilaudid), magnesium sulfate, midazolam (Versed), morphine, multivitamins, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Usual Dosage

**IV, IM; ADULTS, ELDERLY:** 600–2,700 mg/day in 2–4 divided doses. **Maximum IM dose:** 600 mg. **CHILDREN:** 20–40 mg/kg/day in 3–4 divided doses. **Maximum:** 2,700 mg/day. **CHILDREN YOUNGER THAN 1 MO:** 5 mg/kg/dose q6–12h. **NEONATES:** 5 mg/kg/dose q6–12h.

**PO; ADULTS, ELDERLY:** 150–450 mg q6h. **Maximum:** 1,800 mg/day. **INFANTS, CHILDREN, ADOLESCENTS:** 8–40 mg/kg/day in divided doses q6–8h. **Maximum:** 1,800 mg/day. **NEONATES:** 5 mg/kg/dose q6–12 hrs.

**Bacterial Vaginosis**  
**Intravaginal: (Cream): ADULTS:** One applicatorful at bedtime for 3 days in nonpregnant pts or for 7 days in pregnant pts. **(Clindesse): ADULTS:** One applicatorful once daily as single dose in nonpregnant

pts. **Suppository: ADULTS:** Once daily into vagina at bedtime for 3 days.

#### Acne Vulgaris

**Topical: ADULTS:** Apply thin layer to affected area twice daily (pledget, lotion, solution); once daily (gel, foam).

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent: Systemic:** Abdominal pain, nausea, vomiting, diarrhea. **Topical:** Dry, scaly skin. **Vaginal:** Vaginitis, pruritus. **Occasional: Systemic:** Phlebitis; pain, induration at IM injection site; allergic reaction, urticaria, pruritus. **Topical:** Contact dermatitis, abdominal pain, mild diarrhea, burning, stinging. **Vaginal:** Headache, dizziness, nausea, vomiting, abdominal pain. **Rare: Vaginal:** Hypersensitivity reaction.

### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may occur during and several wks after clindamycin therapy (including topical form). Blood dyscrasias (leukopenia, thrombocytopenia), nephrotoxicity (proteinuria, azotemia, oliguria) occur rarely. Thrombophlebitis with IV administration.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain WBC. Question pt for history of allergies. Avoid, if possible, concurrent use of neuromuscular blocking agents.

#### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Report diarrhea promptly due to potential for serious colitis (even with topical or vaginal administration). Assess skin for rash (dryness, irritation) with topical application. With all routes of administration, be alert for superinfection: fever, vomiting, diar-

rhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

#### PATIENT/FAMILY TEACHING

- It is essential to complete drug therapy despite improvement of symptoms. Early discontinuation may result in antibacterial resistance or increase the risk of recurrent infection.
- Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Take oral doses with at least 8 oz water.
- Use caution when applying topical clindamycin concurrently with peeling or abrasive acne agents, soaps, alcohol-containing cosmetics to avoid cumulative effect.
- Do not apply topical preparations near eyes, abraded areas.
- **Vaginal:** In event of accidental contact with eyes, rinse with large amounts of cool tap water.
- Do not engage in sexual intercourse during treatment.
- Wear sanitary pad to protect clothes against stains. Tampons should not be used.

## cloBAZam

kloe-**ba**-zam  
(Onfi, Sympazan)

**BLACK BOX ALERT** Concomitant use with opioids may result in profound sedation, respiratory depression, coma, and death. The use of cloBAZam, exposes users to risks of abuse, misuse, and addiction. Continued use may lead to significant physical dependence.

**Do not confuse cloBAZam with clonazepam or clozapine.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Anticonvulsant.

#### USES

Adjunctive treatment of seizures associated with Lennox-Gastaut syndrome in pts 2 yrs of age and older. **OFF-LABEL:** Catamenial epilepsy; epilepsy (monotherapy).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to cloBAZam. **Cautions:** Elderly, debilitated, mild to moderate hepatic impairment, preexisting muscle weakness or ataxia, concomitant CNS depressants, impaired gag reflex, respiratory disease, sleep apnea, concomitant poor CYP2C19 metabolizers, pts at risk for falls, myasthenia gravis, narrow-angle glaucoma.

#### ACTION

Potentiates neurotransmission of gamma-aminobutyric acid (GABA) by binding to GABA receptor. Depresses nerve impulse transmission in motor cortex. **Therapeutic Effect:** Decreases seizure activity.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Peak plasma concentration: 0.5–4 hrs. Protein binding: 80–90%. Primarily excreted in urine. Unknown if removed by dialysis. **Half-life:** 36–42 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Excreted in breast milk. Hormonal contraceptives may have decreased effectiveness. Non-hormonal contraception recommended. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** May have decreased clearance levels (initial dose 5 mg/day).

#### INTERACTIONS

**DRUG:** CYP2C19 inhibitors (e.g., flucanazole, fluvoxamine, omeprazole, ticlopidine) may increase concentration/effect. Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. May decrease effects of hormonal contraceptives. CYP2C19 inducers (e.g., prednisone, rifampin) may decrease concentration/effect. Olanzapine may increase adverse effects. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. Yohimbine may diminish

the therapeutic effect. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Oral Suspension:** 2.5 mg/mL. **Tablets:** 10 mg, 20 mg. **Oral Film:** 5 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

- May give without regard to food.
- Tablets may be crushed and mixed with applesauce.
- Shake suspension well. Use oral syringe supplied with suspension.

### Oral Film

- Apply on top of tongue where it can dissolve. Apply only one at a time.
- Do not give with liquids; ensure swallowing of a normal manner.
- Pt should not chew, spit, or talk as film dissolves.

## INDICATIONS/ROUTES/DOSAGE

### Seizure Control (Lennox-Gastaut Syndrome)

**PO: CHILDREN WEIGHING 30 KG OR LESS:** Initially, 5 mg once daily for at least 7 days, then increase to 5 mg twice for at least 7 days, then increase to 10 mg twice daily. **Maximum:** 20 mg/day. **ADULTS, CHILDREN WEIGHING MORE THAN 30 KG:** Initially, 5 mg twice daily for at least 7 days, then increase to 10 mg twice daily for at least 7 days, then increase to 20 mg twice daily. **Maximum:** 40 mg/day. **ELDERLY, HEPATIC IMPAIRMENT, CYP2C19 POOR METABOLIZERS:** Initially, 5 mg once daily for at least 7 days, then increase to 5 mg twice daily for at least 7 days, then increase to 10 mg twice daily. After 1 wk, may increase to 20 mg twice daily.

### Dosage in Renal Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (26%–10%):** Sleepiness, URI, lethargy. **Occasional (9%–5%):** Drooling, nausea, vomiting, constipation, irritability, ataxia, insomnia, cough, fatigue. **Rare (4%–2%):** Psychomotor hyperactivity,

UTI, decreased/increased appetite, dysarthria, pyrexia, dysphagia, bronchitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of suicidal behavior/ideation (less than 1%). Physical dependence can increase with higher doses or concomitant alcohol/drug abuse. Abrupt benzodiazepine withdrawal may present as profuse sweating, cramping, nausea, vomiting, muscle pain, convulsions, psychosis, hallucinations, aggression, tremor, anxiety, insomnia. Overdose may result in confusion, lethargy, diminished reflexes, respiratory depression, coma. **Antidote:** Flumazenil (see Appendix J for dosage). Decreased mobility may potentiate higher risk of pneumonia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Offer emotional support. Review history of seizure disorder (frequency, duration, intensity, level of consciousness [LOC]). Question history of alcohol use. Obtain baseline vital signs. Assess history of depression/suicidal ideation.

### INTERVENTION/EVALUATION

Monitor for excess sedation, respiratory depression, suicidal ideation. Implement seizure precautions, observe frequently for seizure activity. Assist with ambulation if drowsiness, dizziness occurs. Evaluate for therapeutic response. Encourage turning, coughing, deep breathing for pts with decreased mobility or who are bedridden.

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication.
- If tapering, monitor for drug withdrawal symptoms.
- Avoid alcohol.
- Report depression, aggression, thoughts of suicide/self-harm, excessive drowsiness.

## clofarabine

kloe-far-a-bine  
(Clolar)

**Do not confuse clofarabine with cladribine or clevidipine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-metabolite (purine analog). **CLINICAL:** Antineoplastic.

### USES

Treatment of pediatric pts (1–21 yrs) with relapsed or refractory acute lymphoblastic leukemia (ALL) (after at least 2 prior regimens). **OFF-LABEL:** Acute myeloid leukemia (AML) in adults 60 yrs or older. Treatment of relapsed/refractory ALL.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to clofarabine. **Cautions:** Dehydration, hypotension, concomitant nephrotoxic or hepatotoxic medications, renal/hepatic impairment.

### ACTION

Metabolized intracellularly to clofarabine triphosphate. Inhibits ribonucleoside reductase, which inhibits DNA synthesis. Competes with DNA polymers, decreasing cell replication. **Therapeutic Effect:** Decreases cell replication, inhibits cell repair. Produces cell death.

### PHARMACOKINETICS

Protein binding: 47%. Metabolized intracellularly. Primarily excreted in urine (40%–60% unchanged). **Half-life:** 5.2 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **Herbals with hypertensive properties** (e.g., licorice, yohimbe) or **hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, uric acid, ALT, AST, bilirubin.

### AVAILABILITY (Rx)

**Injection Solution:** 1 mg/mL (20-mL vial).

### ADMINISTRATION/HANDLING

**Reconstitution** • Filter clofarabine through sterile, 0.2-micrometer syringe filter prior to dilution with D<sub>5</sub>W or 0.9% NaCl to final concentration of 0.15–0.4 mg/mL.

**Rate of administration** • Administer over 1–2 hrs. • Continuously infuse IV fluids to decrease risk of tumor lysis syndrome, other adverse events.

**Storage** • Store at room temperature. • Use diluted solution within 24 hrs.

### 🧪 IV INCOMPATIBILITIES

Do not administer any other medication through same IV line.

### INDICATIONS/ROUTES/DOSAGE

#### Acute Lymphoblastic Leukemia (ALL)

**IV; CHILDREN 1–21 YRS:** 52 mg/m<sup>2</sup> over 2 hrs once daily for 5 consecutive days; repeat q2–6wks following recovery or return to baseline organ function. (Subsequent cycles should begin no sooner than 14 days from day 1 of previous cycle and when ANC is 750 cells/mm<sup>3</sup> or greater.)

#### Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
30–60 mL/min	Decrease dose by 50%
Less than 30 mL/min	Use with caution

**Dosage in Hepatic Impairment**

**Baseline impairment:** No dose adjustment. **Hepatotoxicity during treatment; Grade 3 or higher increase in bilirubin:** Discontinue. May restart at 25% dose reduction following recovery to baseline.

**SIDE EFFECTS**

**Frequent (83%–20%):** Vomiting, nausea, diarrhea, pruritus, headache, fever, dermatitis, rigors, abdominal pain, fatigue, tachycardia, epistaxis, anorexia, petechiae, limb pain, hypotension, anxiety, constipation, edema. **Occasional (19%–11%):** Cough, mucosal inflammation, erythema, flushing, hematuria, dizziness, gingival bleeding, injection site pain, respiratory distress, pharyngitis, back pain, palmar-plantar erythrodysesthesia syndrome, myalgia, oral candidiasis, hypertension, depression, irritability, arthralgia, anorexia. **Rare (10%):** Tremor, weight gain, drowsiness.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Neutropenia occurred in 57% of pts; pericardial effusion in 35%; left ventricular systolic dysfunction in 27%; hepatomegaly, jaundice in 15%; pleural effusion, pneumonia, bacteremia in 10%; capillary leak syndrome in less than 10%.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question possibility of pregnancy. Obtain CBC, BMP, LFT, CrCl prior to therapy.

**INTERVENTION/EVALUATION**

Monitor CBC, renal function test, LFT, serum uric acid. Monitor respiratory status, cardiac function. Monitor daily pattern of bowel activity, stool consistency. Assess for GI disturbances. Assess skin for pruritus, dermatitis, petechiae, erythema on palms of hands and soles of feet. Assess for fever, sore throat; obtain blood cultures to detect evidence of infection. Ensure adequate hydration.

**PATIENT/FAMILY TEACHING**

- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with anyone who recently received a live virus vaccine.
- Avoid crowds, those with infection.
- Avoid pregnancy; pts of child-bearing potential should use effective contraception.
- Maintain strict oral hygiene and frequent handwashing.
- Report fever, respiratory distress, prolonged nausea, vomiting, diarrhea, easy bruising.

**clonazePAM**

kloe-naz-e-pam

(Klonopin, Rivotril )

**BLACK BOX ALERT** Concomitant use with opioids may result in profound sedation, respiratory depression, coma, and death. The use of clonazePAM exposes users to risks of abuse, misuse, and addiction. Continued use may lead to significant physical dependence. **Do not confuse clonazePAM or Klonopin with cloBAZam, cloNIDine, cloZAPine, or LORazepam.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Anticonvulsant, antianxiety.

**USES**

Adjunct in treatment of Lennox-Gastaut syndrome (petit mal variant epilepsy); akinetic, myoclonic seizures; absence seizures (petit mal) unresponsive to succinimides. Treatment of panic disorder. **OFF-LABEL:** Burning mouth syndrome, REM sleep behavior disorder, essential tremor.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to clonazePAM. Active narrow-angle glaucoma, severe hepatic disease. **Cautions:** Renal/hepatic impairment, impaired gag reflex, chronic respiratory dis-

ease, elderly, debilitated pts, depression, pts at risk of suicide or drug dependence, concomitant use of other CNS depressants.

## ACTION

Enhances activity of GABA; depresses nerve impulse transmission in motor cortex. **Therapeutic Effect:** Produces anxiolytic, anticonvulsant effects.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	20–60 min	—	12 hrs or less

Well absorbed from GI tract. Protein binding: 85%. Metabolized in liver. Excreted in urine. Not removed by hemodialysis. **Half-life:** 18–50 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. May be distributed in breast milk. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children:** Long-term use may adversely affect physical/mental development. **Elderly:** Not recommended in elderly due to anticholinergic effects, potential for sedation, orthostatic hypotension.

## INTERACTIONS

**DRUG:** Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **Yohimbine** may diminish the therapeutic effect. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 0.5 mg, 1 mg, 2 mg. **Tablets (Orally Disintegrating):** 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Swallow whole with water.

### Orally Disintegrating Tablet

• Open pouch, peel back foil; do not push tablet through foil. • Remove tablet with dry hands, place in mouth. • Swallow with or without water. • Use immediately after removing from package.

## INDICATIONS/ROUTES/DOSAGE

### Seizures

**PO: ADULTS, ELDERLY:** Initial dose not to exceed 1.5 mg/day in 3 divided doses; may be increased in 0.5- to 1-mg increments every 3–7 days until seizures are controlled or adverse effects occur. **Maintenance:** 2–8 mg/day in 1–2 divided doses. **Maximum:** 20 mg/day. **CHILDREN 10 YRS AND OLDER OR WEIGHING 30 KG OR MORE:** Initially, 0.01–0.05 mg/kg/day in 2 or 3 doses (maximum initial dose: 0.05 mg 3 times/day). May increase in increments of 25% or 0.5–1 mg q3–7 days. **Maintenance:** 0.05–0.2 mg/kg/day in 2–3 divided doses. **Maximum:** 20 mg/day. **INFANTS, CHILDREN YOUNGER THAN 10 YRS OR WEIGHING LESS THAN 30 KG:** 0.01–0.03 mg/kg/day (maximum initial dose: 0.05 mg/kg/day) in 2–3 divided doses; may be increased by no more than 0.25–0.5 mg every 3 days until seizures are controlled or adverse effects occur. **Maintenance:** 0.1–0.2 mg/kg/day in 3 divided doses. **Maximum:** 0.2 mg/kg/day.

### Panic Disorder

**PO: ADULTS, ELDERLY:** Initially, 0.25 mg twice daily. Increase in increments of 0.125–0.25 mg twice daily every 3 days. **Target dose:** 1 mg/day. **Maximum:** 4 mg/day. **Note:** Discontinue gradually by 0.125 mg twice daily q3days until completely withdrawn.

### Dosage in Renal Impairment

Use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** Use with caution. **Severe impairment:** Contraindicated.

**SIDE EFFECTS**

**Frequent (37%–11%):** Mild, transient drowsiness; ataxia, behavioral disturbances (aggression, irritability, agitation), esp. in children. **Occasional (10%–5%):** Dizziness, ataxia, URI, fatigue. **Rare (4% or less):** Impaired memory, dysarthria, nervousness, sinusitis, rhinitis, constipation, allergic reaction.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Abrupt withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal/muscle cramps, diaphoresis, vomiting, status epilepticus. Overdose results in drowsiness, confusion, diminished reflexes, coma. **Antidote:** Flumazenil (see Appendix J for dosage).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Review history of seizure disorder (frequency, duration, intensity, level of consciousness [LOC]). For panic attack, assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis).

**INTERVENTION/EVALUATION**

Observe for excess sedation, respiratory depression, suicidal ideation. Assess children, elderly for paradoxical reaction, particularly during early therapy. Initiate seizure precautions, observe frequently for recurrence of seizure activity. Assist with ambulation if drowsiness, ataxia occur. For pts on long-term therapy, CBC, BMP, LFT should be performed periodically. Evaluate for therapeutic response: decreased intensity and frequency of seizures or, if used in panic attack, calm facial expression, decreased restlessness.

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is estab-

lished. • Do not abruptly discontinue medication after long-term therapy. • Strict maintenance of drug therapy is essential for seizure control. • Avoid alcohol. • Report depression, thoughts of suicide/self-harm, excessive drowsiness, GI symptoms, worsening or loss of seizure control.

**cloNIDine****klon-i-deen**

(Catapres-TTS, Duraclon, Kapvay)

**■ BLACK BOX ALERT ■ Epidural:**

Not to be used for perioperative, obstetric, or postpartum pain. Must dilute concentrated epidural injectable (500 mcg/mL) prior to use.

**Do not confuse Catapres with Cataflam, or cloNIDine with clomiPHENE, clonazepam, Klonopin, or quiniDine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Alpha<sub>2</sub>-adrenergic agonist. **CLINICAL:** Antihypertensive.

**USES**

**Immediate-Release, Transdermal Patch:** Treatment of hypertension alone or in combination with other antihypertensive agents. **Kapvay:** Treatment of attention-deficit hyperactivity disorder (ADHD). **Epidural: (Additional)** Combined with opiates for relief of severe cancer pain. **OFF-LABEL:** Opioid or nicotine withdrawal, prevention of migraine headaches, treatment of diarrhea in diabetes mellitus, treatment of dysmenorrhea, menopausal flushing, alcohol dependence, glaucoma, cloZAPine-induced sialorrhea, Tourette's syndrome, insomnia in children.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cloNIDine. **Epidural:** Contraindicated in pts with bleeding diathesis or infection at the injection site; pts receiving anticoagulation therapy. **Cautions:** Depression, elderly. Severe coronary insufficiency, re-

cent MI, cerebrovascular disease, chronic renal impairment, preexisting bradycardia, sinus node dysfunction, conduction disturbances; concurrent use with digoxin, diltiazem, metoprolol, verapamil.

## ACTION

Stimulates  $\alpha_2$ -adrenergic receptors in the brainstem, reducing sympathetic outflow from the CNS. **Epidural:** Prevents pain signal transmission to brain and produces analgesia at pre- and post-alpha-adrenergic receptors in spinal cord. **ADHD:** Mechanism of action unknown. **Therapeutic Effect:** Reduces peripheral resistance; decreases B/P, heart rate. Produces analgesia.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–1 hr	2–4 hrs	6–10 hrs

Well absorbed from GI tract. Transdermal best absorbed from chest and upper arm; least absorbed from thigh. Protein binding: 20%–40%. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 6–20 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** More sensitive to effects; use caution. **Elderly:** Not recommended in elderly due to high risk of CNS adverse effects, orthostatic hypotension. Avoid as first-line antihypertensive.

## INTERACTIONS

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxycodone, zolpidem) may increase CNS depression. May increase AV blocking effect of **beta blockers** (e.g., atenolol, carvedilol, metoprolol). **Tricyclic antidepressants** (e.g., amitriptyline, doxepin, nortriptyline) may decrease effect (may require increased dose of cloNIDine). **Digoxin, diltiazem, metoprolol, verapamil** may increase risk of serious bradycardia. **HERBAL:** Herbs with **sedative properties** (e.g., chamomile,

kava kava, valerian) may increase CNS depression. **Herbals with hypertensive properties** (e.g., licorice, yohimbe) or **hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** 100 mcg/mL, 500 mcg/mL. **Tablets:** 0.1 mg, 0.2 mg, 0.3 mg. **Transdermal Patch: (Catapres-TTS):** 2.5 mg (release at 0.1 mg/24 hrs), 5 mg (release at 0.2 mg/24 hrs), 7.5 mg (release at 0.3 mg/24 hrs).

**Extended-Release Tablets: (Kapvay):** 0.1 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Tablets may be crushed.
- Give last oral dose just before bedtime.
- Swallow extended-release tablets whole; do not break, crush, dissolve, or divide.

### Transdermal

- Apply transdermal system to dry, hairless area of intact skin on upper arm or chest.
- Rotate sites (prevents skin irritation).
- Do not trim patch to adjust dose.

### Epidural

- Must be administered only by medical personnel trained in epidural management.

## IV INCOMPATIBILITIES

None known.

## IV COMPATIBILITIES

Bupivacaine (Marcaine, Sensorcaine), fentanyl (Sublimaze), heparin, ketamine (Ketalar), lidocaine, lorazepam (Ativan).

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS: (Immediate-Release):** Initially, 0.1 mg twice a day. Increase by

0.1 mg/day at wkly intervals. **Dosage range:** 0.2–0.6 mg/day in 2 divided doses. **ELDERLY:** Initially, 0.1 mg at bedtime. May increase gradually. **CHILDREN 12 YRS AND OLDER:** Initially, 0.2 mg/day in 2 divided doses. May increase gradually at 7-day intervals in 0.1 mg/day increments. **Usual Dose:** 0.2–0.6 mg/day. **Maximum:** 2.4 mg/day.

**Transdermal: ADULTS, ELDERLY:** Initially, system delivering 0.1 mg/24 hrs applied once q7days. May increase by 0.1 mg at 1- to 2-wk intervals. **Usual dosage range:** 0.1–0.3 mg once wkly.

#### Attention-Deficit Hyperactivity Disorder (ADHD)

**Note:** When discontinuing, taper gradually over 1–2 wks. (**Extended-Release Tablets:**) Taper by 0.1 mg or less q3–7 days.

**PO: CHILDREN WEIGHING 45 KG OR LESS: (Immediate-Release):** Initially 0.05 mg/day at bedtime. May increase in increments of 0.05 mg/day q3–7days up to a maximum of 0.2 mg/day (27–40.5 kg), 0.3 mg/day (40.5–45 kg). **MORE THAN 45 KG: (Immediate-Release):** 0.1 mg at bedtime. May increase 0.1 mg/day q3–7 days. **Maximum:** 0.4 mg/day. (**Extended-Release Tablet [Kapvay]:**) **CHILDREN 6 YRS AND OLDER:** Initially, 0.1 mg daily at bedtime. May increase in increments of 0.1 mg/day at wkly intervals (**maximum:** 0.4 mg/day). Doses should be taken twice daily with higher split dose given at bedtime.

#### Severe Pain

**Epidural: ADULTS, ELDERLY:** 30–40 mcg/hr. **CHILDREN:** Range: 0.5–2 mcg/kg/hr, not to exceed adult dose.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (40%–10%):** Dry mouth, drowsiness, dizziness, sedation, constipation. **Occasional (5%–1%):** **Tablets, Injection:** Depression, pedal edema, loss

of appetite, decreased sexual function, itching eyes, dizziness, nausea, vomiting, nervousness. **Transdermal:** Pruritus, redness, or darkening of skin. **Rare (less than 1%):** Nightmares, vivid dreams, feeling of coldness in distal extremities (esp. the digits).

#### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose produces profound hypotension, irritability, bradycardia, respiratory depression, hypothermia, miosis (pupillary constriction), arrhythmias, apnea. Abrupt withdrawal may result in rebound hypertension associated with nervousness, agitation, anxiety, insomnia, paresthesia, tremor, flushing, diaphoresis. May produce sedation in pts with acute CVA.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain B/P immediately before each dose is administered, in addition to regular monitoring (be alert to B/P fluctuations).

##### INTERVENTION/EVALUATION

Monitor B/P, pulse, mental status. Monitor daily pattern of bowel activity, stool consistency. If cloNIDine is to be withdrawn, discontinue concurrent beta-blocker therapy several days before discontinuing cloNIDine (prevents cloNIDine withdrawal hypertensive crisis). Slowly reduce cloNIDine dosage over 2–4 days.

##### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- To reduce hypotensive effect, rise slowly from lying to standing.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Avoid alcohol.
- If patch loosens during 7-day application period, secure with adhesive cover.

## clopidogrel

TOP  
100 HIGH  
ALERT

kloe-pid-oh-grel  
(Plavix)

**BLACK BOX ALERT** Diminished effectiveness in CYP2C19 metabolizers increases risk for cardiovascular events. Pts with CYP2C19\*2 and/or CYP2C19\*3 alleles may have reduced platelet inhibition.

**Do not confuse Plavix with Elavil or Paxil.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Thienopyridine derivative. **CLINICAL:** Antiplatelet.

### USES

To reduce rate of MI and stroke (with aspirin) in pts with non-ST-segment elevation acute coronary syndrome (ACS), acute ST-elevation MI (STEMI); pts with history of recent MI or stroke, or established peripheral arterial disease (PAD). **OFF-LABEL:** Graft patency (saphenous vein), stable coronary artery disease (in combination with aspirin). Initial treatment of ACS in pts allergic to aspirin.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to clopidogrel. Active bleeding (e.g., peptic ulcer, intracranial hemorrhage). **Cautions:** Severe hepatic/renal impairment, pts at risk of increased bleeding (e.g., trauma), concurrent use of anticoagulants. Avoid concurrent use of CYP2C19 inhibitors (e.g., omeprazole).

### ACTION

Active metabolite irreversibly blocks P2Y<sub>12</sub> component of ADP receptors on platelet surface, preventing activation of GPIIb/IIIa receptor complex. **Therapeutic Effect:** Inhibits platelet aggregation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2 hrs	5–7 days (with repeated doses of 75 mg/day)	5 days after last dose

Rapidly absorbed. Protein binding: 98%. Metabolized in liver. Eliminated equally in the urine and feces. **Half-life:** 8 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May increase adverse effects of apixaban, dabigatran, edoxaban, warfarin. **Strong CYP2C19 inhibitors (e.g., fluvoxamine, fluoxetine)** may decrease concentration/effect. **Chronic use of NSAIDs (e.g., diclofenac, meloxicam, naproxen)** may increase risk of GI bleeding. **HERBAL: Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba), glucosamine** may increase risk of bleeding. **FOOD: Grapefruit products** may decrease therapeutic effect. **LAB VALUES:** May increase serum bilirubin, ALT, AST, cholesterol, uric acid. May decrease neutrophil count, platelet count.

### AVAILABILITY (Rx)

**Tablets:** 75 mg, 300 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Avoid grapefruit products.

### INDICATIONS/ROUTES/DOSAGE

**Recent MI, Stroke, PAD**

**PO: ADULTS, ELDERLY:** 75 mg once daily.

**Acute Coronary Syndrome (ACS), Unstable Angina/NSTEMI**

**PO: ADULTS, ELDERLY:** Initially, loading dose of 300–600 mg, then 75 mg once daily (in combination with aspirin for up to 12 months, then aspirin indefinitely).

**ACS (STEMI)**

**Note:** Continue for at least 14 days up to 12 mos in absence of bleeding.

**PO: ADULTS, ELDERLY 75 YRS OR YOUNGER:** Initially 300-mg loading dose, then 75 mg once daily. **ELDERLY OLDER THAN 75 YRS:** 75 mg once daily.

**ACS (PCI)**

**PO: ADULTS, ELDERLY:** Initially, 600 mg, then 75 mg once daily (in combination with aspirin) for at least 12 months.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent (15%):** Skin disorders. **Occasional (8%–6%):** Upper respiratory tract infection, chest pain, flu-like symptoms, headache, dizziness, arthralgia. **Rare (5%–3%):** Fatigue, edema, hypertension, abdominal pain, dyspepsia, diarrhea, nausea, epistaxis, dyspnea, rhinitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Agranulocytosis, aplastic anemia/pancytopenia, thrombotic thrombocytopenic purpura (TTP) occur rarely. Hepatitis, hypersensitivity reaction, anaphylactoid reaction have been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain baseline chemistries, platelet count, PFA. Perform platelet counts before drug therapy, q2days during first wk of treatment, and wkly thereafter until therapeutic maintenance dose is reached. Abrupt discontinuation of drug

therapy produces elevated platelet count within 5 days.

**INTERVENTION/EVALUATION**

Monitor platelet count for evidence of thrombocytopenia. Assess Hgb, Hct, for evidence of bleeding; serum ALT, AST, bilirubin, BUN, creatinine; signs/symptoms of hepatic insufficiency during therapy.

**PATIENT/FAMILY TEACHING**

- It may take longer to stop bleeding during drug therapy.
- Report any unusual bleeding.
- Inform physicians, dentists if clopidogrel is being taken, esp. before surgery is scheduled or before taking any new drug.

**cloZAPine**

kloe-za-peen

(Clozaril, Versacloz)

**BLACK BOX ALERT**

Significant risk of life-threatening agranulocytosis, increased risk of potentially fatal cardiovascular events, particularly myocarditis, in elderly pts with dementia-related psychosis. May cause severe orthostatic hypotension, bradycardia, syncope, cardiac arrest, dose-dependent seizures.

**Do not confuse cloZAPine with clonazepam, cloNIDine, or Klo-noPIN, or Clozaril with Clinoril or Colazal.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Second-generation (atypical) antipsychotic.

**CLINICAL:** Antipsychotic.

**USES**

Management of severely ill schizophrenic pts who have failed to respond to other antipsychotic therapy. Treatment of recurrent suicidal behavior in schizophrenia or schizoaffective disorder. **OFF-LABEL:** Schizoaffective disorder, bipolar disorder, childhood psychosis, obsessive-

compulsive disorder, agitation related to Alzheimer's dementia.

**C****PRECAUTIONS**

**Contraindications:** Hypersensitivity to cloZAPine. History of cloZAPine-induced agranulocytosis or severe granulocytopenia. **Cautions:** History of seizures, cardiovascular disease, myocarditis, respiratory/hepatic/renal impairment, alcohol withdrawal, high risk of suicide, paralytic ileus, myasthenia gravis, pts at risk for aspiration pneumonia, urinary retention, narrow-angle glaucoma, prostatic hypertrophy, xerostomia, visual disturbances, constipation, history of bowel obstruction, diabetes mellitus. History of long QT prolongation/ventricular arrhythmias; concomitant use of medications that prolong QT interval; hypokalemia, hypomagnesemia.

**ACTION**

Interferes with binding of DOPamine and serotonin receptor sites. Also acts as an antagonist at alpha-adrenergic, histamine H<sub>1</sub>, cholinergic, and other dopaminergic and serotonergic receptors. **Therapeutic Effect:** Diminishes schizophrenic behavior.

**PHARMACOKINETICS**

Readily absorbed from GI tract. Protein binding: 97%. Metabolized in liver. Excreted in urine. **Half-life:** 12 hrs.

**🕒 LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Avoid use during pregnancy. Distributed in breast milk. Breastfeeding not recommended. **Children:** Not recommended for use. **Elderly:** Avoid use in pts with dementia.

**INTERACTIONS**

**DRUG:** CNS depressants (e.g., alcohol, morphine, oxyCODONE, zolpidem) may increase CNS depression. **Anticholinergics** (e.g., aclidinium, ipratropium, umeclidinium) may increase anticholinergic effect. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase

concentration/effect. **Strong CYP3A4 inducers** (e.g., carbAMazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Metoclopramide** may increase adverse effects. **HERBAL: Herbals with hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may alter effects. **Herbals with sedative properties** (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol (rare), triglycerides (rare).

**AVAILABILITY (Rx)**

**Oral Suspension: (Versacloz):** 50 mg/mL (100 mL). **Tablets: (Clozaril):** 25 mg, 50 mg, 100 mg, 200 mg. **Tablets: (Orally Disintegrating):** 12.5 mg, 25 mg, 100 mg, 150 mg, 200 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- **Suspension:** Use oral syringes (provided). Shake well, administer dose immediately after preparing. Suspension stable for 100 days after initial bottle opening.

**Orally Disintegrating Tablets**

- Remove from foil blister; do not push tablet through foil.
- Remove tablet with dry hands, place in mouth.
- Allow to dissolve in mouth; swallow with saliva.
- If dose requires splitting tablet, discard unused portion.

**INDICATIONS/ROUTES/DOSAGE****Schizophrenic Disorders**

**◀ALERT▶** For initiation of therapy, must have WBC equal to or greater than 3,500 cells/mm<sup>3</sup> and ANC equal to or greater than 1,500 cells/mm<sup>3</sup>. 1,000 cells/mm<sup>3</sup> or greater in pts with documented benign ethnic neutropenia (BEN). **PO: ADULTS:** Initially, 12.5 mg once or twice daily. May increase by 25–50 mg/day over 2 wks until target dose of 300–450 mg/day is achieved. May further increase by 50–100 mg/day no more than once or twice wkly. Range:

200–600 mg/day. **Maximum:** 900 mg/day. **ELDERLY:** Initially, 12.5 mg/day for 3 days, then 25 mg/day for 3 days. May further increase in increments of 12.5–25 mg daily q3days. **Mean dose:** 300 mg/day. **Maximum:** 700 mg/day.

#### Suicidal Behavior in Schizophrenia or Schizoaffective Disorder

**PO: ADULTS:** Initially, 12.5 mg 1–2 times/day. May increase in increments of 25–50 mg/day to a target dose of 300–450 mg/day after 2 wks. **Mean dose:** 300 mg/day. **Maximum:** 900 mg/day.

#### Dose Modification

**Leukopenia/granulocytopenia: Mild: (WBC 3,000–3,500 cells/mm<sup>3</sup> and/or ANC 1,500–2,000 cells/mm<sup>3</sup>):** Continue treatment, monitor WBC and ANC twice wkl until WBC greater than 3,500 cells/mm<sup>3</sup> and ANC greater than 2,000 cells/mm<sup>3</sup>. **Moderate: (WBC 2,000–3,000 cells/mm<sup>3</sup> and/or ANC greater than 1,000 cells/mm<sup>3</sup>–1,500 cells/mm<sup>3</sup>):** Interrupt therapy, monitor WBC and ANC daily until WBC greater than 3,000 cells/mm<sup>3</sup> and ANC greater than 1,500 cells/mm<sup>3</sup>, then twice wkl until WBC greater than 3,500 cells/mm<sup>3</sup> and ANC greater than 2,000 cells/mm<sup>3</sup>. **Severe: (WBC less than 2,000 cells/mm<sup>3</sup> and/or ANC less than 1,500 cells/mm<sup>3</sup>):** Discontinue treatment. **Discontinue:** QTC interval greater than 500 msec, cardiomyopathy/myocarditis, hepatotoxicity, or neuroleptic malignant syndrome.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (39%–14%):** Drowsiness, salivation, tachycardia, dizziness, constipation. **Occasional (9%–4%):** Hypotension, headache, tremor, syncope, diaphoresis, dry mouth, nausea, visual disturbances, nightmares, restlessness, akinesia, agitation, hy-

pertension, abdominal discomfort, heartburn, weight gain. **Rare:** Rigidity, confusion, fatigue, insomnia, diarrhea, rash.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Seizures occur occasionally (3% of pts). Overdose produces CNS depression (sedation, delirium, coma), respiratory depression, hypersalivation. Blood dyscrasias, particularly agranulocytosis, mild leukopenia, may occur.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain baseline weight, glucose, Hgb A1c, WBC, absolute neutrophil count (ANC) before initiating treatment. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content.

##### INTERVENTION/EVALUATION

Monitor B/P for hypertension/hypotension. Assess pulse for tachycardia (common side effect). Monitor CBC for blood dyscrasias. Monitor ANC, WBC count every wk for first 6 mos, then biweekly for 6 mos. If CBC and ANC are normal after 12 mos, then monthly monitoring of CBC and ANC is recommended. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression).

##### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue long-term drug therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Drowsiness generally subsides during continued therapy.
- Avoid alcohol, caffeine.
- Report fever, sore throat, flu-like symptoms.

## cobimetinib

koe-bi-me-ti-nib  
(Cotellic)

**Do not confuse cobimetinib with cabozantinib, imatinib, or trametinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** MEK inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of pts with unresectable or metastatic melanoma with a BRAF V600E or V600K mutation, in combination with vemurafenib.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to cobimetinib. **Cautions:** Baseline anemia, lymphopenia, thrombocytopenia; cardiomyopathy, hepatic/renal impairment, HF, hypertension, ocular disorders; pts at risk for bleeding (history of gastrointestinal, genitourinary, intracranial, reproductive system bleeding), electrolyte imbalance. Not recommended in pts taking moderate or strong CYP3A inhibitors.

### ACTION

Potent and selective inhibitor of mitogen-activated extracellular kinase (MEK) pathway. Reversibly inhibits MEK1 and MEK2, which are upstream regulators of the ERK pathway. The ERK pathway promotes cellular proliferation. MEK1 and MEK2 are part of the BRAF pathway. **Therapeutic Effect:** Increases apoptosis and reduces tumor growth.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95%. Peak plasma concentration: 2.4 hrs. Steady state reached in 9 days. Eliminated in feces (76%), urine (18%). **Half-life:** 44 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Females of reproductive potential should use effective contraception during treatment and up to 2 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May reduce fertility in females and males. **Children/Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., atazanavir, ciprofloxacin) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, rifampicin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase serum concentration/effect. **LAB VALUES:** Many increase serum alkaline phosphatase, ALT, AST, creatine phosphokinase, creatinine, GGT. May decrease Hct, Hgb, lymphocytes, platelets, RBCs; serum albumin, calcium, sodium. May increase or decrease serum potassium.

### AVAILABILITY (Rx)

**Tablets:** 20 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • If dose is missed or vomiting occurs during administration, give next dose at regularly scheduled time.

### INDICATIONS/ROUTES/DOSAGE

#### Metastatic Melanoma

**PO: ADULTS, ELDERLY:** 60 mg (three 20-mg tablets) once daily for first 21 days of 28-day cycle (in combination with vemurafenib). Continue until disease progression or unacceptable toxicity.

**Concomitant Use of CYP3A Inhibitors**

Reduce dose to 20 mg once daily if short-term (14 days or less) use of moderate CYP3A inhibitors is unavoidable. May resume 60-mg once-daily dose once the short-term CYP3A inhibitor is discontinued. Use an alternative strong or moderate CYP3A inhibitor in pts already taking reduced dose of 20 mg or 40 mg daily.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE) grading 1–4. See prescribing information for vemurafenib for recommended dose modification.

**Dose Reduction Schedule**

**First dose reduction:** 40 mg once daily. **Second dose reduction:** 20 mg once daily. Permanently discontinue if unable to tolerate 20 mg once daily.

**Cardiomyopathy**

**Asymptomatic decrease in left ventricular ejection fraction (LVEF) greater than 10% from baseline and less than institutional lower limit of normal (LLN):** Withhold treatment for 2 wks, then reassess LVEF. Resume at next lower dose level if LVEF is at or above LLN and the decrease from baseline is 10% or less. Permanently discontinue if LVEF is less than LLN or the decrease from baseline LVEF is more than 10%. **Symptomatic decrease of LVEF from baseline:** Withhold treatment for up to 4 wks, then reassess LVEF. Resume at next lower dose level if symptoms resolve, LVEF is at or above LLN, and the decrease from baseline LVEF is 10% or less. Permanently discontinue if symptoms persist, LVEF is less than LLN, or the decrease from baseline LVEF is more than 10%.

**Dermatologic Reactions**

**Grade 2 (intolerable); Grade 3 or 4:** Withhold or reduce dose.

**Hepatotoxicity or Hepatic Laboratory Abnormalities**

**First occurrence, Grade 4:** Withhold treatment for up to 4 wks. If improved

to Grade 0 or 1, resume at next lower dose level. If not improved to Grade 0 or 1 within 4 wks, permanently discontinue.

**Recurrent Grade 4:** Permanently discontinue.

**Hemorrhage**

**Grade 3:** Withhold treatment for up to 4 wks. If not improved to Grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue. **Grade 4:** Permanently discontinue.

**New Primary Malignancies (Cutaneous or Noncutaneous)**

No dose adjustment.

**Nonspecific Adverse Effects**

**Any intolerable Grade 2; any Grade 3:** Withhold for up to 4 wks. If improved to Grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue. **First occurrence of any Grade 4:** Permanently discontinue.

**Ocular Toxicities**

**Serious retinopathy:** Withhold treatment for up to 4 wks. If signs and symptoms improve, resume at next lower dose level. If not improved or symptoms recur at the lower dose within 4 wks, permanently discontinue. **Retinal vein occlusion:** Permanently discontinue.

**Photosensitivity**

**Grade 2 (intolerable); Grade 3 or 4:** Withhold treatment for up to 4 wks. If improved to Grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue.

**Rhabdomyolysis, CPK Level Elevations**

**Grade 4 CPK elevation or any CPK elevation with myalgia:** Withhold treatment for up to 4 wks. If improved to Grade 3 or lower, resume at next lower dose level. If not improved within 4 wks, permanently discontinue.

**Severe Hypersensitivity Reaction**

Permanently discontinue.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (60%–24%):** Diarrhea, photosensitivity, sunburn, solar dermatitis, nausea, pyrexia, vomiting. **Occasional (16%–10%):** Acneiform dermatitis, stomatitis, aphthous stomatitis, mouth ulceration, mucosal inflammation, alopecia, hypertension, vision impairment, blurred vision, reduced visual acuity, hyperkeratosis, erythema, chills.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, lymphopenia, thrombocytopenia is an expected response to therapy. New primary malignancies, including squamous cell carcinoma, keratoacanthoma, secondary-primary melanomas, were reported. Serious, sometimes fatal hemorrhagic events, including GI bleeding (4% of pts), intracranial bleeding (1% of pts), hematuria (2% of pts), reproductive system hemorrhage (2% of pts), have occurred. Other hemorrhagic events may include cerebral/conjunctival/intracranial/gingival/hemorrhoidal/ovarian/pulmonary/rectal/uterine/vaginal bleeding; ecchymosis, epistaxis. Grade 3 or 4 cardiomyopathy reported in 26% of pts. Grade 3 or 4 skin reactions including severe rash occurred in 16% of pts. Ocular toxicities, including retinopathy, chorioretinopathy, retinal detachment, reported in 26% of pts. Grade 3 or 4 CPK level elevations occurred in 14% of pts and may lead to rhabdomyolysis. Hepatotoxicity reported in 7%–11% of pts. Severe photosensitivity reported in 47% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Confirm presence of BRAF V600E or V600K mutation in tumor specimen prior

to initiation. Obtain baseline CBC, BMP, LFT, CPK; serum albumin, magnesium, phosphate, ionized calcium; urine pregnancy; vital signs. Obtain ophthalmologic exam with visual acuity; ECG, echocardiogram for LVEF. Assess skin for moles, lesions, papillomas. Verify use of effective contraception in females of reproductive potential. Receive full medication history, including herbal products. Question history as listed in Precautions. Assess hydration status.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT, CPK; serum albumin, magnesium, phosphate, ionized calcium; vital signs. Assess skin for new lesions, dermal toxicities at least q2mos during treatment and for least 6 mos after discontinuation. Assess LVEF by echocardiogram 1 mo after initiation, then q3mos thereafter until discontinuation. If treatment interrupted due to change in LVEF, monitor LVEF at 2 wks, 4 wks, 10 wks, and 16 wks, and then as indicated. Conduct ophthalmologic examinations regularly, esp. with any new or worsening visual disturbances. Assess for eye pain, visual changes. Immediately report GI bleeding, hematuria, unusual reproductive system hemorrhage; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Monitor for hepatotoxicity; monitor for signs of rhabdomyolysis, such as dark-colored urine, flank pain, decreased urine output, muscle aches. Due to high risk of diarrhea, strictly monitor I&O.

**PATIENT/FAMILY TEACHING**

- Blood levels monitoring, cardiac function tests, eye exams, skin exams will be conducted frequently.
- Treatment may lead to severe anemia, HF, kidney failure, new cancers, severe light sensitivity, liver dysfunction, skin toxicities (such as severe rash, peeling), vision changes.
- Report bloody stools, bloody urine, unusual reproductive system bleeding, nosebleeds, coughing up blood; abdominal or

flank pain, dark-colored urine, decreased urinary output; stroke-like symptoms; new skin moles or lesions, rash; eye pain, vision changes; heart problems such as shortness of breath, dizziness, fainting, palpitations. • Report any newly prescribed medications. • Avoid sunlight, tanning beds. Wear protective clothing, high-SPF sunscreen, and lip balm when outdoors. • Use contraception to avoid pregnancy. Do not breastfeed. Treatment may reduce fertility.

## colchicine

HIGH  
ALERT

**kol-chi-seen**

(Colcrys, Gloperba, Mitigare)

**Do not confuse colchicine with Cortrosyn.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkaloid.

**CLINICAL:** Antigout.

### USES

Prevention, treatment of acute gouty arthritis. Used to reduce frequency of recurrence of familial Mediterranean fever (FMF) in adults and children 4 yrs and older. **OFF-LABEL:** Treatment of biliary cirrhosis, recurrent pericarditis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to colchicine. Concomitant use of a P-glycoprotein (e.g., cycloSPORINE) or strong CYP3A4 inhibitor (e.g., clarithromycin) in presence of renal or hepatic impairment. **Mitigare:** Pts with both renal/hepatic impairment. **Cautions:** Hepatic impairment, elderly, debilitated pts, renal impairment. Concomitant use of cycloSPORINE, diltiazEM, verapamil, fibrates, statins may increase risk of myopathy.

### ACTION

Disrupts cytoskeletal functions by preventing activation, degranulation,

and migration of neutrophils associated with gout symptoms. In FMF, may interfere with intracellular assembly of inflammasome complex present in neutrophils and monocytes. **Therapeutic Effect:** Reduces inflammatory process.

### PHARMACOKINETICS

Rapidly absorbed from GI tract. Oral bioavailability: 45%. Highest concentration is in liver, spleen, kidney. Protein binding: 30%–50%. Re-enters intestinal tract by biliary secretion and is reabsorbed from intestines. Partially metabolized in liver via CYP3A4. Eliminated primarily in feces. **Half-life:** 27–31 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Drug crosses placenta and is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more susceptible to cumulative toxicity. Age-related renal impairment may increase risk of myopathy.

### INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), P-glycoprotein/ABCBI inhibitors (e.g., amiodarone) may increase concentration/effect. May increase concentration/effect; risk of adverse effects (myopathy) of HMG-CoA inhibitors (statins) (e.g., atorvastatin). **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/toxicity. **LAB VALUES:** May increase serum alkaline phosphatase, AST. May decrease platelet count.

### AVAILABILITY (Rx)

**Tablets:** (Colcrys): 0.6 mg. **Capsule:** (Mitigare): 0.6 mg. **Oral Solution:** (Gloperba): 0.6 mg/5 mL.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. • For FMF, give in 1 or 2 divided doses. • Give with adequate water and maintain fluid intake.

**INDICATIONS/ROUTES/DOSAGE****Acute Gouty Arthritis (Colcrys)**

**PO: ADULTS, ELDERLY:** Initially, 1.2 mg at first sign of gout flare, then 0.6 mg 1 hr later. **Maximum:** 1.8 mg within 1 hr. **Coadministration with strong CYP3A4 inhibitors:** Initially, 0.6 mg, then 0.3 mg dose 1 hr later. Do not repeat for at least 3 days. **Coadministration with moderate CYP3A4 inhibitors:** 1.2 mg once. Do not repeat for at least 3 days. **Coadministration with P-glycoprotein inhibitors:** 0.6 mg once. Do not repeat for at least 3 days.

**Gout Prophylaxis (Colcrys, Mitigare)**

**Note:** Duration of prophylaxis is 6 mos or 3 mos (pts without tophi) to 6 mos (pts with 1 or more tophi)

**PO: ADULTS, ELDERLY:** 0.6 mg 1–2 times/day. **Maximum:** 1.2 mg/day. **Coadministration with strong CYP3A4 inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg every other day. **Coadministration with moderate CYP3A4 inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg twice daily or 0.6 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg once daily. **Coadministration with P-glycoprotein inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg every other day.

**FMF (Colcrys)**

**PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 1.2–1.8 mg/day in 1–2 divided doses. Titrate dose in 0.6-mg increments. **Maximum:** 3 mg/day.

**Coadministration with strong CYP3A4 inhibitors: Maximum:** 0.6 mg once daily (or 0.3 mg twice daily). **Coadministration with moderate CYP3A4 inhibitors:** 1.2 mg/day (0.6 mg twice daily). **Coadministration with P-glycoprotein inhibitors:** 0.6 mg once daily (or 0.3 mg twice daily). **CHILDREN 7–12 YRS:** 0.9–1.8 mg/day in 1–2 divided doses. **CHILDREN 4–6 YRS:** 0.3–1.8 mg/day in 1–2 divided doses. **Note:** Increase or decrease dose by 0.3 mg/day, not to exceed maximum dose.

**Pericarditis**

**PO: ADULTS, ELDERLY:** 0.6 mg 2 times/day.

**Dosage in Renal Impairment**

<b>Creatinine Clearance</b>	<b>Dosage</b>
Less than 30 mL/min	
FMF	0.3 mg initially
Gout prophylaxis	0.3 mg/day
Gout flare	No reduction
HD	
FMF	0.3 mg as single dose
Gout prophylaxis	0.3 mg 2–4 times/wk

**Dosage in Hepatic Impairment**

Use caution.

**SIDE EFFECTS**

**Frequent:** Nausea, vomiting, abdominal discomfort. **Occasional:** Anorexia. **Rare:** Hypersensitivity reaction, including angioedema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Bone marrow depression (aplastic anemia, agranulocytosis, thrombocytopenia) may occur with long-term therapy. Overdose initially causes burning feeling in skin/throat; severe diarrhea, abdominal pain. Second stage manifests as fever, seizures, delirium, renal impairment (hematuria, oliguria). Third stage causes hair loss, leukocytosis, stomatitis.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline laboratory studies. **Gout:** Assess involved joints for pain, mobility, edema. **Mediterranean fever:** Assess abdominal pain, fever, chills, erythema, swollen skin lesions.

### INTERVENTION/EVALUATION

Discontinue medication immediately if GI symptoms occur. Encourage high fluid intake (3,000 mL/day). Monitor I&O (output should be at least 2,000 mL/day), CBC, hepatic/renal function tests. Monitor serum uric acid. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

- Drink 8–10 (8-oz) glasses of fluid daily while taking medication.
- Report skin rash, sore throat, fever, unusual bruising/bleeding, weakness, fatigue, numbness.
- Stop medication as soon as gout pain is relieved or at first sign of nausea, vomiting, diarrhea.
- Avoid grapefruit products.

## copanlisib

koe-pan-lis-ib  
(Aliqopa)

**Do not confuse copanlisib with cabozantinib, cobimetinib, duvelisib, or idelalisib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Phosphatidylinositol 3-kinase inhibitor.  
**CLINICAL:** Antineoplastic.

## USES

Treatment of adults with relapsed follicular lymphoma who have received at least two prior systemic therapies.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to copanlisib. **Cautions:** Baseline cytopenias; active infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of diabetes, hypertension, pulmonary disease. Concomitant use of moderate CYP3A inhibitors.

## ACTION

Inhibits phosphatidylinositol-3-kinase (PI3K) expressed on malignant B-cells. Inhibits signaling pathway of B-cell receptors, lymphoma cells lines, and CXCR12-mediated chemotaxis of malignant B-cells. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis. Induces cellular death by apoptosis.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 84%. Excreted in feces (64%), urine (22%). **Half-life:** 39 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use reliable form of contraception (failure rate less than 1% per yr) during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. May impair fertility in females and males of reproductive potential. **Males:** Must use condoms during treatment and up to 1 mo after treatment, despite prior history of vasectomy. **Children:** Safety and efficacy not

established. **Elderly:** No age-related precautions noted.

**C****INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin, carbamazepine) may decrease concentration/effect. May decrease effect of BCG (intravesical). May enhance adverse/toxic effects of natalizumab, pimecrolimus, tacrolimus, vaccines (live). **HERBAL:** Echinacea may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum glucose, lipase, triglycerides, uric acid. May decrease Hgb, lymphocytes, neutrophils, platelets, WBC; serum phosphate.

**AVAILABILITY (Rx)**

**Injection, Lyophilized Solid for Reconstitution:** 60 mg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute lyophilized solid using 4.4 mL of 0.9% NaCl for a vial concentration of 15 mg/mL. • Gently shake vial for 30 sec. • Allow vial to settle for 1 min (allowing bubbles to rise to surface). • If any contents are not completely dissolved, repeat gentle shaking and settling process. • Visually inspect for particulate matter or discoloration. Solution should appear colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed. • For 60 mg dose, withdraw 4 mL of solution from vial. For 45 mg dose, withdraw 3 mL of solution from vial. For 30 mg dose, withdraw 2 mL of solution from vial. • Dilute solution in 100 mL of 0.9% NaCl. • Mix by gentle inversion.

**Rate of administration** • Infuse over 60 min.

**Storage** • Refrigerate unused vials. • May refrigerate reconstituted vial or diluted solution for up to 24 hrs. • If refrigerated, allow diluted solution to warm to room temperature before infusion. • Avoid direct sunlight.

**IV COMPATIBILITIES/INCOMPATIBILITIES**

Reconstitute and dilute using only 0.9% NaCl. Do not infuse with other medications.

**INDICATIONS/ROUTES/DOSAGE****Follicular Lymphoma**

**IV: ADULTS, ELDERLY:** 60 mg on days 1, 8, and 15 of a 28-day cycle on an intermittent schedule (3 wks on, 1 wk off). Continue until disease progression or unacceptable toxicity.

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

**Hyperglycemia**

**Fasting serum blood glucose level equal to 160 mg/mL or greater (pre-dose):** Withhold treatment until fasting serum glucose is 160 mg/mL or less. **Random/nonfasting blood glucose level equal to 200 mg/mL or greater:** Withhold treatment until random/non-fasting glucose is 200 mg/mL or less. **Serum blood glucose level equal to 500 mg/mL or greater (pre-dose or post-dose): First occurrence:** Withhold treatment until fasting glucose is 160 mg/mL or less, or until random/nonfasting glucose is 200 mg/mL or less. Then reduce dose to 45 mg dose. **Subsequent occurrences:** Withhold treatment until fasting glucose is 160 mg/mL or less, or until random/nonfasting glucose is 200 mg/mL or less. Then reduce dose to 30 mg dose. If hyperglycemia persists at 30 mg dose, permanently discontinue.

**Hypertension**

**B/P 150/90 mmHg or greater (pre-dose):** Withhold treatment until two consecutive B/P measurements (at least 15 min apart) are less than 150/90 mmHg. **Non-life-threatening B/P 150/90 mmHg or greater (post-dose):** Continue at same dose if antihypertensive therapy is not indicated. If antihypertensive therapy is indicated, consider dose reduction from 60 mg to 45 mg, or from 45 mg to 30 mg. If B/P remains 150/90 mmHg or higher at 30 mg dose despite antihypertensive therapy, permanently discontinue. **Life-threatening B/P 150/90 mmHg or greater (post-dose):** Permanently discontinue.

**Infection**

**Grade 3 or higher infection:** Withhold treatment until resolved. **Suspected *Pneumocystis jiroveci* pneumonia (PJP) infection of any grade:** Withhold treatment. If PJP infection is confirmed, treat infection until resolved. Then resume treatment at same dose with concomitant PJP preventative therapy.

**Neutropenia**

**Absolute neutrophil count (ANC) less than 500 cells/mm<sup>3</sup>:** Withhold treatment until ANC is 500 cells/mm<sup>3</sup> or greater, then resume at same dose. **Recurrence of ANC 500 cells/mm<sup>3</sup> or less:** Reduce dose to 45 mg.

**Noninfectious Pneumonitis**

**Grade 2 noninfectious pneumonitis (NIP):** Withhold treatment and treat NIP. Once recovered to Grade 1 or 0, reduce dose at 45 mg dose. If Grade 2 NIP recurs, permanently discontinue. **Grade 3 or higher noninfectious pneumonitis (NIP):** Permanently discontinue.

**Severe Cutaneous Reactions**

**Grade 3 severe cutaneous reactions:** Withhold treatment until resolved, then reduce dose from 60 mg to

45 mg, or from 45 mg to 30 mg. **Life-threatening severe cutaneous reactions:** Permanently discontinue.

**Thrombocytopenia**

**Platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count is 75,000 cells/mm<sup>3</sup> or greater. If recovery occurs within 21 days, reduce dose from 60 mg to 45 mg, or from 45 mg to 30 mg. If recovery does not occur within 21 days, permanently discontinue.

**Other Toxicities**

**Any other Grade 3 toxicities:** Withhold treatment until resolved, then reduce dose from 60 mg to 45 mg, or from 45 mg to 30 mg.

**Concomitant Use of Strong CYP3A Inhibitors**

If strong CYP3A inhibitor cannot be discontinued, reduce dose to 45 mg.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (36%):** Fatigue, asthenia, diarrhea. **Occasional (15%–7%):** Rash, stomatitis, oropharyngeal erosion, oral pain, vomiting, mucosal inflammation, paresthesia, dysesthesia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Serious infections including bacterial/fungal/pneumococcal/viral pneumonia, bronchopulmonary aspergillosis, lung infection reported

in 21% of pts. *Pneumocystis jiroveci* pneumonia reported in less than 1% of pts. Hyperglycemia reported 54% of pts. Blood glucose levels usually peaked 5–8 hrs after infusion. CTCAE Grade 3 hypertension occurred in 26% of pts. Noninfectious pneumonitis occurred in 5% of pts. Severe cutaneous reactions reported in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, vital signs. Screen for active infection. Obtain pregnancy test in females of reproductive potential. Question current breastfeeding status. Confirm compliance of effective contraception. Question history of diabetes, hypertension, pulmonary disease. Pts with history of diabetes, hypertension should have adequate control prior to initiation. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC, platelet count periodically. Monitor blood glucose level prior to each treatment; B/P before and after each treatment. Be alert for infections, esp. lower respiratory tract infection such as *pneumocystis jiroveci* pneumonia, bacterial/fungal/pneumococcal/viral pneumonia (cough, dyspnea, hypoxia, pleuritic chest pain). Consider ABG, radiologic test if lung infection or pneumonitis suspected. If treatment-related toxicities occur, consider referral to specialist. Assess skin for cutaneous reactions.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of high blood sugar levels (confusion, excessive thirst/hunger, headache, frequent urination);

high blood pressure (dizziness, headache, fainting); inflammation of the lung (excessive cough, difficulty breathing); toxic skin reactions (itching, peeling, rash, redness, swelling).

- Use contraception to avoid pregnancy. Do not breastfeed.
- Treatment may impair fertility.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.
- Do not ingest grapefruit products.

## crizotinib

kriz-o-ti-nib  
(Xalkori)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tyrosine kinase inhibitor. Anaplastic lymphoma kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of metastatic non–small-cell lung cancer (NSCLC) that is anaplastic lymphoma kinase (ALK) positive or is ROS-1 positive. Treatment of anaplastic large cell lymphoma, systemic ALK-positive, relapsed or refractory in pts 1–21 yrs of age.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to crizotinib. **Cautions:** Baseline hepatic impairment, congenital long QT interval syndrome. Pregnancy (avoid use). Concomitant use of CYP3A4 inducers/inhibitors, medications known to cause bradycardia, renal impairment.

### ACTION

Inhibits receptor tyrosine kinases, including anaplastic lymphoma kinase (ALK), hepatocyte growth factor receptors (HGFR, c-Met), recepteur d'origine nantais (RON). ALK gene abnormalities due to mutation may result in expression

of oncogenic fusion proteins. **Therapeutic Effect:** Inhibits tumor cell proliferation of cells expressing genetic alteration.

## PHARMACOKINETICS

Well absorbed after PO administration. Peak plasma concentration: 4–6 hrs. Protein binding: 91%. Metabolized in liver. Excreted in feces (63%) and urine (22%). **Half-life:** 42 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy. May cause fetal harm. Contraception should be considered during therapy and for at least 12 wks after discontinuation. Do not initiate therapy until pregnancy status confirmed. Unknown if crosses placenta or distributed in breast milk. Nursing mothers must discontinue either nursing or drug therapy. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration/effect of aprepitant, bosutinib, budesonide, cobimetinib, cycloSPORINE, ivabradine, neratinib, sirolimus, tacrolimus. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/toxicity (potential for torsades, myelotoxicity). **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, bilirubin. May decrease neutrophils, platelets, lymphocytes.

## AVAILABILITY (Rx)

 **Capsules:** 200 mg, 250 mg.

## ADMINISTRATION/HANDLING

- May give without regard to food.
- Avoid grapefruit products.
- Do not break, crush, dissolve, or divide capsules.

## INDICATIONS/ROUTES/DOSAGE

**Non–Small-Cell Lung Cancer (ALK Positive), Metastatic NSCLC, ROS-1 Positive**

**PO: ADULTS:** 250 mg twice daily. Continue until disease progression or unacceptable toxicity.

**Anaplastic Large Cell Lymphoma, Systemic ALK-Positive (Relapsed or Refractory)**

**PO: ADULTS, CHILDREN 1-18 YRS:** 280 mg/m<sup>2</sup> twice daily. Continue until disease progression or unacceptable toxicity.

### Dosage Modification

Interrupt and/or reduce to 200 mg twice daily based on graded protocol, including hematologic toxicity (Grade 4), elevated LFT with bilirubin elevation (Grade 1), QT prolongation (Grade 3). May reduce to 250 mg once daily if indicated. Discontinue treatment for QT prolongation (Grade 4), elevated LFT with bilirubin elevation (Grades 2, 3, 4), pneumonitis of any grade.

### Hematologic Toxicity

**Grade 3 toxicity (WBC 1,000–2,000 cells/mm<sup>3</sup>, ANC 500–1,000 cells/mm<sup>3</sup>, platelets 25,000–50,000 cells/mm<sup>3</sup>), Grade 3 anemia:** Withhold treatment until recovery to Grade 2 or less, then resume at same dosage. **Grade 4 toxicity (WBC less than 1,000 cells/mm<sup>3</sup>, ANC less than 500 cells/mm<sup>3</sup>, platelets less than 25,000 cells/mm<sup>3</sup>), Grade 4 anemia:** Withhold treatment until recovery to Grade 2 or less, then resume at 200 mg twice daily. **Grade 4 toxicity on 200 mg twice daily:** Withhold treatment until recovery to Grade 2 or less, then resume at 250 mg once daily. **Recurrent Grade 4 toxicity on 250 mg once daily:** Permanently discontinue.

**Cardiotoxicity**

**Grade 3 QTc prolongation on at least 2 separate ECGs:** Withhold treatment until recovery to baseline or Grade 1 or less. Resume at 200 mg twice daily. **Recurrent Grade 3 QTc prolongation on 200 mg twice daily:** Withhold treatment until recovery to baseline or Grade 1 or less. Resume at 250 mg once daily. **Recurrent Grade 3 QTc prolongation on 250 mg once daily:** Permanently discontinue.

**Bradycardia**

**Grades 2 or 3:** Withhold until recovery to asymptomatic bradycardia or heart rate 60 or more beats/min, evaluate concomitant medications, then resume at 200 mg twice daily. **Grade 4 due to crizotinib:** Permanently discontinue. **Grade 4 associated with concurrent medications known to cause bradycardia/hypotension:** Withhold until recovery to asymptomatic bradycardia or heart rate 60 or more beats/min, and if concurrent medications can be stopped, resume at 250 mg once daily.

**Pulmonary Toxicity**

Permanently discontinue.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min:** 250 mg once daily.

**Dosage in Hepatic Impairment**

No dose adjustment (see dose for hepatotoxicity during treatment).

**SIDE EFFECTS**

**Frequent (62%–27%):** Diplopia, photopsia, photophobia, blurry vision, visual field defect, vitreous floaters, reduced visual acuity, nausea, diarrhea, vomiting, peripheral/localized edema, constipation. **Occasional (20%–4%):** Fatigue, decreased appetite, dizziness, neuropathy, paresthesia, dysgeusia, dyspepsia, dysphagia, esophageal obstruction/pain/spasm/ulcer, odynophagia, reflux esophagitis, rash, abdominal pain/tenderness, stomatitis, glossodynia, glossitis, cheilitis,

mucosal inflammation, oropharyngeal pain/discomfort, bradycardia, headache, cough. **Rare (3%–1%):** Musculoskeletal chest pain, insomnia, dyspnea, arthralgia, nasopharyngitis, rhinitis, pharyngitis, URI, back pain, complex renal cysts, chest pain/tightness.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Severe, sometimes fatal treatment-related pneumonitis, pneumonia, dyspnea, pulmonary embolism in less than 2% of pts was noted. Grade 3–4 elevation of hepatic enzymes, increased QT prolongation may require discontinuation. May cause thrombocytopenia, neutropenia, lymphopenia. Severe/worsening vitreous floaters, photopsia may indicate retinal hole, retinal detachment.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess vital signs, O<sub>2</sub> saturation. Obtain baseline CBC with differential, serum chemistries, LFT, PT/INR, ECG; pregnancy test in females of reproductive potential. Obtain full medication history including vitamins, herbal products. Detection of ALK-positive NSCLC test needed prior to treatment. Assess history of tuberculosis, HIV, HE, bradyarrhythmias, electrolyte imbalance, medications that prolong QT interval. Assess visual acuity, history of vitreous floaters. Offer emotional support.

**INTERVENTION/EVALUATION**

Assess vital signs, O<sub>2</sub> saturation routinely. Monitor CBC with differential monthly, LFT, monthly; increase testing for Grades 2, 3, 4 adverse effects. Obtain ECG for bradycardia, electrolyte imbalance, chest pain, difficulty breathing. Monitor for bruising, hematuria, jaundice, right upper abdominal pain, weight loss, or acute infection (fever, diaphoresis, lethargy, oral mucosal changes, productive cough). Worsening cough, fever, or shortness of breath may indicate pneumonitis. Consider ophthalmological evaluation for vision changes. Reinforce birth control compliance.

**PATIENT/FAMILY TEACHING**

- Report urine changes, bloody or clay-colored stools, upper abdominal pain, nausea, vomiting, bruising, fever, cough, difficulty breathing.
- Report history of liver abnormalities or heart problems, including long QT syndrome, syncope, palpitations, extremity swelling.
- Immediately report any newly prescribed medications, suspected pregnancy, or vision changes, including light flashes, blurred vision, photophobia, or new or increased floaters.
- Use contraception to avoid pregnancy. Do not breastfeed.
- Avoid alcohol, grapefruit products.

**cyclobenzaprine**

syeh-kloe-ben-za-preen  
(Amrix, Fexmid)

**Do not confuse cyclobenzaprine with cycloSERINE or cyproheptadine.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Centrally acting muscle relaxant. **CLINICAL:** Skeletal muscle relaxant.

**USES**

Treatment of muscle spasm associated with acute, painful musculoskeletal conditions. **OFF-LABEL:** Treatment of muscle spasms associated with temporomandibular joint pain (TMJ).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to cyclobenzaprine. Acute recovery phase of MI, arrhythmias, HF, heart block, conduction disturbances, hyperthyroidism, use within 14 days of MAOIs. **Cautions:** Hepatic impairment, history of urinary hesitancy or retention, angle-closure glaucoma, increased intraocular pressure (IOP), elderly.

**ACTION**

Centrally acting skeletal muscle relaxant that reduces tonic somatic muscle activity at level of brainstem. Influences both alpha and gamma motor neurons. **Therapeutic Effect:** Relieves local skeletal muscle spasm.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	1 hr	3–4 hrs	12–24 hrs

Well but slowly absorbed from GI tract. Protein binding: 93%. Metabolized in GI tract and liver. Primarily excreted in urine. **Half-life:** 8–37 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased sensitivity to anticholinergic effects (e.g., confusion, urinary retention). Increased risk of falls, fractures. Not recommended.

**INTERACTIONS**

**DRUG:** Alcohol, other CNS depressant medications (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. MAOIs (e.g., phenelzine, selegiline) may increase risk of hypertensive crisis, seizures. **Anticholinergics** (e.g., acclidinium, ipratropium, umecclidinium) may increase anticholinergic effect. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant.

**AVAILABILITY (Rx)**

**Tablets:** 5 mg, 7.5 mg, 10 mg.

**⚠ Capsules:** (Extended-Release [Amrix]): 15 mg, 30 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Do not break, crush, dissolve, or divide ex-

tended-release capsule. • Give extended-release capsule at same time each day.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Do not use longer than 2–3 wks.

### Acute, Painful Musculoskeletal Conditions

**PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER:** Initially, 5 mg 3 times/day. May increase to 40 mg/day in 1–3 divided doses.

**PO: (Extended-Release): ADULTS:** 15–30 mg once daily. Not recommended in elderly.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

**Note:** Extended-release capsule not recommended in hepatic impairment. **Mild impairment:** 5 mg 3 times/day. **Moderate to severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (39%–11%):** Drowsiness, dry mouth, dizziness. **Rare (3%–1%):** Fatigue, asthenia, blurred vision, headache, anxiety, confusion, nausea, constipation, dyspepsia, unpleasant taste.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may result in visual hallucinations, hyperactive reflexes, muscle rigidity, vomiting, hyperpyrexia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling.

### INTERVENTION/EVALUATION

Assist with ambulation. Assess for therapeutic response: relief of pain; decreased stiffness, swelling; increased joint mobil-

ity; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

• Avoid tasks that require alertness, motor skills until response to drug is established. • Drowsiness usually diminishes with continued therapy. • Avoid alcohol, other depressants while taking medication. • Avoid sudden changes in posture. • Sugarless gum, sips of water may relieve dry mouth.

## cyclophosphamide **HIGH ALERT**

sye-kloe-foss-fa-mide  
(Procytox )

**Do not confuse cyclophosphamide with cycloSPORINE or ifosfamide.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alkylating agent. **CLINICAL:** Antineoplastic.

## USES

Treatment of acute lymphocytic, acute nonlymphocytic, chronic myelocytic, chronic lymphocytic leukemias; ovarian, breast carcinomas; neuroblastoma; retinoblastoma; Hodgkin's, non-Hodgkin's lymphomas; multiple myeloma; mycosis fungoides; nephrotic syndrome in children. **OFF-LABEL:** Treatment of adrenocortical, bladder, cervical, endometrial, prostatic, testicular carcinomas; Ewing's sarcoma; multiple sclerosis; non-small-cell, small-cell lung cancer; organ transplant rejection; osteosarcoma; ovarian germ cell, primary brain, trophoblastic tumors; rheumatoid arthritis; soft-tissue sarcomas; systemic dermatomyositis; systemic lupus erythematosus; Wilms' tumor.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to cyclophosphamide. Urinary outflow ob-

struction. **Cautions:** Severe leukopenia, thrombocytopenia, tumor infiltration of bone marrow, previous therapy with other antineoplastic agents, radiation, renal/hepatic/cardiac impairment, acute UTI.

## ACTION

Inhibits DNA, RNA protein synthesis by cross-linking with DNA, RNA strands. Cell cycle–phase nonspecific. **Therapeutic Effect:** Prevents cell growth. Potent immunosuppressant.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 10%–60%. Crosses blood-brain barrier. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 3–12 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy. Use of effective contraception during therapy and up to 1 yr after completion of therapy is recommended. May cause fetal malformations (limb abnormalities, cardiac anomalies, hernias). Distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** CYP2D6 inducers (e.g., carbamazepine, phenobarbital) may decrease concentration/effect. Anthracycline agents (e.g., doxorubicin, epirubicin) may increase risk of cardiomyopathy. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Pts with an estrogen-dependent tumor should avoid black cohosh, dong quai. Echinacea may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

## AVAILABILITY (Rx)

 **Capsules:** 25 mg, 50 mg. **Injection, Powder for Reconstitution:** 500 mg, 1 g, 2 g.

## ADMINISTRATION/HANDLING

**◀ALERT▶** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

**Reconstitution** • Reconstitute each 100 mg with 5 mL Sterile Water for Injection, 0.9% NaCl, or D<sub>5</sub>W to provide concentration of 20 mg/mL. • Shake to dissolve. • Allow to stand until clear.

**Rate of administration** • Infusion rates vary based on protocol. May give by direct IV injection, IV piggyback, or continuous IV infusion.

**Storage** • Reconstituted solution in 0.9% NaCl is stable for 24 hrs at room temperature or up to 6 days if refrigerated.

## PO

• Give on an empty stomach. If GI upset occurs, give with food. • Do not cut or crush. • To minimize risk of bladder irritation, do not give at bedtime.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## IV COMPATIBILITIES

Granisetron (Kytril), heparin, HYDROMORPHONE (Dilaudid), LORAZEPAM (Ativan), morphine, ondansetron (Zofran), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**Note:** Hematologic toxicity may require dose reduction.

**Usual Dosage (Refer to Individual Protocols)**

**IV: ADULTS, ELDERLY, CHILDREN:** (Single agent): 40–50 mg/kg in divided doses over 2–5 days or 10–15 mg/kg q7–10 days or 3–5 mg/kg twice wkly.

**PO: ADULTS, ELDERLY, CHILDREN:** 1–5 mg/kg/day.

### Nephrotic Syndrome

**PO: ADULTS, CHILDREN:** 2 mg/kg/day for 60–90 days. **Maximum cumulative dose:** 168 mg/kg.

### Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution.

## SIDE EFFECTS

**Expected:** Marked leukopenia 8–15 days after initiation. **Frequent:** Nausea, vomiting (beginning about 6 hrs after administration and lasting about 4 hrs); alopecia (33%).

**Occasional:** Diarrhea, darkening of skin/fingernails, stomatitis, headache, diaphoresis. **Rare:** Pain/redness at injection site.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (leukopenia, anemia, thrombocytopenia, hypoprotrombinemia) is an expected response to therapy. Expect leukopenia to resolve in 17–28 days. Anemia generally occurs after large doses or prolonged therapy. Thrombocytopenia may occur 10–15 days after drug initiation. Hemorrhagic cystitis occurs commonly in long-term therapy (esp. in children). Pulmonary fibrosis, cardiotoxicity noted with high doses. Amenorrhea, azoospermia, hyperkalemia may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC w/ky during therapy or until maintenance dose is established, then at 2- to 3-wk intervals. Question history of urinary outlet flow obstruction, hepatic/renal impairment, active infections. Obtain pregnancy test in females of reproductive potential.

### INTERVENTION/EVALUATION

Monitor CBC, serum BUN, creatinine, electrolytes, urine output. Monitor WBC counts closely during initial therapy.

Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Recovery from marked leukopenia due to myelosuppression can be expected in 17–28 days.

### PATIENT/FAMILY TEACHING

- Encourage copious fluid intake, frequent voiding (assists in preventing cystitis) at least 24 hrs before, during, after therapy.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, difficulty or pain with urination, unusual bruising/bleeding from any site.
- Hair loss is reversible, but new hair growth may have different color, texture.
- Avoid pregnancy for up to 1 yr after completion of treatment.

## cycloSPORINE

sy-e-kloe-spor-in

(Gengraf, Neoral, Restasis, SandIMMUNE)

**■ BLACK BOX ALERT ■** Only physicians experienced in management of immunosuppressive therapy and organ transplant pts should prescribe. Renal impairment may occur with high dosage. Increased risk of neoplasia, susceptibility to infections. May cause hypertension, nephrotoxicity. Psoriasis pts: Increased risk of developing skin malignancies. The modified/nonmodified formulations are not bioequivalent and cannot be used interchangeably without close monitoring.

**Do not confuse cycloSPORINE with cycloSERINE or cyclophosphamide, Gengraf with ProGraf, Neoral with Neurontin or Nizoral, or SandIMMUNE with SandoSTATIN.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcineurin inhibitor. **CLINICAL:** Immunosuppressant.

## USES

**Modified, Nonmodified:** Prevents organ rejection of kidney, liver, heart in combination with steroid therapy and an antiproliferative immunosuppressive agent. **Nonmodified:** Treatment of chronic allograft rejection in those previously treated with other immunosuppressives. **Modified:** Treatment of severe, active rheumatoid arthritis, severe recalcitrant plaque psoriasis in nonimmunocompromised adults. **Ophthalmic:** Chronic dry eyes. **OFF-LABEL:** Allogenic stem cell transplants for prevention/treatment of graft-vs-host disease; focal segmental glomerulosclerosis, lupus nephritis, severe ulcerative colitis.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity to cycloSPORINE, polyoxyethylated castor oil; rheumatoid arthritis and psoriasis, renal dysfunction, uncontrolled hypertension, renal impairment, or malignancies in treatment of psoriasis or rheumatoid arthritis. **Cautions:** Hepatic/renal impairment. History of seizures. Avoid live vaccines.

## ACTION

Inhibits cellular, humoral immune responses by inhibiting interleukin-2, a proliferative factor needed for T-cell activity. **Therapeutic Effect:** Prevents organ rejection, relieves symptoms of psoriasis, arthritis.

## PHARMACOKINETICS

Variably absorbed from GI tract. Protein binding: 90%. Metabolized in liver. Eliminated primarily by biliary or fecal excretion. Not removed by hemodialysis. **Half-life:** Adults, 10–27 hrs; children, 7–19 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted in transplant pts. **Elderly:** Increased risk of hypertension, increased serum creatinine.

## INTERACTIONS

**DRUG:** May increase concentration/effects of **aliskiren, atorvastatin, dronedarone, lovastatin, pazopanib, simvastatin. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's response to vaccine. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD: Grapefruit products** may increase absorption/immunosuppression, risk of toxicity. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, amylase, bilirubin, creatinine, potassium, uric acid, ALT, AST. May decrease serum magnesium. **Therapeutic peak serum level:** 50–400 ng/mL; **toxic serum level:** greater than 400 ng/mL.

## AVAILABILITY (Rx)

 **Capsules:** (*Gengraf, Neoral [Modified], SandIMMUNE [Nonmodified]*): 25 mg, 50 mg, 100 mg. **Injection, Solution:** (*SandIMMUNE*): 50 mg/mL. **Ophthalmic Emulsion:** (*Restasis*): 0.05%. **Oral Solution:** (*Gengraf, Neoral [Modified], SandIMMUNE [Nonmodified]*): 100 mg/mL.

## ADMINISTRATION/HANDLING

**◀ ALERT ▶** Oral solution available in bottle form with calibrated liquid measuring device. Oral form should replace IV administration as soon as possible.

**Reconstitution** • Dilute each mL (50 mg) concentrate with 20–100 mL 0.9% NaCl or D<sub>5</sub>W (**maximum concentration**: 2.5 mg/mL).

**Rate of administration** • Infuse over 2–6 hrs. • Monitor pt continuously for hypersensitivity reaction (facial flushing, dyspnea).

**Storage** • Store parenteral form at room temperature. • Protect IV solution from light. • After diluted, stable for 6 hrs in PVC; 24 hrs in non-PVC or glass.

#### PO

• Administer consistently with relation to time of day and meals. • Oral solution may be mixed in glass container with milk, chocolate milk, orange juice, or apple juice (preferably at room temperature). Stir well. • Drink immediately. • Add more diluent to glass container. Mix with remaining solution to ensure total amount is given. • Dry outside of calibrated liquid measuring device before replacing cover. • Do not rinse with water. • Avoid refrigeration of oral solution (solution may separate). • Discard oral solution after 2 mos once bottle is opened.

#### Ophthalmic

• Invert vial several times to obtain uniform suspension. • Instruct pt to remove contact lenses before administration (may reinsert 15 min after administration). • May use with artificial tears.

#### IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B complex (Abelcet, AmBisome, Amphotec), magnesium.

#### IV COMPATIBILITIES

Propofol (Diprivan).

#### INDICATIONS/ROUTES/DOSAGE

**Note:** The modified/nonmodified formulations are not bioequivalent and cannot be used interchangeably without

close monitoring. Refer to institutional protocols. Dosing in clinical practice may differ greatly compared to manufacturer's labeling.

#### Transplantation, Prevention of Organ Rejection

**Note:** Initial dose given 4–12 hrs prior to transplant or postoperatively.

**PO: ADULTS, ELDERLY, CHILDREN: Not modified:** Refer to institutional protocol for specific dosing. **Modified:** (dose dependent upon type of transplant). **Renal:** 6–12 mg/kg/day in 2 divided doses. **Hepatic:** 4–12 mg/kg/day in 2 divided doses. **Heart:** 4–10 mg/kg/day in 2 divided doses.

**IV: ADULTS, ELDERLY, CHILDREN: Not modified:** Initially, 5–6 mg/kg/dose daily. Switch to oral as soon as possible.

#### Rheumatoid Arthritis

**PO: ADULTS, ELDERLY: Modified:** Initially, 1–3 mg/kg a day in 2 divided doses. May increase by 0.5–0.75 mg/kg/day after 8 wks with additional increases made at 12 wks. **Maximum:** 4 mg/kg/day.

#### Psoriasis

**PO: ADULTS, ELDERLY: Modified:** Initially, 1–3 mg/kg/day in 2 divided doses. May increase by 0.5 mg/kg/day after 4 wks; additional increases may be made q2wks. **Maximum:** 4 mg/kg/day.

#### Dry Eye

**Ophthalmic: ADULTS, ELDERLY:** Instill 1 drop in each affected eye q12h.

#### Dosage in Renal Impairment

Modify dose if serum creatinine levels 25% or above pretreatment levels.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution.

#### SIDE EFFECTS

**Frequent (26%–12%):** Mild to moderate hypertension, hirsutism, tremor.

**Occasional (4%–2%):** Acne, leg cramps, gingival hyperplasia (red, bleeding, tender gums), paresthesia, diarrhea, nausea, vomiting, headache. **Rare (less than 1%):** Hypersensitivity reaction, abdominal discomfort, gynecomastia, sinusitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Mild nephrotoxicity occurs in 25% of renal transplants, 38% of cardiac transplants, 37% of liver transplants, generally 2–3 mos after transplantation (more severe toxicity may occur soon after transplantation). Hepatotoxicity occurs in 4% of renal, 7% of cardiac, and 4% of liver transplants, generally within first mo after transplantation. Both toxicities usually respond to dosage reduction. Severe hyperkalemia, hyperuricemia occur occasionally.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, LFT. If nephrotoxicity occurs, mild toxicity is generally noted 2–3 mos after transplantation; more severe toxicity noted early after transplantation; hepatotoxicity may be noted during first mo after transplantation.

### INTERVENTION/EVALUATION

Diligently monitor serum BUN, creatinine, bilirubin, ALT, AST, LDH levels for evidence of hepatotoxicity/nephrotoxicity (mild toxicity noted by slow rise in serum levels; more overt toxicity noted by rapid rise in levels; hematuria also noted in nephrotoxicity). Monitor serum potassium for hyperkalemia. Encourage diligent oral hygiene (gingival hyperplasia). Monitor B/P for evidence of hypertension. **Note:** Reference ranges dependent on organ transplanted, organ function, cycloSPORINE toxicity. Trough levels should be obtained immediately prior to next dose. **Therapeutic serum level:** 50–400 ng/mL; **toxic serum level:** greater than 400 ng/mL.

## PATIENT/FAMILY TEACHING

- Report severe headache, persistent nausea/vomiting, unusual swelling of extremities, chest pain.
- Avoid grapefruit products (increases concentration/effects), St. John's wort (decreases concentration).
- Do not take any newly prescribed or OTC medications unless approved by the prescriber who originally started treatment.

## cytarabine

**HIGH ALERT**

sye-tar-a-bine  
(Cytosar-U )

**BLACK BOX ALERT** Must be administered by personnel trained in administration/handling of chemotherapeutic agents. **Conventional:** Potent myelosuppressant. High risk of multiple toxicities (GI, CNS, pulmonary, cardiac). **Liposomal:** Chemical arachnoiditis, manifested by profound nausea, vomiting, fever, may be fatal if untreated.

**Do not confuse cytarabine with cladribine, clofarabine, Cytosar, Cytoxan, daunorubicin, vidarabine, or vinorelbine, or Cytosar with cytarabine, Cytovene, Cytoxan, or Neosar.**

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimetabolite. **CLINICAL:** Antineoplastic.

## USES

**Conventional:** Remission induction in acute myeloid leukemia (AML), treatment of acute lymphoblastic leukemia (ALL) and chronic myeloid leukemia (CML), prophylaxis and treatment of meningeal leukemia. **OFF-LABEL: Arac:** Carcinomatous meningitis, Hodgkin's and non-Hodgkin's lymphomas, myelodysplastic syndrome.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to cytarabine. **Liposomal:** Active menin-

geal infection. **Cautions:** Renal/hepatic impairment, prior drug-induced bone marrow suppression.

## ACTION

Inhibits DNA polymerase. Cell cycle-specific for S phase of cell division. **Therapeutic Effect:** Inhibits DNA synthesis. Potent immunosuppressive activity.

## PHARMACOKINETICS

Widely distributed; moderate amount crosses blood-brain barrier. Protein binding: 15%. Primarily excreted in urine. **Half-life:** 1–3 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy. May cause fetal malformations. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **vaccines (live)**. May increase adverse effects of **natalizumab**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, AST.

## AVAILABILITY (Rx)

**Injection, Solution** 20 mg/mL, 100 mg/mL.

## ADMINISTRATION/HANDLING

◀**ALERT**▶ May give by subcutaneous, IV push, IV infusion, intrathecal routes at concentration not to exceed 100 mg/mL. May be carcinogenic, mutagenic, teratogenic (embryonic deformity). Handle with extreme care during preparation/administration.

## IV, Intrathecal

**Reconstitution** • Dilute with 250–1,000 mL D<sub>5</sub>W or 0.9% NaCl for IV infusion. • **Intrathecal:** reconstitute vial with preservative-free 0.9% NaCl or pt's spinal fluid. Dose usually administered in 5–15 mL of solution, after equivalent volume of CSF removed.

**Rate of administration** • Conventional: For IV infusion, give over 1–3 hrs or as continuous infusion.

**Storage** • Conventional: Store at room temperature. • Reconstituted solution is stable for 48 hrs at room temperature. • Use diluted solution within 24 hrs. • Discard if slight haze develops.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ganciclovir (Cytovene), heparin, insulin (regular).

## IV COMPATIBILITIES

Dexamethasone (Decadron), diphenhydramine (Benadryl), filgrastim (Neupogen), granisetron (Kytril), HYDROMORPHONE (Dilaudid), LORAZEPAM (Ativan), morphine, ondansetron (Zofran), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**Usual Dosage for Induction (Conventional)**  
(Refer to Individual Protocols)

**IV: ADULTS, ELDERLY, CHILDREN:** (Induction): 100 mg/m<sup>2</sup>/day continuous infusion for 7 days or 200 mg/m<sup>2</sup>/day continuous infusion (as 100 mg/m<sup>2</sup> over 12 hrs q12h) for 7 days.

## Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent: IV (33%–16%):** Asthenia, fever, pain, altered taste/smell, nausea, vomiting (risk greater with IV push than

with continuous IV infusion). **Intrathecal (28%–11%)**: Headache, asthenia, altered taste/smell, confusion, drowsiness, nausea, vomiting. **Occasional: IV (11%–7%)**: Abnormal gait, drowsiness, constipation, back pain, urinary incontinence, peripheral edema, headache, confusion. **Intrathecal (7%–3%)**: Peripheral edema, back pain, constipation, abnormal gait, urinary incontinence.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (leukopenia, anemia, thrombocytopenia, megaloblastosis, reticulocytopenia), occurring minimally after single IV dose. Leukopenia, anemia, thrombocytopenia should be expected with daily or continuous IV therapy. Cytarabine syndrome (fever, myalgia, rash, conjunctivitis, malaise, chest pain), hyperuricemia may occur. High-dose therapy may produce severe CNS, GI, pulmonary toxicity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain baseline CBC, renal function, LFT. Leukocyte count decreases within 24 hrs

after initial dose, continues to decrease for 7–9 days followed by brief rise at 12 days, decreases again at 15–24 days, then rises rapidly for next 10 days. Platelet count decreases 5 days after drug initiation to its lowest count at 12–15 days, then rises rapidly for next 10 days.

### INTERVENTION/EVALUATION

Monitor BMP, LFT; serum uric acid. Monitor CBC for myelosuppression. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Monitor for signs of neuropathy (gait disturbances, handwriting difficulties, paresthesia).

### PATIENT/FAMILY TEACHING

- Increase fluid intake (may protect against hyperuricemia).
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.

## dabigatran

 TOP  
100

 dab-i-gah-tran  
(Pradaxa)

**BLACK BOX ALERT** Risk of thrombotic events (e.g., stroke) is increased if discontinued for a reason other than pathological bleeding. Spinal or epidural hematoma may occur with neuraxial anesthesia.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Direct thrombin inhibitor. **CLINICAL:** Anti-coagulant.

### USES

Indicated to reduce risk of stroke, systemic embolism in pts with nonvalvular atrial fibrillation. Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE) in pts who have been treated with a parenteral anticoagulant for at least 5 days and to reduce risk of recurrence of DVT and PE in previously treated pediatric pts aged 3 mos to 11 yrs (oral pellets), pediatric pts aged 8–7 yrs (capsules), and adults. Prophylaxis of DVT and PE in pts who have undergone hip replacement surgery.

### PRECAUTIONS

**Contraindications:** Severe hypersensitivity to dabigatran. Active major bleeding, pts with mechanical prosthetic heart valves. **Cautions:** Renal impairment (CrCl 15–30 mL/min), moderate hepatic impairment, invasive procedures, spinal anesthesia, major surgery, pts with congenital or acquired bleeding disorders, elderly, concurrent use of medications that increase risk of bleeding, valvular heart disease.

### ACTION

Reversible direct thrombin inhibitor that inhibits both free and fibrin-bound thrombin. **Therapeutic Effect:** Inhibits coagulation. Prevents thrombin-mediated effects, including cleavage of fibrinogen

to fibrin; activation of factors V, VIII, XI, and XIII; and inhibition of thrombin-induced platelet aggregation.

### PHARMACOKINETICS

Metabolized in liver. Protein binding: 35%. Eliminated primarily in urine. **Half-life:** 12–17 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Severe renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Dronedarone, P-glycoprotein/ABC1 inhibitors (e.g., amiodarone, colchicine, omeprazole) may increase concentration/effect. **Antacids, P-glycoprotein(P-gp)/ABC1 inducers** (e.g., carBAMazepine, phenytoin) may decrease concentration/effect. **Apixaban, edoxaban** may increase anticoagulant effect. **Aspirin, vorapaxar** may increase adverse effects. **HERBAL:** Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. **FOOD:** High-fat meal delays absorption approx. 2 hrs. **LAB VALUES:** May increase aPTT, PT, INR.

### AVAILABILITY (Rx)

 **Capsules:** 75 mg, 110 mg, 150 mg.

### ADMINISTRATION/HANDLING

#### PO

- May be given without regard to food. Administer with water.
- Do not break, cut, open capsules.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Medication should be discontinued prior to invasive or surgical procedures.

#### Treatment/Prevention of DVT/PE

**PO: ADULTS, ELDERLY:** 150 mg twice daily (after at least 5 days of treatment

with parenteral anticoagulants). **PEDI-  
ATRIC PTS 8–17 YRS:** (11–15 KG): 75 mg twice daily. (16–25 KG): 110 mg twice daily. (26–40 KG): 150 mg twice daily. (41–60 KG): 185 mg twice daily. (61–80 KG): 220 mg twice daily. (81 KG or greater): 260 mg twice daily.

#### Nonvalvular Atrial Fibrillation

**PO: ADULTS, ELDERLY:** 150 mg twice daily (to reduce risk of stroke/systemic embolism).

#### Prophylaxis Following Hip Surgery

**PO: ADULTS, ELDERLY:** 110 mg on day one (1–4 hr postoperative and established hemostasis), then 220 mg daily for a minimum of 10–14 days up to 35 days.

#### Dosage in Renal Impairment

**Nonvalvular atrial fibrillation: CrCl 15–30 mL/min:** Reduce dose to 75 mg twice daily. **CrCl less than 15 mL/min, or HD:** Not recommended (HD removes ~60% over 2–3 hrs). **CrCl 30–50 mL/min with concomitant use of P-gp inhibitors:** Reduce dose to 75 mg twice daily if given with P-gp inhibitors dronedarone or ketoconazole (systemic). **CrCl less than 30 mL/min with concomitant use of P-gp inhibitors:** Avoid coadministration.

**Treatment/Prevention of DVT/PE: CrCl less than or equal to 30 mL/min:** Not specified. **CrCl less than 50 mL/min with concomitant use of P-gp inhibitors:** Avoid coadministration.

**Prophylaxis following hip surgery: CrCl less than or equal to 30 mL/min:** Not specified. **CrCl less than 50 mL/min with concomitant use of P-gp inhibitors:** Avoid coadministration.

#### Dosage in Hepatic Impairment

No dosage adjustment.

### SIDE EFFECTS

**Frequent (less than 16%):** Dyspepsia (heartburn, nausea, indigestion), diarrhea, upper abdominal pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe, sometimes fatal, hemorrhagic events, including intracranial hemorrhage, hemorrhagic stroke, GI bleeding, may occur. Hypersensitivity reactions, including anaphylaxis, reported in less than 1% of pts.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC (esp. platelet count), BUN, serum creatinine; GFR, CrCl. Question history of mechanical heart valve, recent surgery; hepatic, renal impairment; recent spinal, epidural procedures; recent hemorrhagic events (intracranial hemorrhage, hemorrhagic stroke, GI/GU bleeding). Receive full medication history and screen for interactions. Screen for active bleeding.

#### INTERVENTION/EVALUATION

Obtain aPTT, platelet count if bleeding occurs. Assess for any signs of bleeding (hematuria, melena, bleeding from gums, petechiae, bruising), hematoma, hypotension, tachycardia, abdominal pain. Question for increase in discharge during menses. Use care when removing adhesives, tape. Monitor for symptoms of intracranial hemorrhage (altered mental status, aphasia, lethargy, hemiparesis, hemiplegia, seizures, vision changes).

#### PATIENT/FAMILY TEACHING

- Treatment may increase risk of bleeding.
- Report dark or bloody urine, black or bloody stool, coffee-ground vomitus, bloodysputum, nosebleeds.
- Stroke-like symptoms may indicate bleeding into the brain; report difficulty speaking, headache, numbness, paralysis, vision changes, seizures.
- Do not chew, crush, open, or divide capsules.
- Use electric razor, soft toothbrush to prevent bleeding.
- Do not take newly prescribed medications, including OTC medications such as ibuprofen or naproxen, unless approved by physician who originally started treatment.
- Stopping therapy may increase the risk of blood clots or stroke.

## dabrafenib

da-braf-e-nib  
(Tafinlar)

**Do not confuse dabrafenib with dasatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** BRAF kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of unresectable or metastatic melanoma with BRAF V600E mutation (single-agent therapy) or in pts with BRAF V600E or V600K mutations (in combination with trametinib). Adjuvant treatment of melanoma (in combination with trametinib) in pts with a BRAF V600E or BRAF V600K mutation, and lymph node involvement. Treatment of metastatic non-small-cell lung cancer (NSCLC) in combination with trametinib in pts with BRAF V600E mutation. Treatment of locally advanced or metastatic anaplastic thyroid cancer (in combination with trametinib) in pts with BRAF V600E mutation and with no satisfactory locoregional treatment options.

◀**ALERT**▶ Not indicated for treatment of wild-type BRAF melanomas, wild-type BRAF NSCLC, or wild-type BRAF anaplastic thyroid cancer.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dabrafenib. **Cautions:** Diabetes, hepatic/renal impairment, dehydration, glucose-6-phosphate dehydrogenase (G6PD) deficiency, pts at increased risk for arrhythmias, HE.

### ACTION

Selectively inhibits some mutant forms of protein kinase B-raf (BRAF). **Therapeutic Effect:** Inhibits tumor cell growth and survival.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99.7%. Peak plasma

concentration: 2 hrs. Excreted in feces (71%), urine (23%). **Half-life:** 8 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Must use effective nonhormonal contraception during treatment and for at least 2 wks after discontinuation (intrauterine device, barrier methods). Unknown if distributed in breast milk. May impair fertility in females and males. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects, skin lesions.

### INTERACTIONS

**DRUG:** Strong CYP2C8 inhibitors (e.g., gemfibrozil), strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration/effects of pazopanib, topotecan, voxilaprevir. May decrease concentration/effect of abemaciclib, axitinib, neratinib, olaparib, ranolazine. May decrease effectiveness of hormonal contraceptives. **HERBAL:** None significant. **FOOD:** High-fat meals may decrease absorption/effect. **LAB VALUES:** May increase serum glucose, alkaline phosphatase. May decrease serum phosphate, sodium.

### AVAILABILITY (Rx)

📦 **Capsules:** 50 mg, 75 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give at least 1 hr before or at least 2 hrs after meal.
- Do not break, crush, open, or divide capsule.
- Missed dose may be given up to 6 hrs before next dose.

### INDICATIONS/ROUTES/DOSAGE

**Melanoma, Metastatic/Unresectable (With BRAF V600E Mutation)**

**PO: ADULTS, ELDERLY:** 150 mg twice daily (about 12 hrs apart). Continue until disease progression or unacceptable toxicity.

### Melanoma (Metastatic/Unresectable or Adjuvant), NSCLC

**PO: ADULTS, ELDERLY:** 150 mg twice daily (in combination with trametinib). Continue until disease progression or unacceptable toxicity.

#### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Reduction Levels	Dose
1st dose reduction	100 mg twice daily
2nd dose reduction	75 mg twice daily
3rd dose reduction	50 mg twice daily

#### Cardiac

**Symptomatic HF; absolute decrease in LVEF greater than 20% from baseline that is below the lower limit of normal:** Withhold treatment until cardiac function improves, then resume at same dose.

#### Febrile Drug Reaction

**Fever 101.3°F–104°F:** Withhold treatment until resolved. Then resume at same dose (or at reduced dose level). **Fever greater than 104°F; fever associated with dehydration, hypotension, renal failure:** Withhold treatment until resolved, then resume at reduced dose level (or permanently discontinue).

#### Dermatologic Toxicity

**Intolerable Grade 2 or any Grade 3 or 4 dermatologic toxicity:** Withhold treatment for up to 3 wks. If improved, resume at reduced dose level. If not improved, permanently discontinue.

#### New Primary Malignancies

**Noncutaneous RAS mutation-positive malignancies:** Permanently discontinue.

#### Uveitis

**Uveitis (including iritis and iridocyclitis):** If mild to moderate uveitis does not improve with ocular therapy or if severe uveitis occurs, withhold treatment for up to 6 wks. If improved to Grade 1 or 0, resume at same dose (or at reduced dose level). If not improved, permanently discontinue.

#### Any Other Toxicity

**Intolerable Grade 2 or any Grade 3 toxicity:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. If not improved, permanently discontinue. **First occurrence of any Grade 4 toxicity:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level (or permanently discontinue). **Recurrence of any Grade 4 toxicity:** Permanently discontinue.

#### Dosage in Renal Impairment

**Mild to moderate impairment:** No dosage adjustment. **Severe impairment:** Not specified; use caution.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dosage adjustment. **Moderate to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (37%–17%):** Hyperkeratosis, headache, pyrexia, arthralgia, alopecia, rash. **Occasional (12%–10%):** Back pain, cough, myalgia, constipation, nasopharyngitis, fatigue.

### ADVERSE EFFECTS/TOXIC REACTIONS

Cutaneous squamous cell carcinoma (cUSCC) and keratoacanthomas reported in 7% of pts (esp. elderly, prior skin cancer, chronic sun exposure). Skin reactions including palmar-plantar erythrodysesthesia syndrome (PPES), papilloma have occurred. May increase cell proliferation of wild-type BRAF melanoma or new malignant melanomas. Eye conditions including uveitis, iritis reported. Hyperglycemia reported in 6% of pts. Serious febrile drug reactions including hypotension, rigors, dehydration reported in 4% of pts. Pts with G6PD deficiency have increased risk of hemolytic anemia. Pancreatitis, interstitial nephritis, bullous rash reported in less than 10% of pts. Hemorrhagic events including GI bleeding, major organ bleeding may occur in pts receiving concomitant trametinib therapy.

Cardiomyopathy with an absolute decrease in LVEF greater than 10% was reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BMP, blood glucose level; pregnancy test in females of reproductive potential. Confirm BRAF V600 mutation status. Make note of current moles, lesions for future comparison. Conduct ophthalmologic exam, visual acuity. Receive full medication history (including herbal products) and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor serum electrolytes; serum blood glucose periodically (esp. in pts with diabetes). Obtain CBC if hemolytic anemia suspected in pts with G6PD deficiency. Monitor for signs of hyperglycemia. Assess skin for new moles, lesions q2 mos during treatment and at least 6 mos after discontinuation. Immediately report any vision changes, eye pain/swelling, febrile drug reactions, worsening renal function. Monitor I&Os. Consider echocardiogram in pts suspected of cardiomyopathy, decreased LVEF.

### PATIENT/FAMILY TEACHING

- Treatment may increase risk of new cancers.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report symptoms of high blood sugar levels (confusion, excessive thirst/hunger, headache, frequent urination); toxic skin reactions (itching, peeling, rash, redness, swelling); eye pain/swelling, vision changes; new moles or lesions of the skin.
- Fevers may be complicated by low pressure, dehydration, or kidney failure.
- Minimize exposure to sunlight.
- Report bleeding of any kind.
- Therapy may reduce your heart's ability to pump effectively; report difficulty breathing, chest pain, dizziness, palpitations, swelling of the legs or feet.
- Do not take newly prescribed medications unless approved by the prescriber who originally started treatment.

## dacomitinib

**dak-oh-mi-ti-nib**  
(Vizimpro)

**Do not confuse dacomitinib with afatinib, dabrafenib, dasatinib, erlotinib, gefitinib, or osimertinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tyrosine kinase inhibitor. Epidermal growth factor receptor (EGFR) inhibitor.

**CLINICAL:** Antineoplastic.

### USES

First-line treatment of metastatic non-small-cell lung cancer (NSCLC) with EGFR exon 19 deletion or exon 21 L858R substitution mutations.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dacomitinib. **Cautions:** Baseline cytopenias; dehydration, diabetes, hepatic impairment; history of pulmonary disease.

### ACTION

Irreversibly inhibits kinase activity of human EGFR family and certain EGFR mutations. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 98%. Peak plasma concentration: 6 hrs. Excreted in feces (79%), urine (3%). **Half-life:** 70 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 17 days after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 17 days after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have higher risk of Grade 3 and 4 toxic

reactions; higher frequency of treatment interruptions or discontinuation.

## INTERACTIONS

**DRUG:** Histamine H<sub>2</sub> receptor antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. May increase concentration/effects of CYP2D6 substrates (e.g., amitriptyline, carvedilol, FLUoxetine, tamoxifen). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, creatinine, glucose. May decrease serum albumin, calcium, potassium, sodium, magnesium; Hgb, Hct, lymphocytes, RBC count.

## AVAILABILITY (Rx)

**Tablets:** 15 mg, 30 mg, 45 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- If a dose is missed or vomiting occurs after administration, skip dose and give at next regularly scheduled time.
- Give at least 6 hrs before or at least 10 hrs after H<sub>2</sub> receptor antagonists (e.g., famotidine).

## INDICATIONS/ROUTES/DOSAGE

### Non–Small-Cell Lung Cancer

**PO: ADULTS, ELDERLY:** 45 mg once daily. Continue until disease progression or unacceptable toxicity.

### Reduction Schedule for Adverse Reactions

**First dose reduction:** 30 mg. **Second dose reduction:** 15 mg.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Dermatologic Toxicity

**Grade 2 skin reaction:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose level. **Recurrent or persistent Grade 2 skin reaction, Grade 3 or 4 skin**

**reaction:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level.

### GI Toxicity

**Grade 2 diarrhea:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose level. **Recurrent Grade 2 diarrhea, Grade 3 or 4 diarrhea:** Withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level.

### Pulmonary Toxicity

**Interstitial lung disease (ILD) of any grade:** Permanently discontinue.

### Other Toxicities

**Any other Grade 3 or 4 toxic reactions:** Withhold treatment until improved to Grade 2 or less, then resume at reduced dose level.

### Dosage in Renal/Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (87%–26%):** Diarrhea, rash, paronychia, stomatitis, decreased appetite, dry skin, xerosis, decreased weight.

**Occasional (23%–7%):** Alopecia, pruritus, cough, nasal disorder (inflammation, epistaxis, mucosal disorder, rhinitis), conjunctivitis, nausea, extremity pain, constipation, dyspnea, asthenia, musculoskeletal pain, mouth ulceration, insomnia, dermatitis, chest pain, fatigue, vomiting, dysgeusia. **Rare (2%–1%):** Keratitis, dehydration.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, lymphopenia is an expected response to treatment. Nail reactions including nail infection, nail toxicity, onychoclasia, onycholysis, onychomadesis, paronychia reported in 64% of pts. CTCAE Grade 3 or 4 skin reactions occurred in 21% of pts. Upper respiratory tract infection reported in 12% of pts. Palmar-plantar erythrodysesthesia syndrome 15% of

pts. Severe, sometimes fatal, ILD/pneumonitis reported in 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, LFTs; pregnancy test in females of reproductive potential. Question current breastfeeding status. Confirm compliance of effective contraception. Question history of hepatic impairment, pulmonary disease. Assess skin for open wounds, lesions. Assess hydration status. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFTs as clinically indicated. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, hypoxia) is suspected. Monitor daily pattern of bowel activity, stool consistency. Antidiarrheal medication may be needed to manage diarrhea. Assess skin for dermal toxicities, rash; nail toxicities. Monitor for symptoms of hyperglycemia (dehydration, confusion, excessive thirst, Kussmaul respirations, polyuria). Monitor I&Os, hydration status.

### PATIENT/FAMILY TEACHING

- Treatment may cause severe diarrhea, which may require antidiarrheal medication. Report worsening of diarrhea or dehydration.
- Drink plenty of fluids.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Antacids may interfere with absorption. Take dacomitinib at least 6 hrs before or at least 10 hrs after antacid.
- Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen and lip balm to protect against sunburn.
- Report symptoms of liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes); inflammation of the lung (excessive cough, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling), high blood sugar levels (e.g., blurry vision, confusion, frequent urination, increased thirst, fruity breath).

## dalfampridine

dal-fam-pri-deen  
(Ampyra, Fampyra )

**Do not confuse Ampyra with anakinra, or dalfampridine with desipramine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Potassium channel blocker. **CLINICAL:** Multiple sclerosis agent.

### USES

Indicated to improve ambulation in pts with MS.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dalfampridine. History of seizures, moderate to severe renal impairment (CrCl equal to or less than 50 mL/min). **Cautions:** Mild renal impairment (CrCl equal to 51–80 mL/min).

### ACTION

Improves conduction in demyelinated axons by delaying repolarization and prolonging duration of action potentials. **Therapeutic Effect:** Strengthens skeletal muscle fiber twitch activity; improves peripheral motor neurologic function.

### PHARMACOKINETICS

Rapidly absorbed from GI tract. Minimally metabolized in liver. Primarily excreted in urine. **Half-life:** 5.2–6.5 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Dolutegravir, trilaciclib may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase creatinine clearance.

**AVAILABILITY (Rx)**

 **Tablet, Film-Coated, Extended-Release:**  
10 mg.

**ADMINISTRATION/HANDLING****PO**

- May give without regard to food.
- Do not break, crush, dissolve, or divide tablets.

**INDICATIONS/ROUTES/DOSAGE****Multiple Sclerosis**

**PO:** ADULTS 18 YRS AND OLDER, ELDERLY:  
10 mg twice daily. **Maximum:** 20 mg/day.

**Dosage in Renal Impairment**

**CrCl 50 mL/min or less:** Contraindicated.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (9%–5%):** Insomnia, dizziness, headache, nausea, asthenia, back pain. **Rare (4%–2%):** Paresthesia, nasopharyngitis, constipation, dyspepsia, pharyngolaryngeal pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Urinary tract infection occurs in 12% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BUN, creatinine clearance, serum chemistries prior to treatment and routinely thereafter. Conduct baseline neurologic exam. Assess motor function, gait, ability to ambulate.

**INTERVENTION/EVALUATION**

Monitor CBC, serum chemistries, renal function tests, particularly creatinine clearance. Monitor for urinary, respiratory infection. Assess for therapeutic response (improvement in walking as demonstrated by increase in walking speed).

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report difficulty in sleeping, dizziness, headache, nausea, back pain, loss of strength or energy.
- Do not chew, crush, dissolve, or divide tablets.
- Inform physician if ambulation does not improve or worsens.

**dalteparin****HIGH ALERT**

dal-te-par-in  
(Fragmin)

**BLACK BOX ALERT** Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

**Do not confuse dalteparin with heparin.**

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Low molecular weight heparin. **CLINICAL:** Anticoagulant.

**USES**

Prevention of ischemic complications in pts with unstable angina or non-Q-wave MI. Prevention of deep vein thrombosis (DVT) in pts undergoing hip replacement surgery or in pts undergoing abdominal surgery who are at risk for thromboembolic complications (e.g., pts older than 40 yrs, obese, pts with malignancy, history of DVT or PE, surgery requiring general anesthesia and lasting more than 30 min). Extended treatment of symptomatic venous thromboembolism (VTE) to reduce recurrence of VTE in cancer pts. Prevention of DVT or pulmonary embolism in acutely ill pts with severely restricted mobility. Treatment of symptomatic venous thromboembolism (VTE) (e.g., DVT and/or PE) to reduce the recurrence of VTE

in infants 1 mo or older, children, and adolescents.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dalteparin, heparin, pork products; active major bleeding; concurrent heparin therapy; unstable angina; history of heparin-induced thrombocytopenia (HIT), or HIT with thrombosis; non-Q-wave MI; prolonged venous thromboembolism undergoing epidural/neuraxial anesthesia. **Cautions:** Conditions with increased risk for hemorrhage, bacterial endocarditis, renal/hepatic impairment, uncontrolled hypertension, history of recent GI ulceration/hemorrhage, peptic ulcer disease, pericarditis, preexisting thrombocytopenia, recent childbirth, concurrent use of aspirin.

## ACTION

Antithrombin in presence of low molecular weight heparin inhibits factor Xa, thrombin. **Therapeutic Effect:** Produces anticoagulation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
SQ	N/A	4 hrs	N/A

Protein binding: less than 10%. **Half-life:** 3–5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use with caution, particularly during last trimester, immediate postpartum period (increased risk of maternal hemorrhage). Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of bleeding. May increase effect of apixaban, dabigatran, edoxaban, rivaroxaban. **HERBAL:** Herbals with

anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May decrease serum triglycerides.

## AVAILABILITY (Rx)

**Injection, Solution:** 2,500 units/0.2 mL, 5,000 units/0.2 mL, 7,500 units/0.3 mL, 10,000 units/mL, 12,500 units/0.5 mL, 15,000 units/0.6 mL, 18,000 units/0.72 mL.

## ADMINISTRATION/HANDLING

### SQ

- Visually inspect for particulate matter or discoloration.
- Subcutaneously insert needle into abdomen, outer thigh, or upper arm region and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, rashes, inflammation, or infection. Rotate injection sites.

## INDICATIONS/ROUTES/DOSAGE

### Non-Orthopedic Surgery

**SQ: ADULTS, ELDERLY:** 5,000 units 12 hrs before surgery (or evening before), then 5,000 units once daily. Continue until fully ambulatory and VTE risk has diminished.

### Total Hip Surgery

**SQ: ADULTS, ELDERLY:** 5,000 units once daily (initial dose 12 or more hrs pre-operative or 12 or more hrs post-operative once hemostasis achieved) for 10–14 days up to 35 days.

### Unstable Angina, Non-Q-Wave MI

**SQ: ADULTS, ELDERLY:** 120 units/kg q12h for up to 5–8 days (**maximum:** 10,000 units/dose) given with aspirin. Discontinue dalteparin once clinically stable.

### Venous Thromboembolism (Cancer pts)

**SQ: ADULTS, ELDERLY:** Initially (1 mo), 200 units/kg (**maximum:** 18,000 units) daily for 30 days. **Maintenance (2–6 mos):** 150 units/kg once daily (**maximum:** 18,000 units). If platelet

count 50,000–100,000 cells/mm<sup>3</sup>, reduce dose by 2,500 units until platelet count recovers to 100,000 cells/mm<sup>3</sup> or more. If platelet count less than 50,000 cells/mm<sup>3</sup>, discontinue until platelet count recovers to more than 50,000 cells/mm<sup>3</sup>.

#### Prevention of DVT, Acutely Ill Pt, Immobile Pt

**SQ: ADULTS, ELDERLY:** 5,000 units once daily. Continue for length of hospital stay or until pt is fully ambulatory and VTE risk has diminished.

#### Treatment, Symptomatic VTE (Children)

**SQ: CHILDREN 8 YRS AND OLDER, ADOLESCENTS:** 100 units/kg/dose q12h. **CHILDREN 2 YRS TO YOUNGER THAN 8 YRS:** 125 units/kg/dose q12h. **INFANTS TO CHILDREN YOUNGER THAN 2 YRS:** 150 units/kg/dose q12h.

#### Dosage in Renal Impairment

For CrCl less than 30 mL/min, monitor anti-Xa levels to determine appropriate dose.

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Occasional (7%–3%):** Hematoma at injection site. **Rare (less than 1%):** Hypersensitivity reaction (chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, headache); mild, local skin irritation.

### ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Thrombocytopenia occurs rarely.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain baseline coagulation studies, CBC, esp. platelet count. Determine baseline B/P. Screen for risk factors as listed in Precautions.

### INTERVENTION/EVALUATION

Periodically monitor CBC, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). Assess for any sign of bleeding (bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, bruising/bleeding at injection sites). Monitor for DVT (extremity pain, swelling, redness), pulmonary embolism (chest pain, dyspnea, hypoxia, tachycardia).

### PATIENT/FAMILY TEACHING

- Usual length of therapy is 5–10 days.
- Do not take any OTC medication (esp. aspirin) without consulting physician.
- Report bleeding, bruising, dizziness, light-headedness, rash, itching, fever, swelling, breathing difficulty.
- Rotate injection sites daily.
- Teach proper injection technique.
- Monitor for symptoms of blood clots in the leg (extremity pain, swelling, redness) or blood clots in the lungs (chest pain, difficulty breathing, shortness of breath, fast heart rate).

## dantrolene

dan-troe-leen

(Dantrium, Revonto, Ryanodex)

**■ BLACK BOX ALERT ■** Potential for hepatotoxicity.

**Do not confuse Dantrium with danazol or Daraprim, or Revonto with Revatio.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcium release blocker. **CLINICAL:** Skeletal muscle relaxant.

### USES

**PO:** Treatment of spasticity associated with upper motor neuron disorder (e.g., spinal cord injuries, CVA, cerebral palsy, multiple sclerosis). Management of malignant hyperthermia (MH), prevention of MH in susceptible individuals.

**Parenteral:** Management of malignant hyperthermia. Prevention of malignant hyperthermia (preoperative/postoperative administration). **OFF-LABEL:** Neuroleptic malignant syndrome.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dantrolene. **IV:** None. **PO:** When spasticity used to maintain posture/balance during locomotion or to obtain increased motor function. Active hepatic disease. **Cautions:** Cardiac/pulmonary impairment, history of previous hepatic disease.

## ACTION

Interferes with release of calcium from sarcoplasmic reticulum of skeletal muscle. Prevents/reduces the increase in myoplasmic calcium ion concentration. **Therapeutic Effect:** Dissociates excitation-contraction coupling. Interferes with catabolic process associated with malignant hyperthermia.

## PHARMACOKINETICS

Poorly absorbed from GI tract. Protein binding: High. Metabolized in liver. Primarily excreted in urine. **Half-life:** **IV:** 4–8 hrs; **PO:** 8.7 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Readily crosses placenta. Breastfeeding not recommended. **Children:** No age-related precautions noted in pts 5 yrs and older. **Elderly:** No precautions specified.

## INTERACTIONS

**DRUG:** CNS depressants (e.g., **LORazepam, morphine, zolpidem**) may increase CNS depression with short-term use. **Strong CYP3A4 inducers** (e.g., **carBAMazepine, phenytoin, rifAMPin**) may decrease concentration/effect. **HERBAL:** Herbs with sedative properties (e.g., **chamomile, kava kava, valerian**) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May alter serum ALT, AST.

## AVAILABILITY (Rx)

**Capsules:** 25 mg, 50 mg, 100 mg. **Injection, Powder for Reconstitution:** 20-mg vial. **Injection Suspension:** 250 mg powder.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute 20-mg vial with 60 mL Sterile Water for Injection (not Bacteriostatic Water for Injection). **(RyanoDex):** 250-mg vial with 5 mL Sterile Water for Injection.

**Rate of administration** • For therapeutic or emergency dose, give IV over 2–3 min. • For IV infusion, administer over 1 hr. • Diligently monitor for extravasation (high pH of IV preparation). May produce severe complications. **(RyanoDex):** Do not dilute; infuse into IV catheter or indwelling catheter. Infuse over 1 min.

**Storage** • Store at room temperature. • Use within 6 hrs after reconstitution. • Solution is clear, colorless. Discard if cloudy, precipitate forms.

## PO

- Give without regard to food.

## IV INCOMPATIBILITIES

D<sub>5</sub>W, 0.9% NaCl.

## INDICATIONS/ROUTES/DOSAGE

### Spasticity

**PO: ADULTS, ELDERLY:** Initially, 25 mg once daily for 7 days; then 25 mg 3 times/day for 7 days; then 50 mg 3 times/day for 7 days; then 100 mg 3 times/day. **Maximum:** 400 mg/day. **CHILDREN: 5 YRS AND OLDER, ADOLESCENTS: 50 KG OR GREATER:** Initially, 25 mg once daily for 7 days. May increase to 25 mg 3 times/day for 7 days, then 50 mg 3 times/day for 7 days, then 100 mg 3 times/day. **Maximum:** 400 mg/day. **LESS THAN 50 KG:** Initially, 0.5 mg/kg/dose once daily for 7 days; then 0.5 mg/kg/dose 3 times/day for 7 days; then 1 mg/kg/dose 3 times/day for 7 days; then 2 mg/kg/dose 3 times/day. **Maximum:** 12 mg/kg/day up to 400 mg/day.

### Perioperative Prophylaxis for Malignant Hyperthermic Crisis

**PO: ADULTS, ELDERLY, CHILDREN:** 4–8 mg/kg/day in 3–4 divided doses beginning 1–2 days before surgery; give last dose 3–4 hrs before surgery.

**IV: ADULTS, ELDERLY, CHILDREN:** 2.5 mg/kg about 1.25 hrs before surgery with additional doses as needed.

### Management of Malignant Hyperthermic Crisis

**IV: ADULTS, ELDERLY, CHILDREN:** Initially, a minimum of 2.5 mg/kg rapid IV; may repeat up to total cumulative dose of 10 mg/kg. May follow with 1 mg/kg q4–6h (route not specified).

### Dosage in Renal/Hepatic Impairment

No dose adjustment. Contraindicated with active hepatic disease.

### SIDE EFFECTS

**Frequent:** Drowsiness, dizziness, weakness, general malaise, diarrhea (mild).

**Occasional:** Confusion, diarrhea (severe), headache, insomnia, constipation, urinary frequency. **Rare:** Paradoxical CNS excitement or restlessness, paresthesia, tinnitus, slurred speech, tremor, blurred vision, dry mouth, nocturia, impotence, rash, pruritus.

### ADVERSE EFFECTS/TOXIC REACTIONS

Risk of hepatotoxicity, most notably in females, pts 35 yrs and older, pts taking other hepatotoxic medications concurrently. Overt hepatitis noted most frequently between 3rd and 12th mo of therapy. Overdose results in vomiting, muscular hypotonia, muscle twitching, respiratory depression, seizures.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain LFT. Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling.

#### INTERVENTION/EVALUATION

Assist with ambulation. For pts on long-term therapy, hepatic/renal function

tests, CBC should be performed periodically. Assess for therapeutic response: relief of pain, stiffness, spasm.

#### PATIENT/FAMILY TEACHING

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol/other depressants.
- Report continued weakness, fatigue, nausea, diarrhea, skin rash, itching, bloody/tarry stools.

## dapagliflozin

dap-a-gli-floe-zin  
(Farxiga)

**Do not confuse dapagliflozin with canagliflozin, empagliflozin, or ertugliflozin. Farxiga with Fetzima.**

### FIXED-COMBINATIONS

**Qtern:** dapagliflozin/saxagliptin (an antidiabetic): 5 mg/5 mg, 10 mg/5 mg. **Qternmet XR:** dapagliflozin/saxagliptin/metformin (an antidiabetic): 2.5 mg/2.5 mg/1000 mg, 5 mg/2.5 mg/1000 mg, 5 mg/5 mg/1000 mg, 10 mg/5 mg/1000 mg. **Xigduo XR:** dapagliflozin/metformin (an antidiabetic): 2.5 mg/1000 mg, 5 mg/1000 mg, 10 mg/500 mg, 10 mg/1000 mg.

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sodium-glucose cotransporter 2 (SGLT2) inhibitor. **CLINICAL:** Antidiabetic.

### USES

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus. To reduce risk of hospitalization for HF in adults with type 2 diabetes mellitus and established cardiovascular disease or multiple cardiovascular risk factors. To reduce risk of cardiovascular death and hospitalization for HF in adults with HF with reduced

ejection fraction (NYHA class II–IV). To reduce the risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, and hospitalization for HF in adults with chronic kidney disease at risk of progression.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dapagliflozin; pts who are being treated for glycemic control without established cardiovascular disease or multiple cardiovascular risk factors with severe renal impairment (eGFR less than 30 mL/min); ESRD requiring dialysis. **Cautions:** Concomitant use of loop diuretics, other hypoglycemic agents (e.g., insulin, insulin secretagogues), baseline systolic hypotension, renal impairment, hypovolemia/dehydration, recent genital mycotic infection; pts at risk for diabetic ketoacidosis (insulin dose reduction, acute febrile illness, reduced calorie intake, surgery, alcohol abuse, history of pancreatitis). Not recommended in pts with active bladder cancer, diabetic ketoacidosis, type 1 diabetes mellitus.

## ACTION

Inhibits SGLT2 in proximal renal tubule, reducing reabsorption of filtered glucose from tubular lumen and lowering renal threshold for glucose. Reduces reabsorption of sodium and increases delivery of sodium to the distal tubule. **Therapeutic Effect:** Increases urinary excretion of glucose; lowers serum glucose levels. Reduces cardiac preload and afterload; downregulates sympathetic activity.

## PHARMACOKINETICS

Rapidly absorbed and widely distributed. Metabolized in liver. Protein binding: 91%. Peak plasma concentration: 2 hrs. Eliminated in urine (75%), feces (21%). Unknown if removed by hemodialysis. **Half-life:** 12.9 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not recommended during second or third

trimester. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk for adverse reactions (dehydration, hypotension, syncope).

## INTERACTIONS

**DRUG:** Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of hypoglycemia. **HERBAL:** Maitake may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine; low-density lipoprotein cholesterol (LDL-C); Hct. May decrease serum bicarbonate; eGFR. Expected to result in positive urine glucose test. May interfere with 1,5-anhydroglucitol (1,5-AG) assay.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer in the morning without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes Mellitus (Glycemic Control)

**PO: ADULTS, ELDERLY:** Initially, 5 mg once daily in AM. May increase to 10 mg once daily after 4–12 wks if needed for additional glycemic control.

### Type 2 Diabetes Mellitus (Risk Reduction for HF, Cardiovascular Disease)

**PO: ADULTS, ELDERLY:** 10 mg once daily.

### Heart Failure (Risk Reduction)

**PO: ADULTS, ELDERLY:** 10 mg once daily.

### Chronic Kidney Disease

**PO: ADULTS, ELDERLY:** 10 mg once daily.

### Dose Modification

**Concomitant use of insulin, insulin secretagogue:** Consider lowering dose of insulin or insulin secretagogue to reduce hypoglycemic events.

**Dosage in Renal Impairment****Type 2 Diabetes Mellitus (Glycemic Control)**

**eGFR 45 mL/min or greater:** No dose adjustment. **eGFR 30–44 mL/min:** Not recommended. **eGFR less than 30 mL/min, ESRD/dialysis:** Contraindicated.

**Type 2 Diabetes Mellitus (Risk Reduction for HF, Cardiovascular Disease)**

**eGFR 45 mL/min or greater:** No dose adjustment. **eGFR 44 mL/min or less:** Insufficient data to recommend dose adjustment. **ESRD/dialysis:** Contraindicated.

**HF (Risk Reduction)**

**eGFR 30 mL/min or greater:** No dose adjustment. **eGFR less than 30 mL/min:** Insufficient data to recommend dose adjustment. **ESRD/dialysis:** Contraindicated.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** No dose adjustment; use caution.

**SIDE EFFECTS**

**Rare (3%–1%):** Back pain, increased urination, nausea, constipation, extremity pain, discomfort with urination.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Symptomatic hypotension (orthostatic hypotension, postural dizziness, syncope) may occur, esp. in pts who are elderly, use concomitant loop diuretics, or have baseline systolic hypotension. Intravascular volume depletion/contraction may cause acute kidney injury requiring dialysis. Fatal cases of ketoacidosis were reported. Hypoglycemic events were reported in pts using concomitant insulin, insulin secretagogues. Infections including influenza, nasopharyngitis, pyelonephritis, urosepsis, UTI, genital mycotic infections (male and female), upper respiratory tract infection may occur. Necrotizing fasciitis of the perineum (Fournier gangrene),

a life-threatening necrotizing infection of the genital and perineum region that requires urgent surgical intervention, has been reported. Hypersensitivity reactions including anaphylaxis, angioedema, urticaria have occurred.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P. Assess hydration status. Correct volume depletion prior to initiation. Assess pt's understanding of diabetes management, routine home glucose monitoring. Obtain dietary consult for nutritional education. Question history of renal impairment, type 1 diabetes, ketoacidosis. In pts with requiring surgery, consider suspending treatment at least 3 days prior to surgery.

**INTERVENTION/EVALUATION**

Monitor BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P periodically. Monitor for ketoacidosis (e.g., dehydration, confusion, extreme thirst, sweet-smelling breath, Kussmaul respirations, nausea), hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (fatigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting). Pts presenting with metabolic acidosis should be screened for ketoacidosis, regardless of serum glucose levels. Concomitant use of beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Monitor for acute kidney injury (dark-colored urine, flank pain, decreased urine output, muscle aches), infections (cough, fatigue, fever), urinary tract infections (dysuria, fever, flank pain, malaise), mycotic infections, Fournier gangrene (perineal necrosis). Screen for glucose-altering conditions (fever, increased activity or stress, surgical procedures). Monitor weight, I&Os. Monitor for hypersensitivity reactions (anaphylaxis, angioedema, urticaria).

**PATIENT/FAMILY TEACHING**

• Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake. • When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose). • Genital itching or discharge may indicate yeast infection. • Report symptoms of perineal necrosis (e.g., discoloration, pain, swelling of the scrotum, penis, or perineum). • Therapy may increase risk for dehydration, low blood pressure, which may cause kidney failure. Report decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet. Drink enough fluids to maintain adequate hydration. Pts with HF should be cautious of overhydration. • Report symptoms of UTI, kidney infection (back pain, pelvic pain, burning while urinating, cloudy or foul-smelling urine), allergic reactions (difficulty breathing, rash, wheezing; swelling of the face or tongue). • Go slowly from lying to standing. • Do not breastfeed.

**DAPTOmycin**

dap-toe-mye-sin  
(Cubicin)

**Do not confuse Cubicin with Cleocin, or DAPTOmycin with DACTINomycin.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Cyclic lipopeptide antibacterial agent. **CLINICAL:** Antibiotic.

**USES**

Treatment of complicated skin/skin structure infections caused by susceptible strains of gram-positive pathogens,

including *S. aureus* (methicillin susceptible and methicillin resistant [MRSA]), *S. pyogenes*, *S. agalactiae*. Treatment of *S. aureus* systemic infections caused by methicillin-susceptible and methicillin-resistant *S. aureus*. **OFF-LABEL:** Severe infections caused by MRSA or vancomycin-resistant *Enterococcus* (VRE); treatment of prosthetic joint infection caused by staphylococci or *Enterococcus*.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to daptomycin. **Cautions:** Severe renal impairment (CrCl less than 30 mL/min), concurrent use of other medications associated with myopathy (e.g., statins).

**ACTION**

Binds to bacterial membranes and causes rapid depolarization. Inhibits intracellular protein, DNA, RNA synthesis. **Therapeutic Effect:** Bactericidal.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 90%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 7–8 hrs (increased in renal impairment).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Pts younger than 12 mos of age may have increased risk of nervous/muscular system effects. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** HMG-CoA reductase inhibitors (e.g., simvastatin) may cause myopathy. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase alkaline phosphatase, CPK, serum potassium. May alter LFT results.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 500 mg/vial.

**ADMINISTRATION/HANDLING**

**Reconstitution** • Reconstitute 500-mg vial with 10 mL 0.9% NaCl to provide a concentration of 50 mg/mL. May further dilute in 0.9% NaCl. • Do not shake or agitate vial.

**Rate of administration** • For IV injection, give over 2 min (concentration: 50 mg/mL). • For intermittent IV infusion (piggyback), infuse over 30 min.

**Storage** • Refrigerate intact vials. • Appears as pale yellow to light brown lyophilized cake. • Reconstituted solution is stable for 12 hrs at room temperature or up to 48 hrs if refrigerated. • Discard if particulate forms.

**IV INCOMPATIBILITIES**

Diluents containing dextrose. If same IV line is used to administer different drugs, flush line with 0.9% NaCl.

**IV COMPATIBILITIES**

0.9% NaCl, lactated Ringer's, aztreonam (Azactam), DOPamine, fluconazole (Diflucan), gentamicin, heparin, levofloxacin (Levaquin).

**INDICATIONS/ROUTES/DOSAGE****Complicated Skin/Skin Structure Infections**

**IV: ADULTS, ELDERLY:** 4–6 mg/kg every 24 hrs (total duration usually 5–14 days).

**Systemic Infections**

**IV: ADULTS, ELDERLY:** 6–10 mg/kg once daily for 14 days or longer from day of first negative blood culture.

**Dosage in Renal Impairment**

**CrCl less than 30 mL/min, hemodialysis (HD), peritoneal dialysis (PD):** Dosage is 4 mg/kg q48h for skin and soft tissue infections; 6 mg/kg q48h for staphylococcal bacteremia. **HD:** Give dose after dialysis. **Continuous renal replacement therapy: Continuous venovenous hemodialysis (CVVHD):** 8 mg/kg q48h. **Continuous venovenous hemofiltration (CVVH)**

**or continuous venovenous hemodiafiltration (CVVHDF):** 8 mg/kg q48h or 4–6 mg/kg q24h.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (6%–5%):** Constipation, nausea, peripheral injection site reactions, headache, diarrhea. **Occasional (4%–3%):** Insomnia, rash, vomiting. **Rare (less than 3%):** Pruritus, dizziness, hypotension.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myopathy (muscle pain/weakness, particularly in distal extremities) with CPK levels greater than 10 times ULN has occurred. Rhabdomyolysis may cause renal failure. Eosinophilic pneumonia, with symptoms including fever, hypoxia, respiratory insufficiency, pulmonary infiltrates was reported 2–4 wks after initiation. Antibiotic-associated colitis (abdominal cramps, fever, severe diarrhea), other superinfections may result from altered bacterial balance in GI tract. Persisting or relapsing *S. aureus* bacteremia/endocarditis, caused by reduced DAPTOmycin susceptibility, has occurred.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CPK, blood cultures before first dose (therapy may begin before results are known). Question history of renal impairment. Screen for concomitant use of statins.

**INTERVENTION/EVALUATION**

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor for myopathy (muscle pain, weakness), CPK levels, renal function tests. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/

genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor for dizziness; institute appropriate measures. Obtain repeat blood cultures in pts with persistent or relapsing *S. aureus* bacteremia/endocarditis or poor response to therapy.

#### PATIENT/FAMILY TEACHING

- Report rash, headache, nausea, dizziness, constipation, diarrhea, muscle pain, or any other new symptom.

## daratumumab

dar-a-toom-ue-mab  
(Darzalex)

**Do not confuse daratumumab with adalimumab, ofatumumab, panitumumab, or necitumumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD38 monoclonal antibody. **CLINICAL:** Antineoplastic.

## USES

**Multiple myeloma (relapsed/refractory):** Monotherapy for the treatment of pts with multiple myeloma who have received at least three prior lines of therapy including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent. In combination with dexamethasone and either lenalidomide or bortezomib for treatment of multiple myeloma in pts who have received at least one prior therapy. In combination with pomalidomide and dexamethasone for treatment of multiple myeloma in pts who have received at least two prior therapies including lenalidomide and a proteasome inhibitor. **Multiple myeloma (newly diagnosed):** Treatment of newly diagnosed multiple myeloma in combination with bortezomib, melphalan, and prednisONE or in combination with lenalidomide and

dexamethasone in pts ineligible for autologous stem cell transplant.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to daratumumab. **Cautions:** Obstructive pulmonary disorders (e.g., COPD, emphysema), baseline cytopenias, herpes zoster infection, elderly.

## ACTION

Binds to cell surface glycoprotein CD38 on CD38-expressing tumor cells (highly expressed on myeloma cells). Inhibits tumor cell proliferation and induces apoptosis. **Therapeutic Effect:** Inhibits tumor cell growth. Promotes tumor cell death.

## PHARMACOKINETICS

Widely distributed. Metabolism not specified. Steady state reached approx. 5 mos into the q4wk dosing period (by 21st infusion). Elimination not specified. **Half-life:** 18 ± 9 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations. Monoclonal antibodies are known to cross the placenta. Females of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG intravesical, vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None significant. **LAB VALUES:** Drug may be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M protein. May affect the determination of complete response and disease progression of some

pts with immunoglobulin G kappa myeloma protein. May cause positive Coombs' test. Expected to decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs.

### AVAILABILITY (Rx)

**Injection Solution:** 100 mg/5 mL, 400 mg/20 mL.

### ADMINISTRATION/HANDLING

**Preparation for administration** • Calculate the dose required based on weight in kg. • Solution should appear colorless to pale yellow. Do not use if opaque particles, discoloration, or foreign particles are observed. • Remove a volume from the 0.9% NaCl infusion bag that is equal to the required volume of the dose solution. • Dilute in 1000 mL (first infusion) or 500 mL (subsequent infusions) 0.9% NaCl bag. • Mix by gentle inversion. Do not shake or agitate. • Infusion bags must be made of polyvinylchloride, polypropylene, polyethylene, or polyolefin blend. • Diluted solution may develop very small translucent to white proteinaceous particles; do not use if diluted solution is discolored or if visibly opaque or foreign particles are observed. • Discard used portions of vials.

**Infusion guidelines** • Prior to administration, premedicate with an IV corticosteroid, acetaminophen, and an IV or oral antihistamine approx. 60 min before each infusion (see manufacturer guidelines). • Infuse using an in-line, sterile, nonpyrogenic, low protein-binding polyethersulfone filter (0.22 or 0.2 µm). • Infuse via dedicated line using infusion pump. • Do not administer as IV push or bolus. • Infusion should be completed within 15 hrs. • If infusion cannot be completed for any reason, do not save unused portions for reuse. • Postinfusion, administer an oral corticosteroid on the first and second day after each infusion to reduce risk of delayed infusion reactions (see manufacturer guidelines). • In pts with a history of obstructive pulmonary

disease, consider short-acting and long-acting bronchodilators and an inhaled corticosteroid postinfusion (may discontinue if no infusion reaction occurs after the first four infusions).

**Rate of administration** • **First infusion (1000 mL volume):** Infuse at 50 mL/hr for the first 60 min. Increase in increments of 50 mL/hr q1hr if no infusion reactions occur. **Maximum:** 200 mL/hr. • **Second infusion (500 mL volume):** Infuse at 50 mL/hr for the first 60 min. Increase in increments of 50 mL/hr q1hr if there were no Grade 1 or greater infusion reactions during the first 3 hrs of first infusion. **Maximum:** 200 mL/hr. • **Subsequent infusions (500 mL volume):** Infuse at 100 mL/hr if there were no Grade 1 or greater infusion reactions during a final infusion rate of greater than or equal to 100 mL/hr in the first two infusions. Increase in increments of 50 mL/hr q1hr if tolerated. **Maximum:** 200 mL/hr.

**Storage** • Refrigerate unused vials. • Do not shake. • May refrigerate diluted solution up to 24 hrs. • If diluted solution is refrigerated, allow solution to warm to room temperature before use. • Protect from light.

### IV INCOMPATIBILITIES

Do not mix with other medications.

### INDICATIONS/ROUTES/DOSAGE

**Note:** The initial dose (16 mg/kg on wk 1) may be divided over 2 consecutive days (8 mg/kg/day on days 1 and 2 of wk 1 of therapy) to facilitate administration.

#### Multiple Myeloma (Relapsed/Refractory)

**IV: ADULTS, ELDERLY: (Monotherapy or combination with lenalidomide/dexamethasone or pomalidomide/dexamethasone):** Wks 1–8: 16 mg/kg once wkly. Wks 9–24: 16 mg/kg once q2wks. **Wk 25 and beyond:** 16 mg/kg once q4wks until disease progression. **(Combination with bortezomib/dexamethasone):** Wks 1–9: 16 mg/kg once wkly. **Wks 10–24:** 16 mg/

kg q3wks for 5 doses. **Wk 25 and beyond:** 16 mg/kg q4wks until disease progression.

### Multiple Myeloma (Newly Diagnosed)

**IV: ADULTS, ELDERLY: (In combination with bortezomib, melphalan and predniSONE):** Wks 1–6: 16 mg/kg once wkly. Wks 7–54: 16 mg/kg q3wks for 16 doses. **Wk 55 and beyond:** 16 mg/kg q4wks until disease progression. **(In combination with lenalidomide and low-dose dexamethasone):** Wks 1–8: 16 mg/kg once wkly for 8 doses. **Wks 9–24:** 16 mg/kg once q2wks for 8 doses. **Wks 25 and beyond:** 16 mg/kg once q4wks until disease progression.

### Dose Modification

#### Infusion Reactions

Promptly interrupt infusion if any reaction occurs.

**Grade 1 or 2 reaction:** Once symptoms resolve, resume infusion at a decreased rate that is 50% (or less) of previous rate. If no further reactions are observed, may increase infusion rate as appropriate.

**Grade 3 reaction:** If symptoms resolve to Grade 2 or less, consider resuming infusion at a decreased rate that is 50% (or less) of previous rate. If no further reactions are observed, may increase rate as appropriate. If a Grade 3 reaction recurs, decrease rate as outlined earlier. If Grade 3 reaction occurs for a third time, permanently discontinue.

**Grade 4 reaction:** Permanently discontinue.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not specified; use caution.

### SIDE EFFECTS

**Frequent (37%–14%):** Fatigue, back pain, nausea, pyrexia, cough, nasal congestion, arthralgia, diarrhea, dyspnea, decreased appetite, extremity pain, constipation,

vomiting. **Occasional (12%–10%):** Headache, musculoskeletal chest pain, chills, hypertension.

### ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Infusion reactions occurred in approx. 50% of pts (mostly during first infusion). Infusion reactions can also occur with subsequent infusions (mainly during the infusion or within 4 hrs of completion). Severe infusion reactions may include cough, dyspnea, bronchospasm, hypertension, hypoxia, laryngeal edema, pulmonary edema, wheezing. Less common reactions may include chills, headache, hypotension, rash, nausea, pruritus, urticaria, vomiting. Infections including pneumonia, upper respiratory tract infection, nasopharyngitis reported in 20%–11% of pts. Herpes zoster reported in 3% of pts. Thrombocytopenia may increase risk of bleeding.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC, blood type and screen; vital signs. Obtain pregnancy test in female pts of reproductive potential. Question history of COPD, emphysema, herpes infection; prior hypersensitivity reaction to any drug in treatment regimen; prior infusion reaction. Assess nutritional status. Screen for active infection. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC, vital signs periodically. Administer in an environment equipped to monitor for and manage infusion reactions. If infusion reaction of any grade/severity occurs, immediately interrupt infusion and manage symptoms. Accurately record characteristics of infusion reactions (severity, type, time of onset). Reactions may affect future infusion rates. To prevent herpes zoster reactivation in pts with prior history, consider antiviral prophylaxis within 1 wk of starting treatment and continue for 3 mos following discontinuation. Monitor for

infection. Monitor daily pattern of bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Severe infusion reactions can occur at any time. Immediately report symptoms of infusion reactions such as chills, cough, difficulty breathing, headache, hives, itching, nausea, rash, stuffy or runny nose, throat tightness, vomiting, wheezing.

## daratumumab/ hyaluronidase fihj

**dar-a-toom-ue-mab hye-al-ure-on-i-dase**  
(Darzalex Faspro)

**Do not confuse daratumumab with daclizumab, daratumumab, darolutamide, denosumab, dinutuximab, dupilumab, durvalumab, elotuzumab, rituximab/hyaluronidase, trastuzumab/hyaluronidase, or Darzalex Faspro with Darzalex.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-CD38 Monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Treatment of adults with multiple myeloma: in combination with bortezomib, melphalan, and prednisone in newly diagnosed pts who are ineligible for autologous stem cell transplant; in combination with lenalidomide and dexamethasone in newly diagnosed pts who are ineligible for autologous stem cell transplant and in pts with relapsed or refractory multiple

myeloma who have received at least one prior therapy; in combination with bortezomib and dexamethasone in pts who have received at least one prior therapy; as monotherapy in pts who have received at least three prior lines of therapy including a proteasome inhibitor (PI) and an immunomodulatory agent or who are double refractory to a PI and an immunomodulatory agent. Treatment of newly diagnosed light-chain amyloidosis in adults (in combination with bortezomib, cyclophosphamide, and dexamethasone).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to daratumumab, hyaluronidase. Combination treatment with lenalidomide in pregnant women. **Cautions:** Baseline cytopenias, active infection, obstructive pulmonary disorders (e.g., COPD, emphysema), herpes zoster infection, elderly; conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); history of hepatitis B infection.

#### ACTION

Daratumumab binds to cell surface glycoprotein CD38 on CD38-expressing tumor cells (highly expressed on myeloma cells). Inhibits tumor cell proliferation and induces apoptosis. Hyaluronidase increases permeability of subcutaneous tissue. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

#### PHARMACOKINETICS

Widely distributed. Peak plasma concentration: 3 days. Eliminated by parallel and nonlinear saturable target mediated clearance. **Half-life:** 20 days.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk.

Breastfeeding not recommend. **Children:** Safety and efficacy not established. **Elderly:** May have higher risk of infections, side effects.

## D

## INTERACTIONS

**DRUG:** May decrease effect of **BCG intravesical, vaccines (live)**. May increase adverse/toxic effect of **natalizumab, Pimecrolimus, tacrolimus** may increase adverse/toxic effects.

**HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB**

**VALUES:** May mask detection of antibodies to minor antigens. Drug may be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M-protein. May affect the determination of complete response and disease progression of some pts with IgG kappa myeloma protein. May cause positive Coombs test. May increase serum glucose. May decrease serum calcium; Hgb, leukocytes, lymphocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection Solution:** Daratumumab 1,800 mg/hyaluronidase 30,000 units (120 mg/2,000 units/mL).

## ADMINISTRATION/HANDLING

### Subcutaneous

**Premedication** • Pretreat with acetaminophen 650–1000 mg PO, diphenhydramine 25–50 mg PO or IV, and a long- or intermediate-acting corticosteroid 1–3 hrs prior to each dose. • See manufacturer guidelines regarding premedication and postmedication corticosteroid therapy.

**Preparation** • Remove vial from refrigerator and allow solution to warm to room temperature. • Visually inspect for particulate matter or discoloration. Solution should appear colorless to yellow, clear to opalescent. Do not use if solution is cloudy, discolored, or visible particles are observed. • Withdraw 15 mL from vial into syringe. • To avoid clogging, immediately attach a new hypodermic needle or subcutaneous infusion set to syringe.

**Administration** • Insert needle subcutaneously into abdomen (only), approx. 3 inches (7.5 cm) to the right or left of navel and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites. • Do not administer IV or intramuscularly. • If a dose is missed, administer as soon as possible and adjust dosing schedule to maintain dosing intervals.

**Rate of administration** • Inject over 3–5 minutes. • Decrease injection rate or interrupt administration if pain is experienced. If pain is not relieved by slowing or interrupting injection, may choose second injection site on opposite side of abdomen.

**Storage** • Refrigerate vials in original carton until time of use. • Protect from light. • Do not shake. • Do not freeze or expose to heating sources. • After vial is allowed to warm to room temperature, use within 24 hrs. • May store syringe containing solution at room temperature for up to 4 hrs.

## INDICATIONS/ROUTES/DOSAGE

### Multiple Myeloma, Light-Chain Amyloidosis

**SQ: ADULTS:** 1,800 mg/30,000 units/dose according to schedule. Continue until disease progression or unacceptable toxicity.

### Dosing Schedule

**Monotherapy or in combination with lenalidomide and dexamethasone:** Give dose once weekly on wks 1–8, then once q2wks on wks 9–24, then once monthly on wk 25 and thereafter.

**In combination with bortezomib, melphalan, prednisone:** Give dose once weekly on wks 1–6, then once q3wks on wks 7–54, then once monthly on wk 55 and thereafter.

**In combination with bortezomib and dexamethasone:** Give dose once weekly on wks 1–9, then once q3wks on wks 10–24, then once monthly on wk 25 and thereafter.

### Light-Chain Amyloidosis (Newly Diagnosed)

**SO: ADULTS:** (*In combination with bortezomib, cyclophosphamide, and dexamethasone*): **Wks 1–8:** Give dose once wkly for a total of 8 doses. **Wks 9–24:** Give dose once q2wks (beginning wk 9) for a total of 8 doses. **Wks 25 and beyond:** Give dose once q4wks (beginning week 25). Continue until disease progression or unacceptable toxicity or a maximum of 2 yrs.

### Dose Modifications

#### Myelosuppression

Consider withholding treatment until neutropenia, thrombocytopenia improves.

#### Hypersensitivity Reactions

Permanently discontinue if anaphylaxis or Grade 4 administration-related reactions occur.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

NOTE: Frequency and occurrence of side effects may vary based on treatment as monotherapy or in combination with other therapies. **Occasional (15%–6%):** Diarrhea, fatigue, pyrexia, back pain, injection site reaction, peripheral edema, arthralgia, musculoskeletal chest pain, constipation, vomiting, abdominal pain, decreased appetite, dehydration, insomnia, hypertension, hypotension, dizziness, neuropathy, paresthesia, pruritus, rash, cough, nausea, chills, dyspnea.

## ADVERSE EFFECTS/TOXIC REACTIONS

NOTE: Frequency and occurrence of adverse reactions may vary based on treatment as monotherapy or in combination with other therapies. Myelosuppression (anemia, leukopenia, neutropenia,

thrombocytopenia) has occurred. Grade 3 and 4 neutropenia was reported, esp. in pts with lower body weights. Severe systemic reactions including bronchospasm, dyspnea, hypertension, hypoxia, tachycardia wheezing reported in 10% of pts. Other systemic reactions including nasal congestion, cough, throat irritation, allergic rhinitis may occur. Anaphylactic reactions including chest pain, chills, hypotension, nausea, pruritus, pyrexia, vomiting were reported. Infections including upper respiratory tract infection (24% of pts), pneumonia (8% of pts); herpes zoster, UTI, influenza, sepsis (10% of pts) were reported. Atrial fibrillation reported in less than 10% of pts. May cause hepatitis B virus reactivation. Thrombocytopenia may increase risk of bleeding. Immunogenicity (auto-daratumumab antibodies) reported in 8% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, blood type and screen; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Inform blood bank of treatment and possible treatment-related interference with serologic testing. In pts with COPD, inhaled corticosteroids and bronchodilators should be considered during the first 4 treatment doses. If pt does not experience a major systemic administration-related reaction after the first 4 doses, consider discontinuation of the additional inhaled corticosteroids and bronchodilators. To prevent herpes zoster reactivation in pts with a history of infection, initiate antiviral prophylaxis within 1 wk of initiation and continue for 3 mos after last dose. Question history of hepatitis B virus infection, COPD, emphysema, herpes zoster infection. Screen for active infection. Administer premedication and postmedication therapy per manufacturer guidelines. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC periodically for myelosuppression. Diligently observe for hypersen-

sitivity reactions throughout injection and treatment course; early detection is vital. If anaphylactic reaction occurs, initiate appropriate medical care (antipyretics, corticosteroids, oxygen therapy, IV hydration). Monitor for infections (cough, fever, fatigue), herpes zoster or hepatitis B virus reactivation; symptoms of hyperglycemia (blurred vision, confusion, excessive thirst, Kussmaul respirations, polyuria). If serious infection, sepsis occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Encourage nutritional intake.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection. Dormant chronic viral infections such as herpes zoster, hepatitis B infection can become reactivated.
- Pretreatment and posttreatment with acetaminophen, antihistamines, or steroidal anti-inflammatories may help reduce allergic reactions.
- Life-threatening anaphylaxis may occur. Immediately report serious allergic reactions of any kind, regardless of the time the dose was administered.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Females of childbearing potential must use effective contraception during treatment and for at least 3 mos after last dose. Do not breastfeed.
- Diarrhea is a common side effect. Drink plenty of fluids.

## darbepoetin alfa

TOP  
100

dar-be-poe-e-tin al-fa  
(Aranesp)

### BLACK BOX ALERT

Increased risk of serious cardiovascular events, thromboembolic events, mortality, time-to-tumor progression when administered to a target hemoglobin greater than 11 g/

dL. Shortened overall survival and/or increased risk of tumor progression has been reported with breast, cervical, head/neck, NSCL cancers.

**Do not confuse Aranesp with Aricept, or darbepoetin with dalteparin or epoetin.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Erythropoiesis stimulating agent (ESA).  
**CLINICAL:** Hematopoietic agent.

#### USES

Treatment of anemia associated with chronic renal failure (including pts on dialysis and pts not on dialysis), treatment of anemia caused by concurrent myelosuppressive chemotherapy in pts planned to receive chemotherapy for minimum of 2 additional months. **OFF-LABEL:** Treatment of symptomatic anemia in myelodysplastic syndrome (MDS).

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to darbepoetin. Pure red cell aplasia that begins after treatment with darbepoetin alfa or other erythropoietin protein medication. Uncontrolled hypertension. **Cautions:** History of seizures, hypertension. Not recommended in pts with mild to moderate anemia and HF or CAD.

#### ACTION

Stimulates division and differentiation of committed erythroid progenitor cells; induces release of reticulocytes from bone marrow into bloodstream. **Therapeutic Effect:** Induces erythropoiesis.

#### PHARMACOKINETICS

Widely distributed. **Half-life:** 48.5 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Contraceptives (e.g., estradiol, levonorgestrel), estrogens may increase risk of thrombosis. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum ferritin, serum transferrin saturation.

## AVAILABILITY (Rx)

**Injection Solution:** 25 mcg/mL, 40 mcg/mL, 60 mcg/mL, 100 mcg/mL, 200 mcg/mL, 300 mcg/mL. **Prefilled Syringe:** 10 mcg/0.4 mL, 25 mcg/0.42 mL, 40 mcg/0.4 mL, 60 mcg/0.3 mL, 100 mcg/0.5 mL, 150 mcg/0.3 mL, 200 mcg/0.4 mL, 300 mcg/0.6 mL, 500 mcg/mL.

## ADMINISTRATION/HANDLING

**Preparation** • Avoid excessive agitation of vial; do not shake (will cause foaming). Do not dilute.

**Rate of administration** • May be given as IV bolus.

**Storage** • Refrigerate. • Do not shake. Vigorous shaking may denature medication, rendering it inactive.

### SO

• Use 1 dose per vial; do not reenter vial. Discard unused portion.

## IV INCOMPATIBILITIES

Do not mix with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Anemia in Chronic Renal Failure

**◀ALERT▶** Individualize dosing and use lowest dose to reduce need for RBC transfusions. **On Dialysis:** Initiate when Hgb less than 10 g/dL; reduce or stop dose when Hgb approaches or exceeds 11 g/dL.

**Not on Dialysis:** Initiate when Hgb less than 10 g/dL and Hgb decline would likely result in RBC transfusion; reduce dose or stop if Hgb exceeds 10 g/dL.

**IV, SQ: ADULTS, ELDERLY: On Dialysis:** Initially, 0.45 mcg/kg once wkly or 0.75 mcg/kg once q2wks. **Not on Dialysis:** 0.45 mcg/kg q4wks.

**Decrease dose by 25%:** If Hgb approaches 12 g/dL or increases greater than 1 g/dL in any 2-wk period.

**Increase dose by 25%:** If Hgb does not increase by 1 g/dL after 4 wks of therapy and Hgb is below target range (with adequate iron stores). Do not increase dose more frequently than every 4 wks.

**Note:** If pt does not attain Hgb range of 10–12 g/dL after appropriate dosing over 12 wks, do not increase dose and use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions. Discontinue treatment if responsiveness does not improve.

### Anemia Associated With Chemotherapy

**◀ALERT▶** Initiate only if Hgb less than 10 g/dL and anticipated duration of myelosuppression is 2 months or longer. Titrate dose to maintain Hgb level and avoid RBC transfusions. Discontinue upon completion of chemotherapy.

**SQ: ADULTS, ELDERLY:** 2.25 mcg/kg once wkly or 500 mcg every 3 wks.

**Increase dose:** If Hgb does not increase by 1 g/dL after 6 wks and remains below 10 g/dL, increase dose to 4.5 mcg/kg once wkly. No dose adjustment if using q3wk dosing.

**Decrease dose:** Decrease dose by 40% if Hgb increases greater than 1 g/dL in any 2-wk period or Hgb reaches level that will avoid red blood cell transfusions.

**Note:** Withhold dose when Hgb exceeds a level needed to avoid RBC transfusions; resume at dose 40% lower when Hgb approaches a level where transfusions may be required.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** Myalgia, hypertension/hypotension, headache, diarrhea. **Occasional:** Fatigue, edema, vomiting, reaction at injection site, asthenia, dizziness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cardiovascular events, including CVA, MI, venous thromboembolism, vascular access device thrombosis, mortality, may occur when given to target hemoglobin greater than 11 g/dL or during rapid rise in hemoglobin. Hypersensitivity reactions, including anaphylaxis, may occur. Cases of anemia and pure red cell aplasia may occur in pts with chronic renal disease when given subcutaneously.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (esp. note Hgb, Hct). Assess B/P before drug administration. B/P often rises during early therapy in pts with history of hypertension. Assess serum iron (transferrin saturation should be greater than 20%), serum ferritin (greater than 100 ng/mL) before and during therapy. Consider supplemental iron therapy.

### INTERVENTION/EVALUATION

Monitor CBC, reticulocyte count, serum BUN, creatinine, ferritin, potassium, phosphate. Monitor B/P aggressively for increase (25% of pts taking medication require antihypertension therapy, dietary restrictions).

### PATIENT/FAMILY TEACHING

- Frequent blood tests needed to determine correct dose.
- Report swollen extremities, breathing difficulty, extreme fatigue, or severe headache.
- Avoid tasks requiring alertness, motor skills until response to drug is established.

## darifenacin

dare-i-fen-a-sin  
(Enblex )

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Muscarinic receptor antagonist. Anticholinergic agent. **CLINICAL:** Urinary antispasmodic.

## USES

Management of symptoms of bladder overactivity (urge incontinence, urinary urgency/frequency).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to darifenacin. Pts with or at risk of uncontrolled narrow-angle glaucoma, gastric retention, urine retention. **Cautions:** Bladder outflow obstruction, hepatic impairment, nonobstructive prostatic hyperplasia, decreased GI motility (e.g., severe constipation, ulcerative colitis), GI obstructive disorders, controlled narrow-angle glaucoma, myasthenia gravis, concurrent use of strong CYP3A4 inhibitors. Hot weather and/or exercise.

## ACTION

Acts as a direct antagonist at muscarinic receptor sites in cholinergically innervated organs; limits bladder contractions. **Therapeutic Effect:** Reduces symptoms of bladder irritability/overactivity (urge incontinence, urinary urgency/frequency), improves bladder capacity.

## PHARMACOKINETICS

Widely distributed. Protein binding: 98%. Metabolized in liver. Excreted in urine (60%), feces (40%). **Half-life:** 13–19 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Anticholinergics** (e.g., acridinium, ipratropium, tiotropium, umecclidinium) may increase anticholinergic

effect. May increase concentration/effect of **thioridazine**. **HERBAL**: None significant. **FOOD**: None known. **LAB VALUES**: None known.

## AVAILABILITY (Rx)

 **Tablets (Extended-Release)**: 7.5 mg, 15 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Administer extended-release tablets whole; do not break, crush, dissolve, or divide tablet.

## INDICATIONS/ROUTES/DOSAGE

### Overactive Bladder

**PO**: **ADULTS, ELDERLY**: Initially, 7.5 mg once daily. If response is not adequate after at least 2 wks, may increase to 15 mg once daily. Do not exceed 7.5 mg once daily in moderate hepatic impairment or concurrent use with strong or potent CYP3A4 inhibitors (e.g., clarithromycin, fluconazole, protease inhibitors).

### Dosage in Renal Impairment

No dose adjustment.

### Dosage Hepatic Impairment

**Moderate impairment**: **Maximum**: 7.5 mg. **Severe impairment**: Not recommended.

## SIDE EFFECTS

**Frequent (35%–21%)**: Dry mouth, constipation. **Occasional (8%–4%)**: Dyspepsia, headache, nausea, abdominal pain. **Rare (3%–2%)**: Asthenia, diarrhea, dizziness, ocular dryness.

## ADVERSE EFFECTS/TOXIC REACTIONS

UTI occurs occasionally.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Monitor voiding pattern, assess signs/symptoms of overactive bladder prior to therapy as baseline.

## INTERVENTION/EVALUATION

Monitor I&O. Palpate bladder and use bladder scanner to assess for urine retention. Monitor daily pattern of bowel activity, stool consistency for evidence of constipation. Dry mouth may be relieved with sips of water. Assess for relief of symptoms of overactive bladder (urge incontinence, urinary frequency/urgency).

## PATIENT/FAMILY TEACHING

- Swallow tablet whole; do not chew, crush, dissolve, or divide.
- Increase fluid intake to reduce risk of constipation.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## darolutamide

dar-oh-loo-ta-mide  
(Nubeqa)

**Do not confuse darolutamide with abiraterone, apalutamide, bicalutamide, dutasteride, enzalutamide, flutamide, or nilutamide.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC**: Androgen receptor inhibitor. **CLINICAL**: Anti-neoplastic.

## USES

Treatment of nonmetastatic castration-resistant prostate cancer.

## PRECAUTIONS

**Contraindications**: Hypersensitivity to darolutamide. **Cautions**: Hepatic/renal impairment, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of cardiovascular disease (HF, ischemic heart disease). Avoid concomi-

tant use of a combined G-gp and strong or moderate CYP3A4 inducer.

## ACTION

Binds directly to ligands of androgen receptor, inhibiting androgen-receptor translocation and androgen receptor-mediated transcription. **Therapeutic Effect:** Decreases proliferation of prostate tumor cells, increases apoptosis (cellular death), resulting decreased tumor volume.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver to active metabolite. Protein binding: 92%. Peak plasma concentration: 4 hrs. Steady state reached in 2–5 days. Excreted in feces (32%), urine (63%). **Half-life:** 20 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not indicated in female population. May cause fetal harm if administered in pregnant females. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and up to 1 wk after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effect of **alpelisib, cladribine, ozanimod, pazopanib, topotecan. Combined P-gp and strong or moderate CYP3A4 inducers (e.g., carBAM-azepine, phenytoin, rifAMPin)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum AST, bilirubin. May decrease neutrophils.

## AVAILABILITY (Rx)

**Tablets:** 300 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food.
- Swallow tablets whole; do not break, cut, crush, or divide.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Give concurrently with a gonadotropin-releasing hormone analog if pt had not received bilateral orchiectomy.

### Nonmetastatic Castration-Resistant Prostate Cancer

**PO: ADULTS, ELDERLY:** 600 mg twice daily.

### Dose Modification

Based on Common Terminology Criteria for Adverse Effects (CTCAE).

**Any Grade 3 toxicity or intolerable side effect:** Withhold treatment or reduce to 300 mg twice daily until symptoms improve. Doses less than 300 mg twice daily not recommended.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment (eGFR 15–29 mL/min) not undergoing HD:** 300 mg twice daily.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** 300 mg twice daily. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Occasional (16%–6%):** Fatigue, asthenia, extremity pain. **Rare (3%–less than 1%):** Rash, hypertension, nausea, diarrhea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cardiovascular events including ischemic heart disease (4% of pts), cardiac failure (2% of pts), cardiac arrest were reported. Other adverse effects may include hematuria, urinary retention, pneumonia.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Pts should also receive a concomitant gonadotropin-releasing hormone analog or had a bilateral orchiectomy. Question

history of hepatic/renal impairment, cardiac disease. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC periodically for neutropenia. Monitor for symptoms of HF (dyspnea, exercise intolerance, palpitations, peripheral edema), infection (cough, fever, fatigue).

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of liver problems (e.g., bruising, confusion; dark, amber, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); heart failure (e.g., chest pain, difficulty breathing, palpitations, swelling of extremities).
- Males with female partners of childbearing potential must wear condoms during sexual activity.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Avoid herbal supplements (esp. St. John's wort).

## darunavir

TOP  
100

dar-ue-na-veer  
(Prezista)

#### FIXED-COMBINATION(S)

**Prezcobix:** Darunavir/cobicistat (antiretroviral booster): 800 mg/150 mg.

**Symtuza:** Darunavir/cobicistat (antiretroviral booster)/emtricitabine (reverse transcriptase inhibitor)/tenofovir alafenamide (reverse transcriptase inhibitor): 800 mg/150 mg/200 mg/10 mg.

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Protease inhibitor (anti-HIV). **CLINICAL:** Antiretroviral.

## USES

Treatment of HIV infection in combination with ritonavir and other antiretroviral agents in adults and children 3 yrs and older.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to darunavir. Concurrent therapy with alfu-zosin, colchicine (in pts with renal and/or hepatic impairment), dihydroergotamine, dronedarone, elbasvir/grazoprevir, ergonovine, ergotamine, lovastatin, lurasidone, methylergonovine, oral midazolam, pimo-zide, ranolazine, rifAMPin, sildenafil (for treatment of PAH), simvastatin, St. John's wort, triazolam. **Cautions:** Diabetes, hemophilia, known sulfonamide allergy, hepatic impairment.

## ACTION

Binds to site of HIV-I protease activity, inhibiting cleavage of viral precursors into functional proteins required for infectious HIV. **Therapeutic Effect:** Prevents formation of mature viral cells.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 95%. Excreted in feces (80%), urine (14%). Not significantly removed by hemodialysis. **Half-life:** 15 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase concentration/effects of amiodarone, axitinib, bosutinib, budesonide, colchicine, dronedarone, eletriptan, ergot derivatives (e.g., ergotamine), fluticasone (nasal), lovastatin, midazolam, nimodipine, ranolazine, rogorafenib, simvastatin,

thioridazine. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A4 inhibitors (e.g., carbamazepine, ketoconazole, ritonavir) may increase concentration/effect. May decrease effects of methadone, oral contraceptives. **HERBAL:** Garlic, St. John's wort may lead to loss of virologic response, potential resistance to darunavir. **FOOD:** Food increases plasma concentration. **LAB VALUES:** May increase aPTT, PT, serum alkaline phosphatase, bilirubin, amylase, lipase, cholesterol, triglycerides, uric acid. May decrease lymphocytes/neutrophil count, platelets, WBC count; serum bicarbonate, albumin, calcium. May alter serum glucose, sodium.

## AVAILABILITY (Rx)

**Suspension, Oral: (Prezista):** 100 mg/mL

**Tablets: (Prezista):** 75 mg, 150 mg, 600 mg, 800 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food (increases plasma concentration).
- Coadministration with ritonavir required.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Shake suspension prior to each dose. Use provided oral dosing syringe.

## INDICATIONS/ROUTES/DOSAGE

**Note:** Genotypic testing recommended in therapy-experienced pts.

### HIV Infection, Treatment Experienced

**PO: ADULTS, ELDERLY: (With 1 or more darunavir resistance-associated substitution):** 600 mg administered twice daily with 100 mg ritonavir twice daily. **(With no darunavir resistance-associated substitutions):** 800 mg with 100 mg ritonavir or 150 mg cobicistat once daily.

### HIV Infection, Treatment Naive

**PO: ADULTS, ELDERLY:** 800 mg administered with 100 mg ritonavir or 150 mg cobicistat once daily.

### Usual Dosage During Pregnancy

**PO: ADULTS:** 600 mg administered twice daily with 100 mg ritonavir twice daily.

### Treatment Naive or Experienced Without or With 1 or More Darunavir Resistance-Associated Substitution

**PO: (tablet or suspension) CHILDREN WEIGHING 40 KG OR MORE:** 600 mg twice daily with 100 mg ritonavir. **WEIGHING 30–39 KG:** 450 mg twice daily with 60 mg ritonavir. **WEIGHING 15–29 KG:** 375 mg twice daily with 48 mg ritonavir.

**PO: (suspension only): WEIGHING 14 KG TO LESS THAN 15 KG:** 280 mg (48 mg ritonavir) twice daily. **13 KG TO LESS THAN 14 KG:** 260 mg (40 mg ritonavir) twice daily. **12 KG TO LESS THAN 13 KG:** 240 mg (40 mg ritonavir) twice daily. **11 KG TO LESS THAN 12 KG:** 220 mg (32 mg ritonavir) twice daily. **10 KG TO LESS THAN 11 KG:** 200 mg (32 mg ritonavir) twice daily.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (19%–13%):** Diarrhea, nausea, headache, nasopharyngitis. **Occasional (3%–2%):** Constipation, abdominal pain, vomiting. **Rare (less than 2%):** Allergic dermatitis, dyspepsia, flatulence, abdominal distention, anorexia, arthralgia, myalgia, paresthesia, memory impairment.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hyperglycemia, exacerbation of diabetes, diabetic ketoacidosis, new-onset diabetes have been reported in protease inhibitors. Drug-induced hepatotoxicity was reported, esp. in pts with advanced HIV disease, cirrhosis, hepatitis B or

C virus infection, or pts taking multiple medications. May increase risk of bleeding in pts with history of hemophilia A or B. Immune reconstitution syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré) may occur. Skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis) occur rarely. Hypersensitivity reactions including anaphylaxis, angioedema, bronchospasm may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CD4+ count, viral load, HIV RNA level. Confirm HIV genotype. Question history of diabetes, hemophilia, hepatic impairment, prior hypersensitivity reactions. Receive full medication history (including herbal products); screen for contraindications/interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV RNA level for treatment effectiveness. Monitor BMP, LFT, renal function, serum blood glucose periodically. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Closely monitor for GI discomfort. Monitor daily pattern of bowel activity, stool consistency. Monitor for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss), hypersensitivity reactions. Assess skin for rash, other skin reactions. Assess for immune reconstitution syndrome, opportunistic infections (onset of fever, oral mucosa changes, cough, other respiratory symptoms).

### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection, nor does it reduce risk of transmission. Practice safe sex with barrier methods or

abstinence. • There is a high risk of drug interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment. Do not take herbal products, esp. St. John's wort. • If amiodarone therapy cannot be withheld or stopped, immediately report symptoms of slow heart rate such as chest pain, confusion, dizziness, fainting, light-headedness, memory problems, palpitations, weakness. • Report any skin reactions. • Report any signs of decreased urine output, abdominal pain, yellowing of skin or eyes, darkened urine, clay-colored stools, weight loss. • As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath. Antiretrovirals may cause excess body fat in the upper back, neck, breast, and trunk and may cause decreased body fat in legs, arms, and face. • Drug resistance can form if therapy is interrupted for even a short time; do not run out of supply. • Report symptoms of high blood sugar levels (confusion, excessive thirst/hunger, headache, frequent urination).

## dasatinib

**HIGH ALERT**

da-sa-ti-nib  
(Sprycel)

**Do not confuse dasatinib with erlotinib, imatinib, or lapatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** BCR-ABL tyrosine kinase inhibitor. **CLINICAL:** Antineoplastic.

### USES

**Chronic myeloid leukemia (CML): (Adults):** Treatment of chronic, accelerated, myeloid or lymphoid blast phase of CML with resistance, intolerance to prior

therapy, including imatinib. Treatment of Philadelphia chromosome–positive (Ph+) CML in chronic phase of newly diagnosed pt. **(Children):** Treatment of Ph+ CML in chronic phase. **Acute lymphoblastic leukemia:** Treatment of adults with Ph+ acute lymphoblastic leukemia (ALL) with resistance or intolerance to prior therapy, including imatinib. **(Children):** Treatment of newly diagnosed Ph+ ALL. **OFF-LABEL:** Post–stem cell transplant follow-up treatment of CML. Treatment of GI stromal tumor.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dasatinib. **Cautions:** Hepatic impairment, myelosuppression (particularly thrombocytopenia), pts prone to fluid retention, pts at risk for QT interval prolongation or torsades de pointes (congenital long QT syndrome, medications that prolong QT interval, hypokalemia, hypomagnesemia); cardiovascular/pulmonary disease. Concomitant use of anticoagulants, CYP3A4 inducers/inhibitors may increase risk of pulmonary arterial hypertension.

## ACTION

Reduces activity of proteins responsible for uncontrolled growth of leukemia cells by binding to most imatinib-resistant BCR-ABL mutations of pts with CML or ALL. **Therapeutic Effect:** Inhibits proliferation, tumor growth of CML and ALL cancer cell lines.

## PHARMACOKINETICS

Widely distributed. Protein binding: 96%. Metabolized in liver. Eliminated primarily in feces. **Half-life:** 3–5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Has potential for severe teratogenic effects, fertility impairment. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease therapeutic effect of BCG (intravesical), vaccines (live). H<sub>2</sub> antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. May increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/toxicity (increased risk of torsades, myelotoxicity). **LAB VALUES:** May decrease WBC, platelets, Hgb, Hct, RBC; serum calcium, phosphates. May increase serum ALT, AST, bilirubin, creatinine.

## AVAILABILITY (Rx)

 **Tablets (Film-Coated):** 20 mg, 50 mg, 70 mg, 80 mg, 100 mg, 140 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Give with food or large glass of water if GI upset occurs.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Do not give antacids either 2 hrs prior to or within 2 hrs after dasatinib administration.

## INDICATIONS/ROUTES/DOSAGE

**Note:** CYP3A4 inhibitors: Consider decreasing dose from 100 mg to 20 mg or 140 mg to 40 mg. CYP3A4 inducers: Consider increasing dose with monitoring.

### CML (Resistant or Intolerant)

**PO: ADULTS, ELDERLY: Chronic phase:** 100 mg once daily. May increase to 140 mg once daily in pts not achieving cytogenetic response. **Accelerated or**

**blast phase:** 140 mg once daily. May increase to 180 mg once daily in pts not achieving cytogenetic response.

#### Ph+ CML (Newly Diagnosed in Chronic Phase)

**PO: ADULTS, ELDERLY:** 100 mg once daily. May increase to 140 mg/day in pts not achieving cytogenetic response. **CHILDREN (1 YR AND OLDER) WEIGHING 45 KG OR MORE:** 100 mg once daily. May increase to 120 mg once daily. **30–44 KG:** 70 mg once daily. May increase to 90 mg once daily. **20–29 KG:** 60 mg once daily. May increase to 70 mg once daily. **10–19 KG:** 40 mg once daily. May increase to 50 mg once daily.

#### Ph+ ALL

**PO: ADULTS, ELDERLY:** 140 mg once daily. May increase to 180 mg once daily in pts not achieving cytogenetic response. **CHILDREN WEIGHING 10 KG OR MORE, ADOLESCENTS WEIGHING 45 KG OR MORE:** 100 mg once daily. **30 TO LESS THAN 45 KG:** 70 mg once daily. **20 TO LESS THAN 30 KG:** 60 mg once daily. **10 TO LESS THAN 20 KG:** 40 mg once daily.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (50%–32%):** Fluid retention, diarrhea, headache, fatigue, musculoskeletal pain, fever, rash, nausea, dyspnea. **Occasional (28%–12%):** Cough, abdominal pain, vomiting, anorexia, asthenia, arthralgia, stomatitis, dizziness, constipation, peripheral neuropathy, myalgia. **Rare (less than 12%):** Abdominal distention, chills, weight increase, pruritus.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Pleural effusion occurred in 8% of pts, febrile neutropenia in 7%, GI bleeding, pneumonia in 6%, thrombocytopenia in 5%, dyspnea in 4%; anemia, cardiac failure in 3%.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC weekly for first mo, biweekly for second mo, and periodically thereafter. Monitor LFT before treatment begins and monthly thereafter. Obtain baseline weight. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC weekly for first mo, biweekly for second mo, then periodically thereafter. Monitor LFT monthly. Weigh daily, monitor for unexpected rapid weight gain. Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess oral mucous membranes for evidence of stomatitis. Monitor CBC for neutropenia, thrombocytopenia; monitor hepatic function tests for hepatotoxicity.

### PATIENT/FAMILY TEACHING

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations.
- Antacids may be taken up to 2 hrs before or 2 hrs after taking dasatinib.
- Avoid grapefruit products.
- Do not chew, crush, dissolve, or divide tablets.

## DAUNOrubicin

HIGH ALERT

daw-noe-roo-bi-sin  
(Cerubidine)

**BLACK BOX ALERT** ■ May cause cumulative, dose-related myocardial toxicity. Severe myelosuppression may lead to infection or hemorrhage. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Caution in pts with renal impairment or hepatic dysfunction. Extravasation may cause severe local tissue necrosis.

**Do not confuse DAUNOrubicin with DACTINomycin, DOXOrubicin, epiRUBicin, IDArubicin, or valrubicin.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anthracycline topoisomerase II inhibitor.

**CLINICAL:** Antineoplastic.

D

## USES

**Cerubidine:** Treatment of leukemias (acute lymphocytic [ALL], acute myeloid [AML]) in combination with other agents.

**Vyxeos:** Treatment of adults with newly diagnosed therapy-related AML or AML with myelodysplasia-related changes.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to DAUNOrubicin. **Cautions:** Preexisting heart disease or bone marrow suppression, hypertension, concurrent chemotherapeutic agents, elderly, infants, radiation therapy.

## ACTION

Inhibits DNA and RNA synthesis by intercalation between DNA base pairs and by steric obstruction. Cell cycle–phase non-specific. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

## PHARMACOKINETICS

Widely distributed. Protein binding: High. Does not cross blood-brain barrier. Metabolized in liver. Excreted in urine (40%); biliary excretion (40%). **Half-life:** 18.5 hrs; metabolite: 26.7 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Breastfeeding not recommended. **Children:** Cardiotoxicity may be more frequent and occur at lower cumulative doses. **Elderly:** Cardiotoxicity may be more frequent; reduced bone marrow reserves require caution. Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Bevacizumab, cyclophosphamide may increase risk of cardiotoxicity. **Bone marrow depressants (e.g., cladribine)** may enhance myelosuppression. May decrease

therapeutic effect of **BCG (intravesical)**. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** *Echinacea* may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, AST.

## AVAILABILITY (Rx)

**Injection Solution (Cerubidine):** 5 mg/mL

**Injection Suspension:** DAUNOrubicin 44 mg/cytarabine 100 mg

## ADMINISTRATION/HANDLING

### IV (Cerubidine)

Give by IV push or IV infusion.

**Reconstitution** • May further dilute with 100 mL D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • For IV push, withdraw desired dose into syringe containing 10–15 mL 0.9% NaCl. Inject over 1–5 min into tubing of rapidly infusing IV solution of D<sub>5</sub>W or 0.9% NaCl. • For IV infusion, further dilute with 100 mL D<sub>5</sub>W or 0.9% NaCl. Infuse over 15–30 min. • Extravasation produces immediate pain, severe local tissue damage. Aspirate as much infiltrated drug as possible, then infiltrate area with hydrocortisone sodium succinate injection (50–100 mg hydrocortisone) and/or isotonic sodium thiosulfate injection or ascorbic acid injection (1 mL of 5% injection). Apply cold compresses.

**Storage** • Refrigerate intact vials. • Protect from light. • Solutions prepared for infusion stable for 24 hrs at room temperature.

### IV (Vyxeos)

**Reconstitution** • Reconstitute each vial with 19 mL Sterile Water for Injection to a concentration of 2.2 mg/mL. • Swirl contents for 5 min while gently inverting vial q30sec. • Allow vial to rest for 15 min. • Dilute in 500 mL infusion bag containing NS or D<sub>5</sub>W.

**Rate of administration** • Infuse

over 90 min. **Storage** • Refrigerate vials. • Protect from light. • Stable for up to 4 hrs when refrigerated.

#### IV INCOMPATIBILITIES

Allopurinol (Aloprim), aztreonam (Azactam), cefepime (Maxipime), dexamethasone (Decadron), heparin, piperacillin, and tazobactam (Zosyn).

#### IV COMPATIBILITIES

Granisetron (Kytrel), ondansetron (Zofran).

#### INDICATIONS/ROUTES/DOSAGE

**ALERT** Refer to individual protocols. Cumulative dose should not exceed 550 mg/m<sup>2</sup> in adults (increased risk of cardiotoxicity) or 400 mg/m<sup>2</sup> in those receiving chest irradiation.

##### Acute Lymphocytic Leukemia

**IV: ADULTS, ELDERLY:** 45 mg/m<sup>2</sup> on days 1, 2, and 3 (in combination with vinCRiStine, predniSONE, asparaginase). **CHILDREN 2 YRS AND OLDER AND BODY SURFACE AREA 0.5 m<sup>2</sup> OR GREATER:** 25 mg/m<sup>2</sup> on day 1 of every wk for up to 4–6 cycles (in combination with vinCRiStine, predniSONE). **CHILDREN YOUNGER THAN 2 YRS, OR BODY SURFACE AREA LESS THAN 0.5 m<sup>2</sup>:** 1 mg/kg/dose on day 1 of every wk for up to 4 to 6 cycles (in combination with vinCRiStine, predniSONE).

##### Acute Myeloid Leukemia

**IV: ADULTS YOUNGER THAN 60 YRS:** 45 mg/m<sup>2</sup> on days 1, 2, and 3 of induction course, then on days 1 and 2 of subsequent courses (in combination with cytarabine). **ADULTS 60 YRS AND OLDER:** 30 mg/m<sup>2</sup> on days 1, 2, and 3 of induction course, then on days 1 and 2 of subsequent courses (in combination with cytarabine).

##### AML (Vyxeos)

**IV: ADULTS, ELDERLY: (Induction first cycle):** DAUNOrubicin 44 mg/m<sup>2</sup> and cytarabine 100 mg/m<sup>2</sup> on days 1, 3, and 5. **(Induction second cycle):** Days 1 and 3 (may give 2–5 wks after 1st induction cycle). **(Consolidation):** DAUNOrubicin 29 mg/m<sup>2</sup> and cytarabine 65 mg/m<sup>2</sup> on

days 1 and 3 (may give 1st consolidation cycle 5–8 wks after start of last induction and 2nd consolidation 5–8 wks after start of 1st consolidation cycle).

##### Dosage in Renal Impairment

**Serum creatinine greater than 3 mg/dL:** 50% of normal dose.

##### Dosage in Hepatic Impairment

**Bilirubin 1.2–3 mg/dL:** 75% of normal dose. **Bilirubin 3.1–5 mg/dL:** 50% of normal dose. **Bilirubin greater than 5 mg/dL:** DAUNOrubicin is not recommended for use in this pt population.

#### SIDE EFFECTS

**Frequent:** Complete alopecia (scalp, axillary, pubic), nausea, vomiting (beginning a few hrs after administration and lasting 24–48 hrs). **Occasional:** Diarrhea, abdominal pain, esophagitis, stomatitis, transverse pigmentation of fingernails, toenails. **Rare:** Transient fever, chills.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (severe leukopenia, anemia, thrombocytopenia) is expected. Decreases in platelet count, WBC count occur in 10–14 days, then return to normal level by third week. Cardiotoxicity including absolute decrease in LVEF, HE, death may occur, esp. in children and pts with preexisting cardiac disease. ECG findings and/or cardiomyopathy is manifested as HF (risk increases when cumulative dose exceeds 550 mg/m<sup>2</sup> in adults, 300 mg/m<sup>2</sup> in children 2 yrs and older, or total dosage greater than 10 mg/kg in children younger than 2 yrs). Pericarditis-myocarditis may occur. Secondary leukemias were reported in pts exposed to topoisomerase II inhibitors when used concomitantly with other antineoplastics or radiation therapy. Extravasation can cause severe local tissue necrosis.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Obtain CBC, LFT; BUN, serum creatinine, CrCl, GFR in pts with renal impairment.

Obtain ECG before initiation, esp. in pts with cardiac disease. Antiemetics may be effective in preventing, treating nausea. Ensure patency of IV access. Obtain accurate height and weight for dose calculation. Offer emotional support.

#### INTERVENTION/EVALUATION

Obtain CBC frequently; BMP, LFT, serum uric acid periodically. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site); symptoms of anemia (excessive fatigue, weakness). Diligently monitor for extravasation, tissue necrosis.

#### PATIENT/FAMILY TEACHING

- Urine may turn reddish color for 1–2 days after beginning therapy.
- Hair loss is reversible, but new hair growth may have different color, texture. New hair growth resumes about 5 wks after last therapy dose.
- Maintain strict oral hygiene.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, yellowing of whites of eyes/skin, difficulty breathing.
- Report persistent nausea, vomiting.
- Treatment may impair the heart's ability to pump blood effectively; report difficulty breathing, chest pain, palpitations, swelling of the legs or feet.

## deferasirox

dee-fur-a-sir-ox  
(Exjade, Jadenu)

**BLACK BOX ALERT** ■ May cause renal/hepatic failure, hepatotoxicity, gastrointestinal hemorrhage.

**Do not confuse deferasirox with deferoxamine.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Iron-chelating agent. **CLINICAL:** Iron reduction agent.

#### USES

Treatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis) in pts 2 yrs and older or due to non-transfusion-dependent thalassemia syndrome in pts 10 yrs and older.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to deferasirox. Platelet count less than 50,000 cells/mm<sup>3</sup>; poor performance status, high-risk myelodysplastic syndromes or advanced malignancies; CrCl less than 40 mL/min or serum creatinine greater than 2 times the upper limit of normal. **Cautions:** Renal/hepatic impairment, elderly, concurrent medications that may increase GI effects (e.g., NSAIDs).

#### ACTION

Selective for iron. Binds iron with high affinity in a 2:1 ratio. **Therapeutic Effect:** Induces iron excretion through the feces.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 99%. Metabolized in liver. Excreted in feces (84%), urine (8%). **Half-life:** 8–16 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for pts younger than 2 yrs. **Elderly:** No age-related precautions noted.

#### INTERACTIONS

**DRUG:** Antacids containing aluminum may decrease concentration/effect. May increase concentration/effect of theophylline, tiZANidine. **HERBAL:** None

significant. **FOOD:** Bioavailability is variably increased when given with food. **LAB VALUES:** Decreases serum ferritin. May increase serum ALT, AST, creatinine; urine protein.

## AVAILABILITY (Rx)

**Packets, Sprinkle: (Jadenu):** 90 mg, 180 mg, 360 mg. **Tablets: (Jadenu):** 90 mg, 180 mg, 360 mg. **Tablets, Soluble: (Exjade):** 125 mg, 250 mg, 500 mg.

## ADMINISTRATION/HANDLING

### PO

- Give on empty stomach 30 min before food.
- Do not give simultaneously with aluminum-containing antacids, cholestyramine.
- Tablets for suspension should not be chewed or swallowed whole.
- Disperse tablet by stirring in water, apple juice, orange juice until fine suspension is achieved.
- Dosage less than 1 g should be dispersed in 3.5 oz of liquid, dosage more than 1 g should be dispersed in 7 oz of liquid. If any residue remains in glass, resuspend with a small amount of liquid.
- Give regular tablets whole with water.

## INDICATIONS/ROUTES/DOSAGE

### Iron Overload Due to Transfusions

**PO: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER: (Exjade):** Initially, 20 mg/kg once daily. **Maintenance:** (Titrate to individual response and goals.) Adjust dosage by 5 or 10 mg/kg/day every 3–6 mos based on serum ferritin levels. Consider holding for serum ferritin less than 500 mcg/L. **Maximum:** 40 mg/kg once daily. **(Jadenu):** Initially, 14 mg/kg once daily. **Maintenance:** (Titrate to individual response and goals.) Adjust dosage by 3.5 or 7 mg/kg/day based on serum ferritin levels. Consider holding for serum ferritin less than 500 mcg/L. **Maximum:** 28 mcg/kg once daily.

### Thalassemia Syndromes

**PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: (Exjade):** Initially, 10 mg/kg once daily. May increase to 20 mg/kg once

daily after 4 wks if baseline iron is greater than 15 mg Fe/g dry wt. **(Jadenu):** Initially, 7 mg/kg once daily. May increase to 14 mg/kg/day after 4 wks if baseline iron greater than 15 mg Fe/g dry wt. **Maintenance: (Exjade/Jadenu):** Dose adjustments based on serum ferritin and hepatic iron concentrations.

### Dosage in Renal Impairment

**Note:** See Contraindications.

**ADULTS:** For increase in serum creatinine greater than 33% on 2 consecutive measures, reduce daily dose by 10 mg/kg. **CHILDREN:** For increase in serum creatinine above age-appropriate upper limit of normal on 2 consecutive measures, reduce daily dose by 10 mg/kg. **CrCl 40–60 mL/min:** Reduce starting dose by 50%.

### Dosage in Hepatic Impairment

For severe or persistent elevations in hepatic function tests, consider dose reduction or discontinuation. **Moderate impairment:** Reduce initial dose by 50%.

## SIDE EFFECTS

**Frequent (19%–10%):** Fever, headache, abdominal pain, cough, nasopharyngitis, diarrhea, nausea, vomiting. **Occasional (9%–4%):** Rash, arthralgia, fatigue, back pain, urticaria. **Rare (1%):** Edema, sleep disorder, dizziness, anxiety.

## ADVERSE EFFECTS/TOXIC REACTIONS

Bronchitis, pharyngitis, acute tonsillitis, ear infection occur occasionally. Hepatitis, auditory disturbances, ocular abnormalities occur rarely. Acute renal failure, cytopenias (e.g., agranulocytosis, neutropenia, thrombocytopenia) may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC. Auditory, ophthalmic testing should be obtained before therapy and annually thereafter.

**INTERVENTION/EVALUATION**

Monitor CBC, ferritin monthly (or as clinically indicated). Treatment should be interrupted if serum ferritin levels are consistently less than 500 mcg/L. Suspend treatment if severe rash occurs.

**PATIENT/FAMILY TEACHING**

- Take on empty stomach 30 min before food.
- Do not chew or swallow soluble tablets; disperse tablet completely in water, apple juice, orange juice; drink resulting suspension immediately.
- Do not take aluminum-containing antacids concurrently.
- Report severe skin rash, changes in vision/hearing, or yellowing of skin/eyes.

**denosumab**TOP  
100

den-oh-sue-mab  
(Prolia, Xgeva)

**Do not confuse denosumab with daclizumab, or Prolia with Avandia or Zebeta.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Monoclonal antibody (with affinity for RANKL).

**CLINICAL:** Bone-modifying agent.

**USES**

**Prolia:** Treatment of osteoporosis in postmenopausal women at high risk for fracture. Treatment of glucocorticoid-induced osteoporosis in pts at high risk of fracture who are receiving an equivalent dose of 7.5 mg or more of prednisONE for duration of at least 6 mos. Treatment to increase bone mass in men at high risk for fractures; treatment of bone loss in men receiving androgen deprivation therapy for nonmetastatic prostate cancer and in women at high risk for fractures receiving adjuvant aromatase inhibitor therapy for breast cancer. **Xgeva:** Prevention of skeletal-related events (e.g., fracture, spinal

cord compression) in pts with bone metastases from solid tumor or multiple myeloma. Treatment of giant cell tumor of bone in adults and skeletally mature adolescents. Treatment of hypercalcemia of malignancy refractory to bisphosphonate therapy. **OFF-LABEL:** Treatment of bone destruction caused by rheumatoid arthritis.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to denosumab. **Prolia:** Preexisting hypocalcemia, pregnancy. **Xgeva:** Preexisting hypocalcemia. **Cautions:** History of hypoparathyroidism, thyroid/parathyroid surgery, malabsorption syndromes, excision of small intestine, immunocompromised pts. Pts with severe renal impairment or receiving dialysis (greater risk for developing hypocalcemia). Pts with impaired immune system or immunosuppressive therapy.

**ACTION**

Binds to RANKL; blocks interaction between RANKL and RANK, preventing osteoclast formation. **Therapeutic Effect:** Decreases bone resorption; increases bone mass in osteoporosis; decreases skeletal-related events and tumor-induced bone destruction in solid tumors, multiple myeloma. Inhibits tumor growth.

**PHARMACOKINETICS**

Serum level detected 1 hr after administration. **Half-life:** 32 days.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Approved for use only in postmenopausal women.

**Children:** Approved for use only in postmenopausal women. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May enhance adverse/toxic effect of **belimumab, immunosuppressants**.

**HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium. May increase serum cholesterol.

**AVAILABILITY (Rx)**

**Injection, Solution:** (*Prolia*): 60 mg/mL.  
(*Xgeva*): 120 mg/1.7 mL.

**ADMINISTRATION/HANDLING****SO**

- Administer in upper arm, upper thigh, or abdomen.

**Storage** • Refrigerate. Use within 14 days once at room temperature. • Solution appears as clear, colorless to pale yellow.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Administer calcium and vitamin D to prevent/treat hypocalcemia.

**Prolia**

**Androgen Deprivation, Bone Loss, Osteoporosis**

**SO: ADULTS, ELDERLY:** 60 mg every 6 mos.

**Xgeva**

**Prevention of Skeletal-Related Events From Solid Tumors, Multiple Myeloma**

**SO: ADULTS, ELDERLY:** 120 mg q4wks.

**Giant Cell Tumor of Bone, Hypercalcemia of Malignancy**

**SO: ADULTS, ELDERLY, MATURE ADOLESCENTS:** 120 mg q4wks with additional doses on days 8 and 15 of first mo of therapy.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (35%–12%):** Back pain, extremity pain. **Occasional (8%–5%):** Musculoskeletal pain, vertigo, peripheral edema, sciatica. **Rare (4%–2%):** Bone pain, upper abdominal pain, rash, insomnia, flatulence, pruritus, myalgia, asthenia, GI reflux.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Increases risk of infection, specifically cystitis, upper respiratory tract infection, pneumonia, pharyngitis, herpes zoster (shingles) occur in 2%–6% of

pts. Osteonecrosis of the jaw (OJN) was reported. Suppression of bone turnover, pancreatitis have been reported.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Hypocalcemia must be corrected prior to treatment. Calcium 1,000 mg/day and vitamin D at least 400 international units/day should be given. Dental exam should be provided prior to treatment. Recommend baseline bone density scan.

**INTERVENTION/EVALUATION**

Monitor serum magnesium, calcium, ionized calcium, phosphate. In pts predisposed with hypocalcemia and disturbances of mineral metabolism, clinical monitoring of calcium, mineral levels is highly recommended. Adequately supplement all pts with calcium and vitamin D. Monitor for delayed fracture healing.

**PATIENT/FAMILY TEACHING**

- Report rash, new-onset eczema.
- Seek prompt medical attention if signs, symptoms of severe infection (rash, itching, reddened skin, cellulitis) occur.
- Report muscle stiffness, numbness, cramps, spasms (signs of hypocalcemia); swelling or drainage from jaw, mouth, or teeth.

**desmopressin**

des-moe-press-in  
(DDAVP, Stimate)

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Synthetic vasopressin analog (hormone, posterior pituitary). **CLINICAL:** Antihemophilic. Hemostatic.

**USES**

**Intranasal, Injection: Diabetes Insipidus, Central:** Antidiuretic replacement therapy for management of central (cranial) diabetes insipidus, temporary polyuria/polydipsia following head trauma or surgery in pituitary region. Use in pts with mild hemophilia A or von Willebrand disease to maintain hemostasis during surgical procedures. **Intranasal:** Treatment of nocturia due to nocturnal polyuria in adults who awaken at least 2 times per night to void. **Oral: Diabetes Insipidus, Central:** Antidiuretic replacement therapy in the management of central diabetes insipidus. Management of temporary polyuria and polydipsia following head trauma or surgery in the pituitary region. Treatment of nocturia due to nocturnal polyuria in adults who awaken at least 2 times per night to void. Management of primary nocturnal enuresis, either alone or as an adjunct to behavioral conditioning or other nonpharmacologic intervention.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to desmopressin. Hyponatremia, history of hyponatremia, moderate to severe renal impairment. **Cautions:** Predisposition to thrombus formation; conditions with fluid, electrolyte imbalance; coronary artery disease; hypertensive cardiovascular disease, elderly pts, cystic fibrosis, HE, renal impairment, polydipsia. Avoid use in hemophilia A with factor VIII levels less than 5%; hemophilia B; severe type I, type IIB, platelet-type von Willebrand's disease.

**ACTION**

Increases cAMP in renal tubular cells, which increases water permeability, decreasing urine volume. Increases levels of von Willebrand factor, factor VIII, tissue plasminogen activator (tPA). **Therapeutic Effect:** Shortens activated partial thromboplastin time (aPTT), bleeding time. Decreases urinary output.

**PHARMACOKINETICS**

Route	Onset	Peak	Duration
PO	1 hr	2–7 hrs	8–12 hrs
IV	15–30 min	1.5–3 hrs	8–12 hrs
Intranasal	15 min–1 hr	1–5 hrs	8–12 hrs

Poorly absorbed after PO, nasal administration. Metabolism: Unknown. **Half-life:** **PO:** 1.5–2.5 hrs. **Intranasal:** 3.3–3.5 hrs. **IV:** 0.4–4 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Caution in neonates, pts younger than 3 mos (increased risk of fluid balance problems). Careful fluid restrictions recommended in infants. **Elderly:** Increased risk of hyponatremia, water intoxication.

**INTERACTIONS**

**DRUG:** CarBAMazepine, lamoTRigine, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), SSRIs (e.g., citalopram, sertraline), tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline) may increase effect. Demeclocycline, lithium may decrease effect. Corticosteroids (e.g., dexamethasone, predniSONE), loop diuretics (e.g., furosemide) may increase hyponatremic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

**AVAILABILITY (Rx)**

**Injection Solution: (DDAVP):** 4 mcg/mL. **Nasal Solution:** 100 mcg/mL (10 mcg/spray). **Nasal Spray: (Stimate):** 1.5 mg/mL (150 mcg/spray). **Tablets: (DDAVP):** 0.1 mg, 0.2 mg. **Tablets, Sublingual:** 27.7 mcg, 55.3 mcg.

**ADMINISTRATION/HANDLING**

**Reconstitution** • For IV infusion, dilute in 10–50 mL 0.9% NaCl (10 mL for children 10 kg or less; 50 mL for adults, children greater than 10 kg).

**Rate of administration** • Infuse over 15–30 min.

**Storage** • Refrigerate.

### SQ

• Withdraw dose from vial. Further dilution not required.

### Intranasal

• Refrigerate DDAVP Rhinal Tube solution, Stimite nasal spray. • Rhinal Tube solution, Stimite nasal spray are stable for 3 wks at room temperature. • DDAVP nasal spray is stable at room temperature. • Calibrated catheter (rhinyle) is used to draw up measured quantity of desmopressin; with one end inserted in nose, pt blows on other end to deposit solution deep in nasal cavity. • For infants, young children, obtunded pts, air-filled syringe may be attached to catheter to deposit solution.

## INDICATIONS/ROUTES/DOSAGE

### Nocturia

**Sublingual: ADULTS, ELDERLY: (Females):** 27.7 mcg once daily 1 hr before bedtime. **(Males):** 55.3 mcg once daily 1 hr before bedtime.

### Primary Nocturnal Enuresis

**PO: CHILDREN 6 YRS AND OLDER:** 0.2–0.6 mg once before bedtime. Limit fluid intake 1 hr prior and at least 8 hrs after dose.

### Central Cranial Diabetes Insipidus

**◀ALERT▶** Fluid restriction should be observed.

**PO: ADULTS, ELDERLY:** Initially, 0.05–0.2 mg once daily at bedtime. Adjust bedtime dosage in 0.05-mg increments. Assess need for daytime dose based on daytime polyuria. **Maintenance:** 0.1–0.8 mg/day in 2–3 equally divided doses. Maximum: 1.2 mg/day. **CHILDREN 4 YRS AND OLDER, ADOLESCENTS:** Initially, 0.05 mg twice daily. Titrate to desired response. **Daily range:** 0.1–0.8 mg/day in 2–3 divided doses.

**IV, SQ: ADULTS, ELDERLY:** 0.25–1 mcg q12–24h. **CHILDREN 12 YRS AND OLDER:** 2–4 mcg/day in 2 divided doses or one-tenth of maintenance intranasal dose.

**Intranasal: (Use 100 mcg/mL concentration): ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS:** 5–40 mcg (0.1–0.4 mL) in 1–3 doses/day. Usual dose: 10 mcg 2 times/day. **CHILDREN 3 MOS–12 YRS:** Initially, 5 mcg (0.05 mL)/day. Range: 5–30 mcg (0.05–0.3 mL)/day as a single or 2 divided doses.

### Hemophilia A, Von Willebrand's Disease (Type I)

**IV infusion: ADULTS, ELDERLY, CHILDREN:** 0.3 mcg/kg as slow infusion.

**Intranasal: (Use 1.5 mg/mL concentration providing 150 mcg/spray): ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 50 KG:** 300 mcg; use 1 spray in each nostril. **ADULTS, ELDERLY, CHILDREN WEIGHING 50 KG OR LESS:** 150 mcg as a single spray. Repeat use based on clinical conditions/laboratory work.

### Dosage in Renal Impairment

**CrCl less than 50 mL/min:** Not recommended.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Occasional: IV:** Pain, redness, swelling at injection site; headache, abdominal cramps, vulvular pain, flushed skin, mild B/P elevation, nausea with high dosages. **Nasal:** Rhinorrhea, nasal congestion, slight B/P elevation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Water intoxication, hyponatremia (headache, drowsiness, confusion, decreased urination, rapid weight gain, seizures, coma) may occur in overhydration. Children, elderly pts, infants are esp. at risk.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum electrolytes, vital signs, urine specific gravity. Check lab values for factor VIII coagulant concentration for hemophilia A, von Willebrand's disease; coagulation profiles.

**INTERVENTION/EVALUATION**

Check B/P, pulse with IV infusion. Monitor pt weight, fluid intake; urine volume, urine specific gravity, osmolality, serum electrolytes for diabetes insipidus. Assess factor VIII antigen levels, aPTT, factor VIII activity level for hemophilia.

**PATIENT/FAMILY TEACHING**

- Avoid overhydration.
- Follow guidelines for proper intranasal administration.
- Report headache, shortness of breath, heartburn, nausea, abdominal cramps.

**dexamethasone**

dex-a-meth-a-son

(Decadron, Dexamethasone Intensol, DexPak, Maxidex)

**Do not confuse Decadron with Percodan, or dexamethasone with dextroamphetamine, or Maxidex with Maxzide.**

**FIXED-COMBINATION(S)**

**Ciprodex Otic:** dexamethasone/ciprofloxacin (antibiotic): 0.1%/0.3%.

**Dexacidin, Maxitrol:** dexamethasone/neomycin/polymyxin (anti-infectives): 0.1%/3.5 mg/10,000 units per g or mL.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Glucocorticoid. **CLINICAL:** Anti-inflammatory. Antiemetic.

**USES**

Used primarily as an anti-inflammatory or immunosuppressant agent in a variety of diseases (e.g., allergic states, edematous states, neoplastic diseases, rheumatic disorders). **OFF-LABEL:** Antiemetic, treatment of croup, dexamethasone suppression test (indicator consistent with suicide and/or depression), accelerate fetal lung

maturation. Treatment of acute mountain sickness, high-altitude cerebral edema.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to dexamethasone. Systemic fungal infections. **Cautions:** Thyroid disease, renal/hepatic impairment, cardiovascular disease, diabetes, glaucoma, cataracts, myasthenia gravis, pts at risk for seizures, osteoporosis, post-MI, elderly.

**ACTION**

Decreases inflammation by suppression of neutrophil migration, decreases production of inflammatory mediators. Reverses increased capillary permeability. Suppresses normal immune response. **Therapeutic Effect:** Decreases inflammation.

**PHARMACOKINETICS**

Widely distributed. Protein binding: High. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 3–4.5 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Prolonged treatment with high-dose therapy may decrease short-term growth rate, cortisol secretion. **Elderly:** Higher risk for developing hypertension, osteoporosis.

**INTERACTIONS**

**DRUG:** **Amphotericin** may increase hypokalemia. **CYP3A4 inducers** (e.g., **carbamazepine, phenytoin, rifampin**) may decrease concentration/effect. **CYP3A4 inhibitors** (e.g., **clarithromycin, ketoconazole, ritonavir, macrolide antibiotics**) may increase concentration/effect. May decrease therapeutic effect of **aldesleukin**. May increase hyponatremic effect of **desmopressin**. **Live virus vaccines** may decrease pt's antibody response to vaccine, increase

vaccine side effects, potentiate virus replication. **HERBAL:** *Echinacea* may increase immunosuppressant effect. **FOOD:** Interferes with **calcium** absorption. **LAB VALUES:** May increase serum glucose, lipids, sodium levels. May decrease serum calcium, potassium, thyroxine, WBC.

## AVAILABILITY (Rx)

**Elixir:** 0.5 mg/5 mL. **Injection, Solution:** 4 mg/mL, 10 mg/mL. **Ophthalmic Solution:** 0.1%. **Ophthalmic Suspension:** 0.1%. **Solution, Oral:** 0.5 mg/5 mL. **Solution, Oral Concentrate: (Dexamethasone Intensol):** 1 mg/mL. **Tablets:** 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg.

## ADMINISTRATION/HANDLING

IV

**ALERT** Dexamethasone sodium phosphate may be given by IV push or IV infusion. Rapid injection may cause genital burning sensation in females.

- For IV push, give over 1–4 min if dose is less than 10 mg.
- For IV infusion, mix with 50–100 mL 0.9% NaCl or D<sub>5</sub>W and infuse over 15–30 min.
- For neonates, solution must be preservative free.
- IV solution must be used within 24 hrs.

### IM

- Give deep IM, preferably in gluteus maximus.

### PO

- Give with milk, food (to decrease GI effect).

### Ophthalmic Solution, Suspension

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place prescribed number of drops or 1/4 to 1/2 inch ointment into pocket.
- Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac).
- Instruct pt to apply digital pressure to lacrimal sac at inner canthus for 1–2 min to minimize systemic absorption.

## IV INCOMPATIBILITIES

Ciprofloxacin (Cipro), DAUNOrubicin (Cerubidine), IDArubicin (Idamycin), midazolam (Versed).

## IV COMPATIBILITIES

Cimetidine (Tagamet), CISplatin (Platinol), cyclophosphamide (Cytosan), cytarabine (Cytosar), DOCEtaxel (Taxotere), DOXOrubicin (Adriamycin), etoposide (VePesid), furosemide (Lasix), granisetron (Kytril), heparin, HYDRomorphone (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran), PACLitaxel (Taxol), palonosetron (Aloxi), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO, IM, IV: ADULTS, ELDERLY:** 4–20 mg/day as a single dose or in 2–4 divided doses. High dose: 0.4–0.8 mg/kg/day (usually not exceeding 40 mg/day).

### Usual Ophthalmic Dosage, Ocular Inflammatory Conditions

**ADULTS, ELDERLY, CHILDREN:** (**Solution:**) Initially, 1–2 drops q1h while awake and q2h at night for 1 day, then reduce to 3–4 times/day. (**Suspension:**) 1–2 drops up to 4–6 times/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent:** **Inhalation:** Cough, dry mouth, hoarseness, throat irritation. **Intranasal:** Burning, mucosal dryness. **Ophthalmic:** Blurred vision. **Systemic:** Insomnia, facial edema (cushingoid appearance [“moon face”]), moderate abdominal distention, indigestion, increased appetite, nervousness, facial flushing, diaphoresis. **Occasional:** **Inhalation:** Localized fungal infection (thrush). **Intranasal:** Crusting inside nose, epistaxis, sore throat, ulceration of nasal mucosa. **Ophthalmic:** Decreased vision; lacrimation; eye pain; burning, stinging, redness of eyes; nausea; vomiting. **Systemic:** Dizziness,

decreased/blurred vision. **Rare:** **Inhalation:** Increased bronchospasm, esophageal candidiasis. **Intranasal:** Nasal/pharyngeal candidiasis, eye pain. **Systemic:** Generalized allergic reaction (rash, urticaria); pain, redness, swelling at injection site; psychological changes; false sense of well-being; hallucinations; depression.

### ADVERSE EFFECTS/TOXIC REACTIONS

**Long-term therapy:** Muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, HE. **Ophthalmic:** Glaucoma, ocular hypertension, cataracts. **Abrupt withdrawal following long-term therapy:** Severe joint pain, severe headache, anorexia, nausea, fever, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Question for hypersensitivity to any corticosteroids. Obtain baselines for height, weight, B/P, serum glucose, electrolytes. Question medical history as listed in Precautions.

#### INTERVENTION/EVALUATION

Monitor I&O, daily weight, serum glucose. Assess for edema. Evaluate food tolerance. Report hyperacidity promptly. Check vital signs at least twice daily. Be alert to infection (sore throat, fever, vague symptoms). Monitor serum electrolytes, esp. for hypercalcemia, hypokalemia, paresthesia (esp. lower extremities, nausea/vomiting, irritability). Assess emotional status, ability to sleep. Abrupt withdrawal may cause adrenal insufficiency; taper dose gradually.

#### PATIENT/FAMILY TEACHING

- Do not change dose/schedule or stop taking drug.
- Must** taper off gradually under medical supervision.
- Report fever, sore throat, muscle aches, sudden weight gain, edema, exposure to mea-

les/chickenpox.

- Severe stress (serious infection, surgery, trauma) may require increased dosage.
- Avoid alcohol, limit caffeine.

## dexmedetomidine

dex-med-e-toe-mye-deen  
(Precedex)

**Do not confuse Precedex with Percocet or Peridex.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha<sub>2</sub> agonist. **CLINICAL:** Sedative.

### USES

Sedation of initially intubated, mechanically ventilated adults in intensive care setting. Use in nonintubated pts requiring sedation before and/or during surgical and other procedures. **OFF-LABEL:** Treatment of shivering, use in children. Awake craniotomy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dexmedetomidine. **Cautions:** Cardiac conduction delay disorders (e.g., AV block), bradycardia, hepatic impairment, hypovolemia, diabetes, hypotension, chronic hypertension, severe ventricular dysfunction, elderly, use of vasodilators or drugs decreasing heart rate.

### ACTION

Selective alpha<sub>2</sub>-adrenergic agonist. Inhibits norepinephrine release. **Therapeutic Effect:** Produces anesthetic, sedative effects.

### PHARMACOKINETICS

Protein binding: 94%. Metabolized in liver. Excreted in urine (85%), feces (4%). **Half-life:** 2 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of hypotension.

## INTERACTIONS

**DRUG:** Sedatives (e.g., midazolam, LORazepam), opioids (e.g., fentaNYL, morphine, HYDRomorphone), hypnotics (e.g., zolpidem, temazepam) may increase CNS depression. Anti-hypertensives (e.g., amLODIPine, cloNIDine, lisinopril, valsartan) may increase risk of hypotension. Beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., dilTIAZem, verapamil) may increase risk of bradycardia, hypotension. Tricyclic antidepressants (e.g., amitriptyline, doxepin) may decrease antihypertensive effect. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, glucose, potassium. May decrease serum calcium, magnesium; Hgb, Hct, RBC.

## AVAILABILITY (Rx)

**Injection Solution:** 80 mcg/20 mL, 200 mcg/2 mL vials, 4 mcg/mL solutions (50 mL, 100 mL).

## ADMINISTRATION/HANDLING

- Reconstitution** • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless.
- Dilute 2 mL of dexmedetomidine with 48 mL 0.9% NaCl for a final concentration of 4 mcg/mL.
- Rate of administration** • Individualized, titrated to desired effect. Use controlled infusion pump.
- Storage** • Store at room temperature.

## IV INCOMPATIBILITIES

Do not mix with any other medications.

## IV COMPATIBILITIES

Amiodarone (Cordarone), bumetanide (Bumex), calcium gluconate, cisatracurium (Nimbex), dexamethasone, DOBUtamine,

DOPamine, magnesium sulfate, norepinephrine (Levophed), propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### ICU Sedation

**Note:** Loading dose is generally not recommended due to concerns for hemodynamic compromise (e.g., hypertension, hypotension, bradycardia). **IV: ADULTS:** Loading dose of 1 mcg/kg over 10 min followed by maintenance infusion of 0.2–0.7 mcg/kg/hr. **ELDERLY:** May require decreased dosage.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Frequent (25%–12%):** Hypotension, hypertension. **Occasional (9%–3%):** Nausea, constipation, bradycardia, pyrexia, dry mouth, vomiting, hypovolemia. **Rare (2%–less than 1%):** Agitation, hyperpyrexia, thirst, oliguria, wheezing.

## ADVERSE EFFECTS/TOXIC REACTIONS

Significant bradycardia, sinus arrest, cardiac arrest, AV block, SVT, ventricular tachycardia may occur and may be fatal. Transient hypertension was reported during loading doses. Atrial fibrillation, hypoxia, pleural effusion may occur with too-rapid IV infusion. Bradycardia, hypotension may be more pronounced in pts with diabetes, hypovolemia, hypertension, or who are elderly. Acute respiratory distress syndrome (ARDS), respiratory failure, acidosis may occur with prolonged infusion time greater than 24 hrs.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P, heart rate. Recommend continuous cardiac monitoring during use. Assess mental status prior to initiation. Obtain full medication history; screen for medications known to cause hypotension, bradycardia,

sedation. Question history of heart block, bradycardia, severe ventricular dysfunction; hepatic impairment.

#### INTERVENTION/EVALUATION

Assess cardiac monitor for arrhythmia, bradycardia, hypotension. Anticholinergic agents (e.g., glycopyrrolate, atropine) may be effective in treating drug-induced bradycardia. Monitor level of sedation; respiratory rate, rhythm. Monitor ventilator settings. Discontinue once pt is extubated.

#### PATIENT/FAMILY TEACHING

- B/P, heart will be continuously monitored during infusion.
- If infusion is used for more than 6 hrs, agitation, nervousness, headaches may occur for up to 48 hrs.
- Report other symptoms that may occur within 48 hrs (abdominal pain, confusion, constipation, dizziness, sweating, weakness, salt cravings, weight loss).

## dextroamphetamine and amphetamine

TOP 100

dex-troe-am-fet-ah-meen/am-fet-ah-meen

(Adderall, Adderall-XR, Mydayis)

**BLACK BOX ALERT** High potential for abuse. Prolonged administration may lead to drug dependence. Severe cardiovascular events including CVA/MI reported.

**Do not confuse Adderall with Inderal.**

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Amphetamine (Schedule II). **CLINICAL:** CNS stimulant.

#### USES

Treatment of narcolepsy (immediate-release only); treatment of ADHD.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to dextroamphetamine, amphetamine, or sympathomimetics. Advanced

arteriosclerosis, agitated mental states, glaucoma, history of alcohol or drug abuse, hypersensitivity to sympathomimetic amines, hyperthyroidism, moderate to severe hypertension, symptomatic cardiovascular disease, use of MAOIs within 14 days. **Cautions:** Elderly, debilitated pts, history of seizures, mild hypertension; history of drug abuse and misuse, drug-seeking behavior, dependency. Preexisting psychotic or bipolar disorder.

#### ACTION

Promotes release of primarily dopamine and norepinephrine from storage site in presynaptic nerve terminals. **Therapeutic Effect:** Increases motor activity, mental alertness; decreases drowsiness, fatigue; suppresses appetite.

#### PHARMACOKINETICS

Widely distributed including CNS. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 10–13 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** Age-related cardiovascular, cerebrovascular disease, hepatic/renal impairment may increase risk of side effects.

#### INTERACTIONS

**DRUG:** MAOIs (e.g., phenelzine, selegiline) may prolong, intensify effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase plasma corticosteroid.

#### AVAILABILITY (Rx)

**Tablets:** (Adderall): 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg.

**Capsules:** (Extended-Release [Adderall-XR]): 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg. **Mydayis:** 12.5 mg, 25 mg, 37.5 mg, 50 mg.

**ADMINISTRATION/HANDLING****PO**

• Give immediate-release tablets at least 6 hrs before bedtime to prevent insomnia. • Extended-release capsules should be swallowed whole; do not break, crush, or cut. • Avoid afternoon doses to prevent insomnia. • May open capsules and sprinkle on applesauce. Instruct pt not to chew sprinkled beads; take immediately.

**INDICATIONS/ROUTES/DOSAGE****Narcolepsy**

**PO: ADULTS, CHILDREN OLDER THAN 12 YRS:** Initially, 10 mg/day. Increase by 10 mg/day at wkly intervals until therapeutic response is achieved. **Usual Range:** 20–60 mg/day given in 1–3 divided doses. **CHILDREN 6–12 YRS:** Initially, 5 mg/day. Increase by 5 mg/day at wkly intervals until therapeutic response is achieved. **Usual Range:** 5–60 mg/day given in 1–3 divided doses.

**ADHD**

**ADULTS, ELDERLY: (Adderall):** Initially, 5 mg 1–2 times/day. May increase by 5-mg increments at wkly intervals. **Maximum:** 40 mg/day in 2–3 divided doses (usual intervals of 4–6 hrs). **(Adderall-XR):** Initially, 10–20 mg once daily in the morning. May increase in increments of 10–20 mg wkly up to 60 mg/day. **(Mydayis):** Initially, 12.5 mg once daily in morning. May increase by 12.5 mg no sooner than once wkly. **Maximum:** 50 mg/day. **CHILDREN 13–17 YRS: (Adderall):** Initially, 5 mg 1–2 times/day. May increase by 5 mg at wkly intervals. **Maximum:** 40 mg/day in 1–3 divided doses (usual intervals of 4–6 hrs). **(Adderall-XR):** Initially, 10 mg once daily in the morning. May increase to 20 mg/day after 1 wk if symptoms are not controlled. May increase up to 60 mg/day. **(Mydayis):** Initially, 12.5 mg once daily in morning. May increase by 12.5 mg no sooner than once wkly. **Maximum:** 25 mg/day. **CHILDREN 6–12 YRS: (Adderall):** Initially, 5 mg 1–2 times/day. May increase in 5-mg increments at wkly intervals until optimal response is obtained. **Maximum:** 40 mg/day given in 1–3 divided doses (use inter-

vals of 4–6 hrs between additional doses). **(Adderall-XR):** Initially, 5–10 mg once daily in the morning. May increase daily dose in 5- to 10-mg increments at wkly intervals. **Maximum:** 30 mg/day. **CHILDREN 3–5 YRS: (Adderall):** Initially, 2.5 mg/day given every morning. May increase daily dose in 2.5-mg increments at wkly intervals until optimal response is obtained. **Maximum:** 40 mg/day given in 1–3 divided doses (use intervals of 4–6 hrs between additional doses). Not recommended in children younger than 3 yrs.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Increased motor activity, talkativeness, nervousness, mild euphoria, insomnia. **Occasional:** Headache, chills, dry mouth, GI distress, worsening depression in pts who are clinically depressed, tachycardia, palpitations, chest pain, dizziness, decreased appetite.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may produce skin pallor/flushing, arrhythmias, psychosis. Abrupt withdrawal after prolonged use of high doses may produce lethargy (may last for wks). Prolonged administration to children with ADHD may temporarily suppress normal weight/height pattern.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess attention span, impulse control, interaction with others. Assess risk of drug abuse, misuse, drug-seeking behavior. Obtain baseline B/P. Assess sleep pattern.

**INTERVENTION/EVALUATION**

Monitor for CNS overstimulation, increase in B/P, growth rate, change in pulse rate, respirations, weight loss. Screen for misuse, abuse, drug-seeking behavior. **Narcolepsy:** Observe/document frequency of narcoleptic episodes. **ADHD:** Observe for improved attention span.

**PATIENT/FAMILY TEACHING**

• Normal dosage levels may produce tolerance to drug's anorexic mood-elevating effects within a few wks. • Dry mouth may be relieved with sugarless gum, sips of water. • Take early in day. • Do not break, chew, or crush extended-release capsules. • May mask extreme fatigue. • Report pronounced anxiety, dizziness, decreased appetite, dry mouth, new or worsening behavior, chest pain, palpitations. • Avoid alcohol, caffeine.

**diazepam**

dye-az-e-pam  
(Diastat, Diazepam Intensol,  
Valium, Valtoco)

**BLACK BOX ALERT** ■ Concomitant use of benzodiazepines and opioids may result in profound sedation, respiratory depression, and death. Reserve for pts for whom alternative treatment options are inadequate. Due to high risk of abuse, monitor for symptoms of drug abuse and misuse (drug-seeking behavior, dependency). Continued use may lead to clinically significant physical dependence.

**Do not confuse diazepam with diazoxide, dilTIAZem, Ditropan, or LORazepam, or Valium with Valcyte.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Benzodiazepine (Schedule IV). **CLINICAL:** Antianxiety, skeletal muscle relaxant, anticonvulsant.

**USES**

Short-term relief of anxiety symptoms, relief of acute alcohol withdrawal. Adjunct for relief of acute musculoskeletal conditions, treatment of seizures (IV route used for termination of status epilepticus). **Gel:** Control of increased seizure activity in refractory epilepsy in pts on stable regimens. **OFF-LABEL:**

Treatment of panic disorder. Short-term treatment of spasticity in children with cerebral palsy. Sedation for mechanically ventilated pts in ICU.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to diazepam. Acute narrow-angle glaucoma, untreated open-angle glaucoma, severe respiratory depression, severe hepatic insufficiency, sleep apnea syndrome, myasthenia gravis. Children younger than 6 mos (oral).

**Cautions:** Pts receiving other CNS depressants or psychoactive agents, depression, history of drug and alcohol abuse, renal/hepatic impairment, respiratory disease, impaired gag reflex, concurrent use of strong CYP3A4 inhibitors or inducers.

**ACTION**

Depresses all levels of CNS by enhancing action of gamma-aminobutyric acid (GABA), a major inhibitory neurotransmitter in the brain. **Therapeutic Effect:** Produces anxiolytic effect, elevates seizure threshold, produces skeletal muscle relaxation.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 98%. Excreted in urine. Minimally removed by hemodialysis. **Half-life:** 20–70 hrs (increased in hepatic dysfunction, elderly).

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May increase risk of fetal abnormalities if administered during first trimester of pregnancy. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children/Elderly:** Use small initial doses with gradual increases to avoid ataxia, excessive sedation. Elderly at increased risk of impaired cognition, delirium, falls, fractures.

**INTERACTIONS**

**DRUG:** Alcohol, CNS depressants (e.g., gabapentin, morphine,

zolpidem) may increase CNS depression. **CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration. **CYP3A4 inhibitors** (e.g., itraconazole, ketoconazole) may increase concentration/effect. **OLANzapine** may increase adverse effects. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** None significant. **Therapeutic serum level:** 0.5–2 mcg/mL; **toxic serum level:** greater than 3 mcg/mL.

### AVAILABILITY (Rx)

**Injection, Solution:** 5 mg/mL. **Nasal:** 5 mg/0.1 mL, 7.5 mg/0.1 mL, 10 mg/0.1 mL. **Oral Concentrate:** (*Diazepam Intensional*): 5 mg/mL. **Oral Solution:** 5 mg/5 mL. **Rectal Gel:** (*Diastat*): 2.5 mg, 10 mg, 20 mg. **Tablet:** (*Valium*): 2 mg, 5 mg, 10 mg.

### ADMINISTRATION/HANDLING

**Rate of administration** • Give by IV push into tubing of flowing IV solution as close as possible to vein insertion point. • Administer directly into large vein (reduces risk of thrombosis/phlebitis). Do not use small veins (e.g., wrist/dorsum of hand). • Administer IV at rate not exceeding 5 mg/min for adults. For children, give 1–2 mg/min (too-rapid IV may result in hypotension, respiratory depression). • Monitor respirations q5–15 min for 2 hrs. **Storage** • Store at room temperature.

#### Intranasal

- Do not test or prime before use.
- Administer one spray into one nostril.

#### IM

- Injection may be painful. Inject deeply into large muscle mass.

#### PO

- Give without regard to food. • Dilute oral concentrate with water, juice, carbonated beverages; may be mixed in semisolid food (applesauce, pudding). • Tablets may be crushed.

#### GEL

- Insert rectal tip and gently push plunger over 3 sec. Remove tip after 3 additional sec. • Buttocks should be held together for 3 sec after removal.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), diltiazem (Cardizem), fluconazole (Diflucan), foscarnet (Foscavir), furosemide (Lasix), heparin, hydrocortisone (SOLU-Cortef), hydromorphone (Dilaudid), meropenem (Merrem IV), potassium chloride, propofol (Diprivan), vitamins.

### IV COMPATIBILITIES

DObutamine (Dobutrex), fentanyl, morphine.

### INDICATIONS/ROUTES/DOSAGE

#### Anxiety (Acute/Severe)

**IM, IV, PO: ADULTS:** 2–10 mg q3–6hrs PRN up to 40 mg/day based on response and tolerability.

#### Anxiety Disorders

**PO:** Initially, 2–5 mg once or twice daily. May gradually increase based on response and tolerability up to 40 mg/day in 2–4 divided doses.

#### Muscle Spasm, Spasticity/Rigidity

**PO: ADULTS:** Initially, 2 mg twice daily or 5 mg at bedtime. May gradually increase up to 40–60 mg/day in 3–4 divided doses based on response and tolerability. **ADOLESCENTS, CHILDREN, INFANTS 6 MOS AND OLDER:** Initially, 1–2.5 mg 3–4 times daily. May gradually increase as needed and tolerated.

#### Alcohol Withdraw

**IV, PO: ADULTS:** 5–20 mg PRN until appropriate sedation achieved. Dose and

frequency determined by severity of withdrawal symptoms.

### Status Epilepticus

**IV: ADULTS:** 5–10 mg as a single dose given at a maximum infusion rate of 5 mg/min. May repeat in 3–5 min if seizures do not subside. **INFANTS, CHILDREN:** 0.15–0.2 mg/kg over 2 min; may repeat after 5–10 min. **Maximum:** 10 mg/dose.

### Acute Active Seizures

**IV: ADULTS:** 5–10 mg as a single dose. May repeat at 3- to 5-min intervals up to a total dose of 30 mg. **Intranasal:** 0.2 mg/kg as a single dose. May repeat once based on response and tolerability after 4 or more hrs. **Maximum dose:** 2 doses/episode. Do not use for more than 1 episode q5days or more than 5 episodes/mo.

### Control of Increased Seizure Activity (Breakthrough Seizures) in Pts With Refractory Epilepsy Who Are on Stable Regimens of Anticonvulsants

**Note:** Do not use gel for more than 5 episodes/mo or more than 1 episode q5days. **PO: ADULTS, ELDERLY:** 2–10 mg 2–4 times/day.

**Rectal gel: ADULTS, CHILDREN 12 YRS AND OLDER:** 0.2–0.5 mg/kg; may be repeated in 4–12 hrs. **CHILDREN 6–11 YRS:** 0.3 mg/kg; may be repeated in 4–12 hrs. **Maximum:** 20 mg. **CHILDREN 2–5 YRS:** 0.5 mg/kg; may be repeated in 4–12 hrs. **Maximum:** 20 mg.

### Dosage in Renal Impairment

Use caution.

### Dosage in Hepatic Impairment

Use caution. Oral tablets contraindicated in severe hepatic impairment.

## SIDE EFFECTS

**Frequent:** Pain with IM injection, drowsiness, fatigue, ataxia. **Occasional:** Slurred speech, orthostatic hypotension, headache, hypoactivity, constipation, nausea, blurred vision. **Rare:** Paradoxical CNS reactions (hyperactivity/nervousness

in children, excitement/restlessness in elderly/debilitated pts) generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain.

## ADVERSE EFFECTS/TOXIC REACTIONS

IV route may produce pain, swelling, thrombophlebitis, carpal tunnel syndrome. Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal/muscle cramps, diaphoresis, vomiting, seizures. Abrupt withdrawal in pts with epilepsy may produce increase in frequency/severity of seizures. Overdose results in drowsiness, confusion, diminished reflexes, CNS depression, coma. **Antidote:** Flumazenil (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, pulse, respirations immediately before administration. Assess risk of drug abuse, misuse, drug-seeking behavior. **Anxiety:** Assess autonomic response (cold, clammy hands; diaphoresis), motor response (agitation, trembling, tension). **Musculoskeletal spasm:** Record onset, type, location, duration of pain. Check for immobility, stiffness, swelling. **Seizures:** Review history of seizure disorder (length, intensity, frequency, duration, LOC). Observe frequently for recurrence of seizure activity. Assess for potential of abuse/misuse (e.g., drug-seeking behavior, mental health conditions, history of substance abuse).

### INTERVENTION/EVALUATION

Monitor heart rate, respiratory rate, B/P, mental status. Assess children, elderly for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response (decrease in intensity/frequency of seizures; calm

facial expression, decreased restlessness; decreased intensity of skeletal muscle pain). Screen for misuse, abuse, drug-seeking behavior. **Therapeutic serum level:** 0.5–2 mcg/mL; **toxic serum level:** greater than 3 mcg/mL.

#### PATIENT/FAMILY TEACHING

- Avoid alcohol.
- Limit caffeine.
- May cause drowsiness; avoid tasks that require alertness, motor skills until response to drug is established.
- May be habit forming.
- Avoid abrupt discontinuation after prolonged use.

## diclofenac

dye-kloe-fen-ak  
(Cambia, Flector, Voltaren Gel, Zipsor, Zorvolex)

**BLACK BOX ALERT** Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines. Contraindicated for treatment of perioperative pain in setting of CABG surgery.

**Do not confuse Cataflam with Catapres, diclofenac with Diflucan or Duphalac, or Voltaren with tramADol, Ultram, or Verelan.**

#### FIXED-COMBINATION(S)

**Arthrotec:** diclofenac/miSOPROStol (an antisecretory gastric protectant): 50 mg/200 mcg, 75 mg/200 mcg.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NSAID (nonselective). **CLINICAL:** Analgesic, anti-inflammatory.

#### USES

Acute or long-term use for relief of signs and symptoms of ankylosing spondylitis.

Treatment of primary dysmenorrhea. Treatment of migraine attacks with or without aura in adults. Relief of signs and symptoms of osteoarthritis, rheumatoid arthritis. Treatment of juvenile idiopathic arthritis.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to diclofenac. Pts experiencing asthma, urticaria after taking aspirin, other NSAIDs. Pts with moderate to severe renal impairment in perioperative period who are at risk for volume depletion (injection only); perioperative pain in setting of CABG surgery. **Cautions:** HF, hypertension, renal/hepatic impairment, hepatic porphyria, history of GI disease (e.g., bleeding, ulcers), concomitant use of aspirin or anticoagulants, elderly, debilitated pts.

#### ACTION

Reversibly inhibits cyclo-oxygenase-1 and -2 (COX-1 and COX-2) enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Produces analgesic, antipyretic, anti-inflammatory effects.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	2–3 hrs	Up to 8 hrs

Completely absorbed from GI tract. Protein binding: greater than 99%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 1.2–2 hrs.

#### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Unknown if distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and

efficacy not established. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended.

## INTERACTIONS

**DRUG:** Aspirin, NSAIDs (e.g., ibuprofen, naproxen) may increase risk of GI side effects/bleeding. May increase cycloSPORINE concentration/toxicity. **HERBAL:** Herbals with anticoagulant/antiplatelet activity (e.g., garlic, ginger, ginkgo biloba) may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May increase urine protein, serum BUN, alkaline phosphatase, creatinine, LDH, potassium, ALT, AST. May decrease serum uric acid.

## AVAILABILITY (Rx)

**Transdermal Patch:** (*Flector*): 1.3%. **Transdermal Gel:** (*Voltaren*): 1%. **Capsules:** (*Zipsor*): 25 mg. (*Zorvolex*): 18 mg, 35 mg. **Oral Solution:** (*Cambia*): 50-mg packets. **Tablets:** 50 mg.

 **Tablets:** (*Delayed-Release*): 25 mg, 50 mg, 75 mg.  **Tablets:** (*Extended-Release*): 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Do not break, crush, dissolve, or divide enteric-coated tablets.
- May give with food, milk, antacids if GI distress occurs.
- (*Cambia*): Mix one packet in 1–2 oz water, stir well, and instruct pt to drink immediately.

### Transdermal Patch

- Apply to intact skin; avoid contact with eyes.
- Do not wear when bathing/showering.
- Wash hands after handling.

## INDICATIONS/ROUTES/DOSAGE

### Osteoarthritis

**PO:** (*Immediate-Release*): **ADULTS, ELDERLY:** 50 mg 2–3 times/day.

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** 100 mg/day as a single dose. (*Zorvolex*): 35 mg 3 times/day.

**PO:** (*Delayed-Release*): **ADULTS, ELDERLY:** 50 mg 2–3 times/day or 75 mg twice daily.

**Topical gel:** **ADULTS, ELDERLY:** Apply 4 times/day.

### Rheumatoid Arthritis (RA)

**PO:** (*Immediate-Release*): **ADULTS, ELDERLY:** 50 mg 3–4 times/day.

**PO:** (*Extended-Release*): **ADULTS, ELDERLY:** 100 mg once daily. May increase to 200 mg/day in 2 divided doses.

**PO:** (*Delayed-Release*): **ADULTS, ELDERLY:** 50 mg 3–4 times/day or 75 mg twice daily.

### Ankylosing Spondylitis

**PO:** **ADULTS, ELDERLY:** 100–150 mg/day in divided doses (may choose immediate release [given in 2–4 divided doses], delayed release [given in 2–4 divided doses], or extended release [given once daily]). **Maximum:** 150 mg/day

### Pain, Primary Dysmenorrhea

**PO:** **ADULTS, ELDERLY:** 150 mg/day in divided doses (may choose immediate release [given in 2–4 divided doses] or delayed release [given in 2–4 divided doses]). May give 75–100 mg as an initial loading dose followed by a maintenance dose. **Maximum:** (after day 1): 150 mg/day. 100 mg initially, then 50 mg 3 times/day.

### Migraine (Oral Solution)

**PO:** **ADULTS, ELDERLY:** 50–100 mg (one packet) once.

### Dosage in Renal Impairment

Not recommended in severe impairment.

### Dosage in Hepatic Impairment

May require dose adjustment. Use caution.

## SIDE EFFECTS

**Frequent (9%–4%):** **PO:** Headache, abdominal cramps, constipation, diarrhea, nausea, dyspepsia. **Ophthalmic:**

Burning, stinging on instillation, ocular discomfort. **Occasional (3%–1%): PO:** Flatulence, dizziness, epigastric pain. **Ophthalmic:** Ocular itching, tearing. **Rare (less than 1%): PO:** Rash, peripheral edema, fluid retention, visual disturbances, vomiting, drowsiness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may result in acute renal failure. In pts treated chronically, peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), severe hypersensitivity reaction (bronchospasm, angioedema) occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain B/P. **Anti-inflammatory:** Assess onset, type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition.

### INTERVENTION/EVALUATION

Monitor CBC, renal function, LFT, urine output, occult blood test, B/P. Monitor for headache, dyspepsia. Monitor daily pattern of bowel activity, stool consistency. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

### PATIENT/FAMILY TEACHING

- Swallow tablets whole; do not chew, crush, dissolve, or divide.
- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk.
- Report skin rash, itching, weight gain, changes in vision, black stools, bleeding, jaundice, upper quadrant pain, persistent headache.
- **Ophthalmic:** Do not use hydrogel soft contact lenses.
- **Topical:** Avoid exposure to sunlight, sunlamps.
- Report rash.

## digoxin

**HIGH ALERT**

di-jox-in

(Digitex, Digox, Lanoxin)

**Do not confuse digoxin with Desoxyx or doxepin, or Lanoxin with Lasix, Levoxyl, Levsinex, Lonox, or Mefoxin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Cardiac glycoside. **CLINICAL:** Antiarrhythmic.

## USES

Treatment of mild to moderate HF in adults and to increase myocardial contractility in pediatric pts with HF. Control ventricular response rate in pts with chronic atrial fibrillation. **OFF-LABEL:** Fetal tachycardia with or without hydrops; decrease ventricular rate in supraventricular tachyarrhythmias.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to digoxin. Ventricular fibrillation. **Cautions:** Renal impairment, sinus nodal disease, acute MI (within 6 mos), second- or third-degree heart block (unless functioning pacemaker), concurrent use of strong inducers or inhibitors of P-glycoprotein (e.g., cyclosporine), hyperthyroidism, hypothyroidism, hypokalemia, hypocalcemia.

## ACTION

**HF:** Inhibits sodium/potassium ATPase pump in myocardial cells. Promotes calcium influx. **Supraventricular arrhythmias:** Suppresses AV node conduction. **Therapeutic Effect: HF:** Increases contractility. **Supraventricular arrhythmias:** Increases effective refractory period/decreases conduction velocity, decreases ventricular heart rate of fast atrial arrhythmias.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–2 hrs	2–8 hrs	3–4 days
IV	5–30 min	1–4 hrs	3–4 days

Readily absorbed from GI tract. Widely distributed. Protein binding: 30%. Partially metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 36–48 hrs (increased in renal impairment, elderly).

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk.

**Children:** Premature infants more susceptible to toxicity. **Elderly:** Age-related hepatic/renal impairment may require dosage adjustment. Increased risk of loss of appetite. Avoid use as first-line therapy for atrial fibrillation or HF.

### INTERACTIONS

**DRUG:** Amiodarone may increase concentration/toxicity. **Beta blockers (e.g., metoprolol), calcium channel blockers (e.g., diltiazem)** may have additive effect on slowing AV nodal conduction. **Potassium-depleting diuretics (e.g., furosemide)** may increase toxicity due to hypokalemia. **Ketoconazole, vemurafenib** may increase concentration/effect. **Sucralfate** may decrease absorption/concentration. **HERBAL:** Licorice may increase adverse effects. **FOOD:** Meals with increased fiber (bran) or high in pectin may decrease absorption. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Oral Solution:** (Lanoxin): 50 mcg/mL.

**Injection Solution:** (Lanoxin): 100 mcg/mL, 250 mcg/mL. **Tablets:** (Lanoxin): 62.5 mcg, 125 mcg, 187.5 mcg, 250 mcg.

### ADMINISTRATION/HANDLING

**◀ALERT▶** IM rarely used (produces severe local irritation, erratic absorption). If no other route possible, give deep into muscle followed by massage. Give no more than 2 mL at any one site.

#### IV

• May give undiluted or dilute with at least a 4-fold volume of Sterile Water for Injection or D<sub>5</sub>W (less may cause

precipitate). • Use immediately. • Give IV slowly over at least 5 min.

#### PO

• May give without regard to food. • Tablets may be crushed.

### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan), foscarnet (Foscavir), propofol (Diprivan).

### IV COMPATIBILITIES

Diltiazem (Cardizem), furosemide (Lasix), heparin, insulin regular, lidocaine, midazolam (Versed), milrinone (Primacor), morphine, potassium chloride.

### INDICATIONS/ROUTES/DOSAGE

**Note:** Loading dose not recommended in HF.

#### HF

**PO: ADULTS, ELDERLY:** 0.125–0.25 mg once daily.

#### Maintenance Dosage

	PO	IV/IM
Preterm infant	5–7.5 mcg/kg	4–6 mcg/kg
Full-term infant	8–10 mcg/kg	5–8 mcg/kg
1 mo–2 yrs	10–15 mcg/kg	9–15 mcg/kg
2–5 yrs	8–10 mcg/kg	6–9 mcg/kg
5–10 yrs	5–10 mcg/kg	4–8 mcg/kg
>10 yrs	2.5–5 mcg/kg	2–3 mcg/kg

**Note:** If age 11 yrs or older, give once daily. If 10 yrs or younger, give in equally divided doses twice daily.

#### Atrial Fibrillation

**ADULTS, ELDERLY: Digitalizing dose (IV):** Initially, 0.25–0.5 mg over several minutes. May repeat doses of 0.25 mg q6hrs up to a maximum of 1.5 mg over 24 hrs. **Maintenance dose (PO):** 0.125–0.25 mg once daily.

#### Dosage in Renal Impairment

Dosage adjustment is based on creatinine clearance. **Loading dose:** Decrease by 50% in end-stage renal disease.

**Maintenance Dose**

eGFR	Dosage
10–50 mL/min	25%–75% of usual dose or q36h (0.0625 mg q24–36hrs)
Less than 10 mL/min (HD, PD, CRRT)	10%–25% of usual dose or q48h (0.0625 mg q48h)

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

Dizziness, headache, diarrhea, rash, visual disturbances.

**ADVERSE EFFECTS/TOXIC REACTIONS**

The most common early manifestations of digoxin toxicity are GI disturbances (anorexia, nausea, vomiting), neurologic abnormalities (fatigue, headache, depression, weakness, drowsiness, confusion, nightmares). Facial pain, personality change, ocular disturbances (photophobia, light flashes, halos around bright objects, yellow or green color perception) may occur. Sinus bradycardia, AV block, ventricular arrhythmias noted. **Antidote:** Digoxin immune FAB (see Appendix J for dosage).

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess apical pulse. If pulse is 60 or less/min (70 or less/min for children), withhold drug, contact physician. Blood samples are best taken 6–8 hrs after dose or just before next dose.

**INTERVENTION/EVALUATION**

Monitor pulse for bradycardia, ECG for arrhythmias for 1–2 hrs after administration (excessive slowing of pulse may be first clinical sign of toxicity). Assess for GI disturbances, neurologic abnormalities (signs of toxicity) q2–4h during loading dose (daily during maintenance). Monitor serum potassium, magnesium, calcium, renal function. **Therapeutic**

**serum level:** 0.8–2 ng/mL; **toxic serum level:** greater than 2 ng/mL.

**PATIENT/FAMILY TEACHING**

- Follow-up visits, blood tests are an important part of therapy.
- Follow guidelines to take apical pulse and report pulse of 60 or less/min (or as indicated by physician).
- Wear/carry identification of digoxin therapy and inform dentist, other physician of taking digoxin.
- Do not increase or skip doses.
- Do not take OTC medications without consulting physician.
- Report decreased appetite, nausea/vomiting, diarrhea, visual changes.

**dilTIAZem**TOP  
100

dil-tye-a-zem

(Apo-Diltiaz , Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilt-XR, Matzim LA, Taztia XT, Tiadylt ER, Tiazac)

**Do not confuse Cardizem with Cardene or Cardene SR, Cartia XT with Procardia XL, dilTIAZem with Calan, diazepam, or Dilantin, or Tiazac with Ziac.**

**FIXED-COMBINATION(S)**

**Teczem:** dilTIAZem/enalapril (ACE inhibitor): 180 mg/5 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Calcium channel blocker. Non-dihydropyridine. **CLINICAL:** Antianginal, antihypertensive, class IV antiarrhythmic.

**USES**

**PO:** Treatment of angina due to coronary artery spasm (Prinzmetal's variant angina), chronic stable angina (effort-associated angina). Treatment of hypertension. **Parenteral:** Temporary control of rapid ventricular rate in atrial fibrillation/flutter. Rapid conversion of

paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm.

## PRECAUTIONS

**Contraindications:** **PO:** Hypersensitivity to diltiazem, acute MI, pulmonary congestion, second- or third-degree AV block (except in presence of pacemaker), severe hypotension (less than 90 mm Hg, systolic), sick sinus syndrome (except in presence of pacemaker). **IV:** Hypersensitivity to diltiazem. Sick sinus syndrome or second- or third-degree block (except with functioning pacemaker), cardiogenic shock, administration of IV beta blocker within several hours, atrial fibrillation/flutter associated with accessory bypass tract, severe hypotension, ventricular tachycardia. **Cautions:** Renal/hepatic impairment, HF, concurrent use with beta blocker, hypertrophic obstructive cardiomyopathy.

## ACTION

Inhibits calcium movement across cardiac, vascular smooth-muscle cell membranes (causes dilation of coronary arteries, peripheral arteries, arterioles) during depolarization. **Therapeutic Effect:** Relaxes coronary vascular smooth muscle, and coronary vasodilation increases myocardial oxygen delivery in pts with vasospastic angina.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5–1 hr	N/A	N/A
PO (extended-release)	2–3 hrs	N/A	N/A
IV	3 min	N/A	N/A

Well absorbed from GI tract. Protein binding: 70%–80%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–8 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** Beta blockers (e.g., atenolol, carvedilol, metoprolol) may increase effects; risk of bradycardia. **Statins** (e.g., atorvastatin, simvastatin), **strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration/effects of **bosutinib, budesonide**. **HERBAL:** **Ephedra, St. John's wort, yohimbe** may decrease concentration/effect. **Herbals with hypotensive properties** (e.g., garlic, ginger, ginkgo biloba) may increase effect. **FOOD:** **Grapefruit products** may increase concentration/effect. **LAB VALUES:** ECG: May increase PR interval.

## AVAILABILITY (Rx)

**Injection, Solution:** 25 mg/5 mL, 50 mg/10 mL, 125 mg/25 mL. **Tablets, Immediate-Release:** 30 mg, 60 mg, 90 mg, 120 mg.

 **Capsules, Extended-Release, 24 Hour:** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg.  **Capsules, Extended-Release, 12 Hour:** 60 mg, 90 mg, 120 mg.

 **Tablets, Extended-Release, 24 Hour:** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Add 125 mg to 100 mL D<sub>5</sub>W, 0.9% NaCl to provide concentration of 1 mg/mL.

**Rate of administration** • Infuse per dilution/rate chart provided by manufacturer.

**Storage** • Refrigerate vials. • After dilution, stable for 24 hrs.

## PO

• Give immediate-release tablets before meals and at bedtime. • Tablets may be crushed. • Do not break, crush,

dissolve, or divide sustained-release capsules or extended-release capsules or tablets. • Taztia XT capsules may be opened and mixed with applesauce; follow with glass of water. • Cardizem CD, Cardizem IA, Cartia XT, Matzim IA may be given without regard to food. • Dilacor XR, Dilt-XR to be given on empty stomach.

#### IV INCOMPATIBILITIES

AcetaZOLAMIDE (Diamox), acyclovir (Zovirax), ampicillin, ampicillin/sulbactam (Unasyn), diazePAM (Valium), furosemide (Lasix), heparin, insulin, nafcillin, phenytoin (Dilantin), rifAMPin (Rifadin), sodium bicarbonate.

#### IV COMPATIBILITIES

Albumin, aztreonam (Azactam), bumetanide (Bumex), ceFAZolin (Ancef), cefotaxime (Claforan), cefTAZidime (Fortaz), cefTRIAxone (Rocephin), cefuroxime (Zinacef), ciprofloxacin (Cipro), clindamycin (Cleocin), dexmedetomidine (Precedex), digoxin (Lanoxin), DOBUtamine (Dobutrex), DOPamine (Intropin), gentamicin, HYDROmorphone (Dilaudid), lidocaine, LORazepam (Ativan), metoclopramide (Reglan), metroNIDAZOLE (Flagyl), midazolam (Versed), morphine, multivitamins, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, tobramycin (Nebcin), vancomycin (Vancocin).

### INDICATIONS/ROUTES/DOSAGE

#### Angina

**PO: (*Immediate-Release*):** ADULTS, ELDERLY: Initially, 30 mg 4 times/day. Range: 240–360 mg/day in 3–4 divided doses.

**PO: (*24h Once Daily*):** ADULTS, ELDERLY: Initially, 120–180 mg once daily. May increase at 7- to 14-day intervals. Range: 240–360 mg.

#### Hypertension

**PO: (*Extended-Release Capsule [once-daily dosing]*):** Initially, 120–240 mg/day. May increase at 7- to 14-day intervals. Usual dose: 120–360 mg/day.

**PO: (*Extended-Release Capsule [twice-daily dosing]*):** ADULTS, ELDERLY: Initially, 60–120 mg twice daily. May increase at 7- to 14-day intervals. **Maintenance:** 120–180 mg twice daily.

#### Temporary Control of Rapid Ventricular Rate in Atrial Fibrillation/Flutter; Rapid Conversion of Paroxysmal Supraventricular Tachycardia to Normal Sinus Rhythm

**IV bolus:** ADULTS, ELDERLY: Initially, 0.25 mg/kg (average dose: 20 mg) actual body weight over 2 min. May repeat in 15 min at dose of 0.35 mg/kg (average dose: 25 mg) actual body weight. Subsequent doses individualized.

**IV infusion:** ADULTS, ELDERLY: After initial bolus injection, may begin infusion at 5–10 mg/hr; may increase by 5 mg/hr up to a maximum of 15 mg/hr. Continuous infusion longer than 24 hrs or infusion rate greater than 15 mg/hr are not recommended. Attempt conversion to PO therapy as soon as possible.

#### Dosage in Renal/Hepatic Impairment

Use with caution.

### SIDE EFFECTS

**Frequent (10%–5%):** Peripheral edema, dizziness, light-headedness, headache, bradycardia, asthenia. **Occasional (5%–2%):** Nausea, constipation, flushing, ECG changes. **Rare (less than 2%):** Rash, micturition disorder (polyuria, nocturia, dysuria, frequency of urination), abdominal discomfort, drowsiness.

### ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt withdrawal may increase frequency, duration of angina, HF; second- or third-degree AV block occurs rarely. Overdose produces nausea, drowsiness, confusion, slurred speech, profound bradycardia. **Antidote:** Glucagon, insulin drip with continuous calcium infusion (see Appendix J for dosage).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Assess baseline renal/hepatic function tests. Assess B/P, apical pulse immediately before drug is administered. Obtain baseline ECG in pts with history of arrhythmia.

### INTERVENTION/EVALUATION

Assist with ambulation if dizziness occurs. Assess for peripheral edema. Monitor pulse rate for bradycardia. Assess B/P, renal function, LFT, ECG with IV therapy. Question for asthenia, headache.

### PATIENT/FAMILY TEACHING

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control anginal pain.
- To avoid postural dizziness, go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report palpitations, shortness of breath, pronounced dizziness, nausea, constipation.
- Avoid alcohol (may increase risk of hypotension or vasodilation).

## dimethyl fumarate TOP 100

dye-meth-il-fue-ma-rate  
(Tecfidera)

**Do not confuse dimethyl fumarate with dimethyl sulfoxide or monomethyl fumarate.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fumaric acid agent. **CLINICAL:** Multiple sclerosis agent. Immunomodulator.

### USES

Treatment of relapsing-remitting multiple sclerosis.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dimethyl fumarate. **Cautions:** Hepatic impairment (may increase hepatic transaminases, lymphopenia (may decrease lymphocyte count)).

## ACTION

Exact mechanism of action unknown. May include anti-inflammatory action and cytoprotective properties. **Therapeutic Effect:** Modifies disease progression.

## PHARMACOKINETICS

Undergoes rapid hydrolysis into active metabolite, monomethyl fumarate. Peak concentration: 2–212 hrs. Protein binding: 27%–45%. Extensively metabolized by esterases. Primarily eliminated as exhaled carbon dioxide (60%). **Half-life:** 1 hr.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease therapeutic effects; increase adverse effects of **vaccines (live)**. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May decrease lymphocytes. May increase serum ALT, AST; eosinophils; urine albumin.

## AVAILABILITY (Rx)

**Capsules, Delayed-Release:** 120 mg, 240 mg.

## ADMINISTRATION/HANDLING

### PO

- Give capsule whole; do not break, crush, dissolve, or divide.
- May give without regard to food. May give with food to decrease flushing reaction and GI effects.
- Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Relapsing-Remitting Multiple Sclerosis

**PO: ADULTS/ELDERLY:** Initially, 120 mg twice daily for 7 days. Then, increase to 240 mg twice daily.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent (40%):** Flushing. **Occasional (18%–5%):** Abdominal pain, diarrhea, nausea, vomiting, dyspepsia, pruritus, rash, erythema.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Lymphopenia may increase risk for infection. Severe flushing may lead to non-compliance of therapy.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, CMP, urine pregnancy if applicable. Assess hydration status (urine output, skin turgor). Question history of hepatic impairment, lymphopenia. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Screen for active infection.

**INTERVENTION/EVALUATION**

Monitor CBC, LFT. Encourage PO intake. Offer antiemetics for nausea, vomiting. Question any episodes of noncompliance due to flushing, GI symptoms. Monitor for infectious process (fever, malaise, chills, body aches, cough). Conduct neurologic assessment. Assess for symptomatic improvement of MS.

**PATIENT/FAMILY TEACHING**

- Abdominal pain, diarrhea, nausea, and flushing are common. Side effects may decrease over time.
- Take with meals to decrease flushing reaction.
- Swallow capsule whole; do not chew, crush, dissolve, or divide.
- Two dosage strengths will be provided for starting dose and maintenance dose.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, dark-colored urine, fever, body aches, cough, dehydration.

**dinutuximab**

din-ue-tux-i-mab  
(Unituxin)

**■ BLACK BOX ALERT ■** Life-threatening infusion-related reactions have occurred. Administer required prehydration and premedication, including antihistamines, prior to each infusion. Treatment causes severe neuropathic pain. Administer IV opioids prior to each infusion and for 2 hrs following completion of infusion. Severe peripheral sensory neuropathy occurred in pts with neuroblastoma. Severe motor neuropathy was observed. Discontinue therapy if severe unresponsive pain, severe sensory neuropathy, or moderate to severe peripheral motor neuropathy occurs. **Do not confuse dinutuximab with brentuximab, cetuximab, ritUXimab, or siltuximab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** GD2-binding monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Used in combination with granulocyte-macrophage colony-stimulating factor (GM-CSF), interleukin-2 (IL-2), and 13-cis-retinoic acid for the treatment of pediatric pts with high-risk neuroblastoma who achieve at least a partial response to prior fine-line multiagent, multimodality therapy.

**PRECAUTIONS**

**Contraindications:** History of anaphylaxis to dinutuximab. **Cautions:** Active infection; baseline cytopenias; diabetes, dehydration, electrolyte imbalance, hepatic/renal impairment, peripheral or generalized edema; intolerance of opioids, antipyretics, antihistamines; history of arrhythmias, hypotension, neuropathy, optic disorders.

**ACTION**

Binds to glycolipid GD2 expressed on neuroblastoma cells and on normal cells of neuroectodermal origin, including CNS and peripheral nerves. Induces

cell lysis of GD2-expressing cells through antibody-dependent cell-mediated cytotoxicity and complement-dependent cytotoxicity. **Therapeutic Effect:** Inhibits tumor cell growth and survival.

## PHARMACOKINETICS

Widely distributed. Metabolism not specified. Protein binding: not specified. Elimination not specified. **Half-life:** 10 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm, esp. in third trimester. Unknown if distributed in breast milk. However, human immunoglobulin G is present in human breast milk. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos following discontinuation. **Children:** No age-related precautions noted. **Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** May decrease therapeutic effect of **BCG (intravesical)**, **vaccines (live)**. May increase adverse effects of **natalizumab**, **vaccines (live)**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs; serum albumin, calcium, magnesium, phosphate, potassium, sodium. May increase serum ALT, AST, bilirubin, creatinine, glucose; urine protein.

## AVAILABILITY (Rx)

**Injection Solution:** 17.5 mg/5 mL (3.5 mg/mL).

## ADMINISTRATION/HANDLING

### **Pretreatment Guidelines**

**Hydration** • Administer bolus of 0.9% NaCl 10 mL/kg IV over 1 hr prior to initiation.

**Analgesics** • Administer morphine sulfate 50 mcg/kg IV immediately prior to initiation and then continue as morphine sulfate drip at rate of 20–50 mcg/kg/hr

during and for 2 hrs following completion of infusion. • Administer additional doses of morphine sulfate 25–50 mcg/kg IV once every 2 hrs as needed for pain, followed by an increase in morphine infusion rate, if clinically stable. • Consider use of fentaNYL or HYDROMORPHONE if morphine sulfate not tolerated. • If pain is inadequately controlled with opioids, consider use of gabapentin or lidocaine in addition to IV morphine.

**Antihistamines and antipyretics** • Administer an antihistamine such as diphenhydramine 0.5–1 mg/kg (maximum dose 50 mg) IV over 10–15 min, starting 20 min prior to initiation and as tolerated every 4–6 hrs during infusion. • Administer acetaminophen 10–15 mg/kg (maximum dose 650 mg) 20 minutes prior to each infusion and every 4–6 hrs as needed for fever/pain. • May administer ibuprofen 5–10 mg/kg every 6 hrs as needed for persistent fever/pain.

**Preparation** • Visually inspect for particulate matter or discoloration. Do not use if solution is cloudy or contains particulate matter. • Withdraw required volume from vial and inject into 100 mL 0.9% NaCl. • Mix by gentle inversion. Do not shake or agitate. • Discard unused portions of vial. **Rate of administration** • Initiate infusion rate at 0.875 mg/m<sup>2</sup>/hr for 30 min via dedicated IV line. May gradually increase rate to maximum rate of 1.75/m<sup>2</sup>/hr as tolerated. • Do not infuse as IV push or bolus.

**Storage** • Refrigerate vials. • Protect from light by storing in outer carton. • May refrigerate diluted solution up to 4 hrs. • Discard diluted solution 24 hrs after preparation.

## IV INCOMPATIBILITIES

Do not mix with other medications.

## INDICATIONS/ROUTES/DOSAGE

### **Neuroblastoma**

**IV; PEDIATRIC:** 17.5 mg/m<sup>2</sup>/day over 10–20 hrs for 4 consecutive days for maximum of 5 cycles (Tables 1 and 2).

**TABLE 1 SCHEDULE OF DINUTUXIMAB ADMINISTRATION FOR CYCLES 1, 3, AND 5**

Cycle Day	1 through 3	4	5	6	7	8 through 24*
dinutuximab		X	X	X	X	

\*Cycles 2 and 4 are 32 days in duration.

**TABLE 2 SCHEDULE OF DINUTUXIMAB ADMINISTRATION FOR CYCLES 2 AND 4**

Cycle Day	1 through 7	8	9	10	11	12 through 32*
dinutuximab		X	X	X	X	

\*Cycles 2 and 4 are 32 days in duration.

## Dose Modification

### Infusion-Related Reactions

**Mild to moderate adverse reactions (transient rash, fever, rigors, or localized urticaria that respond promptly to symptomatic treatment):** Decrease infusion rate to 50% of the previous rate. Once resolved, gradually increase infusion rate up to a maximum rate of 1.75 mg/m<sup>2</sup>/hr. **Prolonged or severe adverse reactions (mild bronchospasm without other symptoms, angioedema that does not affect the airway):** Immediately interrupt infusion. If symptoms resolve rapidly, restart infusion at 50% of the previous rate. **First recurrence of severe reaction:** Discontinue treatment until the following day. If symptoms resolve and continued treatment is still warranted, premedicate with hydrocortisone (per guidelines) and administer dinutuximab infusion at a rate of 0.875 mg/m<sup>2</sup>/hr in an intensive care unit. **Second recurrence of severe reaction:** Permanently discontinue.

### Capillary Leak Syndrome

**Moderate to severe, non-life-threatening capillary leak syndrome:** Interrupt infusion. Once resolved, resume infusion rate at 50% of previous rate. **Life-threatening capillary leak syndrome:** Discontinue treatment for the current cycle. Once resolved, administer at 50% of the previous rate for subsequent cycles. **First recurrence:** Permanently discontinue.

### Hypotension

**Hypotension requiring medical intervention:** Interrupt infusion. Once resolved,

resume infusion rate at 50% of previous rate. If blood pressure remains stable for at least 2 hrs, increase infusion rate as tolerated up to maximum rate of 1.75 mg/m<sup>2</sup>/hr.

### Neurologic Disorders of the Eye

**Dilated pupil with sluggish reflex; other visual disturbances:** Interrupt infusion. Once resolved, resume infusion rate at 50% of previous rate. **First recurrence or if accompanied by visual impairment:** Permanently discontinue.

### Adverse Reactions Requiring Permanent Discontinuation (based on Common Terminology for Adverse Events [CTCAE])

Grade 3 or 4 anaphylaxis, serum sickness; Grade 3 pain unresponsive to maximum supportive measures; Grade 4 sensory neuropathy or Grade 3 sensory neuropathy that interferes with daily activities for more than 2 wks; Grade 2 peripheral motor neuropathy, subtotal or total vision loss; Grade 4 hyponatremia despite appropriate fluid management.

### Infection

**Severe systemic infection or sepsis:** Discontinue treatment until infection resolves, then continue with subsequent cycles of treatment.

### Dosage in Renal/Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Frequent (85%–24%):** Pain (abdominal, back, bladder, bone, chest, neck, facial, gingival, musculoskeletal, oropharyngeal, extremity), arthralgia, myalgia, neuralgia,

proctalgia, pyrexia, hypotension, vomiting, diarrhea, urticaria, hypoxia. **Occasional (19%–10%):** Tachycardia, edema, hypertension, peripheral neuropathy, weight gain, nausea.

D

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, neutropenia, lymphopenia, thrombocytopenia are expected results of therapy. Severe bone marrow suppression occurred in up to 39% of pts. Serious infusion-related reactions, such as bronchospasm, dyspnea, facial and upper airway edema, hypotension, or stridor, may require urgent interventions, including bronchodilator therapy, blood pressure support, corticosteroids, infusion interruption, infusion rate reduction, or permanent treatment discontinuation. Severe infusion-related reactions were reported in 26% of pts. Infusion-related reactions usually occurred during or within 24 hrs of infusion completion. Other serious adverse effects may include: severe urticaria (13% of pts); anaphylaxis, cardiac arrest (1% or less of pts); pain despite pretreatment with analgesics including morphine sulfate infusion (85% of pts); Grade 3 pain (51% of pts); Grade 3 peripheral sensory/motor neuropathy (1% of pts); Grade 3–5 capillary leak syndrome (23% of pts); Grade 3 hypotension (16% of pts); Grade 3 or 4 bacteremia requiring IV antibiotics or other urgent interventions (13% of pts); sepsis (18% of pts); neurologic disorders of the eye, including blurred vision, photophobia, mydriasis, fixed or unequal pupils, optic nerve disorder, eyelid ptosis, papilledema (2%–13% of pts); Grade 3 or 4 electrolyte abnormalities, including hyponatremia, hypokalemia, hypocalcemia (37%–23% of pts); atypical hemolytic uremic syndrome resulting in anemia, electrolyte imbalance, hypertension, renal insufficiency. Bleeding events, including GI/rectal/renal/respiratory/urinary tract/catheter site hemorrhage, disseminated intravascular coagulation, epistaxis, hematemesis, hematochezia, hematuria, were reported. Immunogenicity (anti-dinutuximab antibodies) reported in 18% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Verify that pts have adequate hematologic/hepatic/ophthalmic/respiratory/renal function and proper hydration status prior to start of each infusion. Ensure proper resuscitative equipment/medications are readily available. Obtain baseline visual acuity, pupillary response, neurologic status. Question history of anaphylaxis; intolerance of opioids, antipyretics, antihistamines. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Frequently monitor CBC, BMP, LFT, other serum electrolytes, vital signs. Monitor I&O. Administer required prehydration and premedication with antihistamine, antipyretics, opioids prior to each infusion and during infusion as indicated. Diligently monitor for infusion-related reactions as listed in Adverse Effects/Toxic Reactions and institute medical support as needed. Monitor for bleeding events of any kind. Consider administration of naloxone if narcotic overdose is suspected. Routinely assess visual acuity, hydration status. Initiate fall precautions.

### PATIENT/FAMILY TEACHING

- Serious infusion reactions, including anaphylaxis, difficulty breathing, facial swelling, itching, rash, and wheezing, may occur during or within 24 hrs of each infusion.
- Immediately report any allergic reactions; bleeding of any kind; decreased urine output or dark urine; disorders of the eye including blurry vision, double vision, unequal pupil size, sensitivity to light, eyelid drooping; fever; palpitations; seizures (related to electrolyte imbalance); severe nerve pain or loss of motor function; signs of low blood pressure such as confusion, fainting, pallor; swelling of face, arms, or legs.
- Moderate to severe generalized pain is an expected side effect. Medications for pain, fever,

and mild allergic reactions will need to be provided before or during each infusion; report any intolerance to such medications. • Therapy is expected to lower blood counts/immune system and may increase risk of bleeding or infection. • Drink plenty of fluids. • Use effective contraception to avoid pregnancy. Do not breastfeed.

## diphenhydrAMINE

dye-fen-hye-dra-meen

(Banophen, Benadryl, Benadryl Children's Allergy, Diphen, Diphenhist, Genahist, Nytol)

**Do not confuse Benadryl with benazepril, Bentyll, or Benylin, or diphenhydrAMINE with desipramine, dicyclomine, or dimenhydrINATE.**

### FIXED-COMBINATION(S)

**Advil PM:** diphenhydramine/ibuprofen (NSAID): 38 mg/200 mg. With calamine, an astringent, and camphor, a counterirritant (**Caladryl**).

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Histamine-1 antagonist, first generation.

**CLINICAL:** Antihistamine, anticholinergic, antipruritic, antitussive, antiemetic, antidykinetic.

### USES

Treatment of allergic reactions, including nasal allergies and allergic dermatoses; parkinsonism, including drug-induced extrapyramidal symptoms; prevention/treatment of nausea, vomiting, or vertigo due to motion sickness; antitussive; short-term management of insomnia; adjunct to EPINEPHrine in treatment of anaphylaxis. Topical form used for relief of pruritus from insect bites, skin irritations.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to diphenhydrAMINE. Neonates or premature infants, breastfeeding. **Cautions:** Narrow-angle glaucoma, stenotic peptic ulcer, prostatic hypertrophy, pyloroduodenal/bladder neck obstruction, asthma, COPD, increased IOP, cardiovascular disease, hyperthyroidism, elderly.

### ACTION

Competes with histamine for H-1 receptor site on effector cells in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Produces anticholinergic, antipruritic, antitussive, antiemetic, antidyskinetic, sedative effects.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15–30 min	1–4 hrs	4–6 hrs
IV, IM	Less than 15 min	1–4 hrs	4–6 hrs

Widely distributed. Protein binding: 98%–99%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1–4 hrs. Adults: 7–12 hrs, elderly: 9–18 hrs, children: 4–7 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Detected in breast milk (may produce irritability in breastfed infants). Increased risk of seizures in neonates, premature infants if used during third trimester of pregnancy. May prohibit lactation. **Children:** Not recommended in newborns, premature infants (increased risk of paradoxical reaction, seizures). **Elderly:** Potentially inappropriate due to potent anticholinergic effects. Increased risk for dizziness, sedation, confusion, hypotension, hyperexcitability.

### INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** (e.g., acclidinium, ipratropium, tiotropium,

umecclidinium) may increase anticholinergic effects. **HERBAL:** Gotu kola, kava kava, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May suppress wheal/flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

### AVAILABILITY (OTC)

**Capsules:** 25 mg, 50 mg. **Cream:** 1%, 2%. **Elixir:** 12.5 mg/5 mL. **Injection Solution:** 50 mg/mL. **Liquid:** 12.5 mg/5 mL. **Syrup:** 12.5 mg/5 mL. **Tablets:** 25 mg, 50 mg. **Tablets, Chewable:** 12.5 mg.

### ADMINISTRATION/HANDLING

• May be given undiluted. • Give IV injection over at least 1 min. **Maximum rate:** 25 mg/min.

#### IM

• Give deep IM into large muscle mass.

#### PO

• Give with food to decrease GI distress. • Scored tablets may be crushed.

### IV INCOMPATIBILITIES

Allopurinol (Aloprim), cefepime (Maxipime), dexamethasone (Decadron), foscarnet (Foscavir).

### IV COMPATIBILITIES

Atropine, cisplatin (Platinol), cyclophosphamide (Cytoxan), cytarabine (Ara-C), fentaNYL, glycopyrrolate (Robinul), heparin, hydrocortisone (SOLU-Cortef), HYDRomorphone (Dilaudid), hydroXYzine (Vistaril), lidocaine, metoclopramide (Reglan), ondansetron (Zofran), potassium chloride, promethazine (Phenergan), propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Allergic Reaction

**PO:** ADULTS, ELDERLY: 25 mg q4–6h PRN or 50 mg q6–8h PRN. **IM, IV:** 10–50 mg/dose q6hrs PRN. **PO, IV, IM:**

**CHILDREN:** 5 mg/kg/day in divided doses q6–8h. **Maximum:** 300 mg/day.

#### Motion Sickness

**Note:** When used for prophylaxis, give 30 min before motion.

**PO: (Prophylaxis/Treatment):** ADULTS, ELDERLY: 25 mg q4–6h PRN or 50 mg q6–8h PRN. **CHILDREN:** 5 mg/kg/day in 3–4 divided doses. **Usual dose:** 12.5–25 mg/dose. **IV/IM: (Treatment):** ADULTS, ELDERLY: 10–50 mg/dose. **INFANTS, CHILDREN, ADOLESCENTS:** 1.25 mg/kg/dose q6h.

#### Nighttime Sleep Aid

**PO:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 25–50 mg at bedtime. **CHILDREN 2–11 YRS:** 0.5–1 mg/kg/dose. **Maximum Single Dose:** 50 mg.

#### Pruritus

**Topical:** ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply 1% or 2% cream or spray 3–4 times/day. **CHILDREN 2–11 YRS:** Apply 1% cream or spray 3–4 times/day.

#### Parkinsonism, Dystonic Reaction

**PO:** ADULTS, ELDERLY: 25–50 mg q4–12h. **Maximum:** 300 mg/day. **IM/IV:** 25–50 mg/dose.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent:** Drowsiness, dizziness, muscle weakness, hypotension, urinary retention, thickening of bronchial secretions, dry mouth, nose, throat, lips; in elderly: sedation, dizziness, hypotension. **Occasional:** Epigastric distress, flushing, visual/hearing disturbances, paresthesia, diaphoresis, chills.

### ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions (eczema, pruritus, rash, cardiac disturbances, photosensitivity) may occur. Overdose symptoms may vary from CNS depression (sedation,

apnea, hypotension, cardiovascular collapse, death) to severe paradoxical reactions (hallucinations, tremors, seizures). Children, infants, neonates may experience paradoxical reactions (restlessness, insomnia, euphoria, nervousness, tremors). Overdosage in children may result in hallucinations, seizures, death.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

If pt is having acute allergic reaction, obtain history of recently ingested foods, drugs, environmental exposure, emotional stress. Monitor B/P rate; depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales.

### INTERVENTION/EVALUATION

Monitor B/P, esp. in elderly (increased risk of hypotension). Monitor children closely for paradoxical reaction. Monitor for sedation.

### PATIENT/FAMILY TEACHING

- Tolerance to antihistaminic effect generally does not occur; tolerance to sedative effect may occur.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Dry mouth, drowsiness, dizziness may be an expected response to drug.
- Avoid alcohol.

## diphenoxylate with atropine

dye-fen-ox-i-late at-roe-peen  
(Lomotil)

**Do not confuse Lomotil with LaMICtal, LamISIL, Lamotrigine, Lanoxin, or Lasix**

### FIXED-COMBINATION(S)

**Lomotil:** diphenoxylate/atropine (anticholinergic, antispasmodic): 2.5 mg/0.025 mg.

## CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Opioid/anticholinergic (**Schedule V**). **CLINICAL:** Antidiarrheal.

## USES

Adjunctive treatment of acute, chronic diarrhea.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to diphenoxylate, atropine. Obstructive jaundice, diarrhea associated with pseudomembranous colitis or enterotoxin-producing bacteria. **Cautions:** Children (not recommended in children younger than 2 yrs): acute ulcerative colitis, renal/hepatic impairment.

## ACTION

Acts locally and centrally on gastric mucosa. **Therapeutic Effect:** Reduces excessive GI motility and GI propulsion.

## PHARMACOKINETICS

	Onset	Peak	Duration
Antidiarrheal	45–60 min	—	3–4 hrs

Well absorbed from GI tract. Metabolized in liver. Primarily eliminated in feces. **Half-life:** 2.5 hrs; metabolite: 12–24 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended (increased susceptibility to toxicity, including respiratory depression). **Elderly:** More susceptible to anticholinergic effects, confusion, respiratory depression.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** (e.g., acridinium, ipratropium, tiotropium, umeclidinium) may increase effects of atropine. **MAOIs** (e.g., phenelzine,

**selegiline**) may precipitate hypertensive crisis. **HERBAL:** **Herbals with sedative properties** (e.g., **chamomile, kava kava, valerian**) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase.

### AVAILABILITY (Rx)

**Liquid:** (*Lomotil*): 2.5 mg diphenoxylate/0.025 mg atropine/5 mL. **Tablets:** (*Lomotil*): 2.5 mg diphenoxylate/0.025 mg atropine.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food. If GI irritation occurs, give with food.
- Use liquid for children 2–12 yrs (use graduated dropper for administration of liquid medication).

### INDICATIONS/ROUTES/DOSAGE

#### Diarrhea

**Note:** Only the liquid product is recommended for children less than 13 yrs of age. **PO: ADULTS, ELDERLY:** Initially, 5 mg (2 tabs or 10 mL) 3–4 times/day. **Maximum:** 20 mg/day. Then reduce dose as needed. **CHILDREN 2–12 YRS OF AGE:** 0.3–0.4 mg/kg/day in 4 divided doses (reduce dose as soon as symptoms controlled). **Maximum:** 10 mg/day diphenoxylate.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution with severe renal/hepatic disease.

### SIDE EFFECTS

**Frequent:** Drowsiness, light-headedness, dizziness, nausea. **Occasional:** Headache, dry mouth. **Rare:** Flushing, tachycardia, urinary retention, constipation, paradoxical reaction (marked by restlessness, agitation), blurred vision.

### ADVERSE EFFECTS/TOXIC REACTIONS

Dehydration may predispose pt to diphenoxylate toxicity. Paralytic ileus, toxic megacolon (constipation, decreased appetite, abdominal pain with nausea/vomiting) occur rarely. Severe anticholinergic reaction

(severe lethargy, hypotonic reflexes, hyperthermia) may result in severe respiratory depression, coma.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Check hydration status: skin turgor, mucous membranes for dryness, urinary status. Assess usual stool frequency, consistency.

### INTERVENTION/EVALUATION

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Record time of evacuation. Assess for abdominal disturbances. Discontinue medication if abdominal distention occurs.

### PATIENT/FAMILY TEACHING

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report persistent fever, palpitations, diarrhea.
- Report abdominal distention.

## diroximel fumarate

dye-rox-i-mel fyoo-ma-rate  
(Vumerity)

**Do not confuse diroximel fumarate with dimethyl fumarate or monomethyl fumarate.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fumaric acid derivative. **CLINICAL:** Multiple sclerosis agent.

### USES

Treatment of relapsing forms of multiple sclerosis (MS) in adults, to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

### PRECAUTIONS

**Contraindications:** Hypersensitivity reactions to diroximel fumarate or dimethyl fumarate. Concomitant use with dimethyl

fumarate. **Cautions:** Baseline lymphopenia, hepatic/renal impairment; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); history of chronic opportunistic infections (esp. fungal/viral infections, tuberculosis).

**ACTION**

Exact mechanism of action unknown. May include anti-inflammatory action and cytoprotective properties via activation of the nuclear factor (erythroid-derived 2)-like-2 pathway. **Therapeutic Effect:** Modifies disease progression of MS.

**PHARMACOKINETICS**

Undergoes rapid hydrolysis by esterases into active metabolite, monomethyl fumarate. Protein binding: 27%–45%. Peak plasma concentration: 2.5–3 hrs. Primarily eliminated as exhaled carbon dioxide. **Half-life:** 1 hr.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Generally not initiated in pts considering a planned pregnancy or during pregnancy. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not specified.

**INTERACTIONS**

**DRUG:** Alcohol may decrease concentration/effect. **Dimethyl or monomethyl fumarate** may increase adverse effects. **HERBAL:** None significant. **FOOD:** High-fat, high-calorie meals may reduce absorption/concentration. **LAB VALUES:** May increase serum ALT, AST, bilirubin; urine albumin. May decrease lymphocytes, eosinophils.

**AVAILABILITY (Rx)**

**Capsules, Delayed-Release:** 231 mg.

**ADMINISTRATION/HANDLING**

**PO**

- May take with or without food. Avoid high-fat, high-calorie meals. Meals

should not be more than 700 calories and contain no more than 30 g of fat.
 

- Administer capsule whole; do not crush, open, or sprinkle on food.
- Avoid alcohol at same time of administration.

**INDICATIONS/ROUTES/DOSAGE**

**Multiple Sclerosis (Relapsing)**

**PO: ADULTS:** 231 mg twice daily for 7 days, then increase to a maintenance dose of 462 mg twice daily.

**Dose Modifications**

**Unable to tolerate maintenance dose (GI effects, flushing):** May reduce dose to 231 mg twice daily for up to 4 wks, then re-escalate dose to 462 mg twice daily. Consider permanent discontinuation if unable to tolerate return to maintenance dose.

**Hepatotoxicity**

**Acute hepatic injury:** Permanently discontinue if significant hepatic injury occurs.

**Infections**

**Bacterial/fungal/viral infections:** Consider withholding treatment until infection is resolved.

**Lymphopenia**

**Lymphocyte count less than 500 cells/mm<sup>3</sup> for greater than 6 mos:** Consider withholding treatment until improved.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended.

**Dosage in Hepatic Impairment**

**Mild to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (40%):** Flushing. **Occasional (18%–5%):** Abdominal pain, diarrhea, nausea, vomiting, pruritus, rash, erythema, dyspepsia.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reactions including anaphylaxis, angioedema, dyspnea, urticaria

✦ Canadian trade name

 Non-Crushable Drug

 High Alert drug

were reported. Progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain caused by the JC virus, may result in progressive permanent disability and death. Serious herpes zoster infections including disseminated herpes zoster, herpes zoster ophthalmicus, herpes zoster meningoencephalitis, herpes zoster meningomyelitis was reported. Other serious bacterial, fungal, viral infections may occur. Acute hepatic injury with serum aminotransferase greater than 5 times ULN and total bilirubin greater than 2 times ULN was reported. Severe flushing may lead to noncompliance of therapy.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (including lymphocyte count), LFT. Assess baseline symptoms of MS (e.g., bladder/bowel dysfunction, cognitive impairment, depression, dysphagia, fatigue, gait disorder, numbness/tingling, pain, seizures, spasticity, tremors, weakness). Screen for active infection. Question history of hypersensitivity reactions, hepatic/renal impairment, herpes zoster infection, chronic infection.

### INTERVENTION/EVALUATION

Obtain CBC (including lymphocyte count) 6 mos after initiation, then q6–12mos thereafter. Monitor LFT as clinically indicated. Pts with altered mental status, seizures, visual disturbances, generalized or unilateral weakness should be evaluated for herpes zoster meningoencephalitis, herpes zoster meningomyelitis, PML. If herpes zoster infection or other serious infection occurs, initiate treatment as appropriate. To reduce occurrence/severity of flushing, may administer non-enteric-coated aspirin (up to 325 mg) PO 30 min prior to dose. Question for noncompliance due to flushing, GI symptoms. Conduct neurologic assessment. Assess for symptomatic improvement of MS.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection. Report travel plans to possible endemic areas.
- PML, an opportunistic viral infection of the brain, may cause progressive, permanent disabilities or death. Report symptoms of PML or herpes zoster infection of the brain such as confusion, memory loss, paralysis, trouble speaking, vision loss, seizures, weakness.
- GI symptoms (e.g., abdominal pain, diarrhea, nausea, vomiting, upset stomach), flushing are common side effects.
- Take with meals to decrease flushing reaction. If taken with food, avoid high-fat, high-calorie meal or snack. Do not ingest alcohol with dose.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes).
- Allergic reactions such as difficulty breathing, hives, rash, swelling of the face or tongue, wheezing can happen at any time. If allergic reaction occurs, seek immediate medical attention.

## DOBU**T**amine

**HIGH  
ALERT**

doe-bue-ta-meen

**Do not confuse DOBU**T**amine with DOPamine.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Adrenergic agonist. **CLINICAL:** Cardiac stimulant.

### USES

Short-term management of cardiac decompensation.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dobutamine. Hypertrophic cardiomyopathy with outflow obstruction. **Cautions:** Atrial

fibrillation, hypovolemia, post-MI, concurrent use of MAOIs, elderly.

## ACTION

Direct-action inotropic agent acting primarily on myocardial  $\beta_1$ -adrenergic receptors. **Therapeutic Effect:** Enhances myocardial contractility, increases heart rate.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1–2 min	10 min	Length of infusion

Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis.

**Half-life:** 2 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Sympathomimetics (e.g., norepinephrine, phenylephrine), linezolid may increase effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

## AVAILABILITY (Rx)

**Infusion (Ready-to-Use):** 1 mg/mL (250 mL), 2 mg/mL (250 mL), 4 mg/mL (250 mL). **Injection Solution:** 12.5-mg/mL vial.

## ADMINISTRATION/HANDLING

**◀ALERT▶** Correct hypovolemia with volume expanders before DOBUtamine infusion. Pts with atrial fibrillation should be digitalized before infusion. Administer by IV infusion only.

**Reconstitution** • Dilute vial in 0.9% NaCl or D<sub>5</sub>W to maximum concentration of 5,000 mcg/mL (5 mg/mL).

**Rate of administration** • Use infusion pump to control flow rate. • Titrate dosage to individual response. • Infiltration causes local inflammatory changes. • Extravasation may cause dermal necrosis.

**Storage** • Store at room temperature. • Pink discoloration of solution (due to oxidation) does not indicate significant loss of potency if used within recommended time period. • Further diluted solution for infusion is stable for 48 hrs at room temperature, 7 days if refrigerated.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), alteplase (Activase), amphotericin B complex (Abelcet, AmBisome, Amphotec), bumetanide (Bumex), cefepime (Maxipime), foscarnet (Foscavir), furosemide (Lasix), heparin, piperacillin/tazobactam (Zosyn), sodium bicarbonate.

## IV COMPATIBILITIES

Amiodarone (Cordarone), calcium chloride, calcium gluconate, diltiazem (Cardizem), DOPamine (Intropin), enalapril (Vasotec), EPINEPHrine, famotidine (Pepcid), HYDROMORPHONE (Dilaudid), insulin (regular), lidocaine, LORAZEPAM (Ativan), magnesium sulfate, midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, nitroprusside (Nipride), norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Dosage determined by severity of decompensation.

### Cardiac Decompensation (Hemodynamic support)

**IV infusion: ADULTS, ELDERLY:** Initially, 0.5–5 mcg/kg/min. **Maintenance:** 2–20 mcg/kg/min titrated to desired response. May be infused at a rate of up to 40 mcg/kg/min to increase cardiac output. **NEONATES, INFANTS, CHILDREN, ADOLESCENTS:** Initially, 0.5–1 mcg/kg/min. Titrate gradually every few minutes until desired response. **Usual Range:** 2–20 mcg/kg/minute.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (greater than 5%):** Increased heart rate, B/P. **Occasional (5%–3%):** Pain at injection site. **Rare (3%–1%):** Nausea, headache, anginal pain, shortness of breath, fever.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may produce severe tachycardia, severe hypertension.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Pt must be on continuous cardiac monitoring. Determine weight (for dosage calculation). Obtain initial B/P, heart rate, respirations. Correct hypovolemia before drug therapy.

### INTERVENTION/EVALUATION

Continuously monitor for cardiac rate, arrhythmias. Maintain accurate I&O; measure urinary output frequently. Assess serum potassium, plasma DOBUTamine (therapeutic range: 40–190 ng/mL). Monitor B/P continuously (hypertension risk greater in pts with preexisting hypertension). Check cardiac output, pulmonary wedge pressure/central venous pressure (CVP) frequently. Immediately notify physician of decreased urinary output, cardiac arrhythmias, significant increase in B/P, heart rate, or less commonly, hypotension.

## DOCEtaxel

HIGH  
ALERT

doe-se-tax-el  
(Taxotere)

**BLACK BOX ALERT** ■ Avoid use with serum bilirubin more than upper limit of normal (ULN) or serum ALT, AST more than 1.5 times ULN in conjunction with serum alkaline phosphatase more than 2.5 times ULN. Severe hypersensitivity reaction (rash, hypotension, bronchospasm, anaphylaxis) may occur. Fluid retention syndrome (pleural effusions, ascites, edema, dyspnea at rest) has been reported. Pts with abnormal hepatic function, receiving higher doses, and pts with non–small-cell lung carcinoma (NSCLC) and history of prior platinum treatment receiving DOCEtaxel dose of 100 mg/m<sup>2</sup> at higher risk for mortality. Avoid use with ANC less than 1,500 cells/mm<sup>3</sup>.

**Do not confuse DOCEtaxel with PACLitaxel or Taxotere with Taxol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antimicrotubular, taxoid. **CLINICAL:** Antineoplastic.

## USES

Treatment of locally advanced or metastatic breast carcinoma after failure of prior chemotherapy. Treatment of metastatic non–small-cell lung cancer (NSCLC). Treatment of metastatic prostate cancer, head and neck cancer (with predniSONE). Treatment of advanced gastric adenocarcinoma. **OFF-LABEL:** Bladder, esophageal, ovarian, small-cell lung carcinoma; soft tissue carcinoma, cervical cancer, Ewing's sarcoma, osteosarcoma.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to DOCEtaxel. History of severe hypersensitivity to drugs formulated with polysorbate 80, neutrophil count less than 1,500 cells/mm<sup>3</sup>. **Cautions:** Hepatic impairment, baseline cytopenias; concomitant CYP3A4 inhibitors/inducers, fluid retention, pulmonary disease, HE, active infection.

## ACTION

Promotes assembly of microtubules and inhibits depolymerization of tubulin, which stabilizes microtubules. **Therapeutic Effect:** Inhibits DNA, RNA, protein synthesis. Inhibits tumor cell growth and survival.

## PHARMACOKINETICS

Widely distributed. Protein binding: 94%. Extensively metabolized in liver. Excreted in feces (75%), urine (6%). **Half-life:** 11.1 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May cause fetal harm. Unknown if distributed in breast milk.

Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Live virus vaccines may potentiate replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease therapeutic effect. St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. Reduces neutrophil, platelet count, Hgb, Hct.

## AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL, 20 mg/mL.

## ADMINISTRATION/HANDLING

**Reconstitution (solution)** • Withdraw dose and add to 250–500 mL 0.9% NaCl or D<sub>5</sub>W in glass or polyolefin container to provide a final concentration of 0.3–0.74 mg/mL.

**Rate of administration** • Administer as a 1-hr infusion. • Monitor closely for hypersensitivity reaction (flushing, localized skin reaction, bronchospasm [may occur within a few min after beginning infusion]).

**Storage** • Store vials between 36°F –77°F. • Protect from bright light. • If refrigerated, stand vial at room temperature for 5 min before administering (do not store in PVC bags). • Diluted solution should be used within 4 hrs (including infusion time).

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone), methyl-PREDNISolone (SOLU), nalbuphine (Nubain).

## IV COMPATIBILITIES

Bumetanide (Bumex), calcium gluconate, dexamethasone (Decadron), diphenhydramine (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), granisetron (Kytril), heparin, HYDRomorphine (Dilaudid), LORazepam (Ativan), magnesium sulfate, mannitol, morphine, ondansetron (Zofran), palonosetron (Aloxi), potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Premedicate with oral corticosteroids (e.g., dexamethasone 16 mg/day for 5 days beginning day 1 before DOCEtaxel therapy); reduces severity of fluid retention, hypersensitivity reaction.

### Breast Carcinoma

**IV: ADULTS:** Locally advanced or metastatic: 60–100 mg/m<sup>2</sup> given over 1 hr q3wks as a single agent. Operable, node positive: 75 mg/m<sup>2</sup> q3wks for 6 courses (in combination with DOXOrubicin and cyclophosphamide).

### Non-Small-Cell Lung Carcinoma

**IV: ADULTS:** 75 mg/m<sup>2</sup> q3wks (as monotherapy or in combination with CISplatin).

### Prostate Cancer

**IV: ADULTS, ELDERLY:** 75 mg/m<sup>2</sup> q3wks with concurrent administration of predniSONE.

### Head/Neck Cancer

**IV: ADULTS, ELDERLY:** 75 mg/m<sup>2</sup> q3wks (in combination with CISplatin and fluorouracil) for 3–4 cycles, followed by radiation therapy.

**Gastric Adenocarcinoma**

**IV: ADULTS, ELDERLY:** 75 mg/m<sup>2</sup> q3wks (in combination with CISplatin and fluorouracil).

**Dose Modification for Gastric or Head/Neck Cancer**

ALT, AST 2.5 to 5 times ULN and alkaline phosphatase less than or equal to 2.5 times ULN	80% of dose
ALT, AST 1.5 to 5 times ULN and alkaline phosphatase 2.5 to 5 times ULN	80% of dose
ALT, AST greater than 5 times ULN and/or alkaline phosphatase greater than 5 times ULN	Discontinue DOCEtaxel

**Note:** Toxicity includes febrile neutropenia, neutrophils less than 500 cells/mm<sup>3</sup> for longer than 1 wk, severe cutaneous reactions. Also, for NSCLC, platelet nadir less than 25,000 cells/mm<sup>3</sup>, any CTCAE Grade 3 or 4 nonhematologic toxicity.

**Breast Cancer**

Reduce dose to 75 mg/m<sup>2</sup>; if toxicity persists, reduce to 55 mg/m<sup>2</sup>.

**Breast Cancer Adjuvant**

Administer when neutrophils are less than 1,500 cells/mm<sup>3</sup>. If toxicity persists, or Grade 3 or 4 stomatitis, reduce dose to 60 mg/m<sup>2</sup>.

**Non–Small-Cell Lung Cancer****Monotherapy**

Hold dose until toxicity resolves, then reduce dose to 55 mg/m<sup>2</sup>. Discontinue if Grade 3 or 4 neuropathy occurs.

**Combination Therapy**

Reduce dose to 65 mg/m<sup>2</sup>; may further reduce to 50 mg/m<sup>2</sup> if needed.

**Prostate Cancer**

Reduce dose to 60 mg/m<sup>2</sup>; discontinue if toxicity persists.

**Gastric or Head and Neck Cancer**

Reduce dose to 60 mg/m<sup>2</sup>; if neutropenic toxicity persists, further reduce

to 45 mg/m<sup>2</sup>. For Grade 3 or 4 thrombocytopenia, reduce dose from 75 mg/m<sup>2</sup> to 60 mg/m<sup>2</sup>; discontinue if toxicity persists.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Total bilirubin more than ULN, or ALT, AST more than 1.5 times ULN with alkaline phosphatase more than 2.5 times ULN:** Use not recommended.

**SIDE EFFECTS**

**Frequent (80%–19%):** Alopecia, asthenia, hypersensitivity reaction (e.g., dermatitis), which is decreased in pts pretreated with oral corticosteroids; fluid retention, stomatitis, nausea, diarrhea, fever, nail changes, vomiting, myalgia. **Occasional:** Hypotension, edema, anorexia, headache, weight gain, infection (urinary tract, injection site, indwelling catheter tip), dizziness. **Rare:** Dry skin, sensory disorders (vision, speech, taste), arthralgia, weight loss, conjunctivitis, hematuria, proteinuria.

**ADVERSE EFFECTS/TOXIC REACTIONS**

In pts with normal hepatic function, neutropenia (ANC count less than 1,500 cells/mm<sup>3</sup>), leukopenia (WBC count less than 4,000 cells/mm<sup>3</sup>) occur in 96% of pts; anemia (hemoglobin level less than 11 g/dL) occurs in 90% of pts; thrombocytopenia (platelet count less than 100,000 cells/mm<sup>3</sup>) occurs in 8% of pts; infection occurs in 28% of pts. Neurosensory, neuromotor disturbances (distal paresthesia, weakness) occur in 54% and 13% of pts, respectively.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain ANC, CBC, serum chemistries. Antiemetics may be effective in preventing, treating nausea/vomiting. Pt should be pretreated with corticosteroids to reduce

fluid retention, hypersensitivity reaction. Offer emotional support.

### INTERVENTION/EVALUATION

Frequently monitor blood counts, particularly ANC count (less than 1,500 cells/mm<sup>3</sup> requires discontinuation of therapy). Monitor LFT, serum uric acid levels. Observe for cutaneous reactions (rash with eruptions, mainly on hands, feet). Assess for extravascular fluid accumulation: rales in lungs, dependent edema, dyspnea at rest, pronounced abdominal distention (due to ascites).

### PATIENT/FAMILY TEACHING

- Hair loss is reversible, but new hair growth may have different color or texture.
- New hair growth resumes 2–3 mos after last therapy dose.
- Maintain strict oral hygiene.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid those who have recently taken any live virus vaccine.
- Report persistent nausea, diarrhea, respiratory difficulty, chest pain, fever, chills, unusual bleeding, bruising.

## dofetilide

doe-fet-i-lide  
(Tikosyn)

**BLACK BOX ALERT** ■ Pt must be placed in a setting with continuous cardiac monitoring for minimum of 3 days and monitored by staff familiar with treatment of life-threatening arrhythmias.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Potassium channel blocker. **CLINICAL:** Antiarrhythmic: Class III.

### USES

Maintenance of normal sinus rhythm (NSR) in pts with chronic atrial fibrillation/atrial flutter of longer than 1-wk duration who have been converted to

NSR. Conversion of atrial fibrillation/flutter to NSR.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dofetilide. Congenital or acquired prolonged QT syndrome (do not use if baseline QT interval or QTc is greater than 440 msec), severe renal impairment, concurrent use of drugs that may prolong QT interval, hypokalemia, hypomagnesemia, concurrent use with bicitegravir, verapamil, dolutegravir, itraconazole, ketoconazole, prochlorperazine, megestrol, cimetidine, hydroCHLOROthiazide, trimethoprim. Severe renal impairment (CrCl less than 20 mL/min). **Cautions:** Severe hepatic impairment, renal impairment, pts previously taking amiodarone, elderly. Concurrent use of other agents that prolong QT interval. Pts with sick sinus syndrome or second- or third-degree heart block unless functional pacemaker in place.

### ACTION

Prolongs repolarization without affecting conduction velocity by blocking one or more time-dependent potassium currents. No effect on sodium channels, alpha-adrenergic, beta-adrenergic receptors. **Therapeutic Effect:** Terminates reentrant tachyarrhythmias, preventing reinduction.

### PHARMACOKINETICS

Widely distributed. 80% eliminated in urine as unchanged drug, 20% excreted as minimally active metabolites. Protein binding: 60%–70%. **Half-life:** 2–3 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

### INTERACTIONS

**DRUG:** Cimetidine, lamotrigine, ketoconazole, trimethoprim, verapamil

may increase concentration/effect. **QT interval—prolonging medications** (e.g., azithromycin, ceritinib, fingolimod, haloperidol, moxifloxacin) may increase risk of QT interval prolongation.

**HERBAL:** Ephedra may worsen arrhythmias. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Capsules:** 125 mcg, 250 mcg, 500 mcg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Do not break, crush, or open capsules.

### INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** ECG interval measurements (esp. Qtc intervals), creatinine clearance, must be determined prior to first dose. Correct hypokalemia, hypomagnesemia prior to starting.

#### Antiarrhythmias

**PO: ADULTS, ELDERLY:** Initially, 500 mcg twice daily. Modify dose in response to Qtc interval.

#### Dosage in Renal Impairment

##### Creatinine

Clearance	Dosage
Greater than 60 mL/min	500 mcg twice daily
40–60 mL/min	250 mcg twice daily
20–39 mL/min	125 mcg twice daily
Less than 20 mL/min	Contraindicated

#### Dosage in Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Rare (less than 2%):** Headache, chest pain, dizziness, dyspnea, nausea, insomnia, back/abdominal pain, diarrhea, rash.

### ADVERSE EFFECTS/TOXIC REACTIONS

Angioedema, bradycardia, cerebral ischemia, facial paralysis, serious arrhythmias (ventricular, various forms of block) have been noted.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain serum electrolyte levels (esp. potassium, magnesium). Prior to initiating treatment, QTc intervals must be determined. Do not use if heart rate less than 50 beats/min. Provide continuous ECG monitoring, calculation of creatinine clearance, equipment for resuscitation available for minimum of 3 days. Anticipate proarrhythmic events.

### INTERVENTION/EVALUATION

Assess for conversion of cardiac arrhythmias and absence of new arrhythmias. Constantly monitor ECG. Provide emotional support. Monitor renal function for electrolyte imbalance (prolonged or excessive diarrhea, sweating, vomiting, thirst).

### PATIENT/FAMILY TEACHING

- Instruct pt on need for compliance and requirement for periodic monitoring of ECG and renal function.
- Do not break, crush, or open capsule.

## dolutegravir

doe-loo-teg-ra-veer  
(Tivicay, Tivicay PD)

### FIXED COMBINATION(S)

**Dovato:** dolutegravir/lamivudine (antiretrovirals): 50 mg/300 mg.

**Juluca:** dolutegravir/rilopivirine (antiretrovirals): 50 mg/25 mg.

**Triumaq:** dolutegravir/abacavir/lamivudine (antiretrovirals): 50 mg/600 mg/300 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Integrase stand transfer inhibitor (INSTI).

**CLINICAL:** Antiretroviral.

### USES

Treatment of HIV-1 infection in adults and pediatric pts at least 4 wks of age and weighing at least 3 kg.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to dolutegravir. Co-administration of dofetilide. **Cautions:** Diabetes, hepatic/renal impairment, history of hepatitis or tuberculosis, prior hypersensitivity reaction to INSTIs.

## ACTION

Inhibits HIV integrase by blocking strand transfer of retroviral DNA integration (essential for HIV replication cycle). **Therapeutic Effect:** Interferes with HIV replication, slowing progression of HIV infection.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Peak plasma concentration: 2-3 hrs. Excreted in feces (53%), urine (31%). **Half-life:** 14 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May increase risk of neural tube defects when used at conception and in early pregnancy. Breastfeeding not recommended due to risk of postnatal HIV transmission. Unknown if distributed in human breast milk. **Children:** Safety and efficacy not established in pts less than 4wks or weighing under 3 kg or who are INSTI-experienced with documented or clinically suspected resistance to other INSTIs. **Elderly:** May have increased risk of adverse effects or worsening hepatic, renal, cardiac function.

## INTERACTIONS

**DRUG:** Medications containing aluminum, calcium, magnesium or iron; strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), nonnucleoside reverse transcriptase inhibitors (e.g., efavirenz, etravirine, nevirapine); protease inhibitors (e.g., fosamprenavir/ritonavir, tipranavir/ritonavir, sucralfate) may decrease concentration/effects. May increase concentration/effect of metformin. **HERBAL:** St John's wort may decrease therapeutic effect. **FOOD:**

None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, cholesterol, creatinine, creatine kinase (CK), glucose, lipase, triglycerides. May decrease creatinine clearance, neutrophils.

## AVAILABILITY (Rx)

**Tablets:** 10 mg, 25 mg, 50 mg. **Tablets, Soluble:** 5 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. Administer at least 2 hrs before or at least 6 hrs after giving medications containing aluminum, calcium, iron, magnesium (supplements, antacids, laxatives). **Soluble tablets:** May be dispersed in water as an oral suspension or given whole. Do not administer more than 1 tablet at a time to reduce risk of choking. Do not break, cut, or crush tablets.

## INDICATIONS/ROUTES/DOSAGE

### HIV Infection

**PO: ADULTS/ELDERLY: Treatment naïve or treatment-experienced, INSTI naïve; virologically suppressed:** 50 mg once daily. Increase to 50 mg twice daily if also receiving efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, rifampin or INSTI-experienced with certain INSTI-associated resistance substitutions or clinically suspected IN-STI resistance. **INFANTS, CHILDREN, ADOLESCENTS WEIGHING 14 KG OR MORE:** Soluble tablets for oral suspension (preferred in pts less than 20 kg): **14-19 KG:** 25 mg once daily. **20 KG OR GREATER:** 30 mg once daily. **Tablets:** 14-19 kg: 40 mg once daily. 20 kg or greater: 50 mg once daily. **INFANTS AND CHILDREN WEIGHING 3-13 KG:** Soluble tablets for oral suspension: **10-13 KG:** 20 mg once daily. **6-9 KG:** 15 mg once daily. **3-5 KG:** 5 mg once daily.

### Dosage in Renal Impairment

**CrCl 30 ml/min or less:** Use caution.

### Dosage in Hepatic Impairment

**Mild to Severe impairment:** No dose adjustment

## SIDE EFFECTS

**Rare (3%-1%):** Insomnia, headache, nausea.

## ADVERSE EFFECTS/ TOXIC REACTIONS

D

Hypersensitivity reaction including rash, fever, angioedema, difficulty breathing, skin blistering/peeling, arthralgia, lethargy was reported. Pts co-infected with hepatitis B or C have increased risk for viral reactivation, worsening of hepatic function, and may experience hepatic decompensation and/or failure if therapy is discontinued. May cause redistribution/accumulation of body fat (lipodystrophy). May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré).

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, CMP, CD4+ count, viral load, HIV-1 RNA level; pregnancy test in females of reproductive potential. Screen all pts for hepatitis B or C co-infection. Receive full medication history including herbal products. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. Monitor LFT; assess for hepatic injury (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss). If discontinuation of drug regimen occurs, monitor hepatic function for viral reactivation. Initiate anti-HBV therapy if warranted. Monitor renal function as clinically indicated. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV infection). Assess skin for skin reactions, rash. Monitor for immune recovery syndrome.

## PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report fever, chills, body aches, cough, night sweats, shortness of breath.
- Fatal cases of liver inflammation or failure have occurred; report abdominal pain, clay colored stools, yellowing of skin or eyes, weight loss.
- Report symptoms of kidney inflammation or disease (decreased urine output, flank pain, darkened urine); skin reactions (rash, pustules, skin eruptions).
- Breastfeeding not recommended.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk, while also causing decreased body fat in legs, arms, face.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Do not take herbal products, esp. St John's wort.

## donepezil

doe-nep-e-zil

(Aricept RDT , Aricept)

**Do not confuse Aricept with Aciphex, Ascriptin, or Azilect.**

### FIXED-COMBINATION(S)

**Namzaric:** donepezil/memantine (NMDA receptor antagonist): 10 mg/14 mg, 10 mg/28 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Central acetylcholinesterase inhibitor. **CLINICAL:** Cholinergic.

### USES

Treatment of mild, moderate, or severe dementia of Alzheimer's disease.  
**OFF-LABEL:** Treatment of behavioral

syndromes in dementia, dementia associated with Parkinson's disease, Lewy body dementia.

## PRECAUTIONS

**Contraindications:** History of hypersensitivity to donepezil, other piperidine derivatives. **Cautions:** Asthma, COPD, bradycardia, bladder outflow obstruction, history of ulcer disease, those taking concurrent NSAIDs, supraventricular cardiac conduction disturbances (e.g., sick sinus syndrome, Wolff-Parkinson-White syndrome), seizure disorder.

## ACTION

Reversibly inhibits enzyme acetylcholinesterase, increasing concentration of acetylcholine at cholinergic synapses, enhancing cholinergic function in CNS. **Therapeutic Effect:** Slows progression of Alzheimer's disease.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 96%. Extensively metabolized. Eliminated in urine, feces. **Half-life:** 70 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Anticholinergic agents (e.g., glycopyrrolate, scopolamine) may decrease therapeutic effect. May increase concentration/effects of antipsychotic agents, beta blockers (e.g., atenolol, carvedilol, metoprolol), succinylcholine. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 10 mg, 23 mg. **Tablets (Orally Disintegrating):** 5 mg, 10 mg.

## ADMINISTRATION/HANDLING

### PO

- May be given at bedtime without regard to food.
- Swallow tablets whole; do not break, crush, dissolve, or divide.
- Follow dose with water.

## INDICATIONS/ROUTES/DOSAGE

### Alzheimer's Disease

**PO: ADULTS, ELDERLY:** For mild to moderate, initially 5 mg/day at bedtime. May increase at 4- to 6-wk intervals to 10 mg/day at bedtime. Range: 5–10 mg/day. For moderate to severe Alzheimer's, a dose of 23 mg once daily can be administered once pt has been taking 10 mg once daily for at least 3 mos. Range: 10–23 mg/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (11%–8%):** Nausea, diarrhea, headache, insomnia, nonspecific pain, dizziness. **Occasional (6%–3%):** Mild muscle cramps, fatigue, vomiting, anorexia, ecchymosis. **Rare (3%–2%):** Depression, abnormal dreams, weight loss, arthritis, drowsiness, syncope, frequent urination.

## ADVERSE EFFECTS/TOXIC REACTIONS

Overdose may result in cholinergic crisis (severe nausea, increased salivation, diaphoresis, bradycardia, hypotension, flushed skin, abdominal pain, respiratory depression, seizures, cardiorespiratory collapse). Increasing muscle weakness may occur, resulting in death if muscles of respiration become involved. **Antidote:** Atropine sulfate 1–2 mg IV with subsequent doses based on therapeutic response.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess cognitive function (e.g., memory, attention, reasoning). Obtain baseline

vital signs. Assess history for peptic ulcer, urinary obstruction, asthma, COPD, seizure disorder, cardiac conduction disturbances.

### INTERVENTION/EVALUATION

Monitor behavior, mood/cognitive function, activities of daily living. Monitor for cholinergic reaction (GI discomfort/cramping, feeling of facial warmth, excessive salivation/diaphoresis), lacrimation, pallor, urinary urgency, dizziness. Monitor for nausea, diarrhea, headache, insomnia.

### PATIENT/FAMILY TEACHING

- Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, severe abdominal pain, dizziness.
- May take without regard to food (best taken at bedtime).
- Not a cure for Alzheimer's disease but may slow progression of symptoms.

## DOPamine

**HIGH ALERT**

dope-a-meen

**BLACK BOX ALERT** ■ If extravasation occurs, infiltrate area with phentolamine (5–10 mL 0.9% NaCl) as soon as possible, no later than 12 hrs after extravasation.

**Do not confuse DOPamine with DOBUTamine or Dopram.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sympathomimetic (adrenergic agonist).

**CLINICAL:** Cardiac stimulant, vaso-pressor.

### USES

Adjunct in treatment of shock (e.g., MI, trauma, renal failure, cardiac decompensation, open heart surgery), persisting after adequate fluid volume replacement.

**OFF-LABEL:** Symptomatic bradycardia or heart block unresponsive to atropine or cardiac pacing.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dopamine, sulfites. Pheochromocytoma, ventricular fibrillation. Uncorrected tachyarrhythmias. **Cautions:** Ischemic heart disease, occlusive vascular disease, hypovolemia, recent use of MAOIs (within 2–3 wks), ventricular arrhythmias, post-MI.

### ACTION

Stimulates adrenergic and dopaminergic receptors. Effects are dose dependent. Lower dosage stimulates dopaminergic receptors, causing renal vasodilation. Higher doses stimulate both dopaminergic and beta<sub>1</sub>-adrenergic receptors, causing cardiac stimulation and renal vasodilation. Higher doses stimulate alpha-adrenergic receptors, causing vasoconstriction, increased B/P. **Therapeutic Effect:** **Low dosage (1–5 mcg/kg/min):** Increases renal blood flow, urinary flow, sodium excretion. **Low to moderate dosage (5–10 mcg/kg/min):** Increases myocardial contractility, stroke volume, cardiac output. **High dosage (greater than 10 mcg/kg/min):** Increases peripheral resistance, vasoconstriction, B/P.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1–2 min	N/A	Less than 10 min

Widely distributed. Does not cross blood-brain barrier. Metabolized in liver, kidneys, plasma. Primarily excreted in urine. Not removed by hemodialysis.

**Half-life:** 2 min.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Recommended close hemodynamic monitoring (gangrene due to extravasation reported). **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Ergot derivatives (e.g., ergotamine), MAOIs (e.g., phenelzine, selegiline), tricyclic antidepressants (e.g., amitriptyline) may increase hypertensive effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** 40 mg/mL. **Injection (Premix With Dextrose):** 0.8 mg/mL (250 mL, 500 mL), 1.6 mg/mL (250 mL, 500 mL), 3.2 mg/mL (250 mL).

## ADMINISTRATION/HANDLING

**◀ALERT▶** Fluid volume depletion must be corrected before administering DOPamine (may be used concurrently with fluid replacement).

IV

**Reconstitution** • Available prediluted in 250 or 500 mL D<sub>5</sub>W or dilute in 250–500 mL 0.9% NaCl or D<sub>5</sub>W, to maximum concentration of 3,200 mcg/mL (3.2 mg/mL).

**Rate of administration** • Administer into large vein (antecubital fossa, central line preferred) to prevent extravasation. • Use infusion pump to control flow rate. • Titrate drug to desired hemodynamic, renal response (optimum urinary flow determines dosage).

**Storage** • Do not use solutions darker than slightly yellow or discolored to yellow, brown, pink to purple (indicates decomposition of drug). • Stable for 24 hrs after dilution.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), furosemide (Lasix), insulin, sodium bicarbonate.

## IV COMPATIBILITIES

Amiodarone (Cordarone), calcium chloride, dexmedetomidine (Precedex), dilTIAzem (Cardizem), DOBUTamine (Dobutrex), enalapril (Vasotec),

EPINEPHrine, heparin, HYDROMorphone (Dilaudid), labetalol (Trandate), levofLOXacin (Levaquin), lidocaine, LORazepam (Ativan), methylPREDNISolone (Solu-Medrol), midazolam (Versed), milrinone (Primacor), morphine, niCARDipine (Cardene), nitroglycerin, norepinephrine (Levophed), piperacillin/tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

**◀ALERT▶** Effects of DOPamine are dose dependent. Titrate to desired response. Doses greater than 20 mcg/kg/min may not have beneficial effect on BP and may increase risk of tachyarrhythmias.

### Hemodynamic Support

**IV infusion: ADULTS, ELDERLY, CHILDREN:** Range: 2–20 mcg/kg/min. Titrate to desired response. May gradually increase by 5–10 mcg/kg/min increments. **NEONATES:** 2–20 mcg/kg/min. Titrate gradually by 5–10 mcg/kg/min to desired response.

## SIDE EFFECTS

**Frequent:** Headache, arrhythmias, tachycardia, anginal pain, palpitations, vasoconstriction, hypotension, nausea, vomiting, dyspnea. **Occasional:** Piloerection (goose bumps), bradycardia, widening of QRS complex.

## ADVERSE EFFECTS/TOXIC REACTIONS

High doses may produce ventricular arrhythmias, tachycardia. Pts with occlusive vascular disease are at high risk for further compromise of circulation to extremities, which may result in gangrene. Tissue necrosis with sloughing may occur with extravasation of IV solution.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Pt must be on continuous cardiac monitoring. Determine weight (for dosage calculation). Obtain initial B/P, heart rate, respirations. Assess patency of IV access.

**INTERVENTION/EVALUATION**

Continuously monitor for cardiac arrhythmias. Measure urinary output frequently. If extravasation occurs, immediately infiltrate affected tissue with 10–15 mL 0.9% NaCl solution containing 5–10 mg phentolamine mesylate. Monitor B/P, heart rate, respirations q15min during administration (more often if indicated). Assess cardiac output, pulmonary wedge pressure, or central venous pressure (CVP) frequently. Assess peripheral circulation (palpate pulses, note color/temperature of extremities). Immediately notify physician of decreased urinary output, cardiac arrhythmias, significant changes in B/P, heart rate, or failure to respond to increase or decrease in infusion rate, decreased peripheral circulation (cold, pale, mottled extremities). Taper dosage before discontinuing (abrupt cessation of therapy may result in marked hypotension). Be alert to excessive vasoconstriction (decreased urine output, increased heart rate, arrhythmias, disproportionate increase in diastolic B/P, decrease in pulse pressure); slow or temporarily stop infusion, notify physician.

**dostarlimab-gxly**

dos-tar-li-mab  
(Jemperli)

**Do not confuse dostarlimab with atezolizumab, cemiplimab, daratumumab, dinutuximab, durvalumab, ipilimumab, nivolumab, pembrolizumab.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Anti-PD-1 monoclonal antibody. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with mismatch repair deficient (dMMR) recurrent or advanced endometrial cancer that has progressed on or following prior treatment with a platinum-containing regimen.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to dostarlimab-gxly. **Cautions:** Baseline cytopenias, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), diabetes, pts at risk for interstitial lung disease (e.g., COPD, sarcoidosis, connective tissue disease); history of autoimmune disorders (Crohn's disease, demyelinating polyneuropathy, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, rheumatoid arthritis, Type I diabetes, vasculitis); pancreatitis.

**ACTION**

Inhibits programmed cell death-1 (PD-1) activity by binding to the PD-1 receptor on T-cells to block PD-1 ligands (PD-L1 and PD-L2) from binding. Blocking the PD-1 pathway inhibits the negative immune regulation caused by PD-1 receptor signaling. **Therapeutic Effect:** Restores immune responses (including T-cell anti-tumor function), causing decreased tumor growth and proliferation.

**PHARMACOKINETICS**

Widely distributed. Metabolized into small peptides and amino acids via catabolic pathway. **Half-life:** 25.4 days.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 4 mos after discontinuation. Breastfeeding not recommended during treatment and for at least 4 mos after

discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** **Corticosteroids (Systemic)** may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, calcium, creatinine. May decrease serum albumin, sodium, potassium; Hgb, leukocytes, lymphocytes, RBCs.

## AVAILABILITY (Rx)

**Injection Solution:** 500 mg/10 mL (50 mg/mL).

## ADMINISTRATION/HANDLING

IV

**Infusion Guidelines** • Infusion bag must be made of polyvinylchloride (PVC) with DEHP, polyolefin, or ethylene vinyl acetate. Infusion tubing must be made of PVC or platinum-cured silicon with fittings made of PVC or polycarbonate. • Infuse via dedicated IV line using a sterile, non-pyrogenic, low-protein-binding 0.2 micron, in-line filter. • Do not administer as IV push or bolus.

**Preparation** • Must be prepared by personal trained in aseptic manipulations and admixing of cytotoxic drugs. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to yellow. Do not use if solution is cloudy, discolored, or if visible particles are observed. • Dilute the 500 mg dose into an infusion bag containing D5W or 0.9% NaCl to a final concentration of 2-10 mg/mL (maximum 250 mL) or the 1000 mg dose into an infusion bag containing D5W or 0.9% NaCl to a final concentration of 4-10 mg/mL (maximum 250 mL). • Mix by gentle inversion. Do not shake or agitate.

**Rate of Administration** • Infuse over 30 min.

**Infusion Reactions** • **Grade 1 or 2 infusion reactions:** Interrupt or slow

infusion rate. **Grade 3 or 4 infusion reactions:** Permanently discontinue.

**Storage** • Refrigerate unused vials in original carton. Protect from light. • May refrigerate diluted solution for up to 24 hrs or store at room temperature up to 6 hrs (includes infusion time). • Do not shake, agitate, or freeze. • If refrigerated, allow diluted solution to warm to room temperature. Protect from light.

## IV INCOMPATIBILITIES

Do not infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

**Endometrial Cancer (advanced or recurrent; mismatch repair deficient)**

**IV: ADULTS, ELDERLY:** 500 mg q3wks for Doses 1-4, then 1000 mg q6wks thereafter (starting 3 wks after Dose 4). Continue until disease progression or unacceptable toxicity.

### Dose Modification

**NOTE:** No dose reduction is required. Based on severity of adverse reactions, withhold treatment and consider starting corticosteroid therapy. Resume treatment if symptoms improve to Grade 1 or 0 after corticosteroid taper.

### Immune-Mediated Adverse Reactions

**Withhold treatment for the following adverse reactions:** Grade 2 pneumonitis; Grade 2 or 3 colitis; clinically unstable Grade 2-4 endocrinopathies; Grade 2 or 3 nephritis with renal dysfunction; *suspected* Stevens-Johnson Syndrome, toxic epidermal necrolysis, or Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS); serum ALT/AST greater than 3-8 times ULN or total serum bilirubin greater than 1.5-3 times ULN (hepatitis with no tumor involvement of the liver); baseline serum ALT/AST greater than 1-3 times ULN that increases to greater than 5-10 times ULN, or baseline serum ALT/AST greater than 3-5 times ULN that increases to greater than 8-10 times ULN (hepatitis with

tumor involvement of the liver); Grade 2 neurological toxicities.

**Permanently discontinue for the following adverse reactions:** Grade 3 or 4 pneumonitis or recurrent grade 2 pneumonitis; Grade 4 colitis; Grade 4 nephritis with renal dysfunction; *confirmed* Stevens-Johnson Syndrome, toxic epidermal necrolysis, or Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS); serum ALT/AST greater than 8 times ULN or total serum bilirubin greater than 3 times ULN (hepatitis with no tumor involvement of the liver); serum ALT/AST greater than 10 times ULN or total serum bilirubin greater than 3 times ULN (hepatitis with tumor involvement of the liver); Grade 3 or 4 neurological toxicities; Grade 2-4 myocarditis; Grade 3 or 4 infusion-related reactions; symptoms that do not improve to Grade 1 or 0 within 12 wks of starting corticosteroid therapy or unable to tolerate corticosteroid reduction to less than 10 mg prednisone (or equivalent)/day.

#### **Other Immune-Mediated Adverse Reactions**

Unless specified, withhold treatment for other Grade 3 immune-mediated adverse reactions until improved to Grade 1 or 0. Permanently discontinue for other Grade 4 immune-mediated adverse reactions, recurrent Grade 3 immune-mediated adverse reactions requiring an immunosuppressant, or unable to tolerate corticosteroid reduction to less than 10 mg prednisone (or equivalent)/day.

#### **Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment.

#### **Dosage in Hepatic Impairment**

**Mild to severe impairment:** No dose adjustment.

### **SIDE EFFECTS**

**Frequent (48%-20%):** Fatigue, asthenia, nausea, diarrhea, constipation. **Occasional**

**(18%-12%):** Vomiting, decreased appetite, cough, pruritus, myalgia.

### **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia) is an expected response to therapy. May cause severe and/or fatal immune-mediated adverse reactions including acute kidney injury, nephritis; colitis, hepatitis, pancreatitis, pneumonitis; adrenal insufficiency, hypoparathyroidism, hyperthyroidism, hypophysitis, thyroiditis, Type I diabetes mellitus including ketoacidosis; autoimmune neuropathy, encephalitis, Guillian-Barre syndrome, meningitis, myasthenia gravis, myelitis, nerve palsy; myocarditis, pericarditis, vasculitis; iritis, uveitis; myositis, polymyositis, rhabdomyolysis; aplastic anemia, hemolytic anemia, hemophagocytic lymphohistiocytosis, histiocytic necrotizing lymphadenitis, immune thrombocytopenia; sarcoidosis, systemic inflammatory response syndrome. Immune-mediated adverse reactions can affect any organ at any time. Solid organ transplant rejection, allogeneic hematopoietic stem cell transplantation complications were reported. May cause cytomegalovirus infection/reactivation in pts with corticosteroid-refractory immune-related colitis. Dermatologic toxicities including Stevens-Johnson syndrome, toxic epidermal necrolysis may occur. Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS), also known as multi-organ hypersensitivity, has been reported. DRESS may present with facial swelling, eosinophilia, fever, lymphadenopathy, and rash, which may be associated with other organ systems, such as hepatitis, hematological abnormalities, myocarditis, nephritis. Life-threatening infusion reactions may occur. Immunogenicity (auto-dostarlimab antibodies) reported in 1-3% of pts. Urinary tract infections reported in 13% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, thyroid panel; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Verify presence of dMMR in tumor specimens. Screen for history of autoimmune disorders, diabetes, pituitary/pulmonary/thyroid disease. Administer in an environment equipped to monitor for and manage infusion-related reactions. Question for prior infusion-related reactions prior to each infusion. Screen for active infection. Assess usual bowel movement patterns, stool characteristics. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC for myelosuppression; creatinine clearance, LFT, thyroid periodically. Monitor for infections (cough, dysuria, fatigue, fever, urinary frequency). If serious infection occurs, initiate appropriate antimicrobial therapy. Assess for infusion reactions during infusion. If reactions occur, interrupt or decrease rate of infusion. Immune-mediated reactions can affect any organ. Early detection and management is essential. Conduct a complete head-to-toe assessment frequently. Radiological examination, blood sampling; treatment with corticosteroids should be considered if an immune-mediated reaction is suspected. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, lesions, dermatological toxicities; symptoms of Drug Reaction with Eosinophilia and Systemic Symptoms. Monitor blood glucose levels in pts treated with corticosteroids.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection. • Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath,

weight loss; bleeding easily, bloody urine or stool). • Use effective contraception to avoid pregnancy. Do not breast-feed. • Immediately report symptoms of infusion-related reactions such as chills, cough, difficulty breathing, nausea, vomiting. • Report symptoms of drug-induced hypersensitivity syndrome (e.g., fever, swollen face/lymph nodes, skin rash/peeling/inflammation), UTI (fever, urinary frequency, burning during urination, foul smelling urine). • Serious adverse reactions may affect lungs, liver, intestines, kidneys, hormonal glands, nervous system (or any organ), which may require anti-inflammatory medication. • Immediately report any symptoms in the following body systems: colon (severe abdominal pain/swelling, diarrhea); eyes (pain, redness, vision problems), kidneys (decreased or dark-colored urine, flank pain); lung (chest pain, severe cough, shortness of breath); liver (bruising, dark-colored urine, clay-colored/tarry stools, nausea, yellowing of the skin or eyes); nervous system (confusion, difficulty breathing, swallowing; paralysis, weakness), pituitary (persistent or unusual headaches, dizziness, extreme weakness, fainting, vision changes); skin (blisters, bubbling, inflammation, rash), thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]; fatigue, goiter, weight gain [underactive thyroid]), vascular (low blood pressure, vein/artery pain or irritation).

## doxazosin

dox-a-zoe-sin  
(Apo-Doxazosin , Cardura, Cardura XL)

**Do not confuse Cardura with Cardene, Cordarone, Coumadin, K-Dur, or Ridaura, or doxazosin with doxapram, doxepin, or DOXOrubicin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Alpha-adrenergic blocker. **CLINICAL:** Anti-hypertensive.

D

### USES

**Cardura:** Treatment of mild to moderate hypertension. Used alone or in combination with other antihypertensives. Treatment of urinary outflow obstruction and/or obstruction and irritation associated with benign prostatic hyperplasia (BPH). **Cardura XL:** Treatment of urinary outflow obstruction and/or obstruction and irritation associated with benign prostatic hyperplasia. **OFF-LABEL:** Pediatric hypertension. Facilitate distal ureteral stone expulsion. Erectile dysfunction in pts with BPH.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to doxazosin or other quinazolines (prazosin, terazosin). **Cautions:** Constipation, ileus, GI obstruction, hepatic impairment.

### ACTION

**Hypertension:** Selectively blocks alpha<sub>1</sub>-adrenergic receptors, decreasing peripheral vascular resistance. **BPH:** Inhibits postsynaptic alpha-adrenergic receptors in prostatic stromal and bladder neck tissues. **Therapeutic Effect:** **Hypertension:** Causes peripheral vasodilation, lowering B/P. **BPH:** Relaxes smooth muscle of bladder, prostate, reducing BPH symptoms.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (antihypertensive)	1–2 hrs	2–6 hrs	24 hrs

Well absorbed from GI tract. Protein binding: 98%–99%. Metabolized in liver. Primarily eliminated in feces. Not removed by hemodialysis. **Half-life:** 19–22 hrs.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** None significant.

### AVAILABILITY (Rx)

**Tablets:** 1 mg, 2 mg, 4 mg, 8 mg.

 **Tablets, Extended-Release:** 4 mg, 8 mg.

### ADMINISTRATION/HANDLING

#### PO

• Give without regard to food. • Do not break, crush, dissolve, or divide extended-release tablet. • Immediate-release tablets given morning or evening; extended-release tablets given with morning meal.

### INDICATIONS/ROUTES/DOSAGE

#### Hypertension

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 1 mg once daily. May increase to 2 mg once daily. Thereafter, may increase upward over several wks to a maximum of 16 mg/day.

#### Benign Prostatic Hyperplasia

**PO: (Immediate-Release): ADULTS, ELDERLY:** Initially, 1 mg/day. May titrate at intervals of 1–2 wks by doubling daily dose to 2 mg, 4 mg, and 8 mg. **Maximum:** 8 mg/day.

**(Extended-Release):** Initially, 4 mg/day. May increase to 8 mg in 3–4 wks. **Note:** When switching to extended-release, omit evening dose prior to starting morning dose.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild to moderate impairment:** Use caution. **Severe impairment:** Avoid use.

### SIDE EFFECTS

**Frequent (20%–10%):** Dizziness, asthenia, headache, edema. **Occasional (9%–3%):** Nausea, pharyngitis, rhinitis, pain in extremities, drowsiness. **Rare (2%–1%):** Palpitations, diarrhea, constipation, dyspnea, myalgia, altered vision, anxiety.

### ADVERSE EFFECTS/TOXIC REACTIONS

First-dose syncope (hypotension with sudden loss of consciousness) may occur 30–90 min after initial dose of 2 mg or greater, too-rapid increase in dosage, addition of another antihypertensive agent to therapy. First-dose syncope may be preceded by tachycardia (pulse rate 120–160 beats/min).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Give first dose at bedtime. If initial dose is given during daytime, pt must remain recumbent for 3–4 hrs. Assess B/P, pulse immediately before each dose and q15–30min until B/P is stabilized (be alert to fluctuations).

#### INTERVENTION/EVALUATION

Monitor B/P, I&O. Monitor pulse diligently (first-dose syncope may be preceded by tachycardia). Assess for edema, headache. Assist with ambulation if dizziness, light-headedness occurs.

### PATIENT/FAMILY TEACHING

- Full therapeutic effect may not occur for 3–4 wks.
- May cause syncope (fainting); go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.

## doxepin

dox-e-pin

(Prudoxin, Silenor, Sinequan , Zonalon)

**BLACK BOX ALERT** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse doxepin with digoxin, doxapram, doxazosin, Doxidan, or doxycycline, or SINEquan with SEROquel, or Singulair.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tricyclic.  
**CLINICAL:** Antidepressant, antianxiety, antineuralgic, antipruritic.

### USES

Treatment of depression and/or anxiety. **Silenor (only):** Treatment of insomnia in pts with difficulty staying asleep. **Topical:** Treatment of pruritus associated with atopic dermatitis. **OFF-LABEL:** Treatment of neurogenic pain, treatment of anxiety.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to doxepin. Glaucoma, hypersensitivity to other tricyclic antidepressants, urinary retention, use of MAOIs within 14 days. **Cautions:** Cardiac/hepatic/renal disease, pts at risk for suicidal ideation, respiratory compromise, sleep apnea, history

of bowel obstruction, increased IOP, glaucoma, history of seizures, history of urinary retention/obstruction, hyperthyroidism, prostatic hypertrophy, hiatal hernia, elderly.

## ACTION

Increases synaptic concentrations of norepinephrine, serotonin by inhibiting reuptake. **Therapeutic Effect:** Produces antidepressant, anxiolytic effects.

## PHARMACOKINETICS

**PO:** Rapidly absorbed from GI tract. Protein binding: 80%–85%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 6–8 hrs. **Topical:** Absorbed through skin. Distributed to body tissues. Metabolized to active metabolite. Excreted in urine.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Increased risk of toxicity (lower dosages recommended). Avoid doses greater than 6 mg/day due to anticholinergic effects, sedation, and orthostatic hypotension.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS, respiratory depression. **MAOIs** (e.g., phenelzine, selegiline) may increase risk of seizures, hyperpyrexia, hypertensive crisis (discontinue at least 2 wks prior to starting doxepin). **Anticholinergic agents** (e.g., acclidinium, ipratropium, umecclidinium) may increase anticholinergic effect. May increase QT interval-prolonging effect of dronedarone. **Strong CYP2D6 inhibitors** (e.g., buPROPion,

PARoxetine) may increase concentration/effect. **HERBAL:** Herbals with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **St. John's wort** may enhance serotonin effect. **FOOD:** None known. **LAB VALUES:** May alter serum glucose, ECG readings. **Therapeutic serum level:** 110–250 ng/mL; **toxic serum level:** greater than 300 ng/mL.

## AVAILABILITY (Rx)

**Capsules:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cream:** (Prudoxin, Zonalon): 5%. **Oral Concentrate:** 10 mg/mL. **Tablets:** (Silenor): 3 mg, 6 mg.

## ADMINISTRATION/HANDLING

### PO

- Give with food, milk if GI distress occurs.
- Dilute concentrate in 4-oz glass of water, milk, or orange, tomato, prune, pineapple juice. Incompatible with carbonated drinks.
- Give larger portion of daily dose at bedtime.

### Topical

- Apply thin film of cream on affected areas of skin.
- Do not use for more than 8 days.
- Do not use occlusive dressing.

## INDICATIONS/ROUTES/DOSAGE

### Depression, Anxiety

**Note:** Gradually taper dose upon discontinuation of antidepressant therapy. **PO: ADULTS:** Initially, 25–50 mg/day at bedtime. May increase gradually at intervals of 3 days or longer to usual dose of 100 mg–300 mg/day (single dose should not exceed 150 mg). **ELDERLY:** Initially, 10–25 mg at bedtime. May increase by 10–25 mg/day every 3–7 days.

### Insomnia (Silenor Only)

**PO: ADULTS:** 3–6 mg (give within 30 min of bedtime). **ELDERLY:** 3 mg (give within 30 min of bedtime). May increase to 6 mg once daily.

### Pruritus Associated With Atopic Dermatitis

**Topical:** ADULTS, ELDERLY: Apply thin film 4 times/day at 3- to 4-hr intervals. Not recommended for more than 8 days.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Use lower initial dose; adjust gradually.

**Silenor:** Initially, 3 mg once daily.

## SIDE EFFECTS

**Frequent: PO:** Orthostatic hypotension, drowsiness, dry mouth, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste. **Topical:** Edema, increased pruritus, eczema, burning, tingling, stinging at application site, altered taste, dizziness, drowsiness, dry skin, dry mouth, fatigue, headache, thirst. **Occasional: PO:** Blurred vision, confusion, constipation, hallucinations, difficult urination, eye pain, irregular heartbeat, fine muscle tremors, nervousness, impaired sexual function, diarrhea, diaphoresis, heartburn, insomnia. **Silenor:** Nausea, upper respiratory infection. **Topical:** Anxiety, skin irritation/cracking, nausea. **Rare: PO:** Allergic reaction, alopecia, tinnitus, breast enlargement. **Topical:** Fever, photosensitivity.

## ADVERSE EFFECTS/TOXIC REACTIONS

Abrupt or too-rapid withdrawal may result in headache, malaise, nausea, vomiting, vivid dreams. Overdose may produce confusion, severe drowsiness, agitation, tachycardia, arrhythmias, shortness of breath, vomiting.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P, pulse, ECG (those with history of cardiovascular disease). Obtain CBC, serum electrolyte tests before long-term therapy. Assess pt's appearance, behav-

ior, level of interest, mood, suicidal ideation, sleep pattern.

### INTERVENTION/EVALUATION

Monitor B/P, pulse, weight. Perform CBC, serum electrolyte tests periodically to assess renal/hepatic function. Monitor mental status, suicidal ideation. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. **Therapeutic serum level:** 110–250 ng/mL; **toxic serum level:** greater than 300 ng/mL.

### PATIENT/FAMILY TEACHING

- Do not discontinue abruptly.
- Change positions slowly to avoid dizziness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not cover affected area with occlusive dressing after applying cream.
- Avoid alcohol, limit caffeine.
- May increase appetite.
- Avoid exposure to sunlight/artificial light source.
- Therapeutic effect may be noted within 2–5 days, maximum effect within 2–3 wks.
- Report worsening depression, suicidal ideation, unusual changes in behavior (esp. at initiation of therapy or with changes in dosage).

## DOXOrubicin

HIGH ALERT

dox-o-rue-bi-sin  
(Adriamycin, Caelyx , Doxil)

**BLACK BOX ALERT** ■ May cause concurrent or cumulative myocardial toxicity. Acute allergic or anaphylaxis-like infusion reaction may be life-threatening. Severe myelosuppression may occur. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Secondary acute myelogenous leukemia and myelodysplastic syn-

drome have been reported. Potent vesicant.

**Do not confuse DOXOrubicin with dactinomycin, DAUNOrubicin, doxazosin, epiRUBicin, IDArubicin, or valrubicin, or Adriamycin with Aredia or Idamycin.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anthracycline, topoisomerase II inhibitor.

**CLINICAL:** Antineoplastic.

### USES

**Adriamycin:** Treatment of acute lymphocytic leukemia (ALL), acute myeloid leukemia (AML), Hodgkin's lymphoma, malignant lymphoma; breast, gastric, small-cell lung, ovarian, epithelial, thyroid, bladder carcinomas; neuroblastoma, Wilms tumor, osteosarcoma, soft tissue sarcoma. **Doxil, Lipodox:** Treatment of AIDS-related Kaposi's sarcoma, advanced ovarian cancer. Used with bortezomib to treat multiple myeloma in pts who have not previously received bortezomib and have received at least one previous treatment. **OFF-LABEL: Adriamycin:** Multiple myeloma, endometrial carcinoma, uterine sarcoma; head and neck cancer, liver, kidney cancer. **Doxil:** Metastatic breast cancer, Hodgkin's lymphoma, cutaneous T-cell lymphomas, advanced soft tissue sarcomas, recurrent or metastatic cervical cancer, advanced or metastatic uterine sarcoma.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to DOXOrubicin. **Adriamycin:** Severe hepatic impairment, severe myocardial insufficiency, recent MI (within 4–6 wks), severe arrhythmias. Previous or concomitant treatment with high accumulative doses of DOXOrubicin, DAUNOrubicin, IDArubicin, or other anthracyclines or anthracenediones; severe, persistent

drug-induced myelosuppression or baseline ANC count less than 1,500 cells/mm<sup>3</sup>.

**Doxil:** Breastfeeding (Canada). **Cautions:** Hepatic impairment. Cardiomyopathy, preexisting myelosuppression, severe HE. Pts who received radiation therapy.

### ACTION

Inhibits DNA, RNA synthesis by binding with DNA strands. Liposomal encapsulation increases uptake by tumors, prolongs drug action, may decrease toxicity. **Therapeutic Effect:** Prevents cell division.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 74%–76%. Excreted in feces (40%), urine (5%–12%). **Half-life:** 20–48 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended.

**Children/Elderly:** Cardiotoxicity may be more frequent in pts younger than 2 yrs or older than 70 yrs.

### INTERACTIONS

**DRUG:** CycloSPORINE may increase concentration/effect; risk of hematologic toxicity. **Bevacizumab, DAUNOrubicin** may increase risk of cardiotoxicity. **Bone marrow depressants (e.g., cladribine)** may increase myelosuppression. **Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration/effect. **Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir)** may increase concentration/effect. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May cause ECG changes, increase serum uric acid. May decrease neutrophils, RBCs.

**AVAILABILITY (Rx)**

**Injection, Powder for Reconstitution:** 10 mg, 50 mg. **Injection Solution:** (*Adriamycin*): 2 mg/mL (5-mL, 10-mL, 25-mL, 100-mL vial). **Lipid Complex:** (*Doxil*): 2 mg/mL (10 mL, 25 mL).

**ADMINISTRATION/HANDLING**

**◀ALERT▶** Wear gloves. If powder or solution comes into contact with skin, wash thoroughly. Avoid small veins; swollen/edematous extremities; areas overlying joints, tendons. • (*Doxil*): Do not use with in-line filter or mix with any diluent except D<sub>5</sub>W. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

**IV**

**Reconstitution** • Dilute with 50–1,000 mL D<sub>5</sub>W or 0.9% NaCl and give as continuous infusion. • (*Doxil*): Dilute each dose in 250 mL D<sub>5</sub>W (doses greater than 90 mg in 500 mL D<sub>5</sub>W).

**Rate of administration** • (*Adriamycin*): For IV push, administer into tubing of freely running IV infusion of D<sub>5</sub>W or 0.9% NaCl, preferably via butterfly needle over 3–5 min (avoids local erythematous streaking along vein and facial flushing). • Must test for flashback q30sec to be certain needle remains in vein during injection. IV piggyback over 15–60 min or continuous infusion. • Extravasation produces immediate pain, severe local tissue damage. Terminate administration immediately; withdraw as much medication as possible, obtain extravasation kit, follow protocol. • (*Doxil*): Give as infusion over 60 min. Do not use in-line filter.

**Storage** • (*Adriamycin solution*): Refrigerate vials. Solutions diluted in D<sub>5</sub>W or 0.9% NaCl stable for 48 hrs at room temperature. • (*Doxil*): Refrigerate unopened vials. After solution is diluted, use within 24 hrs.

**IV INCOMPATIBILITIES**

**DOXOrubicin:** Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), furosemide (Lasix), ganciclovir (Cytovene), heparin, piperacillin/tazobactam (Zosyn), propofol (Diprivan). **Doxil:** Do not mix with any other medications.

**IV COMPATIBILITIES**

Dexamethasone (Decadron), diphenhydramine (Benadryl), granisetron (Kytril), HYDROMorphone (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran).

**INDICATIONS/ROUTES/DOSAGE**

**◀ALERT▶** Refer to individual protocols.

**Usual Dosage**

**IV:** (*Adriamycin*): **ADULTS:** (Single-agent therapy): 60–75 mg/m<sup>2</sup> as a single dose every 21 days, 20 mg/m<sup>2</sup> once wkly. (**Combination therapy**): 40–75 mg/m<sup>2</sup> q21–28 days. Because of risk of cardiotoxicity, do not exceed cumulative dose of 550 mg/m<sup>2</sup> (400–450 mg/m<sup>2</sup> for those previously treated with related compounds or irradiation of cardiac region). **CHILDREN:** (Single-agent therapy): 60–75 mg/m<sup>2</sup> q3wks. (**Combination therapy**): 40–75 mg/m<sup>2</sup> q21–28 days.

**Kaposi's Sarcoma**

**IV:** (*Doxil*): **ADULTS:** 20 mg/m<sup>2</sup> q3wks infused over 30 min. Continue until disease progression or unacceptable toxicity.

**Ovarian Cancer**

**IV:** (*Doxil*): **ADULTS:** 50 mg/m<sup>2</sup> q4wks. Continue until disease progression or unacceptable toxicity.

**Multiple Myeloma**

**IV:** (*Doxil*): **ADULTS:** 30 mg/m<sup>2</sup>/dose on day 4 q3wks (in combination with

bortezomib) for 8 cycles. Continue until disease progression or unacceptable toxicity.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dose Modifications

##### *Adriamycin*

**Neutropenic fever/Infection:** Reduce dose to 75%. **ANC less than 1,000 cells/mm<sup>3</sup>:** Delay treatment until ANC 1,000 cells/mm<sup>3</sup> or more. **Platelets less than 100,000/mm<sup>3</sup>:** Delay treatment until platelets 100,000 cells/mm<sup>3</sup> or more.

##### *Doxil*

**Adjustments for hand-foot syndrome, stomatitis, hematologic toxicities:** Refer to manufacturer's guidelines.

#### Dosage in Hepatic Impairment

##### ADRIAMYCIN

Hepatic Function	Dosage
ALT, AST 2–3 times ULN	75% of normal dose
ALT, AST greater than 3 times ULN or bilirubin 1.2–3 mg/dL	50% of normal dose
Bilirubin 3.1–5 mg/dL	25% of normal dose
Bilirubin greater than 5 mg/dL	Not recommended

ULN = upper limit of normal.

##### DOXIL

Hepatic Function	Dosage
Bilirubin 1.2–3 mg/dL	50% of normal dose
Bilirubin greater than 3 mg/dL	25% of normal dose

## SIDE EFFECTS

**Frequent:** Alopecia, nausea, vomiting, stomatitis, esophagitis (esp. if drug is given on several successive days), reddish urine. **Doxil:** Nausea. **Occasional:** Anorexia, diarrhea;

hyperpigmentation of nailbeds, phalangeal, dermal creases. **Rare:** Fever, chills, conjunctivitis, lacrimation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Myelosuppression (anemia, leukopenia, thrombocytopenia) generally occurs within 10–15 days, returns to normal levels by third wk. Cardiotoxicity (either acute, manifested as transient ECG abnormalities, or chronic, manifested as HF) may occur.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC before and at frequent intervals during therapy. Obtain ECG before therapy, LFT before each dose. Antiemetics may be effective in preventing, treating nausea. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for stomatitis (burning or erythema of oral mucosa at inner margin of lips, difficulty swallowing). Observe IV injection site for infiltration, vein irritation. May lead to ulceration of mucous membranes within 2–3 days. Monitor hematologic status, renal/hepatic function studies, serum uric acid levels. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight

loss; bleeding easily, bloody urine or stool). • Maintain strict oral hygiene. • Do not have immunizations without physician's approval (drug lowers resistance). • Avoid contact with those who have recently received live virus vaccine. • Report persistent nausea/vomiting. • Avoid alcohol (may cause GI irritation, a common side effect with liposomal DOXOrubicin).

## doxycycline

TOP  
100

dox-i-sye-kleen  
(Acticlate, Adoxa, Apo-Doxy , Avidoxy, Doryx, Doxy-100, Oracea, Vibramycin)

**Do not confuse doxycycline with dicyclomine, doxepin, omadacycline, minocycline, tetracycline, or Oracea with Orencia, or Vibramycin with Vancomycin or Vibativ.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Tetracycline. **CLINICAL:** Antibiotic.

### USES

Treatment of susceptible infections due to *H. ducreyi*, *Pasteurella pestis*, *P. tularensis*, *Bacteroides* spp., *V. cholerae*, *Brucella* spp., *Rickettsiae*, *Y. pestis*, *Francisella tularensis*, *M. pneumoniae*, including brucellosis, chlamydia, cholera, granuloma inguinale, lymphogranuloma venereum, malaria prophylaxis, nongonococcal urethritis, pelvic inflammatory disease (PID), plague, psittacosis, relapsing fever, rickettsia infections, primary and secondary syphilis, tularemia. (**Oracea**): Treatment of inflammatory lesions in adults with rosacea. **OFF-LABEL:** Sclerosing agent for pleural effusion; vancomycin-resistant enterococci (VRE); alternative for MRSA,

treatment of refractory periodontitis, juvenile periodontitis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to doxycycline, other tetracyclines. **Cautions:** History or predisposition to oral candidiasis (Oracea); recent *Clostridium difficile* infection or antibiotic-associated colitis; history of pancreatitis. Avoid use during pregnancy, during tooth development in children. Avoid prolonged exposure to sunlight.

### ACTION

Inhibits bacterial protein synthesis by binding to ribosomes. May cause alterations in the cytoplasmic membrane. **Therapeutic Effect:** Bacteriostatic.

### PHARMACOKINETICS

Widely distributed. Partially inactivated in GI tract by chelate formation. Protein binding: greater than 90%. Peak plasma concentration: 1.5–4 hrs (immediate-release); 2.8–3 hrs (delayed-release). Excreted in feces (30%), urine (23%–40%). **Half-life:** 15–24 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** May cause permanent discoloration of teeth, enamel hypoplasia. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Antacids containing aluminum, calcium, magnesium; laxatives containing magnesium, oral iron preparations decrease absorption. **Barbiturates, carBAMazepine** may decrease concentration/effect. **Cholestyramine** may decrease absorption. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, bilirubin, ALT, AST. May alter CBC.

**AVAILABILITY (Rx)**

**Capsules:** 40 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Injection, Powder for Reconstitution:** 100 mg. **Oral Suspension:** 25 mg/5 mL. **Syrup:** 50 mg/5 mL. **Tablets:** 20 mg, 50 mg, 75 mg, 100 mg, 150 mg.

 **Tablets, Delayed-Release:** 50 mg, 75 mg, 100 mg, 150 mg, 200 mg.

**ADMINISTRATION/HANDLING**

 **ALERT** Do not administer IM or SQ. Space doses evenly around clock.

 **IV**

**Reconstitution** • Reconstitute each 100-mg vial with 10 mL Sterile Water for Injection for concentration of 10 mg/mL. • Further dilute each 100 mg with at least 100 mL D<sub>5</sub>W, 0.9% NaCl, lactated Ringer's.

**Rate of administration** • Infuse over 1–4 hrs.

**Storage** • After reconstitution, IV infusion is stable for 12 hrs at room temperature or 72 hrs if refrigerated. • Protect from direct sunlight. Discard if precipitate forms.

**PO**

• Oral suspension is stable for 2 wks at room temperature. • Give with full glass of fluid. • Instruct pt to sit up for 30 min after taking to reduce risk of esophageal irritation and ulceration. • Give without regard to food. Oracea should be given 1 hr before or 2 hrs after meals. • Avoid concurrent use of antacids, milk; separate by 2 hrs.

 **IV INCOMPATIBILITIES**

Allopurinol (Aloprim), heparin, piperacillin/tazobactam (Zosyn).

 **IV COMPATIBILITIES**

Acyclovir (Zovirax), amiodarone (Coronarone), dexmedetomidine (Precedex), dilTIAZem (Cardizem), granisetron (Kytrel), HYDROMORPHONE (Dilaudid), magnesium sulfate, meperidine (Demerol), morphine, ondansetron (Zofran), propofol (Diprivan).

**INDICATIONS/ROUTES/DOSAGE****Usual Dosage**

**PO:** **ADULTS, ELDERLY:** 100–200 mg/day in 1–2 divided doses. **IV:** 100 mg q12h. **IV/PO:** **CHILDREN OLDER THAN 8 YRS:** 2.2 mg/kg/dose. (**Maximum:** 100 mg/dose, 200 mg/day).

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Frequent:** Anorexia, nausea, vomiting, diarrhea, dysphagia, photosensitivity (may be severe). **Occasional:** Rash, urticaria.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Superinfection (esp. fungal), benign intracranial hypertension (headache, visual changes) may occur. Hepatotoxicity, fatty degeneration of liver, pancreatitis occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question for history of allergies, esp. to tetracyclines, sulfites.

**INTERVENTION/EVALUATION**

Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

**PATIENT/FAMILY TEACHING**

• Avoid unnecessary exposure to sunlight. • Do not take with antacids, iron products. • Complete full course of therapy. • After application of dental gel, avoid brushing teeth, flossing the treated areas for 7 days. • Report severe diarrhea. • May cause nausea, vomiting. If GI upset occurs, may take with small amount food; however, Oracea should be taken on an empty stomach.

## dulaglutide

**doo-la-gloo-tide**  
(Trulicity)

**BLACK BOX ALERT** Contraindicated in pts with a personal/family history of medullary thyroid carcinoma (MTC) or in pts with multiple endocrine neoplasia syndrome type 2 (MEN2). Unknown if dulaglutide causes thyroid cell tumors in humans.

**Do not confuse dulaglutide with albiglutide or liraglutide.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** GLP-1 receptor agonist. **CLINICAL:** Antidiabetic.

### USES

Adjunct to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dulaglutide, other GLP-1 receptor agonists. Personal/family history of medullary thyroid carcinoma or multiple endocrine neoplasia syndrome type 2.

**Cautions:** Pts with increased serum calcitonin, thyroid nodules, hx pancreatitis, renal/hepatic impairment. Not recommended in pts with severe GI disease, diabetic ketoacidosis, or type 1 diabetes.

### ACTION

Activates GLP-1 receptors in pancreatic beta cells. **Therapeutic Effect:** Augments glucose-dependent insulin release, slows gastric emptying. Improves glycemic control.

### PHARMACOKINETICS

Readily absorbed following SQ administration. Degraded into amino acids by general protein catabolism. Peak plasma

concentration: 24–72 hrs. Steady state reached in 2–4 wks. Elimination not specified. **Half-life:** 5 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of hypoglycemia. **Liraglutide, semaglutide** may enhance adverse/toxic effects. **HERBAL:** **St. John's wort, Syrian rue** may enhance the serotonergic effect. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum glucose, Hgb A1c. May increase amylase, lipase.

### AVAILABILITY (Rx)

**Prefilled Injector Pen or Syringe:** 0.75 mg/0.5 mL, 1.5 mg/0.5 mL.

### ADMINISTRATION/HANDLING

#### SQ

- Administer any time of day, without regard to food, on same day each week.
- May change administration day if last dose was given more than 3 days prior. If dose missed, administer within 3 days of missed dose. If more than 3 days have passed after missed dose, wait until next regularly scheduled dose to administer.

**Administration** • Subcutaneously insert needle into abdomen, thigh, or upper arm region and inject solution. • Do not reuse needle. • Rotate injection sites each week.

**Storage** • Refrigerate unused pens/syringes; do not freeze. • May store at room temperature for up to 14 days. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes Mellitus

**SQ: ADULTS/ELDERLY:** Initially, 0.75 mg once wkly. May increase to 1.5 mg once wkly after 4-8 wks. May further increase to 3 mg once wkly after at least 4 wks on 1.5 mg wkly dose. **Maximum:** 4.5 mg once wkly after at least 4 wks on 3 mg once wkly.

### Dose Modification

**Concomitant use with insulin secretagogue (e.g., sulfonylurea) or insulin:** Consider reduced dose of insulin secretagogue or insulin based on glyce-mic goal.

### Dosage in Renal Impairment

No dose adjustment.

### Dosage in Hepatic Impairment

Use caution.

## SIDE EFFECTS

**Occasional (12%–6%):** Nausea, diarrhea, vomiting, abdominal pain. **Rare (4% or less):** Decreased appetite, dyspepsia, fatigue, asthenia.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. with dehydration), severe gastroparesis, pancreatitis, thyroid C-cell tumors. May increase risk of hypoglycemia when used with other hypoglycemic agents or insulin. Dyspnea, pruritus, rash may indicate hypersensitivity reaction. May prolong PR interval by 2–3 msec or may rarely cause first-degree AV block, tachycardia. Immunogenicity (antidulaglutide antibody formation) reported. Some pts with antibody formation also tested positive for antibodies to GLP-1 and human albumin.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain fasting glucose level, Hgb A1c, BMP. Question history of medullary thyroid

carcinoma, multiple endocrine neoplasia syndrome type 2, pancreatitis, renal impairment; first-degree AV block, PR interval prolongation. Receive full medication history and screen for use of other hypoglycemic agents or insulin. Assess pt's understanding of diabetes management, routine home glucose monitoring, medication self-administration. Assess hydration status.

### INTERVENTION/EVALUATION

Monitor capillary blood glucose levels, Hgb A1c; renal function test in pts with renal impairment reporting severe GI reactions, including diarrhea, gastroparesis, vomiting. Screen for thyroid tumors (dysphagia, dyspnea, persistent hoarseness, neck mass). If tumor suspected, consider endocrinologist consultation. Clinical significance of serum calcitonin level or thyroid ultrasound with GLP-1–associated thyroid tumors is debated/unknown. Assess for hypoglycemia, hyperglycemia, hypersensitivity/allergic reaction. Screen for glucose-altering conditions: fever, stress, surgical procedures, trauma. Obtain dietary consult for nutritional education. Encourage PO intake.

### PATIENT/FAMILY TEACHING

- Diabetes requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking additional medications to lower blood sugar or when glucose demands are altered (fever, infection, stress, trauma), have low blood sugar treatment available (glucagon, oral dextrose).
- Report suspected pregnancy or plans for breastfeeding.
- Therapy may increase risk of thyroid cancer; report lumps or swelling of the neck; hoarseness, shortness of breath, trouble swallowing.
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Rash, itching, hives may indicate allergic reaction.

# DULoxetine

 TOP  
100

 du-**lox**-e-teen

(Cymbalta, Drizalma Sprinkle)

**BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

**Do not confuse DULoxetine with FLUoxetine or PARoxetine.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin norepinephrine reuptake inhibitor (SNRI). **CLINICAL:** Antidepressant.

## USES

Treatment of major depression. Management of pain associated with diabetic neuropathy or chronic musculoskeletal pain. Treatment of generalized anxiety disorder. Treatment of fibromyalgia. **OFF-LABEL:** Treatment of stress urinary incontinence in women.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to DULoxetine. Uncontrolled narrow-angle glaucoma. Use of MAOI intended to treat psychiatric disorder (concurrent or within 14 days of discontinuing MAOI). Initiation of MAOI intended to treat psychiatric disorder within 5 days of discontinuing DULoxetine. Initiation of DULoxetine in pt receiving linezolid or IV methylene blue. **Cautions:** Renal impairment, history of alcoholism, chronic hepatic disease, history of mania, pts with suicidal ideation or behavior. Concurrent use with inhibitors of CYP1A2 or thioridazine, CNS depressants. Hypertension, controlled narrow-angle glaucoma, impaired GI motility. Concomitant use of NSAIDs (may increase risk of bleeding), history of seizures. Use of medications

that lower seizure threshold; elderly; pts at high risk for suicide.

## ACTION

Appears to inhibit serotonin and norepinephrine reuptake at CNS neuronal presynaptic membranes; is a less potent inhibitor of DOPamine reuptake. **Therapeutic Effect:** Produces antidepressant effect.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: greater than 90%. Metabolized in liver. Excreted in urine (70%), feces (20%). **Half-life:** 8–17 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May produce neonatal adverse reactions (constant crying, feeding difficulty, hyperreflexia, irritability). Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Caution required when increasing dosage.

## INTERACTIONS

**DRUG:** Alcohol increases risk of hepatic injury. CYP1A2 and CYP2D6 inhibitors (e.g., FLUoxetine, fluvoxamine, PARoxetine) may increase plasma concentration. MAOIs may cause serotonin syndrome (autonomic hyperactivity, coma, diaphoresis, excitement, hyperthermia, rigidity). Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of bleeding. May increase concentration, potential toxicity of tricyclic antidepressants. **HERBAL:** Glucosamine, herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. St. John's wort, Syrian rue may enhance the serotonergic effect resulting in serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, alkaline phosphatase.

## AVAILABILITY (Rx)

 **Capsules (Delayed-Release, Enteric-Coated Pellets):** 20 mg, 30 mg, 40 mg, 60 mg. **(Drizalma Sprinkle):** 20 mg, 30 mg, 40 mg, 60 mg delayed-release capsules.

## ADMINISTRATION/HANDLING

 **ALERT** Allow at least 14 days to elapse between use of MAOIs and DULoxetine.

### PO

- Give without regard to food. Give with food, milk if GI distress occurs.
- Do not break, crush, cut delayed-release capsules.
- Contents of capsule may be sprinkled on applesauce or mixed in apple juice and swallowed (without chewing) immediately.

## INDICATIONS/ROUTES/DOSAGE

### Fibromyalgia

**PO: ADULTS, ELDERLY, ADOLESCENTS 13 YRS OF AGE OR OLDER:** Initially, 30 mg/day for 1 wk. Increase to 60 mg/day as tolerated.

### Major Depressive Disorder

**PO: ADULTS, ELDERLY:** Initially, 40–60 mg/day in 1 or 2 divided doses. For doses greater than 60 mg/day, titrate in increments of 30 mg/day over 1 wk. **Maximum:** 120 mg/day.

### Diabetic Neuropathy Pain

**PO: ADULTS, ELDERLY:** 60 mg once daily. **Maximum:** 60 mg/day. Consider lower dose with renal impairment or if tolerability is a concern.

### Generalized Anxiety Disorder

**PO: ADULTS, ELDERLY:** Initially, 30–60 mg once daily. May increase up to 120 mg/day in 30-mg increments wkly. **CHILDREN 7–17 YRS:** Initially, 30 mg once daily. After 2 wks, may increase to 60 mg once daily. May further increase in increments of 30 mg/day at wkly intervals. **Maximum:** 120 mg/day.

### Chronic Musculoskeletal Pain

**PO: ADULTS, ELDERLY:** 30 mg once daily for 1 wk, then increase to 60 mg once daily. **Maximum:** 60 mg/day.

## Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment (GFR less than 30 mL/min):** Not recommended.

## Dosage in Hepatic Impairment

Avoid use in pts with chronic hepatic disease or cirrhosis.

## SIDE EFFECTS

**Frequent (20%–11%):** Nausea, dry mouth, constipation, insomnia. **Occasional (9%–5%):** Dizziness, fatigue, diarrhea, drowsiness, anorexia, diaphoresis, vomiting. **Rare (4%–2%):** Blurred vision, erectile dysfunction, delayed or failed ejaculation, anorgasmia, anxiety, decreased libido, hot flashes.

## ADVERSE EFFECTS/TOXIC REACTIONS

May slightly increase heart rate. Colitis, dysphagia, gastritis, irritable bowel syndrome occur rarely.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess appearance, behavior, speech pattern, level of interest, mood, sleep pattern, suicidal tendencies. Question pain level, intensity, location of pain.

### INTERVENTION/EVALUATION

For pts on long-term therapy, serum chemistry profile to assess hepatic/renal function should be performed periodically. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor B/P, mental status, anxiety, social functioning, serum glucose levels.

### PATIENT/FAMILY TEACHING

- Therapeutic effect may be noted within 1–4 wks.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Inform physician of intention of pregnancy or if pregnancy occurs.
- Report anxiety, agitation, panic attacks, worsening of de-

pression. • Avoid heavy alcohol intake (associated with severe hepatic injury).

## dupilumab

doo-pil-ue-mab  
(Dupixent)

**Do not confuse dupilumab with belimumab, daclizumab, denosumab or durvalumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Interleukin-4 alpha antagonist. Monoclonal antibody. **CLINICAL:** Antiasthmatic.

### USES

Treatment of moderate to severe atopic dermatitis in adults and pediatric pts 6 yrs and older whose disease is not adequately controlled with topical prescription therapies or when those therapies are not advisable. May be used with or without corticosteroids. Add-on maintenance treatment of asthma in adults and pts 6 yrs and older with an eosinophilic phenotype or corticosteroid-dependent asthma. Add-on maintenance treatment in adults with inadequately controlled chronic rhinosinusitis with nasal polyposis.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to dupilumab. **Cautions:** History of herpes simplex infection, parasitic (helminth) infection. Avoid use of live vaccines.

### ACTION

Binds to the IL-4Ra subunit inhibiting interleukin-4 (IL-4) and interleukin-13 (IL-13), signaling cytokine-induced responses, including release of pro-inflammatory cytokines. Mechanism of action in asthma not established. **Therapeutic Effect:** Reduces skin inflammation.

### PHARMACOKINETICS

Widely distributed. Degraded into small peptides and amino acids via catabolic

pathway. Peak plasma concentration: 7 days. Steady state reached by wk 16. Excretion/clearance: time to nondetectable concentration: 10 wks. **Half-life:** Not specified.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

### INTERACTIONS

**DRUG:** May enhance the adverse/toxic effects of **live virus vaccines**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase eosinophils.

### AVAILABILITY (Rx)

**Injection, Solution:** 200 mg/1.14 mL, 300 mg/2 mL in prefilled syringe. **Solution, Pen Injector:** 300 mg/2 mL (2 mL).

### ADMINISTRATION/HANDLING

#### SQ

**Preparation** • Remove prefilled syringe from refrigerator and allow to warm to room temperature (approx. 45 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Refrigerate in original carton until time of use. • May be stored at room temperature for up to 14 days. • Protect from light. • Do not freeze or expose to external heat sources. • Do not shake.

**INDICATIONS/ROUTES/DOSAGE****Atopic Dermatitis**

**SQ: ADULTS, ELDERLY:** Initially, 600 mg (two 300-mg injections at different sites), then 300 mg every other week. If a dose is missed, administer within 7 days of missed dose, then resume normal schedule. If missed dose is not within 7 days, wait until next scheduled dose. **CHILDREN 6 YRS AND OLDER, ADOLESCENTS 17 YRS OR YOUNGER, WEIGHING 60 KG OR MORE:** Initially, 600 mg once (administered as two 300-mg injections), followed by a maintenance dose of 300 mg q2wks. **WEIGHING 30–59 KG:** Initially, 400 mg once (administered as two 200-mg injections), followed by a maintenance dose of 200 mg q2wks. **WEIGHING 15–29 KG:** Initially, 600 mg once (given as two 300-mg injections). **Maintenance:** 300 mg q4wks.

**Asthma (Moderate to Severe)**

**SQ: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 400 mg (give as two 200-mg injections) or 600 mg (give as two 300-mg injections). **Maintenance:** 200 mg (following initial 400-mg dose) or 300 mg (following initial 600-mg dose) every other wk. **CHILDREN 6–11 YRS: (Note):** An initial loading dose is not necessary. If patient has atopic dermatitis comorbidity, the dosing for atopic dermatitis (including the initial loading dose) should be used to determine dupilumab therapy. **30 KG OR GREATER:** 200 mg q2wks. **15–29 KG:** 100 mg q2wks or 300 mg q4wks.

**Asthma (Steroid-Dependent or With Atopic Dermatitis)**

**SQ: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** Initially, 600 mg, then 300 mg every other wk.

**Rhinosinusitis (Chronic) With Nasal Polyposis**

**SQ: ADULTS, ELDERLY:** 300 mg every other wk. If a dose is missed, administer within 7 days of missed dose, then resume usual schedule. If a dose is missed by more than 7 days, skip dose and give at next regularly scheduled time.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment (not studied).

**SIDE EFFECTS**

**Occasional (10%):** Injection site reactions, eye inflammation/irritation. **Rare (1%):** Eye pruritus, dry eye.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hypersensitivity reactions including serum sickness (arthralgia, itching, glomerulonephritis, hypotension, lymphadenopathy, malaise, proteinuria, pyrexia, rash, shock, splenomegaly), urticaria reported in less than 1% of pts, which correlated with high antibody titers. Blepharitis, conjunctivitis (allergic, bacterial, giant papillary, viral), keratitis (ulcerative, allergic, atopic keratoconjunctivitis), herpes simplex infection (genital, otitis externa, herpes virus infection) may occur. Unknown if treatment will influence the immunologic response to helminth (parasite) infection. Immunogenicity (auto-dupilumab antibodies) reported in 7% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Question history of herpes zoster infection, parasitic infection, hypersensitivity reaction. Question recent administration of live virus vaccine. Pts with preexisting helminth (parasite) infection should be treated prior to first dose. Inhaled or systemic corticosteroids should not be suddenly discontinued upon initiation. Conduct dermatologic exam; record characteristics of psoriatic lesions. Consider administration of age-appropriate immunizations (if applicable) before initiation. Assess pt's willingness to self-inject medication.

**INTERVENTION/EVALUATION**

Interrupt or discontinue treatment if hypersensitivity reaction, opportunistic infection (esp. parasite infection, herpes zoster infection), worsening of asthma-related symptoms (esp. in pts tapering off corticosteroids) occurs. Concomitant use

of topical calcineurin inhibitors is allowed, but only for areas that remain problematic (face, neck, genitals, skin folds). Assess for improvement of skin lesions.

#### PATIENT/FAMILY TEACHING

- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Inject medication into your outer thigh or abdomen; caregivers may also inject medication in the outer arm.
- Immediately report allergic reactions such as difficulty breathing, itching, hives, rash, swelling of the face or tongue.
- Report infections of any kind.
- Do not stop corticosteroid therapy unless directed by prescriber.
- Do not receive live vaccines.
- Do not interrupt or stop asthma medications or treatments.

## durvalumab

dur-val-ue-mab  
(Imfinzi)

**Do not confuse durvalumab with daclizumab, dupilumab, or nivolumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-programmed death ligand-1 (PD-L1). Monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Treatment of pts with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy. Treatment of unresectable stage III non-small-cell lung cancer (NSCLC) that has not progressed following concurrent platinum-based chemotherapy and radiation

therapy. First-line treatment of adults with extensive stage small-cell lung cancer (ES-SCLC) in combination with etoposide and either CARBOplatin or CISplatin.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to durvalumab. **Cautions:** Active infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); corticosteroid intolerance, baseline hematologic cytopenias, elderly pts, hepatic impairment, interstitial lung disease, renal insufficiency; history of autoimmune disorders (Crohn's disease, demyelinating polyneuropathy, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, rheumatoid arthritis, Type 1 diabetes, vasculitis); diabetes, pancreatitis.

#### ACTION

Blocks programmed cell death ligand 1 (PD-L1) binding to PD-1 and CD80 (B7.1). PD-L1 blockade increases T-cell activation allowing T-cells to kill tumor cells. Restores antitumor T-cell function. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

#### PHARMACOKINETICS

Widely distributed. Metabolism not specified. Steady state reached in 16 wks. Excretion not specified. **Half-life:** 17 days.

#### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. Breastfeeding not recommended during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of toxic reactions; use caution.

## INTERACTIONS

**DRUG:** Corticosteroids (Systemic) may decrease therapeutic effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum albumin, alkaline phosphatase, ALT, AST, bilirubin, calcium, creatinine, glucose, magnesium. May decrease serum sodium; Hgb, Hct, lymphocytes, neutrophils, RBCs. May increase or decrease serum potassium.

## AVAILABILITY (Rx)

**Injection:** 120 mg/2.4 mL (50 mg/mL), 500 mg/10 mL (50 mg/mL).

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect vial for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly yellow in color. • Do not use if solution is cloudy, discolored, or if visible particles are observed. • Do not shake. • Withdraw proper volume from vial and dilute in 0.9% NaCl or D<sub>5</sub>W to a final concentration of 1–15 mg/mL. • Gently invert to mix; do not shake. • Diluted solution should appear clear, colorless, and free of particles.

**Rate of administration** • Infuse over 60 min via dedicated IV line using a sterile, low protein-binding 0.2- or 0.22-micron in-line filter.

**Storage** • Refrigerate unused vials in original carton. • Protect from light. May refrigerate diluted solution for no more than 24 hrs or store at room temperature for no more than 4 hrs. If refrigerated, allow diluted solution to warm to room temperature before use. • Do not freeze or shake.

## IV INCOMPATIBILITIES

Do not infuse with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Urothelial Carcinoma

**IV: ADULTS, ELDERLY:** 10 mg/kg q2wks. Continue until disease progression or unacceptable toxicity.

### NSCLC

**IV: ADULTS, ELDERLY: 30 KG OR GREATER:** 10 mg/kg q2wks or 1,500 mg q4wks. **LESS THAN 30 KG:** 10 mg/kg q2wks. Continue until disease progression or unacceptable toxicity or a maximum of 12 mos.

### ES-SCLC

**IV: ADULTS, ELDERLY: 30 KG OR GREATER:** 1,500 mg q3wks (in combination with etoposide and either carboplatin or cisplatin) for 4 cycles, then q4wks as single therapy. **LESS THAN 30 KG:** 20 mg/kg q3wks (in combination with etoposide and either carboplatin or cisplatin) for 4 cycles, then 10 mg/kg q2wks as a single agent. Continue until disease progression or unacceptable toxicity.

### Dose Modification

**Note:** Withhold and/or discontinue durvalumab to manage adverse reactions. Based on severity of adverse reactions, withhold durvalumab and administer systemic corticosteroids. Initiate corticosteroid taper when adverse reactions improve to below Grade 1, and continue taper over at least 1 mo. If treatment is not permanently discontinued due to adverse reactions, resume therapy when adverse reactions return to Grade 1 or lower and the corticosteroid dose has been reduced to less than 10 mg predniSONE (or equivalent) per day. No dose reductions of durvalumab are recommended.

### Colitis (GI toxicity)

**Grade 2 diarrhea or colitis:** Withhold dose. Start predniSONE 1–2 mg/kg/day (or equivalent) followed by taper. **Grade 3 or 4 diarrhea or colitis:** Permanently discontinue. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper.

### Dermatitis

**Grade 2 rash or dermatitis (for greater than 1 wk); Grade 3 rash or dermatitis:** Withhold dose. Consider starting predniSONE 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 4 rash or dermatitis:** Permanently discontinue. Consider starting predniSONE 1–2 mg/kg/day (or equivalent), followed by taper.

### Endocrinopathies

**Grade 2–4 adrenal insufficiency (hypophysitis, hypopituitarism):** Withhold dose until clinically stable. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper. Consider hormone replacement therapy as clinically indicated. **Grade 2–4 hyperthyroidism:** Withhold dose until clinically stable and manage symptoms. **Grade 2–4 hypothyroidism:** Consider hormone replacement therapy. **Grade 2–4 type 1 diabetes:** Withhold dose until clinically stable. Start insulin therapy as clinically indicated.

### Hepatotoxicity

**Grade 2 hepatitis (serum ALT or AST greater than 3 and up to 5 times upper limit of normal [ULN] or serum bilirubin greater than 1.5 and up to 3 times ULN); Grade 3 hepatitis (serum ALT or AST less than or equal to 8 times ULN or serum bilirubin less than or equal to 5 times ULN):** Withhold dose. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 hepatitis (serum ALT or AST greater than 8 times ULN or serum bilirubin greater than 5 times ULN; transaminase elevation (concurrent serum ALT or AST greater than 3 times ULN and serum bilirubin greater than 2 times ULN) with no known cause:** Permanently discontinue. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper.

### Infection

**Grade 3 or 4 infection:** Withhold dose and manage symptoms. Start anti-infectives for suspected or confirmed infections.

### Infusion-Related Reactions

**Grade 1 or 2 infusion reactions:** Interrupt or decrease rate of infusion. Consider premedication for subsequent infusions. **Grade 3 or 4 infusion reactions:** Permanently discontinue.

### Nephritis (Renal toxicity during treatment)

**Grade 2 nephritis (serum creatinine greater than 1.5 and up to 3 times**

**ULN):** Withhold dose. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 nephritis (serum creatinine greater than 3 and up to 6 times ULN); Grade 4 nephritis (serum creatinine greater than 6 times ULN):** Permanently discontinue. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper.

### Other Toxic Reactions

**Any other Grade 3 reactions:** Withhold dose and manage symptoms. **Any other Grade 4 reactions:** Permanently discontinue. Start predniSONE 1–4 mg/kg/day (or equivalent), followed by taper.

### Pneumonitis

**Grade 2 pneumonitis:** Withhold dose. Start predniSONE 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 or Grade 4 pneumonitis:** Permanently discontinue. Start predniSONE 1–4 mg/kg/day (or equivalent) followed by taper.

### Dosage in Renal/Hepatic Impairment (Prior to Treatment Initiation)

Not specified; use caution.

## SIDE EFFECTS

**Frequent (39%–19%):** Fatigue, asthenia, malaise, back/musculoskeletal/neck pain, myalgia, constipation, decreased appetite.

**Occasional (16%–11%):** Nausea, peripheral edema, scrotal edema, lymphedema, abdominal/flank pain, diarrhea, pyrexia, dyspnea, cough, dermatitis, dermatitis acneiform, dermatitis psoriasiform, psoriasis, maculopapular rash, pustular rash, eczema, erythema, erythema multiforme, erythematous rash, acne, lichen planus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, neutropenia, lymphopenia are expected responses to therapy. May cause severe, sometimes fatal immune-mediated reactions such as adrenal insufficiency (1% of pts), colitis (2% of pts), hepatitis (1% of pts), hypothyroidism (9% of pts), hyperthyroidism (6% of pts), hypophysitis,

nephritis (less than 1% of pts), pneumonitis (2% of pts), type 1 diabetes (less than 1% of pts), rash (15% of pts); aseptic meningitis, hemolytic anemia, keratitis, myocarditis, myositis, thrombocytopenic purpura, uveitis. Urinary tract infections including candiduria, cystitis, urosepsis occurred in 15% of pts. Immunogenicity (auto-durvalumab antibodies) reported in 3% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT, thyroid function test; pregnancy test in females of reproductive potential; vital signs. Question medical history as listed in Precautions; prior infusion reactions. Question intolerance to corticosteroids. Screen for active infection. Assess nutritional/hydration status. Conduct neurologic/dermatologic exam. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, BMP, LFT, serum ionized calcium, magnesium; thyroid function test periodically. Monitor for infusion reactions including angioedema, back or neck pain, dyspnea, flushing, pruritus, pyrexia, rash, syncope. Consider increasing corticosteroid dose if toxic effects worsen or do not improve. Assess skin for rash, lesions. Diligently monitor for immune-mediated adverse effects as listed in Adverse Effects/Toxic Reactions. If immune-mediated reactions occur, consider referral to specialist. Obtain CXR if interstitial lung disease, pneumonitis suspected. Interrupt or discontinue treatment if serious infection, opportunistic infection, sepsis occurs, and initiate appropriate antimicrobial therapy. If corticosteroid therapy is started, monitor capillary blood glucose and screen for corticosteroid side effects or intolerance. Report neurologic changes including nuchal rigidity with fever, positive Kernig's sign, positive Brudzinski's sign, altered mental status, seizures (related to aseptic meningitis). Strictly monitor I&O. Encourage fluid intake.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Use effective contraception to avoid pregnancy. Do not breast-feed.
- Treatment may cause serious or life-threatening inflammatory reactions. Report symptoms of treatment-related inflammatory events in the following body systems: brain (confusion, headache, fever, rigid neck, seizures), colon (severe abdominal pain or diarrhea), eye (blurry vision, double vision, unequal pupil size, sensitivity to light, drooping eyelid), lung (chest pain, cough, shortness of breath), liver (bruising easily, amber-colored urine, clay-colored/tarry stools, yellowing of skin or eyes), nerves (severe nerve pain or loss of motor function), pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes), thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid] or fatigue, goiter, weight gain [underactive thyroid]). Immediately report infusion reactions such as neck or back pain, dizziness, fever, flushing, itching, shortness of breath, swelling of the face.
- Treatment may cause severe diarrhea. Drink plenty of fluids.

## duvelisib

**doo-ve-lis-ib**  
(Copiktra)

■ **BLACK BOX ALERT** ■ Fatal and/or serious infections, diarrhea, colitis, pneumonitis, cutaneous reactions have occurred. Monitor for infections, GI symptoms, pulmonary symptoms, infiltrates, cutaneous toxicities.

**Do not confuse Copiktra with Cometriq; duvelisib with copanlisib, dabrafenib, dasatinib, durvalumab, or idelalisib.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Phosphatidylinositol-3-kinase inhibitor.  
**CLINICAL:** Antineoplastic.

**USES**

Treatment of relapsed or refractory chronic lymphocytic leukemia (CLL) or small lymphocytic lymphoma (SLL) after at least two prior therapies. Treatment of relapsed or refractory follicular lymphoma after at least two prior systemic therapies.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to duvelisib. **Cautions:** Baseline anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia; active infection, conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), dehydration, hepatic impairment, history of pulmonary disease. Concomitant use of strong CYP3A inducers or CYP3A inhibitors.

**ACTION**

Inhibits phosphatidylinositol-3-kinase (PI3K) expressed on malignant B-cells. Inhibits signaling pathway of B-cell receptors, lymphoma cells lines, and CXCR12-mediated chemotaxis of malignant B cells. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 98%. Peak plasma concentration: 1–2 hrs. Excreted in feces (79%), urine (14%). **Half-life:** 4.7 hrs.

**LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at

least 1 mo after discontinuation. **Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 1 mo after discontinuation. May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease efficacy of BCG (intravesical), vaccines (live). May increase adverse effects of vaccines (live). **HERBAL:** Echinacea may decrease therapeutic effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, creatinine, lipase, potassium. May decrease serum albumin, calcium, sodium, phosphate; absolute neutrophil count (ANC), Hct, Hgb, leukocytes, lymphocytes, neutrophils, platelets, RBC count.

**AVAILABILITY (Rx)**

**Capsules:** 15 mg, 25 mg.

**ADMINISTRATION/HANDLING****PO**

- Give without regard to food.
- Administer whole; do not break, cut, or open capsule. Capsule cannot be chewed.
- If a dose is missed by no more than 6 hrs, administer as soon as possible. If a dose is missed by more than 6 hrs, skip dose and administer at next regularly scheduled time.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Recommend prophylactic therapy for *Pneumocystis jirovecii* pneumonia (PJP) during treatment and until absolute CD4+ T-cell count is greater than 200 cells/mm<sup>3</sup>. To prevent cytomegalovirus (CMV) infection, recommend pro-

phylactic antiviral therapy during treatment.

### CLL, SLL, Follicular Lymphoma

**PO:** ADULTS, ELDERLY: 25 mg twice daily.

### Reduction Schedule for Adverse Effects

**First dose reduction:** 15 mg. Unable to tolerate 15 mg dose: Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Cutaneous Reactions

**Grade 1 or 2 cutaneous reactions:** Maintain dose and treat with supportive therapy. **Grade 3 cutaneous reactions:** Withhold treatment until resolved with supportive therapy, then resume at reduced dose. **Life-threatening or recurrent cutaneous reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia and systemic reaction:** Permanently discontinue.

### Diarrhea or Colitis (noninfectious)

**Grade 1 or 2 diarrhea that is responsive to antidiarrheal medication; asymptomatic Grade 1 colitis:** Maintain dose and treat with antidiarrheal medication. **Grade 1 or 2 diarrhea that is not responsive to antidiarrheal medication:** Withhold treatment until resolved with supportive therapy. Once resolved, resume at reduced dose. **Grade 3 diarrhea, abdominal pain, hematochezia, stool with mucus, change in bowel habits, peritoneal signs:** Withhold treatment until resolved with supportive therapy, then resume at reduced dose. **Recurrent Grade 3 diarrhea; recurrent colitis (any grade):** Permanently discontinue.

### Hepatotoxicity

**Serum ALT/AST elevation 3–5 times upper limit of normal (ULN):** Maintain dose. **Serum ALT/AST elevation**

**greater than 5–20 times ULN:** Withhold treatment until serum ALT/AST less than 3 times ULN, then resume at same dose for first occurrence or at reduced dose for subsequent occurrence. **Serum ALT/AST elevation greater than 20 times ULN:** Permanently discontinue.

### Infection

**Grade 3 or higher infection:** Withhold treatment until resolved, then resume at same or reduced dose. **PJP infection of any grade:** Withhold treatment and evaluate for confirmation. If PJP infection is confirmed, permanently discontinue. **Clinical CMV infection or viremia (confirmed with positive PCR test or antigen test):** Withhold treatment until resolved, then resume at same or reduced dose.

### Neutropenia

**ANC 500–1000 cells/mm<sup>3</sup>:** Maintain dose. **ANC less than 500 cells/mm<sup>3</sup>:** Withhold treatment until ANC is greater than 500 cells/mm<sup>3</sup>, then resume at same dose for first occurrence or at reduced dose for subsequent occurrence.

### Thrombocytopenia

**Platelet count 25,000 to less than 50,000 cells/mm<sup>3</sup> with Grade 1 bleeding:** Maintain dose. **Platelet count 25,000 to less than 50,000 cells/mm<sup>3</sup> with Grade 2 bleeding; platelet count less than 25,000 cells/mm<sup>3</sup>:** Withhold treatment until platelet count is greater than or equal to 25,000 cells/mm<sup>3</sup> and bleeding has resolved (if applicable). Resume at same dose for first occurrence or at reduced dose for subsequent occurrence.

### Pneumonitis (Noninfectious)

**Grade 2 symptomatic pneumonitis:** Withhold treatment and treat pneumonitis as appropriate. Once improved to Grade 1 or 0, resume at reduced dose. **Grade 3 pneumonitis; life-threatening or recurrent pneumonitis despite steroid therapy:** Permanently discontinue.

### Concomitant Use With Strong CYP3A Inhibitors

If CYP3A inhibitor cannot be discontinued, reduce dose to 15 mg twice daily.

### Dosage in Renal/Hepatic Impairment

**Mild to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (50%–13%):** Diarrhea, rash, fatigue, pyrexia, cough, nausea, musculoskeletal pain, abdominal pain, vomiting, mucositis, edema, decreased appetite, constipation. **Occasional (12%–10%):** Headache, dyspnea, arthralgia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Anemia, leukopenia, lymphopenia, lymphocytosis, neutropenia, thrombocytopenia are expected responses to therapy. Serious infections including pneumonia, bronchopulmonary aspergillosis, sepsis, lung infection reported in 31% of pts. *Pneumocystis jirovecii* pneumonia reported in less than 1% of pts. CMV infection/reactivation or viremia reported in 1% of pts. Fatal and/or severe diarrhea or colitis reported in 18% of pts. Serious cutaneous reactions including erythema, pruritus, rash, toxic skin eruption, skin peeling, exfoliation, keratinocyte necrosis occurred in 5% of pts. Fatal cases of toxic epidermal necrolysis, drug reaction with eosinophilia and systemic reaction have occurred. Noninfectious pneumonitis occurred in 5% of pts. Grade 3 or 4 hepatotoxicity reported in 2%–8% of pts. Grade 3 or 4 neutropenia reported in 42% of pts, which may greatly increase risk of infection.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain ANC, CBC, LFTs; pregnancy test in female pts of reproductive potential. Screen for active infection. Recommend prophylaxis therapy for *Pneumocystis jirovecii* pneumonia during treatment

and until absolute CD4+ T cell count is greater than 200 cells/mm<sup>3</sup>. To prevent CMV infection, recommend prophylactic antiviral therapy during treatment. Assess skin for open wounds, lesions. Assess hydration status. Question history of hepatic impairment, pulmonary disease. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor ANC, CBC, LFT periodically. If blood dyscrasias occurs, monitor ANC, CBC wkly until improved. If hepatotoxicity occurs, monitor LFTs wkly until improved. Be alert for infections, esp. respiratory tract infection such as *Pneumocystis jirovecii* pneumonia, bacterial/fungal/pneumococcal/viral pneumonia (cough, dyspnea, hypoxia, pleuritic chest pain). If infection occurs, provide anti-infective therapy as appropriate. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, hypoxia) is suspected. If treatment-related toxicities occur, consider referral to specialist. Assess skin for cutaneous reactions, skin toxicities. Monitor for CMV reactivation (by PCR test or antigen test) at least monthly in pts who test positive for CMV. In pts who develop diarrhea, colitis, abdominal pain, or change in bowel habits, monitor daily pattern of bowel activity and stool consistency at least wkly until resolved with supportive therapies. In pts who develop cutaneous reactions, monitor at least wkly until resolved with supportive therapies. Monitor I&Os, hydration status.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report symptoms of liver

**D** problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes); inflammation of the lung (excessive cough, difficulty breathing, chest pain); toxic skin reactions (itching, peeling, rash, redness, swelling). • Use effective contraception to avoid pregnancy. Do not breastfeed.

• Treatment may cause severe diarrhea, which may require antidiarrheal medication. Report worsening of diarrhea or dehydration. Drink plenty of fluids. • Do not take newly prescribed medications unless approved by the prescriber who originally started treatment. • Do not ingest grapefruit products.

## edoxaban

e-dox-a-ban

(Savaysa, Lixiana )

**BLACK BOX ALERT** ■ Avoid use in nonvalvular atrial fibrillation pts with creatinine clearance (CrCl) greater than 95 mL/min (increased risk of ischemic stroke). Premature discontinuation of oral anticoagulant in the absence of alternative anticoagulation may increase risk of ischemic events. If treatment is discontinued for any reason other than pathologic bleeding or completion of course of therapy, consider coverage with another anticoagulant as described in transition guideline. Epidural or spinal hematomas may occur in pts who are receiving neuraxial anesthesia or undergoing spinal puncture, which may result in long-term or permanent paralysis.

**Do not confuse edoxaban with apixaban or rivaroxaban.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Factor Xa inhibitor. **CLINICAL:** Anticoagulant.

### USES

To reduce risk of stroke and systemic embolism (SE) in pts with nonvalvular atrial fibrillation (NVAF). Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE) following 5–10 days of initial therapy with a parenteral anticoagulant.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to edoxaban. Major active bleeding. **Cautions:** Elderly, pts at increased risk of bleeding (e.g., prior trauma, thrombocytopenia, severe uncontrolled hypertension; history of bleeding ulcers, upper or lower GI bleeding), recent surgery, renal/hepatic impairment. Avoid concomitant use with aspirin, heparin, low molecular weight heparin (LMWH), NSAIDs, P-gp inducers (e.g., rifAMPin). Not recommended in pts with CrCl greater than

95 mL/min (increased risk of ischemic stroke); mechanical heart valves; moderate to severe mitral stenosis.

### ACTION

Inhibits free factor Xa and prothrombinase activity, inhibits thrombin-induced platelet aggregation. **Therapeutic Effect:** Reduces thrombin generation and thrombus formation.

### PHARMACOKINETICS

Readily absorbed and widely distributed. Peak plasma concentration: 1–2 hrs. Steady state reached within 3 days. Protein binding: 55%. Primarily excreted in urine (50%), biliary/intestinal excretion (remaining %). Not removed by hemodialysis. **Half-life:** 10–14 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of bleeding due to age-related renal impairment.

### INTERACTIONS

**DRUG:** NSAIDs (e.g., ibuprofen, ketorolac, naproxen), fibrinolytic therapy (e.g., alteplase), aspirin may increase concentration/effect; may increase risk of bleeding. **Strong CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifAMPin) may decrease concentration/effect. **Apixaban, dabigatran, rivaroxaban** may increase anticoagulant effect. **HERBAL:** Herbals with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May increase serum AST, ALT. May prolong aPTT, PT/INR.

### AVAILABILITY (Rx)

 **Tablets:** 15 mg, 30 mg, 60 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.
- Do not administer within 2 hrs of removal of epidural or intrathecal catheters.

**INDICATIONS/ROUTES/DOSAGE****Nonvalvular Atrial Fibrillation**

**PO: ADULTS, ELDERLY:** 60 mg once daily.

**DVT/PE**

**PO: ADULTS, ELDERLY WEIGHING MORE THAN 60 KG:** 60 mg once daily following 5–10 days of initial therapy with a parenteral anticoagulant. **60 KG OR LESS:** 30 mg once daily.

**Dose Modification**

**Body weight less than or equal to 60 kg or concomitant use of certain P-gp inhibitors:** 30 mg once daily.

**Dosage in Renal Impairment**

**(DVT/PE): CrCl 15–50 mL/min:** 30 mg once daily. **CrCl less than 15 mL/min:** Not recommended. **(Nonvalvular atrial fibrillation): CrCl greater than 95 mL/min:** Not recommended. **CrCl 51–95 mL/min:** No dose adjustment. **CrCl 15–50 mL/min:** 30 mg once daily. **CrCl less than 15 mL/min:** Not recommended.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended.

**Discontinuation for Surgery or Other Interventions**

Discontinue at least 24 hrs before invasive surgical procedures. May restart as soon as adequate hemostasis is achieved, noting that the time of onset of pharmacodynamic effect is 1–2 hrs.

**Transition Guideline to Edoxaban**

**From warfarin or other vitamin K antagonists:** Discontinue warfarin and start edoxaban when INR is less than or equal to 2.5. **From oral anticoagulants other than warfarin or other vitamin K antagonists:** Discontinue current oral anticoagulant and start edoxaban at the time of the next scheduled dose of the other oral anticoagulant. **From LMWH:** Discontinue LMWH and start edoxaban at the time of the next

scheduled dose of LMWH. **From low unfractionated heparin:** Discontinue infusion and start edoxaban 4 hrs later.

**Transition Guideline From Edoxaban to Other Anticoagulant**

**To Warfarin: Oral option:** For pts taking edoxaban 60 mg, reduce to 30 mg and begin warfarin concomitantly. For pts taking edoxaban 30 mg, reduce dose to 15 mg and begin warfarin concomitantly. Once stable INR greater than or equal to 2, discontinue edoxaban and continue warfarin. **Parenteral option:** Discontinue edoxaban and administer parenteral anticoagulant and warfarin at the time of next scheduled edoxaban dose. Once stable INR greater than or equal to 2, discontinue parenteral anticoagulant and continue warfarin. **To non-vitamin K-dependent oral anticoagulant or parenteral anticoagulant:** Discontinue edoxaban and start other oral anticoagulant at the time of the next scheduled dose.

**SIDE EFFECTS**

**Rare (4%):** Rash.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hemorrhagic events including intracranial hemorrhage, hemorrhagic stroke, cutaneous/GI/GU/oral/pharyngeal/urethral/vaginal bleeding, epistaxis, epidural/spinal hematoma (esp. with epidural catheters, spinal trauma) were reported. Discontinuation in the absence of other adequate anticoagulants may increase the risk of ischemic events, stroke. May increase risk of epidural or spinal hematomas, which can lead to long-term or permanent paralysis. Protamine sulfate, vitamin K, tranexamic acid are not expected to reverse anticoagulant effect. Interstitial lung disease was reported in less than 1% of pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain renal function test, esp. creatinine clearance; PT/INR in pts transitioning on

or off warfarin therapy. Do not initiate if CrCl greater than 95 mL/min. Question history of bleeding disorders, recent surgery, spinal procedures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, renal/hepatic impairment, trauma. Receive full medication history including herbal products.

#### INTERVENTION/EVALUATION

Monitor renal function test; occult urine/stool, urine output. Monitor for symptoms of hemorrhage: abdominal/back pain, headache, altered mental status, weakness, paresthesia, aphasia, vision changes, GI bleeding. Question for increase in menstrual bleeding/discharge. Assess peripheral pulses; skin for ecchymosis, petechiae. Assess urine output for hematuria.

#### PATIENT/FAMILY TEACHING

- Do not discontinue current blood thinning regimen or take any newly prescribed medication unless approved by prescriber who started anticoagulant therapy.
- Suddenly stopping therapy may increase risk of stroke or blood clots. Refill prescriptions so that next scheduled dose is not missed.
- Immediately report bleeding of any kind.
- Avoid alcohol, aspirin, NSAIDs.
- Consult physician before surgery/dental work.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report any numbness, muscular weakness, signs of stroke (confusion, headache, one-sided weakness, trouble speaking), bloody stool or urine, nosebleeds.
- Monitor changes in urine output.

## elbasvir/grazoprevir

el-bas-vir/graz-oh-pre-vir  
(Zepatier)

■ **BLACK BOX ALERT** ■ Hepatitis B virus reactivation may cause fulminant hepatitis, hepatic failure, and death.

**Do not confuse elbasvir with daclatasvir, ombitasvir or grazoprevir with boceprevir or simeprevir.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** NS5A inhibitor/NS3/4A protease inhibitor.  
**CLINICAL:** Antihemipaciviral.

#### USES

Treatment of chronic hepatitis C virus genotypes 1 or 4 infection in adults, with or without ribavirin.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to elbasvir or grazoprevir, decompensated hepatic cirrhosis, moderate or severe hepatic impairment; concomitant use of organic anion transporting polypeptides 1B1/3 (OATP1B1/3) inhibitors, strong CYP3A inducers. Concomitant use of atazanavir, carbamazepine, cyclosporine, darunavir, efavirenz, lopinavir, phenytoin, rifampin, saquinavir, St. John's wort, tipranavir. Any contraindications or hypersensitivity to ribavirin (if used with treatment regimen). **Cautions:** HIV infection, mild hepatic impairment. Safety and efficacy not established in pts with hepatitis B virus coinfection, liver transplant recipients.

#### ACTION

Elbasvir inhibits hepatitis C virus (HCV) NS5A protein, which is essential for viral RNA replication and virion assembly. Grazoprevir inhibits HCV NS3/4A protease needed for processing HCV-encoded polyproteins, which is essential for viral replication. **Therapeutic Effect:** Inhibits viral replication of hepatitis C virus.

#### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: elbasvir (99.9%), grazoprevir (98.8%). Peak plasma concentration: 3 hrs. Steady state reached in approx. 6 days. Excreted in feces (greater

than 90%), urine (less than 1%). **Half-life:** elbasvir: 24 hrs; grazoprevir: 31 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use caution in pregnancy. Unknown if distributed in breast milk. When used with ribavirin, breastfeeding and pregnancy are contraindicated during treatment and up to 6 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of hepatotoxicity.

### INTERACTIONS

**DRUG:** Anticonvulsants (e.g., carbamazepine, phenytoin), antimycobacterials (e.g., rifabutin, rifampin), efavirenz may significantly decrease concentration/effect; use contraindicated. Atazanavir, darunavir, cyclosporine may significantly increase risk of hepatotoxicity; use contraindicated. Moderate CYP3A inducers (e.g., amiodarone, diltiazem, fluconazole) may decrease concentration/effect. Elvitegravir/cobicistat/emtricitabine/tenofovir (disoproxil or alafenamide), ketoconazole may increase concentration/effect. May increase concentration/effect of atorvastatin, fluvastatin, hydrocodone, lovastatin, niMODipine, rosuvastatin, simvastatin, tacrolimus. **HERBAL:** St. John's wort may decrease concentration/effect; use contraindicated. **FOOD:** None known. **LAB VALUES:** May decrease Hgb. May increase serum ALT, bilirubin.

### AVAILABILITY (Rx)

**Fixed-Dose Combination Tablets:** elbasvir 50 mg/grazoprevir 100 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give without regard to food.

### INDICATIONS/ROUTES/DOSAGE

**Note:** NS5A resistance testing recommended in HCV genotype 1a infected pts prior to initiating treatment with Zepatier.

### Chronic Hepatitis C Virus Infection

**PO: ADULTS, ELDERLY:** 1 tablet once daily (with or without ribavirin).

#### Treatment Regimen and Duration

**PO: ADULTS, ELDERLY: Genotype 1a: Treatment-naïve or peginterferon alfa (PegIFN)/ribavirin (RBV)—experienced without baseline NS5A polymorphisms:** 1 tablet once daily for 12 wks. **Genotype 1a: Treatment-naïve or PegIFN/RBV—experienced with baseline NS5A polymorphisms:** 1 tablet once daily with ribavirin for 16 wks. **Genotype 1b: Treatment-naïve or PegIFV/RBV—experienced:** 1 tablet once daily for 12 wks. **Genotype 1a or 1b: PegIFV/RBV/protease inhibitor—experienced:** 1 tablet once daily with ribavirin for 12 wks. **Genotype 4: Treatment-naïve:** 1 tablet once daily for 12 wks. **Genotype 4: PegIFN/RBV—experienced:** 1 tablet once daily with ribavirin for 16 wks.

#### Treatment-Induced Hepatotoxicity

Consider discontinuation in pts with persistent serum ALT elevation greater than 10 times upper limit of normal (ULN). Permanently discontinue if serum ALT elevation is accompanied with elevated alkaline phosphatase, conjugated bilirubin, prolonged INR, or signs of acute hepatic inflammation.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Contraindicated.

### SIDE EFFECTS

**Occasional (11%–3%):** Fatigue, headache, diarrhea, nausea, insomnia, dyspnea, rash, pruritus, irritability. **Rare (2%):** Abdominal pain, arthralgia.

### ADVERSE EFFECTS/TOXIC REACTIONS

Serum ALT elevation up to 5 times ULN reported in 1% of pts. Serum bilirubin

elevation greater than 2.5 times ULN occurred in 6% of pts. Serum ALT elevation occurred more frequently in the elderly, female pts, and pts of Asian ancestry.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, LFT, HCV-RNA level; pregnancy test in female pts of reproductive potential. Confirm hepatitis C genotype. In pts with HCV genotype 1a, recommend testing for the presence of NS5A resistance-associated polymorphisms prior to initiation. Receive full medication history including herbal products; screen for contraindications. Question history of chronic anemia, hepatitis B virus infection, HIV infection, liver transplantation.

### INTERVENTION/EVALUATION

Obtain LFT at wk 8, then as clinically indicated. For pts receiving 16 wks of therapy, obtain additional LFT at wk 12. Monitor CBC periodically; HCV-RNA levels at wks 4, 8, 12, 16 and as clinically indicated. Monitor for hepatotoxicity. Assess for anemia-related dizziness, exertional dyspnea, fatigue, weakness, syncope. Encourage nutritional intake. Assess for decreased appetite, weight loss. Obtain monthly pregnancy tests in females of reproductive potential if treated with ribavirin.

### PATIENT/FAMILY TEACHING

- Treatment may be used in combination with ribavirin (inform pt of side effects/toxic reactions). If therapy includes ribavirin, female pts of reproductive potential should avoid pregnancy during treatment and up to 6 mos after last dose.
- Do not take newly prescribed medication unless approved by the doctor who originally started treatment.
- Do not take herbal products, esp. St. John's wort.
- Avoid alcohol, grapefruit products.
- Report signs of treatment-induced liver injury such as abdominal pain, clay-colored stool, dark amber urine, decreased appetite, fatigue, weakness, yellowing of the skin or eyes.
- Maintain proper nutritional intake.

## eletriptan

el-e-**trip**-tan  
(Relpax)

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Serotonin receptor agonist. **CLINICAL:** Antimigraine.

### USES

Treatment of acute migraine headache with or without aura.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to eletriptan. Arrhythmias associated with conduction disorders, cerebrovascular syndrome including strokes and transient ischemic attacks (TIAs), coronary artery disease, hemiplegic or basilar migraine, ischemic heart disease, peripheral vascular disease including ischemic bowel disease, severe hepatic impairment, uncontrolled hypertension; use within 24 hrs of treatment with another 5-HT<sub>1</sub> agonist, an ergotamine-containing or ergot-type medication such as dihydroergotamine (DHE) or methysergide. Recent use (within 72 hrs) of strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, itraconazole, ritonavir). **Cautions:** Mild to moderate renal/hepatic impairment, controlled hypertension, history of CVA.

### ACTION

Selective agonist for serotonin in cranial arteries; causes vasoconstriction and reduces inflammation. **Therapeutic Effect:** Relieves migraine headache.

### PHARMACOKINETICS

Widely distributed. Metabolized by liver. Excreted in urine. **Half-life:** 4.4 hrs (increased in hepatic impairment, elderly [older than 65 yrs]).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** May decrease possibility of ovulation. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of hypertension in those older than 65 yrs.

## E INTERACTIONS

**DRUG:** Ergot derivatives (e.g., ergotamine) may increase vasoconstrictive effect. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. MAOIs (e.g., phenelzine, selegiline) may cause serotonin syndrome. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

 **Tablets:** 20 mg, 40 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

## INDICATIONS/ROUTES/DOSAGE

### Acute Migraine Headache

**PO: ADULTS, ELDERLY:** Initially, 20–40 mg as a single dose. **Maximum:** 40 mg/dose. If headache improves but then returns, dose may be repeated after 2 hrs. **Maximum:** 80 mg/day.

### Dosage in Renal/Hepatic Impairment

No dose adjustment. Not recommended in severe hepatic impairment.

## SIDE EFFECTS

**Occasional (6%–5%):** Dizziness, drowsiness, asthenia, nausea. **Rare (3%–2%):** Paresthesia, headache, dry mouth, warm or hot sensation, dyspepsia, dysphagia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage,

CVA) occur rarely, particularly in pts with hypertension, obesity, diabetes, strong family history of coronary artery disease; smokers; males older than 40 yrs; postmenopausal women. May cause GI ischemia, bowel infarction, non-cardiac-related vasospasms including peripheral vascular ischemia, Raynaud's syndrome. Overuse may increase frequency, occurrence of headaches.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms). Obtain baseline B/P for evidence of uncontrolled hypertension (contraindication).

### INTERVENTION/EVALUATION

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, fogginess). Monitor for cardiac arrhythmia, coronary events, hypertension, hypersensitivity reaction.

### PATIENT/FAMILY TEACHING

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine headaches, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Immediately report palpitations, pain/tightness in chest/throat, sudden or severe abdominal pain, pain/weakness of extremities.

## elexacaftor/ tezacaftor/ivacaftor

e-lex-a-kaf-tor/tez-a-kaf-tor/eye-va-kaf-tor  
(Trikafta)

**Do not confuse elexacaftor/  
tezacaftor/ivacaftor (Trikafta)**

with lumacaftor/ivacaftor (Orkambi).

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Cystic fibrosis transmembrane conductance regulator (CFTR) modulator. **CLINICAL:** Cystic fibrosis agent.

**USES**

Treatment of cystic fibrosis (CF) in pts aged 6 yrs and older who have at least one F508del mutation in the CFTR gene.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to elexacaftor, tezacaftor, ivacaftor. **Cautions:** Moderate hepatic impairment, concomitant use of CYP3A inhibitors. Avoid use of concomitant strong CYP3A inducers. Not recommended in severe hepatic impairment.

**ACTION**

Mutations in the CFTR gene (encodes the CFTR protein) are the cause of cystic fibrosis. The Phe508del mutation (most common CFTR mutation) causes abnormal CFTR trafficking, reducing the quantity of CFTR protein at the cell surface and disrupting channel gating. Elexacaftor and tezacaftor improve cellular processing/trafficking of Phe508del-CFTR, increasing CFTR at the cell surface. Ivacaftor increases chloride channel transport by augmenting channel gating. **Therapeutic Effect:** Improves lung/organ function, decreases respiratory exacerbations.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: elexacaftor: greater than 99%, tezacaftor: 99%, ivacaftor: 99%. Peak plasma concentration: elexacaftor: 4–12 hrs, tezacaftor: 2–4 hrs, ivacaftor: 3–6 hrs. Steady state reached within 14 days (elexacaftor), 8 days (tezacaftor), 3–5 days (ivacaftor). Excretion: elexacaftor: feces (87%), urine (less than

1%); tezacaftor: feces (72%), urine (14%); ivacaftor: feces (89%), urine (7%). **Half-life:** elexacaftor: 29.8 ± 10.6 hrs, tezacaftor: 17.4 ± 3.66 hrs, ivacaftor: 15 ± 3.92 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Unknown if distributed in breast milk. Hormonal contraceptives may increase incidence of rash events. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Safety and efficacy not established.

**INTERACTIONS**

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., erythromycin, fluconazole) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May increase concentration of afatinib, colchicine, conivaptan, idelalisib, pazopanib, rimegepant, topotecan. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST, bilirubin, CPK. May decrease serum glucose.

**AVAILABILITY (Rx)**

**Fixed-Dose Combination Tablets (Copackaged With Ivacaftor Tablets):** elexacaftor 100 mg/tezacaftor 50 mg/ivacaftor 75 mg per tablet; ivacaftor 150 mg.

**ADMINISTRATION/HANDLING**

**PO**

- Give with fat-containing food (e.g., eggs, butter, peanut butter, whole-milk dairy products [e.g., whole milk, cheese, yogurt]).
- Administer tablets whole; do not break, crush, or divide.
- If a morning dose is missed by more than 6 hrs, give as soon as possible, but do not give evening dose. If an evening

dose is missed by more than 6 hrs, skip the evening dose and administer the morning dose at usual scheduled time. Do not give morning and evening doses at same time.

## INDICATIONS/ROUTES/DOSAGE

### Cystic Fibrosis

**PO: ADULTS, CHILDREN 6 YRS AND OLDER:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning and 1 tablet of ivacaftor (150 mg) in the evening (approx. 12 hrs apart).

### Dose Modification

#### Concomitant Use of Moderate CYP3A Inhibitors

**Note:** Do not give evening dose of ivacaftor.

**Dosing schedule for day 1:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning. **Day 2:** 1 tablet of ivacaftor (150 mg) in the morning. **Day 3:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning. **Day 4:** 1 tablet of ivacaftor (150 mg) in the morning. Repeat the 4-day cycle thereafter.

#### Concomitant Use of Strong CYP3A Inhibitors

**Note:** Do not give evening dose of ivacaftor.

**Dosing schedule for day 1:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning. **Day 2 and 3:** No dose. **Day 4:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning. Repeat the 4-day cycle thereafter.

### Hepatotoxicity

**Serum ALT/AST greater than 5 times ULN, serum ALT/AST greater than 3 times ULN with bilirubin greater than 2 times ULN:** Withhold treatment until resolved. Consider the risk versus benefit of resuming treatment.

### Rash Events

**Rash in females taking hormonal contraception:** Consider withholding treatment and hormonal contraceptive until rash is resolved, then consider resuming treatment without hormonal contraceptive. If rash does not recur, may consider resuming hormonal contraceptive.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment, ESRD:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate impairment:** 2 fixed-dose combination tablets (elexacaftor 100 mg, tezacaftor 50 mg, ivacaftor 75 mg per tablet) in the morning only (do not give evening ivacaftor dose). **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Occasional (17%–7%):** Headache, abdominal pain, diarrhea, rash, nasal congestion, rhinorrhea, rhinitis. **Rare (5%–2%):** Flatulence, abdominal distention, dizziness, dysmenorrhea, acne, eczema, pruritus.

## ADVERSE EFFECTS/TOXIC REACTIONS

Elevated transaminases may occur. Worsening of hepatic function was reported in pts with baseline hepatic impairment. Cataracts were reported in pediatric pts taking ivacaftor. Infections including upper respiratory tract infection (16% of pts), influenza (7% of pts), sinusitis (5% of pts), conjunctivitis, pharyngitis, tonsillitis, UTI were reported. Rash events were reported more frequently in females, which may be related to concomitant use of hormonal contraceptives.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT. If pt's genotype is unknown, a CF mutation test should be obtained to

confirm presence of at least one F508del mutation. Assess baseline symptoms of cystic fibrosis (abdominal discomfort/gas, persistent cough, inability to mobilize secretions, poor weight gain, lung infections, dyspnea). Question history of hepatic impairment. Receive full medication history and screen for drug interactions.

#### INTERVENTION/EVALUATION

Monitor LFT q3mos for 12 mos, then annually thereafter (or more frequently in pts with baseline hepatic impairment). Assess respiratory function, organ function for treatment effectiveness. Assess sputum production; ability to mobilize secretions. If concomitant use of strong or moderate CYP3A inhibitors is unavoidable, monitor for toxicities. Monitor for rash in females taking hormonal contraception.

#### PATIENT/FAMILY TEACHING

- Always take medication with fatty foods.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started therapy.
- Avoid vitamins, grapefruit products, herbal supplements (esp. St. John's wort).
- Report symptoms of liver problems (e.g., bruising, confusion; dark, amber, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes).
- Report vision changes, cataracts; signs of respiratory infection (e.g., cough, fever, shortness of breath).
- Rashes are more common in female pts taking hormonal contraception.

## elotuzumab

el-oh-too-zue-mab  
(Empliciti)

**Do not confuse elotuzumab with alemtuzumab, eculizumab, evolocumab, pertuzumab, gemtuzumab, trastuzumab.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-SLAMF7. Monoclonal antibody. **CLINICAL:** Antineoplastic.

#### USES

Treatment of multiple myeloma (in combination with lenalidomide and dexamethasone) in pts who have received one to three prior therapies or (in combination with pomalidomide and dexamethasone) in pts who have received at least two prior therapies including lenalidomide and a proteasome inhibitor.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to elotuzumab. **Cautions:** Diabetes, baseline cytopenias, hypertension; history of chronic opportunistic infections (esp. viral infections, fungal infections), conditions predisposing to infection (e.g., diabetes, kidney failure, open wounds). Concomitant use of medications known to cause bradycardia (e.g., antiarrhythmics, beta blockers, calcium channel blockers). Concomitant use of live vaccines not recommended during treatment and up to 3 mos after discontinuation. Avoid use during severe active infection.

#### ACTION

Binds to and specifically targets signaling lymphocytic activation molecule family member 7 (SLAMF7), a protein that is expressed on most myeloma and natural killer cells. Directly activates natural killer cells and facilitates cellular death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

#### PHARMACOKINETICS

Widely distributed. Metabolism not specified. Elimination not specified. **Half-life:** Not specified; 97% of steady-state concentration is expected to be eliminated within 82 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm/malformations/fetal demise when used with lenalidomide. Unknown if distributed in breast milk. However, immunoglobulin G (IgG) is present in breast milk. Breast-feeding contraindicated when used with concomitant lenalidomide treatment. **Men:** Lenalidomide is present in semen. Recommend use of barrier methods during sexual activity. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May increase immunosuppressant/toxic effects of **immunosuppressants** (e.g.,  **fingolimod**, **leflunomide**, **nivolumab**). **Roflumilast** may increase immunosuppressant effect. May enhance adverse/toxic effect of **live vaccines**; may decrease therapeutic effect of **vaccines (live)**, **BCG (intravesical)**. **HERBAL:** **Echinacea** may decrease effect. **FOOD:** None known. **LAB VALUES:** May be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M-protein. May affect the determination of complete response and disease progression of some pts with IgG kappa myeloma protein. Expected to decrease lymphocytes, leukocytes, platelets. May decrease serum albumin, bicarbonate, calcium. May increase serum alkaline phosphatase, ALT, AST, glucose, potassium.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 300 mg, 400 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Calculate the dose and number of vials required based on weight in kg. • Reconstitute the 300-mg vial with 13 mL of Sterile Water for Injection or the 400-mg vial with 17 mL of Sterile Water for Injection using an 18-g or lower (e.g., 17, 16, or 15) needle. • Gently roll

vial upright to mix. To dissolve any powder left on top of vial or stopper, gently invert vial several times. • Do not shake or agitate. • The powder should dissolve in less than 10 min. • After dissolution, allow vials to stand for 5–10 min. • Visually inspect solution for particulate matter of discoloration. Solution should appear clear, colorless to slightly yellow. Discard if solution is cloudy or discolored or if foreign particles are observed. Each vial contains an overfill volume to allow for a specific withdrawal of 12 mL (300-mg vial) or 16 mL (400-mg vial). • Final concentration of withdrawn volume (without overfill) will equal 25 mg/mL. • Dilute in 230 mL of 0.9% NaCl or 5% Dextrose injection in polyvinyl chloride or polyolefin infusion bag. • Mix by gentle inversion; do not shake or agitate. • The volume may be adjusted in order to not exceed 5 mL/kg of pt weight at any given dose.

**Infusion guidelines** • Prior to administration, premedicate with dexamethasone, acetaminophen, antihistamine (H<sub>1</sub> antagonist, plus H<sub>2</sub> antagonist) approx. 45–90 min before each infusion (see manufacturer guidelines). • Use an in-line, sterile, nonpyrogenic, low protein-binding filter (0.2–1.2 mm). • Infuse via dedicated line using an infusion pump.

**Rate of administration** • **First infusion (cycle 1, dose 1):** Infuse at 0.5 mL/min for the first 30 min. If no infusion reactions occur, may increase to 1 mL/min for next 30 min. If tolerated, may increase to 2 mL/min. **Maximum rate:** 2 mL/min. • **Second infusion (cycle 1, dose 2):** Initiate at 1 mL/min for first 30 min if no infusion reactions occurred during first infusion. If tolerated, may increase to 2 mL/min until infusion completed. **Maximum rate:** 2 mL/min. • **Subsequent infusions (cycle 1, doses 3 and 4, all subsequent infusions):** Initiate at 2 mL/min until completion if no infusion reactions occurred during prior infusion. **Maximum rate:** 2 mL/min. In pts who have received four cycles of treatment, infusion rate may be increased to maximum rate of 5 mL/min.

**Storage** • Refrigerate intact vials until time of use. • Do not freeze or shake. • Refrigerate diluted solution up to 24 hrs. • May store at room temperature up to 8 hrs (of the total 24 hrs). • Diluted solution must be administered within 24 hrs of reconstitution. • Protect from light.

**IV INCOMPATIBILITIES**

Do not mix with other medications.

**INDICATIONS/ROUTES/DOSAGE**

**Multiple Myeloma**

**Note:** Premedicate with dexamethasone, H<sub>1</sub> or H<sub>2</sub> blocker, and acetaminophen 45–90 mins before infusion.

**IV: ADULTS, ELDERLY:** (*In combination with lenalidomide and dexamethasone*): **Cycles 1 and 2:** 10 mg/kg once wkly on days 1, 8, 15, 22 of 28-day cycle.

**Cycles 3 and beyond:** 10 mg/kg once q2wks on days 1 and 15 of 28-day cycle. Continue until disease progression or unacceptable toxicity. (*In combination with pomalidomide and dexamethasone*): **Cycles 1 and 2:** 10 mg/kg once wkly on days 1, 8, 15, 22 of 28-day cycle.

**Cycles 3 and beyond:** 20 mg/kg once q4wks on day 1 of 28-day cycle. Continue until disease progression or unacceptable toxicity.

**Dose Modification**

**Infusion Reactions**

**Grade 2 or higher reaction:** Interrupt infusion until symptoms improve. Once resolved to Grade 1 or 0, resume infusion at 0.5 mL/min. If tolerated, increase in increments of 0.5 mL/min q30mins back to previous rate. May further increase rate as indicated if no reaction recurs. If infusion reaction recurs, stop infusion and do not restart for that day.

**Dosage in Renal/Hepatic Impairment**

Not specified; use caution.

**SIDE EFFECTS**

**Frequent (61%–20%):** Fatigue, diarrhea, pyrexia, constipation, cough, peripheral neuropathy, decreased appetite.

**Occasional (16%–10%):** Extremity pain, headache, vomiting, decreased weight, oropharyngeal pain, hypoesthesia, mood change, night sweats.

**ADVERSE EFFECTS/TOXIC REACTIONS**

All cases were reported in combination with lenalidomide and dexamethasone. Infusion reactions reported in 10% of pts. Most infusion reactions were Grade 3 and lower. Lymphopenia, leukopenia, thrombocytopenia are expected responses to therapy. Infections were reported in 81% of pts. Grade 3 or 4 infections occurred in 28% of pts. Nasopharyngitis (25% of pts), upper respiratory tract infection (23% of pts), opportunistic infection (22% of pts), herpes zoster (14% of pts), fungal infection (10% of pts), influenza; second primary malignancies, skin malignancies, solid tumors, malignant neoplasms; tachycardia, bradycardia, systolic or diastolic hypertension, hypotension; pulmonary embolism may occur. Hepatotoxicity with elevation of serum alkaline phosphatase greater than 2 times upper limit of normal (ULN), serum ALT/AST greater than 3 times ULN, total bilirubin greater than 2 times ULN reported in 3% of pts. Other adverse effects may include cataracts (12% of pts), hyperglycemia (89% of pts), hypersensitivity reaction (greater than 5% of pts). Immunogenicity (auto-elotuzumab antibodies) occurred in 19% of pts. Thrombocytopenia may increase risk of bleeding.

**NURSING CONSIDERATIONS**

**BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT; serum ionized calcium; capillary blood glucose, vital signs; pregnancy test in female pts of reproductive potential. Obtain baseline ECG in pts

concurrently using medications known to cause bradycardia. Question history of chronic opportunistic infections, diabetes, hepatic impairment, pulmonary embolism; prior infusion or hypersensitivity reactions. Screen for medications known to cause bradycardia, hyperglycemia. Screen for active infection. Offer emotional support.

#### INTERVENTION/EVALUATION

Obtain CBC, BMP, LFT, ionized calcium periodically. Administer in an environment equipped to monitor for and manage infusion reactions. If infusion reaction of any grade/severity occurs, immediately interrupt infusion and manage symptoms. Accurately record characteristics of infusion reactions (severity, type, time of onset). Infusion reactions may affect future infusion rates. Monitor HR, BP q30mins during infusion and for at least 2 hrs after completion in pts with prior hemodynamic reactions. Cough, dyspnea, hypoxia, tachycardia may indicate pulmonary embolism. Monitor for bradycardia, cataracts, hyperglycemia, hyperkalemia, hypersensitivity reaction, hepatotoxicity, neuropathy, tachycardia. Assess for new primary malignancies (solid tumors, skin cancers); skin for new lesions, moles. Monitor daily pattern bowel activity, stool consistency.

#### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Therapy may decrease your heart rate, esp. in those taking medications that lower heart rate; report dizziness, chest pain, palpitations, or fainting.
- Avoid pregnancy. Do not breastfeed.
- Male pts should use condoms during sexual activity.
- Treatment includes a steroid that may raise blood sugar levels; report dehydration, blurry vision, confu-

sion, frequent urination, increased thirst, fruity breath.

- Report allergic reactions of any kind.
- Abdominal pain, easy bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes may indicate liver problem.

## eluxadoline

el-ux-ad-oh-leen  
(Viberzi)

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Mu-opioid receptor agonist. Schedule IV.  
**CLINICAL:** GI agent.

#### USES

Treatment of irritable bowel syndrome with diarrhea (IBS-D) in adults.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to eluxadoline. Known or suspected biliary duct obstruction, sphincter of Oddi disease or dysfunction; pts without a gallbladder; severe hepatic impairment; severe constipation or sequelae from constipation, or known or suspected mechanical GI obstruction. History of alcoholism, alcohol abuse, alcohol addiction, or consumption of more than 3 alcoholic beverages/day. History of pancreatitis; structural disease of the pancreas, including known or suspected pancreatic duct obstruction. **Cautions:** Mild to moderate hepatic impairment, respiratory disease.

#### ACTION

Acts locally on mu opioid, delta opioid, and kappa opioid receptors involved with gut motility, pain sensations, and secretion of liquids within the digestive tract.  
**Therapeutic Effect:** Reduces abdomi-

nal pain and diarrhea (without causing constipation).

## PHARMACOKINETICS

Metabolism not specified. Protein binding: 81%. Peak plasma concentration: 1.5 hrs. Primarily excreted in feces (82%), urine (less than 1%). **Half-life:** 3.7–6 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** OATP1B1 inhibitors (e.g., cycloSPORINE, ritonavir, rifAMPin), gemfibrozil may increase concentration/effect. **Drugs that cause constipation** (e.g., alosetron, anticholinergics [e.g., diphenhydrAMINE], loperamide, opioids [e.g., morphine]) may increase risk of serious constipation-associated adverse effects. May increase concentration of rosuvastatin, increasing risk of myopathy/rhabdomyolysis. **Alcohol** may enhance the adverse/toxic effect. **HERBAL:** None significant. **FOOD:** High-fat meals may decrease absorption. **LAB VALUES:** May increase serum ALT, AST, lipase.

## AVAILABILITY (Rx)

 **Tablets:** 75 mg, 100 mg.

## ADMINISTRATION/HANDLING

### PO

- Administer with food.
- If scheduled dose is missed, give next dose at the regular time; do not give 2 doses at once.

## INDICATIONS/ROUTES/DOSAGE

### Irritable Bowel Syndrome–Associated Diarrhea

**PO: ADULTS, ELDERLY:** 100 mg twice daily. May decrease to 75 mg twice daily if unable to tolerate 100-mg dose.

## Dose Modification

**Pts who are unable to tolerate 100-mg dose, or are receiving concomitant OATP1B1 inhibitors:** 75 mg twice daily.

**Pts who develop severe constipation for more than 4 days:** Permanently discontinue.

## Dosage in Renal Impairment

Not specified; use caution.

## Dosage in Hepatic Impairment

**Mild to moderate impairment:** 75 mg twice daily. **Severe impairment:** Contraindicated.

## SIDE EFFECTS

**Occasional (8%–4%):** Constipation, nausea, abdominal pain (upper or lower), upper respiratory tract infection, vomiting. **Rare (3%–1%):** Abdominal distention, dizziness, flatulence, rash, urticaria, fatigue, sedation, somnolence, euphoric mood.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of sphincter of Oddi spasm (esp. in pts without a gallbladder), resulting in pancreatitis or hepatic enzyme elevation that may be associated with or without acute abdominal pain, or nausea/vomiting; 80% of pts reported sphincter of Oddi spasm within the first week of treatment. May also increase risk of pancreatitis that is not associated with sphincter of Oddi spasm. Infections including upper respiratory tract infection, bronchitis, nasopharyngitis, viral gastroenteritis were reported. May cause hypersensitivity reaction including asthma, bronchospasm, respiratory failure, wheezing. Recreational abuse may produce feelings of euphoria, which may lead to physical dependence.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT in pts with baseline hepatic impairment. Receive full medication history and screen for interactions. Question pt's usual stool characteristics (color, frequency, consistency). Question history of alcoholism, biliary duct obstruction, cholecystectomy, mechanical GI obstruction, hepatic impairment, hypersensitivity reaction, pancreatic disease, respiratory disease, sphincter of Oddi disease or spasm. Assess hydration status.

### INTERVENTION/EVALUATION

Monitor for abdominal pain that radiates to the back or shoulder, with or without nausea or vomiting (esp. during first few weeks of treatment). Obtain LFT, serum lipase level if acute pancreatitis, sphincter of Oddi spasm, biliary tract obstruction suspected. Monitor for hypersensitivity reaction including dyspnea, rash, wheezing. Observe and record daily pattern of bowel activity, stool consistency. Encourage PO intake. If an acute overdose occurs, a narcotic mu-opioid antagonist such as naloxone may be considered if reversal of overdose-related adverse effects is needed.

### PATIENT/FAMILY TEACHING

- Therapy may cause inflammation of the pancreas (pancreatitis) or elevated liver-associated abdominal pain, esp. during the first few weeks of treatment. Report any new or worsening abdominal pain that radiates to the back or shoulder, with or without nausea/vomiting.
- Avoid chronic or acute excessive use of alcohol; may increase risk of liver or pancreas injury.
- If a dose is missed, take the next dose at the regular time; do not take 2 doses at once.
- Report constipation lasting longer than 4 days.
- Avoid medications that cause constipation (e.g., antidiarrheals, narcotics).
- Report signs of allergic reaction; respiratory problems

such as worsening of asthma, bronchitis, wheezing. • Drink plenty of fluids.

## empagliflozin

em-pa-gli-floe-zin  
(Jardiance)

**Do not confuse empagliflozin with canagliflozin, dapagliflozin, or ertugliflozin.**

### FIXED-COMBINATION(S)

**Glyxambi:** empagliflozin/linagliptin (an antidiabetic): 10 mg/5 mg, 25 mg/5 mg. **Synjardy:** Empagliflozin/metFORMIN (an antidiabetic): 5 mg/500 mg, 5 mg/1000 mg, 12.5 mg/500 mg, 12.5 mg/1000 mg. **Trijardy XR:** empagliflozin/linagliptin (an antidiabetic)/metformin (an antidiabetic): 10 mg/5 mg/1,000 mg; 25 mg/5 mg/1,000 mg; 5mg/ 2.5 mg/1,000 mg; 12.5 mg/2.5 mg/1,000 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sodium-glucose co-transporter 2 (SGLT2) inhibitor. **CLINICAL:** Antidiabetic.

### USES

Adjunctive treatment to diet and exercise to improve glycemic controls in pts with type 2 diabetes mellitus. Reduce risk of cardiovascular death in pts with type 2 diabetes and cardiovascular disease.

### PRECAUTIONS

**Contraindications:** History of hypersensitivity to empagliflozin, other SGLT2 inhibitors, severe renal impairment (eGFR less than 30 mL/min), end-stage renal disease, dialysis. **Cautions:** Concomitant use of loop diuretics, other hypoglycemic agents (e.g., insulin, insulin secretagogues), baseline systolic hypotension, renal impairment, hypovolemia/dehydra-

tion, recent genital mycotic infection; pts at risk for diabetic ketoacidosis (insulin dose reduction, acute febrile illness, reduced calorie intake, surgery, alcohol abuse, history of pancreatitis). Not recommended in pts with active bladder cancer, diabetic ketoacidosis, type 1 diabetes mellitus.

## ACTION

Inhibits SGLT2 in proximal renal tubule, reducing reabsorption of filtered glucose from tubular lumen and lowering renal threshold for glucose. Reduces reabsorption of sodium and increases delivery of sodium to the distal tubule. **Therapeutic Effect:** Increases urinary excretion of glucose; lowers serum glucose levels. Reduces cardiac preload and afterload; downregulates sympathetic activity.

## PHARMACOKINETICS

Rapidly absorbed and widely distributed. Metabolized in liver. Peak plasma concentration: 1.5 hrs. Protein binding: 86%. Excreted in urine (54%) and feces (41%). **Half-life:** 12.4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid use during second or third trimester. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk for adverse reactions (e.g., hypotension, syncope, dehydration).

## INTERACTIONS

**DRUG:** Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of hypoglycemia. **Loop diuretics** (e.g., furosemide) may increase risk of symptomatic hypotension. **HERBAL:** Fenugreek, garlic, ginkgo, ginger, ginseng, maitake may increase hypoglycemic effect. **FOOD:** None

known. **LAB VALUES:** May increase serum creatinine; low-density lipoprotein cholesterol (LDL-C); Hct. May decrease serum bicarbonate; eGFR. Expected to result in positive urine glucose test. May interfere with 1,5-anhydroglucitol (1,5-AG) assay.

## AVAILABILITY (Rx)

 **Tablets:** 10 mg, 25 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food in the morning.

## INDICATIONS/ROUTES/DOSAGE

**Type 2 Diabetes Mellitus, Reduce Risk of Cardiovascular Death**

**PO: ADULTS, ELDERLY:** Initially, 10 mg once daily in the morning. May increase to 25 mg once daily after 4–12 wks.

### Dosage in Renal Impairment

**GFR 45 mL/min or greater:** No dose adjustment. **GFR less than 45 mL/min:** Discontinue. Do not initiate.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** No dose adjustment.

## SIDE EFFECTS

**Rare (4%–1.1%):** Increased urination, dyslipidemia, arthralgia, nausea.

## ADVERSE EFFECTS/TOXIC REACTIONS

Symptomatic hypotension (orthostatic hypotension, postural dizziness, syncope) may occur, esp. in pts who are elderly, use concomitant loop diuretics, or have baseline systolic hypotension. Intravascular volume depletion/contraction may cause acute kidney injury requiring dialysis. Fatal cases of ketoacidosis were reported. Hypoglycemic events were reported in pts using con-

comitant insulin, insulin secretagogues. Infections including influenza, nasopharyngitis, pyelonephritis, urosepsis, UTI, genital mycotic infections (male and female), upper respiratory tract infection may occur. Necrotizing fasciitis of the perineum (Fournier gangrene), a life-threatening necrotizing infection of the genital and perineum region that requires urgent surgical intervention, has been reported. Hypersensitivity reactions including anaphylaxis, angioedema, urticaria have occurred.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P. Assess hydration status. Correct volume depletion prior to initiation. Assess pt's understanding of diabetes management, routine home glucose monitoring. Obtain dietary consult for nutritional education. Question history of renal impairment, type 1 diabetes, ketoacidosis. In pts with requiring surgery, consider suspending treatment at least 3 days before surgery. Receive full medication history and screen for interactions.

### INTERVENTION/EVALUATION

Monitor BUN, serum creatinine, eGFR, CrCl, blood glucose level, Hgb A1c; B/P periodically. Monitor for ketoacidosis (e.g., dehydration, confusion, extreme thirst, sweet-smelling breath, Kussmaul respirations, nausea), hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors), hyperglycemia (fatigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting). Pts presenting with metabolic acidosis should be screened for ketoacidosis, regardless of serum glucose levels. Concomitant use of beta blockers (e.g., carvedilol,

metoprolol) may mask symptoms of hypoglycemia. Monitor for acute kidney injury (dark-colored urine, flank pain, decreased urine output, muscle aches), infections (cough, fatigue, fever), urinary tract infections (dysuria, fever, flank pain, malaise), mycotic infections, Fournier gangrene (perineal necrosis). Screen for glucose-altering conditions (fever, increased activity or stress, surgical procedures). Monitor weight, I&Os. Monitor for hypersensitivity reactions (anaphylaxis, angioedema, urticaria).

### PATIENT/FAMILY TEACHING

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking combination drug therapy or when glucose conditions are altered (excessive alcohol ingestion, insufficient carbohydrate intake, hormone deficiencies, critical illness), have a low blood sugar treatment available (e.g., glucagon, oral dextrose).
- Genital itching or discharge may indicate yeast infection.
- Report symptoms of perineal necrosis (e.g., discoloration, pain, swelling of the scrotum, penis, or perineum).
- Therapy may increase risk for dehydration, low blood pressure, which may cause kidney failure. Report decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet. Drink enough fluids to maintain adequate hydration. Pts with HF should be cautious of overhydration.
- Report symptoms of UTI, kidney infection (back pain, pelvic pain, burning while urinating, cloudy or foul-smelling urine), allergic reactions (difficulty breathing, rash, wheezing; swelling of the face or tongue).
- Go slowly from lying to standing.
- Do not breastfeed.

## emtricitabine

em-tri-sye-ta-bine (Emtriva)

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, lactic acidosis and severe hepatomegaly with steatosis (fatty liver) have been reported. Severe exacerbations of hepatitis B virus (HBV) reported in pts co-infected with HIV-1 and HBV following discontinuation. If discontinuation of therapy occurs, monitor hepatic function for at least several mos. Initiate anti-HBV therapy if warranted.

### FIXED-COMBINATION(S)

**Atripla:** emtricitabine/efavirenz (an antiretroviral)/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/600 mg/300 mg. **Complera:** emtricitabine/rilpivirine (an antiretroviral)/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/25 mg/300 mg. **Descovy:** emtricitabine/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/25 mg. **Genvoya:** emtricitabine/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/150 mg/150 mg/10 mg. **Odefsey:** emtricitabine/rilpivirine (nonnucleoside reverse transcriptase inhibitor [NNRTI])/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/25 mg/25 mg. **Stribild:** emtricitabine/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/tenofovir disoproxil fumarate (TDF) (a nucleotide reverse transcriptase inhibitor): 200 mg/150 mg/150 mg/300 mg. **Truvada:** emtricitabine/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/300 mg.

### ◆ Classification

**PHARMACOTHERAPEUTIC:** Nucleoside reverse transcriptase inhibitor.  
**CLINICAL:** Antiretroviral agent.

## USES

Used in combination with at least two other antiretroviral agents for treatment of HIV-1 infection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to emtricitabine. **Cautions:** Renal impairment; history of hepatitis, hepatic impairment.

## ACTION

Emtricitabine is phosphorylated intracellularly to emtricitabine 5'-triphosphate, which interferes with HIV viral RNA-dependent DNA polymerase. **Therapeutic Effect:** Impairs HIV replication, slowing progression of HIV infection.

## PHARMACOKINETICS

Widely distributed. Metabolized via phosphorylated by cellular enzymes. Protein binding: less than 4%. Excreted in urine (86%), feces (14%). **Half-life:** 10 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Breastfeeding not recommended due to risk of postnatal transmission of HIV infection. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, lipase, triglycerides. May alter serum glucose.

## AVAILABILITY (Rx)

**Capsules:** 200 mg. **Oral Solution:** 10 mg/mL.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.

## INDICATIONS/ROUTES/DOSAGE

### HIV

**PO: ADULTS, ELDERLY, ADOLESCENTS 18 YRS AND OLDER:** (**Capsules**): 200 mg once daily. (**Solution**): 240 mg once daily. **ADOLESCENTS 17 YRS OR YOUNGER, CHILDREN, INFANTS 3 MOS AND OLDER:** (**Oral solution**): 6 mg/kg/dose once daily. **Maximum:** 240 mg/day. (**Capsules**): **Pts weighing 33 kg or more and able to swallow capsule whole:** 200 mg once daily.

#### Dosage in Renal Impairment

Creatinine Clearance	Capsule	Oral Solution
30–49 mL/min	200 mg q48h	120 mg q24h
15–29 mL/min	200 mg q72h	80 mg q24h
Less than 15 mL/min; hemodialysis pts	200 mg q96h	60 mg q24h (administer after dialysis)

Administer after dialysis on dialysis days.

#### Dosage in Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent (23%-13%):** Headache, rhinitis, rash, diarrhea, nausea. **Occasional (14%-4%):** Cough, vomiting, abdominal pain, insomnia, depression, paresthesia, dizziness, peripheral neuropathy, dyspepsia, myalgia. **Rare (3%-2%):** Arthralgia, abnormal dreams.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Fatal cases of lactic acidosis, severe hepatomegaly with steatosis have occurred. A majority of cases occurred in women. If therapy is discontinued, pts co-infected with hepatitis B virus have an increased risk for viral replication, worsening of hepatic function, and may experience hepatic decompensation and/or failure. May induce immune reconstitution syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, PCP, tuberculosis, or acceleration of autoimmune disorders such as Graves'

disease, polymyositis, Guillain-Barré). Acute renal failure or worsening renal impairment may occur. May cause redistribution or accumulation of body fat (lipodystrophy).

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

CD4+ count, viral load, HIV-1 RNA level; pregnancy test in females of reproductive potential. Test all pts for HBV infection. Offer emotional support. Question history of hepatic disease.

#### INTERVENTION/EVALUATION

Monitor CD4+ count, viral load, HIV-1 RNA level for treatment effectiveness. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Cough, dyspnea, fever, excess band cells on CBC may indicate acute infection (WBC may be unreliable in pts with uncontrolled HIV infection). Obtain serum lactate level if lactic acidosis suspected. Monitor daily pattern of bowel activity, stool consistency. Question for evidence of nausea, pruritus. Assess skin for rash, urticaria. Monitor for immune reconstitution syndrome, hepatitis B virus reactivation.

#### PATIENT/FAMILY TEACHING

- Treatment does not cure HIV infection nor reduce risk of transmission. Practice safe sex with barrier methods or abstinence.
- Drug resistance can form if treatment is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report any new fever, chills, body aches, cough, night sweats, shortness of breath.
- Do not breastfeed.
- Antiretrovirals may cause excess body fat in upper back, neck, breast, trunk; and may cause decreased body fat in legs, arms, face. Report new-onset or worsening of depression.
- Report persistent or severe abdominal pain, nausea, vomiting, numbness.

## enalapril

en-al-a-pril  
(Epaned, Vasotec)

**■ BLACK BOX ALERT ■** May cause fetal injury. Discontinue as soon as possible once pregnancy is detected.

**Do not confuse enalapril with Anafranil, Elavil, Eldepryl, lisinopril, or ramipril.**

### FIXED-COMBINATION(S)

**Lexxel:** enalapril/felodipine (calcium channel blocker): 5 mg/2.5 mg, 5 mg/5 mg. **Teczem:** enalapril/diltiazem (calcium channel blocker): 5 mg/180 mg. **Vaseretic:** enalapril/hydrochlorothiazide (diuretic): 5 mg/12.5 mg, 10 mg/25 mg.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Angiotensin-converting enzyme (ACE) inhibitor. **CLINICAL:** Antihypertensive.

### USES

Treatment of hypertension alone or in combination with other antihypertensives. Adjunctive therapy for symptomatic HF. **Epaned:** Treatment of hypertension in adults and children older than 1 mo. **OFF-LABEL:** Proteinuria in steroid-resistant nephrotic syndrome.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to enalapril. History of angioedema from previous treatment with ACE inhibitors. Idiopathic/hereditary angioedema. Concomitant use of aliskiren in pts with diabetes. Coadministration with or within 36 hrs of switching to or from a neprilysin inhibitor (e.g., sacubitril). **Cautions:** Renal impairment, hypertrophic cardiomyopathy with outflow tract obstruction; severe aortic stenosis; before, during, or immediately after major surgery. Concomitant use of

potassium supplement; unstented unilateral or bilateral renal artery stenosis.

### ACTION

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion.

**Therapeutic Effect:** In hypertension, reduces peripheral arterial resistance. In HF, increases cardiac output; decreases peripheral vascular resistance, B/P, pulmonary capillary wedge pressure, heart size.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 hr	4–6 hrs	24 hrs
IV	15 min	1–4 hrs	6 hrs

Widely distributed. Prodrug undergoes hepatic biotransformation to enalaprilat. Protein binding: 50%–60%. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 11 hrs (increased in renal impairment).

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. May cause fetal/neonatal mortality, morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more susceptible to hypotensive effects.

### INTERACTIONS

**DRUG:** Aliskiren may increase hypokalemic effect. May increase potential for hypersensitivity reactions to allopurinol. **Angiotensin receptor blockers (e.g., losartan, valsartan)** may increase adverse effects. May increase effects of lithium, sacubitril. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** None known. **LAB VALUES:** May increase serum

BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

## AVAILABILITY (Rx)

**Injection Solution:** 1.25 mg/mL. **Oral Solution:** (*Epaned*): 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • May give undiluted or dilute with D<sub>5</sub>W or 0.9% NaCl.

**Rate of administration** • For IV push, give undiluted over 5 min. • For IV piggyback, infuse over 10–15 min.

**Storage** • Store parenteral form at room temperature. • Use only clear, colorless solution. • Diluted IV solution is stable for 24 hrs at room temperature.

### PO

• Give without regard to food. • Tablets may be crushed.

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), phenytoin (Dilantin).

## IV COMPATIBILITIES

Calcium gluconate, dexmedetomidine (Precedex), DOBUtamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), heparin, lidocaine, magnesium sulfate, morphine, nitroglycerin, potassium chloride, potassium phosphate, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Hypertension

**PO: ADULTS, ELDERLY:** Initially, 2.5–5 mg/day (2.5 mg if pt taking a diuretic). Evaluate response q4–6wks. Range: 10–40 mg/day in 1–2 divided doses.

**CHILDREN 1 MO–16 YRS:** Initially, 0.08 mg/kg (maximum dose: 5 mg) once daily. Adjust dose based on pt response. **NEONATES:** 0.04–0.1 mg/kg/day given q24h.

**IV: ADULTS, ELDERLY:** 0.625–1.25 mg q6h up to 5 mg q6h.

### Adjunctive Therapy for HF

**PO: ADULTS, ELDERLY:** Initially, 2.5 mg twice daily. Titrate slowly at 1–2 wk intervals. Range: 5–40 mg/day in 2 divided doses. Target: 10–20 mg twice daily.

### Dosage in Renal Impairment

**CrCl greater than 30 mL/min:** No dosage adjustment. **CrCl 30 mL/min or less: (HTN):** Initially, 2.5 mg/day. Titrate until B/P controlled. **(HF):** Initially, 2.5 mg twice daily. May increase by 2.5 mg/dose at greater than 4-day intervals. **Maximum:** 40 mg/day. **Hemodialysis:** Initially, 2.5 mg on dialysis days; adjust dose on non-dialysis days depending on B/P.

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (7%–5%):** Headache, dizziness. **Occasional (3%–2%):** Orthostatic hypotension, fatigue, diarrhea, cough, syncope. **Rare (less than 2%):** Angina, abdominal pain, vomiting, nausea, rash, asthenia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Excessive hypotension (“first-dose syncope”) may occur in pts with HF, severe salt or volume depletion. Angioedema (facial, lip swelling), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment, collagen vascular diseases (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in those with history of renal disease.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, CrCl. Receive full medication history, esp.

potassium-sparing diuretics. Obtain B/P immediately before each dose (be alert to fluctuations). In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes/immune response, CBC should be performed before beginning therapy, q2wks for 3 mos, then periodically thereafter.

**INTERVENTION/EVALUATION**

Assist with ambulation if dizziness occurs. Monitor B/P. Monitor daily pattern of bowel activity, stool consistency.

**PATIENT/FAMILY TEACHING**

- To reduce hypotensive effect, go from lying to standing slowly.
- Several wks may be needed for full therapeutic effect of B/P reduction.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Limit alcohol intake.
- Report vomiting, diarrhea, diaphoresis, persistent cough, difficulty in breathing; swelling of face, lips, tongue.

**enasidenib**

en-a-sid-a-nib  
(Idhifa)

**BLACK BOX ALERT** ■ May cause differentiation syndrome (a condition of life-threatening complications caused by chemotherapy), which can be fatal if not treated. If differentiation syndrome is suspected, consider treatment with a corticosteroid and hemodynamic monitoring.

**Do not confuse enasidenib with cobimetinib, dabrafenib, encorafenib, ivosidenib, regorafenib, or trametinib.**

◆ **CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Isocitrate dehydrogenase-2 (IDH2) inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of adults with relapsed or refractory acute myeloid leukemia (AML)

with an isocitrate dehydrogenase-2 (IDH2) mutation.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to enasidenib. **Cautions:** Hepatic/renal impairment, dehydration; pts at high risk for tumor lysis syndrome (high tumor burden), conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

**ACTION**

Inhibits isocitrate dehydrogenase-2 (IDH2) enzymes on mutant IDH2 variants, decreasing 2-hydroxyglutarate (2-HG) levels and restoring myeloid differentiation. **Therapeutic Effect:** Reduces blast counts; increases percentage of myeloid cells. Inhibits tumor growth and proliferation.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 4 hrs. Steady state reached in 29 days. Excreted in feces (89%), urine (11%). **Half-life:** 137 hrs.

 **LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential and males with female partners of reproductive potential should use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. May impair fertility in both females and males of reproductive potential. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

**INTERACTIONS**

**DRUG:** May increase concentration/effect of **alpelisib, cladribine, digoxin, grazoprevir, PAZOPanib, rimegepant, topotecan, voxilaprevir.** **HERBAL:** None significant. **FOOD:** None

◆ Canadian trade name

 Non-Crushable Drug

 High Alert drug

known. **LAB VALUES:** May increase serum bilirubin; WBC. May decrease serum calcium, potassium, phosphorus.

## AVAILABILITY (Rx)

 **Tablets:** 50 mg, 100 mg.

E

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food. • Administer whole; do not cut, crush, or divide tablets.

## INDICATIONS/ROUTES/DOSAGE

### Acute Myeloid Leukemia

**PO: ADULTS, ELDERLY:** 100 mg once daily. Continue until disease progression or unacceptable toxicity. For pts without disease progression or unacceptable toxicity, treat for a minimum of 6 mos (allows time for clinical response).

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Differentiation Syndrome

If differentiation syndrome is suspected, treat with a systemic corticosteroid and hemodynamic monitoring. **Pulmonary failure requiring intubation or ventilation, renal dysfunction persisting greater than 48 hrs (despite treatment with a corticosteroid):** Withhold treatment until improved to Grade 2 or less, then resume at 100 mg once daily.

### Hepatotoxicity

**Serum bilirubin elevation greater than 3 times ULN for more than 2 wks (in the absence of transaminase elevation or other hepatic injury):** Reduce dose to 50 mg once daily. If serum bilirubin improves to less than 2 times ULN, increase dose to 100 mg once daily.

### Noninfectious Leukocytosis

**WBC greater than 30,000 cells/mm<sup>3</sup>:** Consider therapy with hydroxyurea. If leukocytosis does not improve with hydroxyurea therapy, withhold enasidenib until WBC improves to less than

30,000/mm<sup>3</sup>, then resume enasidenib at 100 mg once daily.

### Any Other Toxicity

**Any Grade 3 or 4 toxicity related to treatment (tumor lysis syndrome):** Withhold treatment until resolved to Grade 2 or less, then resume at 50 mg once daily. If toxicities resolve to Grade 1 or 0, increase dose to 100 mg once daily.

### Dosage in Renal Impairment

**CrCl greater than 30 mL/min:** No dose adjustment. **CrCl less than 30 mL/min:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Frequent (50%–25%):** Nausea, diarrhea, vomiting, decreased appetite, dysgeusia.

## ADVERSE EFFECTS/TOXIC REACTIONS

Life-threatening differentiation syndrome (bone pain, dyspnea, fever, lymphadenopathy, peripheral edema, plural/pericardial effusion, pulmonary infiltrates, rapid weight gain, respiratory distress; hepatic/renal/multi-organ dysfunction) reported in 14% of pts; may occur 10 days to 5 mos after initiation. Noninfectious leukocytosis reported in 12% of pts. Tumor lysis syndrome may present as acute renal failure, hypocalcemia, hyperuricemia, hyperphosphatemia. Acute respiratory distress syndrome, pulmonary edema occurred in less than 10% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain WBC; pregnancy test in females of reproductive potential. Verify presence of IDH2 mutations in the blood or bone marrow. Screen for active infection. Confirm compliance of effective contraception. Due to increased risk of tumor lysis syndrome, diarrhea, vomiting, assess adequate hydration before initiation. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor WBC for leukocytosis; BMP, serum calcium, phosphate, uric acid for tumor lysis syndrome (acute renal failure, electrolyte imbalance, cardiac arrhythmias, seizures) q2wks for the first 3 mos. Monitor LFT for transaminitis, hepatotoxicity periodically. If differentiation syndrome is suspected, consider treatment with a corticosteroid and hemodynamic monitoring. Once symptoms have resolved, taper corticosteroid therapy. Offer antiemetic if nausea occurs; antidiarrheal if diarrhea occurs. Monitor daily pattern of bowel activity, stool consistency. Ensure adequate hydration, nutrition. Monitor weight, I&Os.

**PATIENT/FAMILY TEACHING**

- Therapy may cause tumor lysis syndrome (a condition caused by the rapid breakdown of cancer cells), which can cause kidney failure and can be fatal. Report decreased urination, amber-colored urine, confusion, difficulty breathing, fatigue, fever, muscle or joint pain, palpitations, seizures, vomiting.
- Treatment may cause differentiation syndrome (a condition of life-threatening complications caused by induction chemotherapy), which can be fatal. Report bone pain, difficulty breathing, fever, swelling of the lymph nodes or extremities, lung congestion or infection, organ dysfunction, rapid weight gain.
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Report treatment-induced liver toxicity such as bruising, confusion; amber, dark, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes.
- Nausea, vomiting, diarrhea are common side effects. Drink plenty of fluids.

**encorafenib**

en-koe-raf-e-nib  
(Braftovi)

**Do not confuse encorafenib with binimetinib, cobimetinib, dabrafenib, dasatinib, erlotinib,**

**trametinib, or vemurafenib, or Braftovi with Mektovi.**

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** BRAF kinase inhibitor. **CLINICAL:** Antineoplastic.

**USES**

Treatment of pts with unresectable or metastatic melanoma with a BRAF V600E or V600K mutation (in combination with binimetinib). Treatment of metastatic colorectal cancer (CRC) in adults with a BRAF V600E mutation (in combination with cetuximab) after prior therapy. **OFF-LABEL:** Treatment of colorectal cancer, metastatic, refractory (RAS wild-type, BRAF V600E-mutant).

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to encorafenib. **Cautions:** Baseline cytopenias; active infection; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), diabetes, hepatic/renal impairment; pts at risk for QTc interval prolongation (congenital long QT syndrome, HF, medications that prolong QTc interval, hypokalemia, hypomagnesemia); concomitant use of strong or moderate CYP3A inhibitors or strong or moderate CYP3A inducers.

**ACTION**

An ATP-competitive inhibitor of protein kinase BRAF, which suppresses the MAPK pathway. **Therapeutic Effect:** Inhibits tumor cell growth.

**PHARMACOKINETICS**

Widely distributed. Metabolized in liver. Protein binding: 86%. Peak plasma concentration: 2 hrs. Steady state reached in 15 days. Excreted in urine (47%), feces (47%). **Half-life:** 3.5 hrs.

**⌚ LIFESPAN CONSIDERATIONS**

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Female pts

of reproductive potential must use effective nonhormonal contraception (e.g., barrier methods) during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 2 wks after discontinuation. **Males:** May impair fertility. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A4 inhibitors (e.g., ciprofloxacin, diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease concentration/effect of oral contraceptives. QT interval-prolonging medications (e.g., amiodarone, azithromycin, haloperidol, sotalol) may increase risk of QTc interval prolongation. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect; avoid use. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, GGT, glucose, magnesium. May decrease serum sodium; Hct, Hgb, leukocytes, lymphocytes, neutrophils, RBCs.

## AVAILABILITY (Rx)

**Capsules:** 75 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food.
- If a dose is missed or vomiting occurs after administration, give next dose at regularly scheduled time
- Do not give a missed dose within 12 hrs of next dose.
- Administer whole; do not break, cut, or open capsule. Capsule cannot be chewed.

## INDICATIONS/ROUTES/DOSAGE

### Metastatic Melanoma

**PO: ADULTS, ELDERLY:** 450 mg once daily (in combination with binimetinib). Con-

tinue until disease progression or unacceptable toxicity. If binimetinib withheld, reduce encorafenib dose to 300 mg until binimetinib is restarted.

### Dose Reduction for Adverse Reactions (Metastatic)

**First dose reduction:** 300 mg once daily. **Second dose reduction:** 225 mg once daily. **Unable to tolerate 225-mg dose:** Permanently discontinue.

### Colorectal Cancer, Metastatic (With BRAF V600E Mutation)

**PO: ADULTS, ELDERLY:** 300 mg once daily (in combination with cetuximab). Continue until disease progression or unacceptable toxicity.

### Dose Reduction for Adverse Reactions (CRC)

**First dose reduction:** 225 mg once daily. **Second dose reduction:** 150 mg once daily. **Unable to tolerate 150-mg dose:** Permanently discontinue.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). See prescribing information for binimetinib for recommended dose modification.

### Dermatologic Reactions

**Grade 2 skin reaction:** If not improved within 2 wks, withhold treatment until improved to Grade 1 or 0, then resume at same dose. **Grade 3 skin reaction:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose for first occurrence or at reduced dose for subsequent occurrence. **Grade 4 skin reaction:** Permanently discontinue.

### Hepatotoxicity

**Grade 2 serum ALT, AST elevation:** Maintain dose. If not improved within 4 wks, withhold treatment until improved to Grade 1 or 0 (or to pretreatment baseline), then resume at same dose. **Grade 3 or 4 serum ALT, AST elevation:** See Other Adverse Reactions.

**New Primary Malignancies**

**Noncutaneous RAS mutation–positive malignancies:** Permanently discontinue.

**QTc Interval Prolongation**

**QTcF interval greater than 500 msec and less than or equal to 60 msec from baseline:** Withhold treatment until QTcF is less than or equal to 500 msec, then resume at reduced dose. **QTcF interval greater than 500 msec and greater than 60 msec from baseline:** Permanently discontinue.

**Uveitis**

**Grade 1 or 2 uveitis that does not respond to ocular therapy; Grade 3 uveitis:** Withhold treatment for up to 6 wks. If symptoms improve, resume at same or reduced dose. If not improved, permanently discontinue.

**Other Adverse Reactions (Including hemorrhage)**

**Any recurrent Grade 2 reaction; first occurrence of any Grade 3 reaction:** Withhold treatment for up to 4 wks. If improved to Grade 1 or 0 (or to pretreatment baseline), resume at reduced dose. If not improved, permanently discontinue. **First occurrence of any Grade 4 reaction:** Permanently discontinue or withhold treatment for up to 4 wks. If improved to Grade 1 or 0 (or to pretreatment baseline), resume at reduced dose. If not improved, permanently discontinue. **Recurrent Grade 3 reaction:** Consider permanent discontinuation. **Recurrent Grade 4 reaction:** Permanently discontinue.

**Concomitant Use With CYP3A Inhibitors**

If strong CYP3A inhibitor cannot be discontinued, reduce dose to one-third of the dose prior to use of strong CYP3A inhibitor. If moderate CYP3A inhibitor cannot be discontinued, reduce dose to one-half of the dose prior to use of moderate CYP3A inhibitor. If CYP3A inhibitor is discontinued for 3–5 half-lives, may resume dose prior to starting CYP3A inhibitor.

**Dosage in Renal Impairment**

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (43%–14%):** Fatigue, nausea, vomiting, abdominal pain, arthralgia, hyperkeratosis, myopathy, rash, headache, constipation, pyrexia, dry skin, dizziness, alopecia. **Occasional (13%–3%):** Pruritus, peripheral neuropathy, extremity pain, dysgeusia, acneiform dermatitis.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia) is an expected response to therapy. In pts receiving combination therapy, new primary cutaneous malignancies including cutaneous squamous cell carcinoma (including keratoacanthoma) (3% of pts), basal cell carcinoma (2% of pts) have occurred. In pts receiving single-agent therapy, new primary cutaneous malignancies including cutaneous squamous cell carcinoma (including keratoacanthoma) (8% of pts), basal cell carcinoma (1% of pts), new primary melanoma (5% of pts) have occurred. May increase potential for new primary noncutaneous malignancies associated with activation of RAS through mutation. May increase cellular proliferation of BRAF wild-type cells and activate MAP-kinase signaling. Serious hemorrhagic events including GI bleeding, rectal bleeding (4% of pts), hematochezia (3% of pts), hemorrhoidal hemorrhage (1% of pts) were reported. Fatal intracranial hemorrhage reported in 2% of pts in the setting of new or progressive brain metastasis. Uveitis, including iritis and iridocyclitis, occurred in 4% of pts. QTc interval prolongation reported in 1% of pts. Grade 3 or 4 dermatitis

logic toxicities reported in 21% of pts when used as a single agent. Other reactions occurring in less than 10% of pts include facial paresis, pancreatitis, panniculitis, drug hypersensitivity.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in female pts of reproductive potential. Confirm compliance of effective nonhormonal contraception. Correct hypokalemia, hypomagnesemia prior to and during treatment. Confirm presence of BRAF V600E or V600K mutation in tumor specimen. Perform full dermatologic exam; assess skin for moles, lesions, papillomas. Consider baseline ECG in pts at risk for QTc interval prolongation. Receive full medication history and screen for interactions (esp. QTc interval–prolonging medications). Question history of diabetes, hepatic/renal impairment, HF. Screen for active infection. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC for anemia, leukopenia, lymphopenia, neutropenia; LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss); serum potassium, magnesium in pts with QTc interval prolongation. Assess skin for new lesions, toxicities q2mos during treatment and up to 6 mos after discontinuation. Assess for eye pain/redness, visual changes at each office visit and at regular intervals. Monitor for toxicities if discontinuation of CYP3A inhibitor or CYP3A inducer is unavoidable. Monitor for signs of hyperglycemia (thirst, polyuria, confusion, dehydration). If QT interval–prolonging medications cannot be withheld, diligently monitor ECG for QT interval prolongation, cardiac arrhythmias. Monitor for GI bleeding, bloody stool; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Diligently screen for infections.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Expect frequent eye exams, skin exams.
- Report any vision changes, eye redness.
- Treatment may cause new skin cancers. Report new warts, moles.
- Report symptoms of liver problems (bruising, confusion; dark, amber- or orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); hemorrhagic stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision), GI bleeding such (bloody stools, rectal bleeding).
- Use effective contraception to avoid pregnancy. Do not breastfeed.
- Avoid grapefruit products, herbal supplements (esp. St. John's wort).
- Report palpitations, chest pain, shortness of breath, dizziness, fainting; may indicate arrhythmia.

## enfortumab vedotin-ejfv

en-fort-ue-mab ve-doe-tin  
(Padcev)

**Do not confuse enfortumab with brentuximab vedotin, or elotuzumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Anti-Nectin-4, antibody-drug conjugate (ADC), monoclonal antibody. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with locally advanced or metastatic urothelial carcinoma who have previously received a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor and a

platinum-containing chemotherapy in the neoadjuvant/adjuvant, locally advanced, or metastatic setting.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to enfortumab vedotin-ejfv. **Cautions:** Baseline cytopenias, diabetes, pts at risk for hyperglycemia (e.g., diabetes, chronic use of corticosteroids); conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds); dermatologic disease; history of herpes zoster infection; concomitant use of CYP3A4 inhibitors. Not recommended in pts with moderate to severe hepatic impairment.

## ACTION

Binds to and internalizes Nectin-4 antibody conjugated to a microtubule-disrupting agent, monomethyl auristatin E (MMAE). MMAE binds to and disrupts cellular microtubule network, causing cell cycle arrest and apoptosis (cellular death). **Therapeutic Effect:** Inhibits tumor cell growth.

## PHARMACOKINETICS

Widely distributed. Metabolized via catabolism to small peptides, amino acids, unconjugated MMAE, unconjugated MMAE-related catabolites. Protein binding: 68%–82%. Peak plasma concentration: ADC: at end of infusion; MMAE: 2 days. Excreted in feces (17%), urine (6%). **Half-life:** ADC: 3.4 days; MMAE: 2.4 days.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 3 wks after discontinuation. May impair fertility. **Males:** Males with females of reproductive potential must use effective contraception dur-

ing treatment and for at least 4 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, glucose, lipase, uric acid. May decrease serum phosphate, potassium, sodium; Hgb, leukocytes, lymphocytes, neutrophils, platelets.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 20 mg, 30 mg.

## ADMINISTRATION/HANDLING

### IV

**Reconstitution** • Must be prepared by personnel trained in aseptic manipulations and admixing of cytotoxic drugs. • Calculate the number of vials needed for reconstitution based on weight in kg. • Directing stream toward glass wall of vial, reconstitute 20-mg vial with 2.3 mL or 30-mg vial with 3.3 mL of Sterile Water for Injection to a final concentration of 10 mg/mL. • To prevent foaming, swirl vial gently until powder is completely dissolved. • Allow contents to settle until all bubbles are gone (at least 1 min). Do not shake or agitate. • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to slightly yellow in color. Do not use if solution is cloudy or discolored or if visible particles are observed. • Dilute in infusion bag of 5% Dextrose, 0.9% NaCl, or lactated Ringer's to a final concentration of 0.3–4 mg/mL. • Do not shake or agitate diluted solution. • Discard unused portions of vial.

**Rate of administration** • Give over 30 min via dedicated IV line. • Do not infuse as IV push or bolus.

**Storage** • Refrigerate unused vials in original carton. • May refrigerate reconstituted vials for up to 4 hrs. • May refrigerate diluted solution for up to 8 hrs. • Protect from light. • Do not shake, agitate, or freeze.

## **IV INCOMPATIBILITIES**

Do not mix with other medications or other infusion solutions that contain medications.

## **INDICATIONS/ROUTES/DOSAGE**

### **Urothelial Carcinoma**

**IV: ADULTS, ELDERLY:** 1.25 mg/kg (up to a maximum of 125 mg for pts weighing greater than or equal to 100 kg) on days 1, 8, and 15 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

### **Dose Reduction Schedule for Adverse Events**

**First dose reduction:** 1 mg/kg up to 100 mg.

**Second dose reduction:** 0.75 mg/kg up to 75 mg.

**Third dose reduction:** 0.5 mg/kg up to 50 mg.

### **Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### **Hyperglycemia**

**Serum blood glucose greater than 250 mg/dL:** Withhold treatment until serum blood glucose level is less than or equal to 250 mg/dL, then resume at same dose.

### **Peripheral Neuropathy**

**Grade 2 peripheral neuropathy:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose. If neuropathy recurs, withhold treatment until improved to Grade 1 or 0, then resume at reduced dose level. **Grade 3 or 4 peripheral neuropathy:** Permanently discontinue.

### **Thrombocytopenia**

**Grade 2 or 3 thrombocytopenia:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose or reduced dose level. **Grade 4 thrombocytopenia:** Permanently discontinue.

### **Skin Toxicity**

**Grade 3 rash, pruritus, cutaneous reactions:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose or reduced dose level. **Grade 4 or recurrent Grade 3 rash, pruritus, cutaneous reactions:** Permanently discontinue.

### **Other Nonhematologic Toxicity**

**Grade 3 nonhematologic toxicity:** Withhold treatment until improved to Grade 1 or 0, then resume at same dose or reduced dose level. **Grade 4 nonhematologic toxicity:** Permanently discontinue.

### **Dosage in Renal Impairment**

**Mild to severe impairment:** No dose adjustment.

### **Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not recommended.

## **SIDE EFFECTS**

**Frequent (56%–26%):** Fatigue, asthenia, decreased appetite, nausea, dysgeusia, diarrhea, dry eye, eye irritation, increased lacrimation, ocular discomfort, rash, erythema, skin exfoliation, urticaria, alopecia, dry skin, pruritus. **Occasional (18%):** Vomiting.

## **ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, leukopenia, lymphopenia, neutropenia) is an expected response to therapy. Fatal cases of hyperglycemia, diabetic ketoacidosis (DKA) were reported in pts regardless of history of diabetes. Grade 3 or 4 hyperglycemia was reported in 8% of pts, and more prevalent in pts with higher body mass index and in pts with

elevated hemoglobin A1c. Peripheral neuropathy including hypoesthesia, gait disturbance, muscular weakness, paresthesia, peripheral motor/sensorimotor neuropathy reported in 49% of pts. Ocular disorders including keratitis, blurred vision, limbal stem cell deficiency, and other events associated with dry eyes have occurred. Grade 3 or 4 skin reactions including symmetrical drug-related intertriginous and flexural exanthema, bullous dermatitis, exfoliative dermatitis, palmar-plantar erythrodysesthesia (redness, swelling, numbness, skin sloughing of the hands and feet) reported in 10% of pts. Skin and soft tissue infusion site extravasation with secondary cellulitis, bullae, exfoliation reported in 1% of pts. Other serious reactions including UTI (6% of pts), cellulitis (5% of pts), febrile neutropenia (4% of pts), sepsis (3% of pts), acute kidney injury (3% of pts); acute respiratory failure, aspiration pneumonia, cardiac disorder (less than 1% of pts) may occur. GI events including colitis, enterocolitis were reported. Herpes zoster infection reported in 3% of pts. Immunogenicity (anti-enfortumabvedotin antibodies) reported in 1% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain weight in kilograms. Obtain CBC, LFT, blood glucose level, pregnancy test in females of reproductive potential. Verify compliance of effective contraception in females and males with female partners of reproductive potential. Obtain visual acuity. Screen for active infection. Question history of dermatological disease, hepatic impairment, optic disorders. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, blood glucose levels periodically. Monitor for hyperglycemia (blurred vision, confusion, excessive thirst, Kussmaul respirations, polyuria); new onset or worsening peripheral neu-

ropathy. Assess skin for dermatologic toxicities, palmar-plantar erythrodysesthesia. Consider topical corticosteroid if dermatologic effects occur. Consider artificial tears for dry eye prophylaxis. If symptoms do not resolve, consider treatment with topical steroids and referral to ophthalmologist. Monitor for drug toxicities if discontinuation or dose reduction of concomitant CYP3A inhibitor is unavoidable. If extravasation occurs, stop infusion and monitor for adverse reactions. Monitor daily pattern of bowel activity, stool consistency. Monitor for infections (cough, fatigue, fever). If serious infection, sepsis occurs, initiate appropriate antimicrobial therapy.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression (e.g., bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool).
- Report change of vision, blurry vision, dry eye symptoms not relieved by artificial tears.
- Report symptoms of toxic skin reactions (e.g., itching, peeling, rash, redness, swelling); high blood sugar levels (e.g., blurred vision, excessive thirst/hunger, headache, frequent urination); or nervous system changes (e.g., altered memory, confusion, delirium, difficulty speaking, gait disturbance, numbness, tremors).
- Females of childbearing potential must use effective contraception during treatment and for at least 2 mos after last dose. Do not breastfeed. Males with female partners of childbearing potential must use effective contraception during treatment and for at least 4 mos after last dose.
- There is a high risk of interactions with other medications. Do not take any newly prescribed medications unless approved by prescriber who originally started treatment. Avoid grapefruit products, herbal supplements (esp. St. John's

wort). • Diarrhea is a common side effect. Drink plenty of fluids.

## enoxaparin

TOP  
100 HIGH  
ALERT

en-ox-a-par-in  
(Lovenox)

**BLACK BOX ALERT** ■ Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

**Do not confuse Lovenox with Lasix, Levaquin, Lotronex, or Protonix, or enoxaparin with dalteparin or heparin.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Low molecular weight heparin. **CLINICAL:** Anticoagulant.

### USES

DVT prophylaxis following hip or knee replacement surgery, abdominal surgery, or pts with severely restricted mobility during acute illness. Treatment of acute coronary syndrome (ACS): unstable angina, non-Q-wave MI, acute ST-segment elevation MI (STEMI). Treatment of DVT with or without pulmonary embolism (PE) (inpatient); without PE (outpatient). **OFF-LABEL:** DVT prophylaxis following moderate-risk general surgery, gynecologic surgery; management of venous thromboembolism (VTE) during pregnancy. Bariatric surgery, mechanical heart valve to bridge anticoagulation, percutaneous coronary intervention (PCI) adjunctive therapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to enoxaparin. Active major bleeding, concurrent heparin therapy, hypersensitivity to heparin, pork products. History of heparin-induced thrombocytopenia (HIT) in past 100 days or in the pres-

ence of circulating antibodies. **Cautions:** Conditions with increased risk of hemorrhage, platelet defects, renal impairment (renal failure), elderly, uncontrolled arterial hypertension, history of recent GI ulceration or hemorrhage. When neuraxial anesthesia (epidural or spinal anesthesia) or spinal puncture is used, pts anticoagulated or scheduled to be anticoagulated with enoxaparin for prevention of thromboembolic complications are at risk for developing an epidural or spinal hematoma that can result in long-term or permanent paralysis. Bacterial endocarditis, hemorrhagic stroke, history of heparin-induced thrombocytopenia (HIT), severe hepatic disease.

### ACTION

Enhances the inhibition rate of clotting proteases by antithrombin III. Impairs normal hemostasis and inhibition of factor Xa. **Therapeutic Effect:** Produces anticoagulation. Does not significantly influence PT, aPTT.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
SQ	N/A	3–5 hrs	12 hrs

Widely distributed. Excreted primarily in urine. Not removed by hemodialysis. **Half-life:** 4.5–7 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Use with caution, particularly during third trimester, immediate postpartum period (increased risk of maternal hemorrhage). Unknown if distributed in breast milk. Pregnant women with mechanical heart valves (and their fetuses) may have increased risk of bleeding. **Children:** Safety and efficacy not established in pts younger than 1 mo. **Elderly:** May be more susceptible to bleeding.

### INTERACTIONS

**DRUG:** Anticoagulants (e.g., apixaban, dabigatran, edoxaban, rivaroxaban),

antiplatelets (e.g., aspirin, clopidogrel, ticagrelor), NSAIDs (ibuprofen, ketorolac, naproxen), thrombolytics (e.g., alteplase), warfarin may increase anticoagulant effect; risk of bleeding. **HERBAL:** Herbs with anticoagulant/antiplatelet activity (e.g., garlic, ginger, ginkgo biloba) may increase adverse effects. **FOOD:** None known. **LAB VALUES:** Increases serum alkaline phosphatase, ALT, AST. May decrease Hgb, Hct, platelets, RBCs.

### AVAILABILITY (Rx)

**Injection Solution:** 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/mL, 120 mg/0.8 mL, 150 mg/mL in prefilled syringes.

### ADMINISTRATION/HANDLING

**ALERT** Do not mix with other injections, infusions. Do not give IM.

#### SQ

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

**Administration** • Flick syringe so that the air bubble rises toward the plunger. • Insert needle subcutaneously into abdomen or outer thigh and inject solution (including air bubble). • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Rotate injection sites.

**Storage** • Store at room temperature.

### INDICATIONS/ROUTES/DOSAGE

#### Prevention of Deep Vein Thrombosis (DVT) After Hip and Knee Surgery

**SQ: ADULTS, ELDERLY: Knee surgery:** 30 mg twice daily, generally for 10 days or up to 35 days, with initial dose given 12 hrs or more pre-operatively or 12 hrs or more post-operatively once hemostasis achieved. **Hip surgery: (Once daily):** An initial dose of 40 mg,

given 12 hrs or more pre-operatively or 12 hrs or more post-operatively once hemostasis achieved. Following hip surgery, recommend continuing 40 mg once daily for at least 10 days or up to 35 days post-op. **(Twice daily):** 30 mg q12h with initial dose, 12 hrs or more pre-operatively or 12 hrs or more post-operatively once hemostasis achieved and q12h for at least 10 days or up to 35 days.

#### Prevention of DVT After Non-Orthopedic Surgery

**SQ: ADULTS, ELDERLY:** 40 mg/day for 7–10 days, with initial dose given 2 hrs before abdominal surgery or approximately 12 hrs before other surgeries.

#### Prevention of DVT After Bariatric Surgery

**BMI 50 kg/m<sup>2</sup> or less:** 40 mg q12h. **BMI greater than 50 kg/m<sup>2</sup>:** 60 mg q12h.

#### Prevention of Long-Term DVT in Nonsurgical Acute Illness

**SQ: ADULTS, ELDERLY:** 40 mg once daily; continue until risk of DVT has diminished (usually 6–11 days).

#### Prevention of Ischemic Complications of Unstable Angina, Non-Q-Wave MI (With Oral Aspirin Therapy)

**SQ: ADULTS, ELDERLY:** 1 mg/kg q12h (with oral aspirin).

#### STEMI

**SQ: ADULTS YOUNGER THAN 75 YRS:** 30 mg IV once plus 1 mg/kg q12h (**maximum:** 100 mg first 2 doses only). **ADULTS 75 YRS OR OLDER:** 0.75 mg/kg (**maximum:** 75 mg first 2 doses only) q12h.

#### Acute DVT

**SQ: ADULTS, ELDERLY: (inpatient):** 1 mg/kg q12h or 1.5 mg/kg once daily. **(outpatient):** 1 mg/kg q12h.

#### Usual Pediatric Dosage

**SQ: CHILDREN 2 MOS AND OLDER:** 0.5 mg/kg q12h (prophylaxis); 1 mg/kg

q12h (treatment). **NEONATES, INFANTS YOUNGER THAN 2 MOS:** 0.75/mg/kg/dose q12h (prophylaxis); 1.5 mg/kg/dose q12h (treatment).

#### Dosage in Renal Impairment

Elimination is decreased when CrCl is less than 30 mL/min. Monitor and adjust dosage as necessary.

Use	Dosage
Abdominal surgery, pts with acute illness	30 mg once/day
Hip, knee surgery	30 mg once/day
DVT, angina, MI	1 mg/kg once/day
STEMI: (younger than 75 yrs)	30 mg IV once plus 1 mg/kg q24h
STEMI (75 yrs or older)	1 mg/kg q24h
NSTEMI	1 mg/kg q24h

#### Dosage in Hepatic Impairment

Use caution.

### SIDE EFFECTS

**Occasional (4%–1%):** Injection site hematoma, nausea, peripheral edema.

### ADVERSE EFFECTS/TOXIC REACTIONS

May lead to bleeding complications ranging from local ecchymoses to major hemorrhage. May cause heparin-induced thrombocytopenia (HIT). **Antidote:** IV injection of protamine sulfate (1% solution) equal to dose of enoxaparin injected. 1 mg protamine sulfate neutralizes 1 mg enoxaparin. One additional dose of 0.5 mg protamine sulfate per 1 mg enoxaparin may be given if aPTT tested 2–4 hrs after first injection remains prolonged.

### NURSING CONSIDERATIONS

#### BASELINE ASSESSMENT

Obtain CBC. Note platelet count. Question medical history as listed in Precautions. Ensure that pt has not received spinal anesthesia, spinal procedures. Assess for active bleeding. Assess pt's willingness to self-inject medication. Assess potential risk of bleeding.

### INTERVENTION/EVALUATION

Periodically monitor CBC, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). A decrease in the platelet count of more than 50% from baseline may indicate heparin-induced thrombocytopenia. Ensure active hemostasis of puncture site following PCI. Assess for any sign of bleeding (bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, bruising, bleeding from injection sites).

### PATIENT/FAMILY TEACHING

- Usual length of therapy is 7–10 days.
- A healthcare provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Do not discontinue current blood thinning regimen or take any newly prescribed medications unless approved by the prescriber who originally started treatment.
- Suddenly stopping therapy may increase the risk of blood clots or stroke.
- Report bleeding of any kind (bloody urine, stool; nosebleeds; increased menstrual bleeding). If bleeding occurs, it may take longer to stop bleeding.
- Immediately report signs of stroke (confusion, headache, numbness, one-sided weakness, trouble speaking, loss of vision).
- Minor blunt force trauma to the head, chest, or abdomen can be life-threatening.
- Do not take aspirin, herbal supplements, OTC nonsteroidal anti-inflammatories (may increase risk of bleeding).
- Consult physician before any surgery/dental work.
- Use electric razor, soft toothbrush to prevent bleeding.

## entrectinib

en-trek-ti-nib  
(Rozlytrek)

**Do not confuse entrectinib with alectinib, enasidenib, encorafenib, erdafitinib, erlotinib, fedratinib, or larotrectinib.**

### ◆ Classification

**PHARMACOTHERAPEUTIC:** Tropomyosin receptor kinase (TRK) inhibitor. **CLINICAL:** Antineoplastic.

### USES

Treatment of adults with metastatic non-small-cell lung cancer (NSCLC) whose tumors are ROS1 positive. Treatment of adult and pediatric pts (12 yrs and older) with solid tumors that have a neurotrophic receptor tyrosine kinase (NTRK) gene fusion without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatment or that have progressed following treatment.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to entrectinib. **Cautions:** Baseline cytopenias, hepatic impairment, cardiac disease (cardiomyopathy, HF), conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), pts at risk for bone fractures (e.g., fall risk, osteoporosis, chronic use of corticosteroids), pts at risk for QTc interval prolongation, cardiac arrhythmias (congenital long QT syndrome, HF, concomitant use of QT interval-prolonging medications, hypokalemia, hypomagnesemia); pts at high risk for suicide ideation and behavior (e.g., history of depression, mood disorder, psychiatric disorder). History of hyperuricemia, gout. Avoid concomitant use of moderate or strong CYP3A inhibitors/inducers.

### ACTION

Inhibits activation of tropomyosin receptor kinase (TRK) proteins encoded by NTRK gene fusions. Inhibits proto-oncogenic tyrosine-protein kinase ROS1 and anaplastic lymphoma kinase (ALK). **Therapeutic Effect:** Inhibits tumor cell proliferation.

### PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 4–6 hrs. Excreted in feces (83%), urine (3%). **Half-life:** 20–40 hrs.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 5 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and up to 7 days after discontinuation. **Males:** Males with female partners of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Safety and efficacy not established.

### INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A4 inhibitors (e.g., fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. May increase QT interval—prolonging effect of amiodarone, azithromycin, ciprofloxacin, haloperidol, methadone, sotalol. **HERBAL:** None significant. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, amylase, creatinine, lipase, potassium, sodium, uric acid. May decrease serum albumin, calcium, phosphate; Hgb, RBC, lymphocytes, neutrophils.

### AVAILABILITY (Rx)

**Capsules:** 100 mg, 200 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. Administer capsules whole; do not break, cut, or open. • Capsules cannot be chewed. • If a dose is missed, give as soon as possible unless next dose is due within 12 hrs. • If vomiting occurs immediately after administration, repeat the dose.

## INDICATIONS/ROUTES/DOSAGE

### NSCLC (ROS1-Positive)

**PO: ADULTS:** 600 mg once daily.

Continue until disease progression or unacceptable toxicity.

### Solid Tumors (NTRK Gene Fusion Positive)

**PO: ADULTS:** 600 mg once daily. Continue until disease progression or unacceptable toxicity. **CHILDREN WITH BODY SURFACE AREA (BSA) GREATER THAN 1.5 m<sup>2</sup>:** 600 mg once daily. Continue until disease progression or unacceptable toxicity. **BSA 1.11–1.5 m<sup>2</sup>:** 500 mg once daily. **BSA 0.91–1.1 m<sup>2</sup>:** 400 mg once daily.

### Dose Reduction Schedule

Dose Reduction for Adverse Reactions	Adults/Children 12 yrs and Older With BSA Greater Than 1.5 m <sup>2</sup>	Children 12 yrs and Older With BSA 1.11–1.5 m <sup>2</sup>	Children 12 yrs and Older With BSA 0.91–1.1 m <sup>2</sup>
First reduction	400 mg once daily	400 mg once daily	300 mg once daily
Second reduction	200 mg once daily	200 mg once daily	200 mg once daily

Permanently discontinue if unable to tolerate two dose reductions.

### Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

### Cardiotoxicity

**Grade 2 or 3 HF:** Withhold treatment until improved to Grade 1 or 0, then

resume at reduced dose level. **Grade 4 HF:** Permanently discontinue. **QTc interval greater than 500 msec:** Withhold treatment until QTc interval recovers to baseline. Resume at the same dose if risk factors for QT interval prolongation are identified and corrected. Resume at a reduced dose if risk factors for QT interval prolongation risk factors are not identified. **Torsades de pointes, polymorphic ventricular tachycardia, symptoms of serious arrhythmia:** Permanently discontinue.

### Central Nervous System (CNS) Toxicity

**Intolerable Grade 2 CNS effects:** Withhold treatment until improved to Grade 1 or baseline, then resume at same dose or reduced dose level. **Grade 3 CNS effects:** Withhold treatment until improved to Grade 1 or baseline, then resume at reduced dose level. **Grade 4 CNS effects:** Permanently discontinue.

### Hematologic Toxicity

**Grade 3 or 4 anemia or neutropenia:** Withhold treatment until improves to Grade 2 or less, then resume at the same or reduced dose.

### Hepatotoxicity

**Grade 3 hepatotoxicity:** Withhold treatment until improved to Grade 1 or baseline. Resume at same dose if resolved within 4 wks. Permanently discontinue if not resolved within 4 wks. **Recurrence of Grade 3 hepatotoxicity:** Resume at reduced dose if resolved within 4 wks. **Grade 4 hepatotoxicity:** Withhold treatment until improved to Grade 1 or baseline. Resume at reduced dose if resolved within 4 wks. Permanently discontinue if not resolved within 4 wks or if Grade 4 hepatotoxicity recurs. **Serum ALT/AST greater than 3 times ULN with bilirubin greater than 1.5 times ULN (without cholestasis or hemolysis):** Permanently discontinue.

### Hyperuricemia

**Grade 4 or symptomatic hyperuricemia:** Start urate-lowering medication. Withhold treatment until improved, then resume or same or reduced dose.

**Ocular Toxicity**

**Grade 2 (or greater) vision disorders:** Withhold treatment until improved or stabilized, then resume at the same or reduced dose.

**Other Toxicities**

**Any other Grade 3 or 4 toxicity:** Withhold treatment until toxicity improves to Grade 1 or baseline, then resume at the same or reduced dose if resolved within 4 wks. Permanently discontinue if not resolved within 4 wks or if Grade 4 toxicity recurs.

**Concomitant Use of CYP3A Inhibitor**

If strong CYP3A inhibitor cannot be avoided, reduce entrectinib dose to 100 mg. If moderate CYP3A inhibitor cannot be avoided, reduce entrectinib dose to 200 mg. If strong or moderate CYP3A inhibitor is discontinued for 3–5 half-lives, resume entrectinib dose prior to use of CYP3A inhibitor.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (48%–21%):** Fatigue, asthenia, constipation, dysgeusia, edema (facial, generalized, localized, peripheral), dizziness, vertigo, postural dizziness, diarrhea, nausea, dysesthesia, paresthesia, hyperesthesia, hypoesthesia, dysesthesia, oral hypoesthesia, dyspnea, myalgia, musculoskeletal pain, increased weight, cough, vomiting, pyrexia, arthralgia.

**Occasional (18%–10%):** Headache, hypotension, abdominal pain, sleep disorder, hypersomnia, insomnia, somnolence, decreased appetite, muscular weakness, back pain, rash, extremity pain, dysphagia, dehydration.

**Rare (4%):** Hypoxia, syncope.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Myelosuppression (anemia, lymphopenia, neutropenia) is an expected response

to therapy. HF reported in 3% of pts. Median onset of HF was approx. 2 mos. Myocarditis in the absence of HF reported in less than 1% of pts. CNS effects including altered mental status, aphasia, amnesia, ataxia, balance disorder, cognitive impairment, confusion, delirium, disturbance in attention, hallucinations, memory impairment, peripheral neuropathy reported in 27% of pts. Mood disorders including affect lability, affective disorder, agitation, anxiety, depression, euphoria, irritability, mood swings, psychomotor dysfunction, suicide reported in 10% of pts. Bone fractures (hip, femoral, bilateral femoral neck, tibial shaft) reported in 5% of adults and 23% of pediatric pts. Hepatotoxicity (serum ALT/AST elevation) reported in 36%–42% of pts; Grade 3 or 4 transaminase elevation reported in 3% of pts. Hyperuricemia reported in 9% of pts. QTc interval prolongation of greater than 60 msec (3% of pts) and greater than 500 msec (less than 1% of pts) has occurred. Ocular toxicities including adhesions, blindness, blurry vision, cataract, corneal erosion, diplopia, visual impairment, photophobia, photopsia, retinal hemorrhage, vitreous detachment, vitreous floaters may occur. Infections including respiratory tract infection, lung infection, pneumonia (10% of pts), UTI (13% of pts), sepsis were reported. Other reactions may include pulmonary embolism, falls, GI perforation.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, LFT, uric acid level; pregnancy test in females of reproductive potential. Verify use of effective contraception in females of reproductive potential. Confirm presence of NTRK gene fusion or ROS1 rearrangements in tumor specimen. Assess risk of QT interval prolongation, fractures, falls. Question history of cardiac disease, HF, gout, hyperuricemia; depression, mood disorder, suicidal ideation and behavior. Obtain ECG; echocardiogram for baseline

LVEF. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

#### INTERVENTION/EVALUATION

Monitor CBC, uric acid level periodically. Monitor LFT for hepatotoxicity (bruising, hematuria, jaundice, right upper abdominal pain, nausea, vomiting, weight loss) q2wks for 1 mo, then monthly thereafter. Monitor for symptoms of HF (dyspnea, edema, fatigue, palpitations). Assess LVEF by echocardiogram if cardiotoxicity, HF is suspected. Monitor ECG periodically. Diligently assess for suicidal ideation and behavior; new-onset or worsening of anxiety, depression, mood disorder. Consult mental health professional if mood disorder is suspected. Monitor for symptoms of tumor lysis syndrome (acute renal failure, electrolyte imbalance, hyperuricemia, cardiac arrhythmias, seizures); bone fractures (pain, deformity, changes in mobility), hyperuricemia (joint pain/inflammation/redness), PE (chest pain, dyspnea, tachycardia); infections (cough, fatigue, fever). If serious infection or sepsis occurs, initiate appropriate antimicrobial therapy. Assess for visual changes at each office visit. If change of vision occurs, consider referral to ophthalmologist. Assess for CNS effects. Monitor for toxicities if discontinuation of CYP3A inhibitor is unavoidable. If QT interval-prolonging medications cannot be withheld, diligently monitor ECG for QT interval prolongation, cardiac arrhythmias. Monitor daily pattern of bowel activity, stool consistency, I&Os.

#### PATIENT/FAMILY TEACHING.

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness

of breath, weight loss; bleeding easily, bloody urine or stool.

- Therapy may cause vision changes or decrease the heart's ability to pump blood effectively.
- Report symptoms of liver problems (bruising, confusion; dark, amber, orange-colored urine; right upper abdominal pain, yellowing of the skin or eyes); HF (shortness of breath, palpitations; swelling of legs, ankle, feet); bone fractures (e.g., pain, deformity, changes in mobility), gout (joint pain/swelling/redness/warmth), nervous system changes (altered memory, confusion, delirium, difficulty speaking, gait disturbance, numbness, tremors), lung embolism (difficulty breathing, chest pain, rapid heart rate).
- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occurs.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Use effective contraception. Do not breastfeed.
- There is a high risk of interactions with other medications. Do not take any newly prescribed medications unless approved by prescriber who originally started treatment. Avoid grapefruit products, herbal supplements.
- Diarrhea is a common side effect. Drink plenty of fluids.

## enzalutamide

en-za-loo-ta-mide  
(Xtandi)

**Do not confuse enzalutamide with bicalutamide, flutamide, or nilutamide.**

#### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Antiandrogen renal inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of metastatic castration-resistant prostate cancer. Treatment of castration-sensitive prostate cancer.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to enzalutamide. Women who are pregnant or may become pregnant (not indicated in female population). **Cautions:** History of seizure disorder, underlying brain injury with loss of consciousness, transient ischemic attack within past 12 mos, CVA, brain metastases, brain arteriovenous abnormality, ischemic heart disease; pts at risk for fractures (e.g., osteoporosis, osteopenia), falls; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), use of concurrent medications that may lower seizure threshold.

## ACTION

Inhibits androgen binding to androgen receptors in target tissue, and inhibits interaction with DNA. **Therapeutic Effect:** Decreases proliferation, induces cell death of prostate cancer cells.

## PHARMACOKINETICS

Readily absorbed in GI tract. Maximum plasma concentration achieved in 0.5–3 hrs. Metabolized in liver. Protein binding: (97%–98%). Primarily excreted in urine. **Half-life:** 5.8 days (Range: 2.8–10.2 days).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not used in female population. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP2C8, CYP3A4 inhibitors (e.g., gemfibrozil, itraconazole) may increase concentration/

effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Drugs that lower seizure threshold** (e.g., buPROPion, cloZAPine, haloperidol, traMADol) may increase risk of seizures. May decrease concentration/effect of cycloSPORINE, ergot derivatives (e.g., ergotamine), fosphenytoin, phenytoin, sirolimus, tacrolimus. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease Hgb, Hct, platelets, WBC count.

## AVAILABILITY (Rx)

 **Capsules:** 40 mg, 80 mg.

## ADMINISTRATION/HANDLING

### PO

- May give with or without food. Take at same time each day. Swallow whole.
- Do not break, crush, dissolve, or open capsules.

## INDICATIONS/ROUTES/DOSAGE

**Metastatic Castration-Resistant or Castration-Sensitive Prostate Cancer**

**PO: ADULTS, ELDERLY:** 160 mg once daily.

### Dose Modification

If CTCAE Grade 3 or greater toxicity or an intolerable side effect occurs, withhold treatment for 1 week or until symptoms improve to Grade 2 or less, then resume at same dose or a reduced dose (120 mg or 80 mg). **Concurrent use of strong CYP2C8 inhibitors:** Avoid use (if possible). If concurrent use is necessary, reduce the enzalutamide dose to 80 mg once daily. **Concurrent use of strong CYP3A4 inducers:** Increase dose to 240 mg once daily.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Common (51%):** Asthenia. **Frequent (26%–15%):** Back pain, diarrhea, arthralgia, hot flashes, peripheral edema, musculoskeletal pain. **Occasional (12%–6%):** Headache, dizziness, insomnia, hematuria, paresthesia, anxiety, hypertension. **Rare (4%–2%):** Mental impairment disorders (includes amnesia, memory impairment, cognitive disorder, attention deficit), hematuria (includes pollakiuria, pruritus, dry skin).

## ADVERSE EFFECTS/TOXIC REACTIONS

Upper respiratory tract infection occurs in 11% of pts; lower respiratory tract and lung infection (includes pneumonia, bronchitis) occur in slightly less (9% of pts). Spinal cord compression and cauda equina syndrome occur in 7% of pts. Life-threatening ischemic heart disease reported in 3% of pts. May increase risk of cardiovascular disease. Fall and fractures were reported. Reversible posterior leukoencephalopathy syndrome (RPLS) may present as aphasia, altered mental status, paralysis, vision loss, weakness. Hypersensitivity reactions including angioedema, anaphylaxis may occur. May increase risk of seizures.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain LFT. Assess risk for falls/fractures. Screen for active infection. Question history of seizures, ischemic heart disease, cerebrovascular disease. Optimize cardiovascular risk factors (diabetes, hypertension, dyslipidemia) to reduce risk of treatment-induced ischemic heart disease. Obtain full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor LFT periodically. Monitor B/P for hypertension. Obtain echocardiogram if ischemic heart disease (dyspnea, edema, exercise intolerance, palpitations) is suspected. Monitor for hypersensitivity reactions, seizure activity. Monitor for infections (cough, fatigue, fever). RPLS should

be considered in pts with altered mental status, confusion, headache, seizures, visual disturbances. Altered gait, paralysis, numbness/weakness/pain of extremities may indicate spinal cord compression or cauda equina syndrome. Question incidence of falls.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- There is a high risk of interactions with other medications. Do not take any newly prescribed medications unless approved by prescriber who originally started treatment. Avoid herbal supplements (esp. St. John's wort).
- Treatment may increase risk of falls/fractures, seizures.
- Life-threatening heart disease may occur. Report difficulty breathing, palpitations, swelling of ankles or feet.
- Nervous system changes including confusion, seizures, headache, blurry vision, trouble speaking may indicate life-threatening brain dysfunction/swelling.
- Sexually active men must wear condom during treatment and for 1 wk after treatment due to potential risks to fetus.
- Women who are pregnant or are planning pregnancy may not touch medication without gloves.

## EPINEPHrine

**HIGH ALERT**

ep-i-nef-rin  
(Adrenalin, EpiPen, EpiPen Jr.)  
**Do not confuse EPINEPHrine with ePHEDrine.**

### FIXED-COMBINATION(S)

**LidoSite:** EPINEPHrine/lidocaine (anesthetic): 0.1%/10%.

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sympathomimetic (alpha-, beta-adrenergic agonist). **CLINICAL:** Antiglaucoma,

bronchodilator, cardiac stimulant, antiallergic, antihemorrhagic, prisms reversal agent.

## USES

Treatment of allergic reactions (including anaphylactic reactions). Treatment of hypotension associated with septic shock. Added to local anesthetics to decrease systemic absorption and increase duration of activity of local anesthetic. Decreases superficial hemorrhage. **OFF-LABEL:** Ventricular fibrillation or pulseless ventricular tachycardia unresponsive to initial defibrillatory shocks; pulseless electrical activity, asystole, hypotension unresponsive to volume resuscitation; bradycardia/hypotension unresponsive to atropine or pacing; inotropic support.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to EPINEPHrine. **Note:** There are no absolute contraindications with injectable EPINEPHrine in a life-threatening situation. **IV:** Narrow-angle glaucoma, thyrotoxicosis, diabetes, hypertension, other cardiovascular disorders. **Inhalation:** Concurrent use or within 2 wks of MAOIs. **Cautions:** Elderly, diabetes mellitus, hypertension, Parkinson's disease, thyroid disease, cerebrovascular or cardiovascular disease, concurrent use of tricyclic antidepressants. History of prostate enlargement, urinary retention.

## ACTION

Stimulates alpha-adrenergic receptors (vasoconstriction, pressor effects), beta<sub>1</sub>-adrenergic receptors (cardiac stimulation), beta<sub>2</sub>-adrenergic receptors (bronchial dilation, vasodilation). **Therapeutic Effect:** Relaxes smooth muscle of bronchial tree, produces cardiac stimulation, dilates skeletal muscle vasculature.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IM	5–10 min	20 min	1–4 hrs
SQ	5–10 min	20 min	1–4 hrs
Inhalation	3–5 min	20 min	1–3 hrs

Well absorbed after parenteral administration; minimally absorbed after inhalation. Metabolized in liver, other tissues, sympathetic nerve endings. Excreted in urine. Ophthalmic form may be systemically absorbed as a result of drainage into nasal pharyngeal passages. Mydriasis occurs within several min and persists several hrs; vasoconstriction occurs within 5 min and lasts less than 1 hr.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease effects of beta blockers (e.g., carvedilol, metoprolol). Digoxin, sympathomimetics (e.g., dopamine, norepinephrine) may increase risk of cardiac arrhythmias. Ergonovine, methergine, oxytocin may increase vasoconstriction. MAOIs (e.g., phenelzine, selegiline), tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline) may increase cardiovascular effects. **HERBAL:** Ephedra, yohimbe may increase CNS stimulation. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

## AVAILABILITY (Rx)

**Injection, Solution (Prefilled Syringes): (EpiPen):** 0.3 mg/0.3 mL. **(EpiPen Jr.):** 0.15 mg/0.3 mL. **Injection, Solution:** 0.1 mg/mL (1:10,000), 1 mg/mL (1:1,000).

**Solution for Oral Inhalation: (Adrenalin):** 2.25% (0.5 mL).

## ADMINISTRATION/HANDLING

**Reconstitution** • For injection, dilute each 1 mg of 1:1,000 solution with 10 mL 0.9% NaCl to provide 1:10,000 solution and inject each 1 mg or fraction thereof over 1 min or more (except in cardiac arrest). • For infusion, further dilute

with 250–500 mL D<sub>5</sub>W. Maximum concentration 64 mcg/mL.

**Rate of administration** • For IV infusion, give at 1–10 mcg/min (titrate to desired response).

**Storage** • Store parenteral forms at room temperature. • Do not use if solution appears discolored or contains a precipitate.

### SQ

• Shake ampule thoroughly. • Use tuberculin syringe for injection into lateral deltoid region. • Massage injection site (minimizes vasoconstriction effect). Use only 1:1,000 solution.

### Nebulizer

• No more than 10 drops Adrenalin Chloride solution 1:100 should be placed in reservoir of nebulizer. • Place nozzle just inside pt's partially opened mouth. • As bulb is squeezed once or twice, instruct pt to inhale deeply, drawing vaporized solution into lungs. • Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness). • When nebulizer is not in use, replace stopper, keep in upright position.

### IV INCOMPATIBILITIES

Ampicillin, pantoprazole (Protonix), sodium bicarbonate.

### IV COMPATIBILITIES

Calcium chloride, calcium gluconate, dexmedetomidine (Precedex), dilTIAzem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), heparin, HYDRomorphone (Dilaudid), LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

### INDICATIONS/ROUTES/DOSAGE

#### Hypersensitivity Reactions (Including Anaphylaxis)

**IM: ADULTS, ELDERLY:** 0.3–0.5 mg (use 0.5 mg in pts greater than 50 kg) using the 1 mg/mL solution. May repeat

q5–15min for adequate response. **ADOLESCENTS, CHILDREN, INFANTS:** 0.01 mg/kg (0.01 mL/kg/dose of the 1 mg/mL solution) not to exceed: (Prepubertal child): 0.3 mg/dose; (Adolescent): 0.5 mg/dose administered q5–15min.

#### Hypotension (Shock)

**IV infusion: ADULTS, ELDERLY:** Initially, 0.01–0.2 mcg/kg/min. Titrate to desired response. **ADOLESCENTS, CHILDREN, INFANTS:** Initially, 0.1–1 mcg/kg/min. Titrate to desired response.

#### Cardiac Arrest

**IV: ADULTS, ELDERLY:** Initially, 1 mg. May repeat q3–5min as needed. **CHILDREN:** Initially, 0.01 mg/kg (0.1 mL/kg of a 0.1 mg/mL solution). May repeat q3–5min as needed.

**Endotracheal: ADULTS, ELDERLY:** 2–2.5 mg q3–5min as needed. **CHILDREN:** 0.1 mg/kg (0.1 mL/kg of a 1 mg/mL solution). May repeat q3–5min as needed. **Maximum single dose:** 2.5 mg.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

### SIDE EFFECTS

**Frequent: Systemic:** Tachycardia, palpitations, anxiety. **Ophthalmic:** Headache, eye irritation, watering of eyes. **Occasional: Systemic:** Dizziness, lightheadedness, facial flushing, headache, diaphoresis, increased B/P, nausea, trembling, insomnia, vomiting, fatigue. **Ophthalmic:** Blurred/decreased vision, eye pain. **Rare: Systemic:** Chest discomfort/pain, arrhythmias, bronchospasm, dry mouth/throat.

### ADVERSE EFFECTS/TOXIC REACTIONS

Excessive doses may cause acute hypertension, arrhythmias. Prolonged/excessive use may result in metabolic acidosis due to increased serum lactic acid. Metabolic acidosis may cause disorientation, fatigue, hyperventilation, headache, nausea, vomiting, diarrhea.

## NURSING CONSIDERATIONS

### INTERVENTION/EVALUATION

Monitor changes of B/P, HR. Assess lung sounds for rhonchi, wheezing, rales. Monitor ABGs. In cardiac arrest, adhere to ACLS protocols.

### PATIENT/FAMILY TEACHING

- Avoid excessive use of caffeine.
- Report any new symptoms (tachycardia, shortness of breath, dizziness) immediately: may be systemic effects.

## eplerenone

ep-ler-e-none  
(Inspra)

**Do not confuse Inspra with Spiriva.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Aldosterone receptor antagonist. **CLINICAL:** Antihypertensive.

## USES

Treatment of hypertension alone or in combination with other antihypertensive agents. Treatment of HF following acute myocardial infarction (AMI).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to eplerenone. Concurrent use with strong CYP3A4 inhibitors (e.g., ketoconazole, itraconazole), CrCl less than 30 mL/min, serum potassium level greater than 5.5 mEq/L at initiation. Use in pts with Addison's disease. **Hypertension (Additional):** Type 2 diabetes with microalbuminuria; CrCl less than 50 mL/min; serum creatinine greater than 2 mg/dL in men, greater than 1.8 mg/dL in women; concomitant use of potassium supplements or potassium-sparing diuretics. **Cautions:** Hyperkalemia, HF, post-MI, diabetes, mild renal impairment.

## ACTION

Binds to mineralocorticoid receptors in kidney, heart, blood vessels, brain, blocking binding of aldosterone. **Therapeutic Effect:** Reduces B/P. Prevents myocardial and vascular fibrosis.

## PHARMACOKINETICS

Widely distributed. Protein binding: 50%. Metabolized in liver. Excreted in urine (67%), feces (32%). Not removed by hemodialysis. **Half-life:** 4–6 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** ACE inhibitors (e.g., enalapril, lisinopril), angiotensin II antagonists (e.g., losartan, valsartan), potassium-sparing diuretics (e.g., spironolactone), potassium supplements increase risk of hyperkalemia. May increase the hyperkalemic effect of cycloSPORINE, tacrolimus. Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. NSAIDs (e.g., diclofenac, meloxicam, naproxen) may decrease antihypertensive effect. **HERBAL:** Herbs with hypertensive properties (e.g., licorice, yohimbe) or hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may alter effects. **FOOD:** Grapefruit products may increase potential for hyperkalemia, arrhythmias. **LAB VALUES:** May increase serum potassium, ALT, AST, cholesterol, triglycerides, serum creatinine, uric acid. May decrease serum sodium.

## AVAILABILITY (Rx)

 **Tablets:** 25 mg, 50 mg.

**ADMINISTRATION/HANDLING**

- Do not break, crush, dissolve, or divide film-coated tablets.
- May give without regard to food.

**INDICATIONS/ROUTES/DOSAGE****Hypertension**

**PO: ADULTS, ELDERLY:** Initially, 50 mg once daily. If 50 mg once daily produces an inadequate B/P response, may increase dosage to 50 mg twice daily. If pt is concurrently receiving CYP3A4 inhibitors (e.g., erythromycin, verapamil, or fluconazole), reduce initial dose to 25 mg once daily. **Maximum:** 50 mg/day.

**HF Following MI**

**PO: ADULTS, ELDERLY:** Initially, 25 mg once daily. If tolerated, titrate up to 50 mg once daily within 4 wks.

**Dosage Adjustment for Serum Potassium Concentrations in HF**

**Less than 5 mEq/L:** Increase dose from 25 mg daily to 50 mg daily or increase dose from 25 mg every other day to 25 mg daily. **5–5.4 mEq/L:** No adjustment needed. **5.5–5.9 mEq/L:** Decrease dose from 50 mg daily to 25 mg daily or from 25 mg daily to 25 mg every other day. Decrease dose from 25 mg every other day to withhold medication. **6 mEq/L or greater:** Withhold medication until potassium is less than 5.5 mEq/L, then restart at 25 mg every other day.

**Dosage in Renal Impairment**

Contraindicated in pts with hypertension with CrCl less than 50 mL/min or serum creatinine greater than 2 mg/dL in males or greater than 1.8 mg/dL in females. All other indications, CrCl less than 30 mL/min, use is contraindicated.

**Dosage in Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS**

**Rare (3%–1%):** Dizziness, diarrhea, cough, fatigue, flu-like symptoms, abdominal pain.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hyperkalemia may occur, particularly in pts with type 2 diabetes mellitus and microalbuminuria.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain serum potassium level. Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated.

**INTERVENTION/EVALUATION**

Monitor serum potassium. Assist with ambulation if dizziness occurs. Assess B/P for hypertension/hypotension. Assess for evidence of flu-like symptoms.

**PATIENT/FAMILY TEACHING**

- Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
- Hypertension requires lifelong control.
- Avoid exercising during hot weather (risk of dehydration, hypotension).
- Do not use salt substitutes containing potassium.

**epoetin alfa**TOP  
100

e-poe-e-tin al-fa  
(Epoen, Eprex , Procrit, Retacrit)

**BLACK BOX ALERT** Increased risk of serious cardiovascular events, thromboembolic events, mortality, time-to-tumor progression in pts with head and neck cancer, metastatic breast cancer, non-small-cell lung cancer when administered to a target hemoglobin of more than 11 g/dL. Increases rate of deep vein thrombosis in perioperative pts not receiving anticoagulant therapy.

**Do not confuse epoetin with darbepoetin, or Eprex with Neupogen.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Erythropoiesis-stimulating agent (ESA).  
**CLINICAL:** Erythropoietin.

## USES

Treatment of anemia in pts receiving or who have received myelosuppressive chemotherapy for a planned minimum of 2 mos of chemotherapy; pts with chronic renal failure to decrease need for RBC transfusion; HIV-infected pts on zidovudine (AZT) therapy when endogenous erythropoietin levels are 500 Units/mL or less; pts scheduled for elective noncardiac, nonvascular surgery, reducing need for allogenic blood transfusions when perioperative Hgb is greater than 10 or less than or equal to 13 g/dL and high risk for blood loss.  
**OFF-LABEL:** Anemia in myelodysplastic syndromes.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to epoetin. Pure red cell aplasia that begins after treatment, uncontrolled hypertension.  
**Cautions:** History of seizures or controlled hypertension.  
**Cancer pts:** Tumor growth, shortened survival may occur when Hgb levels of 11 g/dL or greater are achieved with epoetin alfa.  
**Chronic renal failure pts:** Increased risk for serious cardiovascular reactions (e.g., stroke, MI) when Hgb levels greater than 11 g/dL are achieved with epoetin alfa.

## ACTION

Stimulates division, differentiation of erythroid progenitor cells in bone marrow.  
**Therapeutic Effect:** Induces erythropoiesis, releases reticulocytes from bone marrow into blood, where they mature into erythrocytes.

## PHARMACOKINETICS

Well absorbed after SQ administration. Following administration, an increase in reticulocyte count occurs within 10

days, and increases in Hgb, Hct, and RBC count are seen within 2–6 wks. **Half-life:** 4–13 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk.  
**Children:** Safety and efficacy not established in pts 12 yrs and younger.  
**Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, phosphorus, potassium, creatinine, uric acid, sodium. May decrease bleeding time, iron concentration, serum ferritin.

## AVAILABILITY (Rx)

**Injection Solution:** (*Epogen, Procrit*): 2,000 units/mL, 3,000 units/mL, 4,000 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL.

## ADMINISTRATION/HANDLING

◀ **ALERT** ▶ Avoid excessive agitation of vial; do not shake (foaming).

**Reconstitution** • No reconstitution necessary.

**Rate of administration** • May be given as an IV bolus.

**Storage** • Refrigerate. • Vigorous shaking may denature medication, rendering it inactive.

## SQ

• Mix in syringe with bacteriostatic 0.9% NaCl with benzyl alcohol 0.9% (bacteriostatic saline) at a 1:1 ratio (benzyl alcohol acts as local anesthetic; may reduce injection site discomfort). • Use 1 dose per vial; do not enter vial. Discard unused portion.

## IV INCOMPATIBILITIES

Do not mix injection form with other medications.

**INDICATIONS/ROUTES/DOSAGE****Anemia Associated With Chemotherapy**

**◀ALERT▶** Begin therapy only if Hgb less than 10 g/dL and anticipated duration of myelosuppressive chemotherapy is greater than 2 mos. Use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions. Discontinue upon completion of chemotherapy.

**SQ: ADULTS, ELDERLY:** Initially, 150 units/kg 3 times/wk (commonly used dose of 10,000 units 3 times/wk) or 40,000 units once wkly. **IV: CHILDREN 5 YRS AND OLDER:** 600 units/kg once wkly. **Maximum:** 40,000 units.

**Increase dose: ADULTS, ELDERLY:** If Hgb does not increase by greater than 1 g/dL and remains below 10 g/dL after initial 4 wks, may increase to 300 units/kg 3 times/wk or 60,000 units once wkly. **CHILDREN:** If Hgb does not increase by greater than 1 g/dL and remains less than 10 g/dL after initial 4 wks of once-wkly dosing, may increase dose to 900 units/kg/wk. **Maximum:** 60,000 units once wkly.

**Decrease dose:** Decrease dose by 25% if Hgb increases greater than 1 g/dL in any 2-wk period or Hgb level reaches level that will avoid red blood cell transfusions.

**Reduction of Allogenic Blood****Transfusions in Elective Surgery**

**SQ: ADULTS, ELDERLY:** 300 units/kg/day for 10 days before and 4 days after surgery or 600 units/kg once weekly for 4 doses given 21, 14, 7 days before surgery and on the day of surgery.

**Anemia in Chronic Renal Failure**

**◀ALERT▶** Individualize dose, using lowest dose to reduce need for RBC transfusions. **On dialysis:** Initiate when Hgb less than 10 g/dL; reduce dose or discontinue if Hgb approaches or exceeds 11 g/dL. **Not on dialysis:** Initiate when Hgb less than 10 g/dL; reduce dose or stop if Hgb exceeds 10 g/dL.

**IV, SQ: ADULTS, ELDERLY:** 50–100 units/kg 3 times/wk. **CHILDREN:** 50 units/kg 3 times/wk. **Maintenance: Decrease**

**dose by 25%:** If Hgb increases greater than 1 g/dL in any 2-wk period. **Increase dose by 25%:** If Hgb does not increase by greater than 1 g/dL after 4 wks of therapy. Do not increase dose more frequently than every 4 wks. **Note:** If pt does not attain adequate response after appropriate dosing over 12 wks, do not continue to increase dose, and use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions.

**HIV Infection in Pts Treated With Zidovudine (AZT)**

**IV, SQ: ADULTS:** Initially, 100 units/kg 3 times/wk for 8 wks; may increase by 50–100 units/kg 3 times/wk. Evaluate response q4–8wks thereafter. Adjust dosage by 50–100 units/kg 3 times/wk. If dosages larger than 300 units/kg 3 times/wk are not eliciting response, it is unlikely pt will respond. **Maintenance:** Titrate to maintain desired Hgb level. Hgb levels should not exceed 12 g/dL. If Hgb greater than 12 g/dL, resume treatment with 25% dose reduction when Hgb drops below 11 g/dL. Discontinue if Hgb increase not attained with 300 units/kg for 8 wks.

**Dosage in Renal/Hepatic Impairment**

No dose adjustment.

**SIDE EFFECTS****Pts Receiving Chemotherapy**

**Frequent (20%–17%):** Fever, diarrhea, nausea, vomiting, edema. **Occasional (13%–11%):** Asthenia, shortness of breath, paresthesia. **Rare (5%–3%):** Dizziness, trunk pain.

**Pts With Chronic Renal Failure**

**Frequent (24%–11%):** Hypertension, headache, nausea, arthralgia. **Occasional (9%–7%):** Fatigue, edema, diarrhea, vomiting, chest pain, skin reactions at administration site, asthenia, dizziness.

**Pts With HIV Infection Treated With AZT**

**Frequent (38%–15%):** Fever, fatigue, headache, cough, diarrhea, rash, nausea. **Occasional (14%–9%):** Shortness of

breath, asthenia, skin reaction at injection site, dizziness.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypertensive encephalopathy, thrombosis, cerebrovascular accident, MI, seizures occur rarely. Hyperkalemia occurs occasionally in pts with chronic renal failure, usually in those who do not comply with medication regimen, dietary guidelines, frequency of dialysis regimen.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Assess B/P before initiation (80% of pts with chronic renal failure have history of hypertension). B/P often rises during early therapy in pts with history of hypertension. Consider that all pts eventually need supplemental iron therapy. Assess serum iron (should be greater than 20%), serum ferritin (should be greater than 100 ng/mL) before and during therapy. Establish baseline CBC (esp. note Hct).

### INTERVENTION/EVALUATION

Assess CBC routinely (esp. Hgb, Hct). Monitor aggressively for increased B/P (25% of pts require antihypertensive therapy, dietary restrictions). Monitor temperature, esp. in cancer pts on chemotherapy and zidovudine-treated HIV pts. Monitor serum BUN, uric acid, creatinine, phosphorus, potassium, esp. in chronic renal failure pts.

### PATIENT/FAMILY TEACHING

- Frequent laboratory assessments needed to determine correct dosage.
- Immediately report any severe headache.
- Avoid potentially hazardous activity during first 90 days of therapy (increased risk of seizures in pts with chronic renal failure during first 90 days).
- Specific dietary regimen must be maintained.

## eptinezumab-jjmr

ep-ti-**nez**-ue-mab  
(Vyepti)

**Do not confuse eptinezumab with eptifibatide, galcanezumab, fremanezumab, obinutuzumab, or trastuzumab, or Vyepti with Vyleesi or Vyzulta.**

### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcitonin gene–related peptide (CGRP) ligand, humanized immunoglobulin G1 (IgG1) monoclonal antibody. **CLINICAL:** Migraine prophylaxis agent.

### USES

Preventative treatment of migraines in adults.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to eptinezumab-jjmr. **Cautions:** None known.

### ACTION

Binds to and inhibits calcitonin gene–related peptide (CGRP) receptor. **Therapeutic Effect:** Reduces occurrence of acute or chronic migraine headaches.

### PHARMACOKINETICS

Widely distributed. Metabolized and eliminated via proteolytic degradation into small peptides, amino acids. Steady state reached after first dose. **Half-life:** 27 days.

### LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

## INTERACTIONS

**DRUG:** None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

## AVAILABILITY (RX)

**Injection Solution:** 100 mg.

## ADMINISTRATION/HANDLING

**Preparation** • Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly opalescent, colorless to brownish-yellow in color. Do not use if solution is cloudy or discolored or if visible particles are observed. • Withdraw 1 mL from vial (or 1 mL from each 3 single-dose vials for 300-mg dose) into syringe and dilute into 100-mL bag containing 0.9% NaCl. Infusion bag must be made of polyvinyl chloride (PVC), polyethylene, or polyolefin. • Mix by gentle inversion. • Do not shake or agitate.

**Rate of administration** • Infuse over 30 min using 0.2–0.22 micron filter via dedicated IV line. • Do not administer as IV push or bolus.

**Postinfusion guidelines** • After infusion is complete, flush IV line with 20 mL 0.9% NaCl.

**Storage** • Refrigerate vials in original carton until time of use. • Protect from light. • Do not shake. • Do not freeze or expose to heating sources. • Store diluted solution at room temperature for up to 8 hrs.

## IV INCOMPATIBILITIES

Do not infuse or mix with other medications.

## INDICATIONS/ROUTES/DOSAGE

### Migraine Headaches

**IV: ADULTS:** 100 mg once q3mos. **Maximum:** 300 mg once q3mos.

### Dosage in Renal Impairment

**Mild to severe impairment:** No dose adjustment.

### Dosage in Hepatic Impairment

**Mild to severe impairment:** No dose adjustment.

## SIDE EFFECTS

**Occasional (8%–6%):** Nasopharyngitis.

## ADVERSE EFFECTS/TOXIC REACTIONS

Hypersensitivity reactions including angioedema, facial flushing, urticaria, rash may occur. Immunogenicity (auto-epitanezumab antibodies) reported in 18%–20% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms). Question for hypersensitivity reactions.

### INTERVENTION/EVALUATION

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, fogging). Monitor for hypersensitivity reactions.

### PATIENT/FAMILY TEACHING

• Allergic reactions such as itching, rash, swelling of the face or tongue can happen at any time. If allergic reaction occurs, seek immediate medical attention. • Consult healthcare provider if pregnancy occurs or for any plans to breastfeed.

## erdafitinib

er-da-fi-ti-nib  
(Balversa)

**Do not confuse erdafitinib with enasidenib, encorafenib, erlotinib or gefitinib, or Balversa with Balziva.**

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Fibroblast growth factor receptor (FGFR) inhibitor. Tyrosine kinase inhibitor.  
**CLINICAL:** Antineoplastic.

## USES

Treatment of adult pts with locally advanced or metastatic urothelial carcinoma that has susceptible FGFR3 or FGFR2 genetic mutation alterations and progressed during or following at least one line of prior platinum-containing chemotherapy including within 12 mos of neoadjuvant or adjuvant platinum-containing chemotherapy.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to erdafitinib. **Cautions:** Baseline hemoglobinemia, neutropenia, leukopenia, thrombocytopenia; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds), hepatic/renal impairment, optic disorders, pts at risk for hyperphosphatemia (hypoparathyroidism, concomitant use of phosphorus-containing medications, chronic kidney disease), CYP2C9 poor metabolizers (pts with CYP2C9\*3/\*3 genotype); concomitant use of CYP3A inhibitors or inducers, CYP2C9 inducers or inhibitors, CYP3A4 substrates, OAT2 substrates, or P-gp substrates.

## ACTION

Binds to and inhibits fibroblast growth factor receptor (FGFR) enzyme activity. Decreases FGFR-related signaling and cell viability. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis. Induces cellular death of tumor cells.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 99.8%. Peak

plasma concentration: 2.5 hrs. Steady state reached in 2 wks. Excreted in feces (69%), urine (19%). **Half-life:** 59 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females and males with female partners of reproductive potential should use effective contraception during treatment and up to 1 mo after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. May impair fertility in female pts. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole), moderate CYP3A inhibitors (e.g., ciprofloxacin, diltiazem, fluconazole, verapamil) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. Phosphate-altering drugs (e.g., ergocalciferol, K-phos, PhosLo, Renigel) may alter phosphate level; may affect dose modifications. **HERBAL:** None significant. **St. John's wort** may decrease concentration/effect. **FOOD:** Phosphorus-containing foods (e.g., dairy products, deli meats, nuts, peanut butter) may increase serum phosphate; may affect dose modifications. Restrict phosphate intake to 600–800 mg daily. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, calcium, creatinine, glucose, potassium. May decrease serum albumin, sodium; Hgb, leukocytes, neutrophils, platelets. May increase or decrease serum phosphate.

## AVAILABILITY (Rx)

**Tablets:** 3 mg, 4 mg, 5 mg.

**ADMINISTRATION/HANDLING****PO**

• Give without regard to food. Administer tablets whole; do not break, cut, crush, or divide. Tablets should not be chewed. • If a dose is missed, give as soon as possible. If vomiting occurs after administration, give next dose at regularly scheduled time.

**INDICATIONS/ROUTES/DOSAGE**

**Note:** Assess serum phosphate levels 14–21 days after therapy initiation.

Restrict phosphate intake to 600–800 mg daily

***Urothelial Carcinoma***

**PO: ADULTS, ELDERLY:** Initially, 8 mg once daily. After 14–21 days, increase dose to 9 mg once daily if serum phosphate is less than 5.5 mg/dL and there are no ocular toxicities or Grade 2 (or higher) adverse reactions. Continue until disease progression or unacceptable toxicity.

**Dose Reduction Schedule for Adverse Reactions**

Dose	First Dose Reduction	Second Dose Reduction	Third Dose Reduction	Fourth Dose Reduction	Fifth Dose Reduction
9 mg	8 mg	6 mg	5 mg	4 mg	Discontinue
8 mg	6 mg	5 mg	4 mg	Discontinue	N/A

**Dose Modification**

Based on Common Terminology Criteria for Adverse Events (CTCAE).

***Hyperphosphatemia***

**Serum phosphate 5.6–6.9 mg/dL (1.8–2.3 mmol/L):** Maintain dose. **7–9 mg/dL (2.3–2.9 mmol/L):** Withhold treatment until serum phosphate is less than 5.5 mg/dL (or baseline), then resume at same dose. May reduce dose if hyperphosphatemia lasts greater than 1 wk. **Greater than 9 mg/dL and less than 10 mg/dL (greater than 2.9 mmol/L):** Withhold treatment until serum phosphate is less than 5.5 mg/dL (or baseline), then resume at next lower dose level. **Greater than 10 mg/dL (greater than 3.2 mmol/L); significant change of baseline renal function; Grade 3 hypercalcemia:** Withhold treatment until serum phosphate is less than 5.5 mg/dL (or baseline), then resume at 2 lower dose levels.

***Serious Retinopathy/Retinal Pigment Epithelial Detachment***

**Asymptomatic; clinical of diagnostic observation:** Withhold treatment until resolved. Resume at next lower dose level if resolved within 4 wks. Consider re-escalation of dose if symptoms do not recur for 1 mo. If stable but not resolved for 2 consecutive eye exams, resume at next lower dose level. **Visual acuity 20/40 (or better) or greater than or equal to 3 lines of decreased vision from baseline:** Withhold treatment until resolved. Resume at next lower dose level if resolved within 4 wks. **Visual acuity worse than 20/40 or greater than 3 lines of decreased vision from baseline:** Withhold treatment until resolved. Resume at 2 lower dose levels if resolved within 4 wks. Consider permanent discontinuation if recurrent. **Visual acuity 20/200 or worse in affected eye:** Permanently discontinue.

**Other Adverse Reactions**

**Any Grade 3 reaction:** Withhold treatment until improved to Grade 1 or 0, then resume at next lower dose level.  
**Any Grade 4 reaction:** Permanently discontinue.

**Dosage in Renal Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

**Dosage in Hepatic Impairment**

**Mild impairment:** No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

**SIDE EFFECTS**

**Frequent (56%–20%):** Stomatitis, fatigue, asthenia, lethargy, malaise, diarrhea, dry mouth, onycholysis, onychoclasis, nail disorder, nail dystrophy, nail ridging, decreased appetite, dysgeusia, constipation, dry eye, alopecia, abdominal pain, nausea, musculoskeletal pain, back/chest/neck pain. **Occasional (17%–10%):** Blurry vision, decreased weight, cachexia, pyrexia, vomiting, nail discoloration, oropharyngeal pain, arthralgia, increased lacrimation, dyspnea.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Hemoglobinemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Ocular toxicities including serious retinopathy/retinal pigment epithelial detachment reported in 25% of pts. Ocular disorders including keratitis, foreign body sensation, corneal erosion reported in 28% of pts. Grade 3 serious retinopathy/retinal pigment epithelial detachment reported in 3% of pts. Hyperphosphatemia reported in 76% of pts with 32% of pts requiring oral phosphate binders. Palmar-plantar erythrodysesthesia syndrome reported in 26% of pts. Hematuria reported in 11% of pts. Infections including paronychia (17% of pts), urinary tract infection (17% of pts), conjunctivitis (11% of pts) may occur.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Obtain CBC, BMP, LFT, pregnancy test in female pts of reproductive potential. Confirm presence of susceptible FGFR genetic alterations in tumor specimens. Verify compliance of effective contraception in female pts and male pts with female partners of reproductive potential. Obtain visual acuity. Screen for active infection. Question history of hepatic/renal impairment, optic disorders. Receive full medication history and screen for interactions. Offer emotional support.

**INTERVENTION/EVALUATION**

Monitor CBC, BMP, LFT, serum ionized calcium periodically. Obtain serum phosphate level 14–21 days after initiation. Restrict phosphorus intake to 600–800 mg daily. If serum phosphate is greater than 7 mg/dL, consider administration of an oral phosphate binder until serum phosphate is less than 5.5 mg/dL. Obtain weekly serum phosphate levels in pts who develop hyperphosphatemia. Monitor for symptoms of hyperphosphatemia, which may mimic symptoms of hypocalcemia (facial twitching, muscle cramps, numbness of hand, feet, lips; seizures). Assess skin for dermal toxicities. Monthly ophthalmologic exams (including visual acuity, slit lamp examination, funduscopy, optical coherence tomography) should be performed by a specialist for the first 4 mos, then q3mos thereafter, or emergently if new symptoms occur. Obtain urinalysis if UTI is suspected (dysuria, fever, foul-smelling or cloudy urine, urinary frequency). Diligently monitor for infections.

**PATIENT/FAMILY TEACHING**

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Report

symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool. • Expect frequent eye exams, skin exams. Immediately report vision changes of any kind. • Use effective contraception to avoid pregnancy. Do not breastfeed. • Limit intake of phosphorus-containing food unless blood tests verify acceptable phosphate levels. • Report liver problems such as bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes; symptoms of UTI (burning with urination, fever, urinary frequency, foul-smelling or cloudy urine). • There is a high risk of interactions with other medications. Do not take any newly prescribed medications unless approved by prescriber who originally started treatment. • Avoid grapefruit products, herbal supplements (esp. St. John's wort).

## erenumab-aooe

e-ren-ue-mab-aooe  
(Aimovig)

**Do not confuse erenumab with aducanumab or secukinumab.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Calcitonin gene-related peptide (CGRP) receptor antagonist. Monoclonal antibody. **CLINICAL:** Migraine prophylaxis agent.

### USES

Preventative treatment of migraines in adults.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to erenumab-aooe. **Cautions:** Latex allergy (when handling needle cap).

### ACTION

Binds to and inhibits calcitonin gene-related peptide (CGRP) receptor. **Therapeutic Effect:** Reduces occurrence of acute or chronic migraine headaches.

### PHARMACOKINETICS

Widely distributed. Peak plasma concentration: 6 days. Steady state reached by 3 mos of dosing. Eliminated mainly via proteolytic degradation. **Half-life:** 28 days.

### ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not specified.

### INTERACTIONS

**DRUG:** None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None known.

### AVAILABILITY (Rx)

**Injection Solution:** 70 mg/1 mL, 140 mg/mL in prefilled syringe or autoinjector.

### ADMINISTRATION/HANDLING

#### SO

**Preparation** • Remove prefilled syringe or autoinjector from refrigerator and allow solution to warm to room temperature (approx. 30 min) with needle cap intact. • Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or visible particles are observed.

**Administration** • Insert needle subcutaneously into upper arm, outer thigh, or abdomen and inject solution. • Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis. • Do not administer IV or intramuscularly. • Rotate injection sites.

**Storage** • Refrigerate prefilled syringes in original carton until time of use. • May store at room temperature for up to 7 days. Once warmed to

room temperature, do not place back into refrigerator. • Do not freeze or expose to heating sources. • Do not shake. • Protect from light.

## INDICATIONS/ROUTES/DOSAGE

### Acute or Chronic Migraine Headaches

**SQ; ADULTS:** 70 mg once monthly. May increase to 140 mg once monthly if 70 mg dose is ineffective.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

Not specified; use caution.

## SIDE EFFECTS

**Occasional (6%–1%):** Injection site pain/erythema, constipation, cramps, muscle spasm.

## ADVERSE EFFECTS/TOXIC REACTIONS

Immunogenicity (auto-erenumab antibodies) occurred in 6.2% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question characteristics of migraine headaches (onset, location, duration, possible precipitating symptoms). Question history of latex allergy. Assess pt's willingness to self-inject medication.

### INTERVENTION/EVALUATION

Evaluate for relief of migraine headaches (photophobia, phonophobia, nausea, vomiting, pain, dizziness, foggy).

### PATIENT/FAMILY TEACHING

- Latex needle cap may cause a skin reaction in pts with a latex allergy if direct skin contact is made.
- A healthcare provider will show you how to properly prepare and inject medication. You must demonstrate correct preparation and injection techniques before using medication at home.

## eriBULin

er-i-bue-lin  
(Halaven)

**Do not confuse eriBULin with epiRUBicin or erlotinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Microtubule inhibitor. **CLINICAL:** Antineoplastic.

## USES

Treatment of metastatic breast cancer in pts who previously received at least 2 chemotherapeutic regimens for treatment. Treatment of metastatic or unresectable liposarcoma in pts who received a prior anthracycline-containing regimen.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to eriBULin. **Cautions:** Pts at risk for QT interval prolongation (e.g., congenital long QT syndrome, QT interval-prolonging medications, hypokalemia, hypomagnesemia); hepatic/renal impairment, moderate to severe neuropathy, HF; conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

## ACTION

Inhibits growth phase of microtubule by inhibiting formation of mitotic spindles. Causes mitotic blockage and arrests the cell cycle. **Therapeutic Effect:** Blocks cells in mitotic phase of cell division, leading to tumor cell death.

## PHARMACOKINETICS

Widely distributed. Metabolism is negligible. Protein binding: 49%–65%. Excreted in feces (82%), urine (9%).

**Half-life:** 40 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy; may cause fetal harm. Females of

reproductive potential must use effective contraception during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk.

**Males:** Males with female partners of reproductive potential must use effective contraception during treatment and for at least 3.5 mos after discontinuation. May impair fertility. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** May decrease levels/effects of BCG (intravesical). May increase QT interval—prolonging effect of amiodarone, azithromycin, ciprofloxacin, haloperidol. **HERBAL:** None significant.

**FOOD:** None known. **LAB VALUES:** May decrease WBC, Hgb, Hct, platelet count, potassium. May increase ALT.

## AVAILABILITY (Rx)

**Injection, Solution:** 1 mg/2 mL (0.5 mg/mL).

## ADMINISTRATION/HANDLING

**Reconstitution** • May administer undiluted or dilute in 100 mL 0.9% NaCl.

**Rate of administration** • Administer over 2–5 min.

**Storage** • Store at room temperature. • Once diluted, syringe or diluted solution may be stored for up to 4 hrs at room temperature or up to 24 hrs if refrigerated.

## IV INCOMPATIBILITIES

Do not dilute with D<sub>5</sub>W or administer through IV line containing solutions with dextrose or in same IV line with other medications.

## INDICATIONS/ROUTES/DOSAGE

**Metastatic Breast Cancer, Liposarcoma**

**IV: ADULTS, ELDERLY:** 1.4 mg/m<sup>2</sup> over 2–5 min on days 1 and 8 of 21-day cycle.

## Recommended Dose Delays

Do not administer day 1 or day 8 of treatment for any of the following: ANC less than 1,000 cells/mm<sup>3</sup>, platelets less than 75,000 cells/mm<sup>3</sup>, Grade 3 or 4 nonhematologic toxicities. Day 8 dose may be delayed for maximum of 1 wk. If toxicities do not resolve or improve to Grade 2 severity by day 15, omit dose. If toxicities resolve or improve to Grade 2 severity by day 15, continue treatment at reduced dose and initiate next cycle no sooner than 2 wks later. Do not re-escalate dose after it has been reduced.

## Dosage in Renal Impairment

**Mild impairment:** No dose adjustment.

**Moderate to severe impairment: CrCl 15–49 mL/min:** 1.1 mg/m<sup>2</sup>/dose.

## Dosage in Hepatic Impairment

**Mild impairment:** 1.1 mg/m<sup>2</sup>/dose.

**Moderate impairment:** 0.7 mg/m<sup>2</sup>/dose. **Severe impairment:** Use not recommended.

## SIDE EFFECTS

**Common (54%–35%):** Fatigue, asthenia, alopecia, peripheral sensory neuropathy, nausea. **Frequent (25%–18%):** Constipation, arthralgia/myalgia, decreased weight, anorexia, pyrexia, headache, diarrhea, vomiting. **Occasional (16%–9%):** Back pain, dyspnea, cough, bone pain, extremity pain, urinary tract infection, oral mucosal inflammation.

## ADVERSE EFFECTS/TOXIC REACTIONS

Neutropenia occurs in 82% of pts, with 57% developing Grade 3 neutropenia. Severe neutropenia (ANC less than 500 cells/mm<sup>3</sup>) lasting more than 1 wk occurred in 12%. Anemia occurs in 58% of pts. Peripheral neuropathy occurs in 8% of pts. Prolonged QTc interval may be noted on or after day 8 of treatment.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC (prior to each dose); pregnancy test in females of reproductive

potential. Screen for active infection, QT interval—prolonging medications. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor for infections (cough, fatigue, fever). Monitor for symptoms of neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain). Assess hands, feet for erythema. Monitor CBC for evidence of neutropenia, thrombocytopenia. Assess mouth for stomatitis (erythema, ulceration, mucosal burning).

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of bone marrow depression such as bruising, fatigue, fever, shortness of breath, weight loss; bleeding easily, bloody urine or stool.
- Report liver problems (abdominal pain, bruising, clay-colored stool, amber- or dark-colored urine, yellowing of the skin or eyes), kidney problems (decreased urine output, flank pain, darkened urine).
- Use effective contraception to avoid pregnancy. Do not breastfeed.

## erlotinib

HIGH  
ALERT

er-loe-ti-nib  
(Tarceva)

**Do not confuse erlotinib with dasatinib, eriBULin, gefitinib, imatinib, or lapatinib.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Epidermal growth factor receptor (EGFR) inhibitor; tyrosine kinase inhibitor.  
**CLINICAL:** Antineoplastic.

## USES

Treatment of locally advanced or metastatic non–small-cell lung cancer (NSCLC) after failure of at least one prior chemotherapy regimen (as monotherapy). First-line treatment of locally advanced, unresectable, or metastatic pancreatic cancer (in combination with gemcitabine).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to erlotinib. **Cautions:** Severe hepatic/renal impairment, cardiovascular disease. Concurrent use of strong CYP3A4 inhibitors and inducers or CYP1A2 inhibitors, pts at risk for GI perforation (e.g., peptic ulcer disease, diverticular disease), conditions predisposing to infection (e.g., diabetes, renal failure, immunocompromised pts, open wounds).

## ACTION

Reversibly inhibits overall epidermal growth factor receptor (EGFR)—tyrosine kinase activity. Inhibits intracellular phosphorylation. **Therapeutic Effect:** Produces tumor cell death.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Protein binding: 93%. Excreted in feces (83%), urine (8%). **Half-life:** 24–36 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **Antacids, proton pump inhibitors (e.g., omeprazole, pan-**

toprazole), H<sub>2</sub> antagonists (e.g., ranitidine) may decrease absorption/effect. Warfarin may increase risk of bleeding. Statins (e.g., atorvastatin, simvastatin) may increase risk of myopathy, rhabdomyolysis. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase potential for myelotoxicity. **LAB VALUES:** May increase serum bilirubin, ALT, AST.

### AVAILABILITY (Rx)

**Tablets:** 25 mg, 100 mg, 150 mg.

### ADMINISTRATION/HANDLING

#### PO

- Give at least 1 hr before or 2 hrs after ingestion of food.
- Avoid grapefruit products.
- May dissolve in 3–4 oz water and give orally or via feeding tube.
- Give 10 hrs after or 2 hrs before H<sub>2</sub> antagonists (e.g., famotidine), proton pump inhibitors (e.g., omeprazole, pantoprazole).

### INDICATIONS/ROUTES/DOSAGE

#### NSCLC

**PO: ADULTS, ELDERLY:** 150 mg/day until disease progression or unacceptable toxicity occurs.

#### Pancreatic Cancer

**PO: ADULTS, ELDERLY:** 100 mg/day, in combination with gemcitabine, until disease progression or unacceptable toxicity occurs.

#### Dose Modification

Permanently discontinue treatment in pts with interstitial lung disease (ILD); severe hepatotoxicity that does not significantly improve or resolve within 3 wks; GI perforation; severe bullous, blistering, or exfoliative skin conditions; corneal perforation or severe ulceration. Withhold treatment and consider discontinuation in pts with preexisting hepatic impairment or biliary obstruction for doubling or tripling of transaminase values over baseline;

severe renal toxicity, acute or worsening ocular disorders. Withhold treatment in pts with severe rash or persistent diarrhea not responsive to medical management; Grade 3 or 4 keratitis or Grade 2 keratitis lasting longer than 2 wks; or pt being investigated for ILD. Once improved to Grade 1 or 0, then resume at reduced 50-mg dose increments.

#### Dosage in Renal Impairment

Interrupt dosing for Grade 3 or 4 renal toxicity during treatment.

#### Dosage in Hepatic Impairment

Use extreme caution. Reduce starting dose to 75 mg and individualize dose escalation if tolerated.

### SIDE EFFECTS

**Frequent (85%–21%):** Rash, diarrhea, decreased appetite, fatigue, cough, dyspnea, pyrexia, nausea, dry skin. **Occasional (19%–11%):** Back pain, chest pain, mucosal inflammation, stomatitis, pruritus, cough, headache, paronychia, arthralgia, musculoskeletal pain.

### ADVERSE EFFECTS/TOXIC REACTIONS

Severe, life-threatening pneumonitis, ILD, respiratory failure reported in 9% of pts. Life-threatening hepatorenal syndrome reported in less 1% of pts. Fatal cases of GI perforation; blistering, and exfoliative skin reactions, including Stevens-Johnson syndrome/toxic epidermal necrolysis; ocular disorders including dry eye, keratoconjunctivitis, keratitis, leading to corneal perforation or ulceration, were reported. CVA reported in 3% of pts. Microangiopathic hemolytic anemia with thrombocytopenia was reported. Fatal hemorrhagic events were reported in pts taking concomitant warfarin. Myopathy, rhabdomyolysis was reported in pts taking concomitant statin therapy. Depression reported in 19% of pts.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain CBC, BMP, LFT; pregnancy test in females of reproductive potential. Confirm compliance of effective contraception. Question history of CVA, optic disorders, pulmonary disease, hepatic/renal impairment, GI perforation. Screen for active infection. Receive full medication history and screen for interactions. Offer emotional support.

### INTERVENTION/EVALUATION

Monitor CBC, LFT, renal function periodically. An increase of serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Consider ABG, radiologic test if ILD/pneumonitis (excessive cough, dyspnea, fever, hypoxia) is suspected. Consider treatment with corticosteroids if ILD/pneumonitis is confirmed. Monitor for infections (cough, fatigue, fever). If serious infection occurs, initiate appropriate antimicrobial therapy. Monitor daily pattern of bowel activity, stool consistency. Abdominal pain, fever, melena may indicate GI perforation. Monitor for toxic skin reactions, rash. Assess for symptoms of CVA (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Monitor for ocular toxicities. Monitor for depression.

### PATIENT/FAMILY TEACHING

- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report symptoms of lung inflammation (excessive coughing, difficulty breathing, chest pain); liver problems (abdominal pain, bruising, clay-colored stool, amber or dark colored urine, yellowing of the skin or eyes), eye problems (dry eye, eye pain/swelling/redness), kidney problems (decreased urine output, flank pain, darkened urine); toxic skin

reactions (rash, skin eruptions), stroke (confusion, difficulty speaking, one-sided weakness or paralysis, loss of vision), intestinal tear (abdominal pain, bloody stool, fever).

- Use effective contraception to avoid pregnancy. Do not breast-feed.
- There is a high risk of interactions with other medications. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Report changes in mood, depression.

## ertapenem

er-ta-pen-em  
(INVanz)

**Do not confuse ertapenem with doripenem, imipenem, or meropenem, or INVanz with AVINza.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Carbapenem. **CLINICAL:** Antibiotic.

## USES

Treatment of susceptible infections due to *S. aureus* (methicillin-susceptible only), *S. agalactiae*, *S. pneumoniae* (penicillin-susceptible only), *S. pyogenes*, *E. coli*, *H. influenzae* (beta-lactamase negative strains only), *K. pneumoniae*, *M. catarrhalis*, *Bacteroides* spp., *C. clostridioforme*, *Peptostreptococcus* spp., including moderate to severe intra-abdominal, skin/skin structure infections; community-acquired pneumonia; complicated UTI; acute pelvic infection; adult diabetic foot infections without osteomyelitis. Prevention of surgical site infection. **OFF-LABEL:** Treatment of IV catheter-related bloodstream infection; prosthetic joint infection.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ertapenem. History of anaphylactic hypersensitivity to beta-lactams (e.g., imipenem,

meropenem), hypersensitivity to amide-type local anesthetics (e.g., lidocaine) (IM use only). **Cautions:** Hypersensitivity to penicillins, cephalosporins, renal impairment, CNS disorders (brain lesions or history of seizure disorder), elderly.

## ACTION

Penetrates bacterial cell wall of microorganisms, binds to penicillin-binding proteins, inhibiting cell wall synthesis. **Therapeutic Effect:** Produces bacterial cell death.

## PHARMACOKINETICS

Almost completely absorbed after IM administration. Protein binding: 85%–95%. Widely distributed. Primarily excreted in urine (80%), feces (10%). Removed by hemodialysis. **Half-life:** 4 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Advanced or end-stage renal insufficiency may require dosage adjustment.

## INTERACTIONS

**DRUG:** Probenecid may increase concentration/effect. May decrease concentration/effect of valproic acid, BCG (intravesical). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, glucose, PT, aPTT, sodium. May decrease platelet count, Hgb, Hct, WBC.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 1 g.

## ADMINISTRATION/HANDLING

**Reconstitution** • Dilute 1-g vial with 10 mL 0.9% NaCl or Bacteriostatic Water for Injection. • Shake well to dissolve. • Further dilute with 50 mL 0.9% NaCl (**maximum concentration:** 20 mg/mL).

**Rate of administration** • Give by intermittent IV infusion (piggyback). Do not give IV push. • Infuse over 30 min. **Storage** • Solution appears colorless to yellow (variation in color does not affect potency). • Discard if solution contains precipitate. • Reconstituted solution is stable for 6 hrs at room temperature or 24 hrs if refrigerated.

## IM

• Reconstitute with 3.2 mL 1% lidocaine HCl injection (without EPINEPHRINE). • Shake vial thoroughly. • Inject deep in large muscle mass (gluteal or lateral part of thigh). • Administer suspension within 1 hr after preparation.

## IV INCOMPATIBILITIES

Do not mix or infuse with any other medications. Do not use diluents or IV solutions containing dextrose.

## IV COMPATIBILITIES

Heparin, potassium chloride, tigecycline (Tygacil), Sterile Water for Injection, 0.9% NaCl.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**IM, IV: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER:** 1 g/day. **CHILDREN 3 MOS–12 YRS:** 15 mg/kg 2 times/day. **Maximum:** 500 mg/dose.

### Dosage in Renal Impairment

CrCl 30 mL/min or less	500 mg once daily
Hemodialysis	If daily dose given within 6h prior to HD, give 150 mg dose after HD.
Peritoneal dialysis	500 mg once daily

### Dosage in Hepatic Impairment

No dose adjustment.

## SIDE EFFECTS

**Frequent (10%–6%):** Diarrhea, nausea, headache. **Occasional (5%–2%):** Altered mental status, insomnia, rash, abdominal

pain, constipation, chest pain, vomiting, edema, fever. **Rare (less than 2%):** Dizziness, cough, oral candidiasis, anxiety, tachycardia, phlebitis at IV site.

## ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Anaphylactic reactions have been reported. Seizures may occur in pts with CNS disorders (brain lesions, history of seizures), bacterial meningitis, severe renal impairment.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Question for history of allergies, particularly to beta-lactams, penicillins, cephalosporins. Inquire about history of seizures.

### INTERVENTION/EVALUATION

Monitor WBC count. Monitor renal/hepatic function. Monitor daily pattern of bowel activity, stool consistency. Monitor for nausea, vomiting. Evaluate hydration status. Evaluate for inflammation at IV injection site. Assess skin for rash. Observe mental status; be alert to tremors, possible seizures. Assess sleep pattern for evidence of insomnia.

### PATIENT/FAMILY TEACHING

- Report tremors, seizures, rash, prolonged diarrhea, chest pain, other new symptoms.

## ertugliflozin

er-too-gli-floe-zin  
(Steglatro)

**Do not confuse ertugliflozin with canagliflozin, dapagliflozin, or empagliflozin.**

### FIXED-COMBINATIONS

**Segluromet:** ertugliflozin/metformin (an antidiabetic): 2.5 mg/500 mg.

**Steglujan:** ertugliflozin/sitagliptin (an antidiabetic): 5 mg/100 mg.

## ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Sodium-glucose cotransporter 2 (SGLT2) inhibitor. **CLINICAL:** Antidiabetic.

## USES

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to ertugliflozin, other SGLT2 inhibitors; severe renal impairment (eGFR less than 30 mL/min), ESRD, dialysis. **Cautions:** Concurrent use of diuretics, other hypoglycemic medications; mild to moderate renal impairment (CrCl less than 30 mL/min), hypovolemia (anemia, dehydration), elderly; pts with low systolic B/P, hyperlipidemia. Pts at risk for lower leg amputation (diabetic foot ulcers, peripheral vascular disease, neuropathy). History of genital mycotic infection. Not recommended in pts with diabetic ketoacidosis, type 1 diabetes mellitus.

## ACTION

Inhibits SGLT2 in proximal renal tubule, reducing reabsorption of filtered glucose from tubular lumen and lowering renal threshold for glucose. **Therapeutic Effect:** Increases urinary excretion of glucose, lowers serum glucose levels.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver by glucuronidation. Protein binding: 94%. Peak plasma concentration: 1 hr. Excreted in urine (50%), feces (41%). **Half-life:** 17 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Not recommended in second or third trimester. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established.

**Elderly:** May have increased risk for adverse reactions (dehydration, hypotension, syncope).

## INTERACTIONS

**DRUG:** Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of hypoglycemia. **Loop diuretics** (e.g., furosemide) may increase risk of symptomatic hypotension. **HERBAL:** Fenugreek, garlic, ginkgo, ginger, ginseng, maitake may increase hypoglycemic effect. None significant. **FOOD:** None known. **LAB VALUES:** May increase low-density lipoprotein cholesterol (LDL-C), serum creatinine phosphate; Hgb. May decrease eGFR.

## AVAILABILITY (Rx)

**Tablets:** 5 mg, 15 mg.

## ADMINISTRATION/HANDLING

### PO

- Give without regard to food in the morning.

## INDICATIONS/ROUTES/DOSAGE

### Type 2 Diabetes Mellitus

**PO: ADULTS, ELDERLY:** Initially, 5 mg once daily in the morning. May increase dose based on tolerability. **Maximum:** 15 mg/day.

### Dosage in Renal Impairment

**eGFR greater than 60 mL/min:** No dose adjustment. **eGFR 30–59 mL/min:** Not recommended. **eGFR less than 30 mL/min:** Contraindicated.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not specified; use caution.

## SIDE EFFECTS

**Rare (2%–less than 1%):** Headache, increased urination, nasopharyngitis, back pain, decreased weight, thirst, dry mouth, polydipsia, dry throat.

## ADVERSE EFFECTS/TOXIC REACTIONS

Symptomatic hypotension (orthostatic hypotension, postural dizziness, syncope) may occur, esp. in pts who are elderly, use diuretics, or have low systolic B/P. Fatal cases of ketoacidosis have occurred. Intravascular volume depletion/contraction may cause acute kidney injury requiring dialysis. Hypoglycemic events were reported, esp. in pts using concomitant hypoglycemic medications that cause hypoglycemia. Infections including urosepsis, pyelonephritis, UTI, genital mycotic infections (male and female), upper respiratory tract infection may occur. May increase risk of lower limb amputations. Necrotizing fasciitis of the perineum (Fournier gangrene), a life-threatening necrotizing infection of the genital and perineum region that requires urgent surgical intervention, has been reported.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain BUN, serum creatinine, eGFR, CrCl; capillary blood glucose, Hgb A1c; B/P. Correct volume-depletion before initiation. Assess pt's understanding of diabetes management, routine home glucose monitoring. Receive full medication history and screen for interactions. Question history of renal impairment. Screen for risks of lower limb amputation (e.g., peripheral vascular disease, diabetic foot ulcers, neuropathy).

### INTERVENTION/EVALUATION

Obtain BUN, serum creatinine, eGFR, CrCl; capillary blood glucose, Hgb A1c periodically. Monitor for symptoms of ketoacidosis (e.g., dehydration, confusion, extreme thirst, fruity breath, Kussmaul respirations, nausea). Pts presenting with metabolic acidosis should be screened for ketoacidosis, regardless of serum glucose levels. Assess for hypoglycemia (anxiety, confusion, diaphoresis, diplopia, dizziness, headache, hunger, perioral numbness, tachycardia, tremors); hyperglycemia (fa-

tigue, Kussmaul respirations, polyphagia, polyuria, polydipsia, nausea, vomiting). Concomitant use of beta blockers (e.g., carvedilol, metoprolol) may mask symptoms of hypoglycemia. Monitor for acute kidney injury (dark-colored urine, flank pain, decreased urine output, muscle aches), UTI (dysuria, fever, flank pain, malaise), mycotic infections, Fournier gangrene (perineal necrosis). Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Obtain dietary consult for nutritional education. Encourage fluid intake. Monitor weight, I&Os.

#### PATIENT/FAMILY TEACHING

- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood sugar regularly.
- Monitor daily calorie intake.
- When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress), have low blood sugar treatment readily available (glucagon, oral dextrose).
- Go slowly from lying to standing to prevent dizziness.
- Genital itching may indicate yeast infection.
- Therapy may increase risk for dehydration/low blood pressure, which may cause kidney failure. Immediately report decreased urination, amber-colored urine, flank pain, fatigue, swelling of the hands or feet.
- Report symptoms of UTI, kidney infection (e.g., burning while urinating, cloudy or foul-smelling urine, pelvic pain, back pain), perineal necrosis (e.g., discoloration, pain, swelling of the scrotum, penis, or perineum).
- Do not breastfeed.

## erythromycin

er-ith-roe-mye-sin

(Akne-Mycin, EES, Erybid , Eryc, EryDerm, EryPed, Ery-Tab, Erythrocin)

**Do not confuse Eryc with Emcyc, or erythromycin with azithromycin or clarithromycin.**

#### FIXED-COMBINATION(S)

**Eryzole, Pediazole:** erythromycin/sulfisoxazole (sulfonamide): 200 mg/600 mg per 5 mL.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Macrolide. **CLINICAL:** Antibiotic, anti-acne.

#### USES

Treatment of susceptible infections due to *S. pyogenes*, *S. pneumoniae*, *S. aureus*, *M. pneumoniae*, *Legionella*, *Chlamydia*, *N. gonorrhoeae*, *E. histolytica*, including syphilis, nongonococcal urethritis, diphtheria, pertussis, chancroid, *Campylobacter* gastroenteritis. **Topical:** Treatment of acne vulgaris. **Ophthalmic:** Prevention of gonococcal ophthalmia neonatorum, superficial ocular infections. **OFF-LABEL:** **Systemic:** Treatment of acne vulgaris, chancroid, *Campylobacter* enteritis, gastroparesis, Lyme disease, preoperative gut sterilization. **Topical:** Treatment of minor bacterial skin infections. **Ophthalmic:** Treatment of blepharitis, conjunctivitis, keratitis, chlamydial trachoma.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to erythromycin. Concomitant administration with ergot derivatives, lovastatin, pimozide, simvastatin. **Cautions:** Elderly, myasthenia gravis, strong CYP3A4 inhibitor, hepatic impairment, pts with prolonged QT intervals, uncorrected hypokalemia or hypomagnesemia, concurrent use of class IA or III antiarrhythmics.

#### ACTION

Penetrates bacterial cell membranes, reversibly binds to bacterial ribosomes, inhibiting RNA-dependent protein synthesis. **Therapeutic Effect:** Bacteriostatic.

## PHARMACOKINETICS

Variably absorbed from GI tract (depending on dosage form used). Protein binding: 70%–90%. Widely distributed. Metabolized in liver. Primarily eliminated in feces by bile. Not removed by hemodialysis. **Half-life:** 1.4–2 hrs (increased in renal impairment).

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta. Distributed in breast milk. Erythromycin estolate may increase hepatic enzymes in pregnant women. **Children/Elderly:** No age-related precautions noted. High dosage in pts with decreased hepatic/renal function increases risk of hearing loss.

## INTERACTIONS

**DRUG:** May increase concentration/effect of **bosutinib, budesonide, busPIRone, cycloSPORINE, calcium channel blockers (e.g., diTIAZem, verapamil), statins (e.g., atorvastatin, simvastatin), Amiodarone, dronedarone, fluconazole** may increase QT interval—prolonging effect. **Strong CYP3A4 inducers (e.g., carbAMazepine, phenytoin, rifAMPin)** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

## AVAILABILITY (Rx)

**Gel, Topical:** 2%. **Injection, Powder for Reconstitution:** 500 mg. **Ointment, Ophthalmic:** 0.5%. **Ointment, Topical: (Akne-Mycin):** 2%. **Oral Suspension: (EES, EryPed):** 200 mg/5 mL, 400 mg/5 mL. **Tablet as Base:** 250 mg, 500 mg. **Tablet as Ethylsuccinate: (EES):** 400 mg.

**Capsules, Delayed-Release:** 250 mg. **Tablets, Delayed-Release (Ery-Tab):** 250 mg, 333 mg, 500 mg.

## ADMINISTRATION/HANDLING

**Reconstitution** • Reconstitute each 500 mg with 10 mL Sterile Water for

Injection without preservative to provide a concentration of 50 mg/mL. • Further dilute with 100–250 mL D<sub>5</sub>W or 0.9% NaCl to maximum concentration of 5 mg/mL.

**Rate of administration** • For intermittent IV infusion (piggyback), infuse over 20–60 min.

**Storage** • Store parenteral form at room temperature. • Initial reconstituted solution in vial is stable for 2 wks refrigerated or 24 hrs at room temperature. • Diluted IV solution stable for 8 hrs at room temperature or 24 hrs if refrigerated. • Discard if precipitate forms.

## PO

• May give with food to decrease GI upset. Do not give with milk or acidic beverages. • Oral suspension is stable for 35 days at room temperature. • Do not crush delayed-release capsules, tablets.

## Ophthalmic

• Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid. • Place 1/4–1/2 inch of ointment into pocket. • Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac) and to roll eyeball to increase contact area of drug to eye.

## IV INCOMPATIBILITIES

Fluconazole (Diflucan), furosemide (Lasix), heparin, metoclopramide (Reglan).

## IV COMPATIBILITIES

Amiodarone (Cordarone), diTIAZem (Cardizem), HYDROMorphone (Dilaudid), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, multivitamins, potassium chloride.

## INDICATIONS/ROUTES/DOSAGE

### Usual Dosage Range

**PO: ADULTS, ELDERLY: (Base):** 250–500 mg q6–12h. **Maximum:** 4 g/day. **CHILDREN:** 30–50 mg/kg/day in divided

doses q6–8h. **Maximum:** 2 g/day. (*Ethylsuccinate*): **ADULTS, ELDERLY:** 400–800 mg q6–12h. **Maximum:** 4 g/day. **CHILDREN:** 30–50 mg/kg/day in divided doses q6–8h. **Maximum:** 2 g/day. **NEONATES:** 10 mg/kg/dose q8–12h. **IV: ADULTS, ELDERLY:** 15–20 mg/kg/day divided q6h. **Maximum:** 4 g/day. **CHILDREN, INFANTS:** 15–20 mg/kg/day divided q6h. **Maximum:** 4 g/day. **NEONATES:** 10 mg/kg/dose q8–12h.

#### Dosage in Renal/Hepatic Impairment

No dose adjustment.

#### SIDE EFFECTS

**Frequent:** **IV:** Abdominal cramping/discomfort, phlebitis/thrombophlebitis. **Topical:** Dry skin (50%). **Occasional:** Nausea, vomiting, diarrhea, rash, urticaria. **Rare:** **Ophthalmic:** Sensitivity reaction with increased irritation, burning, itching, inflammation. **Topical:** Urticaria.

#### ADVERSE EFFECTS/TOXIC REACTIONS

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever), reversible cholestatic hepatitis may occur. High dosage in pts with renal impairment may lead to reversible hearing loss. Anaphylaxis occurs rarely. Ventricular arrhythmias, prolonged QT interval occur rarely with IV form.

#### NURSING CONSIDERATIONS

##### BASELINE ASSESSMENT

Question for history of allergies (particularly erythromycins), hepatitis. Receive full medication history and screen for interactions.

##### INTERVENTION/EVALUATION

Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Assess for hepatotoxicity (malaise, fever, abdominal pain, GI disturbances). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Check for phlebitis (heat, pain, red streaking over vein). Monitor for high-dose hearing loss.

#### PATIENT/FAMILY TEACHING

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Take medication with 8 oz water 1 hr before or 2 hrs following food or beverage.
- **Ophthalmic:** Report burning, itching, inflammation.
- **Topical:** Report excessive skin dryness, itching, burning.
- Improvement of acne may not occur for 1–2 mos; maximum benefit may take 3 mos; therapy may last mos or yrs.
- Use caution if using other topical acne preparations containing peeling or abrasive agents, medicated or abrasive soaps, cosmetics containing alcohol (e.g., astringents, aftershave lotion).

## escitalopram

es-sye-tal-o-pram  
(Ciprallex , Lexapro)

**BLACK BOX ALERT** Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

#### CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Selective serotonin reuptake inhibitor. **CLINICAL:** Antidepressant.

#### USES

Treatment of major depressive disorder. Treatment of generalized anxiety disorder (GAD). **OFF-LABEL:** Seasonal affective disorder (SAD) in children and adolescents, pervasive developmental disorders (e.g., autism), vasomotor symptoms associated with menopause.

#### PRECAUTIONS

**Contraindications:** Hypersensitivity to escitalopram. Use of MAOI intended to treat psychiatric disorders (concurrent or within 14 days of discontinuing either escitalopram or MAOI). Initiation in pts receiving linezolid or IV methylene blue. Concurrent use with pimozide. **Cautions:** Hepatic/renal impairment, history of seizure disorder,

concurrent use of CNS depressants, pts at high risk of suicide, concomitant aspirin, NSAIDs, warfarin (may potentiate bleeding risk), elderly, metabolic disease; recent history of MI, cardiovascular disease.

## ACTION

Blocks uptake of neurotransmitter serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Antidepressant effect.

## PHARMACOKINETICS

Readily absorbed. Protein binding: 56%. Primarily metabolized in liver. Primarily excreted in feces, with a lesser amount eliminated in urine. **Half-life:** 35 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Distributed in breast milk. **Children:** May cause increased anticholinergic effects or hyperexcitability. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth), more likely to experience dizziness, sedation, confusion, hypotension, hyperexcitability.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Linezolid, aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. MAOIs (e.g., phenelzine, selegiline) may cause serotonin syndrome (autonomic hyperactivity, diaphoresis, excitement, hyperthermia, rigidity, neuroleptic malignant syndrome, coma). SUMatriptan may cause weakness, hyperreflexia, poor coordination. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort, Syrian rue may enhance serotonergic effect of serotonergic agents. Herbs with anticoagulant/antiplatelet properties (e.g., garlic, ginger, ginkgo biloba) may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

## AVAILABILITY (Rx)

**Oral Solution:** 5 mg/5 mL.

 **Tablets:** 5 mg, 10 mg, 20 mg.

## ADMINISTRATION/HANDLING

### PO

• Give without regard to food. • Do not break, crush, dissolve, or divide tablets.

## INDICATIONS/ROUTES/DOSAGE

### Depression

**PO: ADULTS:** Initially, 10 mg once daily in the morning or evening. May increase to 20 mg after a minimum of 1 wk. **ELDERLY:** 10 mg/day. **ADOLESCENTS 12–17 YRS:** Initially, 10 mg once daily. May increase to 20 mg/day after at least 3 wks. **Maximum:** 20 mg once daily. Recommended: 10 mg once daily.

### Generalized Anxiety Disorder

**PO: ADULTS:** Initially, 10 mg once daily in morning or evening. May increase to 20 mg after minimum of 1 wk. **ELDERLY:** 10 mg/day.

### Dosage in Renal Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Use caution in pts with CrCl less than 20 mL/min.

### Dosage in Hepatic Impairment

10 mg/day.

## SIDE EFFECTS

**Frequent (21%–11%):** Nausea, dry mouth, drowsiness, insomnia, diaphoresis. **Occasional (8%–4%):** Tremor, diarrhea, abnormal ejaculation, dyspepsia, fatigue, anxiety, vomiting, anorexia. **Rare (3%–2%):** Sinusitis, sexual dysfunction, menstrual disorder, abdominal pain, agitation, decreased libido.

## ADVERSE EFFECTS/TOXIC REACTIONS

May increase risk of suicidal thoughts and behavior in adolescents and young adults. Life-threatening serotonin syndrome may include mental status changes (agitation, hallucinations, delirium, coma), auto-

nostic instability (tachycardia, labile blood pressure, dizziness, sweating, flushing, hyperthermia), neuromuscular symptoms (tremor, rigidity, myoclonus hyperactive reflexes, incoordination). May cause hyponatremia as a result of syndrome of inappropriate antidiuretic hormone (SIADH). May increase risk of bleeding; narrow angle glaucoma; seizures.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

For pts on long-term therapy, LFT, renal function tests, blood counts should be performed periodically. Observe, record behavior. Assess psychological status, thought content, sleep pattern, appearance, interest in environment.

### INTERVENTION/EVALUATION

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, suicide potential increases). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor for suicidal ideation (esp. at beginning of therapy or when doses are increased or decreased), social interaction, mania, panic attacks.

### PATIENT/FAMILY TEACHING

- Do not stop taking medication or increase dosage.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

## esketamine

es-ket-a-meen

(Spravato)

**■ BLACK BOX ALERT ■** May cause sedation, dissociative or perceptual changes after administration. Monitor for at least 2 hrs after each treatment session. Assess if pt is clinically stable before discharge from healthcare setting. Due to high risk of abuse, monitor for symptoms of drug abuse and misuse (drug-seeking behavior,

dependency). May increase risk of suicidal thoughts and behavior.

**Do not confuse esketamine with amphetamine, ketamine, or ergotamine, or Spravato with Steglatro.**

### ◆ Classification

**PHARMACOTHERAPEUTIC:** N-methyl-D-aspartate (NMDA) receptor antagonist (Schedule III). **CLINICAL:** Antidepressant.

## USES

Treatment of adults with treatment-resistant depression (in combination with an oral antidepressant). Treatment of adults with depressive symptoms with major depressive disorder (MDD) with acute suicidal ideation and behavior (in combination with an oral antidepressant).

## PRECAUTIONS

**Contraindications:** Hypersensitivity to esketamine, ketamine. Aneurysmal vascular disease, arteriovenous malformation. History of intracerebral hemorrhage. **Cautions:** Hypertension, hepatic impairment, pts at high risk for suicide and ideation; history of drug abuse and misuse, drug-seeking behavior, dependency. History of hypertensive encephalopathy. Not indicated as an anesthetic agent.

## ACTION

Exact mechanism unknown. Antagonizes NMDA receptor, an ionotropic glutamine receptor. Noresketamine (major circulating metabolite) demonstrates activity at the same receptor with less affinity.

**Therapeutic Effect:** Decreases effects of depression.

## PHARMACOKINETICS

Metabolized in liver. Protein binding: 43%–45%. Peak plasma concentration: 20–40 min. Excreted in urine (less than 1%) as unchanged drug. **Half-life:** 7–12 hrs; (metabolite): 8 hrs.

## ⌚ LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Avoid pregnancy, may cause fetal harm. Distributed

in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Alcohol, CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase sedative effects. **Stimulants** (e.g., amphetamines, methylphenidate, modafinil), **MAOIs** (e.g., phenelzine, selegiline) may increase hypertensive effects. **HERBAL:** Herbs with sedative properties (e.g., chamomile, kava kava, valerian) may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None known.

## AVAILABILITY (RX)

**Nasal Spray:** Two-spray, three-spray device containing 28 mg/inhalation.

## ADMINISTRATION/HANDLING

### Intranasal

**Guidelines** • Must be administered in a healthcare setting under the direct supervision of a healthcare provider. Due to nausea/vomiting, pts should avoid eating food at least 2 hrs prior to dose and avoid drinking liquids at least 30 min prior to dose. • Do not prime device before use (will result in waste of dose). Use two devices for 56-mg dose or three devices for 84-mg dose with a 5-min rest between doses. • Place pt in supine position with head of bed at 45 degrees during administration.

**Administration** • Instruct pt to clear nasal passages as much as possible before use. • Insert tip into one nostril, pointing toward nasal turbines, away from nasal septum. Pump medication into one nostril while pt holds other nostril closed and gently sniffs dose. • Repeat steps with a 5-min rest period between next dose.

## INDICATIONS/ROUTES/DOSAGE

### Depression (Treatment-Resistant)

**Intranasal: ADULTS: Induction phase (wks 1–4):** Give twice wkly on wks 1–4. **Starting dose on day 1:** 56 mg. **Subsequent doses:** 56 mg (or 84 mg based

on efficacy and tolerability). **Maintenance:** 56 mg or 84 mg once wkly on wks 5–8, then 56 mg or 84 mg q2wks (or once wkly) on wk 9 and thereafter.

### MDD With Acute Suicidal Ideation and Behavior

**INTRANASAL: ADULTS:** 84 mg twice wkly for 4 wks. May reduce to 56 mg twice wkly based on tolerability. After 4 wks, assess need for continued therapy.

### Dosage in Renal Impairment

**Mild to severe impairment:** Not specified; use caution.

### Dosage in Hepatic Impairment

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Not recommended.

## SIDE EFFECTS

**Frequent (31%–18%):** Anxiety, agitation, fear, irritability, nervousness, tension, dizziness, sedation, somnolence, hypersomnia, vertigo, nausea, headache, dysgeusia, hypoesthesia. **Occasional (11%–5%):** Lethargy, fatigue, increased blood pressure, vomiting, insomnia, nasal discomfort, throat irritation, diarrhea, dry mouth, feeling drunk. **Rare (3%–2%):** Constipation, abnormal feeling, hyperhidrosis, euphoria, dysarthria, tremor, mental impairment, pollakiuria, oropharyngeal pain, tachycardia, extrasystoles.

## ADVERSE EFFECTS/TOXIC REACTIONS

Disassociation and perceptual changes including derealization, depersonalization, diplopia, hallucinations, photophobia, visual impairment; distortion of time, space, illusion reported in 61%–84% of pts. May increase risk of suicidal thoughts and behavior, esp. in pts with major depressive disorder. An increase of systolic B/P greater than or equal to 40 mm Hg and/or diastolic B/P greater than or equal to 25 mm Hg reported in 8%–19% of pts. A substantial increase in B/P can occur with any dose, regardless of prior tolerated doses. Ulcerative or interstitial cystitis, long-

term cognitive impairment may occur with repeated misuse and abuse.

## NURSING CONSIDERATIONS

### BASELINE ASSESSMENT

Obtain pregnancy test in females of reproductive potential. Assess B/P prior to each dose. If systolic B/P is greater than 140 mm Hg or diastolic B/P is greater than 90 mm Hg, consider risk and benefit of treatment. Do not administer if an increase of B/P or intracranial pressure is a serious risk. Concomitant nasal corticosteroids or decongestants on dosing days should be administered at least 1 hr prior to dose. Question history of hypertension, vascular aneurysms, cerebrovascular conditions, hepatic impairment. Assess risk of drug abuse, misuse, drug-seeking behavior. If a treatment session is missed or symptoms of depression worsen, consider returning to prior dosing schedule (e.g., q2wks to once wkly or once wkly to twice wkly).

### INTERVENTION/EVALUATION

Monitor for increased B/P, CNS effects after dose. May discharge pt from healthcare setting if clinically stable for at least 2 hrs and B/P has decreased to acceptable level. Pts with moderate hepatic impairment may need to be monitored for longer than 2 hrs after administration. Monitor for nausea, vomiting after administration. Diligently screen for suicidal ideation and behavior; new onset or worsening of anxiety, depression, mood disorder. Screen for misuse, abuse, drug-seeking behavior. Monitor for ulcerative or interstitial cystitis (bladder/pelvic pain or pressure, nocturia, urgency). Assess for improvement of depression (improved emotion, self-image, interest in activities; decreased agitation, loneliness, self-harm).

### PATIENT/FAMILY TEACHING

- Seek immediate medical attention if thoughts of suicide, new-onset or worsening of anxiety, depression, or changes in mood occurs.
- Nervous system changes including altered perception, euphoria, de-

lirium, difficulty speaking, distortion of time may occur. Avoid tasks that require alertness, motor skills until next day after a restful sleep.

- Treatment may increase blood pressure. Avoid stimulants.
- Do not eat food for at least 2 hrs before dose. Avoid liquids at least 30 min before dose.
- Avoid pregnancy; treatment may cause fetal harm. Do not breastfeed.

## esmolol

**HIGH ALERT**

es-moe-lol  
(Brevibloc)

**Do not confuse Brevibloc with Bumex or Buprenex, or esmolol with Osmitrol.**

### ◆ CLASSIFICATION

**PHARMACOTHERAPEUTIC:** Beta<sub>1</sub>-adrenergic blocker. **CLINICAL:** Anti-arrhythmic, antihypertensive.

### USES

Rapid, short-term control of ventricular rate in supraventricular tachycardia (SVT), atrial fibrillation or flutter; treatment of tachycardia and/or hypertension (esp. intraop or postop). Treatment of noncompensatory sinus tachycardia. **OFF-LABEL:** Postoperative hypertension or SVT in children. Arrhythmia and/or rate control in ACS, intubation, thyroid storm, pheochromocytoma, electroconvulsive therapy.

### PRECAUTIONS

**Contraindications:** Hypersensitivity to esmolol. Cardiogenic shock, uncompensated cardiac failure, second- or third-degree heart block (except in pts with pacemaker), severe sinus bradycardia, sick sinus syndrome, IV administration of calcium blockers in close proximity to esmolol, pulmonary hypertension. **Cautions:** Compensated HF; concurrent use of digoxin, verapamil, diltiazem. Diabetes, myasthenia gravis, renal impairment, history of anaphylaxis to allergens. Hypovolemia, hypertension, bronchospastic

disease, peripheral vascular disease, Raynaud's disease.

## ACTION

Selectively blocks beta<sub>1</sub>-adrenergic receptors. **Therapeutic Effect:** Slows sinus heart rate, decreases cardiac output, reducing B/P.

## PHARMACOKINETICS

Rapidly metabolized primarily by esterase in cytosol of red blood cells. Protein binding: 55%. Less than 1%–2% excreted in urine. **Half-life:** 9 min.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## INTERACTIONS

**DRUG:** Alpha-2 agonists (e.g., norepinephrine), calcium channel blockers (e.g., diltiazem, verapamil), dronedarone, rivastigmine may increase the bradycardic effect. May increase bradycardic effect of fin-golimod. May increase vasoconstricting effect of ergot derivatives (e.g., ergotamine). **HERBAL:** Herbals with hypotensive properties (e.g., garlic, ginger, ginkgo biloba) may increase effect. Herbals with hypertensive properties (e.g., yohimbe) may decrease effect. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection Solution:** 10 mg/mL (10 mL, 250 mL), 20 mg/mL (100 mL).

## ADMINISTRATION/HANDLING

**◀ALERT▶** Give by IV infusion. Avoid butterfly needles, very small veins (can cause thrombophlebitis).

**Rate of administration** • Administer by controlled infusion device; titrate to

tolerance and response. • Infuse IV loading dose over 1–2 min. • Hypotension (systolic B/P less than 90 mm Hg) is greatest during first 30 min of IV infusion.

**Storage** • Use only clear and colorless to light yellow solution. • Discard solution if discolored or precipitate forms.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), furosemide (Lasix).

## IV COMPATIBILITIES

Amiodarone (Cordarone), dexmedetomidine (Precedex), diltiazem (Cardizem), DOPamine (Intropin), heparin, magnesium, midazolam (Versed), potassium chloride, propofol (Diprivan).

## INDICATIONS/ROUTES/DOSAGE

### Rate Control in Supraventricular Arrhythmias

**IV: ADULTS, ELDERLY:** Initially, loading dose of 500 mcg/kg/min for 1 min, followed by 50 mcg/kg/min for 4 min. If optimum response is not attained in 5 min, give second loading dose of 500 mcg/kg/min for 1 min, followed by infusion of 100 mcg/kg/min for 4 min. A third (and final) loading dose can be given and infusion increased by 50 mcg/kg/min, up to 200 mcg/kg/min, for 4 min. Once desired response is attained, increase infusion by no more than 25 mcg/kg/min. Infusion usually administered over 24–48 hrs in most pts. Range: 50–200 mcg/kg/min (average dose 100 mcg/kg/min).

### Intraop/Postop Tachycardia Hypertension (Immediate Control)

**IV: ADULTS, ELDERLY:** Initially, 1,000 mcg/kg over 30 sec, then 150 mcg/kg/min infusion up to 300 mcg/kg/min.

### Dosage in Renal/Hepatic Impairment

No dose adjustment.

**SIDE EFFECTS**

Generally well tolerated, with transient, mild side effects. **Frequent:** Hypotension (systolic B/P less than 90 mm Hg) manifested as dizziness, nausea, diaphoresis, headache, cold extremities, fatigue.

**Occasional:** Anxiety, drowsiness, flushed skin, vomiting, confusion, inflammation at injection site, fever.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Overdose may produce profound hypotension, bradycardia, dizziness, syncope, drowsiness, breathing difficulty, bluish fingernails or palms of hands, seizures. May potentiate insulin-induced hypoglycemia in diabetic pts.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60 or less/min or systolic B/P is 90 mm Hg or less, withhold medication, contact physician).

**INTERVENTION/EVALUATION**

Monitor B/P for hypotension, ECG, heart rate, respiratory rate, development of diaphoresis, dizziness (usually first sign of impending hypotension). Assess pulse for quality, irregular rate, bradycardia, extremities for coldness. Assist with ambulation if dizziness occurs. Assess for nausea, diaphoresis, headache, fatigue.

**esomeprazole**

es-o-mep-ra-zole  
(NexIUM, NexIUM 24 HR, Nexium IV)

**Do not confuse esomeprazole with ARIPiprazole or omeprazole, or NexIUM with NexAVAR.**

**FIXED-COMBINATION(S)**

**Vimovo:** esomeprazole/naproxen (NSAID): 20 mg/375 mg, 20 mg/500 mg.

**CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Proton pump inhibitor. **CLINICAL:** Gastric acid inhibitor.

**USES**

**PO:** Short-term treatment (4–8 wks) of erosive esophagitis; maintenance treatment of healing of erosive esophagitis; symptomatic gastroesophageal reflux disease (GERD). Treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Used in triple therapy with amoxicillin and clarithromycin for treatment of *H. pylori* infection in pts with duodenal ulcer. Reduces risk of NSAID-induced gastric ulcer. **OTC:** Treatment of frequent heartburn (2 or more days/wk). **IV:** Treatment of GERD with erosive esophagitis. Reduce risk of ulcer re-bleeding postprocedures.

**PRECAUTIONS**

**Contraindications:** Hypersensitivity to esomeprazole, other proton pump inhibitors. Concomitant use with rilpivirine.

**Cautions:** May increase risk of hip, wrist, spine fractures; hepatic impairment; elderly; Asian populations. Concurrent use of CYP3A4 inducers (e.g., rifAMPin).

**ACTION**

Inhibits H<sup>+</sup>/K<sup>+</sup>-ATPase on surface of gastric parietal cells. **Therapeutic Effect:** Reduces gastric acid secretion.

**PHARMACOKINETICS**

Widely distributed. Protein binding: 97%. Extensively metabolized in liver. Primarily excreted in urine. **Half-life:** 1–1.5 hrs.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

## **E** INTERACTIONS

**DRUG:** May decrease concentration/effect of **acalabrutinib**, **cefuroxime**, **erlotinib**, **neratinib**, **pazopanib**. **Strong CYP2C19 inducers** (e.g., **FLUoxetine**) may decrease concentration/effect. **CYP3A4 inducers** (e.g., **carbamazepine**, **phenytoin**, **rifampin**) may decrease concentration/effect. **HERBAL:** **St. John's wort** may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** None significant.

## AVAILABILITY (Rx)

**Injection, Powder for Reconstitution:** 40 mg. **Oral Suspension, Delayed-Release Packets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 40 mg.

 **Capsules** (*Delayed-Release:* [**Nexium**]): 20 mg, 40 mg. [**Nexium 24 HR**]: 20 mg. **Tablets:** (*Delayed-Release:*) 20 mg.

## ADMINISTRATION/HANDLING

### IV

**Reconstitution** • For IV push, add 5 mL of 0.9% NaCl to esomeprazole vial.

**Infusion** • For IV infusion, dissolve contents of one vial in 50 mL 0.9% NaCl, or D<sub>5</sub>W.

**Rate of administration** • For IV push, administer over not less than 3 min. For intermittent infusion (piggy-back) infuse over 10–30 min. • Flush line with 0.9% NaCl, or D<sub>5</sub>W, both before and after administration.

**Storage** • Use only clear and colorless to very slightly yellow solution. • Discard solution if particulate forms. • IV infusion stable for 12 hrs in 0.9% NaCl or lactated Ringer's; 6 hrs in D<sub>5</sub>W.

### PO (Capsules)

• Give 1 hr or more before eating (best before breakfast). • Do not crush, cut capsule; administer whole. • For pts with difficulty swallowing capsules, open capsule and mix pellets with 1 tbsp applesauce. Swallow immediately without chewing.

### PO (Oral Suspension)

• Empty contents into 5 mL water for 2.5 mg, 5 mg; 15 mL for 10 mg, 20 mg, 40 mg and stir. • Let stand 2–3 min to thicken. • Stir and drink within 30 min.

## IV INCOMPATIBILITIES

Do not mix esomeprazole with any other medications through the same IV line or tubing.

## IV COMPATIBILITIES

Ceftaroline (Teflaro), doripenem (Doribax).

## INDICATIONS/ROUTES/DOSAGE

### Erosive Esophagitis

**PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER:** 20–40 mg once daily for 4–8 wks. May continue for additional 4–8 wks. **CHILDREN 1–11 YRS, WEIGHING 20 KG OR MORE:** 10–20 mg/day for up to 8 wks. **WEIGHING LESS THAN 20 KG:** 10 mg/day for up to 8 wks. **CHILDREN 1–11 MOS, WEIGHING MORE THAN 7.5 KG–12 KG:** 10 mg/day for up to 6 wks. **6–7.5 KG:** 5 mg/day for up to 6 wks. **3–5 KG:** 2.5 mg/day for up to 6 wks.

### Maintenance Therapy for Erosive Esophagitis

**PO: ADULTS, ELDERLY:** 20 mg/day.

### Treatment of NSAID-Induced Gastric Ulcers

**PO: ADULTS, ELDERLY:** 20 mg/day for 8 wks.

### Prevention of NSAID-Induced Gastric Ulcer

**PO: ADULTS, ELDERLY:** 20–40 mg once daily for up to 6 mos.

**Gastroesophageal Reflux Disease (GERD)**

**IV: ADULTS, ELDERLY:** 20 or 40 mg once daily for up to 10 days. **CHILDREN 1–17 YRS, WEIGHING 55 KG OR MORE:** 20 mg once daily; **1–17 YRS, WEIGHING LESS THAN 55 KG:** 10 mg once daily; **1 MO TO LESS THAN 1 YR:** 0.5 mg/kg once daily.

**PO: ADULTS, ELDERLY, CHILDREN, 12–17 YRS:** 20 mg once daily for up to 8 wks. **CHILDREN 1–11 YRS:** 10 mg/day for up to 8 wks.

**Zollinger-Ellison Syndrome**

**PO: ADULTS, ELDERLY:** 40 mg 2 times/day. Doses up to 240 mg/day have been used.

**Duodenal Ulcer Caused by *Helicobacter pylori***

**PO: ADULTS, ELDERLY:** 20–40 mg twice daily (as part of multidrug regimen).

**Heartburn (OTC)**

**PO: ADULTS, ELDERLY:** 20 mg/day for 14 days. May repeat after 4 mos if needed.

**Dosage in Renal Impairment**

No dose adjustment.

**Dosage in Hepatic Impairment**

**Mild to moderate impairment:** No dose adjustment. **Severe impairment:** Doses should not exceed 20 mg/day.

**SIDE EFFECTS**

**Frequent (7%):** Headache. **Occasional (3%–2%):** Diarrhea, abdominal pain, nausea. **Rare (less than 2%):** Dizziness, asthenia, vomiting, constipation, rash, cough.

**ADVERSE EFFECTS/TOXIC REACTIONS**

Pancreatitis, hepatotoxicity, interstitial nephritis occur rarely.

**NURSING CONSIDERATIONS****BASELINE ASSESSMENT**

Assess epigastric/abdominal pain. Question history of hepatic impairment, pathologic bone fractures.

**INTERVENTION/EVALUATION**

Evaluate for therapeutic response (relief of GI symptoms). Question if GI

discomfort, nausea, diarrhea occur. Monitor for occult blood, observe for hemorrhage in pts with peptic ulcer.

**PATIENT/FAMILY TEACHING**

- Report headache.
- Take at least 1 hr before eating.
- If swallowing capsules is difficult, open capsule and mix pellets with 1 tbsp applesauce. Swallow immediately without chewing.

**estradiol****es-tra-dye-ole**

(Alora, Climara, Delestrogen, Depo-Estradiol, Divigel, Dotti, Elestrin, Estrogel, Evamist, Femring, Menostar, Minivelle, Vivelle-Dot)

**■ BLACK BOX ALERT ■** Increased risk of dementia when given to women 65 yrs and older. Use of estrogen without progestin increases risk of endometrial cancer in postmenopausal women with intact uterus. Increased risk of invasive breast cancer in postmenopausal women using conjugated estrogens with medroxyPROGESTERone. Do not use to prevent cardiovascular disease or dementia.

**Do not confuse Alora with Aldara, or Estraderm with Testoderm.**

**FIXED-COMBINATION(S)**

**Activella:** estradiol/norethindrone (hormone): 1 mg/0.5 mg. **Climara**

**PRO:** estradiol/levonorgestrel (progestin): 0.045 mg/24 hr, 0.015 mg/24 hr. **Combi-patch:** estradiol/norethindrone (hormone): 0.05 mg/0.14 mg, 0.05 mg/0.25 mg. **Femhrt:** estradiol/norethindrone (hormone): 5 mcg/1 mg. **Lunelle:** estradiol/medroxyprogesterone (progestin): 5 mg/25 mg per 0.5 mL.

**◆ CLASSIFICATION**

**PHARMACOTHERAPEUTIC:** Estrogen derivative. **CLINICAL:** Estrogen, anti-neoplastic.

## USES

Treatment of moderate to severe vasomotor symptoms associated with menopause, vulvar and vaginal atrophy associated with menopause, hypoestrogenism (due to castration, hypogonadism, primary ovarian failure), metastatic breast cancer (palliation) in men and postmenopausal women, advanced prostate cancer (palliation), prevention of osteoporosis in postmenopausal women.

## PRECAUTIONS

**Contraindications:** Hypersensitivity to estradiol, angioedema, hepatic dysfunction or disease, undiagnosed abnormal vaginal bleeding, active or history of arterial thrombosis, estrogen-dependent cancer (known, suspected, or history of), known or suspected breast cancer (except for pts being treated for metastatic disease), pregnancy, thrombophlebitis or thromboembolic disorders (current or history of), known protein C, protein S, antithrombin deficiency or other known thrombophilic disorder. **Cautions:** Renal insufficiency, diabetes mellitus, endometriosis, severe hypocalcemia, hyperlipidemias, asthma, epilepsy, migraines, SLE, hypertension, hypocalcemia, hypothyroidism, history of jaundice due to past estrogen use or pregnancy, cardiovascular disease, obesity, porphyria, severe hypocalcemia.

## ACTION

Modulates pituitary secretion of gonadotropins; follicle-stimulating hormone (FSH), luteinizing hormone (LH). **Therapeutic Effect:** Promotes normal growth/development of female sex organs. Reduces elevated levels of FSH, LH.

## PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed. Protein binding: 50%–80%. Metabolized in liver. Primarily excreted in urine. **Half-life:** Unknown.

## LIFESPAN CONSIDERATIONS

**Pregnancy/Lactation:** Contraindicated during pregnancy. Breastfeeding not recommended. **Children:** Caution in pts for whom bone growth is not complete (may accelerate epiphyseal closure). **Elderly:** May increase risk of new-onset dementia.

## INTERACTIONS

**DRUG:** CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease concentration/effects. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. May decrease therapeutic effect of anastrozole, exemestane. **HERBAL:** Herbals with estrogenic properties (e.g., dong quai, ginkgo biloba, ginseng, red clover) may increase adverse effects. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, calcium, HDL, triglycerides. May decrease serum cholesterol, LDL. May affect metapyrone testing, thyroid function tests.

## AVAILABILITY (Rx)

**Cream, Topical:** 0.4%, 0.6%. **Emulsion, Topical:** (*Estrasorb*): 4.35 mg estradiol/1.74 g pouch (contents of 2 pouches deliver estradiol 0.05 mg/day). **Gel, Topical:** (*Divigel*): 0.1% (0.25-g packet delivers estradiol 0.25 mg, 0.5-g packet delivers estradiol 0.5 mg, 1-g packet delivers 1 mg). (*Elestrin*): 0.06% delivers 0.52 mg estradiol/actuation. (*Estrogel*): 0.06% delivers 0.75 mg/actuation. **Injection (Cypionate):** *Depo-Estradiol*: 5 mg/mL. (*Valerate*): *Delestrogen*: 10 mg/mL, 20 mg/mL, 40 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg. **Topical Spray:** (*Evamist*): 1.53 mg/spray. **Transdermal System:** (*Alora*): twice wkly: 0.025 mg/24 hrs, 0.05 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. (*Climara*): once wkly: 0.025 mg/24 hrs, 0.0375 mg/24 hrs, 0.05 mg/24 hrs, 0.06 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. (*Menostar*): once wkly: 0.014 mg/24 hrs. (*Minivelle*,

**Vivelle-Dot:** twice wkly: 0.025 mg/24 hrs, 0.0375 mg/24 hrs, 0.05 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. **Vaginal Cream: (Estrace):** 0.1 mg/g. **Vaginal Ring: (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **(Femring):** 0.05 mg/day (total estradiol 12.4 mg release 0.05 mg/day over 3 mos); 0.1 mg/day (total estradiol 24.8 mg-release 0.1 mg/day over 3 mos). **Vaginal Tablet: (Vagifem):** 10 mcg.

## ADMINISTRATION/HANDLING

### IM

- Rotate vial to disperse drug in solution.
- Inject deep IM in large muscle mass.

### PO

- Administer at same time each day.
- Administer with food.

### Transdermal

- Remove old patch; select new site (buttocks are alternative application site).
- Peel off protective strip to expose adhesive surface.
- Apply to clean, dry, intact skin on trunk of body (area with as little hair as possible).
- Press in place for at least 10 sec (do not apply to breasts or waistline).

### Vaginal

- Apply at bedtime for best absorption.
- Insert end of filled applicator into vagina, directed slightly toward sacrum; push plunger down completely.
- Avoid skin contact with cream (prevents skin absorption).

## INDICATIONS/ROUTES/DOSAGE

### Prostate Cancer

**IM: (Delestrogen):** ADULTS, ELDERLY: 30 mg or more q1–2wks.

**PO: ADULTS, ELDERLY:** 1–2 mg tid for at least 3 mos.

### Breast Cancer (Metastatic)

**PO: ADULTS, ELDERLY:** 10 mg 3 times/day for at least 3 mos.

### Osteoporosis Prophylaxis in

#### Postmenopausal Females

**PO: ADULTS, ELDERLY:** 0.5 mg/day cyclically (3 wks on, 1 wk off).

**Transdermal: (Climara):** ADULTS, ELDERLY: Initially, 0.025 mg/24 hrs wkly; adjust dose as needed.

**Transdermal: (Alora, Minivelle, Vivelle-Dot):** ADULTS, ELDERLY: Initially, 0.025 mg/24 hrs patch twice wkly; adjust dose as needed.

**Transdermal: (Menostar):** ADULTS, ELDERLY: 0.014 mg/24 hrs patch wkly.

### Female Hypoestrogenism

**PO: ADULTS, ELDERLY:** 1–2 mg/day; adjust dose as needed.

**IM: (Depo-Estradiol):** ADULTS, ELDERLY: 1.5–2 mg monthly.

**IM: (Delestrogen):** ADULTS, ELDERLY: 10–20 mg q4wks.

**Transdermal: (Alora):** Initially, 0.05 mg/day twice wkly. **(Climara):** 0.025 mg/day once wkly. **(Vivelle-Dot):** 0.025 mg/day twice wkly.

### Vasomotor Symptoms Associated With Menopause

**PO: ADULTS, ELDERLY:** 0.5–2 mg/day cyclically (3 wks on, 1 wk off); adjust dose as needed.

**IM: (Depo-Estradiol):** ADULTS, ELDERLY: 1–5 mg q3–4wks.

**IM: (Delestrogen):** ADULTS, ELDERLY: 10–20 mg q4wks.

**Topical emulsion: (Estrasorb):** ADULTS, ELDERLY: 3.48 g (contents of 2 pouches) once daily in the morning.

**Topical gel: (Estrogel):** ADULTS, ELDERLY: 1.25 g/day.

**Transdermal spray: (Evamist):** Initially, 1 spray daily. May increase to 2–3 sprays daily.

**Transdermal: (Climara):** ADULTS, ELDERLY: 0.025 mg/24 hrs wkly. Adjust dose as needed.

**Transdermal: ADULTS, ELDERLY: (Alora):** 0.05 mg/24 hrs twice wkly. **(Vivelle-Dot):** 0.0375 mg/24 hrs twice wkly.

**Vaginal ring:** (*Femring*): ADULTS, ELDERLY: 0.05 mg. May increase to 0.1 mg if needed.

#### Vulvar and Vaginal Atrophy Associated With Menopause

**IM:** (*Delestrogen*): ADULTS, ELDERLY: 10–20 mg q4wks.

**Vaginal ring:** (*Femring*): Initially 0.05 mg. Usual dose: 0.05–0.1 mg q3mos.

**PO:** (*Estrace*): 0.5–1 mg/day 3 wks on and 1 wk off.

**Topical gel:** (*Estrogel*): 1.25 g/day at same time each day.

**Transdermal:** (*Alora, Climara, Vivelle-Dot*): See dose in availability section).

**Vaginal ring:** (*Estring*): ADULTS, ELDERLY: 2 mg. Ring to remain in place for 90 days.

**Vaginal cream:** (*Estrace*): Insert 2–4 g/day intravaginally for 2 wks, then reduce dose to half of initial dose for 2 wks, then maintenance dose of 1 g 1–3 times/wk.

**Vaginal tablet:** (*Vagifem*): ADULTS, ELDERLY: Initially, 1 tablet/day for 2 wks.

**Maintenance:** 1 tablet twice wkly.

#### Dosage in Renal Impairment

No dose adjustment.

#### Dosage in Hepatic Impairment

Contraindicated.

### SIDE EFFECTS
